  Removes the widget at index from the group but does not delete it.

- Fl_Widget * resizable () const
  See void Fl_Group::resizable(Fl_Widget *box)

- void resizable (Fl_Widget &o)
  See void Fl_Group::resizable(Fl_Widget *box)

- void resizable (Fl_Widget *o)
  The resizable widget defines the resizing box for the group.

- void resize (int, int, int, int)
  Resizes the Fl_Group widget and all of its children.

- virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
virtual class Fl_Gl_Window * as_gl_window ()

Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

virtual Fl_Window * as_window ()

Returns an Fl_Window pointer if this widget is an Fl_Window.

Fl_Boxtype box () const

Gets the box type of the widget.

void box (Fl_Boxtype new_box)

Sets the box type for the widget.

Fl_Callback_p callback () const

Gets the current callback function for the widget.

void callback (Fl_Callback +cb)

Sets the current callback function for the widget.

void callback (Fl_Callback +cb, void +p)

Sets the current callback function for the widget.

void callback (Fl_Callback0 +cb)

Sets the current callback function for the widget.

void callback (Fl_Callback1 +cb, long p=0)

Sets the current callback function for the widget.

unsigned int changed () const

Checks if the widget value changed since the last callback.

void clear_active ()

Marks the widget as inactive without sending events or changing focus.

void clear_changed ()

Marks the value of the widget as unchanged.

void clear_damage (uchar c=0)

Clears or sets the damage flags.

void clear_output ()

Sets a widget to accept input.

void clear_visible ()

Hides the widget.

void clear_visible_focus ()

Disables keyboard focus navigation with this widget.

Fl_Color color () const

Gets the background color of the widget.

void color (Fl_Color bg)

Sets the background color of the widget.

void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.

Fl_Color color2 () const

For back compatibility only.

void color2 (unsigned a)

For back compatibility only.

int contains (const Fl_Widget +w) const

Checks if w is a child of this widget.

void copy_label (const char +new_label)

Sets the current label.

void copyTooltip (const char +text)

Sets the current tooltip text.

uchar damage () const

Returns non-zero if draw() needs to be called.

void damage (uchar c)
Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label.
• const Fl_Image * deimage () const
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label.
• void do_callback ()
  Calls the widget callback.
• void do_callback (Fl_Widget *o, long arg)
  Calls the widget callback.
• void do_callback (Fl_Widget *o, void *arg=0)
  Calls the widget callback.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label.
• const Fl_Image * image () const
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

• `void labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

• `Fl_Labeltype labeltype () const`
  Gets the label type.

• `void labeltype (Fl_Labeltype a)`
  Sets the label type.

• `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

• `unsigned int output () const`
  Returns if a widget is used for output only.

• `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

• `void parent (Fl_Group *p)`
  Internal use only - “for hacks only”.

• `void position (int X, int Y)`
  Repositions the window or widget.

• `void redraw ()`
  Schedules the drawing of the widget.

• `void redraw_label ()`
  Schedules the drawing of the label.

• `Fl_Color selection_color () const`
  Gets the selection color.

• `void selection_color (Fl_Color a)`
  Sets the selection color.

• `void set_active ()`
  Marks the widget as active without sending events or changing focus.

• `void set_changed ()`
  Marks the value of the widget as changed.

• `void set_output ()`
  Sets a widget to output only.

• `void set_visible ()`
  Makes the widget visible.

• `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

• `virtual void show ()`
  Makes a widget visible.

• `void size (int W, int H)`
  Changes the size of the widget.

• `int take_focus ()`
  Gives the widget the keyboard focus.

• `unsigned int takesevents () const`
  Returns if the widget is able to take events.

• `int test_shortcut ()`
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

• `const char * tooltip () const`
  Gets the current tooltip text.

• `void tooltip (const char *text)`
  Sets the current tooltip text.

• `Fl_Window * top_window () const`
Returns a pointer to the top-level window for the widget.

- **Fl_Window** ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
- **uchar** type () const
  Gets the widget type.
- **void** type (uchar t)
  Sets the widget type.
- **int** use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- **void** ∗ user_data () const
  Gets the user data for this widget.
- **void** user_data (void ∗v)
  Sets the user data for this widget.
- **unsigned int** visible () const
  Returns whether a widget is visible.
- **unsigned int** visible_focus ()
  Checks whether this widget has a visible focus.
- **void** visible_focus (int v)
  Modifies keyboard focus navigation.
- **int** visible_r () const
  Returns whether a widget and all its parents are visible.
- **int** w () const
  Gets the widget width.
- **Fl_When** when () const
  Returns the conditions under which the callback is called.
- **void** when (uchar i)
  Sets the flags used to decide when a callback is called.
- **Fl_Window** ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- **int** x () const
  Gets the widget position in its window.
- **int** y () const
  Gets the widget position in its window.
- **virtual** virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

- **void** draw ()
  Draws the widget.

Protected Member Functions inherited from Fl_Group

- **void** draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- **void** draw_children ()
  Draws all children of the group.
- **void** draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- **int** ∗ sizes ()
  Returns the internal array of widget sizes and positions.
- **void** update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.
Protected Member Functions inherited from Fl_Widget

- void **clear_flag** (unsigned int c)
  Clears a flag in the flags mask.
- void **draw_backdrop** () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
  Draws the widget box according its box style.
- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** ()
  draws a focus rectangle around the widget
- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
  Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)
  Creates a widget at the given position and size.
- unsigned int **flags** () const
  Gets the widget flags mask.
- void **h** (int v)
  Internal use only.
- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.
- void **w** (int v)
  Internal use only.
- void **x** (int v)
  Internal use only.
- void **y** (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group ∗ **current** ()
  Returns the currently active group.
- static void **current** (Fl_Group ∗ g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void **default_callback** (Fl_Widget ∗ cb, void ∗ d)
  The default callback for all widgets that don't set a callback.
- static unsigned int **labelShortcut** (const char ∗ t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int **testShortcut** (const char ∗ t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9,/copied_label = 1<<10, CLIP_CHILDREN = 1<<11,

  = 1<<19,
  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}

flags possible values enumeration.

9.92.1 Detailed Description

This widget was designed to add the functionality of compressing and aligning widgets.
If type() is Fl_Pack::HORIZONTAL all the children are resized to the height of the Fl_Pack, and are moved next to
each other horizontally. If type() is not Fl_Pack::HORIZONTAL then the children are resized to the width and are
stacked below each other. Then the Fl_Pack resizes itself to surround the child widgets.
This widget is needed for the Fl_Tabs. In addition you may want to put the Fl_Pack inside an Fl_Scroll.
The resizable for Fl_Pack is set to NULL by default.
See also: Fl_Group::resizable()

9.92.2 Constructor & Destructor Documentation

9.92.2.1 Fl_Pack()

Fl_Pack: Fl_Pack ( int X,
int Y,
int W,
int H,
const char * l = 0 )

Creates a new Fl_Pack widget using the given position, size, and label string.
The default boxtype is FL_NO_BOX.
The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep
a pointer to all the children in the user code. A kludge has been done so the Fl_Pack and all of it's children can be
automatic (local) variables, but you must declare the Fl_Pack first, so that it is destroyed last.

9.92.3 Member Function Documentation

9.92.3.1 draw()

void Fl_Pack::draw ( ) [protected], [virtual]

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Reimplemented from Fl_Group.
The documentation for this class was generated from the following files:

- Fl_Pack.H
- Fl_Pack.cxx
9.93  **Fl_Paged_Device Class Reference**

Represents page-structured drawing surfaces.

```cpp
#include <Fl_Paged_Device.H>
```

Inheritance diagram for Fl_Paged_Device:

![Inheritance diagram](image)

**Classes**

- struct page_format
  width, height and name of a page format

**Public Types**

- enum Page_Format {
  A0 = 0, A1, A2, A3,
  A4, A5, A6, A7,
  A8, A9, B0, B1,
  B2, B3, B4, B5,
  B6, B7, B8, B9,
  B10, C5E, DLE, EXECUTIVE,
  FOLIO, LEDGER, LEGAL, LETTER,
  TABLOID, ENVELOPE, MEDIA = 0x1000 }

Possible page formats.

- enum Page_Layout {
  PORTRAIT = 0, LANDSCAPE = 0x100, REVERSED = 0x200, ORIENTATION = 0x300 }

Possible page layouts.

**Public Member Functions**

- const char * class_name ()
  Returns the name of the class of this object.

- virtual void end_job (void)
  To be called at the end of a print job.

- virtual int end_page (void)
  To be called at the end of each page.

- virtual void margins (int *left, int *top, int *right, int *bottom)
  Computes the dimensions of margins that lie between the printable page area and the full page.

- virtual void origin (int x, int y)
  Sets the position in page coordinates of the current origin of graphics functions.

- virtual void origin (int x, int y)
  Sets the position in page coordinates of the origin of graphics functions.

- virtual void print_widget (Fl_Widget *widget, int delta_x=0, int delta_y=0)
Draws the widget on the printed page.

- void print_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  Prints a window with its title bar and frame if any.

- virtual void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  Prints a rectangular part of an on-screen window.

- virtual int printable_rect (int *w, int *h)
  Computes the width and height of the printable area of the page.

- virtual void rotate (float angle)
  Rotates the graphics operations relatively to paper.

- virtual void scale (float scale_x, float scale_y=0.)
  Changes the scaling of page coordinates.

- virtual int start_job (int pagecount, int *frompage=NULL, int *topage=NULL)
  Starts a print job.

- virtual int start_page (void)
  Starts a new printed page.

- virtual void translate (int x, int y)
  Translates the current graphics origin accounting for the current rotation.

- virtual void untranslate (void)
  Undoes the effect of a previous translate() call.

- virtual ∼Fl_Paged_Device ()
  The destructor.

Public Member Functions inherited from Fl_Surface_Device

- const char * class_name ()
  Returns the name of the class of this object.

- Fl_Graphics_Driver * driver ()
  Returns the graphics driver of this drawing surface.

- void driver (Fl_Graphics_Driver *graphics_driver)
  Sets the graphics driver of this drawing surface.

- virtual void set_current (void)
  Make this surface the current drawing surface.

- virtual ∼Fl_Surface_Device ()
  The destructor.

Public Member Functions inherited from Fl_Device

- virtual ∼Fl_Device ()
  Virtual destructor.

Static Public Attributes

- static const char * class_id = "Fl_Paged_Device"

Static Public Attributes inherited from Fl_Surface_Device

- static const page_format page_formats [NO_PAGE_FORMATS]
  width, height and name of all elements of the enum Page_Format.

Static Public Attributes inherited from Fl_Device

- static const char * class_id = "Fl_Device"
  A string that identifies each subclass of Fl_Device.
Protected Member Functions

• Fl_Paged_Device ()
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

• Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)
  Constructor that sets the graphics driver to use for the created surface.

Protected Attributes

• int x_offset
  horizontal offset to the origin of graphics coordinates

• int y_offset
  vertical offset to the origin of graphics coordinates

Friends

• class Fl_Copy_Surface
• class Fl_Image_Surface

Additional Inherited Members

Static Public Member Functions inherited from Fl_Surface_Device

• static Fl_Surface_Device * surface ()
  The current drawing surface.

9.93.1 Detailed Description

Represents page-structured drawing surfaces.
This class has no public constructor: don't instantiate it; use Fl_Printer or Fl_PostScript_File_Device instead.

9.93.2 Member Enumeration Documentation

9.93.2.1 Page_Format

enum Fl_Paged_Device::Page_Format
Possible page formats.
All paper formats with pre-defined width and height.

Enumerator

<table>
<thead>
<tr>
<th>A0</th>
<th>A0 format.</th>
</tr>
</thead>
<tbody>
<tr>
<td>A4</td>
<td>A4 format.</td>
</tr>
<tr>
<td>LETTER</td>
<td>Letter format.</td>
</tr>
</tbody>
</table>

9.93.2.2 Page_Layout

enum Fl_Paged_Device::Page_Layout
Possible page layouts.

Enumerator

<table>
<thead>
<tr>
<th>PORTRAIT</th>
<th>Portrait orientation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>LANDSCAPE</td>
<td>Landscape orientation.</td>
</tr>
</tbody>
</table>
9.93.3 Member Function Documentation

9.93.3.1 class_name()

```cpp
const char * Fl_Paged_Device::class_name ( ) [inline], [virtual]
```

Returns the name of the class of this object. Use of the `class_name()` function is discouraged because it will be removed from future FLTK versions. The class of an instance of an `Fl_Device` subclass can be checked with code such as:

```cpp
if ( instance->class_name() == Fl_Printer::class_id ) { ... }
```

9.93.3.2 end_job()

```cpp
void Fl_Paged_Device::end_job ( void ) [virtual]
```

To be called at the end of a print job. Reimplemented in `Fl_PostScript_File_Device`, `Fl_System_Printer`, and `Fl_Printer`.

9.93.3.3 end_page()

```cpp
int Fl_Paged_Device::end_page ( void ) [virtual]
```

To be called at the end of each page.

Returns

- 0 if OK, non-zero if any error.

Reimplemented in `Fl_PostScript_File_Device`, `Fl_System_Printer`, and `Fl_Printer`.

9.93.3.4 margins()

```cpp
void Fl_Paged_Device::margins ( int * left,
int * top,
int * right,
int * bottom ) [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page. Values are in the same unit as that used by FLTK drawing functions. They are changed by `scale()` calls.

Parameters

<table>
<thead>
<tr>
<th><code>out</code></th>
<th><code>left</code></th>
<th>If non-null, *left is set to the left margin size.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>out</code></td>
<td><code>top</code></td>
<td>If non-null, *top is set to the top margin size.</td>
</tr>
<tr>
<td><code>out</code></td>
<td><code>right</code></td>
<td>If non-null, *right is set to the right margin size.</td>
</tr>
<tr>
<td><code>out</code></td>
<td><code>bottom</code></td>
<td>If non-null, *bottom is set to the bottom margin size.</td>
</tr>
</tbody>
</table>

Reimplemented in `Fl_PostScript_File_Device`, `Fl_System_Printer`, and `Fl_Printer`.

9.93.3.5 origin() [1/2]

```cpp
void Fl_Paged_Device::origin ( 
```
Computes the page coordinates of the current origin of graphics functions.

Parameters

| in   | x          | If non-null, →x is set to the horizontal page offset of graphics origin. |
|      | y          | Same as above, vertically.                                     |

Reimplemented in Fl_PostScript_File_Device, Fl_System_Printer, and Fl_Printer.

9.93.3.6 origin() [2/2]

void Fl_Paged_Device::origin {
    int x,
    int y ) [virtual]
Sets the position in page coordinates of the origin of graphics functions.
Arguments should be expressed relatively to the result of a previous printable_rect() call. That is, printable←
_rect(&w, &h); origin(w/2, 0); sets the graphics origin at the top center of the page printable area.
Origin() calls are not affected by rotate() calls. Successive origin() calls don’t combine their effects.

Parameters

| in   | x          | Horizontal position in page coordinates of the desired origin of graphics functions. |
|      | y          | Same as above, vertically.                                     |

Reimplemented in Fl_PostScript_File_Device, Fl_System_Printer, and Fl_Printer.

9.93.3.7 print_widget()

void Fl_Paged_Device::print_widget {
    Fl_Widget * widget,
    int delta_x = 0,
    int delta_y = 0 ) [virtual]
Draws the widget on the printed page.
The widget's position on the printed page is determined by the last call to origin() and by the optional delta_x and
delta_y arguments. Its dimensions are in points unless there was a previous call to scale().

Parameters

| in   | widget    | Any FLTK widget (e.g., standard, custom, window). |
|      | delta_x   | Optional horizontal offset for positioning the widget relatively to the current origin of graphics functions. |
|      | delta_y   | Same as above, vertically. |

Reimplemented in Fl_Printer.

9.93.3.8 print_window()

void Fl_Paged_Device::print_window {
    Fl_Window * win,
    int x_offset = 0,
    int y_offset = 0 )
Prints a window with its title bar and frame if any.
x_offset and y_offset are optional coordinates of where to position the window top left. Equivalent to print_widget() if win is a subwindow or has no border. Use Fl_Window::decorated_w() and
Fl_Window::decorated_h() to get the size of the printed window.

### 9.93.3.9 print_window_part()

```cpp
void Fl_Paged_Device::print_window_part (Fl_Window * win, int x, int y, int w, int h, int delta_x = 0, int delta_y = 0) [virtual]
```

Prints a rectangular part of an on-screen window.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>win</td>
<td>The window from where to capture.</td>
</tr>
<tr>
<td>x</td>
<td>The rectangle left</td>
</tr>
<tr>
<td>y</td>
<td>The rectangle top</td>
</tr>
<tr>
<td>w</td>
<td>The rectangle width</td>
</tr>
<tr>
<td>h</td>
<td>The rectangle height</td>
</tr>
<tr>
<td>delta_x</td>
<td>Optional horizontal offset from current graphics origin where to print the captured rectangle.</td>
</tr>
<tr>
<td>delta_y</td>
<td>As above, vertically.</td>
</tr>
</tbody>
</table>

Reimplemented in Fl_Printer.

### 9.93.3.10 printable_rect()

```cpp
int Fl_Paged_Device::printable_rect (int * w, int * h) [virtual]
```

Computes the width and height of the printable area of the page. Values are in the same unit as that used by FLTK drawing functions, are unchanged by calls to origin(), but are changed by scale() calls. Values account for the user-selected paper type and print orientation.

**Returns**

0 if OK, non-zero if any error

Reimplemented in Fl_PostScript_File_Device, Fl_System_Printer, and Fl_Printer.

### 9.93.3.11 rotate()

```cpp
void Fl_Paged_Device::rotate (float angle) [virtual]
```

Rotates the graphics operations relatively to paper. The rotation is centered on the current graphics origin. Successive rotate() calls don't combine their effects.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>angle</td>
<td>Rotation angle in counter-clockwise degrees.</td>
</tr>
</tbody>
</table>

Reimplemented in Fl_PostScript_File_Device, Fl_System_Printer, and Fl_Printer.
9.93.3.12 scale()

```cpp
void Fl_Paged_Device::scale ( 
    float scale_x,
    float scale_y = 0. ) [virtual]
```

Changes the scaling of page coordinates. This function also resets the origin of graphics functions at top left of printable page area. After a `scale()` call, do a `printable_rect()` call to get the new dimensions of the printable page area. Successive `scale()` calls don't combine their effects.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>scale_x</code></td>
<td>Horizontal dimensions of plot are multiplied by this quantity.</td>
</tr>
<tr>
<td><code>scale_y</code></td>
<td>Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code>. Thus, <code>scale(factor);</code> is equivalent to <code>scale(factor, factor);</code></td>
</tr>
</tbody>
</table>

Reimplemented in `Fl_PostScript_File_Device`, `Fl_System_Printer`, and `Fl_Printer`.

9.93.3.13 start_job()

```cpp
int Fl_Paged_Device::start_job ( 
    int pagecount,
    int * frompage = NULL,
    int * topage = NULL ) [virtual]
```

Starts a print job.

**Parameters**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pagecount</code></td>
<td>the total number of pages of the job (or 0 if you don't know the number of pages)</td>
</tr>
<tr>
<td><code>frompage</code></td>
<td>if non-null, <code>frompage</code> is set to the first page the user wants printed</td>
</tr>
<tr>
<td><code>topage</code></td>
<td>if non-null, <code>topage</code> is set to the last page the user wants printed</td>
</tr>
</tbody>
</table>

**Returns**

0 if OK, non-zero if any error

9.93.3.14 start_page()

```cpp
int Fl_Paged_Device::start_page ( 
    void ) [virtual]
```

Starts a new printed page. The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area.

**Returns**

0 if OK, non-zero if any error

Reimplemented in `Fl_PostScript_File_Device`, `Fl_System_Printer`, and `Fl_Printer`.

9.93.3.15 translate()

```cpp
void Fl_Paged_Device::translate ( 
    int x,
    int y ) [virtual]
```

Translates the current graphics origin accounting for the current rotation. This function is only useful after a `rotate()` call. Each `translate()` call must be matched by an `untranslate()` call. Successive `translate()` calls add up their effects.

Reimplemented in `Fl_PostScript_File_Device`, `Fl_System_Printer`, and `Fl_Printer`.
9.93.3.16 untranslate()

```c
void Fl_Paged_Device::untranslate (
    void ) [virtual]
```

Undoes the effect of a previous translate() call.
Reimplemented in Fl_PostScript_File_Device, Fl_System_Printer, and Fl_Printer.
The documentation for this class was generated from the following files:

- Fl_Paged_Device.H
- Fl_Paged_Device.cxx

### 9.94 Fl_Pixmap Class Reference

The Fl_Pixmap class supports caching and drawing of colormap ( pixmap) images, including transparency.

```c
#include <Fl_Pixmap.H>
```

Inheritance diagram for Fl_Pixmap:

```
Fl_Pixmap
   Fl_Image
      Fl_GIF Image Fl_XPM Image
```

#### Public Member Functions

- virtual void `color_average (Fl_Color c, float i)`

  The `color_average()` method averages the colors in the image with the FLTK color value `c`.

- Fl_Image * `copy ()`

  The `copy()` method creates a copy of the specified image.

- virtual Fl_Image * `copy (int W, int H)`

- virtual void `desaturate ()`

  The `desaturate()` method converts an image to grayscale.

- void `draw (int X, int Y)`

- virtual void `draw (int X, int Y, int W, int H, int cx=0, int cy=0)`

  Draws the image with a bounding box.

- Fl_Pixmap (char *const *D)

  The constructors create a new pixmap from the specified XPM data.

- Fl_Pixmap (const char *const *D)

  The constructors create a new pixmap from the specified XPM data.

- Fl_Pixmap (const uchar *const *D)

  The constructors create a new pixmap from the specified XPM data.

- Fl_Pixmap (uchar *const *D)

  The constructors create a new pixmap from the specified XPM data.

- virtual void `label (Fl_Menu_Item *m)`

  The `label()` methods are an obsolete way to set the image attribute of a widget or menu item.

- virtual void `label (Fl_Widget *w)`

  The `label()` methods are an obsolete way to set the image attribute of a widget or menu item.

- virtual void `uncache ()`

  If the image has been cached for display, delete the cache data.

- virtual `~Fl_Pixmap ()`

  The destructor frees all memory and server resources that are used by the pixmap.
Public Member Functions inherited from Fl_Img

- **Fl_Img** ∗ **copy ()**
  The copy() method creates a copy of the specified image.

- **int count () const**
  The count() method returns the number of data values associated with the image.

- **int d () const**
  Returns the current image depth.

- **const char ∗ const ∗ data () const**
  Returns a pointer to the current image data array.

- **void draw (int X, int Y)**
  Draws the image.

- **int fail ()**
  Returns a value that is not 0 if there is currently no image available.

- **Fl_Img (int W, int H, int D)**
  The constructor creates an empty image with the specified width, height, and depth.

- **int h () const**
  Returns the current image height in pixels.

- **void inactive ()**
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

- **int ld () const**
  Returns the current line data size in bytes.

- **int w () const**
  Returns the current image width in pixels.

- **virtual ~Fl_Img ()**
  The destructor is a virtual method that frees all memory used by the image.

Public Attributes

- **int alloc_data**

Protected Member Functions

- **void measure ()**

Protected Member Functions inherited from Fl_Img

- **void d (int D)**
  Sets the current image depth.

- **void data (const char ∗ const ∗ p, int c)**
  Sets the current array pointer and count of pointers in the array.

- **void draw_empty (int X, int Y)**
  The protected method draw_empty() draws a box with an X in it.

- **void h (int H)**
  Sets the current image height in pixels.

- **void ld (int LD)**
  Sets the current line data size in bytes.

- **void w (int W)**
  Sets the current image width in pixels.

- static void measure (const Fl_Label *lo, int &lw, int &lh)

9.94.1 Detailed Description

The Fl_Pixmap class supports caching and drawing of colormap ( pixmap ) images, including transparency.

9.94.2 Constructor & Destructor Documentation

9.94.2.1 Fl_Pixmap() [1/4]

Fl_Pixmap::Fl_Pixmap (char *const * D) [inline], [explicit]

The constructors create a new pixmap from the specified XPM data.

9.94.2.2 Fl_Pixmap() [2/4]

Fl_Pixmap::Fl_Pixmap (uchar *const * D) [inline], [explicit]

The constructors create a new pixmap from the specified XPM data.

9.94.2.3 Fl_Pixmap() [3/4]

Fl_Pixmap::Fl_Pixmap (const char *const * D) [inline], [explicit]

The constructors create a new pixmap from the specified XPM data.
9.94.2.4 Fl_Pixmap() [4/4]

Fl_Pixmap::Fl_Pixmap (const uchar ∗const ∗D) [inline], [explicit]
The constructors create a new pixmap from the specified XPM data.

9.94.3 Member Function Documentation

9.94.3.1 color_average()

void Fl_Pixmap::color_average (Fl_Color c, float i) [virtual]
The color_average() method averages the colors in the image with the FLTK color value c.
The i argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no
color blend, and a value of 0.0 results in a constant image of the specified color.
An internal copy is made of the original image before changes are applied, to avoid modifying the original image.
Reimplemented from Fl_Image.

9.94.3.2 copy()

Fl_Image ∗Fl_Pixmap::copy (int W, int H) [virtual]
The copy() method creates a copy of the specified image.
If the width and height are provided, the image is resized to the specified size. The image should be deleted (or in
the case of Fl_Shared_Image, released) when you are done with it.
Reimplemented from Fl_Image.

9.94.3.3 desaturate()

void Fl_Pixmap::desaturate () [virtual]
The desaturate() method converts an image to grayscale.
If the image contains an alpha channel (depth = 4), the alpha channel is preserved.
An internal copy is made of the original image before changes are applied, to avoid modifying the original image.
Reimplemented from Fl_Image.

9.94.3.4 draw()

void Fl_Pixmap::draw (int X, int Y, int W, int H, int cx = 0, int cy = 0) [virtual]
Draws the image with a bounding box.
Arguments X, Y, W, H specify a bounding box for the image, with the origin
(upper-left corner) of the image offset by the cx and cy arguments.
In other words: fl_push_clip(X,Y,W,H) is applied, the image is drawn with its upper-left corner at
X-cx, Y-cy and its own width and height, fl_pop_clip() is applied.
Reimplemented from Fl_Image.

9.94.3.5 label() [1/2]

void Fl_Pixmap::label (Fl_Menu_Item ∗m) [virtual]
The label() methods are an obsolete way to set the image attribute of a widget or menu item.
Use the `image()` or `deimage()` methods of the `Fl_Widget` and `Fl_Menu_Item` classes instead.
Reimplemented from `Fl_Image`.

**9.94.3.6 label() [2/2]**

```cpp
void FlPixmap::label (Fl_Widget *widget) [virtual]
```

The `label()` methods are an obsolete way to set the image attribute of a widget or menu item. Use the `image()` or `deimage()` methods of the `Fl_Widget` and `Fl_Menu_Item` classes instead.
Reimplemented from `Fl_Image`.

**9.94.3.7 uncache()**

```cpp
void FlPixmap::uncache ( ) [virtual]
```

If the image has been cached for display, delete the cache data.
This allows you to change the data used for the image and then redraw it without recreating an image object.
Reimplemented from `Fl_Image`.

The documentation for this class was generated from the following files:

- `FL_Pixmap.H`
- `FL_Pixmap.hxx`

**9.95 Fl_Plugin Class Reference**

`Fl_Plugin` allows link-time and run-time integration of binary modules.

```
#include <Fl_Plugin.H>
```

Inheritance diagram for `Fl_Plugin`:

```
Fl_Plugin
 |   |   |
|   |   |
|   |   |
|   |   |
|   |   |
|   FL_Device_Plugin
```

**Public Member Functions**

- `Fl_Plugin (const char *klass, const char *name)`
  
  Create a plugin.
- `virtual ~Fl_Plugin ()`
  
  Clear the plugin and remove it from the database.

**9.95.1 Detailed Description**

`Fl_Plugin` allows link-time and run-time integration of binary modules.

`Fl_Plugin` and `Fl_Plugin_Manager` provide a small and simple solution for linking C++ classes at run-time, or optionally linking modules at compile time without the need to change the main application.

`Fl_Plugin_Manager` uses static initialisation to create the plugin interface early during startup. Plugins are stored in a temporary database, organized in classes.

Plugins should derive a new class from `Fl_Plugin` as a base:

```cpp
class My_Plugin : public Fl_Plugin { 
  public:
    My_Plugin() : Fl_Plugin("effects", "blur") { }
    void do_something(...) { }
  
  My_Plugin blur_plugin();
```

Plugins can be put into modules and either linked before distribution, or loaded from dynamically linkable files. An `Fl_Plugin_Manager` is used to list and access all currently loaded plugins.

```cpp
Fl_Plugin_Manager mgr("effects");
int i, n = mgr.plugins();
for (i=0; i<n; i++) {
```
9.95.2 Constructor & Destructor Documentation

9.95.2.1 Fl_Plugin()

Fl_Plugin::Fl_Plugin (
    const char * klass,
    const char * name )

Create a plugin.

Parameters

| in | klass | plugins are grouped in classes |
|    | name  | every plugin should have a unique name |

The documentation for this class was generated from the following files:

- Fl_Plugin.H
- Fl_Preferences.cxx

9.96 Fl_Plugin_Manager Class Reference

Fl_Plugin_Manager manages link-time and run-time plugin binaries.

```cpp
#include <Fl_Plugin.H>
```

Inheritance diagram for Fl_Plugin_Manager:

```
Fl_Preferences
   ▼
   |
Fl_Plugin_Manager
```

Public Member Functions

- **Fl_Preferences::ID addPlugin** (const char *name, Fl_Plugin *plugin)
  
  This function adds a new plugin to the database.

- **Fl_Plugin_Manager** (const char *klass)
  
  Manage all plugins belonging to one class.

- **Fl_Plugin * plugin** (const char *name)
  
  Return the address of a plugin by name.

- **Fl_Plugin * plugin** (int index)
  
  Return the address of a plugin by index.

- **int plugins ()**
  
  Return the number of plugins in the klass.

- **~Fl_Plugin_Manager ()**
  
  Remove the plugin manager.

Public Member Functions inherited from **Fl_Preferences**

- **char clear ()**
  
  Delete all groups and all entries.

- **char deleteAllEntries ()**

Generated by Doxygen
Delete all entries.

- **char deleteAllGroups ()**
  Delete all groups.

- **char deleteEntry (const char *entry)**
  Deletes a single name/value pair.

- **char deleteGroup (const char *group)**
  Deletes a group.

- **int entries ()**
  Returns the number of entries (name/value pairs) in a group.

- **const char * entry (int index)**
  Returns the name of an entry.

- **char entryExists (const char *key)**
  Returns non-zero if an entry with this name exists.

- **Fl_Preferences (const char *path, const char *vendor, const char *application)**
  Use this constructor to create or read a preferences file at an arbitrary position in the file system.

- **Fl_Preferences (const Fl_Preferences &)**
  Create another reference to a Preferences group.

- **Fl_Preferences (Fl_Preferences &parent, const char *group)**
  Generate or read a new group of entries within another group.

- **Fl_Preferences (Fl_Preferences &parent, int groupIndex)**
  Open a child group using a given index.

- **Fl_Preferences (Fl_Preferences *parent, const char *group)**
  Create or access a group of preferences using a name.

- **Fl_Preferences (ID id)**
  Create a new dataset access point using a dataset ID.

- **Fl_Preferences (Root root, const char *vendor, const char *application)**
  The constructor creates a group that manages name/value pairs and child groups.

- **void flush ()**
  Writes all preferences to disk.

- **char get (const char *entry, char *&value, const char *defaultValue)**
  Reads an entry from the group.

- **char get (const char *entry, char *value, const char *defaultValue, int maxSize)**
  Reads an entry from the group.

- **char get (const char *entry, double &value, double defaultValue)**
  Reads an entry from the group.

- **char get (const char *entry, float &value, float defaultValue)**
  Reads an entry from the group.

- **char get (const char *entry, int &value, int defaultValue)**
  Reads an entry from the group.

- **char get (const char *entry, void *&value, const void *defaultValue, int defaultSize)**
  Reads an entry from the group.

- **char get (const char *entry, void *value, const void *defaultValue, int defaultSize, int maxSize)**
  Reads an entry from the group.

- **char getUserdataPath (char *path, int pathlen)**
  Creates a path that is related to the preferences file and that is usable for additional application data.

- **const char * group (int num_group)**
  Returns the name of the Nth (num_group) group.

- **char groupExists (const char *key)**
  Returns non-zero if a group with this name exists.

- **int groups ()**
Returns the number of groups that are contained within a group.

- **ID id ()**
  
  Return an ID that can later be reused to open more references to this dataset.

- **const char * name ()**
  
  Return the name of this entry.

- **const char * path ()**
  
  Return the full path to this entry.

- **char set (const char *entry, const char *value)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, const void *value, int size)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, double value)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, double value, int precision)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, float value)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, float value, int precision)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, int value)**
  
  Sets an entry (name/value pair).

- **int size (const char *entry)**
  
  Returns the size of the value part of an entry.

- **virtual ~Fl_Preferences ()**
  
  The destructor removes allocated resources.

### Static Public Member Functions

- **static int load (const char *filename)**
  
  Load a module from disk.

- **static int loadAll (const char *filepath, const char *pattern=0)**
  
  Use this function to load a whole directory full of modules.

- **static void removePlugin (Fl_Preferences::ID id)**
  
  Remove any plugin.

### Static Public Member Functions inherited from Fl_Preferences

- **static const char * newUUID ()**
  
  Returns a UUID as generated by the system.

- **static char remove (ID id_)**
  
  Remove the group with this ID from a database.

### Additional Inherited Members

**Public Types inherited from Fl_Preferences**

- **typedef void * ID**
  
  Every Fl_Preferences-Group has a unique ID.

- **enum Root { SYSTEM =0 , USER }**
  
  Define the scope of the preferences.
Protected Attributes inherited from Fl_Preferences

- Node * node
- RootNode * rootNode

9.96.1 Detailed Description

Fl_Plugin_Manager manages link-time and run-time plugin binaries.

See also

Fl_Plugin

9.96.2 Constructor & Destructor Documentation

9.96.2.1 ~Fl_Plugin_Manager()

Fl_Plugin_Manager::~Fl_Plugin_Manager ( )
Remove the plugin manager.
Calling this does not remove the database itself or any plugins. It just removes the reference to the database.

9.96.3 Member Function Documentation

9.96.3.1 addPlugin()

Fl_Preferences::ID Fl_Plugin_Manager::addPlugin ( const char * name, Fl_Plugin * plugin )
This function adds a new plugin to the database.
There is no need to call this function explicitly. Every Fl_Plugin constructor will call this function at initialization time.

9.96.3.2 load()

int Fl_Plugin_Manager::load ( const char * filename ) [static]
Load a module from disk.
A module must be a dynamically linkable file for the given operating system. When loading a module, its +init
function will be called which in turn calls the constructor of all statically initialized Fl_Plugin classes and adds them
to the database.

9.96.3.3 removePlugin()

void Fl_Plugin_Manager::removePlugin ( Fl_Preferences::ID id ) [static]
Remove any plugin.
There is no need to call this function explicitly. Every Fl_Plugin destructor will call this function at destruction time.
The documentation for this class was generated from the following files:

- Fl_Plugin.H
- Fl_Preferences.cxx

9.97 Fl_PNG_Image Class Reference

The Fl_PNG_Image class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files.

#include <Fl_PNG_Image.H>

Inheritance diagram for Fl_PNG_Image:
Public Member Functions

- **Fl_PNG_Image** (const char ∗filename)
  
  The constructor loads the named PNG image from the given png filename.

- **Fl_PNG_Image** (const char ∗name_png, const unsigned char ∗buffer, int datasize)
  
  Constructor that reads a PNG image from memory.

Public Member Functions inherited from **Fl_RGB_Image**

- virtual void color_average (Fl_Color c, float i)
  
  The color_average() method averages the colors in the image with the FLTK color value c.

- **Fl_RGB_Image** ∗copy ()

- virtual **Fl_RGB_Image** ∗copy (int W, int H)
  
  The copy() method creates a copy of the specified image.

- virtual void desaturate ()
  
  The desaturate() method converts an image to grayscale.

- void draw (int X, int Y)

- virtual void draw (int X, int Y, int W, int H, int cx=0, int cy=0)
  
  Draws the image with a bounding box.

- **Fl_RGB_Image** (const Fl_Pixmap ∗pxm, Fl_Color bg=FL_GRAY)

  The constructor creates a new RGBA image from the specified Fl_Pixmap.

- **Fl_RGB_Image** (const uchar ∗bits, int W, int H, int D=3, int LD=0)

  The constructor creates a new image from the specified data.

- virtual void label (Fl_Menu_Item ∗m)

  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

- virtual void label (Fl_Widget ∗w)

  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

- virtual void uncache ()

  If the image has been cached for display, delete the cache data.

- virtual ~**Fl_RGB_Image** ()

  The destructor frees all memory and server resources that are used by the image.

Public Member Functions inherited from **Fl_Image**

- **Fl_RGB_Image** ∗copy ()

- int count () const

- int d () const
  
  Returns the current image depth.

- const char ∗const ∗data () const
  
  Returns a pointer to the current image data array.

- void draw (int X, int Y)

  Draws the image.
• int fail()
  Returns a value that is not 0 if there is currently no image available.
• Fl_Image(int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.
• int h() const
  Returns the current image height in pixels.
• void inactive()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.
• int ld() const
  Returns the current line data size in bytes.
• int w() const
  Returns the current image width in pixels.
• virtual ~Fl_Image()
  The destructor is a virtual method that frees all memory used by the image.

Additional Inherited Members

Static Public Member Functions inherited from Fl_RGB_Image
• static size_t max_size()
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
• static void max_size(size_t size)
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

Static Public Member Functions inherited from Fl_Image
• static Fl_RGB_Scaling RGB_scaling()
  Returns the currently used RGB image scaling method.
• static void RGB_scaling(Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).

Public Attributes inherited from Fl_RGB_Image
• int alloc_array
  If non-zero, the object’s data array is delete[]d when deleting the object.
• const uchar * array
  Points to the start of the object’s data array.

Static Public Attributes inherited from Fl_Image
• static const int ERR_FILE_ACCESS = -2
• static const int ERR_FORMAT = -3
• static const int ERR_NO_IMAGE = -1

Protected Member Functions inherited from Fl_Image
• void d(int D)
  Sets the current image depth.
• void data(const char *const *p, int c)
  Sets the current array pointer and count of pointers in the array.
• void draw_empty(int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
• void h(int H)
Sets the current image height in pixels.

- void ld (int LD)

Sets the current line data size in bytes.

- void w (int W)

Sets the current image width in pixels.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label ∗lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label ∗lo, int &lw, int &lh)

9.97.1 Detailed Description

The Fl_PNG_Image class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files. The class loads colormapped and full-color images and handles color- and alpha-based transparency.

9.97.2 Constructor & Destructor Documentation

9.97.2.1 Fl_PNG_Image() [1/2]

Fl_PNG_Image::Fl_PNG_Image (const char ∗filename)

The constructor loads the named PNG image from the given png filename.

The destructor frees all memory and server resources that are used by the image.

Use Fl_Image::fail() to check if Fl_PNG_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the PNG format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason.

Parameters

| in  | filename | Name of PNG file to read |

9.97.2.2 Fl_PNG_Image() [2/2]

Fl_PNG_Image::Fl_PNG_Image (const char ∗name_png,
const unsigned char ∗buffer,
int maxsize)

Constructor that reads a PNG image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary Data" chunks as a great way to add image data into the C++ source code. name_png can be NULL. If a name is given, the image is added to the list of shared images (see: Fl_Shared_Image) and will be available by that name.

Parameters

| name_png | A name given to this image or NULL |
| buffer   | Pointer to the start of the PNG image in memory |
| maxsize  | Size in bytes of the memory buffer containing the PNG image |

The documentation for this class was generated from the following files:

- Fl_PNG_Image.H
- Fl_PNG_Image.cxx
9.98  **FL_PNM_Image Class Reference**

The **FL_PNM_Image** class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files.

```cpp
#include <FL_PNM_Image.H>
```

Inheritance diagram for FL_PNM_Image:

```
 FL_PNM_Image
  |       |
  V       V
FL_RGB_Image
  |       |
  V       V
FL_Image
```

**Public Member Functions**

- **FL_PNM_Image (const char *filename)**
  
  The constructor loads the named PNM image.

**Public Member Functions inherited from FL_RGB_Image**

- virtual void **color_average (FL_Color c, float i)**
  
  The color_average() method averages the colors in the image with the FLTK color value c.

- **FL_Image * copy ()**

  The copy() method creates a copy of the specified image.

- virtual void **desaturate ()**

  The desaturate() method converts an image to grayscale.

- void **draw (int X, int Y)**

- virtual void **draw (int X, int Y, int W, int H, int cx=0, int cy=0)**

  Draws the image with a bounding box.

- **FL_RGB_Image (const FL_Pixmap *pxm, FL_Color bg=FL_GRAY)**

  The constructor creates a new RGBA image from the specified FL_Pixmap.

- **FL_RGB_Image (const uchar *bits, int W, int H, int D=3, int LD=0)**

  The constructor creates a new image from the specified data.

- virtual void **label (FL_Menu_Item *m)**

  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

- virtual void **label (FL_Widget *w)**

  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

- virtual void **uncache ()**

  If the image has been cached for display, delete the cache data.

- virtual ~**FL_RGB_Image ()**

  The destructor frees all memory and server resources that are used by the image.

**Public Member Functions inherited from FL_Image**

- **FL_Image * copy ()**

  The copy() method creates a copy of the specified image.

- int **count () const**

  The count() method returns the number of data values associated with the image.

- int **d () const**

  Returns the current image depth.
• const char *const * data () const
  Returns a pointer to the current image data array.
• void draw (int X, int Y)
  Draws the image.
• int fail ()
  Returns a value that is not 0 if there is currently no image available.
• Fl_IMAGE (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.
• int h () const
  Returns the current image height in pixels.
• void inactive ()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears
grayed out.
• int ld () const
  Returns the current line data size in bytes.
• int w () const
  Returns the current image width in pixels.
• virtual ~Fl_IMAGE ()
  The destructor is a virtual method that frees all memory used by the image.

Additional Inherited Members

Static Public Member Functions inherited from Fl_RGB_IMAGE
• static size_t max_size ()
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_IMAGE object.
• static void max_size (size_t size)
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_IMAGE object.

Static Public Member Functions inherited from Fl_IMAGE
• static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
• static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).

Public Attributes inherited from Fl_RGB_IMAGE
• int alloc_array
  If non-zero, the object’s data array is delete[]’d when deleting the object.
• const uchar * array
  Points to the start of the object’s data array.

Static Public Attributes inherited from Fl_IMAGE
• static const int ERR_FILE_ACCESS = -2
• static const int ERR_FORMAT = -3
• static const int ERR_NO_IMAGE = -1
Protected Member Functions inherited from Fl_Image

- void d (int D)
  Sets the current image depth.
- void data (const char *const *p, int c)
  Sets the current array pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- void h (int H)
  Sets the current image height in pixels.
- void ld (int LD)
  Sets the current line data size in bytes.
- void w (int W)
  Sets the current image width in bytes.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

9.98.1 Detailed Description

The Fl_PNM_Image class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files. The class loads bitmap, grayscale, and full-color images in both ASCII and binary formats.

9.98.2 Constructor & Destructor Documentation

9.98.2.1 Fl_PNM_Image()

Fl_PNM_Image::Fl_PNM_Image (const char * name )

The constructor loads the named PNM image. The destructor frees all memory and server resources that are used by the image. Use Fl_Image::fail() to check if Fl_PNM_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the PNM format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason. The documentation for this class was generated from the following files:

- Fl_PNM_Image.H
- Fl_PNM_Image.cxx

9.99 Fl_Positioner Class Reference

This class is provided for Forms compatibility.

#include <Fl_Positioner.H>

Inheritance diagram for Fl_Positioner:

```
Fl_Widget
    |
    ↓
Fl_Positioner
```
Public Member Functions

- **Fl_Positioner** (int x, int y, int w, int h, const char *l=0)
  
  Creates a new Fl_Positioner widget using the given position, size, and label string.

- int **handle** (int)
  
  Handles the specified event.

- int **value** (double, double)
  
  Returns the current position in x and y.

- void **xbounds** (double, double)
  
  Sets the X axis bounds.

- double **xmaximum** () const
  
  Gets the X axis maximum.

- void **xmaximum** (double a)
  
  Same as xbounds(xminimum(), a)

- double **xmininimum** () const
  
  Gets the X axis minimum.

- void **xmininimum** (double a)
  
  Same as xbounds(a, xmaximum())

- void **xstep** (double a)
  
  Sets the stepping value for the X axis.

- double **xvalue** () const
  
  Gets the X axis coordinate.

- int **xvalue** (double)
  
  Sets the X axis coordinate.

- void **ybounds** (double, double)
  
  Sets the Y axis bounds.

- double **ymaximum** () const
  
  Gets the Y axis maximum.

- void **ymaximum** (double a)
  
  Same as ybounds(ymininimum(), a)

- double **yminimum** () const
  
  Gets the Y axis minimum.

- void **yminimum** (double a)
  
  Same as ybounds(a, ymaximum())

- void **ystep** (double a)
  
  Sets the stepping value for the Y axis.

- double **yvalue** () const
  
  Gets the Y axis coordinate.

- int **yvalue** (double)
  
  Sets the Y axis coordinate.

Public Member Functions inherited from Fl_Widget

- void **_clear_fullscreen** ()

- void **_set_fullscreen** ()

- void **activate** ()
  
  Activates the widget.

- unsigned int **active** () const
  
  Returns whether the widget is active.

- int **active_r** () const
  
  Returns whether the widget and all of its parents are active.

- **Fl_Align align** () const
9.99 Fl_Positioner Class Reference

Gets the label alignment.

- void align (Fl_Align alignment)
  
  Sets the label alignment.

- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- virtual Fl_Gl_Window * as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual Fl_Group * as_group ()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Window * as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- Fl_Boxtype box () const
  
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.

- void callback (Fl_Callback *cb)
  
  Sets the current callback function for the widget.

- void callback (Fl_Callback *cb, void *p)
  
  Sets the current callback function for the widget.

- void callback (Fl_Callback0 *cb)
  
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)
  
  Sets the current callback function for the widget.

- unsigned int changed () const
  
  Checks if the widget value changed since the last callback.

- void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.

- void clear_output ()
  
  Sets a widget to accept input.

- void clear_visible ()
  
  Hides the widget.

- void clear_visible_focus ()
  
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  
  Gets the background color of the widget.

- void color (Fl_Color bg)
  
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  
  For back compatibility only.

- void color2 (unsigned a)
  
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label.
• const Fl_Image *deimage () const
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label.
• void do_callback ()
  Calls the widget callback.
• void do_callback (Fl_Widget *o, long arg)
  Calls the widget callback.
• void do_callback (Fl_Widget *o, void *arg=0)
  Calls the widget callback.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label.
• const Fl_Image *image () const
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char *label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  Sets the label color.

- **Fl_Font labelfont () const**
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  Sets width ww and height hh accordingly with the label size.

- **unsigned int output () const**
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - “for hacks only”.

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**
  Changes the size or position of the widget.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.
• int **take_focus** ()
  
  Gives the widget the keyboard focus.

• unsigned int **takesevents** () const
  
  Returns if the widget is able to take events.

• int **test_shortcut** ()
  
  Returns true if the widget's label contains the entered 'x' shortcut.

• const char **∗** **tooltip** () const
  
  Gets the current tooltip text.

• void **tooltip** (const char **∗** text)
  
  Sets the current tooltip text.

• Fl_Window **∗** **top_window** () const
  
  Returns a pointer to the top-level window for the widget.

• Fl_Window **∗** **top_window_offset** (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar **type** () const
  
  Gets the widget type.

• void **type** (uchar t)
  
  Sets the widget type.

• int **use_accents_menu** ()
  
  Returns non zero if MAC_USE_ACCESTS_MENU flag is set, 0 otherwise.

• void **∗** **user_data** () const
  
  Gets the user data for this widget.

• void **user_data** (void **∗** v)
  
  Sets the user data for this widget.

• unsigned int **visible** () const
  
  Returns whether a widget is visible.

• unsigned int **visible_focus** ()
  
  Checks whether this widget has a visible focus.

• void **visible_focus** (int v)
  
  Modifies keyboard focus navigation.

• int **visible_r** () const
  
  Returns whether a widget and all its parents are visible.

• int **w** () const
  
  Gets the widget width.

• Fl_When **when** () const
  
  Returns the conditions under which the callback is called.

• void **when** (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Window **∗** **window** () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int **x** () const
  
  Gets the widget position in its window.

• int **y** () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Protected Member Functions

• void **draw** ()
  
  Draws the widget.

• void **draw** (int, int, int, int)

• int **handle** (int, int, int, int)
Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus ()
  draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗cb, void ∗d)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int testShortcut (const char ∗, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19,
  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.

9.99.1 Detailed Description

This class is provided for Forms compatibility. It provides 2D input. It would be useful if this could be put atop another widget so that the crosshairs are on top, but this is not implemented. The color of the crosshairs is selection_color().

Figure 9.24 Fl_Positioner

9.99.2 Constructor & Destructor Documentation

9.99.2.1 Fl_Positioner()

Fl_Positioner::Fl_Positioner ( int X, int Y, int W, int H, const char * l = 0 )

Creates a new Fl_Positioner widget using the given position, size, and label string. The default boxtype is FL_NO_BOX.

9.99.3 Member Function Documentation

9.99.3.1 draw()

void Fl_Positioner::draw ( ) [protected], [virtual]

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead. Override this function to draw your own widgets. If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```cpp
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.
9.99.3.2 handle()

```
int Fl_Positioner::handle (  
    int event ) [virtual]
```

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

**Parameters**

| in | event | the kind of event received |

**Return values**

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

**See also**

Fl_Event

Reimplemented from Fl_Widget.
The documentation for this class was generated from the following files:

- Fl_Positioner.H
- Fl_Positioner.cxx

9.100 Fl_PostScript_File_Device Class Reference

To send graphical output to a PostScript file.

```
#include <Fl_PostScript.H>
```

Inheritance diagram for Fl_PostScript_File_Device:

```
Fl_Device

Fl_Surface_Device

Fl_Paged_Device

Fl_PostScript_File_Device

Fl_PostScript_Printer
```

**Public Member Functions**

- const char * class_name ()
  
  Returns the name of the class of this object.
- void end_job (void)
  
  To be called at the end of a print job.
- int end_page (void)
  
  To be called at the end of each page.
• **Fl_PostScript_File_Device ()**
  
  *The constructor.*

• **void margins (int *left, int *top, int *right, int *bottom)**
  
  *Computes the dimensions of margins that lie between the printable page area and the full page.*

• **void origin (int *x, int *y)**
  
  *Computes the page coordinates of the current origin of graphics functions.*

• **void origin (int x, int y)**
  
  *Sets the position in page coordinates of the origin of graphics functions.*

• **int printable_rect (int *w, int *h)**
  
  *Computes the width and height of the printable area of the page.*

• **void rotate (float angle)**
  
  *Rotates the graphics operations relatively to paper.*

• **void scale (float scale_x, float scale_y=0.)**
  
  *Changes the scaling of page coordinates.*

• **int start_job (FILE *ps_output, int pagecount, enum Fl_Paged_Device::Page_Format format=Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout=Fl_Paged_Device::PORTRAIT)**
  
  *Begins the session where all graphics requests will go to FILE pointer.*

• **int start_job (int pagecount, enum Fl_Paged_Device::Page_Format format=Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout=Fl_Paged_Device::PORTRAIT)**
  
  *Begins the session where all graphics requests will go to a local PostScript file.*

• **int start_job (int pagecount, int *from, int *to)**
  
  *Don't use with this class.*

• **int start_page (void)**
  
  *Starts a new printed page.*

• **void translate (int x, int y)**
  
  *Translates the current graphics origin accounting for the current rotation.*

• **void untranslate (void)**
  
  *Undoes the effect of a previous translate() call.*

• **~Fl_PostScript_File_Device ()**
  
  *The destructor.*

### Public Member Functions inherited from Fl_Paged_Device

• **virtual void print_widget (Fl_Widget *widget, int delta_x=0, int delta_y=0)**
  
  *Draws the widget on the printed page.*

• **void print_window (Fl_Window *win, int x_offset=0, int y_offset=0)**
  
  *Prints a window with its title bar and frame if any.*

• **virtual void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)**
  
  *Prints a rectangular part of an on-screen window.*

• **virtual ~Fl_Paged_Device ()**
  
  *The destructor.*

### Public Member Functions inherited from Fl_Surface_Device

• **const char * class_name ()**
  
  *Returns the name of the class of this object.*

• **FL_Graphics_Driver * driver ()**
  
  *Returns the graphics driver of this drawing surface.*

• **void driver (FL_Graphics_Driver *graphics_driver)**
  
  *Sets the graphics driver of this drawing surface.*

• **virtual void set_current (void)**
  
  *Make this surface the current drawing surface.*

• **virtual ~Fl_Surface_Device ()**
  
  *The destructor.*
Public Member Functions inherited from Fl_Device

• virtual ~Fl_Device ()
  
  Virtual destructor.

Static Public Attributes

• static const char *class_id = "Fl_PostScript_File_Device"
• static const char *file_chooser_title = "Select a .ps file"
  
  Label of the PostScript file chooser window.

Static Public Attributes inherited from Fl_Paged_Device

• static const char *class_id = "Fl_Paged_Device"
• static const page_format page_formats [NO_PAGE_FORMATS]
  
  width, height and name of all elements of the enum Page_Format.

Static Public Attributes inherited from Fl_Surface_Device

• static const char *class_id = "Fl_Surface_Device"

Static Public Attributes inherited from Fl_Device

• static const char *class_id = "Fl_Device"
  
  A string that identifies each subclass of Fl_Device.

Protected Member Functions

• Fl_PostScript_Graphics_Driver *driver ()
  
  Returns the PostScript driver of this drawing surface.

Protected Member Functions inherited from Fl_Paged_Device

• Fl_Paged_Device ()
  
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

• Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)
  
  Constructor that sets the graphics driver to use for the created surface.

Additional Inherited Members

Public Types inherited from Fl_Paged_Device

• enum Page_Format {
  A0 = 0 , A1 , A2 , A3 ,
  A4 , A5 , A6 , A7 ,
  A8 , A9 , B0 , B1 ,
  B2 , B3 , B4 , B5 ,
  B6 , B7 , B8 , B9 ,
  B10 , C5E , DLE , EXECUTIVE ,
  FOLIO , LEDGER , LEGAL , LETTER ,
  TABLOID , ENVELOPE , MEDIA = 0x1000 }
  
  Possible page formats.

• enum Page_Layout { PORTRAIT = 0 , LANDSCAPE = 0x100 , REVERSED = 0x200 , ORIENTATION = 0x300 }
  
  Possible page layouts.
Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * surface ()
  
  The current drawing surface.

Protected Attributes inherited from Fl_Paged_Device

- int x_offset
  
  horizontal offset to the origin of graphics coordinates
- int y_offset
  
  vertical offset to the origin of graphics coordinates

9.100.1 Detailed Description

To send graphical output to a PostScript file.

This class is used exactly as the Fl_Printer class except for the start_job() call, two variants of which are usable and allow to specify what page format and layout are desired.

9.100.2 Member Function Documentation

9.100.2.1 class_name()

const char * Fl_PostScript_File_Device::class_name ( ) [inline], [virtual]

Returns the name of the class of this object.

Use of the class_name() function is discouraged because it will be removed from future FLTK versions.

The class of an instance of an Fl_Device subclass can be checked with code such as:

```cpp
if ( instance->class_name() == Fl_Printer::class_id ) { ... }
```

Reimplemented from Fl_Paged_Device.

Reimplemented in Fl_PostScript_Printer.

9.100.2.2 end_job()

void Fl_PostScript_File_Device::end_job ( void ) [virtual]

To be called at the end of a print job.

Reimplemented from Fl_Paged_Device.

9.100.2.3 end_page()

int Fl_PostScript_File_Device::end_page ( void ) [virtual]

To be called at the end of each page.

Returns

0 if OK, non-zero if any error.

Reimplemented from Fl_Paged_Device.

9.100.2.4 margins()

void Fl_PostScript_File_Device::margins ( int * left, int * top, int * right, int * bottom ) [virtual]

Computes the dimensions of margins that lie between the printable page area and the full page.

Values are in the same unit as that used by FLTK drawing functions. They are changed by scale() calls.
Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>left</th>
<th>If non-null, left is set to the left margin size.</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>top</td>
<td>If non-null, top is set to the top margin size.</td>
</tr>
<tr>
<td>out</td>
<td>right</td>
<td>If non-null, right is set to the right margin size.</td>
</tr>
<tr>
<td>out</td>
<td>bottom</td>
<td>If non-null, bottom is set to the bottom margin size.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

### 9.100.2.5 origin() [1/2]

```cpp
void Fl_PostScript_File_Device::origin ( 
    int * x, 
    int * y ) [virtual]
```

Computes the page coordinates of the current origin of graphics functions.

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>x</th>
<th>If non-null, x is set to the horizontal page offset of graphics origin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>y</td>
<td>Same as above, vertically.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

### 9.100.2.6 origin() [2/2]

```cpp
void Fl_PostScript_File_Device::origin ( 
    int x, 
    int y ) [virtual]
```

Sets the position in page coordinates of the origin of graphics functions. Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the page printable area. Origin() calls are not affected by `rotate()` calls. Successive `origin()` calls don’t combine their effects.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x</th>
<th>Horizontal position in page coordinates of the desired origin of graphics functions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>y</td>
<td>Same as above, vertically.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

### 9.100.2.7 printable_rect()

```cpp
int Fl_PostScript_File_Device::printable_rect ( 
    int * w, 
    int * h ) [virtual]
```

Computes the width and height of the printable area of the page. Values are in the same unit that used by FLTK drawing functions, are unchanged by calls to `origin()`, but are changed by `scale()` calls. Values account for the user-selected paper type and print orientation.

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

### 9.100.2.8 rotate()

```cpp
void Fl_PostScript_File_Device::rotate ( 
    float angle ) [virtual]
```

Generated by Doxygen
Rotates the graphics operations relatively to paper.
The rotation is centered on the current graphics origin. Successive \texttt{rotate()} calls don’t combine their effects.

**Parameters**

\begin{verbatim}
| angle | Rotation angle in counter-clockwise degrees. |
\end{verbatim}

Reimplemented from \texttt{Fl_Paged_Device}.

**9.100.2.9 scale()**

\begin{verbatim}
void Fl_PostScript_File_Device::scale {
    float scale_x,
    float scale_y = 0. } [virtual]
\end{verbatim}

Changes the scaling of page coordinates.
This function also resets the origin of graphics functions at top left of printable page area. After a \texttt{scale()} call, do a \texttt{printable_rect()} call to get the new dimensions of the printable page area. Successive \texttt{scale()} calls don’t combine their effects.

**Parameters**

\begin{verbatim}
| scale_x | Horizontal dimensions of plot are multiplied by this quantity. |
| scale_y | Same as above, vertically. The value 0. is equivalent to setting scale_y = scale_x. Thus, scale(factor); is equivalent to scale(factor, factor); |
\end{verbatim}

Reimplemented from \texttt{Fl_Paged_Device}.

**9.100.2.10 start_job() [1/3]**

\begin{verbatim}
int Fl_PostScript_File_Device::start_job (  
    FILE * ps_output,  
    int pagecount,  
    enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,  
    enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT )
\end{verbatim}

Begins the session where all graphics requests will go to \texttt{FILE} pointer.

**Parameters**

\begin{verbatim}
| ps_output | A writable \texttt{FILE} pointer that will receive PostScript output and that should not be closed until after \texttt{end_job()} has been called. |
| pagecount | The total number of pages to be created. Use 0 if this number is unknown when this function is called. |
| format | Desired page format. |
| layout | Desired page layout. |
\end{verbatim}

Returns

always 0.

**9.100.2.11 start_job() [2/3]**

\begin{verbatim}
int Fl_PostScript_File_Device::start_job (  
    int pagecount,  
    enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,  
    enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT )
\end{verbatim}

Begins the session where all graphics requests will go to a local PostScript file.

---

Generated by Doxygen
Opens a file dialog entitled with Fl_PostScript_File_Device::file_chooser_title to select an output PostScript file.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pagecount</td>
<td>The total number of pages to be created. Use 0 if this number is unknown when this function is called.</td>
</tr>
<tr>
<td>format</td>
<td>Desired page format.</td>
</tr>
<tr>
<td>layout</td>
<td>Desired page layout.</td>
</tr>
</tbody>
</table>

Returns

0 if OK, 1 if user cancelled the file dialog, 2 if fopen failed on user-selected output file.

9.100.2.12 start_job() [3/3]

```cpp
int Fl_PostScript_File_Device::start_job (  
    int pagecount,  
    int * from,  
    int * to ) [virtual]
```

Don't use with this class.
Reimplemented from Fl_Paged_Device.
Reimplemented in Fl_PostScript_Printer.

9.100.2.13 start_page()

```cpp
int Fl_PostScript_File_Device::start_page (  
    void ) [virtual]
```

Starts a new printed page.
The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area.

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

9.100.2.14 translate()

```cpp
void Fl_PostScript_File_Device::translate (  
    int x,  
    int y ) [virtual]
```

Translates the current graphics origin accounting for the current rotation.
This function is only useful after a rotate() call. Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects.
Reimplemented from Fl_Paged_Device.

9.100.2.15 untranslate()

```cpp
void Fl_PostScript_File_Device::untranslate (  
    void ) [virtual]
```

Undoes the effect of a previous translate() call.
Reimplemented from Fl_Paged_Device.
The documentation for this class was generated from the following files:

- matrix * fl_matrix

Points to the current coordinate transformation matrix.

9.101.1 Detailed Description

PostScript graphical backend.
PostScript text uses vectorial fonts when using the FLTK standard fonts and the latin alphabet or a few other characters listed in the following table. The latin alphabet means all unicode characters between U+0020 and U+017F, or, in other words, the ASCII, Latin-1 Supplement and Latin Extended-A charts.

<table>
<thead>
<tr>
<th>Char</th>
<th>Code-point</th>
<th>Name</th>
<th>Char</th>
<th>Code-point</th>

<td>†</td>
<td>U+2024</td>
<td>fraction</td>
</tr>
</tbody>
</table>

All other unicode characters or all other fonts (FL_FREE_FONT and above) are output as a bitmap. FLTK standard fonts are output using the corresponding PostScript standard fonts.

9.101.2 Member Function Documentation

9.101.2.1 arc() [1/2]

```cpp
void Fl_PostScript_Graphics_Driver::arc {
    double x,
    double y,
    double r,
    double start,
    double end  } [virtual]
```

see fl_arc(double x, double y, double r, double start, double end).
Reimplemented from Fl_Graphics_Driver.

9.101.2.2 arc() [2/2]

```cpp
void Fl_PostScript_Graphics_Driver::arc {
    int x,
    int y,
    int w,
    int h,
    double a1,
    double a2 ) [virtual]
```
see fl_arc(int x, int y, int w, int h, double a1, double a2).
Reimplemented from Fl_Graphics_Driver.

9.101.2.3  begin_complex_polygon()

void Fl_PostScript_Graphics_Driver::begin_complex_polygon() [inline], [virtual]
see fl_begin_complex_polygon().
Reimplemented from Fl_Graphics_Driver.

9.101.2.4  begin_line()

void Fl_PostScript_Graphics_Driver::begin_line() [virtual]
see fl_begin_line().
Reimplemented from Fl_Graphics_Driver.

9.101.2.5  begin_loop()

void Fl_PostScript_Graphics_Driver::begin_loop() [virtual]
see fl_begin_loop().
Reimplemented from Fl_Graphics_Driver.

9.101.2.6  begin_points()

void Fl_PostScript_Graphics_Driver::begin_points() [virtual]
see fl_begin_points().
Reimplemented from Fl_Graphics_Driver.

9.101.2.7  begin_polygon()

void Fl_PostScript_Graphics_Driver::begin_polygon() [virtual]
see fl_begin_polygon().
Reimplemented from Fl_Graphics_Driver.

9.101.2.8  circle()

void Fl_PostScript_Graphics_Driver::circle(double x, double y, double r) [virtual]
see fl_circle(double x, double y, double r).
Reimplemented from Fl_Graphics_Driver.

9.101.2.9  class_name()

const char* Fl_PostScript_Graphics_Driver::class_name() [inline], [virtual]
Returns the name of the class of this object.
Use of the class_name() function is discouraged because it will be removed from future FLTK versions.
The class of an instance of an Fl_Device subclass can be checked with code such as:
if (instance->class_name() == Fl_Printer::class_id) {...}
Reimplemented from Fl_Graphics_Driver.

9.101.2.10  clip_box()

int Fl_PostScript_Graphics_Driver::clip_box(int x, int y, int w, int h, int & X, int & Y,
Reimplemented from Fl_Graphics_Driver.

```c
int & W,
int & H) [virtual]
```

see `fl_clip_box(int x, int y, int w, int h, int &X, int &Y, int &W, int &H)`.
Reimplemented from `Fl_Graphics_Driver`.

### 9.101.2.11 `locale_printf()`

```c
int Fl_PostScript_Graphics_Driver::locale_printf (const char * format, ...
```

Shields output PostScript data from modifications of the current locale.
It typically avoids PostScript errors caused if the current locale uses comma instead of dot as "decimal point".

**Parameters**

- `format` directives controlling output PostScript data

**Returns**

- value returned by `vfprintf()` call

### 9.101.2.12 `color()` [1/2]

```c
void Fl_PostScript_Graphics_Driver::color (Fl_Color c) [virtual]
```

see `fl_color(Fl_Color c)`.
Reimplemented from `Fl_Graphics_Driver`.

### 9.101.2.13 `color()` [2/2]

```c
void Fl_PostScript_Graphics_Driver::color (uchar r,
uchar g,
uchar b) [virtual]
```

see `fl_color(uchar r, uchar g, uchar b)`.
Reimplemented from `Fl_Graphics_Driver`.

### 9.101.2.14 `curve()`

```c
void Fl_PostScript_Graphics_Driver::curve (double X0,
double Y0,
double X1,
double Y1,
double X2,
double Y2,
double X3,
double Y3) [virtual]
```

see `fl_curve(double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)`.
Reimplemented from `Fl_Graphics_Driver`.

### 9.101.2.15 `descent()`

```c
int Fl_PostScript_Graphics_Driver::descent () [virtual]
```

see `fl_descent()`.
Reimplemented from `Fl_Graphics_Driver`.
9.101.2.16 draw() [1/5]

```cpp
void Fl_PostScript_Graphics_Driver::draw (  
    const char * str,  
    int n,  
    int x,  
    int y ) [inline], [virtual]
```

see \_\_fl_draw(const char *str, int n, int x, int y).

Reimplemented from Fl_Graphics_Driver.

9.101.2.17 draw() [2/5]

```cpp
void Fl_PostScript_Graphics_Driver::draw (  
    Fl_Bitmap * bm,  
    int XP,  
    int YP,  
    int WP,  
    int HP,  
    int cx,  
    int cy ) [virtual]
```

Draws an Fl_Bitmap object to the device.

Specifies a bounding box for the image, with the origin (upper left-hand corner) of the image offset by the cx and cy arguments.

Reimplemented from Fl_Graphics_Driver.

9.101.2.18 draw() [3/5]

```cpp
void Fl_PostScript_Graphics_Driver::draw (  
    Fl_Pixmap * pxm,  
    int XP,  
    int YP,  
    int WP,  
    int HP,  
    int cx,  
    int cy ) [virtual]
```

Draws an Fl_Pixmap object to the device.

Specifies a bounding box for the image, with the origin (upper left-hand corner) of the image offset by the cx and cy arguments.

Reimplemented from Fl_Graphics_Driver.

9.101.2.19 draw() [4/5]

```cpp
void Fl_PostScript_Graphics_Driver::draw (  
    Fl_RGB_Images * rgb,  
    int XP,  
    int YP,  
    int WP,  
    int HP,  
    int cx,  
    int cy ) [virtual]
```

Draws an Fl_RGB_Images object to the device.

Specifies a bounding box for the image, with the origin (upper left-hand corner) of the image offset by the cx and cy arguments.

Reimplemented from Fl_Graphics_Driver.

9.101.2.20 draw() [5/5]

```cpp
void Fl_PostScript_Graphics_Driver::draw (  
    int angle,
```
const char * str,
  int n,
  int x,
  int y) [virtual]

see fl_draw(int angle, const char *str, int n, int x, int y).
Reimplemented from Fl_Graphics_Driver.

9.101.2.21 draw_image() [1/2]

void Fl_PostScript_Graphics_Driver::draw_image (  
  const uchar * buf,
  int X,
  int Y,
  int W,
  int H,
  int D = 3,
  int L = 0) [virtual]

see fl_draw_image(const uchar * buf, int X, int Y, int W, int H, int D, int L).
Reimplemented from Fl_Graphics_Driver.

9.101.2.22 draw_image() [2/2]

void Fl_PostScript_Graphics_Driver::draw_image (  
  Fl_Draw_Image_Cb cb,
  void * data,
  int X,
  int Y,
  int W,
  int H,
  int D = 3) [virtual]

see fl_draw_image(Fl_Draw_Image_Cb cb, void * data, int X, int Y, int W, int H, int D).
Reimplemented from Fl_Graphics_Driver.

9.101.2.23 draw_image_mono() [1/2]

void Fl_PostScript_Graphics_Driver::draw_image_mono (  
  const uchar * buf,
  int X,
  int Y,
  int W,
  int H,
  int D = 1,
  int L = 0) [virtual]

see fl_draw_image_mono(const uchar * buf, int X, int Y, int W, int H, int D, int L).
Reimplemented from Fl_Graphics_Driver.

9.101.2.24 draw_image_mono() [2/2]

void Fl_PostScript_Graphics_Driver::draw_image_mono (  
  Fl_Draw_Image_Cb cb,
  void * data,
  int X,
  int Y,
  int W,
  int H,
  int D = 1) [virtual]

see fl_draw_image_mono(Fl_Draw_Image_Cb cb, void * data, int X, int Y, int W, int H, int D).
Reimplemented from Fl_Graphics_Driver.
9.101.2.25 draw_scaled()

int Fl_PostScript_Graphics_Driver::draw_scaled (  
    Fl_Image * img,  
    int X,  
    int Y,  
    int W,  
    int H ) [virtual]

Draws an Fl_Image scaled to width W & height H with top-left corner at X,Y.

Returns
    zero when the graphics driver doesn't implement scaled drawing, non-zero if it does implement it.

Reimplemented from Fl_Graphics_Driver.

9.101.2.26 end_complex_polygon()

void Fl_PostScript_Graphics_Driver::end_complex_polygon ( ) [inline], [virtual]
see fl_end_complex_polygon().
Reimplemented from Fl_Graphics_Driver.

9.101.2.27 end_line()

void Fl_PostScript_Graphics_Driver::end_line ( ) [virtual]
see fl_end_line().
Reimplemented from Fl_Graphics_Driver.

9.101.2.28 end_loop()

void Fl_PostScript_Graphics_Driver::end_loop ( ) [virtual]
see fl_end_loop().
Reimplemented from Fl_Graphics_Driver.

9.101.2.29 end_points()

void Fl_PostScript_Graphics_Driver::end_points ( ) [virtual]
see fl_end_points().
Reimplemented from Fl_Graphics_Driver.

9.101.2.30 end_polygon()

void Fl_PostScript_Graphics_Driver::end_polygon ( ) [virtual]
see fl_end_polygon().
Reimplemented from Fl_Graphics_Driver.

9.101.2.31 font()

void Fl_PostScript_Graphics_Driver::font (  
    int face,  
    int fsize ) [virtual]
see fl_font(Fl_Font face, Fl_Fontsize size).
Reimplemented from Fl_Graphics_Driver.

9.101.2.32 gap()

void Fl_PostScript_Graphics_Driver::gap ( ) [inline], [virtual]
see fl_gap().
Reimplemented from Fl_Graphics_Driver.
9.101.2.33  height()

int Fl_PostScript_Graphics_Driver::height ( ) [virtual]
see fl_height().
Reimplemented from Fl_Graphics_Driver.

9.101.2.34  line() [1/2]

void Fl_PostScript_Graphics_Driver::line (  
    int x,
    int y,
    int x1,
    int y1  ) [virtual]
see fl_line(int x, int y, int x1, int y1).
Reimplemented from Fl_Graphics_Driver.

9.101.2.35  line() [2/2]

void Fl_PostScript_Graphics_Driver::line (  
    int x,
    int y,
    int x1,
    int y1,
    int x2,
    int y2  ) [virtual]
see fl_line(int x, int y, int x1, int y1, int x2, int y2).
Reimplemented from Fl_Graphics_Driver.

9.101.2.36  line_style()

void Fl_PostScript_Graphics_Driver::line_style (  
    int style,
    int width = 0,
    char * dashes = 0  ) [virtual]
see fl_line_style(int style, int width, char* dashes).
Reimplemented from Fl_Graphics_Driver.

9.101.2.37  loop() [1/2]

void Fl_PostScript_Graphics_Driver::loop (  
    int x0,
    int y0,
    int x1,
    int y1,
    int x2,
    int y2  ) [virtual]
see fl_loop(int x0, int y0, int x1, int y1, int x2, int y2).
Reimplemented from Fl_Graphics_Driver.

9.101.2.38  loop() [2/2]

void Fl_PostScript_Graphics_Driver::loop (  
    int x0,
    int y0,
    int x1,
    int y1,
    int x2,
    int y2,
    int x3,
    int y3  ) [virtual]
see `fl_loop(int x0, int y0, int x1, int y1, int x2, int y2, int x3, int y3)`. Reimplemented from `Fl_Graphics_Driver`.

### 9.101.2.39 `not_clipped()`

```cpp
template <class int Fl_PostScript_Graphics_Driver::not_clipped (int x, int y, int w, int h) [virtual]
```

see `fl_not_clipped(int x, int y, int w, int h)`.
Reimplemented from `Fl_Graphics_Driver`.

### 9.101.2.40 `pie()`

```cpp
void Fl_PostScript_Graphics_Driver::pie (int x, int y, int w, int h, double a1, double a2) [virtual]
```

see `fl_pie(int x, int y, int w, int h, double a1, double a2)`.
Reimplemented from `Fl_Graphics_Driver`.

### 9.101.2.41 `point()`

```cpp
void Fl_PostScript_Graphics_Driver::point (int x, int y) [virtual]
```

see `fl_point(int x, int y)`.
Reimplemented from `Fl_Graphics_Driver`.

### 9.101.2.42 `polygon()` [1/2]

```cpp
void Fl_PostScript_Graphics_Driver::polygon (int x0, int y0, int x1, int y1, int x2, int y2) [virtual]
```

see `fl_polygon(int x0, int y0, int x1, int y1, int x2, int y2)`.
Reimplemented from `Fl_Graphics_Driver`.

### 9.101.2.43 `polygon()` [2/2]

```cpp
void Fl_PostScript_Graphics_Driver::polygon (int x0, int y0, int x1, int y1, int x2, int y2, int x3, int y3) [virtual]
```

see `fl_polygon(int x0, int y0, int x1, int y1, int x2, int y2, int x3, int y3)`.
Reimplemented from `Fl_Graphics_Driver`.
9.101.2.44  pop_clip()

void Fl_PostScript_Graphics_Driver::pop_clip ( ) [virtual]
see fl_pop_clip().
Reimplemented from Fl_Graphics_Driver.

9.101.2.45  push_clip()

void Fl_PostScript_Graphics_Driver::push_clip ( int x, int y, int w, int h ) [virtual]
see fl_push_clip(int x, int y, int w, int h).
Reimplemented from Fl_Graphics_Driver.

9.101.2.46  push_no_clip()

void Fl_PostScript_Graphics_Driver::push_no_clip ( ) [virtual]
see fl_push_no_clip().
Reimplemented from Fl_Graphics_Driver.

9.101.2.47  rect()

void Fl_PostScript_Graphics_Driver::rect ( int x, int y, int w, int h ) [virtual]
see fl_rect(int x, int y, int w, int h).
Reimplemented from Fl_Graphics_Driver.

9.101.2.48  rectf()

void Fl_PostScript_Graphics_Driver::rectf ( int x, int y, int w, int h ) [virtual]
see fl_rectf(int x, int y, int w, int h).
Reimplemented from Fl_Graphics_Driver.

9.101.2.49  rtl_draw()

void Fl_PostScript_Graphics_Driver::rtl_draw ( const char * str, int n, int x, int y ) [virtual]
see fl_rtl_draw(const char *str, int n, int x, int y).
Reimplemented from Fl_Graphics_Driver.

9.101.2.50  text_extents()

void Fl_PostScript_Graphics_Driver::text_extents ( const char * t, int n, int & dx, int & dy,
int & w,
int & h ) [virtual]
see fl_text_extents(const char *, int n, int & dx, int & dy, int & w, int & h).
Reimplemented from Fl_Graphics_Driver.

9.101.2.51 transformed_vertex()

void Fl_PostScript_Graphics_Driver::transformed_vertex ( double xf,
double yf ) [virtual]
see fl_transformed_vertex(double xf, double yf).
Reimplemented from Fl_Graphics_Driver.

9.101.2.52 vertex()

void Fl_PostScript_Graphics_Driver::vertex ( double x,
double y ) [virtual]
see fl_vertex(double x, double y).
Reimplemented from Fl_Graphics_Driver.

9.101.2.53 width() [1/2]

double Fl_PostScript_Graphics_Driver::width ( const char * str,
int n ) [virtual]
see fl_width(const char *str, int n).
Reimplemented from Fl_Graphics_Driver.

9.101.2.54 width() [2/2]

double Fl_PostScript_Graphics_Driver::width ( unsigned int c ) [virtual]
see fl_width(unsigned int n).
Reimplemented from Fl_Graphics_Driver.

9.101.2.55 xyline() [1/3]

void Fl_PostScript_Graphics_Driver::xyline ( int x,
int y,
int x1 ) [virtual]
see fl_xyline(int x, int y, int x1).
Reimplemented from Fl_Graphics_Driver.

9.101.2.56 xyline() [2/3]

void Fl_PostScript_Graphics_Driver::xyline ( int x,
int y,
int x1,
int y2 ) [virtual]
see fl_xyline(int x, int y, int x1, int y2).
Reimplemented from Fl_Graphics_Driver.

9.101.2.57 xyline() [3/3]

void Fl_PostScript_Graphics_Driver::xyline ( int x,
int y,
int x1,
int y2,
int x3 ) [virtual]

see fl_xyline(int x, int y, int x1, int y2, int x3).
Reimplemented from Fl_Graphics_Driver.

9.101.258 yxline() [1/3]

void Fl_PostScript_Graphics_Driver::yxline (  
    int x,
    int y,
    int y1 ) [virtual]

see fl_yxline(int x, int y, int y1).
Reimplemented from Fl_Graphics_Driver.

9.101.259 yxline() [2/3]

void Fl_PostScript_Graphics_Driver::yxline (  
    int x,
    int y,
    int y1,
    int x2 ) [virtual]

see fl_yxline(int x, int y, int y1, int x2).
Reimplemented from Fl_Graphics_Driver.

9.101.260 yxline() [3/3]

void Fl_PostScript_Graphics_Driver::yxline (  
    int x,
    int y,
    int y1,
    int x2,
    int y3 ) [virtual]

see fl_yxline(int x, int y, int y1, int x2, int y3).
Reimplemented from Fl_Graphics_Driver.

The documentation for this class was generated from the following files:

- Fl_PoScript.H
- Fl_PoScript.cxx

9.102 Fl_PostScript_Printer Class Reference

Print support under Unix/Linux.
#include <Fl_Printer.H>

Inheritance diagram for Fl_PostScript_Printer:
Public Member Functions

- **const char ∗ class_name ()**
  Returns the name of the class of this object.
- **int start_job (int pages, int ∗firstpage=NULL, int ∗lastpage=NULL)**
  Starts a print job.

Public Member Functions inherited from Fl_PostScript_File_Device

- **void end_job (void)**
  To be called at the end of a print job.
- **int end_page (void)**
  To be called at the end of each page.
- **Fl_PostScript_File_Device ()**
  The constructor.
- **void margins (int ∗left, int ∗top, int ∗right, int ∗bottom)**
  Computes the dimensions of margins that lie between the printable page area and the full page.
- **void origin (int ∗x, int ∗y)**
  Computes the page coordinates of the current origin of graphics functions.
- **void origin (int x, int y)**
  Sets the position in page coordinates of the origin of graphics functions.
- **int printable_rect (int ∗w, int ∗h)**
  Computes the width and height of the printable area of the page.
- **void rotate (float angle)**
  Rotates the graphics operations relatively to paper.
- **void scale (float scale_x, float scale_y=0.)**
  Changes the scaling of page coordinates.
- **int start_job (FILE ∗ps_output, int pagecount, enum Fl_Paged_Device::Page_Format format=Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout=Fl_Paged_Device::PORTRAIT)**
  Begins the session where all graphics requests will go to FILE pointer.
- **int start_job (int pagecount, enum Fl_Paged_Device::Page_Format format=Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout=Fl_Paged_Device::PORTRAIT)**
  Begins the session where all graphics requests will go to a local PostScript file.
- **int start_page (void)**
  Starts a new printed page.
- **void translate (int x, int y)**
  Translates the current graphics origin accounting for the current rotation.
- **void untranslate (void)**
  Undoes the effect of a previous translate() call.
- **∼Fl_PostScript_File_Device ()**
  The destructor.
Public Member Functions inherited from Fl_Paged_Device

- virtual void print_widget (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Draws the widget on the printed page.

- void print_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Prints a window with its title bar and frame if any.

- virtual void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  
  Prints a rectangular part of an on-screen window.

- virtual ~Fl_Paged_Device ()
  
  The destructor.

Public Member Functions inherited from Fl_Surface_Device

- const char *class_name ()
  
  Returns the name of the class of this object.

- Fl_Graphics_Driver *driver ()
  
  Returns the graphics driver of this drawing surface.

- void driver (Fl_Graphics_Driver *graphics_driver)
  
  Sets the graphics driver of this drawing surface.

- virtual void set_current (void)
  
  Make this surface the current drawing surface.

- virtual ~Fl_Surface_Device ()
  
  The destructor.

Public Member Functions inherited from Fl_Device

- virtual ~Fl_Device ()
  
  Virtual destructor.

Static Public Attributes

- static const char *class_id = Fl_Printer::class_id

Static Public Attributes inherited from Fl_PostScript_File_Device

- static const char *class_id = "Fl_PostScript_File_Device"

- static const char *file_chooser_title = "Select a .ps file"

  Label of the PostScript file chooser window.

Static Public Attributes inherited from Fl_Paged_Device

- static const char *class_id = "Fl_Paged_Device"

- static const page_format page_formats [NO_PAGE_FORMATS]

  width, height and name of all elements of the enum Page_Format.

Static Public Attributes inherited from Fl_Surface_Device

- static const char *class_id = "Fl_Surface_Device"

Static Public Attributes inherited from Fl_Device

- static const char *class_id = "Fl_Device"

  A string that identifies each subclass of Fl_Device.
Protected Member Functions

- FL_PostScript_Printer (void)
  
  The constructor.

Protected Member Functions inherited from FL_PostScript_File_Device

- FL_PostScript_Graphics_Driver * driver ()
  
  Returns the PostScript driver of this drawing surface.

Protected Member Functions inherited from FL_Paged_Device

- FL_Paged_Device ()
  
  The constructor.

Protected Member Functions inherited from FL_Surface_Device

- FL_Surface_Device (FL_Graphics_Driver *graphics_driver)
  
  Constructor that sets the graphics driver to use for the created surface.

Friends

- class FL_Printer

Additional Inherited Members

Public Types inherited from FL_Paged_Device

- enum Page_Format { A0 = 0 , A1 , A2 , A3 , A4 , A5 , A6 , A7 , A8 , A9 , B0 , B1 , B2 , B3 , B4 , B5 , B6 , B7 , B8 , B9 , B10 , C5E , DLE , EXECUTIVE , FOLIO , LEDGER , LEGAL , LETTER , TABLOID , ENVELOPE , MEDIA = 0x1000 }
  
  Possible page formats.

- enum Page_Layout { PORTRAIT = 0 , LANDSCAPE = 0x100 , REVERSED = 0x200 , ORIENTATION = 0x300 }
  
  Possible page layouts.

Static Public Member Functions inherited from FL_Surface_Device

- static FL_Surface_Device * surface ()
  
  The current drawing surface.

Protected Attributes inherited from FL_Paged_Device

- int x_offset
  
  horizontal offset to the origin of graphics coordinates

- int y_offset
  
  vertical offset to the origin of graphics coordinates
9.102.1 Detailed Description

Print support under Unix/Linux.
Class Fl_PostScript_Printer is implemented only on the Unix/Linux platform. It has no public constructor. Use Fl_Printer instead that is cross-platform and has the same API.

9.102.2 Member Function Documentation

9.102.2.1 class_name()

const char * Fl_PostScript_Printer::class_name ( ) [inline], [virtual]
Returns the name of the class of this object.
Use of the class_name() function is discouraged because it will be removed from future FLTK versions.
The class of an instance of an Fl_Device subclass can be checked with code such as:
if ( instance->class_name() == Fl_Printer::class_id ) { ... }
Reimplemented from Fl_PostScript_File_Device.

9.102.2.2 start_job()

int Fl_PostScript_Printer::start_job ( 
   int pages,
   int * firstpage = NULL,
   int * lastpage = NULL ) [virtual]
Starts a print job.
Reimplemented from Fl_PostScript_File_Device.
The documentation for this class was generated from the following files:

  • Fl_Printer.H
  • Fl_PostScript.cxx
  • Fl_Printer.cxx

9.103 Fl_Preferences Class Reference

Fl_Preferences provides methods to store user settings between application starts.
#include <Fl_Preferences.H>
Inheritance diagram for Fl_Preferences:

Classes

- struct Entry
- class Name
  "Name" provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.
- class Node
- class RootNode

Public Types

- typedef void * ID
  Every Fl_Preferences-Group has a unique ID.
- enum Root { SYSTEM =0 , USER }
  Define the scope of the preferences.
Public Member Functions

- `char clear ()`
  "Delete all groups and all entries."

- `char deleteAllEntries ()`
  "Delete all entries."

- `char deleteAllGroups ()`
  "Delete all groups."

- `char deleteEntry (const char * entry)`
  "Deletes a single name/value pair."

- `char deleteGroup (const char * group)`
  "Deletes a group."

- `int entries ()`
  "Returns the number of entries (name/value pairs) in a group."

- `const char * entry (int index)`
  "Returns the name of an entry."

- `char entryExists (const char * key)`
  "Returns non-zero if an entry with this name exists."

- `FL_PREFERENCES (const char * path, const char * vendor, const char * application)`
  "Use this constructor to create or read a preferences file at an arbitrary position in the file system."

- `FL_PREFERENCES (const FL_PREFERENCES &)`
  "Create another reference to a Preferences group."

- `FL_PREFERENCES (FL_PREFERENCES &parent, const char * group)`
  "Generate or read a new group of entries within another group."

- `FL_PREFERENCES (FL_PREFERENCES &parent, int groupIndex)`
  "Open a child group using a given index."

- `FL_PREFERENCES (FL_PREFERENCES * parent, const char * group)`
  "Create or access a group of preferences using a name."

- `FL_PREFERENCES (FL_PREFERENCES * parent, int groupIndex)`

- `FL_PREFERENCES (ID id)`
  "Create a new dataset access point using a dataset ID."

- `FL_PREFERENCES (Root root, const char * vendor, const char * application)`
  "The constructor creates a group that manages name/value pairs and child groups."

- `void flush ()`
  "Writes all preferences to disk."

- `char get (const char * entry, char *&value, const char * defaultValue)`
  "Reads an entry from the group."

- `char get (const char * entry, char *&value, const char * defaultValue, int maxSize)`
  "Reads an entry from the group."

- `char get (const char * entry, double &value, double defaultValue)`
  "Reads an entry from the group."

- `char get (const char * entry, float &value, float defaultValue)`
  "Reads an entry from the group."

- `char get (const char * entry, int &value, int defaultValue)`
  "Reads an entry from the group."

- `char get (const char * entry, void *&value, const void * defaultValue, int defaultSize)`
  "Reads an entry from the group."

- `char get (const char * entry, void *&value, const void * defaultValue, int defaultSize, int maxSize)`
  "Reads an entry from the group."

- `char getUserdataPath (char *&path, int pathlen)`
  "Creates a path that is related to the preferences file and that is usable for additional application data."
• const char * group (int num_group)
  Returns the name of the Nth (num_group) group.
• char groupExists (const char *key)
  Returns non-zero if a group with this name exists.
• int groups ()
  Returns the number of groups that are contained within a group.
• ID id ()
  Return an ID that can later be reused to open more references to this dataset.
• const char * name ()
  Return the name of this entry.
• const char * path ()
  Return the full path to this entry.
• char set (const char *entry, const char *value)
  Sets an entry (name/value pair).
• char set (const char *entry, const void *value, int size)
  Sets an entry (name/value pair).
• char set (const char *entry, double value)
  Sets an entry (name/value pair).
• char set (const char *entry, double value, int precision)
  Sets an entry (name/value pair).
• char set (const char *entry, float value)
  Sets an entry (name/value pair).
• char set (const char *entry, float value, int precision)
  Sets an entry (name/value pair).
• char set (const char *entry, int value)
  Sets an entry (name/value pair).
• int size (const char *entry)
  Returns the size of the value part of an entry.
• virtual ~FL_Preferences ()
  The destructor removes allocated resources.

Static Public Member Functions

• static const char * newUUID ()
  Returns a UUID as generated by the system.
• static char remove (ID id_)
  Remove the group with this ID from a database.

Protected Attributes

• Node * node
• RootNode * rootNode

Friends

• class Node
• class RootNode
9.103.1 Detailed Description

**Fl_Preferences** provides methods to store user settings between application starts. It is similar to the Registry on WIN32 and Preferences on MacOS, and provides a simple configuration mechanism for UNIX. **Fl_Preferences** uses a hierarchy to store data. It bundles similar data into groups and manages entries into those groups as name/value pairs.

Preferences are stored in text files that can be edited manually. The file format is easy to read and relatively forgiving. Preferences files are the same on all platforms. User comments in preference files are preserved. Filenames are unique for each application by using a vendor/application naming scheme. The user must provide default values for all entries to ensure proper operation should preferences be corrupted or not yet exist.

Entries can be of any length. However, the size of each preferences file should be kept small for performance reasons. One application can have multiple preferences files. Extensive binary data however should be stored in separate files: see `getUserdataPath()`.

**Note**

Starting with FLTK 1.3, preference databases are expected to be in UTF-8 encoding. Previous databases were stored in the current character set or code page which renders them incompatible for text entries using international characters.

9.103.2 Member Typedef Documentation

9.103.2.1 ID

```c
typedef void* Fl_Preferences::ID
```

Every **Fl_Preferences**-Group has a unique ID. ID's can be retrieved from an **Fl_Preferences**-Group and can then be used to create more **Fl_Preference** references to the same data set, as long as the database remains open.

9.103.3 Member Enumeration Documentation

9.103.3.1 Root

```c
enum Fl_Preferences::Root
```

Define the scope of the preferences.

**Enumerator**

| SYSTEM | Preferences are used system-wide. |
| USER   | Preferences apply only to the current user. |

9.103.4 Constructor & Destructor Documentation

9.103.4.1 **Fl_Preferences()** [1/7]

```c
Fl_Preferences::Fl_Preferences (  
    Root root,  
    const char * vendor,  
    const char * application )
```

The constructor creates a group that manages name/value pairs and child groups. Groups are ready for reading and writing at any time. The root argument is either **Fl_Preferences::USER** or **Fl_Preferences::SYSTEM**.

This constructor creates the base instance for all following entries and reads existing databases into memory. The vendor argument is a unique text string identifying the development team or vendor of an application. A domain name or an EMail address are great unique names, e.g. "researchATmatthiasm.com" or "fltk.org". The application argument can be the working title or final name of your application. Both vendor and application must be valid relative UNIX pathnames and may contain '/'s to create deeper file structures.

A set of Preferences marked “run-time” exists exactly one per application and only as long as the application runs.

---

Generated by Doxygen
It can be used as a database for volatile information. FLTK uses it to register plugins at run-time.

### Parameters

- **root**: can be `USER` or `SYSTEM` for user specific or system wide preferences
- **vendor**: unique text describing the company or author of this file
- **application**: unique text describing the application

#### 9.103.2 Fl_Preferences() [2/7]

```cpp
Fl_Preferences::Fl_Preferences (const char * path,
                               const char * vendor,
                               const char * application)
```

Use this constructor to create or read a preferences file at an arbitrary position in the file system. The file name is generated in the form `path/application.prefs`. If `application` is NULL, `path` must contain the full file name.

### Parameters

- **path**: path to the directory that contains the preferences file
- **vendor**: unique text describing the company or author of this file
- **application**: unique text describing the application

#### 9.103.3 Fl_Preferences() [3/7]

```cpp
Fl_Preferences::Fl_Preferences (Fl_Preferences & parent,
                               const char * group)
```

Generate or read a new group of entries within another group. Use the `group` argument to name the group that you would like to access. `Group` can also contain a path to a group further down the hierarchy by separating group names with a forward slash `/`.

### Parameters

- **parent**: reference object for the new group
- **group**: name of the group to access (may contain `/`s)

#### 9.103.4 Fl_Preferences() [4/7]

```cpp
Fl_Preferences::Fl_Preferences (Fl_Preferences * parent,
                               const char * group)
```

Create or access a group of preferences using a name.

### Parameters

- **parent**: the parameter parent is a pointer to the parent group. Parent may be NULL. It then refers to an application internal database which exists only once, and remains in RAM only until the application quits. This database is used to manage plugins and other data indexes by strings.
- **group**: a group name that is used as a key into the database
See also

Fl_Preferences( Fl_Preferences&, const char *group )

9.103.4.5  Fl_Preferences() [5/7]

Fl_Preferences::Fl_Preferences ( Fl_Preferences & parent, int groupIndex )

Open a child group using a given index.
Use the groupIndex argument to find the group that you would like to access. If the given index is invalid (negative or too high), a new group is created with a UUID as a name.
The index needs to be fixed. It is currently backward. Index 0 points to the last member in the 'list' of preferences.

Parameters

| in   | parent                  | reference object for the new group          |
|      | in groupIndex           | zero based index into child groups         |

9.103.4.6  Fl_Preferences() [6/7]

Fl_Preferences::Fl_Preferences ( Fl_Preferences * parent, int groupIndex )

See also

Fl_Preferences( Fl_Preferences&, int groupIndex )

9.103.4.7  Fl_Preferences() [7/7]

Fl_Preferences::Fl_Preferences ( Fl_Preferences::ID id )

Create a new dataset access point using a dataset ID.
ID's are a great way to remember shortcuts to database entries that are deeply nested in a preferences database,
as long as the database root is not deleted. An ID can be retrieved from any Fl_Preferences dataset, and can then
be used to create multiple new references to the same dataset.
ID's can be very helpful when put into the user_data() field of widget callbacks.

9.103.4.8  ~Fl_Preferences()

Fl_Preferences::~Fl_Preferences ( ) [virtual]
The destructor removes allocated resources.
When used on the base preferences group, the destructor flushes all changes to the preferences file and deletes all
internal databases.
The destructor does not remove any data from the database. It merely deletes your reference to the database.

9.103.5  Member Function Documentation

9.103.5.1  deleteEntry()

char Fl_Preferences::deleteEntry ( const char * key )

Deletes a single name/value pair.
This function removes the entry key from the database.

Parameters

| in  | key          | name of entry to delete          |
9.103.5.2 deleteGroup()

```cpp
char Fl_Preferences::deleteGroup ( const char * group )
```

Deletes a group.
Removes a group and all keys and groups within that group from the database.

Parameters

- **group** name of the group to delete

Returns

0 if call failed

---

9.103.5.3 entries()

```cpp
int Fl_Preferences::entries ( )
```

Returns the number of entries (name/value pairs) in a group.

Returns

number of entries

---

9.103.5.4 entry()

```cpp
const char * Fl_Preferences::entry ( int index )
```

Returns the name of an entry.
There is no guaranteed order of entry names. The index must be within the range given by entries().

Parameters

- **index** number indexing the requested entry

Returns

pointer to value cstring

---

9.103.5.5 entryExists()

```cpp
char Fl_Preferences::entryExists ( const char * key )
```

Returns non-zero if an entry with this name exists.

Parameters

- **key** name of entry that is searched for
Returns

0 if entry was not found

9.103.5.6 flush()

void Fl_Preferences::flush ( )

Writes all preferences to disk.
This function works only with the base preferences group. This function is rarely used as deleting the base preferences flushes automatically.

9.103.5.7 get() [1/7]

char Fl_Preferences::get ( const char * key, char * & text, const char * defaultValue )

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). get() allocates memory of sufficient size to hold the value. The buffer must be free’d by the developer using ‘free(value)’.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>text</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

9.103.5.8 get() [2/7]

char Fl_Preferences::get ( const char * key, char * text, const char * defaultValue, int maxSize )

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). ‘maxSize’ is the maximum length of text that will be read. The text buffer must allow for one additional byte for a trailing zero.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>text</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
<tr>
<td>in</td>
<td>maxSize</td>
<td>maximum length of value plus one byte for a trailing zero</td>
</tr>
</tbody>
</table>
Returns

0 if the default value was used

9.103.5.9  get() [3/7]

```cpp
cchar Fl_Preferences::get ( 
    const char * key, 
    double & value, 
    double defaultValue )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>value</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

9.103.5.10  get() [4/7]

```cpp
cchar Fl_Preferences::get ( 
    const char * key, 
    float & value, 
    float defaultValue )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>value</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

9.103.5.11  get() [5/7]

```cpp
cchar Fl_Preferences::get ( 
    const char * key, 
    int & value, 
    int defaultValue )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>value</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

9.103.5.12 get() [6/7]

```cpp
cchar Fl_Preferences::get (  
    const char * key,  
    void * & data,  
    const void * defaultValue,  
    int defaultSize  
)
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). `get()` allocates memory of sufficient size to hold the value. The buffer must be free’d by the developer using ‘free(value)’.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>data</td>
<td>value returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultSize</td>
<td>size of default value array</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

9.103.5.13 get() [7/7]

```cpp
cchar Fl_Preferences::get (  
    const char * key,  
    void * & data,  
    const void * defaultValue,  
    int defaultSize,  
    int maxSize  
)
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). ‘maxSize’ is the maximum length of text that will be read.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>data</td>
<td>value returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultSize</td>
<td>size of default value array</td>
</tr>
<tr>
<td>in</td>
<td>maxSize</td>
<td>maximum length of value</td>
</tr>
</tbody>
</table>
Returns

0 if the default value was used

Todo maxSize should receive the number of bytes that were read.

9.103.5.14 getUserdataPath()

char Fl_Preferences::getUserdataPath (  
  char * path,  
  int pathlen )

Creates a path that is related to the preferences file and that is usable for additional application data. This function creates a directory that is named after the preferences database without the .prefs extension and located in the same directory. It then fills the given buffer with the complete path name.

Example:

```cpp
Fl_Preferences prefs( USER, "matthiasm.com", "test" );
char path[FL_PATH_MAX];
prefs.getUserdataPath( path );
```

.. creates the preferences database in (MS Windows):

```
c:/Documents and Settings/matt/Application Data/matthiasm.com/test.prefs
```

.. and returns the userdata path:

```
c:/Documents and Settings/matt/Application Data/matthiasm.com/test/
```

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>path</th>
<th>buffer for user data path</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>pathlen</td>
<td>size of path buffer (should be at least FL_PATH_MAX)</td>
</tr>
</tbody>
</table>

Returns

0 if path was not created or pathname can't fit into buffer

9.103.5.15 group()

const char * Fl_Preferences::group (  
  int num_group )

Returns the name of the Nth (num_group) group.

There is no guaranteed order of group names. The index must be within the range given by groups().

Parameters

| in   | num_group | number indexing the requested group |

Returns

‘C’ string pointer to the group name

9.103.5.16 groupExists()

char Fl_Preferences::groupExists (  
  const char * key )

Returns non-zero if a group with this name exists. Group names are relative to the Preferences node and can contain a path. "." describes the current node, "./" describes the topmost node. By preceding a groupname with a "./", its path becomes relative to the topmost node.

Parameters

| in | key | name of group that is searched for |
9.103.5.17  groups()

int Fl_Preferences::groups ( )
Returns the number of groups that are contained within a group.
Returns
0 for no groups at all

9.103.5.18  newUUID()

const char * Fl_Preferences::newUUID ( ) [static]
Returns a UUID as generated by the system.
A UUID is a “universally unique identifier” which is commonly used in configuration files to create identities. A UUID in ASCII looks like this: 937C4900-51AA-4C11-8DD3-7AB59944F03E. It has always 36 bytes plus a trailing zero.
Returns
a pointer to a static buffer containing the new UUID in ASCII format. The buffer is overwritten during every call to this function!

9.103.5.19  set() [1/7]

char Fl_Preferences::set ( const char * key, const char * text )
Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preferences file.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>text</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

Returns
0 if setting the value failed

9.103.5.20  set() [2/7]

char Fl_Preferences::set ( const char * key, const void * data, int dsize )
Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preferences file.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>data</td>
<td>set this entry to value</td>
</tr>
<tr>
<td>in</td>
<td>dsize</td>
<td>size of data array</td>
</tr>
</tbody>
</table>
Returns
0 if setting the value failed

9.103.5.21 set() [3/7]

char Fl_Preferences::set (  
    const char * key,  
    double value   )

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value
was actually stored in the preferences file.

Parameters

<table>
<thead>
<tr>
<th></th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>value</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

Returns
0 if setting the value failed

9.103.5.22 set() [4/7]

char Fl_Preferences::set (  
    const char * key,  
    double value,  
    int precision   )

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value
was actually stored in the preferences file.

Parameters

<table>
<thead>
<tr>
<th></th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>value</td>
<td>set this entry to value</td>
</tr>
<tr>
<td></td>
<td>precision</td>
<td>number of decimal digits to represent value</td>
</tr>
</tbody>
</table>

Returns
0 if setting the value failed

9.103.5.23 set() [5/7]

char Fl_Preferences::set (  
    const char * key,  
    float value   )

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value
was actually stored in the preferences file.

Parameters

<table>
<thead>
<tr>
<th></th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>value</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>
Returns
0 if setting the value failed

**9.103.24 set() [6/7]**

```cpp
char Fl_Preferences::set (  
    const char * key,  
    float value,  
    int precision  
)  
```

Sets an entry (name/value pair). The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preferences file.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
<tr>
<td>in</td>
<td>precision</td>
<td>number of decimal digits to represent value</td>
</tr>
</tbody>
</table>

Returns
0 if setting the value failed

**9.103.25 set() [7/7]**

```cpp
char Fl_Preferences::set (  
    const char * key,  
    int value  
)  
```

Sets an entry (name/value pair). The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preferences file.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

Returns
0 if setting the value failed

**9.103.26 size()**

```cpp
int Fl_Preferences::size (  
    const char * key  
)  
```

Returns the size of the value part of an entry.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
</table>
Returns
size of value

The documentation for this class was generated from the following files:

- Fl_Preferences.H
- Fl_Preferences.cxx

9.104 Fl_Printer Class Reference

OS-independent print support.

#include <Fl_Printer.H>

Inheritance diagram for Fl_Printer:

```
Fl_Device
    |
    Fl_Surface_Device
    |
    Fl_Paged_Device
    |
Fl_Printer
```

Public Member Functions

- **const char ∗ class_name ()**
  Returns the name of the class of this object.
- **Fl_Graphics_Driver ∗ driver (void)**
- **void end_job (void)**
  To be called at the end of a print job.
- **int end_page (void)**
  To be called at the end of each page.
- **Fl_Printer ∗ (void)**
  The constructor.
- **void margins (int ∗ left, int ∗ top, int ∗ right, int ∗ bottom)**
  Computes the dimensions of margins that lie between the printable page area and the full page.
- **void origin (int ∗ x, int ∗ y)**
  Computes the page coordinates of the current origin of graphics functions.
- **void origin (int x, int y)**
  Sets the position in page coordinates of the origin of graphics functions.
- **void print_widget (Fl_Widget ∗ widget, int delta_x=0, int delta_y=0)**
  Draws the widget on the printed page.
- **void print_window_part (Fl_Window ∗ win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)**
  Prints a rectangular part of an on-screen window.
- **int printable_rect (int ∗ w, int ∗ h)**
  Computes the width and height of the printable area of the page.
- **void rotate (float angle)**
  Rotates the graphics operations relatively to paper.
- **void scale (float scale_x, float scale_y=0.)**
  Changes the scaling of page coordinates.
- **void set_current (void)**
Make this surface the current drawing surface.
- int start_job (int pagecount, int *frompage=NULL, int *topage=NULL)
  Starts a print job.
- int start_page (void)
  Starts a new printed page.
- void translate (int x, int y)
  Translates the current graphics origin accounting for the current rotation.
- void untranslate (void)
  Undoes the effect of a previous translate() call.
- ~Fl_Printer (void)
  The destructor.

Public Member Functions inherited from Fl_Paged_Device
- void print_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  Prints a window with its title bar and frame if any.
- virtual ~Fl_Paged_Device ()
  The destructor.

Public Member Functions inherited from Fl_Surface_Device
- const char *class_name ()
  Returns the name of the class of this object.
- Fl_Graphics_Driver *driver ()
  Returns the graphics driver of this drawing surface.
- void driver (Fl_Graphics_Driver *graphics_driver)
  Sets the graphics driver of this drawing surface.
- virtual ~Fl_Surface_Device ()
  The destructor.

Public Member Functions inherited from Fl_Device
- virtual ~Fl_Device ()
  Virtual destructor.

Static Public Attributes

Static Public Attributes inherited from Fl_Paged_Device

- static const char * class_id = "Fl_Paged_Device"
- static const page_format page_formats [NO_PAGE_FORMATS]
  width, height and name of all elements of the enum Page_Format.

Static Public Attributes inherited from Fl_Surface_Device

- static const char * class_id = "Fl_Surface_Device"

Static Public Attributes inherited from Fl_Device

- static const char * class_id = "Fl_Device"
  A string that identifies each subclass of Fl_Device.

Additional Inherited Members

Public Types inherited from Fl_Paged_Device

- enum Page_Format { 
  A0 = 0 , A1 , A2 , A3 , 
  A4 , A5 , A6 , A7 , 
  A8 , A9 , B0 , B1 , 
  B2 , B3 , B4 , B5 , 
  B6 , B7 , B8 , B9 , 
  B10 , C5E , DLE , EXECUTIVE , 
  FOLIO , LEDGER , LEGAL , LETTER , 
  TABLOID , ENVELOPE , MEDIA = 0x1000 }
  Possible page formats.

- enum Page_Layout { PORTRAIT = 0 , LANDSCAPE = 0x100 , REVERSED = 0x200 , ORIENTATION = 0x300 }
  Possible page layouts.
Static Public Member Functions inherited from Fl_Surface_Device

• static Fl_Surface_Device * surface ()
  The current drawing surface.

Protected Member Functions inherited from Fl_Paged_Device

• Fl_Paged_Device ()
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

• Fl_Surface_Device (Fl_Graphics_Driver * graphics_driver)
  Constructor that sets the graphics driver to use for the created surface.

Protected Attributes inherited from Fl_Paged_Device

• int x_offset
  horizontal offset to the origin of graphics coordinates
• int y_offset
  vertical offset to the origin of graphics coordinates

9.104.1 Detailed Description

OS-independent print support.

Fl_Printer allows to use all drawing, color, text, image, and clip FLTK functions, and to have them operate on printed page(s). There are two main, non exclusive, ways to use it.

• Print any widget (standard, custom, Fl_Window, Fl_Gl_Window) as it appears on screen, with optional translation, scaling and rotation. This is done by calling print_widget(), print_window() or print_window_part().
  
• Use a series of FLTK graphics commands (e.g., font, text, lines, colors, clip, image) to compose a page appropriately shaped for printing.

In both cases, begin by start_job(), start_page(), printable_rect() and origin() calls and finish by end_page() and end_job() calls.

Example of use: print a widget centered in a page

```c++
#include <FL/Fl_Printer.H>
#include <FL/fl_draw.H>

int width, height;
Fl_Graphics_Driver *graphics_driver = ... // a graphics driver
Fl_Printer *printer = new Fl_Printer();
if (printer->start_job(1) == 0) {
  printer->start_page();
  printer->printable_rect(&width, &height);
  fl_color(FL_BLACK);
  fl_line_style(FL_SOLID, 2);
  fl_rect(0, 0, width, height);
  fl_font(FL_COURIER, 12);
  time_t now; time(&now); fl_draw(ctime(&now), 0, fl_height());
  printer->origin(width/2, height/2);
  printer->print_widget(widget, -widget->w()/2, -widget->h()/2);
  printer->end_page();
  printer->end_job();
} delete printer;
```

Platform specifics

• Unix/Linux platforms: Unless it has been previously changed, the default paper size is A4. To change that, press the "Properties" button of the "Print" dialog window opened by an Fl_Printer::start_job() call. This opens a "Printer Properties" window where it's possible to select the adequate paper size. Finally press the "Save" button thereafter to assign the chosen paper size to the chosen printer for this and all further print operations.

Class Fl_RGB_Image prints but loses its transparency if it has one. See class Fl_PostScript_Graphics_Driver for a description of how UTF-8 strings appear in print. Use the static public attributes of this class to set the print dialog to other languages than English. For example, the "Printer:" dialog item Fl_Printer::dialog_printer can be set to French with:
before creation of the Fl_Printer object. Use Fl_PostScript_File_Device::file_chooser_title to customize the title of the file chooser dialog that opens when using the “Print To File” option of the print dialog.

- MSWindows platform: Transparent Fl_RGB_Image’s don’t print with exact transparency on most printers. Fl_RGB_Image’s don’t rotate() well. A workaround is to use the print_window_part() call.
- Mac OS X platform: all graphics requests print as on display.

9.104.2 Member Function Documentation

9.104.2.1 class_name()

const char * Fl_Printer::class_name ( ) [inline], [virtual]

Returns the name of the class of this object.

Use of the class_name() function is discouraged because it will be removed from future FLTK versions.

The class of an instance of an Fl_Device subclass can be checked with code such as:

```c
if ( instance->class_name() == Fl_Printer::class_id ) { ... }
```

Reimplemented from Fl_Paged_Device.

9.104.2.2 end_job()

void Fl_Printer::end_job ( ) [virtual]

To be called at the end of a print job.

Reimplemented from Fl_Paged_Device.

9.104.2.3 end_page()

int Fl_Printer::end_page ( ) [virtual]

To be called at the end of each page.

Returns

0 if OK, non-zero if any error.

Reimplemented from Fl_Paged_Device.

9.104.2.4 margins()

void Fl_Printer::margins ( int * left, int * top, int * right, int * bottom ) [virtual]

Computes the dimensions of margins that lie between the printable page area and the full page.

Values are in the same unit as that used by FLTK drawing functions. They are changed by scale() calls.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>left</td>
<td>int</td>
<td>If non-null, *left is set to the left margin size.</td>
</tr>
<tr>
<td>top</td>
<td>int</td>
<td>If non-null, *top is set to the top margin size.</td>
</tr>
<tr>
<td>right</td>
<td>int</td>
<td>If non-null, *right is set to the right margin size.</td>
</tr>
<tr>
<td>bottom</td>
<td>int</td>
<td>If non-null, *bottom is set to the bottom margin size.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.
9.104.2.5 origin () [1/2]

```c
void Fl_Printer::origin (  
    int * x,  
    int * y ) [virtual]
```

Computes the page coordinates of the current origin of graphics functions.

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>x</th>
<th>If non-null, *x is set to the horizontal page offset of graphics origin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>y</td>
<td>Same as above, vertically.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

9.104.2.6 origin () [2/2]

```c
void Fl_Printer::origin (  
    int x,  
    int y ) [virtual]
```

Sets the position in page coordinates of the origin of graphics functions.

Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the page printable area. Origin() calls are not affected by rotate() calls. Successive origin() calls don't combine their effects.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x</th>
<th>Horizontal position in page coordinates of the desired origin of graphics functions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>y</td>
<td>Same as above, vertically.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

9.104.2.7 print_widget ()

```c
void Fl_Printer::print_widget (  
    Fl_Widget * widget,  
    int delta_x = 0,  
    int delta_y = 0 ) [virtual]
```

Draws the widget on the printed page.

The widget's position on the printed page is determined by the last call to `origin()` and by the optional `delta_x` and `delta_y` arguments. Its dimensions are in points unless there was a previous call to `scale()`.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>widget</th>
<th>Any FLTK widget (e.g., standard, custom, window).</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>delta_x</td>
<td>Optional horizontal offset for positioning the widget relatively to the current origin of graphics functions.</td>
</tr>
<tr>
<td>in</td>
<td>delta_y</td>
<td>Same as above, vertically.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

9.104.2.8 print_window_part ()

```c
void Fl_Printer::print_window_part (  
    Fl_Window * win,  
    int x,  
    int y,  
```
Prints a rectangular part of an on-screen window.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>win</code></td>
<td>The window from where to capture.</td>
</tr>
<tr>
<td><code>x</code></td>
<td>The rectangle left</td>
</tr>
<tr>
<td><code>y</code></td>
<td>The rectangle top</td>
</tr>
<tr>
<td><code>w</code></td>
<td>The rectangle width</td>
</tr>
<tr>
<td><code>h</code></td>
<td>The rectangle height</td>
</tr>
<tr>
<td><code>delta_x</code></td>
<td>Optional horizontal offset from current graphics origin where to print the captured rectangle.</td>
</tr>
<tr>
<td><code>delta_y</code></td>
<td>As above, vertically.</td>
</tr>
</tbody>
</table>

Reimplemented from `Fl_Paged_Device`.

### 9.104.2.9 printable_rect()

```c
int Fl_Printer::printable_rect ( int * w, int * h ) [virtual]
```

Computes the width and height of the printable area of the page.
Values are in the same unit as that used by FLTK drawing functions, are unchanged by calls to `origin()`, but are changed by `scale()` calls. Values account for the user-selected paper type and print orientation.

Returns

0 if OK, non-zero if any error

Reimplemented from `Fl_Paged_Device`.

### 9.104.2.10 rotate()

```c
void Fl_Printer::rotate ( float angle ) [virtual]
```

Rotates the graphics operations relatively to paper.
The rotation is centered on the current graphics origin. Successive `rotate()` calls don’t combine their effects.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>angle</code></td>
<td>Rotation angle in counter-clockwise degrees.</td>
</tr>
</tbody>
</table>

Reimplemented from `Fl_Paged_Device`.

### 9.104.2.11 scale()

```c
void Fl_Printer::scale ( float scale_x, float scale_y = 0. ) [virtual]
```

Changes the scaling of page coordinates.
This function also resets the origin of graphics functions at top left of printable page area. After a `scale()` call, do a `printable_rect()` call to get the new dimensions of the printable page area. Successive `scale()` calls don’t combine their effects.
Parameters

| scale-\_x | Horizontal dimensions of plot are multiplied by this quantity. |
| scale-\_y | Same as above, vertically. The value 0. is equivalent to setting scale_y = scale_x. Thus, scale(factor); is equivalent to scale(factor, factor); |

Reimplemented from Fl_Paged_Device.

### 9.104.2.12 set_current()

```cpp
void Fl_Printer::set_current ()
{
    void  // [virtual]
}
```

Make this surface the current drawing surface. This surface will receive all future graphics requests. Reimplemented from Fl_Surface_Device.

### 9.104.2.13 start_job()

```cpp
int Fl_Printer::start_job (
    int pagecount,
    int * frompage = NULL,
    int * topage = NULL  // [virtual]
)
```

Starts a print job.

Opens a platform-specific dialog window allowing the user to set several options including the desired printer and the page orientation. Optionally, the user can also select a range of pages to be printed. This range is returned to the caller that is in charge of sending only these pages for printing.

Parameters

| in | pagecount | the total number of pages of the job (or 0 if you don’t know the number of pages) |
| out | frompage | if non-null, *frompage is set to the first page the user wants printed |
| out | topage | if non-null, *topage is set to the last page the user wants printed |

Returns

0 if OK, non-zero if any error occurred or if the user cancelled the print request.

Reimplemented from Fl_Paged_Device.

### 9.104.2.14 start_page()

```cpp
int Fl_Printer::start_page ()
{
    void  // [virtual]
}
```

Starts a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area.

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

### 9.104.2.15 translate()

```cpp
void Fl_Printer::translate (
    int x,
    int y  // [virtual]
)
```

Translates the current graphics origin accounting for the current rotation.
This function is only useful after a rotate() call. Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects. Reimplemented from Fl_Paged_Device.

9.104.2.16  untranslate()

void Fl_Printer::untranslate (  
    void                              ) [virtual]

Undoes the effect of a previous translate() call. Reimplemented from Fl_Paged_Device.

The documentation for this class was generated from the following files:

- Fl_Printer.H
- Fl_Printer.cxx

9.105 Fl_Progress Class Reference

Displays a progress bar for the user.
#include <Fl_Progress.H>

Inheritance diagram for Fl_Progress:

\[ \begin{array}{c}
\text{Fl_Widget} \\
\downarrow \\
\text{Fl_Progress}
\end{array} \]

Public Member Functions

- Fl_Progress (int x, int y, int w, int h, const char *l=0)
  The constructor creates the progress bar using the position, size, and label.
- float maximum () const
  Gets the maximum value in the progress widget.
- void maximum (float v)
  Sets the maximum value in the progress widget.
- float minimum () const
  Gets the minimum value in the progress widget.
- void minimum (float v)
  Sets the minimum value in the progress widget.
- float value () const
  Gets the current value in the progress widget.
- void value (float v)
  Sets the current value in the progress widget.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
• `Fl_Align align () const`
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback * cb, void * p)
  Sets the current callback function for the widget.

• void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.
- **void copy_label (const char *new_label)**
  Sets the current label.
- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.
- **uchar damage () const**
  Returns non-zero if draw() needs to be called.
- **void damage (uchar c)**
  Sets the damage bits for the widget.
- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.
- **int damage_resize (int, int, int, int)**
  Internal use only.
- **void deactivate ()**
  Deactivates the widget.
- **Fl_Image *deimage ()**
  Gets the image that is used as part of the widget label.
- **const Fl_Image *deimage () const**
  void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
- **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label.
- **void do_callback ()**
  Calls the widget callback.
- **void do_callback (Fl_Widget *o, long arg)**
  Calls the widget callback.
- **void do_callback (Fl_Widget *o, void *arg=0)**
  Calls the widget callback.
- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- **int h () const**
  Gets the widget height.
- **virtual int handle (int event)**
  Handles the specified event.
- **virtual void hide ()**
  Makes a widget invisible.
- **Fl_Image *image ()**
  Gets the image that is used as part of the widget label.
- **const Fl_Image *image () const**
  void image (Fl_Image &img)
  Sets the image to use as part of the widget label.
- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label.
- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.
- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().
- **const char *label () const**
  Gets the current label text.
• void label (const char∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group ∗parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group ∗p)
  Internal use only - “for hacks only”.
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• virtual void show ()
Makes a widget visible.

- **void size (int W, int H)**
  
  Changes the size of the widget.

- **int take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  
  Returns if the widget is able to take events.

- **int testShortcut ()**
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char * tooltip () const**
  
  Gets the current tooltip text.

- **void tooltip (const char *text)***
  
  Sets the current tooltip text.

- **Fl_Window *top_window () const**
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window *top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  
  Gets the widget type.

- **void type (uchar t)**
  
  Sets the widget type.

- **int use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void *user_data () const**
  
  Gets the user data for this widget.

- **void user_data (void *v)**
  
  Sets the user data for this widget.

- **unsigned int visible () const**
  
  Returns whether a widget is visible.

- **unsigned int visible_focus ()**
  
  Checks whether this widget has a visible focus.

- **void visible_focus (int v)**
  
  Modifies keyboard focus navigation.

- **int visible_r () const**
  
  Returns whether a widget and all its parents are visible.

- **int w () const**
  
  Gets the widget width.

- **Fl_When when () const**
  
  Returns the conditions under which the callback is called.

- **void when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

- **Fl_Window *window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  
  Gets the widget position in its window.

- **int y () const**
  
  Gets the widget position in its window.

- **virtual ~Fl_Widget ()**
  
  Destroys the widget.
Protected Member Functions

- virtual void draw ()
  
  Draws the progress bar.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.

- void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const
  
  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus ()
  
  Draws a focus rectangle around the widget

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

- unsigned int flags () const
  
  Gets the widget flags mask.

- void h (int v)
  
  Internal use only.

- void set_flag (unsigned int c)
  
  Sets a flag in the flags mask.

- void w (int v)
  
  Internal use only.

- void x (int v)
  
  Internal use only.

- void y (int v)
  
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗cb, void ∗d)
  
  The default callback for all widgets that don’t set a callback.

- static unsigned int label_shortcut (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char ∗, const bool require_alt=false)
  
  Returns true if the given text ∗ contains the entered '&x' shortcut.
Protected Types inherited from **Fl_Widget**

```cpp
enum {
    INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
    FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
    OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPY_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
    MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
    GROUP_RELATIVE = 1<<16, COPY_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACENTS_MENU = 1<<19,
    USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
```

flags possible values enumeration.

**9.105.1 Detailed Description**

Displays a progress bar for the user.

**9.105.2 Constructor & Destructor Documentation**

**9.105.2.1 Fl_Progress()**

```cpp
Fl_Progress::Fl_Progress (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ L = 0 )
```

The constructor creates the progress bar using the position, size, and label. You can set the background color with `color()` and the progress bar color with `selection_color()`, or you can set both colors together with `color(unsigned bg, unsigned sel)`. The default colors are `FL_BACKGROUND2_COLOR` and `FL_YELLOW`, resp.

**9.105.3 Member Function Documentation**

**9.105.3.1 draw()**

```cpp
void Fl_Progress::draw {  
    void ) [protected], [virtual]
```

Draws the progress bar. Implements `Fl_Widget`.

**9.105.3.2 maximum() [1/2]**

```cpp
float Fl_Progress::maximum ( ) const [inline]
```

Gets the maximum value in the progress widget.

**9.105.3.3 maximum() [2/2]**

```cpp
void Fl_Progress::maximum (  
    float v ) [inline]
```

Sets the maximum value in the progress widget.
9.105.3.4 minimum() [1/2]

float Fl_Progress::minimum ( ) const [inline]
Gets the minimum value in the progress widget.

9.105.3.5 minimum() [2/2]

void Fl_Progress::minimum ( float v ) [inline]
Sets the minimum value in the progress widget.

9.105.3.6 value() [1/2]

float Fl_Progress::value ( ) const [inline]
Gets the current value in the progress widget.

9.105.3.7 value() [2/2]

void Fl_Progress::value ( float v ) [inline]
Sets the current value in the progress widget.

The documentation for this class was generated from the following files:

- Fl_Progress.H
- Fl_Progress.cxx

9.106 Fl_Quartz_Graphics_Driver Class Reference

The Mac OS X-specific graphics class.

- \texttt{Fl\_Font\_Descriptor \ast font\_descriptor()}
  Returns a pointer to the current \texttt{Fl\_Font\_Descriptor} for the graphics driver.

- void \texttt{font\_descriptor(Fl\_Font\_Descriptor \ast d)}
  Sets the current \texttt{Fl\_Font\_Descriptor} for the graphics driver.

- \texttt{Fl\_Fontsize size()}
  see \texttt{fl\_size()}.

- virtual \texttt{\~Fl\_Graphics\_Driver()}
  The destructor.
Public Member Functions inherited from Fl_Device

- virtual \sim Fl_Device ()

Virtual destructor.

Static Public Attributes

- static const char * class_id = "Fl_Quartz_Graphics_Driver"

Static Public Attributes inherited from Fl_Graphics_Driver

- static const char * class_id = "Fl_Graphics_Driver"

Static Public Attributes inherited from Fl_Device

- static const char * class_id = "Fl_Device"

A string that identifies each subclass of Fl_Device.

Additional Inherited Members

Protected Member Functions inherited from Fl_Graphics_Driver

- virtual void arc (double x, double y, double r, double start, double end)

see fl_arc(double x, double y, double r, double start, double end).

- virtual void arc (int x, int y, int w, int h, double a1, double a2)

see fl_arc(int x, int y, int w, int h, double a1, double a2).

Protected Attributes inherited from Fl_Graphics_Driver

• matrix * fl_matrix
  Points to the current coordinate transformation matrix.

9.106.1 Detailed Description

The Mac OS X-specific graphics class.
This class is implemented only on the Mac OS X platform.

9.106.2 Member Function Documentation

9.106.2.1 class_name()

const char * Fl_Quartz_Graphics_Driver::class_name ( ) [inline], [virtual]
Returns the name of the class of this object.
Use of the class_name() function is discouraged because it will be removed from future FLTK versions.
The class of an instance of an Fl_Device subclass can be checked with code such as:
if ( instance->class_name() == Fl_Printer::class_id ) { ... }
Reimplemented from Fl_Graphics_Driver.

9.106.2.2 color() [1/2]

void Fl_Quartz_Graphics_Driver::color ( Fl_Color c ) [virtual]
see fl_color(Fl_Color c).
Reimplemented from Fl_Graphics_Driver.
9.106.2.3 color() [2/2]

void Fl_Quartz_Graphics_Driver::color (uchar r, uchar g, uchar b) [virtual]
see fl_color(uchar r, uchar g, uchar b).
Reimplemented from Fl_Graphics_Driver.

9.106.2.4 descent()

int Fl_Quartz_Graphics_Driver::descent () [virtual]
see fl_descent().
Reimplemented from Fl_Graphics_Driver.

9.106.2.5 draw() [1/5]

void Fl_Quartz_Graphics_Driver::draw (const char *str, int n, int x, int y) [virtual]
see fl_draw(const char *str, int n, int x, int y).
Reimplemented from Fl_Graphics_Driver.

9.106.2.6 draw() [2/5]

void Fl_Quartz_Graphics_Driver::draw (Fl_Bitmap *bm, int XP, int YP, int WP, int HP, int cx, int cy) [virtual]
Draws an Fl_Bitmap object to the device.
Specifies a bounding box for the image, with the origin (upper left-hand corner) of the image offset by the cx and cy arguments.
Reimplemented from Fl_Graphics_Driver.

9.106.2.7 draw() [3/5]

void Fl_Quartz_Graphics_Driver::draw (Fl_Pixmap *pxm, int XP, int YP, int WP, int HP, int cx, int cy) [virtual]
Draws an Fl_Pixmap object to the device.
Specifies a bounding box for the image, with the origin (upper left-hand corner) of the image offset by the cx and cy arguments.
Reimplemented from Fl_Graphics_Driver.

9.106.2.8 draw() [4/5]

void Fl_Quartz_Graphics_Driver::draw (Fl_RGB_Image *rgb,
Draws an Fl_RGB_Image object to the device.
Specifies a bounding box for the image, with the origin (upper left-hand corner) of the image offset by the cx and cy arguments.
Reimplemented from Fl_Graphics_Driver.

9.106.2.9 draw() [5/5]

void Fl_Quartz_Graphics_Driver::draw (  
    int angle,  
    const char ∗str,  
    int n,  
    int x,  
    int y ) [virtual]

see fl_draw(int angle, const char ∗str, int n, int x, int y).
Reimplemented from Fl_Graphics_Driver.

9.106.2.10 draw_image() [1/2]

void Fl_Quartz_Graphics_Driver::draw_image (  
    const uchar ∗buf,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 3,  
    int L = 0 ) [virtual]

see fl_draw_image(const uchar ∗buf, int X,int Y,int W,int H, int D, int L).
Reimplemented from Fl_Graphics_Driver.

9.106.2.11 draw_image() [2/2]

void Fl_Quartz_Graphics_Driver::draw_image (  
    Fl_Draw_Image_Cb cb,  
    void ∗data,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 3 ) [virtual]

see fl_draw_image(Fl_Draw_Image_Cb cb, void ∗data, int X,int Y,int W,int H, int D).
Reimplemented from Fl_Graphics_Driver.

9.106.2.12 draw_image_mono() [1/2]

void Fl_Quartz_Graphics_Driver::draw_image_mono (  
    const uchar ∗buf,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 1,  
    int L = 0 ) [virtual]

see fl_draw_image_mono(const uchar ∗buf, int X,int Y,int W,int H, int D, int L).
Reimplemented from Fl_Graphics_Driver.

9.106.2.13 draw_image_mono() [2/2]

```c
void Fl_Quartz_Graphics_Driver::draw_image_mono (  
    Fl_Draw_Image_Cb cb,  
    void * data,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 1 ) [virtual]

see fl_draw_image_mono(Fl_Draw_Image_Cb cb, void* data, int X, int Y, int W, int H, int D).
Reimplemented from Fl_Graphics_Driver.
```

9.106.2.14 draw_scaled()

```c
int Fl_Quartz_Graphics_Driver::draw_scaled (  
    Fl_Image * img,  
    int X,  
    int Y,  
    int W,  
    int H ) [virtual]

Draws an Fl_Image scaled to width W & height H with top-left corner at X,Y.

Returns
    zero when the graphics driver doesn’t implement scaled drawing, non-zero if it does implement it.

Reimplemented from Fl_Graphics_Driver.
```

9.106.2.15 font()

```c
void Fl_Quartz_Graphics_Driver::font (  
    Fl_Font face,  
    Fl_Fontsize size ) [virtual]

see fl_font(Fl_Font face, Fl_Fontsize size).
Reimplemented from Fl_Graphics_Driver.
```

9.106.2.16 height()

```c
int Fl_Quartz_Graphics_Driver::height ( ) [virtual]

see fl_height() .
Reimplemented from Fl_Graphics_Driver.
```

9.106.2.17 rtl_draw()

```c
void Fl_Quartz_Graphics_Driver::rtl_draw (  
    const char * str,  
    int n,  
    int x,  
    int y ) [virtual]

see fl_rtl_draw(const char *str, int n, int x, int y).
Reimplemented from Fl_Graphics_Driver.
```

9.106.2.18 text_extents()

```c
void Fl_Quartz_Graphics_Driver::text_extents (  
    const char * t,  
    int n,  
```
9.107 Fl_Radio_Button Class Reference

Inheritance diagram for Fl_Radio_Button:

```

Public Member Functions

- **Fl_Radio_Button** (int X, int Y, int W, int H, const char *L=0)
  
  The constructor creates the button using the given position, size, and label.

Public Member Functions inherited from Fl_Button

- int **clear** ()
  
  Same as value(0).
- Fl_Boxtype **down_box** () const
  
  Returns the current down box type, which is drawn when value() is non-zero.
- void **down_box** (Fl_Boxtype b)
  
  Sets the down box type.
- Fl_Color **down_color** () const
  
  (for backwards compatibility)

The documentation for this class was generated from the following files:

- Fl_Device.H
- fl_color_mac.cxx
- Fl_Device.cxx
- Fl_Double_Window.cxx
- fl_draw_image_mac.cxx

9.106.19 width() [1/2]

double Fl_Quartz_Graphics_Driver::width {
    const char * str,
    int n ) [virtual]

see fl_width(const char *str, int n).
Reimplemented from Fl_Graphics_Driver.

9.106.20 width() [2/2]

double Fl_Quartz_Graphics_Driver::width {
    unsigned int c ) [virtual]

see fl_width(unsigned int n).
Reimplemented from Fl_Graphics_Driver.

Generated by Doxygen
• void **down_color**(unsigned c)
  (for backwards compatibility)

• **Fl_Button**(int X, int Y, int W, int H, const char *L=0)
  The constructor creates the button using the given position, size, and label.

• virtual int **handle**(int)
  Handles the specified event.

• int **set**()
  Same as **value(1)**.

• void **setonly**()
  Turns on this button and turns off all other radio buttons in the group (calling **value(1)** or **set()** does not do this).

• int **shortcut**() const
  Returns the current shortcut key for the button.

• void **shortcut**(const char *s)
  (for backwards compatibility)

• void **shortcut**(int s)
  Sets the shortcut key to s.

• char **value**() const
  Returns the current value of the button (0 or 1).

• int **value**(int v)
  Sets the current value of the button.

Public Member Functions inherited from **Fl_Widget**

• void **_clear_fullscreen**()

• void **_set_fullscreen**()

• void **activate**()
  Activates the widget.

• unsigned int **active**() const
  Returns whether the widget is active.

• int **active_r**() const
  Returns whether the widget and all of its parents are active.

• **Fl_Align** **align**() const
  Gets the label alignment.

• void **align**(Fl_Align alignment)
  Sets the label alignment.

• long **argument**() const
  Gets the current user data (long) argument that is passed to the callback function.

• void **argument**(long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class **Fl_Gl_Window** * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual **Fl_Group** * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual **Fl_Window** * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• **Fl_Boxtype** **box**() const
  Gets the box type of the widget.

• void **box**(Fl_Boxtype new_box)
  Sets the box type for the widget.

• **Fl_Callback** *p callback**() const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Imge *deimage ()
  Gets the image that is used as part of the widget label.
• const Fl_Imge *deimage () const
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label.
• void do_callback ()
  Calls the widget callback.
• void do_callback (Fl_Widget *o, long arg)
  Calls the widget callback.
• void do_callback (Fl_Widget *o, void *arg=0)
  Calls the widget callback.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label.
• const Fl_Image *image () const
  Sets the image to use as part of the widget label.
• void image (Fl_Image &img)
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group ∗ parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group ∗p)
  Internal use only - “for hacks only”.
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void *user_data() const
  Gets the user data for this widget.
- void user_data(void *)
  Sets the user data for this widget.
- unsigned int visible() const
  Returns whether a widget is visible.
- unsigned int visible_focus()
  Checks whether this widget has a visible focus.
- void visible_focus(int v)
  Modifies keyboard focus navigation.
- int visible_r() const
  Returns whether a widget and all its parents are visible.
- int w() const
  Gets the widget width.
- Fl_When when() const
  Returns the conditions under which the callback is called.
- void when(uchar i)
  Sets the flags used to decide when a callback is called.
- Fl_Window *window() const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- int x() const
  Gets the widget position in its window.
- int y() const
  Gets the widget position in its window.
- virtual ~Fl_Widget()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback(Fl_Widget *cb, void *d)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut(const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut(const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
Protected Member Functions inherited from Fl_Button

- virtual void draw ()
  
  Draws the widget.
- void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.
- void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus ()
  
  draws a focus rectangle around the widget
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.
- unsigned int flags () const
  
  Gets the widget flags mask.
- void h (int v)
  
  Internal use only.
- void set_flag (unsigned int c)
  
  Sets a flag in the flags mask.
- void w (int v)
  
  Internal use only.
- void x (int v)
  
  Internal use only.
- void y (int v)
  
  Internal use only.

Static Protected Member Functions inherited from Fl_Button

Static Protected Attributes inherited from Fl_Button

- static Fl_Widget_Tracker ∗ key_release_tracker = 0
9.107.1 Constructor & Destructor Documentation

9.107.1.1 Fl_Radio_Button()

Fl_Radio_Button::Fl_Radio_Button (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ L = 0 )

The constructor creates the button using the given position, size, and label. The Button type() is set to FL_RADIO_BUTTON.

Parameters

| in | X, Y, W, H | position and size of the widget |
| in | L          | widget label, default is no label |

The documentation for this class was generated from the following files:

- Fl_Radio_Button.H
- Fl_Button.cxx

9.108 Fl_Radio_Light_Button Class Reference

Inheritance diagram for Fl_Radio_Light_Button:

```

Fl_Light_Button
   ↓
Fl_Radio_Light_Button
```

Public Member Functions

- Fl_Radio_Light_Button (int X, int Y, int W, int H, const char ∗ L=0)

Public Member Functions inherited from Fl_Light_Button

- Fl_Light_Button (int x, int y, int w, int h, const char ∗ l=0)  
  Creates a new Fl_Light_Button widget using the given position, size, and label string.

- virtual int handle (int)  
  Handles the specified event.

Public Member Functions inherited from Fl_Button

- int clear ()  
  Same as value(0).

- Fl_Boxtype down_box () const  
  Returns the current down box type, which is drawn when value() is non-zero.

- void down_box (Fl_Boxtype b)
Sets the down box type.

- `Fl_Color down_color() const`  
  (for backwards compatibility)
- `void down_color(unsigned c)`  
  (for backwards compatibility)
- `Fl_Button(int X, int Y, int W, int H, const char *L=0)`  
  The constructor creates the button using the given position, size, and label.

  - `int set()`  
    Same as `value(1)`.
  - `void setonly()`  
    Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).

  - `int shortcut() const`  
    Returns the current shortcut key for the button.
  - `void shortcut(const char *s)`  
    (for backwards compatibility)
  - `void shortcut(int s)`  
    Sets the shortcut key to `s`.
  - `char value() const`  
    Returns the current value of the button (0 or 1).
  - `int value(int v)`  
    Sets the current value of the button.

Public Member Functions inherited from Fl_Widget

- `void _clear_fullscreen()`  
- `void _set_fullscreen()`  
- `void activate()`  
  Activates the widget.
- `unsigned int active() const`  
  Returns whether the widget is active.
- `int active_r() const`  
  Returns whether the widget and all of its parents are active.
- `Fl_Align align() const`  
  Gets the label alignment.
- `void align(Fl_Align alignment)`  
  Sets the label alignment.
- `long argument() const`  
  Gets the current user data (long) argument that is passed to the callback function.
- `void argument(long v)`  
  Sets the current user data (long) argument that is passed to the callback function.
- `virtual class Fl_Gl_Window * as_gl_window()`  
  Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.
- `virtual Fl_Group * as_group()`  
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.
- `virtual Fl_Window * as_window()`  
  Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.
- `Fl_Boxtype box() const`  
  Gets the box type of the widget.
- `void box(Fl_Boxtype new_box)`  
  Sets the box type for the widget.
- `Fl_Callback_p callback() const`  

Generated by Doxygen
Gets the current callback function for the widget.

- void callback (Fl_Callback cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback cb, void p)
  Sets the current callback function for the widget.

- void callback (Fl_Callback0 cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image *deimage ()
  Gets the image that is used as part of the widget label.
• const Fl_Image ∗ deimage () const
  
  Sets the image to use as part of the widget label.
• void deimage (Fl_Image &img)

  Sets the image to use as part of the widget label.
• void do_callback ()
  
  Calls the widget callback.
• void do_callback (Fl_Widget ∗o, long arg)
  
  Calls the widget callback.
• void do_callback (Fl_Widget ∗o, void ∗arg=0)
  
  Calls the widget callback.
• void draw_label (int, int, int, int, Fl_Align) const

  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  
  Gets the widget height.
• virtual void hide ()
  
  Makes a widget invisible.
• Fl_Image ∗ image ()

  Gets the image that is used as part of the widget label.
• const Fl_Image ∗ image () const
• void image (Fl_Image &img)

  Sets the image to use as part of the widget label.
• void image (Fl_Image ∗img)

  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget ∗wgt) const

  Checks if this widget is a child of wgt.
• int is_label_copied () const

  Returns whether the current label was assigned with copy_label().
• const char ∗ label () const

  Gets the current label text.
• void label (const char ∗text)

  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)

  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const

  Gets the label color.
• void labelcolor (Fl_Color c)

  Sets the label color.
• Fl_Font labelfont () const

  Gets the font to use.
• void labelfont (Fl_Font f)

  Sets the font to use.
• Fl_Fontsize labelsize () const

  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)

  Sets the font size in pixels.
• Fl_Labeltype labeltype () const

  Gets the label type.
• void labeltype (Fl_Labeltype a)

  Sets the label type.
• void measure_label (int &ww, int &hh) const
Sets width \(ww\) and height \(hh\) accordingly with the label size.

- unsigned int \texttt{output} () const
  Returns if a widget is used for output only.

- \texttt{Fl\_Group\ *} \texttt{parent} () const
  Returns a pointer to the parent widget.

- void \texttt{parent} (\texttt{Fl\_Group\ *}\texttt{p})
  Internal use only - "for hacks only".

- void \texttt{position} (int \texttt{X}, int \texttt{Y})
  Repositions the window or widget.

- void \texttt{redraw} ()
  Schedules the drawing of the widget.

- void \texttt{redraw\_label} ()
  Schedules the drawing of the label.

- virtual void \texttt{resize} (int \texttt{x}, int \texttt{y}, int \texttt{w}, int \texttt{h})
  Changes the size or position of the widget.

- \texttt{Fl\_Color\ *} \texttt{selection\_color} () const
  Gets the selection color.

- void \texttt{selection\_color} (\texttt{Fl\_Color} \texttt{a})
  Sets the selection color.

- void \texttt{set\_active} ()
  Marks the widget as active without sending events or changing focus.

- void \texttt{set\_changed} ()
  Marks the value of the widget as changed.

- void \texttt{set\_output} ()
  Sets a widget to output only.

- void \texttt{set\_visible} ()
  Makes the widget visible.

- void \texttt{set\_visible\_focus} ()
  Enables keyboard focus navigation with this widget.

- virtual void \texttt{show} ()
  Makes a widget visible.

- void \texttt{size} (int \texttt{W}, int \texttt{H})
  Changes the size of the widget.

- int \texttt{take\_focus} ()
  Gives the widget the keyboard focus.

- unsigned int \texttt{takesevents} () const
  Returns if the widget is able to take events.

- int \texttt{test\_shortcut} ()
  Returns true if the widget's label contains the entered '\&x' shortcut.

- const char * \texttt{tooltip} () const
  Gets the current tooltip text.

- void \texttt{tooltip} (const char \*\texttt{text})
  Sets the current tooltip text.

- \texttt{Fl\_Window\ *} \texttt{top\_window} () const
  Returns a pointer to the top-level window for the widget.

- \texttt{Fl\_Window\ *} \texttt{top\_window\_offset} (int \texttt{xoff}, int \texttt{yoff}) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar \texttt{type} () const
  Gets the widget type.

- void \texttt{type} (uchar \texttt{t})
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus ()
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *cb, void *d)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Generated by Doxygen
Protected Member Functions inherited from `Fl_Light_Button`

- virtual void `draw ()`
  
  Draws the widget.

Protected Member Functions inherited from `Fl_Button`

- void `simulate_key_action ()`

Protected Member Functions inherited from `Fl_Widget`

- void `clear_flag (unsigned int c)`
  
  Clears a flag in the flags mask.

- void `draw_backdrop () const`
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void `draw_box () const`
  
  Draws the widget box according its box style.

- void `draw_box (Fl_Boxtype t, Fl_Color c) const`
  
  Draws a box of type t, of color c at the widget's position and size.

- void `draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void `draw_focus ()`
  
  draws a focus rectangle around the widget

- void `draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const`
  
  Draws a focus box for the widget at the given position and size.

- void `draw_label () const`
  
  Draws the widget's label at the defined label position.

- void `draw_label (int, int, int, int) const`
  
  Draws the label in an arbitrary bounding box.

- `Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)`
  
  Creates a widget at the given position and size.

- unsigned int `flags () const`
  
  Gets the widget flags mask.

- void `h (int v)`
  
  Internal use only.

- void `set_flag (unsigned int c)`
  
  Sets a flag in the flags mask.

- void `w (int v)`
  
  Internal use only.

- void `x (int v)`
  
  Internal use only.

- void `y (int v)`
  
  Internal use only.

  Fl_Round_Button
  |
Fl_Radio_Round_Button
```

Public Member Functions

- **Fl_Radio_Round_Button** (int X, int Y, int W, int H, const char ∗L=0)
  Creates a new **Fl_Radio_Button** widget using the given position, size, and label string.

Public Member Functions inherited from **Fl_Round_Button**

- **Fl_Round_Button** (int x, int y, int w, int h, const char ∗l=0)
  Creates a new **Fl_Round_Button** widget using the given position, size, and label string.

Public Member Functions inherited from **Fl_Light_Button**

- **Fl_Light_Button** (int x, int y, int w, int h, const char ∗l=0)
  Creates a new **Fl_Light_Button** widget using the given position, size, and label string.
- virtual int handle (int)
  Handles the specified event.

Public Member Functions inherited from **Fl_Button**

- int clear ()
  Same as **value(0)**.
- Fl_Boxtype down_box () const
  Returns the current down box type, which is drawn when **value()** is non-zero.
- void down_box (Fl_Boxtype b)
  Sets the down box type.
- Fl_Color down_color () const
  (for backwards compatibility)
- void down_color (unsigned c)
  (for backwards compatibility)
- **Fl_Button** (int X, int Y, int W, int H, const char ∗L=0)
  The constructor creates the button using the given position, size, and label.
- int set ()
  Same as **value(1)**.
- void setonly ()
  Turns on this button and turns off all other radio buttons in the group (calling **value(1)** or **set()** does not do this).
- int shortcut () const
  Returns the current shortcut key for the button.

Generated by Doxygen
• void shortcut (const char *s)
  (for backwards compatibility)
• void shortcut (int s)
  Sets the shortcut key to s.
• char value () const
  Returns the current value of the button (0 or 1).
• int value (int v)
  Sets the current value of the button.

Public Member Functions inherited from Fl_Widget
• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output()
  Sets a widget to accept input.
- void clear_visible()
  Hides the widget.
- void clear_visible_focus()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
- void copy_label (const char ∗new_label)
  Sets the current label.
- void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
- uchar damage () const
  Returns non-zero if draw() needs to be called.
- void damage (uchar c)
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
- int damage_resize (int, int, int, int)
  Internal use only.
- void deactivate()
  Deactivates the widget.
- Fl_Image ∗deimage()
  Gets the image that is used as part of the widget label.
- const Fl_Image ∗deimage () const
- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
- void deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label.
- void do_callback()
  Calls the widget callback.
- void do_callback (Fl_Widget ∗o, long arg)
  Calls the widget callback.
- void do_callback (Fl_Widget ∗o, void ∗arg=0)
  Calls the widget callback.
- void draw_label (int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label.
• const Fl_Image * image () const
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void image (Fl_Image * img)
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget * wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group * p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

Fl_Color selection_color () const
  Gets the selection color.

void selection_color (Fl_Color a)
  Sets the selection color.

void set_active ()
  Marks the widget as active without sending events or changing focus.

void set_changed ()
  Marks the value of the widget as changed.

void set_output ()
  Sets a widget to output only.

void set_visible ()
  Makes the widget visible.

void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

virtual void show ()
  Changes the size of the widget.

int take_focus ()
  Gives the widget the keyboard focus.

unsigned int takesevents () const
  Returns if the widget is able to take events.

int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.

const char *tooltip () const
  Gets the current tooltip text.

void tooltip (const char *text)
  Sets the current tooltip text.

Fl_Window *top_window () const
  Returns a pointer to the top-level window for the widget.

Fl_Window *top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

uchar type () const
  Gets the widget type.

void type (uchar t)
  Sets the widget type.

int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

void *user_data () const
  Gets the user data for this widget.

void user_data (void *v)
  Sets the user data for this widget.

unsigned int visible () const
  Returns whether a widget is visible.

unsigned int visible_focus ()
  Checks whether this widget has a visible focus.

void visible_focus (int v)
  Modifies keyboard focus navigation.

int visible_r () const
Returns whether a widget and all its parents are visible.

- **int w () const**
  
  Gets the widget width.

- **Fl_When when () const**
  
  Returns the conditions under which the callback is called.

- **void when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

- **Fl_Window * window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  
  Gets the widget position in its window.

- **int y () const**
  
  Gets the widget position in its window.

- **virtual ~Fl_Widget ()**
  
  Destroys the widget.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

- **static void default_callback (Fl_Widget *cb, void *d)**
  
  The default callback for all widgets that don't set a callback.

- **static unsigned int label_shortcut (const char *t)**
  
  Returns the Unicode value of the '&x' shortcut in a given text.

- **static int test_shortcut (const char *, const bool require_alt=false)**
  
  Returns true if the given text t contains the entered '&x' shortcut.

**Protected Types inherited from Fl_Widget**

- **enum {**

  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }**

  flags possible values enumeration.

**Protected Member Functions inherited from Fl_Light_Button**

- **virtual void draw ()**
  
  Draws the widget.

**Protected Member Functions inherited from Fl_Button**

- **void simulate_key_action ()**
Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_box ()
  draws a focus rectangle around the widget
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget(int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

9.109.1 Constructor & Destructor Documentation

9.109.1.1 Fl_Radio_Round_Button()

Fl_Radio_Round_Button::Fl_Radio_Round_Button ( int X,
                                             int Y,
                                             int W,
                                             int H,
                                             const char * L = 0 )

Creates a new Fl_Radio_Button widget using the given position, size, and label string.
The button type() is set to FL_RADIO_BUTTON.
Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in X,Y,W,H</td>
<td>position and size of the widget</td>
</tr>
<tr>
<td>in L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Radio_Round_Button.H
- Fl_Round_Button.cxx

9.110 Fl_Scroll::Fl_Region_LRTB Struct Reference

A local struct to manage a region defined by left/right/top/bottom.

#include <Fl_Scroll.H>

Public Attributes

- int b
  (b)ottom "y" position, aka y2
- int l
  (l)eft "x" position, aka x1
- int r
  (r)ight "x" position, aka x2
- int t
  (t)op "y" position, aka y1

9.110.1 Detailed Description

A local struct to manage a region defined by left/right/top/bottom.
The documentation for this struct was generated from the following file:

- Fl_Scroll.H

9.111 Fl_Scroll::Fl_Region_XYWH Struct Reference

A local struct to manage a region defined by xywh.

#include <Fl_Scroll.H>

Public Attributes

- int h
- int w
- int x
- int y

9.111.1 Detailed Description

A local struct to manage a region defined by xywh.
The documentation for this struct was generated from the following file:

- Fl_Scroll.H
9.112  Fl_Repeat_Button Class Reference

The Fl_Repeat_Button is a subclass of Fl_Button that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down.

#include <Fl_Repeat_Button.H>

Inheritance diagram for Fl_Repeat_Button:

   v
Fl_Repeat_Button
```

Public Member Functions

- void deactivate ()
- Fl_Repeat_Button (int X, int Y, int W, int H, const char *l=0)
  - Creates a new Fl_Repeat_Button widget using the given position, size, and label string.
- int handle (int)
  - Handles the specified event.

Public Member Functions inherited from Fl_Button

- int clear ()
  - Same as value(0).
- Fl_Boxtype down_box () const
  - Returns the current down box type, which is drawn when value() is non-zero.
- void down_box (Fl_Boxtype b)
  - Sets the down box type.
- Fl_Color down_color () const
  - (for backwards compatibility)
- void down_color (unsigned c)
  - (for backwards compatibility)
- Fl_Button (int X, int Y, int W, int H, const char *L=0)
  - The constructor creates the button using the given position, size, and label.
- int set ()
  - Same as value(1).
- void setonly ()
  - Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).
- int shortcut () const
  - Returns the current shortcut key for the button.
- void shortcut (const char *s)
  - (for backwards compatibility)
- void shortcut (int s)
  - Sets the shortcut key to s.
- char value () const
  - Returns the current value of the button (0 or 1).
- int value (int v)
  - Sets the current value of the button.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  
  Activates the widget.
- unsigned int active () const
  
  Returns whether the widget is active.
- int active_r () const
  
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  
  Gets the label alignment.
- void align (Fl_Align alignment)
  
  Sets the label alignment.
- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual Fl_Group ∗ as_group ()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- Fl_Boxtype box () const
  
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback0 ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  
  Sets the current callback function for the widget.
- unsigned int changed () const
  
  Checks if the widget value changed since the last callback.
- void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.
- void clear_output ()
  
  Sets a widget to accept input.
- void clear_visible ()
  
  Hides the widget.
- void clear_visible_focus ()
Disables keyboard focus navigation with this widget.

- **FL_Color color () const**
  Gets the background color of the widget.

- **void color (FL_Color bg)**
  Sets the background color of the widget.

- **void color (FL_Color bg, FL_Color sel)**
  Sets the background and selection color of the widget.

- **FL_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const FL_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **FL_Image * deimage ()**
  Gets the image that is used as part of the widget label.

- **const FL_Image * deimage () const**
  void deimage (FL_Image &img)
  Sets the image to use as part of the widget label.

- **void deimage (FL_Image *img)**
  Sets the image to use as part of the widget label.

- **void do_callback ()**
  Calls the widget callback.

- **void do_callback (FL_Widget *o, long arg)**
  Calls the widget callback.

- **void do_callback (FL_Widget *o, void *arg=0)**
  Calls the widget callback.

- **void draw_label (int, int, int, int, FL_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **FL_Image * image ()**
  Gets the image that is used as part of the widget label.

- **const FL_Image * image () const**
  void image (FL_Image &img)
  Sets the image to use as part of the widget label.
• void `image (Fl_Image ∗img)`
  Sets the image to use as part of the widget label.
• int `inside (const Fl_Widget ∗wgt) const`
  Checks if this widget is a child of `wgt`.
• int `is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.
• const char ∗ `label () const`
  Gets the current label text.
• void `label (const char ∗text)`
  Sets the current label pointer.
• void `label (Fl_Labeltype a, const char ∗b)`
  Shortcut to set the label text and type in one call.
• `Fl_Color labelcolor () const`
  Gets the label color.
• void `labelcolor (Fl_Color c)`
  Sets the label color.
• `Fl_Font labelfont () const`
  Gets the font to use.
• void `labelfont (Fl_Font f)`
  Sets the font to use.
• `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.
• void `labels size (Fl_Fontsize pix)`
  Sets the font size in pixels.
• `Fl_Labeltype labeltype () const`
  Gets the label type.
• void `labeltype (Fl_Labeltype a)`
  Sets the label type.
• void `measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.
• unsigned int `output () const`
  Returns if a widget is used for output only.
• `Fl_Group ∗parent () const`
  Returns a pointer to the parent widget.
• void `parent (Fl_Group ∗p)`
  Internal use only - “for hacks only”.
• void `position (int X, int Y)`
  Repositions the window or widget.
• void `redraw ()`
  Schedules the drawing of the widget.
• void `redraw_label ()`
  Schedules the drawing of the label.
• virtual void `resize (int x, int y, int w, int h)`
  Changes the size or position of the widget.
• `Fl_Color selection_color () const`
  Gets the selection color.
• void `selection_color (Fl_Color a)`
  Sets the selection color.
• void `set_active ()`
  Marks the widget as active without sending events or changing focus.
• void `set_changed ()`
Marks the value of the widget as changed.

- void `set_output()`
  
  Sets a widget to output only.

- void `set_visible()`
  
  Makes the widget visible.

- void `set_visible_focus()`
  
  Enables keyboard focus navigation with this widget.

- virtual void `show()`
  
  Makes a widget visible.

- void `size(int W, int H)`
  
  Changes the size of the widget.

- int `take_focus()`
  
  Gives the widget the keyboard focus.

- unsigned int `takesevents()` const
  
  Returns if the widget is able to take events.

- int `testShortcut()`
  
  Returns true if the widget's label contains the entered `&x` shortcut.

- const char * `tooltip()` const
  
  Gets the current tooltip text.

- void `tooltip(const char *text)`
  
  Sets the current tooltip text.

- `Fl_Window *top_window()` const
  
  Returns a pointer to the top-level window for the widget.

- `Fl_Window *top_window_offset(int &xoff, int &yoff)` const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar `type()` const
  
  Gets the widget type.

- void `type(uchar t)`
  
  Sets the widget type.

- int `use_accents_menu()`
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void * `user_data()` const
  
  Gets the user data for this widget.

- void `user_data(void *v)`
  
  Sets the user data for this widget.

- unsigned int `visible()` const
  
  Returns whether a widget is visible.

- unsigned int `visible_focus()`
  
  Checks whether this widget has a visible focus.

- void `visible_focus(int v)`
  
  Modifies keyboard focus navigation.

- int `visible_r()` const
  
  Returns whether a widget and all its parents are visible.

- int `w()` const
  
  Gets the widget width.

- `Fl_When when()` const
  
  Returns the conditions under which the callback is called.

- void `when(uchar i)`
  
  Sets the flags used to decide when a callback is called.

- `Fl_Window *window()` const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const  
  Gets the widget position in its window.
• int y () const  
  Gets the widget position in its window.
• virtual ~Fl_Widget ()  
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *cb, void *d)  
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char *t)  
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char *t, const bool require_alt=false)  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
    INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,  
    FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,  
    OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,  
    MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,  
    GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,  
    USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Button

• virtual void draw ()  
  Draws the widget.
• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)  
  Clears a flag in the flags mask.
• void draw_backdrop () const  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const  
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const  
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const  
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus ()  
  draws a focus rectangle around the widget
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  Draws the widget's label at the defined label position.

- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- **Fl_Widget** (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int **flags** () const
  Gets the widget flags mask.

- void **h** (int v)
  Internal use only.

- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.

- void **w** (int v)
  Internal use only.

- void **x** (int v)
  Internal use only.

- void **y** (int v)
  Internal use only.

### 9.112.1 Detailed Description

The **Fl_Repeat_Button** is a subclass of **Fl_Button** that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down.

The speed of the repeat is fixed and depends on the implementation.

### 9.112.2 Constructor & Destructor Documentation

#### 9.112.2.1 Fl_Repeat_Button()

**Fl_Repeat_Button::Fl_Repeat_Button**

```cpp
int X,
int Y,
int W,
int H,
const char * l = 0)
```

Creates a new **Fl_Repeat_Button** widget using the given position, size, and label string.

The default boxtype is **FL_UP_BOX**. Deletes the button.

### 9.112.3 Member Function Documentation

#### 9.112.3.1 handle()

```cpp
int Fl_Repeat_Button::handle {
  int event } [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
Parameters

| in | event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Button.
The documentation for this class was generated from the following files:

- Fl_Repeat_Button.H
- Fl_Repeat_Button.cxx

9.113 Fl_Return_Button Class Reference

The Fl_Return_Button is a subclass of Fl_Button that generates a callback when it is pressed or when the user presses the Enter key.

#include <Fl_Return_Button.H>

Inheritance diagram for Fl_Return_Button:

```
Fl_Widget
  └── Fl_Button
      └── Fl_Return_Button
```

Public Member Functions

- **Fl_Return_Button** (int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Return_Button widget using the given position, size, and label string.

- **int handle** (int)
  
  Handles the specified event.

Public Member Functions inherited from Fl_Button

- **int clear** ()
  
  Same as value(0).

- **Fl_Boxtype down_box** () const
  
  Returns the current down box type, which is drawn when value() is non-zero.

- **void down_box** (Fl_Boxtype b)
  
  Sets the down box type.

- **Fl_Color down_color** () const
  
  (for backwards compatibility)

- **void down_color** (unsigned c)
  
  (for backwards compatibility)

- **Fl_Button** (int X, int Y, int W, int H, const char *L=0)
The constructor creates the button using the given position, size, and label.

- **int `set()`**
  
  *Same as `value(1)`.*

- **void `setonly()`**
  
  *Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).*

- **int `shortcut()` const**
  
  *Returns the current shortcut key for the button.*

- **void `shortcut(const char *s)`**
  
  *(for backwards compatibility)*

- **void `shortcut(int s)`**
  
  *Sets the shortcut key to `s`.*

- **char `value()` const**
  
  *Returns the current value of the button (0 or 1).*

- **int `value(int v)`**
  
  *Sets the current value of the button.*

**Public Member Functions inherited from Fl_Widget**

- **void `_clear_fullscreen()`**

- **void `_set_fullscreen()`**

- **void `activate()`**
  
  *Activates the widget.*

- **unsigned int `active()` const**
  
  *Returns whether the widget is active.*

- **int `active_r()` const**
  
  *Returns whether the widget and all of its parents are active.*

- **Fl_Align `align()` const**
  
  *Gets the label alignment.*

- **void `align(Fl_Align alignment)`**
  
  *Sets the label alignment.*

- **long `argument()` const**
  
  *Gets the current user data (long) argument that is passed to the callback function.*

- **void `argument(long v)`**
  
  *Sets the current user data (long) argument that is passed to the callback function.*

- **virtual class Fl_Gl_Window * as_gl_window()**
  
  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

- **virtual Fl_Group * as_group()**
  
  *Returns an Fl_Group pointer if this widget is an Fl_Group.*

- **virtual Fl_Window * as_window()**
  
  *Returns an Fl_Window pointer if this widget is an Fl_Window.*

- **Fl_Boxtype `box()` const**
  
  *Gets the box type of the widget.*

- **void `box(Fl_Boxtype new_box)`**
  
  *Sets the box type for the widget.*

- **Fl_Callback_p `callback()` const**
  
  *Gets the current callback function for the widget.*

- **void `callback(Fl_Callback *cb)`**
  
  *Sets the current callback function for the widget.*

- **void `callback(Fl_Callback *cb, void *p)`**
  
  *Sets the current callback function for the widget.*

- **void `callback(Fl_Callback0 *cb)`**
Sets the current callback function for the widget.

- **void callback (Fl_Callback ∗cb, long p=0)**
  Sets the current callback function for the widget.

- **unsigned int changed () const**
  Checks if the widget value changed since the last callback.

- **void clear_active ()**
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changes ()**
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output ()**
  Sets a widget to accept input.

- **void clear_visible ()**
  Hides the widget.

- **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const Fl_Widget ∗w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char ∗new_label)**
  Sets the current label.

- **void copy_tooltip (const char ∗text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image ∗deimage ()**
  Gets the image that is used as part of the widget label.

- **const Fl_Image ∗deimage () const**
  Sets the image to use as part of the widget label.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label.

- **void do_callback ()**
  Generated by Doxygen
Calls the widget callback.

- **void do_callback (Fl_Widget *o, long arg)**
  Calls the widget callback.
- **void do_callback (Fl_Widget *o, void *arg=0)**
  Calls the widget callback.
- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.
- **virtual void hide ()**
  Makes a widget invisible.
- **Fl_Image * image ()**
  Gets the image that is used as part of the widget label.
- **const Fl_Image * image () const**
  Sets the image to use as part of the widget label.
- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label.
- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

- **const char * label () const**
  Gets the current label text.
- **void label (const char *text)**
  Sets the current label pointer.
- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  Gets the label color.
- **void labelcolor (Fl_Color c)**
  Sets the label color.
- **Fl_Font labelfont () const**
  Gets the font to use.
- **void labelfont (Fl_Font f)**
  Sets the font to use.
- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.
- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  Gets the label type.

- **void measure_label (int &ww, int &hh) const**
  Sets width ww and height hh accordingly with the label size.

- **unsigned int output () const**
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
9.113 Fl_Return_Button Class Reference

Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw()
  Schedules the drawing of the widget.

- void redraw_label()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active()
  Marks the widget as active without sending events or changing focus.

- void set_changed()
  Marks the value of the widget as changed.

- void set_output()
  Sets a widget to output only.

- void set_visible()
  Makes the widget visible.

- void set_visible_focus()
  Enables keyboard focus navigation with this widget.

- virtual void show()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char ∗ tooltip () const
  Gets the current tooltip text.

- void tooltip (const char ∗text)
  Sets the current tooltip text.

- Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void ∗ user_data () const
  Gets the user data for this widget.

- void user_data (void ∗v)
  Sets the user data for this widget.
- `unsigned int visible () const`
  Returns whether a widget is visible.
- `unsigned int visible_focus ()`
  Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
  Modifies keyboard focus navigation.
- `int visible_r () const`
  Returns whether a widget and all its parents are visible.
- `int w () const`
  Gets the widget width.
- `Fl_When when () const`
  Returns the conditions under which the callback is called.
- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.
- `Fl_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x () const`
  Gets the widget position in its window.
- `int y () const`
  Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
  Destroys the widget.

**Protected Member Functions**

- `void draw ()`
  Draws the widget.

**Protected Member Functions inherited from Fl_Button**

- `void simulate_key_action ()`

**Protected Member Functions inherited from Fl_Widget**

- `void clear_flag (unsigned int c)`
  Clears a flag in the flags mask.
- `void draw_backdrop () const`
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
  Draws the widget box according to its box style.
- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget's position and size.
- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.
- `void draw_focus ()`
  draws a focus rectangle around the widget
- `void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const`
  Draws a focus box for the widget at the given position and size.
- `void draw_label () const`
  Draws the widget's label at the defined label position.
- `void draw_label (int, int, int) const`
  Draws the label in an arbitrary bounding box.
• `Fl_Widget` (int x, int y, int w, int h, const char *label=0L)
  
  Creates a widget at the given position and size.

• unsigned int flags () const
  
  Gets the widget flags mask.

• void h (int v)
  
  Internal use only.

• void set_flag (unsigned int c)
  
  Sets a flag in the flags mask.

• void w (int v)
  
  Internal use only.

• void x (int v)
  
  Internal use only.

• void y (int v)
  
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Widget`

• static void default_callback (Fl_Widget *cb, void *d)
  
  The default callback for all widgets that don’t set a callback.

• static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int test_shortcut (const char *t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from `Fl_Widget`

• enum {
    INACTIVE = 1<<26, INVISIBLE = 1<<27, OUTPUT = 1<<28, NOBORDER = 1<<29,

Static Protected Member Functions inherited from `Fl_Button`

• static void key_release_timeout (void *)

Static Protected Attributes inherited from `Fl_Button`

• static Fl_Widget_Tracker *key_release_tracker = 0

9.113.1 Detailed Description

The `Fl_Return_Button` is a subclass of `Fl_Button` that generates a callback when it is pressed or when the user presses the Enter key.

A carriage-return symbol is drawn next to the button label.
9.113.2 Constructor & Destructor Documentation

9.113.2.1 Fl_Return_Button()

```cpp
Fl_Return_Button::Fl_Return_Button {
    int X,
    int Y,
    int W,
    int H,
    const char ∗ l = 0 )
```

Creates a new Fl_Return_Button widget using the given position, size, and label string.
The default boxtype is FL_UP_BOX.
The inherited destructor deletes the button.

9.113.3 Member Function Documentation

9.113.3.1 draw()

```cpp
void Fl_Return_Button::draw ( ) [protected], [virtual]
```

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
```cpp
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw();             // calls Fl_Scrollbar::draw()
```
Reimplemented from Fl_Button.

9.113.3.2 handle()

```cpp
int Fl_Return_Button::handle ( int event ) [virtual]
```

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

- **event** the kind of event received

Return values

- **0** if the event was not used or understood
- **1** if the event was used and can be deleted

See also

- Fl_Event

Reimplemented from Fl_Button.
The documentation for this class was generated from the following files:
9.114 Fl_RGB_Image Class Reference

The Fl_RGB_Image class supports caching and drawing of full-color images with 1 to 4 channels of color information.

```c
#include <Fl_Image.H>
```

Inheritance diagram for Fl_RGB_Image:

```
Fl_RGB_Image
  ^
  | Fl_Image
  |   +-- Fl_BMP_Image
  |   +-- Fl_JPEG_Image
  |   +-- Fl_PNG_Image
  |   +-- Fl_PNM_Image
```

### Public Member Functions

- virtual void color_average (Fl_Color c, float i)
  
  The color_average() method averages the colors in the image with the FLTK color value c.

- Fl_Image *copy ()
  
  The copy() method creates a copy of the specified image.

- virtual Fl_RGB_Image *copy (int W, int H)
  
  The copy() method creates a copy of the specified image.

- virtual void desaturate ()
  
  The desaturate() method converts an image to grayscale.

- void draw (int X, int Y)
  
  The draw() method draws the image with a bounding box.

- virtual void draw (int X, int Y, int W, int H, int cx=0, int cy=0)
  
  The draw() method draws the image with a bounding box.

- Fl_RGB_Image (const Fl_Pixmap *pxm, Fl_Color bg=FL_GRAY)
  
  The constructor creates a new RGBA image from the specified Fl_Pixmap.

- Fl_RGB_Image (const uchar *bits, int W, int H, int D=3, int LD=0)
  
  The constructor creates a new image from the specified data.

- virtual void label (Fl_Menu_Item *m)
  
  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

- virtual void label (Fl_Widget *w)
  
  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

- virtual void uncache ()
  
  If the image has been cached for display, delete the cache data.

- virtual ~Fl_RGB_Image ()
  
  The destructor frees all memory and server resources that are used by the image.

### Public Member Functions inherited from Fl_Image

- Fl_Image *copy ()
  
  The copy() method creates a copy of the specified image.

- int count () const
  
  The count() method returns the number of data values associated with the image.

- int d () const
  
  Returns the current image depth.

- const char *const *data () const

Generated by Doxygen
Returns a pointer to the current image data array.

- **void** draw (int X, int Y)
  Draws the image.

- **int** fail ()
  Returns a value that is not 0 if there is currently no image available.

- **Fl_Image** (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.

- **int** h () const
  Returns the current image height in pixels.

- **void** inactive ()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

- **int** ld () const
  Returns the current line data size in bytes.

- **int** w () const
  Returns the current image width in pixels.

- **virtual** ~**Fl_Image** ()
  The destructor is a virtual method that frees all memory used by the image.

Static Public Member Functions

- **static size_t** max_size ()
  Returns the maximum allowed image size in bytes when creating an **Fl_RGB_Image** object.

- **static void** max_size (size_t size)
  Sets the maximum allowed image size in bytes when creating an **Fl_RGB_Image** object.

Static Public Member Functions inherited from **Fl_Image**

- **static Fl_RGB_Scaling** RGB_scaling ()
  Returns the currently used RGB image scaling method.

- **static void** RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).

Public Attributes

- **int** alloc_array
  If non-zero, the object's data array is delete[]d when deleting the object.

- **const uchar ∗** array
  Points to the start of the object's data array.

Friends

- class **Fl_GDI_Graphics_Driver**
- class **Fl_GDI_Printer_Graphics_Driver**
- class **Fl_Quartz_Graphics_Driver**
- class **Fl_Xlib_Graphics_Driver**

9.114 Fl_RGB_Image Class Reference

Protected Member Functions inherited from Fl_Image

- void d (int D)
  Sets the current image depth.
- void data (const char * const *p, int c)
  Sets the current array pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- void h (int H)
  Sets the current image height in pixels.
- void ld (int LD)
  Sets the current line data size in bytes.
- void w (int W)
  Sets the current image width in pixels.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

9.114.1 Detailed Description

The Fl_RGB_Image class supports caching and drawing of full-color images with 1 to 4 channels of color information. Images with an even number of channels are assumed to contain alpha information, which is used to blend the image with the contents of the screen.

Fl_RGB_Image is defined in <FL/Fl_Image.H>, however for compatibility reasons <FL/Fl_RGB_Image.H> should be included.

9.114.2 Constructor & Destructor Documentation

9.114.2.1 Fl_RGB_Image() [1/2]

Fl_RGB_Image::Fl_RGB_Image (const uchar * *bits, int W, int H, int D = 3, int LD = 0)

The constructor creates a new image from the specified data.
The data array bits must contain sufficient data to provide W * H * D image bytes and optional line padding, see LD.
W and H are the width and height of the image in pixels, resp.
D is the image depth and can be:

- D=1: each uchar in bits[] is a grayscale pixel value
- D=2: each uchar pair in bits[] is a grayscale + alpha pixel value
- D=3: each uchar triplet in bits[] is an R/G/B pixel value
- D=4: each uchar quad in bits[] is an R/G/B/A pixel value

LD specifies the line data size of the array, see Fl_Image::ld(int). If LD is zero, then W * D is assumed, otherwise LD must be greater than or equal to W * D to account for (unused) extra data per line (padding).
The caller is responsible that the image data array bits persists as long as the image is used.
This constructor sets Fl_RGB_Image::alloc_array to 0. To have the image object control the deallocation of the data array bits, set alloc_array to non-zero after construction.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>bits</th>
<th>The image data array.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>W</td>
<td>The width of the image in pixels.</td>
</tr>
<tr>
<td>in</td>
<td>H</td>
<td>The height of the image in pixels.</td>
</tr>
<tr>
<td>in</td>
<td>D</td>
<td>The image depth, or 'number of channels' (default=3).</td>
</tr>
<tr>
<td>in</td>
<td>LD</td>
<td>Line data size (default=0).</td>
</tr>
</tbody>
</table>

See also

Fl_Image::data(), Fl_Image::w(), Fl_Image::h(), Fl_Image::d(), Fl_Image::ld(int)

9.114.2.2 Fl_RGB_Image() [2/2]

Fl_RGB_Image::Fl_RGB_Image (  
    const Fl_Pixmap * pxm,  
    Fl_Color bg = FL_GRAY )

The constructor creates a new RGBA image from the specified Fl_Pixmap.
The RGBA image is built fully opaque except for the transparent area of the pixmap that is assigned the bg color
with full transparency.
This constructor creates a new internal data array and sets Fl_RGB_Image::alloc_array to 1 so the data array is
deleted when the image is destroyed.

9.114.3 Member Function Documentation

9.114.3.1 color_average()

void Fl_RGB_Image::color_average (  
    Fl_Color c,  
    float i ) [virtual]

The color_average() method averages the colors in the image with the FLTK color value c.
The i argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no
color blend, and a value of 0.0 results in a constant image of the specified color.
An internal copy is made of the original image before changes are applied, to avoid modifying the original image.
Reimplemented from Fl_Image.

9.114.3.2 copy()

Fl_Image * Fl_RGB_Image::copy (  
    int W,  
    int H ) [virtual]

The copy() method creates a copy of the specified image.
If the width and height are provided, the image is resized to the specified size. The image should be deleted (or in
the case of Fl_Shared_Image, released) when you are done with it.
Reimplemented from Fl_Image.

9.114.3.3 desaturate()

void Fl_RGB_Image::desaturate ( ) [virtual]

The desaturate() method converts an image to grayscale.
If the image contains an alpha channel (depth = 4), the alpha channel is preserved.
An internal copy is made of the original image before changes are applied, to avoid modifying the original image.
Reimplemented from Fl_Image.

9.114.3.4 draw()

void Fl_RGB_Image::draw (  
    int X,  
    int Y,  
    int W,  
    int H ) [virtual]
int Y,
int W,
int H,
int cx = 0,
int cy = 0 ) [virtual]

Draws the image with a bounding box.
Arguments X, Y, W, H specify a bounding box for the image, with the origin
(upper-left corner) of the image offset by the cx and cy arguments.
In other words: fl_push_clip(X, Y, W, H) is applied, the image is drawn with its upper-left corner at
X-cx, Y-cy and its own width and height, fl_pop_clip() is applied.
Reimplemented from Fl_Image.

9.114.3.5 label() [1/2]

void Fl_RGB_Image::label ( Fl_Menu_Item * m ) [virtual]
The label() methods are an obsolete way to set the image attribute of a widget or menu item.
Use the image() or deimage() methods of the Fl_Widget and Fl_Menu_Item classes instead.
Reimplemented from Fl_Image.

9.114.3.6 label() [2/2]

void Fl_RGB_Image::label ( Fl_Widget * widget ) [virtual]
The label() methods are an obsolete way to set the image attribute of a widget or menu item.
Use the image() or deimage() methods of the Fl_Widget and Fl_Menu_Item classes instead.
Reimplemented from Fl_Image.

9.114.3.7 max_size() [1/2]

static size_t Fl_RGB_Image::max_size ( ) [inline], [static]
Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
See also
void Fl_RGB_Image::max_size(size_t)

9.114.3.8 max_size() [2/2]

static void Fl_RGB_Image::max_size ( size_t size ) [inline], [static]
Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
The image size in bytes of an Fl_RGB_Image object is the value of the product w() * h() * d(). If this product exceeds
size, the created object of a derived class of Fl_RGB_Image won’t be loaded with the image data. This does not ap-
ply to direct RGB image creation with Fl_RGB_Image::Fl_RGB_Image(const uchar *bits, int W, int H, int D, int LD).
The default max_size() value is essentially infinite.

9.114.3.9 uncache()

void Fl_RGB_Image::uncache ( ) [virtual]
If the image has been cached for display, delete the cache data.
This allows you to change the data used for the image and then redraw it without recreating an image object.
Reimplemented from Fl_Image.
The documentation for this class was generated from the following files:

• Fl_Image.H
• Fl_Image.cxx
The Fl_Roller widget is a "dolly" control commonly used to move 3D objects.

```cpp
#include <Fl_Roller.H>
```

Inheritance diagram for Fl_Roller:

```
Fl_Widget
  ↓
Fl_Valuator
  ↓
Fl_Roller
```

### Public Member Functions

- **Fl_Roller** (int X, int Y, int W, int H, const char ∗L=0)
  
  Creates a new Fl_Roller widget using the given position, size, and label string.

- **int handle** (int)
  
  Handles the specified event.

### Public Member Functions inherited from Fl_Valuator

- **void bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp** (double)
  
  Clamps the passed value to the valuator range.

- **virtual int format** (char ∗)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment** (double, int)
  
  Adds n times the step value to the passed value.

- **double maximum () const**
  
  Gets the maximum value for the valuator.

- **void maximum (double a)**
  
  Sets the maximum value for the valuator.

- **double minimum () const**
  
  Gets the minimum value for the valuator.

- **void minimum (double a)**
  
  Sets the minimum value for the valuator.

- **void precision (int digits)**
  
  Sets the step value to 1.0 / 10^digits.

- **void range** (double a, double b)
  
  Sets the minimum and maximum values for the valuator.

- **double round** (double)
  
  Round the passed value to the nearest step increment.

- **double step () const**
  
  Gets or sets the step value.

- **void step** (double a, int b)
  
  See double Fl_Valuator::step() const

- **void step** (double s)
  
  See double Fl_Valuator::step() const.

- **void step** (int a)
See double Fl_Valuator::step() const

- double value () const
  Gets the floating point(double) value.
- int value (double)
  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function for the widget.
- void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)  
  Clears or sets the damage flags.
• void clear_output ()  
  Sets a widget to accept input.
• void clear_visible ()  
  Hides the widget.
• void clear_visible_focus ()  
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const  
  Gets the background color of the widget.
• void color (Fl_Color bg)  
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)  
  Sets the background and selection color of the widget.
• Fl_Color color2 () const  
  For back compatibility only.
• void color2 (unsigned a)  
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const  
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)  
  Sets the current label.
• void copy_tooltip (const char ∗text)  
  Sets the current tooltip text.
• uchar damage () const  
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)  
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)  
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)  
  Internal use only.
• void deactivate ()  
  Deactivates the widget.
• Fl_Image ∗deimage ()  
  Gets the image that is used as part of the widget label.
• const Fl_Image ∗deimage () const  
  For back compatibility only.
• void deimage (Fl_Image &img)  
  Sets the image to use as part of the widget label.
• void deimage (Fl_Image ∗img)  
  Sets the image to use as part of the widget label.
• void do_callback ()  
  Calls the widget callback.
• void do_callback (Fl_Widget ∗o, long arg)  
  Calls the widget callback.
• void do_callback (Fl_Widget ∗o, void ∗arg=0)  
  Calls the widget callback.
• void draw_label (int, int, int, Fl_Align) const  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const  
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label.
• const Fl_Image * image () const
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int y, int w, int h)
  Changes the size or position of the widget.
• **FL_Color selection_color () const**
  Gets the selection color.

• **void selection_color (FL_Color a)**
  Sets the selection color.

• **void set_active ()**
  Marks the widget as active without sending events or changing focus.

• **void set_changed ()**
  Marks the value of the widget as changed.

• **void set_output ()**
  Sets a widget to output only.

• **void set_visible ()**
  Makes the widget visible.

• **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

• **virtual void show ()**
  Makes a widget visible.

• **void size (int W, int H)**
  Changes the size of the widget.

• **int take_focus ()**
  Gives the widget the keyboard focus.

• **unsigned int takesevents () const**
  Returns if the widget is able to take events.

• **int test_shortcut ()**
  Returns true if the widget's label contains the entered '&x' shortcut.

• **const char * tooltip () const**
  Gets the current tooltip text.

• **void tooltip (const char *text)**
  Sets the current tooltip text.

• **FL_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

• **FL_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

• **uchar type () const**
  Gets the widget type.

• **void type (uchar t)**
  Sets the widget type.

• **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void * user_data () const**
  Gets the user data for this widget.

• **void user_data (void *v)**
  Sets the user data for this widget.

• **unsigned int visible () const**
  Returns whether a widget is visible.

• **unsigned int visible_focus ()**
  Checks whether this widget has a visible focus.

• **void visible_focus (int v)**
  Modifies keyboard focus navigation.

• **int visible_r () const**
  Returns whether a widget and all its parents are visible.

• **int w () const**
Gets the widget width.

- `Fl_When when () const`
  Returns the conditions under which the callback is called.

- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- `virtual ~Fl_Widget ()`
  Destroys the widget.

### Protected Member Functions

- `void draw ()`
  Draws the widget.

### Protected Member Functions inherited from Fl_Valuator

- `Fl_Valuator (int X, int Y, int W, int H, const char * L)`
  Creates a new `Fl_Valuator` widget using the given position, size, and label string.

- `void handle_drag (double newvalue)`
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- `void handle_push ()`
  Stores the current value in the previous value.

- `void handle_release ()`
  Called after an FL_WHEN_RELEASE event is received and before the callback.

- `int horizontal () const`
  Tells if the valuator is an FL_HORIZONTAL one.

- `double previous_value () const`
  Gets the previous floating point value before an event changed it.

- `void set_value (double v)`
  Sets the current floating point value.

- `double softclamp (double)`
  Clamps the value, but accepts v if the previous value is not already out of range.

- `virtual void value_damage ()`
  Asks for partial redraw.

### Protected Member Functions inherited from Fl_Widget

- `void clear_flag (unsigned int c)`
  Clears a flag in the flags mask.

- `void draw_backdrop () const`
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- `void draw_box () const`
  Draws the widget box according its box style.

- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget's position and size.

- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus ()
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗cb, void ∗d)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the 'x' shortcut in a given text.
• static int test_shortcut (const char ∗, const bool require_alt=false)
  Returns true if the given text 't' contains the entered 'x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.
9.115.1 Detailed Description

The Fl_Roller widget is a "dolly" control commonly used to move 3D objects.

![Fl_Roller Widget](image)

Figure 9.26 Fl_Roller

9.115.2 Constructor & Destructor Documentation

9.115.2.1 Fl_Roller()

```cpp
Fl_Roller::Fl_Roller (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char ∗ L = 0 )
```

Creates a new Fl_Roller widget using the given position, size, and label string.
The default boxtype is FL_NO_BOX.
Inherited destructor destroys the valuator.

9.115.3 Member Function Documentation

9.115.3.1 draw()

```cpp
void Fl_Roller::draw ( ) [protected], [virtual]
```

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
```cpp
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar  
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.

9.115.3.2 handle()

```cpp
int Fl_Roller::handle (  
  int event ) [virtual]
```

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>event</th>
<th>the kind of event received</th>
</tr>
</thead>
</table>

Generated by Doxygen
Return values

<table>
<thead>
<tr>
<th></th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

Fl_Event

Reimplemented from Fl_Widget.
The documentation for this class was generated from the following files:

- Fl_Roller.H
- Fl_Roller.cxx

9.116 Fl_Round_Button Class Reference

Buttons generate callbacks when they are clicked by the user.

#include <Fl_Round_Button.H>

Inheritance diagram for Fl_Round_Button:

```
   Fl_Widget
      └── Fl_Button
            └── Fl_Light_Button
                  └── Fl_Round_Button
```

Public Member Functions

- Fl_Round_Button (int x, int y, int w, int h, const char *l=0)
  Creates a new Fl_Round_Button widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Light_Button

- Fl_Light_Button (int x, int y, int w, int h, const char *l=0)
  Creates a new Fl_Light_Button widget using the given position, size, and label string.
- virtual int handle (int)
  Handles the specified event.

Public Member Functions inherited from Fl_Button

- int clear ()
  Same as value(0).
- Fl_Boxtype down_box () const
  Returns the current down box type, which is drawn when value() is non-zero.
- void down_box (Fl_Boxtype b)
  Sets the down box type.
- Fl_Color down_color () const
(for backwards compatibility)

- void **down_color** (unsigned c)
  (for backwards compatibility)

- **Fl_Button** (int X, int Y, int W, int H, const char *L=0)
  The constructor creates the button using the given position, size, and label.

- int **set** ()
  *Same as value(1).*

- void **setonly** ()
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).

- int **shortcut** () const
  Returns the current shortcut key for the button.

- void **shortcut** (const char *s)
  (for backwards compatibility)

- void **shortcut** (int s)
  Sets the shortcut key to s.

- char **value** () const
  Returns the current value of the button (0 or 1).

- int **value** (int v)
  Sets the current value of the button.

### Public Member Functions inherited from Fl_Widget

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
  Activates the widget.

- unsigned int **active** () const
  Returns whether the widget is active.

- int **active_r** () const
  Returns whether the widget and all of its parents are active.

- Fl_Align **align** () const
  Gets the label alignment.

- void **align** (Fl_Align alignment)
  Sets the label alignment.

- long **argument** () const
  Gets the current user data (long) argument that is passed to the callback function.

- void **argument** (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window * **as_gl_window** ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual Fl_Group * **as_group** ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Window * **as_window** ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- Fl_Boxtype **box** () const
  Gets the box type of the widget.

- void **box** (Fl_Boxtype new_box)
  Sets the box type for the widget.

- **Fl_Callback_p** **callback** () const
  Gets the current callback function for the widget.

- void **callback** (Fl_Callback *cb)
Sets the current callback function for the widget.

- `void callback (Fl_Callback *cb, void *p)`
  Sets the current callback function for the widget.
- `void callback (Fl_Callback0 *cb)`
  Sets the current callback function for the widget.
- `void callback (Fl_Callback1 *cb, long p=0)`
  Sets the current callback function for the widget.
- `unsigned int changed () const`
  Checks if the widget value changed since the last callback.
- `void clear_active ()`
  Marks the widget as inactive without sending events or changing focus.
- `void clear_changed ()`
  Marks the value of the widget as unchanged.
- `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.
- `void clear_output ()`
  Sets a widget to accept input.
- `void clear_visible ()`
  Hides the widget.
- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.
- `Fl_Color color () const`
  Gets the background color of the widget.
- `void color (Fl_Color bg)`
  Sets the background color of the widget.
- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.
- `Fl_Color color2 () const`
  For back compatibility only.
- `void color2 (unsigned a)`
  For back compatibility only.
- `int contains (const Fl_Widget *w) const`
  Checks if w is a child of this widget.
- `void copy_label (const char *new_label)`
  Sets the current label.
- `void copy_tooltip (const char *text)`
  Sets the current tooltip text.
- `uchar damage () const`
  Returns non-zero if draw() needs to be called.
- `void damage (uchar c)`
  Sets the damage bits for the widget.
- `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.
- `int damage_resize (int, int, int, int)`
  Internal use only.
- `void deactivate ()`
  Deactivates the widget.
- `Fl_Image * deimage ()`
  Gets the image that is used as part of the widget label.
- `const Fl_Image * deimage () const`
- `void deimage (Fl_Image &img)`
Sets the image to use as part of the widget label.

- void deimage (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label.

- void do_callback ()
  
  Calls the widget callback.

- void do_callback (Fl_Widget ∗o, long arg)
  
  Calls the widget callback.

- void do_callback (Fl_Widget ∗o, void ∗arg=0)
  
  Calls the widget callback.

- void draw_label (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int h () const
  
  Gets the widget height.

- virtual void hide ()
  
  Makes a widget invisible.

- Fl_Image ∗image ()
  
  Gets the image that is used as part of the widget label.

- const Fl_Image ∗image () const
  
  Sets the image to use as part of the widget label.

- void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label.

- Fl_Image ∗image (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label.

- int inside (const Fl_Widget ∗wgt) const
  
  Checks if this widget is a child of wgt.

- int is_label_copied () const
  
  Returns whether the current label was assigned with copy_label().

- const char ∗label () const
  
  Gets the current label text.

- void label (const char ∗text)
  
  Sets the current label pointer.

- void label (Fl_Labeltype a, const char ∗b)
  
  Shortcut to set the label text and type in one call.

- Fl_Color labelcolor () const
  
  Gets the label color.

- void labelcolor (Fl_Color c)
  
  Sets the label color.

- Fl_Font labelfont () const
  
  Gets the font to use.

- void labelfont (Fl_Font f)
  
  Sets the font to use.

- Fl_Fontsize labelsize () const
  
  Gets the font size in pixels.

- void labelsize (Fl_Fontsize pix)
  
  Sets the font size in pixels.

- Fl_Labeltype labeltype () const
  
  Gets the label type.

- void labeltype (Fl_Labeltype a)
  
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

- unsigned int output () const
Returns if a widget is used for output only.

- **Fl_Group* parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group* p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**
  Changes the size or position of the widget.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char* tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char* text)**
  Sets the current tooltip text.

- **Fl_Window* top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window* top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.

- **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void *user_data() const
  Gets the user data for this widget.

• void user_data(void *v)
  Sets the user data for this widget.

• unsigned int visible() const
  Returns whether a widget is visible.

• unsigned int visible_focus()
  Checks whether this widget has a visible focus.

• void visible_focus(int v)
  Modifies keyboard focus navigation.

• int visible_r() const
  Returns whether a widget and all its parents are visible.

• int w() const
  Gets the widget width.

• Fl_When when() const
  Returns the conditions under which the callback is called.

• void when(uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window* window() const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x() const
  Gets the widget position in its window.

• int y() const
  Gets the widget position in its window.

• virtual ~Fl_Widget()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback(Fl_Widget* cb, void *d)
  The default callback for all widgets that don’t set a callback.

• static unsigned int label_shortcut(const char *t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int test_shortcut(const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3, FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7, OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11, MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15, GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCECTS_MENU = 1<<19, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31}
  flags possible values enumeration.
Protected Member Functions inherited from Fl_Light_Button

• virtual void draw ()

  Draws the widget.

Protected Member Functions inherited from Fl_Button

• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)

  Clears a flag in the flags mask.

• void draw_backdrop () const

  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const

  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const

  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const

  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus ()

  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const

  Draws a focus box for the widget at the given position and size.

• void draw_label () const

  Draws the widget's label at the defined label position.

• void draw_label (int, int, int, int) const

  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)

  Creates a widget at the given position and size.

• unsigned int flags () const

  Gets the widget flags mask.

• void h (int v)

  Internal use only.

• void set_flag (unsigned int c)

  Sets a flag in the flags mask.

• void w (int v)

  Internal use only.

• void x (int v)

  Internal use only.

• void y (int v)

  Internal use only.

Static Protected Member Functions inherited from Fl_Button

• static void key_release_timeout (void ∗)

Static Protected Attributes inherited from Fl_Button

• static Fl_Widget_Tracker ∗key_release_tracker = 0
9.116.1 Detailed Description

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for `type()` and `when()`.

![Fl_Round_Button](image)

Figure 9.27 Fl_Round_Button

The `Fl_Round_Button` subclass display the "on" state by turning on a light, rather than drawing pushed in. The shape of the "light" is initially set to `FL_ROUND_DOWN_BOX`. The color of the light when on is controlled with `selection_color()`, which defaults to `FL_FOREGROUND_COLOR`.

9.116.2 Constructor & Destructor Documentation

9.116.2.1 Fl_Round_Button()

```
Fl_Round_Button::Fl_Round_Button (  
ext, int Y,  
int W,  
int H,  
const char * L = 0 )
```

Creates a new `Fl_Round_Button` widget using the given position, size, and label string.

![Fl_Round_Button](image)

Figure 9.28 Fl_Round_Button

The `Fl_Round_Button` subclass displays the "ON" state by turning on a light, rather than drawing pushed in. The default box type is `FL_NO_BOX`, which draws the label w/o a box right of the checkmark. The shape of the "light" is set with `down_box()` and its default value is `FL_ROUND_DOWN_BOX`. The color of the light when on is controlled with `selection_color()`, which defaults to `FL_FOREGROUND_COLOR` (usually black).

Parameters

<table>
<thead>

</table>

The documentation for this class was generated from the following files:

- `Fl_Round_Button.H`
- `Fl_Round_Button.cxx`

9.117 Fl_Round_Clock Class Reference

A clock widget of type `FL_ROUND_CLOCK`.

```cpp
#include <Fl_Round_Clock.H>
```

Inheritance diagram for `Fl_Round_Clock`:
Public Member Functions

• **Fl_Round_Clock** (int X, int Y, int W, int H, const char *L=0)

  Creates the clock widget, setting his type and box.

Public Member Functions inherited from Fl_Clock

• **Fl_Clock** (int X, int Y, int W, int H, const char *L=0)

  Create an Fl_Clock widget using the given position, size, and label string.

• **Fl_Clock** (uchar t, int X, int Y, int W, int H, const char *L)

  Create an Fl_Clock widget using the given boxtype, position, size, and label string.

• int handle (int)

  Handles the specified event.

• ~Fl_Clock ()

  The destructor removes the clock.

Public Member Functions inherited from Fl_Clock_Output

• **Fl_Clock_Output** (int X, int Y, int W, int H, const char *L=0)

  Create a new Fl_Clock_Output widget with the given position, size and label.

• int hour () const

  Returns the displayed hour (0 to 23).

• int minute () const

  Returns the displayed minute (0 to 59).

• int second () const

  Returns the displayed second (0 to 60, 60=leap second).

• ulong value () const

  Returns the displayed time.

• void value (int H, int m, int s)

  Set the displayed time.

• void value (ulong v)

  Set the displayed time.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()

• void _set_fullscreen ()

• void activate ()

  Activates the widget.

• unsigned int active () const

  Returns whether the widget is active.

• int active_r () const
Returns whether the widget and all of its parents are active.

- `Fl_Align align () const`
  Gets the label alignment.

- `void align (Fl_Align alignment)`
  Sets the label alignment.

- `long argument () const`
  Gets the current user data (long) argument that is passed to the callback function.

- `void argument (long v)`
  Sets the current user data (long) argument that is passed to the callback function.

- `virtual class Fl_Gl_Window * as_gl_window ()`
  Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.

- `virtual Fl_Group * as_group ()`
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

- `virtual Fl_Window * as_window ()`
  Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.

- `Fl_Boxtype box () const`
  Gets the box type of the widget.

- `void box (Fl_Boxtype new_box)`
  Sets the box type for the widget.

- `Fl_Callback_p callback () const`
  Gets the current callback function for the widget.

- `void callback (Fl_Callback * cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback * cb, void * p)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback0 * cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback1 * cb, long p=0)`
  Sets the current callback function for the widget.

- `unsigned int changed () const`
  Checks if the widget value changed since the last callback.

- `void clear_active ()`
  Marks the widget as inactive without sending events or changing focus.

- `void clear_changed ()`
  Marks the value of the widget as unchanged.

- `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.

- `void clear_output ()`
  Sets a widget to accept input.

- `void clear_visible ()`
  Hides the widget.

- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.

- `Fl_Color color () const`
  Gets the background color of the widget.

- `void color (Fl_Color bg)`
  Sets the background color of the widget.

- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- `Fl_Color color2 () const`
  For back compatibility only.
- void color2 (unsigned a)
  
  For back compatibility only.
- int contains (const Fl_Widget *w) const
  
  Checks if w is a child of this widget.
- void copy_label (const char *new_label)
  
  Sets the current label.
- void copy_tooltip (const char *text)
  
  Sets the current tooltip text.
- uchar damage () const
  
  Returns non-zero if draw() needs to be called.
- void damage (uchar c)
  
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.
- int damage_resize (int, int, int)
  
  Internal use only.
- void deactivate ()
  
  Deactivates the widget.
- Fl_Image * deimage ()
  
  Gets the image that is used as part of the widget label.
- const Fl_Image * deimage () const
- void deimage (Fl_Image &img)
  
  Sets the image to use as part of the widget label.
- void deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label.
- void do_callback ()
  
  Calls the widget callback.
- void do_callback (Fl_Widget *o, long arg)
  
  Calls the widget callback.
- void do_callback (Fl_Widget *o, void *arg=0)
  
  Calls the widget callback.
- void draw_label (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int h () const
  
  Gets the widget height.
- virtual void hide ()
  
  Makes a widget invisible.
- Fl_Image * image ()
  
  Gets the image that is used as part of the widget label.
- const Fl_Image * image () const
- void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label.
- void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label.
- int inside (const Fl_Widget *wgt) const
  
  Checks if this widget is a child of wgt.
- int is_label_copied () const
  
  Returns whether the current label was assigned with copy_label().
- const char * label () const
  
  Gets the current label text.
- void label (const char *text)
Sets the current label pointer.

- void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

- Fl_Color labelcolor () const
  Gets the label color.

- void labelcolor (Fl_Color c)
  Sets the label color.

- Fl_Font labelfont () const
  Gets the font to use.

- void labelfont (Fl_Font f)
  Sets the font to use.

- Fl_Fontsize labelsize () const
  Gets the font size in pixels.

- void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

- Fl_Labeltype labeltype () const
  Gets the label type.

- void labeltype (Fl_Labeltype a)
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- virtual void show ()
  Makes a widget visible.
• void **size** (int W, int H)
  Changes the size of the widget.

• int **take_focus** ()
  Gives the widget the keyboard focus.

• unsigned int **takesevents** () const
  Returns if the widget is able to take events.

• int **test_shortcut** ()
  Returns true if the widget's label contains the entered 'x' shortcut.

• const char * **tooltip** () const
  Gets the current tooltip text.

• void **tooltip** (const char *text)
  Sets the current tooltip text.

• **Fl_Window** * **top_window** () const
  Returns a pointer to the top-level window for the widget.

• **Fl_Window** * **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar **type** () const
  Gets the widget type.

• void **type** (uchar t)
  Sets the widget type.

• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * **user_data** () const
  Gets the user data for this widget.

• void **user_data** (void *v)
  Sets the user data for this widget.

• unsigned int **visible** () const
  Returns whether a widget is visible.

• unsigned int **visible_focus** ()
  Checks whether this widget has a visible focus.

• void **visible_focus** (int v)
  Modifies keyboard focus navigation.

• int **visible_r** () const
  Returns whether a widget and all its parents are visible.

• int **w** () const
  Gets the widget width.

• **Fl_When** when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• **Fl_Window** * **window** () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int **x** () const
  Gets the widget position in its window.

• int **y** () const
  Gets the widget position in its window.

• virtual **~Fl_Widget** ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗cb, void ∗d)
  
  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0,
  INVISIBLE = 1<<1,
  OUTPUT = 1<<2,
  NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4,
  NON_MODAL = 1<<5,
  SHORTCUT_LABEL = 1<<6,
  CHANGED = 1<<7,
  OVERRIDE = 1<<8,
  VISIBLE_FOCUS = 1<<9,
  COPIED_LABEL = 1<<10,
  CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12,
  TOOLTIP_WINDOW = 1<<13,
  MODAL = 1<<14,
  NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16,
  COPIED_TOOLTIP = 1<<17,
  FULLSCREEN = 1<<18,
  MAC_USE_ACCENTS_MENU = 1<<19,
  USERFLAG3 = 1<<29,
  USERFLAG2 = 1<<30,
  USERFLAG1 = 1<<31
} flags possible values enumeration.

Protected Member Functions inherited from Fl_Clock_Output

- void draw ()
  
  Draw clock with current position and size.

- void draw (int X, int Y, int W, int H)
  
  Draw clock with the given position and size.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.

- void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus ()
  
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  
  Draws the widget's label at the default label position.

- void draw_label (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
Creates a widget at the given position and size.

- **unsigned int flags () const**
  Gets the widget flags mask.

- **void h (int v)**
  *Internal use only.*

- **void set_flag (unsigned int c)**
  Sets a flag in the flags mask.

- **void w (int v)**
  *Internal use only.*

- **void x (int v)**
  *Internal use only.*

- **void y (int v)**
  *Internal use only.*

### 9.117.1 Detailed Description

A clock widget of type FL_ROUND_CLOCK.
Has no box.
The documentation for this class was generated from the following files:

- Fl_Round_Clock.H
- Fl_Scroll.cxx

### 9.118 Fl_Scroll Class Reference

This container widget lets you maneuver around a set of widgets much larger than your window.

```cpp
#include <Fl_Scroll.H>
```

Inheritance diagram for Fl_Scroll:

```
Fl_Widget
  ↓
Fl_Group
  ↓
Fl_Scroll
```

#### Classes

- **struct Fl_Region_LRTB**
  A local struct to manage a region defined by left/right/top/bottom.

- **struct Fl_Region_XYWH**
  A local struct to manage a region defined by xywh.

- **struct Fl_Scrollbar_Data**
  A local struct to manage scrollbar's xywh region and tab values.

- **struct ScrollInfo**
  Structure to manage scrollbar and widget interior sizes.

#### Public Types

```cpp
enum {
  HORIZONTAL = 1 , VERTICAL = 2 , BOTH = 3 , ALWAYS_ON = 4 ,
  HORIZONTAL_ALWAYS = 5 , VERTICAL_ALWAYS = 6 , BOTH_ALWAYS = 7 }
```
Public Member Functions

- **void clear ()**
  
  Clear all but the scrollbars...

- **Fl_Scroll (int X, int Y, int W, int H, const char ∗l=0)**
  
  Creates a new Fl_Scroll widget using the given position, size, and label string.

- **int handle (int)**
  
  Handles the specified event.

- **void resize (int X, int Y, int W, int H)**
  
  Resizes the Fl_Scroll widget and moves its children if necessary.

- **void scroll_to (int, int)**
  
  Moves the contents of the scroll group to a new position.

- **int scrollbar_size () const**
  
  Gets the current size of the scrollbars' troughs, in pixels.

- **void scrollbar_size (int newSize)**
  
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

- **int xposition () const**
  
  Gets the current horizontal scrolling position.

- **int yposition () const**
  
  Gets the current vertical scrolling position.

Public Member Functions inherited from Fl_Group

- **Fl_Widget ∗_ddfdesign_kludge ()**
  
  This is for forms compatibility only.

- **void add (Fl_Widget &)**
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void add (Fl_Widget ∗o)**
  
  See void Fl_Group::add(Fl_Widget &w)

- **void add_resizable (Fl_Widget &o)**
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget ∗const ∗array () const**
  
  Returns a pointer to the array of children.

- **virtual Fl_Group ∗as_group ()**
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin ()**
  
  Exactly the same as current(this->parent()).

- **int find (const Fl_Widget &o) const**
  
  See int Fl_Group::find(const Fl_Widget ∗w) const.

- **int children () const**
  
  Returns how many child widgets the group has.

- **void clear ()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()**
  
  Returns the current clipping mode.

- **void clip_children (int c)**
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **void end ()**
  
  Exactly the same as current(this->parent()).

- **int find (const Fl_Widget ∗o) const**
  
  See int Fl_Group::find(const Fl_Widget ∗w) const.

- **int find (const Fl_Widget ∗) const**

Generated by Doxygen
Searches the child array for the widget and returns the index.

- **Fl_Group** (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.

- void **focus** (Fl_Widget *W)

- void **forms_end** ()
  This is for forms compatibility only.

- void **init_sizes** ()
  Resets the internal array of widget sizes and positions.

- void **insert** (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

- void **insert** (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).

- void **remove** (Fl_Widget &)
  Removes a widget from the group but does not delete it.

- void **remove** (Fl_Widget *o)
  Removes the widget o from the group.

- void **remove** (int index)
  Removes the widget at index from the group but does not delete it.

- Fl_Widget * **resizable** () const
  See void Fl_Group::resizable(Fl_Widget *box)

- void **resizable** (Fl_Widget &o)
  See void Fl_Group::resizable(Fl_Widget *box)

- void **resizable** (Fl_Widget *o)
  The resizable widget defines the resizing box for the group.

- virtual **~Fl_Group** ()
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
  Activates the widget.

- unsigned int **active** () const
  Returns whether the widget is active.

- int **active_r** () const
  Returns whether the widget and all of its parents are active.

- Fl_Align **align** () const
  Gets the label alignment.

- void **align** (Fl_Align alignment)
  Sets the label alignment.

- long **argument** () const
  Gets the current user data (long) argument that is passed to the callback function.

- void **argument** (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class **Fl_Gl_Window** * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- Fl_Boxtype **box** () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback +cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback +cb, void +p)
  Sets the current callback function for the widget.
• void callback (Fl_Callback0 +cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 +cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
Deactivates the widget.

- **FL_Image * deimage ()**
  
  Gets the image that is used as part of the widget label.

- **const FL_Image * deimage () const**
  
  Sets the image to use as part of the widget label.

- **void deimage (FL_Image &img)**
  
  Sets the image to use as part of the widget label.

- **void deimage (FL_Image *img)**
  
  Sets the image to use as part of the widget label.

- **void do_callback ()**
  
  Calls the widget callback.

- **void do_callback (Fl_Widget *o, long arg)**
  
  Calls the widget callback.

- **void do_callback (Fl_Widget *o, void *arg=0)**
  
  Calls the widget callback.

- **void draw_label (int, int, int, int, Fl_Align) const**
  
    Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  
    Gets the widget height.

- **virtual void hide ()**
  
    Makes a widget invisible.

- **FL_Image * image ()**
  
    Gets the image that is used as part of the widget label.

- **const FL_Image * image () const**
  
    Sets the image to use as part of the widget label.

- **void image (FL_Image &img)**
  
    Sets the image to use as part of the widget label.

- **void image (FL_Image *img)**
  
    Sets the image to use as part of the widget label.

- **int inside (const Fl_Widget *wgt) const**
  
    Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  
    Returns whether the current label was assigned with copy_label().

- **const char * label () const**
  
    Gets the current label text.

- **void label (const char *text)**
  
    Sets the current label text.

- **void label (Fl_Labeltype a, const char *b)**
  
    Shortcut to set the label text and type in one call.

- **FL_Color labelcolor () const**
  
    Gets the label color.

- **void labelcolor (FL_Color c)**
  
    Sets the label color.

- **FL_Font labelfont () const**
  
    Gets the font to use.

- **void labelfont (FL_Font f)**
  
    Sets the font to use.

- **FL_Fontsize labelsize () const**
  
    Gets the font size in pixels.

- **void labelsize (FL_Fontsize pix)**
  
    Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  
    Gets the label type.
• void labeltype (Fl_Labeltype a)  
  Sets the label type.
• void measure_label (int &ww, int &hh) const  
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const  
  Returns if a widget is used for output only.
• Fl_Group * parent () const  
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)  
  Internal use only - "for hacks only".
• void position (int X, int Y)  
  Repositions the window or widget.
• void redraw ()  
  Schedules the drawing of the widget.
• void redraw_label ()  
  Schedules the drawing of the label.
• Fl_Color selection_color () const  
  Gets the selection color.
• void selection_color (Fl_Color a)  
  Sets the selection color.
• void set_active ()  
  Marks the widget as active without sending events or changing focus.
• void set_changed ()  
  Marks the value of the widget as changed.
• void set_output ()  
  Sets a widget to output only.
• void set_visible ()  
  Makes the widget visible.
• void set_visible_focus ()  
  Enables keyboard focus navigation with this widget.
• virtual void show ()  
  Makes a widget visible.
• void size (int W, int H)  
  Changes the size of the widget.
• int take_focus ()  
  Gives the widget the keyboard focus.
• unsigned int takesevents () const  
  Returns if the widget is able to take events.
• int testShortcut ()  
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const  
  Gets the current tooltip text.
• void tooltip (const char *text)  
  Sets the current tooltip text.
• Fl_Window * top_window () const  
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const  
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const  
  Gets the widget type.
• void type (uchar t)
Sets the widget type.

- **int** `use_accents_menu()`  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void** `* user_data () const`
  Gets the user data for this widget.

- **void** `* user_data (void *v)`
  Sets the user data for this widget.

- **unsigned int** `visible () const`
  Returns whether a widget is visible.

- **unsigned int** `visible_focus ()`
  Checks whether this widget has a visible focus.

- **void** `visible_focus (int v)`
  Modifies keyboard focus navigation.

- **int** `visible_r () const`
  Returns whether a widget and all its parents are visible.

- **int** `w () const`
  Gets the widget width.

- **Fl_When** `* when () const`
  Returns the conditions under which the callback is called.

- **void** `when (uchar i)`
  Sets the flags used to decide when a callback is called.

- **Fl_Window** `* window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int** `x () const`
  Gets the widget position in its window.

- **int** `y () const`
  Gets the widget position in its window.

- **virtual** `~Fl_Widget ()`
  Destroys the widget.

### Public Attributes

- **Fl_Scrollbar** `hscrollbar`
- **Fl_Scrollbar** `scrollbar`

### Protected Member Functions

- **void** `bbox (int &, int &, int &, int &)`
  Returns the bounding box for the interior of the scrolling area, inside the scrollbars.

- **void** `draw ()`
  Draws the widget.

- **void** `recalc_scrollbars (ScrollInfo &si)`
  Calculate visibility/size/position of scrollbars, find children's bounding box.

### Protected Member Functions inherited from **Fl_Group**

- **void** `draw_child (Fl_Widget &widget) const`
  Forces a child to redraw.

- **void** `draw_children ()`
  Draws all children of the group.

- **void** `draw_outside_label (const Fl_Widget &widget) const`
  Parents normally call this to draw outside labels of child widgets.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget
• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget’s position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus ()
  draws a focus rectangle around the widget
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget’s label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group
• static Fl_Group ∗ current ()
  Returns the currently active group.
• static void current (Fl_Group ∗g)
  Sets the current group.
Static Public Member Functions inherited from \texttt{Fl_Widget}

\begin{itemize}
\item static void \texttt{default\_callback (Fl\_Widget} *\texttt{cb}, void *\texttt{d})
\emph{The default callback for all widgets that don't set a callback.}
\item static unsigned int \texttt{label\_shortcut (const char} *\texttt{t})
\emph{Returns the Unicode value of the 'x' shortcut in a given text.}
\item static int \texttt{test\_shortcut (const char} *\texttt{t}, const bool require\_alt=false)
\emph{Returns true if the given text} \texttt{t} \emph{contains the entered 'x' shortcut.}
\end{itemize}

\end{itemize}

9.118.1 Detailed Description

This container widget lets you maneuver around a set of widgets much larger than your window. If the child widgets are larger than the size of this object then scrollbars will appear so that you can scroll over to them:

![Figure 9.29 Fl_Scroll](image)

If all of the child widgets are packed together into a solid rectangle then you want to set box() to FL\_NO\_BOX or one of the _FRAME types. This will result in the best output. However, if the child widgets are a sparse arrangement you must set box() to a real _BOX type. This can result in some blinking during redrawing, but that can be solved by using a \texttt{Fl\_Double\_Window}.

By default you can scroll in both directions, and the scrollbars disappear if the data will fit in the area of the scroll. Use \texttt{Fl\_Scroll::type()} to change this as follows:

\begin{itemize}
\item 0 - No scrollbars
\item \texttt{Fl\_Scroll::HORIZONTAL - Only a horizontal scrollbar.}
\item \texttt{Fl\_Scroll::VERTICAL - Only a vertical scrollbar.}
\item \texttt{Fl\_Scroll::BOTH - The default is both scrollbars.}
\item \texttt{Fl\_Scroll::HORIZONTAL\_ALWAYS - Horizontal scrollbar always on, vertical always off.}
\item \texttt{Fl\_Scroll::VERTICAL\_ALWAYS - Vertical scrollbar always on, horizontal always off.}
\item \texttt{Fl\_Scroll::BOTH\_ALWAYS - Both always on.}
\end{itemize}
Use `scrollbar.align(int)` (see void Fl_Widget::align(Fl_Align)) to change what side the scrollbars are drawn on.

If the FL_ALIGN_LEFT bit is on, the vertical scrollbar is on the left. If the FL_ALIGN_TOP bit is on, the horizontal scrollbar is on the top. Note that only the alignment flags in scrollbars are considered. The flags in hscrollbar however are ignored.

This widget can also be used to pan around a single child widget "canvas". This child widget should be of your own class, with a `draw()` method that draws the contents. The scrolling is done by changing the x() and y() of the widget, so this child must use the x() and y() to position its drawing. To speed up drawing it should test `fl_not_clipped(int x, int y, int w, int h)` to find out if a particular area of the widget must be drawn.

Another very useful child is a single Fl_Pack, which is itself a group that packs its children together and changes size to surround them. Filling the Fl_Pack with Fl_Tabs groups (and then putting normal widgets inside those) gives you a very powerful scrolling list of individually-openable panels.

Fluid lets you create these, but you can only lay out objects that fit inside the Fl_Scroll without scrolling. Be sure to leave space for the scrollbars, as Fluid won't show these either.

You cannot use Fl_Window as a child of this since the clipping is not conveyed to it when drawn, and it will draw over the scrollbars and neighboring objects.

### 9.118.2 Constructor & Destructor Documentation

#### 9.118.2.1 Fl_Scroll()

Fl_Scroll::Fl_Scroll (int X, int Y, int W, int H, const char ∗L = 0)

Creates a new Fl_Scroll widget using the given position, size, and label string.
The default boxtype is FL_NO_BOX.
The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the Fl_Scroll and all of its children can be automatic (local) variables, but you must declare the Fl_Scroll first, so that it is destroyed last.

### 9.118.3 Member Function Documentation

#### 9.118.3.1 bbox()

void Fl_Scroll::bbox (int & X, int & Y, int & W, int & H) [protected]

Returns the bounding box for the interior of the scrolling area, inside the scrollbars.
Currently this is only reliable after `draw()`, and before any resizing of the Fl_Scroll or any child widgets occur.

**Todo** The visibility of the scrollbars ought to be checked/calculated outside of the `draw()` method (STR #1895).

#### 9.118.3.2 draw()

void Fl_Scroll::draw () [protected], [virtual]

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget ∗s = ∗scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from Fl_Group.
9.118.3.3 handle()

int Fl_Scroll::handle (  
  int event ) [virtual]

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

| in  | event | the kind of event received |

Return values

| 0   | if the event was not used or understood |
| 1   | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Group.

9.118.3.4 recalc_scrollbars()

void Fl_Scroll::recalc_scrollbars (  
  ScrollInfo & si ) [protected]

Calculate visibility/size/position of scrollbars, find children's bounding box.

The si parameter will be filled with data from the calculations. Derived classes can make use of this call to figure out the scrolling area eg. during resize() handling.

Parameters

| in,out | si | – ScrollInfo structure |

9.118.3.5 resize()

void Fl_Scroll::resize (  
  int X,  
  int Y,  
  int W,  
  int H ) [virtual]

Resizes the Fl_Scroll widget and moves its children if necessary.

The Fl_Scroll widget first resizes itself, and then it moves all its children if (and only if) the Fl_Scroll widget has been moved. The children are moved by the same amount as the Fl_Scroll widget has been moved, hence all children keep their relative positions.

Note

Fl_Scroll::resize() does not call Fl_Group::resize(), and child widgets are not resized.

Since children of an Fl_Scroll are not resized, the resizable() widget is ignored (if it is set).

The scrollbars are moved to their proper positions, as given by Fl_Scroll::scrollbar.align(), and switched on or off as necessary.
Note

Due to current (FLTK 1.3.x) implementation constraints some of this may effectively be postponed until the Fl_Scroll is drawn the next time. This may change in a future release.

See also

Fl_Group::resizable()
Fl_Widget::resize(int,int,int,int)

Reimplemented from Fl_Group.

9.118.3.6 scroll_to()

void Fl_Scroll::scroll_to ( int X, int Y )

Moves the contents of the scroll group to a new position.
This is like moving the scrollbars of the Fl_Scroll around. For instance:

```c
Fl_Scroll scroll (10,10,200,200);
Fl_Box b1 ( 10, 10,50,50,"b1"); // relative (x,y) = (0,0)
Fl_Box b2 ( 60, 60,50,50,"b2"); // relative (x,y) = (50,50)
Fl_Box b3 ( 60,110,50,50,"b3"); // relative (x,y) = (50,100)
// populate scroll with more children ...
scroll.end();
scroll.scroll_to(50,100);
```

will move the logical origin of the internal scroll area to (-50,-100) relative to the origin of the Fl_Scroll (10,10), i.e. Fl_Box b3 will be visible in the top left corner of the scroll area.

9.118.3.7 scrollbar_size() [1/2]

int Fl_Scroll::scrollbar_size ( ) const [inline]

Gets the current size of the scrollbars' troughs, in pixels.
If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also

Fl::scrollbar_size(int)

9.118.3.8 scrollbar_size() [2/2]

void Fl_Scroll::scrollbar_size ( int newSize ) [inline]

Sets the pixel size of the scrollbars' troughs to newSize, in pixels.
Normally you should not need this method, and should use Fl::scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.
Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.
Setting newSize to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the default.

Parameters

| in      | newSize    | Sets the scrollbar size in pixels.
|---------|------------|--------------------------------------
|         |            | If 0 (default), scrollbar size tracks the global Fl::scrollbar_size() |

\subsection*{Public Member Functions}

- \texttt{\texttt{Fl\_Scrollbar} (int X, int Y, int W, int H, const char *L=0)}
  
  \textit{Creates a new \texttt{Fl\_Scrollbar} widget with given position, size, and label.}

- \texttt{int handle (int)}

  \textit{Handles the specified event.}

- \texttt{int linesize ( ) const}

  \textit{Get the size of step, in lines, that the arrow keys move.}

- \texttt{void linesize (int i)}

  \textit{This number controls how big the steps are that the arrow keys do.}

- \texttt{int value ( ) const}

  \textit{Gets the integer value (position) of the slider in the scrollbar.}

- \texttt{int value (int p)}

  \textit{Sets the value (position) of the slider in the scrollbar.}

- \texttt{int value (int pos, int windowSize, int first, int total)}

  \textit{Sets the position, size and range of the slider in the scrollbar.}

- \texttt{\texttt{\sim}Fl\_Scrollbar ( )}

  \textit{Destroys the Scrollbar.}
Public Member Functions inherited from Fl_Slider

- void bounds (double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- Fl_Slider (int X, int Y, int W, int H, const char *L=0)
  Creates a new Fl_Slider widget using the given position, size, and label string.
- Fl_Slider (uchar t, int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Slider widget using the given type, position, size, and label string.
- int handle (int)
  Handles the specified event.
- int scrollvalue (int pos, int size, int first, int total)
  Sets the size and position of the sliding knob in the box.
- Fl_Boxtype slider () const
  Gets the slider box type.
- void slider (Fl_Boxtype c)
  Sets the slider box type.
- float slider_size () const
  Get the dimensions of the moving piece of slider.
- void slider_size (double v)
  Set the dimensions of the moving piece of slider.

Public Member Functions inherited from Fl_Valuator

- void bounds (double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- double clamp (double)
  Clamps the passed value to the valuator range.
- virtual int format (char *p)
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double increment (double, int)
  Adds n times the step value to the passed value.
- double maximum () const
  Gets the maximum value for the valuator.
- void maximum (double a)
  Sets the maximum value for the valuator.
- double minimum () const
  Gets the minimum value for the valuator.
- void minimum (double a)
  Sets the minimum value for the valuator.
- void precision (int digits)
  Sets the step value to 1.0 / 10^digits.
- void range (double a, double b)
  Sets the minimum and maximum values for the valuator.
- double round (double)
  Round the passed value to the nearest step increment.
- double step () const
  Gets or sets the step value.
- void step (double a, int b)
  See double Fl_Valuator::step() const
- void step (double s)
  See double Fl_Valulator::step() const.
- **void step** (int a)
  
  See double Fl_Valuator::step() const

- **double value** () const
  
  Gets the floating point(double) value.

- **int value** (double)
  
  Sets the current value.

### Public Member Functions inherited from Fl_Widget

- **void _clear_fullscreen** ()
  
  Activates the widget.

- **void _set_fullscreen** ()

- **void activate** ()
  
  Returns whether the widget is active.

- **int active** () const
  
  Returns whether the widget and all of its parents are active.

- **FI_Align align** () const
  
  Gets the label alignment.

- **void align (FI_Align alignment)**
  
  Sets the label alignment.

- **long argument** () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument** (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class FI_Gl_Window * as_gl_window** ()
  
  Returns an FI_Gl_Window pointer if this widget is an FI_Gl_Window.

- **virtual FI_Group * as_group** ()
  
  Returns an FI_Group pointer if this widget is an FI_Gl_Window.

- **virtual FI_Window * as_window** ()
  
  Returns an FI_Window pointer if this widget is an FI_Window.

- **FI_Boxtype box** () const
  
  Gets the box type of the widget.

- **void box (FI_Boxtype new_box)**
  
  Sets the box type for the widget.

- **FI_Callback_p callback** () const
  
  Gets the current callback function for the widget.

- **void callback (FI_Callback *cb)**
  
  Sets the current callback function for the widget.

- **void callback (FI_Callback *cb, void *p)**
  
  Sets the current callback function for the widget.

- **void callback (FI_Callback0 *cb)**
  
  Sets the current callback function for the widget.

- **void callback (FI_Callback1 *cb, long p=0)**
  
  Sets the current callback function for the widget.

- **unsigned int changed** () const
  
  Checks if the widget value changed since the last callback.

- **void clear_active** ()
  
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed** ()
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label.
• const Fl_Image *deimage () const
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label.
• void do_callback ()
  Calls the widget callback.
• void do_callback (Fl_Widget *o, long arg)
  Calls the widget callback.
• void do_callback (Fl_Widget *o, void *arg=0)
  Calls the widget callback.
• void draw_label (int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label.
• const Fl_Image * image () const
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  Gets the selection color.
- `void selection_color (Fl_Color a)`
  Sets the selection color.
- `void set_active ()`
  Marks the widget as active without sending events or changing focus.
- `void set_changed ()`
  Marks the value of the widget as changed.
- `void set_output ()`
  Sets a widget to output only.
- `void set_visible ()`
  Makes the widget visible.
- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.
- `virtual void show ()`
  Makes a widget visible.
- `void size (int W, int H)`
  Changes the size of the widget.
- `int take_focus ()`
  Gives the widget the keyboard focus.
- `unsigned int takesevents () const`
  Returns if the widget is able to take events.
- `int test_shortcut ()`
  Returns true if the widget's label contains the entered ‘&x’ shortcut.
- `const char ∗ tooltip () const`
  Gets the current tooltip text.
- `void tooltip (const char ∗ text)`
  Sets the current tooltip text.
- `Fl_Window ∗ top_window () const`
  Returns a pointer to the top-level window for the widget.
- `Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type () const`
  Gets the widget type.
- `void type (uchar t)`
  Sets the widget type.
- `int use_accents_menu ()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void ∗ user_data () const`
  Gets the user data for this widget.
- `void user_data (void ∗ v)`
  Sets the user data for this widget.
- `unsigned int visible () const`
  Returns whether a widget is visible.
- `unsigned int visible_focus ()`
  Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
  Modifies keyboard focus navigation.
- `int visible_r () const`
  Returns whether a widget and all its parents are visible.
• int w () const
  
  Gets the widget width.

• Fl_When when () const
  
  Returns the conditions under which the callback is called.

• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~FL_Widget ()
  
  Destroys the widget.

Protected Member Functions

• void draw ()
  
  Draws the widget.

Protected Member Functions inherited from Fl_Slider

• void draw ()
  
  Draws the widget.

• void draw (int, int, int, int)

• int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char *L)
  
  Creates a new Fl_Valuator widget using the given position, size, and label string.

• void handle_drag (double newvalue)
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

• void handle_push ()
  
  Stores the current value in the previous value.

• void handle_release ()
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.

• int horizontal () const
  
  Tells if the valuator is an FL_HORIZONTAL one.

• double previous_value () const
  
  Gets the previous floating point value before an event changed it.

• void set_value (double v)
  
  Sets the current floating point value.

• double softclamp (double)
  
  Clamps the value, but accepts v if the previous value is not already out of range.

• virtual void value_damage ()
  
  Asks for partial redraw.
Protected Member Functions inherited from Fl_Widget

- void **clear_flag** (unsigned int c)
  Clears a flag in the flags mask.
- void **draw_backdrop** () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
  Draws the widget box according its box style.
- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** ()
  Draws a focus rectangle around the widget
- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
  Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int **flags** () const
  Gets the widget flags mask.
- void **h** (int v)
  Internal use only.
- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.
- void **w** (int v)
  Internal use only.
- void **x** (int v)
  Internal use only.
- void **y** (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void **default_callback** (Fl_Widget *cb, void *d)
  The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,

}
flags possible values enumeration.

9.119.1 Detailed Description

The Fl_Scrollbar widget displays a slider with arrow buttons at the ends of the scrollbar. Clicking on the arrows move up/left and down/right by linesize(). Scrollbars also accept FL_SHORTCUT events: the arrows move by linesize(), and vertical scrollbars take Page Up/Down (they move by the page size minus linesize()) and Home/End (they jump to the top or bottom). Scrollbars have step(1) preset (they always return integers). If desired you can set the step() to non-integer values. You will then have to use casts to get at the floating-point versions of value() from Fl_Slider.

![Figure 9.30 Fl_Scrollbar](image)

9.119.2 Constructor & Destructor Documentation

9.119.2.1 Fl_Scrollbar()

Fl_Scrollbar::Fl_Scrollbar (  
  int X,
  int Y,
  int W,
  int H,
  const char ∗ L = 0 )

Creates a new Fl_Scrollbar widget with given position, size, and label. You need to do type(FL_HORIZONTAL) if you want a horizontal scrollbar.

9.119.3 Member Function Documentation

9.119.3.1 draw()

void Fl_Scrollbar::draw ( ) [protected], [virtual]

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead. Override this function to draw your own widgets. If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

---

Generated by Doxygen
FL_Widget *s = &scroll;  // scroll is an embedded Fl_Scrollbar
s->draw();            // calls Fl_Scrollbar::draw()
Implements Fl_Widget.

9.119.3.2 handle()

```cpp
int Fl_Scrollbar::handle ( int event ) [virtual]
```

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>the kind of event received</td>
</tr>
</tbody>
</table>

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the event was not used or understood</td>
</tr>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

See also

Fl_Event

Reimplemented from Fl_Widget.

9.119.3.3 linesize()

```cpp
void Fl_Scrollbar::linesize ( int i ) [inline]
```

This number controls how big the steps are that the arrow keys do.
In addition page up/down move by the size last sent to value() minus one linesize(). The default is 16.

9.119.3.4 value() [1/3]

```cpp
int Fl_Scrollbar::value ( ) const [inline]
```

Gets the integer value (position) of the slider in the scrollbar.
You can get the floating point value with Fl_Slider::value().

See also

Fl_Scrollbar::value(int p)
Fl_Scrollbar::value(int pos, int size, int first, int total)

9.119.3.5 value() [2/3]

```cpp
int Fl_Scrollbar::value ( int p ) [inline]
```

Sets the value (position) of the slider in the scrollbar.

See also

Fl_Scrollbar::value()
Fl_Scrollbar::value(int pos, int size, int first, int total)
9.119.3.6  value()  [3/3]

int Fl_Scrollbar::value (  
   int pos,
   int windowSize,
   int first,
   int total ) [inline]

Sets the position, size and range of the slider in the scrollbar.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>position, first line displayed</td>
</tr>
<tr>
<td>windowSize</td>
<td>number of lines displayed</td>
</tr>
<tr>
<td>first</td>
<td>number of first line</td>
</tr>
<tr>
<td>total</td>
<td>total number of lines</td>
</tr>
</tbody>
</table>

You should call this every time your window changes size, your data changes size, or your scroll position changes (even if in response to a callback from this scrollbar). All necessary calls to `redraw()` are done. Calls `Fl_Slider::scrollvalue(int pos, int size, int first, int total)`.

The documentation for this class was generated from the following files:

- FL_Scrollbar.H
- FL_Scrollbar.cxx

9.120  FL_Scroll::FL_Scrollbar_Data Struct Reference

A local struct to manage a scrollbar's xywh region and tab values.

```cpp
#include <Fl_Scroll.H>
```

Public Attributes

- int first
  scrollbar tab's "number of first line"
- int h
- int pos
  scrollbar tab's "position of first line displayed"
- int size
  scrollbar tab's "size of window in lines"
- int total
  scrollbar tab's "total number of lines"
- int w
- int x
- int y

9.120.1  Detailed Description

A local struct to manage a scrollbar's xywh region and tab values.

The documentation for this struct was generated from the following file:

- FL_Scroll.H

9.121  FL_Secret_Input Class Reference

The `FL_Secret_Input` class is a subclass of `FL_Input` that displays its input as a string of placeholders.

```cpp
#include <FL_Secret_Input.H>
```

Inheritance diagram for `FL_Secret_Input`:
Public Member Functions

- **Fl_Secret_Input** (int X, int Y, int W, int H, const char ∗l=0)
  
  Creates a new Fl_Secret_Input widget using the given position, size, and label string.

- int **handle** (int)
  
  Handles the specified event.

Public Member Functions inherited from Fl_Input

- **Fl_Input** (int, int, int, int, const char ∗=0)
  
  Creates a new Fl_Input widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Input_

- int **copy** (int clipboard)
  
  Put the current selection into the clipboard.

- int **copy_cuts** ()
  
  Copies the yank buffer to the clipboard.

- Fl_Color **cursor_color** () const
  
  Gets the color of the cursor.

- void **cursor_color** (Fl_Color n)
  
  Sets the color of the cursor.

- int **cut** ()
  
  Deletes the current selection.

- int **cut** (int a, int b)
  
  Deletes all characters between index a and b.

- int **cut** (int n)
  
  Deletes the next n bytes rounded to characters before or after the cursor.

- **Fl_Input_** (int, int, int, int, const char ∗=0)
  
  Creates a new Fl_Input_ widget.

- Fl_Char **index** (int i) const
  
  Returns the character at index i.

- int **input_type** () const
  
  Gets the input field type.

- void **input_type** (int t)
  
  Sets the input field type.

- int **insert** (const char ∗t, int l=0)
  
  Inserts text at the cursor position.

- int **mark** () const
  
  Gets the current selection mark.

- int **mark** (int m)
  
  Sets the current selection mark.
• int maximum_size () const
  
  Gets the maximum length of the input field in characters.

• void maximum_size (int m)
  
  Sets the maximum length of the input field in characters.

• int position () const
  
  Gets the position of the text cursor.

• int position (int p)
  
  Sets the cursor position and mark.

• int position (int p, int m)
  
  Sets the index for the cursor and mark.

• int readonly () const
  
  Gets the read-only state of the input field.

• void readonly (int b)
  
  Sets the read-only state of the input field.

• int replace (int b, int e, const char ∗text, int ilen=0)
  
  Deletes text from b to e and inserts the new string text.

• void resize (int, int, int, int)
  
  Changes the size of the widget.

• int shortcut () const
  
  Return the shortcut key associated with this widget.

• void shortcut (int s)
  
  Sets the shortcut key associated with this widget.

• int size () const
  
  Returns the number of bytes in value().

• void size (int W, int H)
  
  Sets the width and height of this widget.

• int static_value (const char ∗)
  
  Changes the widget text.

• int static_value (const char ∗, int)
  
  Changes the widget text.

• int tab_nav () const
  
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

• void tab_nav (int val)
  
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

• Fl_Color textcolor () const
  
  Gets the color of the text in the input field.

• void textcolor (Fl_Color n)
  
  Sets the color of the text in the input field.

• Fl_Font textfont () const
  
  Gets the font of the text in the input field.

• void textfont (Fl_Font s)
  
  Sets the font of the text in the input field.

• Fl_Fontsize textszie () const
  
  Gets the size of the text in the input field.

• void textszie (Fl_Fontsize s)
  
  Sets the size of the text in the input field.

• int undo ()

  Undoes previous changes to the text buffer.

• const char ∗ value () const

  Returns the text displayed in the widget.
Changes the widget text.

- `int value (const char *, int)`
  Changes the widget text.

- `int wrap () const`
  Gets the word wrapping state of the input field.

- `void wrap (int b)`
  Sets the word wrapping state of the input field.

- `~Fl_Input_ ()`
  Destroys the widget.

### Public Member Functions inherited from `Fl_Widget`

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
  Activates the widget.

- `unsigned int active () const`
  Returns whether the widget is active.

- `int active_r () const`
  Returns whether the widget and all of its parents are active.

- `Fl_Align align () const`
  Gets the label alignment.

- `void align (Fl_Align alignment)`
  Sets the label alignment.

- `long argument () const`
  Gets the current user data (long) argument that is passed to the callback function.

- `void argument (long v)`
  Sets the current user data (long) argument that is passed to the callback function.

- `virtual class Fl_Gl_Window * as_gl_window ()`
  Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.

- `virtual Fl_Group * as_group ()`
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

- `virtual Fl_Window * as_window ()`
  Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.

- `Fl_Boxtype box () const`
  Gets the box type of the widget.

- `void box (Fl_Boxtype new_box)`
  Sets the box type for the widget.

- `Fl_Callback_p callback () const`
  Gets the current callback function for the widget.

- `void callback (Fl_Callback * cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback * cb, void * p)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback0 * cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback1 * cb, long p=0)`
  Sets the current callback function for the widget.

- `unsigned int changed () const`
  Checks if the widget value changed since the last callback.

- `void clear_active ()`
Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output ()**
  Sets a widget to accept input.

- **void clear_visible ()**
  Hides the widget.

- **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const Fl_Widget ∗w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char ∗new_label)**
  Sets the current label.

- **void copy_tooltip (const char ∗text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image ∗deimage ()**
  Gets the image that is used as part of the widget label.

- **const Fl_Image ∗deimage () const**
  Sets the image to use as part of the widget label.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label.

- **void deimage (Fl_Image =img)**
  Sets the image to use as part of the widget label.

- **void do_callback ()**
  Calls the widget callback.

- **void do_callback (Fl_Widget ∗o, long arg)**
  Calls the widget callback.

- **void do_callback (Fl_Widget ∗o, void ∗arg=0)**
  Calls the widget callback.

- **void draw_label (int, int, int, Fl_Align) const**
Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **Fl_Image * image ()**
  Gets the image that is used as part of the widget label.

- **const Fl_Image * image () const**
  Sets the image to use as part of the widget label.

- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of `wgt`.

- **int is_label_copied () const**
  Returns whether the current label was assigned with `copy_label()`.

- **const char * label () const**
  Gets the current label text.

- **void label (const char *text)**
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  Sets the label color.

- **Fl_Font labelfont () const**
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  Sets width `ww` and height `hh` accordingly with the label size.

- **unsigned int output () const**
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Generated by Doxygen
Schedules the drawing of the label.

- **FL_Color selection_color () const**
  Gets the selection color.

- **void selection_color (FL_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **virtual void show ()**
  Makes a widget visible.

- **int size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int testShortcut ()**
  Returns true if the widget's label contains the entered `&x` shortcut.

- **const char * tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **FL_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

- **FL_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.

- **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void * user_data () const**
  Gets the user data for this widget.

- **void user_data (void *v)**
  Sets the user data for this widget.

- **unsigned int visible () const**
  Returns whether a widget is visible.

- **unsigned int visible_focus ()**
  Checks whether this widget has a visible focus.

- **void visible_focus (int v)**
  Modifies keyboard focus navigation.

- **int visible_r () const**
  Returns whether a widget and all its parents are visible.
• **int w () const**
  
  *Gets the widget width.*

• **Fl_When when () const**

  *Returns the conditions under which the callback is called.*

• **void when (uchar i)**

  *Sets the flags used to decide when a callback is called.*

• **Fl_Window * window () const**

  *Returns a pointer to the nearest parent window up the widget hierarchy.*

• **int x () const**

  *Gets the widget position in its window.*

• **int y () const**

  *Gets the widget position in its window.*

• **virtual ~Fl_Widget ()**

  *Destroys the widget.*

### Additional Inherited Members

#### Static Public Member Functions inherited from Fl_Widget

• **static void default_callback (Fl_Widget *cb, void *d)**

  *The default callback for all widgets that don’t set a callback.*

• **static unsigned int label_shortcut (const char *t)**

  *Returns the Unicode value of the ‘&x’ shortcut in a given text.*

• **static int test_shortcut (const char *, const bool require_alt=false)**

  *Returns true if the given text t contains the entered ‘&x’ shortcut.*

#### Protected Types inherited from Fl_Widget

• **enum {**

  *INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,\
  *FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,\
  *OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,\
  *MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,\
  *GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,\
  *USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }**

  *flags possible values enumeration.*

#### Protected Member Functions inherited from Fl_Input

• **void draw ()**

  *Draws the widget.*

#### Protected Member Functions inherited from Fl_Input_

• **void drawtext (int, int, int, int)**

  *Draws the text in the passed bounding box.*

• **void handle_mouse (int, int, int, int keepmark=0)**

  *Handles mouse clicks and mouse moves.*

• **int handletextarea (int e, int, int, int)**

  *Handles all kinds of text field related events.*
• int line_end (int i) const
  Finds the end of a line.
• int line_start (int i) const
  Finds the start of a line.
• int linesPerPage ()
• void maybe_do_callback ()
  Moves the cursor to the column given by up_down_pos.
• int word_end (int i) const
  Finds the end of a word.
• int word_start (int i) const
  Finds the start of a word.
• int xscroll () const
• int yscroll () const
  Draws the widget box around the widget.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void xscroll (int yOffset)
• void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget
• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void drawBackdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void drawBackDrop () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus ()
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.
9.121.1 Detailed Description

The Fl_Secret_Input class is a subclass of Fl_Input that displays its input as a string of placeholders. Depending on the platform this placeholder is either the asterisk (‘∗’) or the Unicode bullet character (U+2022). This subclass is usually used to receive passwords and other "secret" information.

9.121.2 Constructor & Destructor Documentation

9.121.2.1 Fl_Secret_Input()

Fl_Secret_Input::Fl_Secret_Input (  
   int X,  
   int Y,  
   int W,  
   int H,  
   const char ∗l = 0 )

Creates a new Fl_Secret_Input widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX. Inherited destructor destroys the widget and any value associated with it.

9.121.3 Member Function Documentation

9.121.3.1 handle()

int Fl_Secret_Input::handle (  
   int event ) [virtual]

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

| in     | event | the kind of event received |

Return values

| 0      | if the event was not used or understood |
| 1      | if the event was used and can be deleted |

Fl_Event

Reimplemented from Fl_Input.

The documentation for this class was generated from the following files:

- Fl_Secret_Input.H
- Fl_Input.cxx

9.122 Fl_Select_Browser Class Reference

The class is a subclass of Fl_Browser which lets the user select a single item, or no items by clicking on the empty space.

#include <Fl_Select_Browser.H>

Inheritance diagram for Fl_Select_Browser:
Public Member Functions

- **Fl_Select_Browser** (int X, int Y, int W, int H, const char ∗L=0)

  Creates a new Fl_Select_Browser widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Browser

- void **add** (const char ∗newtext, void ∗d=0)

  Adds a new line to the end of the browser.
- void **bottomline** (int line)

  Scrolls the browser so the bottom item in the browser is showing the specified line.
- void **clear** ()

  Removes all the lines in the browser.
- char **column_char** () const

  Gets the current column separator character.
- void **column_char** (char c)

  Sets the column separator to c.
- const int ∗**column_widths** () const

  Gets the current column width array.
- void **column_widths** (const int ∗arr)

  Sets the current array to arr.
- void ∗**data** (int line) const

  Returns the user data() for specified line.
- void **data** (int line, void ∗d)

  Sets the user data for specified line to d.
- void **display** (int line, int val=1)

  For back compatibility.
- int **displayed** (int line) const

  Returns non-zero if line has been scrolled to a position where it is being displayed.
- **Fl_Browser** (int X, int Y, int W, int H, const char ∗L=0)

  The constructor makes an empty browser.
- char **format_char** () const

  Gets the current format code prefix character, which by default is '@'.
- void **format_char** (char c)

  Sets the current format code prefix character to c.
- void **hide** ()

  Hides the entire Fl_Browser widget – opposite of show().
- void **hide** (int line)

  Makes line invisible, preventing selection by the user.
• **Fl_Image * icon**(int line) const
  Returns the icon currently defined for line.

• **void icon**(int line, **Fl_Image *icon)**
  Set the image icon for line to the value icon.

• **void insert**(int line, const char *newtext, void *d=0)
  Insert a new entry whose label is newtext above given line, optional data d.

• **void lineposition**(int line, **Fl_Line_Position** pos)
  Updates the browser so that line is shown at position pos.

• **int load**(const char *filename)
  Clears the browser and reads the file, adding each line from the file to the browser.

• **void make_visible**(int line)
  Make the item at the specified line visible().

• **void middleline**(int line)
  Scrolls the browser so the middle item in the browser is showing the specified line.

• **void move**(int to, int from)
  Line from is removed and reinserted at to.

• **void remove**(int line)
  Remove entry for given line number, making the browser one line shorter.

• **void remove_icon**(int line)
  Removes the icon for line.

• **void replace**(int a, const char *b)
  For back compatibility only.

• **int select**(int line, int val=1)
  Sets the selection state of the item at line to the value val.

• **int selected**(int line) const
  Returns 1 if specified line is selected, 0 if not.

• **void show ()**
  Shows the entire Fl_Browser widget – opposite of hide().

• **void show**(int line)
  Makes line visible, and available for selection by user.

• **int size () const**
  Returns how many lines are in the browser.

• **void size**(int W, int H)

• **void swap**(int a, int b)
  Swaps two browser lines a and b.

• **const char * text**(int line) const
  Returns the label text for the specified line.

• **void text**(int line, const char *newtext)
  Sets the text for the specified line to newtext.

• **Fl_Fontsize textsize () const**
  Gets the default text size (in pixels) for the lines in the browser.

• **void textsize**(Fl_Fontsize newSize)
  Sets the default text size (in pixels) for the lines in the browser to newSize.

• **int topline () const**
  Returns the line that is currently visible at the top of the browser.

• **void topline**(int line)
  Scrolls the browser so the top item in the browser is showing the specified line.

• **int value () const**
  Returns the line number of the currently selected line, or 0 if none selected.

• **void value**(int line)
  Sets the browser's value(), which selects the specified line.
• int visible (int line) const  
  Returns non-zero if the specified line is visible, 0 if hidden.

• ~Fl_Browser ()  
  The destructor deletes all list items and destroys the browser.

Public Member Functions inherited from Fl_Browser

• int deselect (int docallbacks=0)  
  Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

• void display (void *item)  
  Displays the item, scrolling the list as necessary.

• int handle (int event)  
  Handles the event within the normal widget bounding box.

• uchar has_scrollbar () const  
  Returns the current scrollbar mode, see Fl_Browser::has_scrollbar(uchar)

• void has_scrollbar (uchar mode)  
  Sets whether the widget should have scrollbars or not (default Fl_Browser::BOTH).

• int hposition () const  
  Gets the horizontal scroll position of the list as a pixel position pos.

• void hposition (int)  
  Sets the horizontal scroll position of the list to pixel position pos.

• int position () const  
  Gets the vertical scroll position of the list as a pixel position pos.

• void position (int pos)  
  Sets the vertical scroll position of the list to pixel position pos.

• void resize (int X, int Y, int W, int H)  
  Repositions and/or resizes the browser.

• void scrollbar_left ()  
  Moves the vertical scrollbar to the lefthand side of the list.

• void scrollbar_right ()  
  Moves the vertical scrollbar to the righthand side of the list.

• int scrollbar_size () const  
  Gets the current size of the scrollbars' troughs, in pixels.

• void scrollbar_size (int newSize)  
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

• int scrollbar_width () const  
  This method has been deprecated, existing for backwards compatibility only.

• void scrollbar_width (int width)  
  This method has been deprecated, existing for backwards compatibility only.

• int select (void *item, int val=1, int docallbacks=0)  
  Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.

• int select_only (void *item, int docallbacks=0)  
  Selects item and returns 1 if the state changed or 0 if it did not.

• void sort (int flags=0)  
  Sort the items in the browser based on flags.

• Fl_Color textcolor () const  
  Gets the default text color for the lines in the browser.

• void textcolor (Fl_Color col)  
  Sets the default text color for the lines in the browser to color col.

• Fl_Font textfont () const  
  Gets the default text font for the lines in the browser.
- **void** `textfont (Fl_Font font)`
  
  Sets the default text font for the lines in the browser to `font`.

- **Fl_Fontsize** `textsize ()` const
  
  Gets the default text size (in pixels) for the lines in the browser.

- **void** `textsize (Fl_Fontsize newSize)`
  
  Sets the default text size (in pixels) for the lines in the browser to `size`.

### Public Member Functions inherited from Fl_Group

- **Fl_Widget** `&_ddfdesign_kludge ()`
  
  This is for forms compatibility only.

- **void** `add (Fl_Widget &)`
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void** `add (Fl_Widget &o)`
  
  See void Fl_Group::add(Fl_Widget &w)

- **void** `add_resizable (Fl_Widget &o)`
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget** `*array () const`
  
  Returns a pointer to the array of children.

- **virtual** `Fl_Group * as_group ()`
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void** `begin ()`
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget** `*child (int n) const`
  
  Returns array()[n].

- **int** `children () const`
  
  Returns how many child widgets the group has.

- **void** `clear ()`
  
  Deletes all child widgets from memory recursively.

- **unsigned int** `clip_children ()`
  
  Returns the current clipping mode.

- **void** `clip_children (int c)`
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **void** `end ()`
  
  Exactly the same as current(this->parent()).

- **int** `find (const Fl_Widget &o) const`
  
  See int Fl_Group::find(const Fl_Widget &w) const.

- **int** `find (const Fl_Widget *) const`
  
  Searches the child array for the widget and returns the index.

- **Fl_Group** `*(int, int, int, int, const char *) =0)`
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void** `focus (Fl_Widget &W)`

- **void** `forms_end ()`
  
  This is for forms compatibility only.

- **int** `handle (int)`
  
  Handles the specified event.

- **void** `init_sizes ()`
  
  Resets the internal array of widget sizes and positions.

- **void** `insert (Fl_Widget &o, Fl_Widget *before)`
  
  The widget is removed from its current group (if any) and then inserted into this group.
This does insert(w, find(before)).

- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
  Removes the widget at index from the group but does not delete it.

- Fl_Widget * resizable () const
  See void Fl_Group::resizable(Fl_Widget *box)
- void resizable (Fl_Widget &o)
  See void Fl_Group::resizable(Fl_Widget *box)
- void resizable (Fl_Widget *o)
  The resizable widget defines the resizing box for the group.
- void resize (int, int, int, int)
  Resizes the Fl_Group widget and all of its children.
- virtual ~Fl_Group ()
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function for the widget.
- void callback (Fl_Callback0 *cb)
Sets the current callback function for the widget.

- void callback (Fl_Callback ∗ cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget ∗ w) const
  Checks if w is a child of this widget.

- void copy_label (const char ∗ new_label)
  Sets the current label.

- void copy_tooltip (const char ∗ text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label.

- const Fl_Image ∗ deimage () const

- void deimage (Fl_Image & img)
  Sets the image to use as part of the widget label.

- void deimage (Fl_Image img)
  Sets the image to use as part of the widget label.

- void do_callback ()
Calls the widget callback.

- void **do_callback** (Fl_Widget ∗o, long arg)
  
  Calls the widget callback.

- void **do_callback** (Fl_Widget ∗o, void ∗arg=0)
  
  Calls the widget callback.

- void **draw_label** (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int **h** () const
  
  Gets the widget height.

- Fl_Imagex **image** ()
  
  Gets the image that is used as part of the widget label.

- const Fl_Imagex **image** () const
  
  void **image** (Fl_Imagex &img)
  
  Sets the image to use as part of the widget label.

- void **image** (Fl_Imagex ∗img)
  
  Sets the image to use as part of the widget label.

- int **inside** (const Fl_Widget ∗wgt) const
  
  Checks if this widget is a child of wgt.

- int **is_label_copied** () const
  
  Returns whether the current label was assigned with copy_label().

- const char ∗ **label** () const
  
  Gets the current label text.

- void **label** (const char ∗text)
  
  Sets the current label pointer.

- void **label** (Fl_Labeltype a, const char ∗b)
  
  Shortcut to set the label text and type in one call.

- Fl_Color **labelcolor** () const
  
  Gets the label color.

- void **labelcolor** (Fl_Color c)
  
  Sets the label color.

- Fl_Font **labelfont** () const
  
  Gets the font to use.

- void **labelfont** (Fl_Font f)
  
  Sets the font to use.

- Fl_Fontsize **labelsze** () const
  
  Gets the font size in pixels.

- void **labelsze** (Fl_Fontsize pix)
  
  Sets the font size in pixels.

- Fl_Labeltype **labeltpe** () const
  
  Gets the label type.

- void **labeltpe** (Fl_Labeltype a)
  
  Sets the label type.

- void **measure_label** (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

- unsigned int **output** () const
  
  Returns if a widget is used for output only.

- Fl_Group ∗ **parent** () const
  
  Returns a pointer to the parent widget.

- void **parent** (Fl_Group ∗p)
  
  Internal use only - "for hacks only".

- void **position** (int X, int Y)
Repositions the window or widget.

- **void** redraw ()
  Schedules the drawing of the widget.

- **void** redraw_label ()
  Schedules the drawing of the label.

- **Fl_Color** selection_color () const
  Gets the selection color.

- **void** selection_color (Fl_Color a)
  Sets the selection color.

- **void** set_active ()
  Marks the widget as active without sending events or changing focus.

- **void** set_changed ()
  Marks the value of the widget as changed.

- **void** set_output ()
  Sets a widget to output only.

- **void** set_visible ()
  Makes the widget visible.

- **void** set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- **void** size (int W, int H)
  Changes the size of the widget.

- **int** take_focus ()
  Gives the widget the keyboard focus.

- **unsigned int** takesevents () const
  Returns if the widget is able to take events.

- **int** test_shortcut ()
  Returns true if the widget's label contains the entered ' &x ' shortcut.

- **const char ∗** tooltip () const
  Gets the current tooltip text.

- **void** tooltip (const char ∗text)
  Sets the current tooltip text.

- **Fl_Window ∗** top_window () const
  Returns a pointer to the top-level window for the widget.

- **Fl_Window ∗** top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar** type () const
  Gets the widget type.

- **void** type (uchar t)
  Sets the widget type.

- **int** use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void ∗** user_data () const
  Gets the user data for this widget.

- **void user_data (void ∗v)
  Sets the user data for this widget.

- **unsigned int** visible () const
  Returns whether a widget is visible.

- **unsigned int** visible_focus ()
  Checks whether this widget has a visible focus.

- **void** visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Public Types inherited from Fl_Browser

• enum Fl_Line_Position { TOP, BOTTOM, MIDDLE }
  For internal use only?

Public Types inherited from Fl_Browser_

• enum {
  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7
}
  Values for has_scrollbar().

Static Public Member Functions inherited from Fl_Group

• static Fl_Group * current ()
  Returns the currently active group.
• static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *cb, void *d)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Public Attributes inherited from Fl_Browser_

• FL_Scrollbar hscrollbar
  Horizontal scrollbar.
• FL_Scrollbar scrollbar
  Vertical scrollbar.
Protected Types inherited from Fl_Widget

enum {
    INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
    FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
    OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
    MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
    GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
    = 1<<19 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }

flags possible values enumeration.

Protected Member Functions inherited from Fl_Browser

• FL_BLINE * _remove (int line) 
  Removes the item at the specified line.
• FL_BLINE * find_line (int line) const 
  Returns the item for specified line.
• int full_height () const 
  The height of the entire list of all visible() items in pixels.
• int incr_height () const 
  The default 'average' item height (including inter-item spacing) in pixels.
• void insert (int line, FL_BLINE * item) 
  Insert specified item above line.
• void * item_at (int line) const 
  Return the item at specified line.
• void item_draw (void * item, int X, int Y , int W, int H) const 
  Draws item at the position specified by XYWH.
• void * item_first () const 
  Returns the very first item in the list.
• int item_height (void * item) const 
  Returns height of item in pixels.
• void * item_last () const 
  Returns the very last item in the list.
• void * item_next (void * item) const 
  Returns the next item after item.
• void * item_prev (void * item) const 
  Returns the previous item before item.
• void item_select (void * item, int val) 
  Change the selection state of item to the value val.
• int item_selected (void * item) const 
  See if item is selected.
• void item_swap (void *a, void *b) 
  Swap the items a and b.
• const char * item_text (void *item) const 
  Returns the label text for item.
• int item_width (void *item) const 
  Returns width of item in pixels.
• int lineno (void *item) const 
  Returns line number corresponding to item, or zero if not found.
• void swap (FL_BLINE *a, FL_BLINE *b) 
  Swap the two items a and b.
Protected Member Functions inherited from Fl_Browser_

• void **bbox** (int &X, int &Y, int &W, int &H) const
  
  Returns the bounding box for the interior of the list's display window, inside the scrollbars.

• void **deleting** (void *item)
  
  This method should be used when item is being deleted from the list.

• int **displayed** (void *item) const
  
  Returns non-zero if item has been scrolled to a position where it is being displayed.

• void **draw** ()
  
  Draws the list within the normal widget bounding box.

• void **find_item** (int ypos)
  
  This method returns the item under mouse y position ypos.

• Fl_Browser_ (int X, int Y, int W, int H, const char *L=0)
  
  The constructor makes an empty browser.

• virtual int **full_width** () const
  
  This method may be provided by the subclass to indicate the full width of the item list, in pixels.

• void **inserting** (void *a, void *b)
  
  This method should be used when an item is in the process of being inserted into the list.

• virtual int **item_quick_height** (void *item) const
  
  This method may be provided by the subclass to return the height of the item, in pixels.

• int **leftedge** () const
  
  This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

• void **new_list** ()
  
  This method should be called when the list data is completely replaced or cleared.

• void **redraw_line** (void *item)
  
  This method should be called when the contents of item has changed, but not its height.

• void **redraw_lines** ()
  
  This method will cause the entire list to be redrawn.

• void **replacing** (void *a, void *b)
  
  This method should be used when item a is being replaced by item b.

• void **selection** () const
  
  Returns the item currently selected, or NULL if there is no selection.

• void **swapping** (void *a, void *b)
  
  This method should be used when two items a and b are being swapped.

• void **top** () const
  
  Returns the item that appears at the top of the list.

Protected Member Functions inherited from Fl_Group

• void **draw** ()
  
  Draws the widget.

• void **draw_child** (Fl_Widget &widget) const
  
  Forces a child to redraw.

• void **draw_children** ()
  
  Draws all children of the group.

• void **draw Outside label** (const Fl_Widget &widget) const
  
  Parents normally call this to draw outside labels of child widgets.

• int **sizes** ()
  
  Returns the internal array of widget sizes and positions.

• void **update child** (Fl_Widget &widget) const
  
  Draws a child only if it needs it.
Protected Member Functions inherited from Fl_Widget

- void **clear_flag** (unsigned int c)
  Clears a flag in the flags mask.
- void **draw_backdrop** () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
  Draws the widget box according its box style.
- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** ()
  Draws a focus rectangle around the widget
- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
  Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗L = 0L)
  Creates a widget at the given position and size.
- unsigned int **flags** () const
  Gets the widget flags mask.
- void **h** (int v)
  Internal use only.
- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.
- void **w** (int v)
  Internal use only.
- void **x** (int v)
  Internal use only.
- void **y** (int v)
  Internal use only.

9.122.1 Detailed Description

The class is a subclass of Fl_Browser which lets the user select a single item, or no items by clicking on the empty space.
As long as the mouse button is held down on an unselected item it is highlighted. Normally the callback is done when the user presses the mouse, but you can change this with when().
See Fl_Browser for methods to add and remove lines from the browser.

9.122.2 Constructor & Destructor Documentation

9.122.2.1 Fl_Select_Browser()

Fl_Select_Browser::Fl_Select_Browser (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char ∗L = 0L )

Creates a new Fl_Select_Browser widget using the given position, size, and label string.
The default boxtype is FL_DOWN_BOX. The constructor specializes Fl_Browser() by setting the type to FL_SELECT_BROWSER. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- Fl_Select_Browser.H
- Fl_Browser.cxx

### 9.123 Fl_Shared_Image Class Reference

This class supports caching, loading, scaling, and drawing of image files.

```cpp
#include <Fl_Shared_Image.H>
```

Inheritance diagram for Fl_Shared_Image:

```
Fl_Shared_Image
    Fl_Image
```

**Public Member Functions**

- `virtual void color_average (Fl_Color c, float i)`
  
  The `color_average()` method averages the colors in the image with the FLTK color value `c`.

- `Fl_Image * copy ()`

  The `copy()` method creates a copy of the specified image.

- `virtual Fl_Image * copy (int W, int H)`

  The `copy()` method creates a copy of the specified image.

- `virtual void desaturate ()`

  The `desaturate()` method converts an image to grayscale.

- `void draw (int X, int Y)`

- `virtual void draw (int X, int Y, int W, int H, int cx, int cy)`

  Draws the image with a bounding box.

- `const char * name ()`

  Returns the filename of the shared image.

- `int original ()`

  Returns whether this is an original image.

- `int refcount ()`

  Returns the number of references of this shared image.

- `void release ()`

  Releases and possibly destroys (if refcount <= 0) a shared image.

- `void reload ()`

  Reloads the shared image from disk.

- `void scale (int width, int height, int proportional=1, int can_expand=0)`

  Sets the drawing size of the shared image.

- `virtual void uncache ()`

  If the image has been cached for display, delete the cache data.

**Public Member Functions inherited from Fl_Image**

- `Fl_Image * copy ()`

  The `copy()` method creates a copy of the specified image.

- `int count () const`

  The `count()` method returns the number of data values associated with the image.

- `int d () const`
Returns the current image depth.

• const char * const * data () const
  Returns a pointer to the current image data array.

• void draw (int X, int Y)
  Draws the image.

• int fail ()
  Returns a value that is not 0 if there is currently no image available.

• Fl_Image (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.

• int h () const
  Returns the current image height in pixels.

• void inactive ()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

• virtual void label (Fl_Menu_Item * m)
  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

• virtual void label (Fl_Widget * w)
  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

• int ld () const
  Returns the current line data size in bytes.

• int w () const
  Returns the current image width in pixels.

• virtual ~Fl_Image ()
  The destructor is a virtual method that frees all memory used by the image.

Static Public Member Functions

• static void add_handler (Fl_Shared_Handler f)
  Adds a shared image handler, which is basically a test function for adding new formats.

• static Fl_Shared_Image * find (const char * name, int W=0, int H=0)
  Finds a shared image from its name and size specifications.

• static Fl_Shared_Image * get (const char * name, int W=0, int H=0)
  Find or load an image that can be shared by multiple widgets.

• static Fl_Shared_Image * get (Fl_RGB_Image * rgb, int own_it=1)
  Builds a shared image from a pre-existing Fl_RGB_Image.

• static Fl_Shared_Image ** images ()
  Returns the Fl_Shared_Image array.

• static int num_images ()
  Returns the total number of shared images in the array.

• static void remove_handler (Fl_Shared_Handler f)
  Removes a shared image handler.

• static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image.

Static Public Member Functions inherited from Fl_Image

• static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB scaling method.

• static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
Protected Member Functions

• void add ()
   
   Adds a shared image to the image cache.

• Fl_Shared_Image ()
   
   Creates an empty shared image.

• Fl_Shared_Image (const char ∗n, Fl_Image ∗img=0)
   
   Creates a shared image from its filename and its corresponding Fl_Image ∗img.

• void update ()
• virtual ∼Fl_Shared_Image ()
   
   The destructor frees all memory and server resources that are used by the image.

Protected Member Functions inherited from Fl_Image

• void d (int D)
   
   Sets the current image depth.

• void data (const char ∗const ∗p, int c)
   
   Sets the current array pointer and count of pointers in the array.

• void draw_empty (int X, int Y)
   
   The protected method draw_empty() draws a box with an X in it.

• void h (int H)
   
   Sets the current image height in pixels.

• void ld (int LD)
   
   Sets the current line data size in bytes.

• void w (int W)
   
   Sets the current image width in pixels.

Static Protected Member Functions

• static int compare (Fl_Shared_Image ∗∗i0, Fl_Shared_Image ∗∗i1)
   
   Compares two shared images.

Static Protected Member Functions inherited from Fl_Image

• static void labeltype (const Fl_Label ∗lo, int lx, int ly, int lw, int lh, Fl_Align la)
• static void measure (const Fl_Label ∗lo, int &lw, int &lh)

Protected Attributes

• int alloc_image_
• Fl_Image ∗image_
• const char ∗name_
• int original_
• int refcount_

Static Protected Attributes

• static int alloc_handlers_ = 0
• static int alloc_images_ = 0
• static Fl_Shared_Handler ∗handlers_ = 0
• static Fl_Shared_Image ∗∗images_ = 0
• static int num_handlers_ = 0
• static int num_images_ = 0

9.123.1 Detailed Description

This class supports caching, loading, scaling, and drawing of image files. Most applications will also want to link against the fltk_images library and call the fl_register_images() function to support standard image formats such as BMP, GIF, JPEG, and PNG. Images can be requested (loaded) with Fl_Shared_Image::get(), find(), and some other methods. All images are cached in an internal list of shared images and should be released when they are no longer needed. A refcount is used to determine if a released image is to be destroyed with delete.

9.123.2 Constructor & Destructor Documentation

9.123.2.1 Fl_Shared_Image() [1/2]

Fl_Shared_Image::Fl_Shared_Image ( ) [protected]

Creates an empty shared image.
The constructors create a new shared image record in the image cache.
The constructors are protected and cannot be used directly from a program. Use the get() method instead.

9.123.2.2 Fl_Shared_Image() [2/2]

Fl_Shared_Image::Fl_Shared_Image ( const char ∗ n, Fl_Image ∗ img = 0 ) [protected]

Creates a shared image from its filename and its corresponding Fl_Image* img.
The constructors create a new shared image record in the image cache.
The constructors are protected and cannot be used directly from a program. Use the get() method instead.

9.123.2.3 ~Fl_Shared_Image()

Fl_Shared_Image::~Fl_Shared_Image ( ) [protected], [virtual]
The destructor frees all memory and server resources that are used by the image.
The destructor is protected and cannot be used directly from a program. Use the Fl_Shared_Image::release() method instead.

9.123.3 Member Function Documentation

9.123.3.1 add()

void Fl_Shared_Image::add ( ) [protected]

Adds a shared image to the image cache.
This **protected** method adds an image to the cache, an ordered list of shared images. The cache is searched for a matching image whenever one is requested, for instance with `Fl_Shared_Image::get()` or `Fl_Shared_Image::find()`.

### 9.123.3.2 color_average()

```c
void Fl_Shared_Image::color_average (Fl_Color c, float i) [virtual]
```

The `color_average()` method averages the colors in the image with the FLTK color value `c`. The `i` argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color. An internal copy is made of the original image before changes are applied, to avoid modifying the original image. Reimplemented from `Fl_Image`.

### 9.123.3.3 compare()

```c
int Fl_Shared_Image::compare (Fl_Shared_Image **i0, Fl_Shared_Image **i1) [static], [protected]
```

Compares two shared images.

The order of comparison is:

1. Image name, usually the filename used to load it
2. Image width
3. Image height

Binary search in a sorted array works only if we search for the same parameters that were also used for sorting. No special cases are possible here. `Fl_Shared_Image::find()` requires a search for an element with a matching name and the original_ flags set. This is not implemented via binary search, but by a simple run of the array inside `Fl_Shared_Image::find()`.

**Returns**

Whether the images match or their relative sort order (see text).

**Return values**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>the images match</td>
</tr>
<tr>
<td>&lt; 0</td>
<td>Image i0 is less than image i1</td>
</tr>
<tr>
<td>&gt; 0</td>
<td>Image i0 is greater than image i1</td>
</tr>
</tbody>
</table>

### 9.123.3.4 copy()

```c
Fl_Image * Fl_Shared_Image::copy (int W, int H) [virtual]
```

The `copy()` method creates a copy of the specified image. If the width and height are provided, the image is resized to the specified size. The image should be deleted (or in the case of `Fl_Shared_Image`, released) when you are done with it. Reimplemented from `Fl_Image`.

### 9.123.3.5 desaturate()

```c
void Fl_Shared_Image::desaturate () [virtual]
```

The `desaturate()` method converts an image to grayscale.
If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image before changes are applied, to avoid modifying the original image. Reimplemented from Fl_Image.

### 9.123.3.6 draw()

```c
void Fl_Shared_Image::draw (  
    int X,  
    int Y,  
    int W,  
    int H,  
    int cx,  
    int cy  
) [virtual]
```

Draws the image with a bounding box. Arguments X, Y, W, H specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the cx and cy arguments. In other words: fl_push_clip(X,Y,W,H) is applied, the image is drawn with its upper-left corner at X-cx,Y-cy and its own width and height, fl_pop_clip() is applied. Reimplemented from Fl_Image.

### 9.123.3.7 find()

```c
Fl_Shared_Image * Fl_Shared_Image::find (  
    const char * name,  
    int W = 0,  
    int H = 0  
) [static]
```

Finds a shared image from its name and size specifications. This uses a binary search in the image cache. If the image name exists with the exact width W and height H, then it is returned. If W == 0 and the image name exists with another size, then the original image with that name is returned. In either case the refcount of the returned image is increased. The found image should be released with Fl_Shared_Image::release() when no longer needed. An image is marked original if it was directly loaded from a file or from memory as opposed to copied and resized images. This comparison is used in Fl_Shared_Image::find() to find an image that matches the requested one or to find the position where a new image should be entered into the sorted list of shared images. It is used in two steps by Fl_Shared_Image::add():

1. search with exact width and height
2. if not found, search again with width = 0 (and height = 0)

The first step will only return a match if the image exists with the same width and height. The second step will match if there is an image marked original with the same name, regardless of width and height.

### 9.123.3.8 get() [1/2]

```c
Fl_Shared_Image * Fl_Shared_Image::get (  
    const char * name,  
    int W = 0,  
    int H = 0  
) [static]
```

Find or load an image that can be shared by multiple widgets. If the image exists with the requested size, this image will be returned. If the image exists, but only with another size, then a new copy with the requested size (width W and height H) will be created as a resized copy of the original image. The new image is added to the internal list of shared images. If the image does not yet exist, then a new image of the proper dimension is created from the filename name. The original image from filename name is always added to the list of shared images in its original size. If the requested size differs, then the resized copy with width W and height H is also added to the list of shared images.
Note

If the sizes differ, then two images are created as mentioned above. This is intentional so the original image is cached and preserved. If you request the same image with another size later, then the original image will be found, copied, resized, and returned.

Shared JPEG and PNG images can also be created from memory by using their named memory access constructor. You should release() the image when you're done with it.

Parameters

<table>
<thead>
<tr>
<th>name</th>
<th>name of the image</th>
</tr>
</thead>
<tbody>
<tr>
<td>W/H</td>
<td>desired size</td>
</tr>
</tbody>
</table>

See also

- Fl_Shared_Image::find(const char *name, int W, int H)
- Fl_Shared_Image::release()
- Fl_JPEG_Image::Fl_JPEG_Image(const char *name, const unsigned char *data)
- Fl_PNG_Image::Fl_PNG_Image (const char *name_png, const unsigned char *buffer, int maxsize)

9.123.3.9 get() [2/2]

Fl_Shared_Image * Fl_Shared_Image::get ( Fl_RGB_Image * rgb,
                                          int own_it = 1 ) [static]

Builds a shared image from a pre-existing Fl_RGB_Image.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>rgb</th>
<th>an Fl_RGB_Image used to build a new shared image.</th>
</tr>
</thead>
<tbody>
<tr>
<td>__it</td>
<td>own</td>
<td>1 if the shared image should delete rgb when it is itself deleted, 0 otherwise</td>
</tr>
</tbody>
</table>

Version

1.3.4

9.123.3.10 original()

int Fl_Shared_Image::original ( ) [inline]

Returns whether this is an original image. Images loaded from a file or from memory are marked original as opposed to images created as a copy of another image with different size (width or height).

Note

This is useful for debugging (rarely used in user code).

Since

FLTK 1.4.0

9.123.3.11 refcount()

int Fl_Shared_Image::refcount ( ) [inline]

Returns the number of references of this shared image. When reference is below 1, the image is deleted.
9.123.3.12 release()

void Fl_Shared_Image::release ( )
Releases and possibly destroys (if refcount <= 0) a shared image.
In the latter case, it will reorganize the shared image array so that no hole will occur.

9.123.3.13 scale()

void Fl_Shared_Image::scale ( int width,
int height,
int proportional = 1,
int can_expand = 0 )
Sets the drawing size of the shared image.
This function gives the shared image its own size, independently from the size of the original image that is typically larger. This can be useful to draw a shared image on a drawing surface whose resolution is higher than the drawing unit for this surface: all pixels of the original image become available to fill an area of the drawing surface sized at width,height. Examples of such drawing surfaces: laser printers, PostScript files, PDF printers, retina displays on Apple hardware.

Parameters

| width,height | maximum width and height (in drawing units) to use when drawing the shared image |
| proportional | if not null, keep the width and height of the shared image proportional to those of its original image |
| can_expand | if null, the width and height of the shared image will not exceed those of the original image |

Version

1.3.4 and requires compiling with FLTK_ABI_VERSION = 10304

Example code: scale an image to fit in a box

FL_Box *b = ... // a box
Fl_Shared_Image *shared = Fl_Shared_Image::get("/path/to/picture.jpeg"); // read a picture file
shared->resize(b->w(), b->h(), 1); // set the drawing size of the shared image to the size of the box
b->image(shared); // use the shared image as the box image
b->align(FL_ALIGN_INSIDE | FL_ALIGN_CENTER | FL_ALIGN_CLIP); // the image is to be drawn centered in the box

9.123.3.14 scaling_algorithm()

static void Fl_Shared_Image::scaling_algorithm ( Fl_RGB_Scaling algorithm ) [inline], [static]
Sets what algorithm is used when resizing a source image.
The default algorithm is FL_RGB_SCALING_BILINEAR. Drawing an Fl_Shared_Image is sometimes performed by first resizing the source image and then drawing the resized copy. This occurs, e.g., when drawing to screen under Linux or MSWindows after having called Fl_Shared_Image::scale(). This function controls what method is used when the image to be resized is an Fl_RGB_image.

Version

1.3.4 and requires compiling with FLTK_ABI_VERSION = 10304

9.123.3.15 uncache()

void Fl_Shared_Image::uncache ( ) [virtual]
If the image has been cached for display, delete the cache data.
This allows you to change the data used for the image and then redraw it without recreating an image object.
Reimplemented from Fl_Image.
The documentation for this class was generated from the following files:

- Fl_Shared_Image.H
- Fl_Shared_Image.cxx
9.124 Fl_Simple_Counter Class Reference

This widget creates a counter with only 2 arrow buttons.

```c
#include <Fl_Simple_Counter.H>
```

Inheritance diagram for Fl_Simple_Counter:

Public Member Functions

- **Fl_Simple_Counter** (int X, int Y, int W, int H, const char *L=0)

Public Member Functions inherited from Fl_Counter

- **Fl_Counter** (int X, int Y, int W, int H, const char *L=0)

  Creates a new Fl_Counter widget using the given position, size, and label string.

- int **handle** (int)
  
  Handles the specified event.

- void **lstep** (double a)
  
  Sets the increment for the large step buttons.

- double **step** () const
  
  Returns the increment for normal step buttons.

- void **step** (double a)
  
  Sets the increment for the normal step buttons.

- void **step** (double a, double b)
  
  Sets the increments for the normal and large step buttons.

- **Fl_Color** **textcolor** () const
  
  Gets the font color.

- void **textcolor** (Fl_Color s)
  
  Sets the font color to s.

- **Fl_Font** **textfont** () const
  
  Gets the text font.

- void **textfont** (Fl_Font s)
  
  Sets the text font to s.

- **Fl_Fontsize** **textsize** () const
  
  Gets the font size.

- void **textsize** (Fl_Fontsize s)
  
  Sets the font size to s.

- **~Fl_Counter** ()
  
  Destroys the valuator.
Public Member Functions inherited from Fl_Valuator

- void **bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- double **clamp** (double)
  
  Clamps the passed value to the valuator range.

- virtual int **format** (char ∗)

  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- double **increment** (double, int)

  Adds n times the step value to the passed value.

- double **maximum** () const

  Gets the maximum value for the valuator.

- void **maximum** (double a)

  Sets the maximum value for the valuator.

- double **minimum** () const

  Gets the minimum value for the valuator.

- void **minimum** (double a)

  Sets the minimum value for the valuator.

- void **precision** (int digits)

  Sets the step value to 1.0 / 10^{digits}.

- void **range** (double a, double b)

  Sets the minimum and maximum values for the valuator.

- double **round** (double)

  Round the passed value to the nearest step increment.

- double **step** () const

  Gets or sets the step value.

- void **step** (double a, int b)

  See double Fl_Valuator::step() const

- void **step** (double s)

  See double Fl_Valuator::step() const.

- void **step** (int a)

  See double Fl_Valuator::step() const

- double **value** () const

  Gets the floating point(double) value.

- int **value** (double)

  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void _**clear_fullscreen** ()

- void _**set_fullscreen** ()

- void **activate** ()

  Activates the widget.

- unsigned int **active** () const

  Returns whether the widget is active.

- int **active_r** () const

  Returns whether the widget and all of its parents are active.

- **FL_Align** **align** () const

  Gets the label alignment.

- void **align** (FL_Align alignment)
Sets the label alignment.

- `long argument () const`
  Gets the current user data (long) argument that is passed to the callback function.

- `void argument (long v)`
  Sets the current user data (long) argument that is passed to the callback function.

- `virtual class Fl_Gl_Window * as_gl_window ()`
  Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.

- `virtual Fl_Group * as_group ()`
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

- `virtual Fl_Window * as_window ()`
  Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.

- `Fl_Boxtype box () const`
  Gets the box type of the widget.

- `void box (Fl_Boxtype new_box)`
  Sets the box type for the widget.

- `Fl_Callback_p callback () const`
  Gets the current callback function for the widget.

- `void callback (Fl_Callback *cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback *cb, void *p)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback0 *cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback1 *cb, long p=0)`
  Sets the current callback function for the widget.

- `unsigned int changed () const`
  Checks if the widget value changed since the last callback.

- `void clear_active ()`
  Marks the widget as inactive without sending events or changing focus.

- `void clear_changed ()`
  Marks the value of the widget as unchanged.

- `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.

- `void clear_output ()`
  Sets a widget to accept input.

- `void clear_visible ()`
  Hides the widget.

- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.

- `Fl_Color color () const`
  Gets the background color of the widget.

- `void color (Fl_Color bg)`
  Sets the background color of the widget.

- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- `Fl_Color color2 () const`
  For back compatibility only.

- `void color2 (unsigned a)`
  For back compatibility only.

- `int contains (const Fl_Widget *w) const`
  Checks if `w` is a child of this widget.
- void **copy_label** (const char *new_label)
  Sets the current label.
- void **copy_tooltip** (const char *text)
  Sets the current tooltip text.
- uchar **damage** () const
  Returns non-zero if **draw()** needs to be called.
- void **damage** (uchar c)
  Sets the damage bits for the widget.
- void **damage** (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
- int **damage_resize** (int, int, int, int)
  Internal use only.
- void **deactivate** ()
  Deactivates the widget.
- Fl_Image * **deimage** ()
  Gets the image that is used as part of the widget label.
- const Fl_Image * **deimage** () const
  void **deimage** (Fl_Image &img)
  Sets the image to use as part of the widget label.
- void **deimage** (Fl_Image *img)
  Sets the image to use as part of the widget label.
- void **do_callback** ()
  Calls the widget callback.
- void **do_callback** (Fl_Widget *o, long arg)
  Calls the widget callback.
- void **do_callback** (Fl_Widget *o, void *arg=0)
  Calls the widget callback.
- void **draw_label** (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int h () const
  Gets the widget height.
- virtual void **hide** ()
  Makes a widget invisible.
- Fl_Image * **image** ()
  Gets the image that is used as part of the widget label.
- const Fl_Image * **image** () const
  void **image** (Fl_Image &img)
  Sets the image to use as part of the widget label.
- void **image** (Fl_Image *img)
  Sets the image to use as part of the widget label.
- int **inside** (const Fl_Widget *wgt) const
  Checks if this widget is a child of **wgt**.
- int **is_label_copied** () const
  Returns whether the current label was assigned with **copy_label()**.
- const char * **label** () const
  Gets the current label text.
- void **label** (const char *text)
  Sets the current label pointer.
- void **label** (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
- Fl_Color **labelcolor** () const
 Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
  unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus ()
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗cb, void ∗d)
  The default callback for all widgets that don't set a callback.

• static unsigned int labelShortcut (const char ∗t)
  Returns the Unicode value of the 'x' shortcut in a given text.

• static int testShortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered 'x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTip_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCEnts_MENu
  = 1<<19,
  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Counter

• void draw ()
  Draws the widget.

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char ∗L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.

• void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

• void handle_push ()
  Stores the current value in the previous value.

• void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.

• int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.

• double previous_value () const
  Gets the previous floating point value before an event changed it.

• void set_value (double v)
  Sets the current floating point value.

• double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.

• virtual void value_damage ()
  Asks for partial redraw.
Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus ()
  draws a focus rectangle around the widget
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

9.124.1 Detailed Description

This widget creates a counter with only 2 arrow buttons.

![Figure 9.31 Fl_Simple.Counter](image)

The documentation for this class was generated from the following files:

- Fl_Simple_Counter.H
- Fl_Counter.cxx
9.125 Fl_Single_Window Class Reference

This is the same as Fl_Window.

#include <Fl_Single_Window.H>

Inheritance diagram for Fl_Single_Window:

```
Fl_Widget
    Fl_Group
    Fl_Window
    Fl_Single_Window
    Fl_Menu_Window
```

Public Member Functions

• Fl_Single_Window (int W, int H, const char ∗l=0)
  
  Creates a new Fl_Single_Window widget using the given size, and label (title) string.

• Fl_Single_Window (int X, int Y, int W, int H, const char ∗l=0)
  
  Creates a new Fl_Single_Window widget using the given position, size, and label (title) string.

• void flush ()
  
  Forces the window to be drawn, this window is also made current and calls draw().

• int make_current ()
  
  Puts the window on the screen.

• void show ()
  
  Puts the window on the screen.

• void show (int a, char ∗∗b)

Public Member Functions inherited from Fl_Window

• virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• unsigned int border () const
  
  See void Fl_Window::border(int)

• void border (int b)
  
  Sets whether or not the window manager border is around the window.

• void clear_border ()
  
  Fast inline function to turn the window manager border off.

• void clear_modal_states ()
  
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

• void copy_label (const char ∗a)
  
  Sets the window titlebar label to a copy of a character string.

• void cursor (const Fl_RGB_Image ∗, int, int)
  
  Changes the cursor for this window.

• void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.

• void cursor (Fl_Cursor)
  
  Changes the cursor for this window.

• int decorated_h ()

Generated by Doxygen
Returns the window height including any window title bar and any frame added by the window manager.

- int decorated_w()
  Returns the window width including any frame added by the window manager.

- void default_cursor(Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  For back compatibility only.

- void default_cursor(Fl_Cursor)
  Sets the default window cursor.

- Fl_Window(int w, int h, const char∗ title=0)
  Creates a window from the given size and title.

- Fl_Window(int x, int y, int w, int h, const char∗ title=0)
  Creates a window from the given position, size and title.

- void free_position()
  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.

- void fullscreen()
  Makes the window completely fill one or more screens, without any window manager border visible.

- unsigned int fullscreen_active() const
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.

- void fullscreen_off()
  Turns off any side effects of fullscreen()

- void fullscreen_off(int X, int Y, int W, int H)
  Turns off any side effects of fullscreen() and does resize(x,y,w,h).

- void fullscreen_screens(int top, int bottom, int left, int right)
  Sets which screens should be used when this window is in fullscreen mode.

- virtual int handle(int)
  Handles the specified event.

- virtual void hide()
  Removes the window from the screen.

- void hotspot(const Fl_Widget &p, int offscreen=0)
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- void hotspot(const Fl_Widget ∗, int offscreen=0)
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- void hotspot(int x, int y, int offscreen=0)
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- const void∗ icon() const
  Gets the current icon window target dependent data.

- void icon(const Fl_RGB_Image ∗)
  Sets or resets a single window icon.

- void icon(const void ∗ic)
  Sets the current icon window target dependent data.

- void iconize()
  Iconifies the window.

- const char∗ iconlabel() const
  See void Fl_Window::iconlabel(const char∗)

- void iconlabel(const char ∗) (const)
  Sets the icon label.

- void icons(const Fl_RGB_Image ∗[], int)
  Sets the window icons.

- const char∗ label() const
• void **label**(const char *)
  Sets the window title bar label.

• void **label**(const char *label, const char *iconlabel)
  Sets the icon label.

• void **make_current**()
  Sets things up so that the drawing functions in `<FL/fl_draw.H>` will go into this window.

• unsigned int **menu_window**() const
  Returns true if this window is a menu window.

• unsigned int modal() const
  Returns true if this window is modal.

• unsigned int **non_modal**() const
  Returns true if this window is modal or non-modal.

• unsigned int **override**() const
  Returns non zero if FL_OVERRIDE flag is set, 0 otherwise.

• virtual void **resize**(int X, int Y, int W, int H)
  Changes the size and position of the window.

• void **set_menu_window**()
  Marks the window as a menu window.

• void **set_modal**()
  A "modal" window, when shown(), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

• void **set_non_modal**()
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a modal() one in that it remains on top, but it has no effect on event delivery.

• void **set_override**()
  Activates the flags NOBORDER|FL_OVERRIDE.

• void **set_tooltip_window**()
  Marks the window as a tooltip window.

• void **shape**(const Fl_Image &b)
  Set the window’s shape with an Fl_Image.

• void **shape**(const Fl_Image *img)
  Assigns a non-rectangular shape to the window.

• void **show**(int argc, char **argv)
  Puts the window on the screen and parses command-line arguments.

• int **shown**()
  Returns non-zero if show() has been called (but not hide() ).

• void **size_range**(int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
  Sets the allowable range the user can resize this window to.

• unsigned int **tooltip_window**() const
  Returns true if this window is a tooltip window.

• void **wait_for_expose**()
  Waits for the window to be displayed after calling show().

• int **x_root**() const
  Gets the x position of the window on the screen.

• const char * **xclass**() const
  Returns the xclass for this window, or a default.

• void **xclass**(const char *c)
  Sets the xclass for this window.

• int **y_root**() const
  Gets the y position of the window on the screen.

• virtual **~Fl_Window**()
  The destructor also deletes all the children.
Public Member Functions inherited from \Fl_Group

- \Fl_Widget & _ddfdesign_kludge()
  This is for forms compatibility only.
- void add (\Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
- void add (\Fl_Widget &w)
  See void Fl_Group::add(\Fl_Widget &w)
- void add_resizable (\Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
- \Fl_Widget *const & array () const
  Returns a pointer to the array of children.
- virtual \Fl_Group * as_group ()
  Returns an \Fl_Group pointer if this widget is an \Fl_Group.
- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
- \Fl_Widget * child (int n) const
  Returns array()[n].
- int children () const
  Returns how many child widgets the group has.
- void clear ()
  Deletes all child widgets from memory recursively.
- unsigned int clip_children ()
  Returns the current clipping mode.
- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- void end ()
  Exactly the same as current(this->parent()).
- int find (const \Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const \Fl_Widget *) const
  Searches the child array for the widget and returns the index.
- \Fl_Group (int, int, int, int, const char * =0)
  Creates a new \Fl_Group widget using the given position, size, and label string.
- void focus (\Fl_Widget *W)
- void forms_end ()
  This is for forms compatibility only.
- void init_sizes ()
  Resets the internal array of widget sizes and positions.
- void insert (\Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (\Fl_Widget &o, \Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (\Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (\Fl_Widget *)&
  Removes the widget o from the group.
- void remove (int index)
  Removes the widget at index from the group but does not delete it.
- \Fl_Widget * resizable () const
  See void Fl_Group::resizable(Fl_Widget *box)
• **void resizable (Fl_Widget &o)**
  
  See void Fl_Group::resizable(Fl_Widget *box)

• **void resizable (Fl_Widget *o)**
  
  The resizable widget defines the resizing box for the group.

• virtual ~Fl_Group ()
  
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

• **void _clear_fullscreen ()**

• **void _set_fullscreen ()**

• **void activate ()**
  
  Activates the widget.

• unsigned int active () const
  
  Returns whether the widget is active.

• int active_r () const
  
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  
  Gets the label alignment.

• void align (Fl_Align alignment)
  
  Sets the label alignment.

• long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• Fl_Boxtype box () const
  
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.

• void callback (Fl_Callback *cb)
  
  Sets the current callback function for the widget.

• void callback (Fl_Callback *cb, void *p)
  
  Sets the current callback function for the widget.

• void callback (Fl_Callback0 *cb)
  
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 *cb, long p=0)
  
  Sets the current callback function for the widget.

• unsigned int changed () const
  
  Checks if the widget value changed since the last callback.

• void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.

• void clear_output ()
  
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
  Sets the current label.
• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• FL_IMAGE ∗deimage ()
  Gets the image that is used as part of the widget label.
• const FL_IMAGE ∗deimage () const
• void deimage (FL_IMAGE &img)
  Sets the image to use as part of the widget label.
• void deimage (FL_IMAGE ∗img)
  Sets the image to use as part of the widget label.
• void do_callback ()
  Calls the widget callback.
• void do_callback (FL_Widget ∗o, long arg)
  Calls the widget callback.
• void do_callback (FL_Widget ∗o, void ∗arg=0)
  Calls the widget callback.
• void draw_label (int, int, int, FL_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• FL_IMAGE ∗image ()
  Gets the image that is used as part of the widget label.
• const FL_IMAGE ∗image () const
• void image (FL_IMAGE &img)
Sets the image to use as part of the widget label.

- void image (Fl_Image *img)
  Sets the image to use as part of the widget label.

- int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

- int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

- const char *label () const
  Gets the current label text.

- void label (const char *text)
  Sets the current label pointer.

- void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

- Fl_Color labelcolor () const
  Gets the label color.

- void labelcolor (Fl_Color c)
  Sets the label color.

- Fl_Font labelfont () const
  Gets the font to use.

- void labelfont (Fl_Font f)
  Sets the font to use.

- Fl_Fontsize labelsize () const
  Gets the font size in pixels.

- void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

- Fl_Labeltype labeltype () const
  Gets the label type.

- void labeltype (Fl_Labeltype a)
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group *parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.
• void set_output()
  Sets a widget to output only.
• void set_visible()
  Makes the widget visible.
• void set_visible_focus()
  Enables keyboard focus navigation with this widget.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus()
  Gives the widget the keyboard focus.
• unsigned int takesevents() const
  Returns if the widget is able to take events.
• int testShortcut()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip() const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type() const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data() const
  Gets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible() const
  Returns whether a widget is visible.
• unsigned int visible_focus() const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r() const
  Returns whether a widget and all its parents are visible.
• int w() const
  Gets the widget width.
• Fl_When when() const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x() const
  Gets the widget position in its window.
• int y() const
  Gets the widget position in its window.
• virtual ~Fl_Widget()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Window

- static Fl_Window * current ()
  Returns the last window that was made current.
- static void default_callback (Fl_Window *, void *)
  Back compatibility: Sets the default callback v for win to call on close event.
- static void default_icon (const Fl_RGB_Image *)
  Sets a single default window icon.
- static void default_icons (const Fl_RGB_Image *[], int)
  Sets the default window icons.
- static const char * default_xclass ()
  Returns the default xclass.
- static void default_xclass (const char *)
  Sets the default window xclass.

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *, void *)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3, 
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7, 
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11, 
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15, 
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19, 
  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Window

- virtual void draw ()
  Draws the widget.
- int force_position () const
  Returns the internal state of the window's FORCE_POSITION flag.
- void force_position (int force)
Sets an internal flag that tells FLTK and the window manager to honor position requests.

• void free_icons()
  Deletes all icons previously attached to the window.

Protected Member Functions inherited from Fl_Group

• void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
• void draw_children ()
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus ()
  draws a focus rectangle around the widget
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the given position and size.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.
Protected Attributes inherited from `Fl_Window`

- `shape_data_type * shape_data_`
  non-null means the window has a non-rectangular shape

Static Protected Attributes inherited from `Fl_Window`

- `static Fl_Window * current_`
  Stores the last window that was made current.

### 9.125.1 Detailed Description

This is the same as `Fl_Window`. However, it is possible that some implementations will provide double-buffered windows by default. This subclass can be used to force single-buffering. This may be useful for modifying existing programs that use incremental update, or for some types of image data, such as a movie flipbook.

### 9.125.2 Member Function Documentation

#### 9.125.2.1 flush()

```cpp
void Fl_Single_Window::flush ( ) [virtual]
```

Forces the window to be drawn, this window is also made current and calls `draw()`.
Reimplemented from `Fl_Window`.

#### 9.125.2.2 show()

```cpp
void Fl_Single_Window::show ( ) [virtual]
```

Puts the window on the screen. Usually (on X) this has the side effect of opening the display.
If the window is already shown then it is restored and raised to the top. This is really convenient because your program can call `show()` at any time, even if the window is already up. It also means that `show()` serves the purpose of `raise()` in other toolkits.

`Fl_Window::show(int argc, char **argv)` is used for top-level windows and allows standard arguments to be parsed from the command-line.

**Note**

For some obscure reasons `Fl_Window::show()` resets the current group by calling `Fl_Group::current(0)`. The comments in the code say "get rid of very common user bug: forgot end()". Although this is true it may have unwanted side effects if you `show()` an unrelated window (maybe for an error message or warning) while building a window or any other group widget.

**Todo** Check if we can remove resetting the current group in a later FLTK version (after 1.3.x). This may break "already broken" programs though if they rely on this "feature".

See also

```cpp
Fl_Window::show(int argc, char **argv)
```

Reimplemented from `Fl_Window`.
The documentation for this class was generated from the following files:

- `Fl_Single_Window.H`
- `Fl_Single_Window.cxx`

### 9.126 `Fl_Slider` Class Reference

The `Fl_Slider` widget contains a sliding knob inside a box.

```cpp
#include <Fl_Slider.H>
```
Inheritance diagram for Fl_Slider:

<table>
<thead>
<tr>
<th>Fl_Widget</th>
<th>Fl_Valuator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fl_Slider</td>
<td></td>
</tr>
</tbody>
</table>

Public Member Functions

- void **bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **Fl_Slider** (int X, int Y, int W, int H, const char *=L=0*)
  
  Creates a new Fl_Slider widget using the given position, size, and label string.

- **Fl_Slider** (uchar t, int X, int Y, int W, int H, const char *=L=*)
  
  Creates a new Fl_Slider widget using the given type, position, size, and label string.

- int **handle** (int)
  
  Handles the specified event.

- int **scrollvalue** (int pos, int size, int first, int total)
  
  Sets the size and position of the sliding knob in the box.

- **Fl_Boxtype slider** () const
  
  Gets the slider box type.

- void **slider** (Fl_Boxtype c)
  
  Sets the slider box type.

- float **slider_size** () const
  
  Gets the dimensions of the moving piece of slider.

- void **slider_size** (double v)
  
  Set the dimensions of the moving piece of slider.

Public Member Functions inherited from Fl_Valuator

- void **bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- double **clamp** (double)
  
  Clamps the passed value to the valuator range.

- virtual int **format** (char *=*)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- double **increment** (double, int)
  
  Adds n times the step value to the passed value.

- double **maximum** () const
  
  Gets the maximum value for the valuator.

- void **maximum** (double a)
  
  Sets the maximum value for the valuator.

- double **minimum** () const
  
  Gets the minimum value for the valuator.

- void **minimum** (double a)
  
  Sets the minimum value for the valuator.

- void **precision** (int digits)
  
  Sets the step value to 1.0 / 10**digits**.

- void **range** (double a, double b)
Sets the minimum and maximum values for the valuator.

- double round (double)
  Round the passed value to the nearest step increment.

- double step () const
  Gets or sets the step value.

- void step (double a, int b)
  See double Fl_Valuator::step() const

- void step (double s)
  See double Fl_Valuator::step() const.

- void step (int a)
  See double Fl_Valuator::step() const

- double value () const
  Gets the floating point(double) value.

- int value (double)
  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.

- unsigned int active () const
  Returns whether the widget is active.

- int active_r () const
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  Gets the label alignment.

- void align (Fl_Align alignment)
  Sets the label alignment.

- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- Fl_Boxtype box () const
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  Gets the current callback function for the widget.

- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label.
• const Fl_Image *deimage () const
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label.
• void do_callback ()
  Calls the widget callback.
• void do_callback (Fl_Widget ∗o, long arg)
  Calls the widget callback.
• void do_callback (Fl_Widget ∗o, void ∗arg=0)
  Calls the widget callback.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label.
• const Fl_Image ∗image () const
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group ∗parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group ∗p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (void ∗v)
Sets the user data for this widget.

- **unsigned int visible () const**
  Returns whether a widget is visible.

- **unsigned int visible_focus ()**
  Checks whether this widget has a visible focus.

- **void visible_focus (int v)**
  Modifies keyboard focus navigation.

- **int visible_r () const**
  Returns whether a widget and all its parents are visible.

- **int w () const**
  Gets the widget width.

- **Fl_When when () const**
  Returns the conditions under which the callback is called.

- **void when (uchar i)**
  Sets the flags used to decide when a callback is called.

- **Fl_Window * window () const**
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  Gets the widget position in its window.

- **int y () const**
  Gets the widget position in its window.

- **virtual ~Fl_Widget ()**
  Destroys the widget.

Protected Member Functions

- **void draw ()**
  Draws the widget.

- **void draw (int, int, int, int)**

- **int handle (int, int, int, int)**

- **int handle (int, int, int, int)**

Protected Member Functions inherited from Fl_Valuator

- **Fl_Valuator (int X, int Y, int W, int H, const char *L)**
  Creates a new Fl_Valuator widget using the given position, size, and label string.

- **void handle_drag (double newvalue)**
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- **void handle_push ()**
  Stores the current value in the previous value.

- **void handle_release ()**
  Called after an FL_WHEN_RELEASE event is received and before the callback.

- **int horizontal () const**
  Tells if the valuator is an FL_HORIZONTAL one.

- **double previous_value () const**
  Gets the previous floating point value before an event changed it.

- **void set_value (double v)**
  Sets the current floating point value.

- **double softclamp (double)**
  Clamps the value, but accepts v if the previous value is not already out of range.

- **virtual void value_damage ()**
  Asks for partial redraw.
Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus ()
  draws a focus rectangle around the widget
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗ cb, void ∗ d)
  The default callback for all widgets that don't set a callback.
- static unsigned int labelShortcut (const char ∗ t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int testShortcut (const char ∗ t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19.
  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }

flags possible values enumeration.

9.126.1 Detailed Description

The Fl_Slider widget contains a sliding knob inside a box.
It is often used as a scrollbar. Moving the box all the way to the top/left sets it to the minimum(), and to the bottom/right to the maximum(). The minimum() may be greater than the maximum() to reverse the slider direction.

Use void Fl_Widget::type(int) to set how the slider is drawn, which can be one of the following:

• FL_VERTICAL - Draws a vertical slider (this is the default).
• FL_HORIZONTAL - Draws a horizontal slider.
• FL_VERT_FILL_SLIDER - Draws a filled vertical slider, useful as a progress or value meter.
• FL_HOR_FILL_SLIDER - Draws a filled horizontal slider, useful as a progress or value meter.
• FL_VERT_NICE_SLIDER - Draws a vertical slider with a nice looking control knob.
• FL_HOR_NICE_SLIDER - Draws a horizontal slider with a nice looking control knob.

Figure 9.32 Fl_Slider

9.126.2 Constructor & Destructor Documentation

9.126.2.1 Fl_Slider()

Fl_Slider::Fl_Slider ( int X, int Y, int W, int H, const char * L = 0 )

Creates a new Fl_Slider widget using the given position, size, and label string.
The default boxtype is FL_DOWN_BOX.
9.126.3 Member Function Documentation

9.126.3.1 bounds()

```c
void Fl_Slider::bounds {
    double a,
    double b
}
```
Sets the minimum (a) and maximum (b) values for the valuator widget.
if at least one of the values is changed, a partial redraw is asked.

9.126.3.2 draw()

```c
void Fl_Slider::draw ( ) [protected], [virtual]
```
Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:
```c
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```
Implements Fl_Widget.
Reimplemented in Fl_Value_Slider.

9.126.3.3 handle()

```c
int Fl_Slider::handle ( int event ) [virtual]
```
Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-
circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

| in  | event | the kind of event received |

Return values

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the event was not used or understood</td>
</tr>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

See also

Fl_Event
Reimplemented from Fl_Widget.
Reimplemented in Fl_Value_Slider.

9.126.3.4 scrollvalue()

```c
int Fl_Slider::scrollvalue ( int pos,
    int size,
    int first,
    int total )
```
Sets the size and position of the sliding knob in the box.
### 9.126.3.5 slider_size()

```cpp
void Fl_Slider::slider_size ( double v )
```

Set the dimensions of the moving piece of slider. This is the fraction of the size of the entire widget. If you set this to 1 then the slider cannot move. The default value is .08.

For the "fill" sliders this is the size of the area around the end that causes a drag effect rather than causing the slider to jump to the mouse.

The documentation for this class was generated from the following files:

- Fl_Slider.H
- Fl_Slider.cxx

### 9.127 Fl_Spinner Class Reference

This widget is a combination of the input widget and repeat buttons.

```cpp
#include <Fl_Spinner.H>
```

Inheritance diagram for Fl_Spinner:

#### Public Member Functions

- **Fl_Color color () const**
  
  *Return the background color of the spinner widget's input field.*

- **void color (Fl_Color v)**
  
  *Change the background color of the spinner widget's input field.*

- **Fl_Spinner (int X, int Y, int W, int H, const char *L=0)**
  
  *Creates a new Fl_Spinner widget using the given position, size, and label string.*

- **const char * format ()**
  
  *Sets or returns the format string for the value.*

- **void format (const char *f)**
  
  *Sets or returns the format string for the value.*

- **int handle (int event)**
  
  *Handles the specified event.*

- **double maximum () const**
  
  *Gets the maximum value of the widget.*

- **void maximum (double m)**
  
  *Sets the maximum value of the widget.*
• double maximum () const
  Spelling mistakes retained for source compatibility.
• double minimum () const
  Gets the minimum value of the widget.
• void minimum (double m)
  Sets the minimum value of the widget.
• double minimum () const
  Spelling mistakes retained for source compatibility.
• void range (double a, double b)
  Sets the minimum and maximum values for the widget.
• void resize (int X, int Y, int W, int H)
  Resizes the Fl_Group widget and all of its children.
• Fl_Color selection_color () const
  Return the selection color of the spinner widget's input field.
• void selection_color (Fl_Color val)
  Change the selection color of the spinner widget's input field.
• double step () const
  Sets or returns the amount to change the value when the user clicks a button.
• void step (double s)
  See double Fl_Spinner::step() const.
• Fl_Color textcolor () const
  Gets the color of the text in the input field.
• void textcolor (Fl_Color c)
  Sets the color of the text in the input field.
• Fl_Font textfont () const
  Gets the font of the text in the input field.
• void textfont (Fl_Font f)
  Sets the font of the text in the input field.
• Fl_Fontsize textsize () const
  Gets the size of the text in the input field.
• void textsize (Fl_Fontsize s)
  Sets the size of the text in the input field.
• uchar type () const
  Gets the numeric representation in the input field.
• void type (uchar v)
  Sets the numeric representation in the input field.
• double value () const
  Gets the current value of the widget.
• void value (double v)
  Sets the current value of the widget.

Public Member Functions inherited from Fl_Group
• Fl_Widget * & _ddfdesign_kludge ()
  This is for forms compatibility only.
• void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
• void add (Fl_Widget +o)
  See void Fl_Group::add(Fl_Widget &w)
• void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
• **Fl_Widget** *const + array () const
  Returns a pointer to the array of children.

• virtual **Fl_Group** *as_group ()
  Returns an **Fl_Group** pointer if this widget is an **Fl_Group**.

• void **begin ()**
  Sets the current group so you can build the widget tree by just constructing the widgets.

• **Fl_Widget** *child (int n) const
  Returns array()[n].

• int **children () const**
  Returns how many child widgets the group has.

• void **clear ()**
  Deletes all child widgets from memory recursively.

• unsigned int **clip_children ()**
  Returns the current clipping mode.

• void **clip_children (int c)**
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• void **end ()**
  Exactly the same as current(this->parent()).

• int **find (const Fl_Widget &o) const**
  See int **Fl_Group::find(const Fl_Widget *w) const**.

• int **find (const Fl_Widget *) const**
  Searches the child array for the widget and returns the index.

• **Fl_Group** (int, int, int, int, const char * = 0)
  Creates a new **Fl_Group** widget using the given position, size, and label string.

• void **focus (Fl_Widget *W)**

• void **forms_end ()**
  This is for forms compatibility only.

• void **init_sizes ()**
  Resets the internal array of widget sizes and positions.

• void **insert (Fl_Widget &, int i)**
  The widget is removed from its current group (if any) and then inserted into this group.

• void **insert (Fl_Widget &, Fl_Widget *before)**
  This does insert(w, find(before)).

• void **remove (Fl_Widget &)**
  Removes a widget from the group but does not delete it.

• void **remove (Fl_Widget *)**
  Removes the widget o from the group.

• void **remove (int index)**
  Removes the widget at index from the group but does not delete it.

• **Fl_Widget** *resizable () const
  See void **Fl_Group::resizable(Fl_Widget *box)**

• void **resizable (Fl_Widget &o)**
  See void **Fl_Group::resizable(Fl_Widget *box)**

• void **resizable (Fl_Widget *)**
  The resizable widget defines the resizing box for the group.

• virtual **~Fl_Group ()**
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

• void `_clear_fullscreen` ()
• void `_set_fullscreen` ()
• void activate ()
  
  Activates the widget.
• unsigned int active () const
  
  Returns whether the widget is active.
• int active_r () const
  
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  
  Gets the label alignment.
• void align (Fl_Align alignment)
  
  Sets the label alignment.
• long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• Fl_Boxtype box () const
  
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
  
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  
  Sets the current callback function for the widget.
• void callback (Fl_Callback0 ∗ cb)
  
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  
  Sets the current callback function for the widget.
• unsigned int changed () const
  
  Checks if the widget value changed since the last callback.
• void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.
• void clear_output ()
  
  Sets a widget to accept input.
• void clear_visible ()
  
  Hides the widget.
• void clear_visible_focus ()
  
  Enables keyboard focus navigation with this widget.
• Fl_Color color () const
Gets the background color of the widget.

- void color (Fl_Color bg)
  
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  
  For back compatibility only.

- void color2 (unsigned a)
  
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  
  Sets the current label.

- void copy_tooltip (const char *text)
  
  Sets the current tooltip text.

- uchar damage () const
  
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  
  Internal use only.

- void deactivate ()
  
  Deactivates the widget.

- Fl_Image *deimage ()
  
  Gets the image that is used as part of the widget label.

- const Fl_Image *deimage () const
  
  void deimage (Fl_Image &img)
  
  Sets the image to use as part of the widget label.

- void deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label.

- void do_callback()
  
  Calls the widget callback.

- void do_callback (Fl_Widget *o, long arg)
  
  Calls the widget callback.

- void do_callback (Fl_Widget *o, void *arg=0)
  
  Calls the widget callback.

- void draw_label (int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int h () const
  
  Gets the widget height.

- virtual void hide ()
  
  Makes a widget invisible.

- Fl_Image *image ()
  
  Gets the image that is used as part of the widget label.

- const Fl_Image *image () const
  
  void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label.

- void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - “for hacks only”.
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
Makes the widget visible.

- void `set_visible_focus` ()
  Enables keyboard focus navigation with this widget.

- virtual void `show` ()
  Makes a widget visible.

- void `size` (int W, int H)
  Changes the size of the widget.

- int `take_focus` ()
  Gives the widget the keyboard focus.

- unsigned int `takesevents` () const
  Returns if the widget is able to take events.

- int `test_shortcut` ()
  Returns true if the widget's label contains the entered 'x' shortcut.

- const char ∗ `tooltip` () const
  Gets the current tooltip text.

- void `tooltip` (const char ∗text)
  Sets the current tooltip text.

- Fl_Window ∗ `top_window` () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window ∗ `top_window_offset` (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar `type` () const
  Gets the widget type.

- void `type` (uchar t)
  Sets the widget type.

- int `use_accents_menu` ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void ∗ `user_data` () const
  Gets the user data for this widget.

- void `user_data` (void ∗v)
  Sets the user data for this widget.

- unsigned int `visible` () const
  Returns whether a widget is visible.

- unsigned int `visible_focus` ()
  Checks whether this widget has a visible focus.

- void `visible_focus` (int v)
  Modifies keyboard focus navigation.

- int `visible_r` () const
  Returns whether a widget and all its parents are visible.

- int `w` () const
  Gets the widget width.

- Fl_When `when` () const
  Returns the conditions under which the call back is called.

- void `when` (uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window ∗ `window` () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int `x` () const
  Gets the widget position in its window.

- int `y` () const
  Gets the widget position in its window.

- virtual ~FL_Widget ()
  Destroys the widget.
Protected Attributes

- `Fl_REPEAT_BUTTON down_button_`
- `Fl_INPUT input_`
- `Fl_REPEAT_BUTTON up_button_`

Additional Inherited Members

**Static Public Member Functions inherited from Fl_Group**

- static `Fl_Group * current ()`
  
  Returns the currently active group.

- static void `current (Fl_Group *g)`
  
  Sets the current group.

**Static Public Member Functions inherited from Fl_Widget**

- static void `default_callback (Fl_Widget *cb, void *d)`
  
  The default callback for all widgets that don’t set a callback.

- static unsigned int `labelShortcut (const char *t)`
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int `testShortcut (const char *t, const bool require_alt=false)`
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

**Protected Types inherited from Fl_Widget**

- enum {
  `INACTIVE = 1<<0`, `INVISIBLE = 1<<1`, `OUTPUT = 1<<2`, `NOBORDER = 1<<3`,
  `FORCE_POSITION = 1<<4`, `NON_MODAL = 1<<5`, `SHORTCUT_LABEL = 1<<6`, `CHANGED = 1<<7`,
  `OVERRIDE = 1<<8`, `VISIBLE_FOCUS = 1<<9`, ` Copied_LABEL = 1<<10`, `CLIP_CHILDREN = 1<<11`,
  `MENU_WINDOW = 1<<12`, `TOOLTIP_WINDOW = 1<<13`, `MODAL = 1<<14`, `NO_OVERLAY = 1<<15`,
  `GROUP_RELATIVE = 1<<16`, `COPIED_TOOLTIP = 1<<17`, `FULLSCREEN = 1<<18`, `MAC_USE_ACCENTS_MENU = 1<<19`,
  `USERFLAG3 = 1<<29`, `USERFLAG2 = 1<<30`, `USERFLAG1 = 1<<31` }

  flags possible values enumeration.

**Protected Member Functions inherited from Fl_Group**

- void `draw ()`
  
  Draws the widget.

- void `draw_child (Fl_Widget &widget) const`
  
  Forces a child to redraw.

- void `draw_children ()`
  
  Draws all children of the group.

- void `drawOutsideLabel (const Fl_Widget &widget) const`
  
  Parents normally call this to draw outside labels of child widgets.

- int * `sizes ()`
  
  Returns the internal array of widget sizes and positions.

- void `update_child (Fl_Widget &widget) const`
  
  Draws a child only if it needs it.
Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus ()
  draws a focus rectangle around the widget
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

### 9.127.1 Detailed Description

This widget is a combination of the input widget and repeat buttons. The user can either type into the input area or use the buttons to change the value.

![Figure 9.33 Fl_Spinner widget](image)

**Figure 9.33** Fl_Spinner widget
9.127.2 Constructor & Destructor Documentation

9.127.2.1 Fl_Spinner()

Fl_Spinner::Fl_Spinner (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char * L = 0 )

Creates a new Fl_Spinner widget using the given position, size, and label string.  
Inherited destructor Destroys the widget and any value associated with it.

9.127.3 Member Function Documentation

9.127.3.1 handle()

int Fl_Spinner::handle (  
  int event ) [inline], [virtual]

Handles the specified event.  
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.  
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.  
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-  
circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

| in  | event | the kind of event received |

Return values

- 0 if the event was not used or understood  
- 1 if the event was used and can be deleted

See also

Fl_Event  
Reimplemented from Fl_Group.

9.127.3.2 maximum()

double Fl_Spinner::maximum ( ) const [inline]

Speling mistakes retained for source compatibility.

Deprecated

9.127.3.3 minimum()

double Fl_Spinner::minimum ( ) const [inline]

Speling mistakes retained for source compatibility.

Deprecated

9.127.3.4 resize()

void Fl_Spinner::resize (  
  int X,
int Y, int W, int H ) [inline], [virtual]

Resizes the Fl_Group widget and all of its children.
The Fl_Group widget first resizes itself, and then it moves and resizes all its children according to the rules documented for Fl_Group::resizable(Fl_Widget*)

See also
   Fl_Group::resizable(Fl_Widget*)
   Fl_Group::resizable()
   Fl_Widget::resize(int,int,int,int)

Reimplemented from Fl_Group.

9.127.3.5  step()

double Fl_Spinner::step() const [inline]

Sets or returns the amount to change the value when the user clicks a button.
Before setting step to a non-integer value, the spinner type() should be changed to floating point.

9.127.3.6  type() [1/2]

uchar Fl_Spinner::type() const [inline]

Gets the numeric representation in the input field.

See also
   Fl_Spinner::type(uchar)

9.127.3.7  type() [2/2]

void Fl_Spinner::type(uchar v) [inline]

Sets the numeric representation in the input field.
Valid values are FL_INT_INPUT and FL_FLOAT_INPUT. Also changes the format() template. Setting a new spinner type via a superclass pointer will not work.

Note
   type is not a virtual function.

9.127.3.8  value()

void Fl_Spinner::value(double v) [inline]

Sets the current value of the widget.
Before setting value to a non-integer value, the spinner type() should be changed to floating point.
The documentation for this class was generated from the following files:
   • Fl_Spinner.H
   • Fl_Group.cxx

9.128  Fl_Surface_Device Class Reference

A drawing surface that's susceptible to receive graphical output.
#include <Fl_Device.H>

Inheritance diagram for Fl_Surface_Device:
Public Member Functions

- **const char ∗ class_name ()**
  Returns the name of the class of this object.
- **Fl_Graphics_Driver ∗ driver ()**
  Returns the graphics driver of this drawing surface.
- **void driver (Fl_Graphics_Driver ∗ graphics_driver)**
  Sets the graphics driver of this drawing surface.
- **virtual void set_current (void)**
  Make this surface the current drawing surface.
- **virtual ~Fl_Surface_Device ()**
  The destructor.

Public Member Functions inherited from Fl_Device

- **virtual ~Fl_Device ()**
  Virtual destructor.

Static Public Member Functions

- **static Fl_Surface_Device ∗ surface ()**
  The current drawing surface.

Static Public Attributes

- **static const char ∗ class_id = "Fl_Surface_Device"**

Static Public Attributes inherited from Fl_Device

- **static const char ∗ class_id = "Fl_Device"**
  A string that identifies each subclass of Fl_Device.

Protected Member Functions

- **Fl_Surface_Device (Fl_Graphics_Driver ∗ graphics_driver)**
  Constructor that sets the graphics driver to use for the created surface.

9.128.1 Detailed Description

A drawing surface that's susceptible to receive graphical output.

Any FLTK application has at any time a current drawing surface to which all drawing requests are directed. The current surface is given by Fl_Surface_Device::surface(). When main() begins running, the current drawing surface has been set to the computer's display, an instance of the Fl_Display_Device class.

A drawing surface other than the computer's display, is typically used as follows:

1. Create surface, an object from a particular Fl_Surface_Device derived class (e.g., Fl_Copy_Surface, Fl_Printer).
2. Memorize what is the current drawing surface with Fl_Surface_Device *old_current = Fl_Surface_Device::surface();

3. Call surface->set_current() to redirect all graphics requests to surface which becomes the new current drawing surface (not necessary with class Fl_Printer because it is done by Fl_Printer::start_job()).

4. At this point any of the Drawing functions (e.g., fl_rect()) or the Color & Font functions or Drawing Images functions (e.g., Fl_draw_image(), Fl_Image::draw()) operates on the new current drawing surface. Certain drawing surfaces allow additional ways to draw to them (e.g., Fl_Printer::print_widget(), Fl_Image_Surface::draw()).

5. After all drawing requests have been performed, redirect graphics requests back to their previous destination with old_current->set_current();

6. Delete surface.

9.128.2 Member Function Documentation

9.128.2.1 class_name()

const char * Fl_Surface_Device::class_name ( ) [inline], [virtual]
Returns the name of the class of this object.
Use of the class_name() function is discouraged because it will be removed from future FLTK versions.
The class of an instance of an Fl_Device subclass can be checked with code such as:
if (instance->class_name() == Fl_Printer::class_id) { ... }
Reimplemented from Fl_Device.
Reimplemented in Fl_System_Printer.

9.128.2.2 set_current()

void Fl_Surface_Device::set_current ( 
    void ) [virtual]
Make this surface the current drawing surface.
This surface will receive all future graphics requests.
Reimplemented in Fl_Copy_Surface, Fl_Image_Surface, and Fl_Printer.

9.128.2.3 surface()

static Fl_Surface_Device * Fl_Surface_Device::surface ( ) [inline], [static]
The current drawing surface.
In other words, the Fl_Surface_Device object that currently receives all graphics output
The documentation for this class was generated from the following files:

- Fl_Device.H
- Fl_Device.hxx

9.129 Fl_Sys_Menu_Bar Class Reference

A class to create, modify and delete menus that appear on Mac OS X in the menu bar at the top of the screen.
#include <Fl_Sys_Menu_Bar.H>
Inheritance diagram for Fl_Sys_Menu_Bar:
Public Member Functions

- int add (const char *label, const char *shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)
  Adds a new menu item.
- int add (const char *label, int shortcut, Fl_Callback *, void *user_data=0, int flags=0)
  Add a new menu item to the system menu bar.
- int add (const char *str)
  Forms-compatible procedure to add items to the system menu bar.
- void clear ()
  Set the Fl_Menu_Item array pointer to null, indicating a zero-length menu.
- int clear_submenu (int index)
  Clears the specified submenu pointed to by index of all menu items.
- Fl_Sys_Menu_Bar (int x, int y, int w, int h, const char *l=0)
  The constructor.
- void global ()
  Make the shortcuts for this menu work no matter what window has the focus when you type it.
- int insert (int index, const char *label, const char *shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)
  Insert a new menu item.
- int insert (int index, const char *label, int shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)
  insert in the system menu bar a new menu item
- const Fl_Menu_Item *menu () const
  Return the system menu's array of Fl_Menu_Item's.
- void menu (const Fl_Menu_Item *m)
  create a system menu bar using the given list of menu structs
- int mode (int i) const
  Gets the flags of item i.
- void mode (int i, int fl)
  Sets the flags of item i.
- void remove (int n)
  remove an item from the system menu bar
- void replace (int index, const char *name)
  rename an item from the system menu bar
- void setonly (Fl_Menu_Item *item)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.
- void shortcut (int i, int s)
  Changes the shortcut of item i to n.
- void update ()
  Updates the system menu after any change to its items.
- ~Fl_Sys_Menu_Bar ()
  The destructor.
Public Member Functions inherited from Fl_Menu_Bar

- **Fl_Menu_Bar** (int X, int Y, int W, int H, const char ∗l=0)
  
  Creates a new Fl_Menu_Bar widget using the given position, size, and label string.

- int **handle**(int)
  
  Handles the specified event.

Public Member Functions inherited from Fl_Menu_

- int **add**(const char ∗)
  
  This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with ↑ separating the menu items, and tab separating the menu item names from an optional shortcut string.

- int **add**(const char ∗, int shortcut, Fl_Callback ∗, void ∗=0, int=0)
  
  Adds a new menu item.

- int **add**(const char ∗a, const char ∗b, Fl_Callback ∗c, void ∗d=0, int e=0)
  
  See int Fl_Menu_::add(const char ∗label, int shortcut, Fl_Callback∗, void ∗user_data=0, int flags=0)

- void **clear**()
  
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

- int **clear_submenu**(int index)
  
  Clears the specified submenu pointed to by index of all menu items.

- void **copy**(const Fl_Menu_Item ∗m, void ∗user_data=0)
  
  Sets the menu array pointer with a copy of m that will be automatically deleted.

- Fl_Boxtype **down_box**( ) const
  
  This box type is used to surround the currently-selected items in the menus.

- void **down_box**(Fl_Boxtype b)
  
  See Fl_Boxtype Fl_Menu_::down_box() const

- Fl_Color **down_color**( ) const
  
  For back compatibility, same as selection_color()

- void **down_color**(unsigned c)
  
  For back compatibility, same as selection_color()

- int **find_index**(const char ∗name) const
  
  Find the menu item index for a given menu pathname, such as “Edit/Copy”.

- int **find_index**(const Fl_Menu_Item ∗item) const
  
  Find the index into the menu array for a given item.

- int **find_index**(Fl_Callback ∗cb) const
  
  Find the index into the menu array for a given callback cb.

- const Fl_Menu_Item ∗ **menu**( ) const
  
  Creates a new Fl_Menu_ widget using the given position, size, and label string.

- void **global**( )
  
  Make the shortcuts for this menu work no matter what window has the focus when you type it.

- int **insert**(int index, const char ∗, int shortcut, Fl_Callback ∗, void ∗=0, int=0)
  
  Inserts a new menu item at the specified index position.

- int **insert**(int index, const char ∗a, const char ∗b, Fl_Callback ∗c, void ∗=0, int e=0)
  
  See int Fl_Menu_::insert(const char ∗label, int shortcut, Fl_Callback∗, void ∗user_data=0, int flags=0)

- int **item_pathname**(char ∗name, int namelen, const Fl_Menu_Item ∗finditem=0) const
  
  Get the menu 'pathname' for the specified menuitem.

- const Fl_Menu_Item ∗ **menu**( ) const
Returns a pointer to the array of Fl_Menu_Items.

- `void menu (const Fl_Menu_Item *m)`
  Sets the menu array pointer directly.

- `int mode (int i) const`
  Gets the flags of item i.

- `void mode (int i, int fl)`
  Sets the flags of item i.

- `const Fl_Menu_Item * mvalue () const`
  Returns a pointer to the last menu item that was picked.

- `const Fl_Menu_Item * picked (const Fl_Menu_Item *)`
  When user picks a menu item, call this.

- `void remove (int)`
  Deletes item i from the menu.

- `void replace (int, const char *)`
  Changes the text of item i.

- `void setonly (Fl_Menu_Item *item)`
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

- `void shortcut (int i, int s)`
  Changes the shortcut of item i to s.

- `int size () const`
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.

- `const Fl_Menu_Item * test_shortcut ()`
  Returns the menu item with the entered shortcut (key value).

- `const char * text () const`
  Returns the title of the last item chosen.

- `const char * text (int i) const`
  Returns the title of item i.

- `Fl_Color textcolor () const`
  Get the current color of menu item labels.

- `void textcolor (Fl_Color c)`
  Sets the current color of menu item labels.

- `Fl_Font textfont () const`
  Gets the current font of menu item labels.

- `void textfont (Fl_Font c)`
  Sets the current font of menu item labels.

- `Fl_Fontsize textsize () const`
  Gets the font size of menu item labels.

- `void textsize (Fl_Fontsize c)`
  Sets the font size of menu item labels.

- `int value () const`
  Returns the index into menu() of the last item chosen by the user.

- `int value (const Fl_Menu_Item *)`
  The value is the index into menu() of the last item chosen by the user.

- `int value (int i)`
  The value is the index into menu() of the last item chosen by the user.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function for the widget.
- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
Disables keyboard focus navigation with this widget.

- **FL_Color color () const**
  Gets the background color of the widget.

- **void color (FL_Color bg)**
  Sets the background color of the widget.

- **void color (FL_Color bg, FL_Color sel)**
  Sets the background and selection color of the widget.

- **FL_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **FL_Image * deimage ()**
  Gets the image that is used as part of the widget label.

- **const FL_Image * deimage () const**

- **void deimage (FL_Image &img)**
  Sets the image to use as part of the widget label.

- **void deimage (FL_Image *img)**
  Sets the image to use as part of the widget label.

- **void do_callback ()**
  Calls the widget callback.

- **void do_callback (FL_Widget *o, long arg)**
  Calls the widget callback.

- **void do_callback (FL_Widget *o, void *arg=0)**
  Calls the widget callback.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **FL_Image * image ()**
  Gets the image that is used as part of the widget label.

- **const FL_Image * image () const**

- **void image (FL_Image &img)**
  Sets the image to use as part of the widget label.
• **void image (Fl_Ima**ge ∗img)**
  
  *Sets the image to use as part of the widget label.*

• **int inside (const Fl_**Widget ∗wgt) const**

  *Checks if this widget is a child of wgt.*

• **int is_label_copied () const**

  *Returns whether the current label was assigned with copy_label().*

• **const char ∗ label () const**

  *Gets the current label text.*

• **void label (const char ∗text)**

  *Sets the current label pointer.*

• **void label (Fl_Labeltype a, const char ∗b)**

  *Shortcut to set the label text and type in one call.*

• **Fl_Color labelcolor () const**

  *Gets the label color.*

• **void labelcolor (Fl_Color c)**

  *Sets the label color.*

• **Fl_Font labelfont () const**

  *Gets the font to use.*

• **void labelfont (Fl_Font f)**

  *Sets the font to use.*

• **Fl_Fontsize labelsize () const**

  *Gets the font size in pixels.*

• **void labelsize (Fl_Fontsize pix)**

  *Sets the font size in pixels.*

• **Fl_Labeltype labeltype () const**

  *Gets the label type.*

• **void labeltype (Fl_Labeltype a)**

  *Sets the label type.*

• **void measure_label (int &ww, int &hh) const**

  *Sets width ww and height hh accordingly with the label size.*

• **unsigned int output () const**

  *Returns if a widget is used for output only.*

• **Fl_Group ∗ parent () const**

  *Returns a pointer to the parent widget.*

• **void parent (Fl_Group ∗p)**

  *Internal use only - “for hacks only”.*

• **void position (int X, int Y)**

  *Repositions the window or widget.*

• **void redraw ()**

  *Schedules the drawing of the widget.*

• **void redraw_label ()**

  *Schedules the drawing of the label.*

• **virtual void resize (int x, int y, int w, int h)**

  *Changes the size or position of the widget.*

• **Fl_Color selection_color () const**

  *Gets the selection color.*

• **void selection_color (Fl_Color a)**

  *Sets the selection color.*

• **void set_active ()**

  *Marks the widget as active without sending events or changing focus.*

• **void set_changed ()**
Marks the value of the widget as changed.

- void **set_output ()**
  
  Sets a widget to output only.

- void **set_visible ()**
  
  Makes the widget visible.

- void **set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- virtual void **show ()**
  
  Makes a widget visible.

- void **size (int W, int H)**
  
  Changes the size of the widget.

- int **take_focus ()**
  
  Gives the widget the keyboard focus.

- unsigned int **takesevents () const**
  
  Returns if the widget is able to take events.

- int **test_shortcut ()**
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- const char ∗**tooltip () const**
  
  Gets the current tooltip text.

- void **tooltip (const char ∗text)**
  
  Sets the current tooltip text.

- **Fl_Window ∗top_window () const**
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window ∗top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar **type () const**
  
  Gets the widget type.

- void **type (uchar t)**
  
  Sets the widget type.

- int **use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void ∗**user_data () const**
  
  Gets the user data for this widget.

- void **user_data (void ∗v)**
  
  Sets the user data for this widget.

- unsigned int **visible () const**
  
  Returns whether a widget is visible.

- unsigned int **visible_focus ()**
  
  Checks whether this widget has a visible focus.

- void **visible_focus (int v)**
  
  Modifies keyboard focus navigation.

- int **visible_r () const**
  
  Returns whether a widget and all its parents are visible.

- int **w () const**
  
  Gets the widget width.

- **Fl_When when () const**
  
  Returns the conditions under which the callback is called.

- void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

- **Fl_Window ∗window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw ()
  Draws the widget.

Protected Member Functions inherited from Fl_Menu

• int item_pathname_ (char *name, int namelen, const Fl_Menu_Item *finditem, const Fl_Menu_Item *menu=0) const

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus ()
  Draws a focus rectangle around the widget

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget's label at the defined label position.

• void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

• unsigned int flags () const
  Gets the widget flags mask.

• void h (int v)
  Internal use only.

• void set_flag (unsigned int c)
  Sets a flag in the flags mask.

• void w (int v)
  Internal use only.

• void x (int v)
  Internal use only.

• void y (int v)
  Internal use only.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗cb, void ∗d)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,

- Fl_Color textcolor_
- Fl_Font textfont_
- Fl_Fontsize textsize_

9.129.1 Detailed Description

A class to create, modify and delete menus that appear on Mac OS X in the menu bar at the top of the screen.
On other than Mac OS X platforms, Fl_Sys_Menu_Bar is a synonym of class Fl_Menu_Bar.
To use this class, just replace Fl_Menu_Bar by Fl_Sys_Menu_Bar, and, on the Mac platform, a system menu at the top of the screen will be available. This menu will match an array of Fl_Menu_Item's exactly as with standard FLTK menus.
Changes to the menu state are immediately visible in the menubar when they are made using member functions of the Fl_Sys_Menu_Bar class. Other changes (e.g., by a call to Fl_Menu_Item::set()) should be followed by a call to Fl_Sys_Menu_Bar::update() to be visible in the menubar across all platforms.
A few FLTK features are not supported by the Mac System menu:

- no symbolic labels
- no embossed labels
- no font sizes

You can configure a callback for the 'About' menu item to invoke your own code with fl_mac_set_about().
9.129.2 Constructor & Destructor Documentation

9.129.2.1 Fl_Sys_Menu_Bar()

Fl_Sys_Menu_Bar::Fl_Sys_Menu_Bar (  
    int x,  
    int y,  
    int w,  
    int h,  
    const char * l = 0 )

The constructor.
On Mac OS X, all arguments are unused. On other platforms they are used as by Fl_Menu_Bar::Fl_Menu_Bar().

9.129.3 Member Function Documentation

9.129.3.1 add()[1/3]

int Fl_Sys_Menu_Bar::add (  
    const char * label,  
    const char * shortcut,  
    Fl_Callback * cb,  
    void * user_data = 0,  
    int flags = 0 ) [inline]

Adds a new menu item.
See also
Fl_Menu_::add(const char * label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)

9.129.3.2 add()[2/3]

int Fl_Sys_Menu_Bar::add (  
    const char * label,  
    int shortcut,  
    Fl_Callback * cb,  
    void * user_data = 0,  
    int flags = 0 )

Add a new menu item to the system menu bar.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>- new menu item's label</td>
</tr>
<tr>
<td>shortcut</td>
<td>- new menu item's integer shortcut (can be 0 for none, or e.g. FL_ALT+'x')</td>
</tr>
<tr>
<td>cb</td>
<td>- callback to be invoked when item selected (can be 0 for none, in which case the menubar's callback() can be used instead)</td>
</tr>
<tr>
<td>user_data</td>
<td>- argument to the callback</td>
</tr>
<tr>
<td>flags</td>
<td>- item's flags, e.g. FL_MENU_TOGGLE, etc.</td>
</tr>
</tbody>
</table>

Returns
the index into the menu() array, where the entry was added

See also
Fl_Menu_::add(const char* label, int shortcut, Fl_Callback* cb, void* user_data, int flags)

9.129.3.3 add()[3/3]

int Fl_Sys_Menu_Bar::add (  
    const char * str )
Forms-compatible procedure to add items to the system menu bar.

Returns
the index into the menu() array, where the entry was added

See also
Fl_Menu_::add(const char* str)

9.129.3.4 clear()

void Fl_Sys_Menu_Bar::clear ()
Set the Fl_Menu_Item array pointer to null, indicating a zero-length menu.

See also
Fl_Menu_::clear()

9.129.3.5 clear_submenu()

int Fl_Sys_Menu_Bar::clear_submenu ( int index )
Clears the specified submenu pointed to by index of all menu items.

See also
Fl_Menu_::clear_submenu(int index)

9.129.3.6 draw()

void Fl_Sys_Menu_Bar::draw ( ) [protected], [virtual]
Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Reimplemented from Fl_Menu_Bar.

9.129.3.7 insert() [1/2]

int Fl_Sys_Menu_Bar::insert ( int index,
const char * label,
const char * shortcut,
Fl_Callback * cb,
void * user_data = 0,
int flags = 0 ) [inline]

Insert a new menu item.

See also
Fl_Menu_::insert(int index, const char* label, const char* shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)
9.129.3.8 insert() [2/2]

int Fl_Sys_Menu_Bar::insert (  
    int index,  
    const char * label,  
    int shortcut,  
    Fl_Callback * cb,  
    void * user_data = 0,  
    int flags = 0 )

insert in the system menu bar a new menu item  
Insert in the system menu bar a new menu item, with a title string, shortcut int, callback, argument to the callback,  
and flags.

Returns  
the index into the menu() array, where the entry was inserted

See also  
Fl_Menu_::insert(int index, const char * label, int shortcut, Fl_Callback * cb, void *user_data, int flags)

9.129.3.9 menu()

void Fl_Sys_Menu_Bar::menu (  
    const Fl_Menu_Item * m )

create a system menu bar using the given list of menu structs

Author  
Matthias Melcher

Parameters  
m list of Fl_Menu_Item

9.129.3.10 mode()

void Fl_Sys_Menu_Bar::mode (  
    int i,  
    int fl ) [inline]

Sets the flags of item i.

See also  
Fl_Menu_::mode(int i, int fl)

9.129.3.11 remove()

void Fl_Sys_Menu_Bar::remove (  
    int index )

remove an item from the system menu bar

Parameters  
index the index of the item to remove
9.129.3.12 replace()

```cpp
void Fl_Sys_Menu_Bar::replace (  
   int index,  
   const char * name )
```

rename an item from the system menu bar

Parameters

<table>
<thead>
<tr>
<th>index</th>
<th>the index of the item to rename</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>the new item name as a UTF8 string</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Sys_Menu_Bar.H
- Fl_Sys_Menu_Bar.mm

9.130 Fl_System_Printer Class Reference

Print support under MSWindows and Mac OS.

```cpp
#include <Fl_Printer.H>
```

Inheritance diagram for Fl_System_Printer:

```

```

Public Member Functions

- `const char * class_name ()`
  
  *Returns the name of the class of this object.*

- `void end_job (void)`

  *To be called at the end of a print job.*

- `int end_page (void)`

  *To be called at the end of each page.*

- `void margins (int *left, int *top, int *right, int *bottom)`

  *Computes the dimensions of margins that lie between the printable page area and the full page.*

- `void origin (int *x, int *y)`

  *Computes the page coordinates of the current origin of graphics functions.*

- `void origin (int x, int y)`

  *Sets the position in page coordinates of the origin of graphics functions.*

- `int printable_rect (int *w, int *h)`

  *Computes the width and height of the printable area of the page.*

- `void rotate (float angle)`

  *Rotates the graphics operations relatively to paper.*

- `void scale (float scale_x, float scale_y=0.)`

  *Changes the scaling of page coordinates.*

- `int start_job (int pagecount, int *frompage=NULL, int *topage=NULL)`
Starts a print job.

- **int start_page (void)**
  Starts a new printed page.

- **void translate (int x, int y)**
  Translates the current graphics origin accounting for the current rotation.

- **void untranslate (void)**
  Undoes the effect of a previous translate() call.

- **∼Fl_System_Printer (void)**
  The destructor.

### Public Member Functions inherited from Fl_Paged_Device

- **virtual void print_widget (Fl_Widget ∗widget, int delta_x=0, int delta_y=0)**
  Draws the widget on the printed page.

- **void print_window (Fl_Window ∗win, int x_offset=0, int y_offset=0)**
  Prints a window with its title bar and frame if any.

- **virtual void print_window_part (Fl_Window ∗win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)**
  Prints a rectangular part of an on-screen window.

- **virtual ∼Fl_Paged_Device ()**
  The destructor.

### Public Member Functions inherited from Fl_Surface_Device

- **Fl_Graphics_Driver ∗driver ()**
  Returns the graphics driver of this drawing surface.

- **void driver (Fl_Graphics_Driver ∗graphics_driver)**
  Sets the graphics driver of this drawing surface.

- **virtual ∼Fl_Surface_Device ()**
  The destructor.

### Public Member Functions inherited from Fl_Device

- **virtual ∼Fl_Device ()**
  Virtual destructor.

### Static Public Attributes

- **static const char ∗class_id = Fl_Printer::class_id**

### Static Public Attributes inherited from Fl_Paged_Device

- **static const char ∗class_id = "Fl_Paged_Device"**
- **static const page_format page_formats [NO_PAGE_FORMATS]**
  width, height and name of all elements of the enum Page_Format.

### Static Public Attributes inherited from Fl_Surface_Device

- **static const char ∗class_id = "Fl_Surface_Device"**

### Static Public Attributes inherited from Fl_Device

- **static const char ∗class_id = "Fl_Device"**
  A string that identifies each subclass of Fl_Device.
Protected Member Functions

- Fl_System_Printer (void)
  
  The constructor.

Protected Member Functions inherited from Fl_Paged_Device

- Fl_Paged_Device ()
  
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

- Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)
  
  Constructor that sets the graphics driver to use for the created surface.

Friends

  Possible page formats.

- enum Page_Layou { PORTRAIT = 0, LANDSCAPE = 0x100, REVERSED = 0x200, ORIENTATION = 0x300 }

  Possible page layouts.

Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * surface ()

  The current drawing surface.

Protected Attributes inherited from Fl_Paged_Device

- int x_offset
  
  Horizontal offset to the origin of graphics coordinates

- int y_offset
  
  Vertical offset to the origin of graphics coordinates

9.130.1 Detailed Description

Print support under MSWindows and Mac OS. Class Fl_System_Printer is implemented only on the MSWindows and Mac OS platforms. It has no public constructor. Use Fl_Printer instead that is cross-platform and has the same API.
9.130.2 Member Function Documentation

9.130.2.1 class_name()

const char * Fl_System_Printer::class_name ( ) [inline], [virtual]
Returns the name of the class of this object.
Use of the class_name() function is discouraged because it will be removed from future FLTK versions.
The class of an instance of an Fl_Device subclass can be checked with code such as:
if ( instance->class_name() == Fl_Printer::class_id ) { ... }
Reimplemented from Fl_Paged_Device.

9.130.2.2 end_job()

void Fl_System_Printer::end_job ( 
    void ) [virtual]
To be called at the end of a print job.
Reimplemented from Fl_Paged_Device.

9.130.2.3 end_page()

int Fl_System_Printer::end_page ( 
    void ) [virtual]
To be called at the end of each page.
Returns
    0 if OK, non-zero if any error.
Reimplemented from Fl_Paged_Device.

9.130.2.4 margins()

void Fl_System_Printer::margins ( 
    int * left, 
    int * top, 
    int * right, 
    int * bottom ) [virtual]
Computes the dimensions of margins that lie between the printable page area and the full page.
Values are in the same unit as that used by FLTK drawing functions. They are changed by scale() calls.

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>left</th>
<th>If non-null, *left is set to the left margin size.</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>top</td>
<td>If non-null, *top is set to the top margin size.</td>
</tr>
<tr>
<td>out</td>
<td>right</td>
<td>If non-null, *right is set to the right margin size.</td>
</tr>
<tr>
<td>out</td>
<td>bottom</td>
<td>If non-null, *bottom is set to the bottom margin size.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

9.130.2.5 origin () [1/2]

void Fl_System_Printer::origin ( 
    int * x, 
    int * y ) [virtual]
Computes the page coordinates of the current origin of graphics functions.

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>x</th>
<th>If non-null, *x is set to the horizontal page offset of graphics origin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>y</td>
<td>Same as above, vertically.</td>
</tr>
</tbody>
</table>
Reimplemented from Fl_Paged_Device.

**9.130.2.6 origin() [2/2]**

```cpp
void Fl_System_Printer::origin ( 
    int x, 
    int y ) [virtual]
```

Sets the position in page coordinates of the origin of graphics functions.
Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the page printable area. Origin() calls are not affected by `rotate()` calls. Successive `origin()` calls don't combine their effects.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x</th>
<th>Horizontal position in page coordinates of the desired origin of graphics functions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>y</td>
<td>Same as above, vertically.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

**9.130.2.7 printable_rect()**

```cpp
int Fl_System_Printer::printable_rect ( 
    int * w, 
    int * h ) [virtual]
```

Computes the width and height of the printable area of the page. Values are in the same unit as that used by FLTK drawing functions, are unchanged by calls to `origin()`, but are changed by `scale()` calls. Values account for the user-selected paper type and print orientation.

Returns

- 0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

**9.130.2.8 rotate()**

```cpp
void Fl_System_Printer::rotate ( 
    float angle ) [virtual]
```

Rotates the graphics operations relatively to paper.
The rotation is centered on the current graphics origin. Successive `rotate()` calls don't combine their effects.

Parameters

| angle | Rotation angle in counter-clockwise degrees. |

Reimplemented from Fl_Paged_Device.

**9.130.2.9 scale()**

```cpp
void Fl_System_Printer::scale ( 
    float scale_x, 
    float scale_y = 0. ) [virtual]
```

Changes the scaling of page coordinates.
This function also resets the origin of graphics functions at top left of printable page area. After a `scale()` call, do a `printable_rect()` call to get the new dimensions of the printable page area. Successive `scale()` calls don't combine their effects.
**Parameters**

| scale_{x} | Horizontal dimensions of plot are multiplied by this quantity. |
| scale_{y} | Same as above, vertically. The value 0. is equivalent to setting scale_{y} = scale_{x}. Thus, scale(factor); is equivalent to scale(factor, factor); |

Reimplemented from Fl_Paged_Device.

**9.130.2.10 start_job()**

```cpp
int Fl_System_Printer::start_job (  
  int pagecount,  
  int * frompage = NULL,  
  int * topage = NULL ); [virtual]
```

Starts a print job.

**Parameters**

| in  | pagecount | the total number of pages of the job (or 0 if you don’t know the number of pages) |
| out | frompage  | if non-null, *frompage is set to the first page the user wants printed |
| out | topage    | if non-null, *topage is set to the last page the user wants printed |

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

**9.130.2.11 start_page()**

```cpp
int Fl_System_Printer::start_page (  
  void ) [virtual]
```

Starts a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area.

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

**9.130.2.12 translate()**

```cpp
void Fl_System_Printer::translate (  
  int x,  
  int y ) [virtual]
```

Translates the current graphics origin accounting for the current rotation.

This function is only useful after a rotate() call. Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects.

Reimplemented from Fl_Paged_Device.

**9.130.2.13 untranslate()**

```cpp
void Fl_System_Printer::untranslate (  
  void ) [virtual]
```

Undoes the effect of a previous translate() call.

Reimplemented from Fl_Paged_Device.

The documentation for this class was generated from the following files:

- FL_Printer.H
- FL_Printer.cxx
9.131 Fl_Table Class Reference

A table of widgets or other content.
```cpp
#include <Fl_Table.H>
```

Inheritance diagram for Fl_Table:
```
Fl_Widget
   |   
   v   
Fl_Group
   |   
   v   
Fl_Table
   |   
   v   
Fl_Table_Row
```

Public Types

- enum TableContext {
  CONTEXT_NONE = 0 , CONTEXT_STARTPAGE = 0x01 , CONTEXT_ENDPAGE = 0x02 , CONTEXT_ROW_HEADER = 0x04 ,
  CONTEXT_COL_HEADER = 0x08 , CONTEXT_CELL = 0x10 , CONTEXT_TABLE = 0x20 , CONTEXT_RC_RESIZE = 0x40 }
  The context bit flags for Fl_Table related callbacks.

Public Member Functions

- void add (Fl_Widget &wgt)
- void add (Fl_Widget *wgt)
- Fl_Widget *const *array ()
- void begin ()
- void callback (Fl_Widget *, void *)
  Callbacks will be called depending on the setting of Fl_Widget::when().
- int callback_col ()
  Returns the current column the event occurred on.
- TableContext callback_context ()
  Returns the current 'table context'.
- int callback_row ()
  Returns the current row the event occurred on.
- Fl_Widget * child (int n) const
  Returns the child widget by an index.
- int children () const
  Returns the number of children in the table.
- virtual void clear ()
  Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.
- int col_header ()
  Returns if column headers are enabled or not.
- void col_header (int flag)
  Enable or disable column headers.
- Fl_Color col_header_color ()
  Gets the color for column headers.
- void col_header_color (Fl_Color val)
Sets the color for column headers and redraws the table.

- int **col_header_height** ()
  Gets the column header height.

- void **col_header_height** (int height)
  Sets the height in pixels for column headers and redraws the table.

- int **col_position** ()
  Returns the current column scroll position as a column number.

- void **col_position** (int col)
  Sets the column scroll position to column 'col', and causes the screen to redraw.

- int **col_resize** ()
  Returns if column resizing by the user is allowed.

- void **col_resize** (int flag)
  Allows/disallows column resizing by the user.

- int **col_resize_min** ()
  Returns the current column minimum resize value.

- void **col_resize_min** (int val)
  Sets the current column minimum resize value.

- int **col_width** (int col)
  Returns the current width of the specified column in pixels.

- void **col_width** (int col, int width)
  Sets the width of the specified column in pixels, and the table is redrawn.

- void **col_width_all** (int width)
  Convenience method to set the width of all columns to the same value, in pixels.

- int **cols** ()
  Get the number of columns in the table.

- virtual void **cols** (int val)
  Set the number of columns in the table and redraw.

- void **do_callback** (TableContext context, int row, int col)

- void **draw** (void)
  Draws the widget.

- void **end** ()

- int **find** (const FL_Widget &wgt) const
- int **find** (const FL_Widget *wgt) const
  The constructor for the Fl_Table.

- void **get_selection** (int &row_top, int &col_left, int &row_bot, int &col_right)
  Gets the region of cells selected (highlighted).

- void **init_sizes** ()

- void **insert** (FL_Widget &wgt, FL_Widget *w2)
- void **insert** (FL_Widget &wgt, int n)

- int **is_interactive_resize** ()
  Returns 1 if someone is interactively resizing a row or column.

- int **is_selected** (int r, int c)
  See if the cell at row r and column c is selected.

- int **move_cursor** (int R, int C)
- int **move_cursor** (int R, int C, int shiftselect)

- void **remove** (FL_Widget &wgt)

- void **resize** (int X, int Y, int W, int H)
  Changes the size of the Fl_Table, causing it to redraw.

- int **row_header** ()
  Returns if row headers are enabled or not.
- `void row_header(int flag)`
  Enables/disables showing the row headers.

- `Fl_Color row_header_color()`
  Returns the current row header color.

- `void row_header_color(Fl_Color val)`
  Sets the row header color and causes the screen to redraw.

- `int row_header_width()`
  Returns the current row header width (in pixels).

- `void row_header_width(int width)`
  Sets the row header width to n and causes the screen to redraw.

- `int row_height(int row)`
  Returns the current height of the specified row as a value in pixels.

- `void row_height(int row, int height)`
  Sets the height of the specified row in pixels, and the table is redrawn.

- `void row_height_all(int height)`
  Convenience method to set the height of all rows to the same value, in pixels.

- `int row_position()`
  Returns the current row scroll position as a row number.

- `void row_position(int row)`
  Sets the row scroll position to 'row', and causes the screen to redraw.

- `int row_resize()`
  Returns if row resizing by the user is allowed.

- `void row_resize(int flag)`
  Allows/disallows row resizing by the user.

- `int row_resize_min()`
  Returns the current row minimum resize value.

- `void row_resize_min(int val)`
  Sets the current row minimum resize value.

- `int rows()`
  Returns the number of rows in the table.

- `virtual void rows(int val)`
  Sets the number of rows in the table, and the table is redrawn.

- `int scrollbar_size()`
  Gets the current size of the scrollbars' troughs, in pixels.

- `void scrollbar_size(int newSize)`
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

- `void set_selection(int row_top, int col_left, int row_bot, int col_right)`
  Sets the region of cells to be selected (highlighted).

- `int tab_cell_nav()`
  Get state of table's 'Tab' key cell navigation flag.

- `void tab_cell_nav(int val)`
  Flag to control if Tab navigates table cells or not.

- `void table_box(Fl_Boxtype val)`
  Sets the kind of box drawn around the data table, the default being FL_NO_BOX.

- `Fl_Boxtype table_box(void)`
  Returns the current box type used for the data table.

- `int top_row()`
  Returns the current top row shown in the table.

- `void top_row(int row)`
  Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.
Returns the range of row and column numbers for all visible and partially visible cells in the table.

- void when (Fl_When flags)
  The Fl_Widget::when() function is used to set a group of flags, determining when the widget callback is called:
  - ~Fl_Table ()
    The destructor for the Fl_Table.

Public Member Functions inherited from Fl_Group

- Fl_Widget * & _ddfdesign_kludge ()
  This is for forms compatibility only.
- void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
- void add (Fl_Widget *o)
  See void Fl_Group::add(Fl_Widget &w)
- void addResizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
- Fl_Widget * & ddifice_kludge ()
  Returns a pointer to the array of children.
- virtual Fl_Group * & asGroup ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
- Fl_Widget * & child (int n) const
  Returns array()[n].
- int children () const
  Returns how many child widgets the group has.
- void clear ()
  Deletes all child widgets from memory recursively.
- unsigned int clipChildren ()
  Returns the current clipping mode.
- void clipChildren (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- void end ()
  Exactly the same as current(this->parent()).
- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *o) const
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget *W)
- void formsEnd ()
  This is for forms compatibility only.
- void initSizes ()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &w, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
• void remove (Fl_Widget ∗o)
  Removes the widget o from the group.
• void remove (int index)
  Removes the widget at index from the group but does not delete it.
• Fl_Widget ∗resizable () const
  See void Fl_Group::resizable(Fl_Widget ∗box)
• void resizable (Fl_Widget &o)
  See void Fl_Group::resizable(Fl_Widget ∗box)
• void resizable (Fl_Widget ∗o)
  The resizable widget defines the resizing box for the group.
• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual Fl_Window ∗as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function for the widget.
• void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_COLOR color () const
  Gets the background color of the widget.
• void color (Fl_COLOR bg)
  Sets the background color of the widget.
• void color (Fl_COLOR bg, Fl_COLOR sel)
  Sets the background and selection color of the widget.
• Fl_COLOR color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_IMAGE *deimage ()
  Gets the image that is used as part of the widget label.
• const Fl_IMAGE *deimage () const
  Sets the image to use as part of the widget label.
• void deimage (Fl_IMAGE &img)
  Sets the image to use as part of the widget label.
• void deimage (Fl_IMAGE *img)
  Sets the image to use as part of the widget label.
• void do_callback ()
  Calls the widget callback.
• void do_callback (Fl_Widget *o, long arg)
  Calls the widget callback.
• void do_callback (Fl_Widget *o, void *arg=0)
  Calls the widget callback.
void draw_label (int, int, int, int, Fl_Align) const

Draws the label in an arbitrary bounding box with an arbitrary alignment.

int h () const

Gets the widget height.

virtual void hide ()

Makes a widget invisible.

Fl Image * image ()

Gets the image that is used as part of the widget label.

const Fl Image * image () const

void image (Fl Image &img)

Sets the image to use as part of the widget label.

void image (Fl Image *img)

Sets the image to use as part of the widget label.

int inside (const Fl_Widget *wgt) const

Checks if this widget is a child of wgt.

int is_label_copied () const

Returns whether the current label was assigned with copy_label().

const char * label () const

Gets the current label text.

void label (const char *text)

Sets the current label pointer.

void label (Fl_Labeltype a, const char *b)

Shortcut to set the label text and type in one call.

Fl Color labelcolor () const

Gets the label color.

void labelcolor (Fl Color c)

Sets the label color.

Fl_Font labelfont () const

Gets the font to use.

void labelfont (Fl_Font f)

Sets the font to use.

Fl_Fontsize labelsize () const

Gets the font size in pixels.

void labelsize (Fl_Fontsize pix)

Sets the font size in pixels.

Fl_Labeltype labeltype () const

Gets the label type.

void labeltype (Fl_Labeltype a)

Sets the label type.

void measure_label (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.

unsigned int output () const

Returns if a widget is used for output only.

Fl Group * parent () const

Returns a pointer to the parent widget.

void parent (Fl Group *p)

Internal use only - "for hacks only".

void position (int X, int Y)

Repositions the window or widget.

void redraw ()

Schedules the drawing of the widget.
• void **redraw_label** ()
  Schedules the drawing of the label.
• **Fl_Color** **selection_color** () const
  Gets the selection color.
• void **selection_color** (**Fl_Color** a)
  Sets the selection color.
• void **set_active** ()
  Marks the widget as active without sending events or changing focus.
• void **set_changed** ()
  Marks the value of the widget as changed.
• void **set_output** ()
  Sets a widget to output only.
• void **set_visible** ()
  Makes the widget visible.
• void **set_visible_focus** ()
  Enables keyboard focus navigation with this widget.
• virtual void **show** ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int **take_focus** ()
  Gives the widget the keyboard focus.
• unsigned int **takesevents** () const
  Returns if the widget is able to take events.
• int **test_shortcut** ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char **∗** **tooltip** () const
  Gets the current tooltip text.
• void **tooltip** (const char **∗** text)
  Sets the current tooltip text.
• **Fl_Window** ∗ **top_window** () const
  Returns a pointer to the top-level window for the widget.
• **Fl_Window** ∗ **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ **user_data** () const
  Gets the user data for this widget.
• void **user_data** (void ∗ v)
  Sets the user data for this widget.
• unsigned int **visible** () const
  Returns whether a widget is visible.
• unsigned int **visible_focus** ()
  Checks whether this widget has a visible focus.
• void **visible_focus** (int v)
  Modifies keyboard focus navigation.
• int **visible_r** () const
Returns whether a widget and all its parents are visible.

- int \texttt{w()} \texttt{const}
  
  Gets the widget width.

- \texttt{FL\_When when()} \texttt{const}
  
  Returns the conditions under which the callback is called.

- void \texttt{when(uchar i)}
  
  Sets the flags used to decide when a callback is called.

- \texttt{FL\_Window \star \texttt{window()} \texttt{const}}
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int \texttt{x()} \texttt{const}
  
  Gets the widget position in its window.

- int \texttt{y()} \texttt{const}
  
  Gets the widget position in its window.

- virtual \texttt{\sim FL\_Widget()}
  
  Destroys the widget.

**Protected Types**

- enum \texttt{ResizeFlag}
  
  \begin{verbatim}
  RESIZE\_NONE = 0, RESIZE\_COL\_LEFT = 1, RESIZE\_COL\_RIGHT = 2, RESIZE\_ROW\_ABOVE = 3, RESIZE\_ROW\_BELOW = 4
  \end{verbatim}

**Protected Types inherited from FL\_Widget**

- enum
  
  \begin{verbatim}
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3, FORCE\_POSITION = 1<<4, NON\_MODAL = 1<<5, SHORTCUT\_LABEL = 1<<6, CHANGED = 1<<7, OVERRIDE = 1<<8, VISIBLE\_FOCUS = 1<<9, COPIED\_LABEL = 1<<10, CLIP\_CHILDREN = 1<<11, MENU\_WINDOW = 1<<12, TOOLTIP\_WINDOW = 1<<13, MODAL = 1<<14, NO\_OVERLAY = 1<<15, GROUP\_RELATIVE = 1<<16, COPIED\_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC\_USE\_ACCENTS\_MENU = 1<<19, USERFLAG\_G3 = 1<<29, USERFLAG\_G2 = 1<<30, USERFLAG\_G1 = 1<<31
  \end{verbatim}

  \texttt{flags possible values enumeration.}

**Protected Member Functions**

- void \texttt{change\_cursor(FL\_Cursor newcursor)}

- long \texttt{col\_scroll\_position(int col)}

- TableContext \texttt{cursor2rowcol} (int R, int \&C, ResizeFlag \&resizeflag)

- void \texttt{damage\_zone(TableContext context, int X=0, int Y=0, int W=0, int H=0)}

  \texttt{Subclass should override this method to handle drawing the cells.}

- int \texttt{find\_cell(TableContext context, int R, int C, int \&X, int \&Y, int \&W, int \&H)}

- void \texttt{get\_bounds(TableContext context, int \&X, int \&Y, int \&W, int \&H)}

- int \texttt{handle(int e)}

  \texttt{Handles the specified event.}

- int \texttt{is\_fltk\_container()}

- void \texttt{recalc\_dimensions()}

- void \texttt{redraw\_range(int topRow, int botRow, int leftCol, int rightCol)}

- int \texttt{row\_col\_clamp(TableContext context, int R, int \&C)}

- long \texttt{row\_scroll\_position(int row)}

- void \texttt{table\_resized()}

- void \texttt{table\_scrolled()}

Generated by Doxygen
Protected Member Functions inherited from Fl_Group

- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus ()
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Static Protected Member Functions

- static void scroll_cb (Fl_Widget *, void *)
Protected Attributes

- int botrow
- int current_col
- int current_row
- Fl_Scrollbar * hscrollbar
- int leftcol
- int leftcol_scrollpos
- int rightcol
- int select_col
- int select_row
- Fl_Scroll * table
- int table_h
- int table_w
- int th
- int tw
- int tx
- int ty
- int toh
- int toprow
- int toprow_scrollpos
- int tow
- int tox
- int toy
- Fl_Scrollbar * vscrollbar
- int wih
- int wiw
- int wix
- int wiy

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  
  Returns the currently active group.
- static void current (Fl_Group *g)
  
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *cb, void *d)
  
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  
  Returns true if the given text contains the entered '&x' shortcut.
9.131.1 Detailed Description

A table of widgets or other content. This is the base class for table widgets. To be useful it must be subclassed and several virtual functions defined. Normally applications use widgets derived from this widget, and do not use this widget directly; this widget is usually too low level to be used directly by applications.

This widget does not handle the data in the table. The `draw_cell()` method must be overridden by a subclass to manage drawing the contents of the cells.

This widget can be used in several ways:

- As a custom widget; see examples/table-simple.cxx and test/table.cxx. Very optimal for even extremely large tables.

- As a table made up of a single FLTK widget instanced all over the table, simulating a numeric spreadsheet. See examples/table-spreadsheet.cxx and examples/table-spreadsheet-with-keyboard-nav.cxx. Optimal for large tables.

- As a regular container of FLTK widgets, one widget per cell. See examples/table-as-container.cxx. Not recommended for large tables.

When acting as part of a custom widget, events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events are generated based on the setting for `Fl_Table::when()`.

When acting as a container for FLTK widgets, the FLTK widgets maintain themselves. Although the `draw_cell()` method must be overridden, its contents can be very simple. See the `draw_cell()` code in examples/table-simple.cxx.

The following variables are available to classes deriving from `Fl_Table`:
<table>
<thead>
<tr>
<th>x()/y()/w()/h()</th>
<th>Fl_Table widget's outer dimension. The outer edge of the border of the Fl_Table. (Red in the diagram above)</th>
</tr>
</thead>
<tbody>
<tr>
<td>wix/wiy/wiw/wh</td>
<td>Fl_Table widget's inner dimension. The inner edge of the border of the Fl_Table. eg. if the Fl_Table's box() is FL_NO_BOX, these values are the same as x()/y()/w()/h(). (Yellow in the diagram above)</td>
</tr>
<tr>
<td>tox/toy/tow/toh</td>
<td>The table's outer dimension. The outer edge of the border around the cells, but inside the row/col headings and scrollbars. (Green in the diagram above)</td>
</tr>
<tr>
<td>tix/tiy/tiw/th</td>
<td>The table's inner dimension. The inner edge of the border around the cells, but inside the row/col headings and scrollbars. AKA the table's clip region. eg. if the table_box() is FL_NO_BOX, these values are the same as tox/toy/tow/toh. (Blue in the diagram above)</td>
</tr>
</tbody>
</table>

**CORE DEVELOPERS**
- Greg Ercolano : 12/16/2002 - initial implementation 12/16/02. Fl_Table, Fl_Table_Row, docs.
- Jean-Marc Lienher : 02/22/2004 - added keyboard nav + mouse selection, and ported Fl_Table into fltk-utf8-1.1.4

**OTHER CONTRIBUTORS**
- Inspired by the Feb 2000 version of FLVW's Flvw_Table widget. Mucho thanks to those folks.
- Mister Satan : 04/07/2003 - MinGW porting mods, and singleinput.cxx; a cool Fl_Input oriented spreadsheet example
- Marek Paliwoda : 01/08/2003 - Porting mods for Borland
- Ori Berger : 03/16/2006 - Optimizations for >500k rows/cols

**LICENSE**
Greg added the following license to the original distribution of Fl_Table. He kindly gave his permission to integrate Fl_Table and Fl_Table_Row into FLTK, allowing FLTK license to apply while his widgets are part of the library. If used on its own, this is the license that applies:

Fl_Table License
December 16, 2002

The Fl_Table library and included programs are provided under the terms of the GNU Library General Public License (LGPL) with the following exceptions:
1. Modifications to the Fl_Table configure script, config header file, and makefiles by themselves to support a specific platform do not constitute a modified or derivative work.

The authors do request that such modifications be contributed to the Fl_Table project - send all contributions to "erco at seriss dot com".

2. Widgets that are subclassed from Fl_Table widgets do not constitute a derivative work.

3. Static linking of applications and widgets to the Fl_Table library does not constitute a derivative work and does not require the author to provide source code for the application or widget, use the shared Fl_Table libraries, or link their applications or widgets against a user-supplied version of Fl_Table.

If you link the application or widget to a modified version of Fl_Table, then the changes to Fl_Table must be provided under the terms of the LGPL in sections 1, 2, and 4.

4. You do not have to provide a copy of the Fl_Table license with programs that are linked to the Fl_Table library, nor do you have to identify the Fl_Table license in your program or documentation as required by section 6 of the LGPL.

However, programs must still identify their use of Fl_Table. The following example statement can be included in user documentation to satisfy this requirement:

[program/widget] is based in part on the work of the Fl_Table project http://seriss.com/people/erco/fltk/Fl_Table/

### 9.131.2 Member Enumeration Documentation

#### 9.131.2.1 TableContext

Enum Fl_Table::TableContext

The context bit flags for Fl_Table related callbacks.

Used in `draw_cell()`, `callback()`, etc.

**Enumerator**

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTEXT_NONE</td>
<td>no known context</td>

### 9.131.3 Constructor & Destructor Documentation

#### 9.131.3.1 Fl_Table()

Fl_Table::Fl_Table ( 
    int X,    
    int Y,    

Generated by Doxygen
The constructor for the Fl_Table.
The constructor for the Fl_Table.
This creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

9.131.3.2 ~Fl_Table()
Fl_Table::~Fl_Table();
The destructor for the Fl_Table.
Destroys the table and its associated widgets.

9.131.4 Member Function Documentation

9.131.4.1 callback()

void Fl_Table::callback(Fl_Widget *, void *);

Callbacks will be called depending on the setting of Fl_Widget::when().
Callback functions should use the following functions to determine the context/row/column:

- Fl_Table::callback_row() returns current row
- Fl_Table::callback_col() returns current column
- Fl_Table::callback_context() returns current table context

callback_row() and callback_col() will be set to the row and column number the event occurred on. If someone clicked on a row header, col will be 0.
If someone clicked on a column header, row will be 0.
callback_context() will return one of the following:

| Fl_Table::CONTEXT_ROW_HEADER | Someone clicked on a row header. Excludes resizing. |
| Fl_Table::CONTEXT_COL_HEADER | Someone clicked on a column header. Excludes resizing. |
| Fl_Table::CONTEXT_CELL       | Someone clicked on a cell. To receive callbacks for FL_RELEASE events, you must set when(FL_WHEN_RELEASE). |
| Fl_Table::CONTEXT_RC_RESIZE  | Someone is resizing rows/columns either interactively, or via the col_width() or row_height() API. Use is_interactive_resize() to determine interactive resizing. If resizing a column, R=0 and C=column being resized. If resizing a row, C=0 and R=row being resized. NOTE: To receive resize events, you must set when(FL_WHEN_CHANGED). |

class MyTable : public Fl_Table {
    [...] 
private:
    // Handle events that happen on the table
    void event_callback2() {
        int R = callback_row(), // row where event occurred
            C = callback_col(); // column where event occurred
        TableContext context = callback_context(); // which part of table
        fprintf(stderr, "callback: Row=%d Col=%d Context=%d Event=%d\n",
            R, C, (int)context, (int)Fl::event());
    }

    // Actual static callback
    static void event_callback(Fl_Widget *, void *data) {
        MyTable *o = (MyTable*)data;
        o->event_callback2();
    }

    public:
    // Constructor

Generated by Doxygen
MyTable() {
    ...
    table.callback(event_callback, {void}*this); // setup callback
    table.when(FL_WHEN_CHANGED|FL_WHEN_RELEASE); // when to call it
}

9.131.4.2 callback_col()

int Fl_Table::callback_col ( ) [inline]
Returns the current column the event occurred on.
This function should only be used from within the user's callback function.

9.131.4.3 callback_context()

TableContext Fl_Table::callback_context ( ) [inline]
Returns the current 'table context'.
This function should only be used from within the user's callback function.

9.131.4.4 callback_row()

int Fl_Table::callback_row ( ) [inline]
Returns the current row the event occurred on.
This function should only be used from within the user's callback function.

9.131.4.5 child()

Fl_Widget * Fl_Table::child (int n) const [inline]
Returns the child widget by an index.
When using the Fl_Table as a container for FLTK widgets, this method returns the widget pointer from the internal array of widgets in the container.
Typically used in loops, eg:
for ( int i=0; i<children(); i++ ) {
    Fl_Widget *w = child(i);
    ...
}

9.131.4.6 children()

int Fl_Table::children ( ) const [inline]
Returns the number of children in the table.
When using the Fl_Table as a container for FLTK widgets, this method returns how many child widgets the table has.
See also
child(int)

9.131.4.7 clear()

virtual void Fl_Table::clear ( ) [inline], [virtual]
Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.
See also
rows(int), cols(int)
Reimplemented in Fl_Table_Row.
9.131.4.8 col_header()

void Fl_Table::col_header ( 
    int flag ) [inline]
Enable or disable column headers.  
If changed, the table is redrawn.

9.131.4.9 col_resize()

void Fl_Table::col_resize ( 
    int flag ) [inline]
Allows/disallows column resizing by the user.  
1=allow interactive resizing, 0=disallow interactive resizing.  
Since interactive resizing is done via the column headers, col_header() must also be enabled to allow resizing.

9.131.4.10 col_resize_min()

void Fl_Table::col_resize_min ( 
    int val ) [inline]
Sets the current column minimum resize value.  
This is used to prevent the user from interactively resizing any column to be smaller than 'pixels'.  Must be a value >=1.

9.131.4.11 col_width()

void Fl_Table::col_width ( 
    int col, 
    int width )
Sets the width of the specified column in pixels, and the table is redrawn.  
callback() will be invoked with CONTEXT_RC_RESIZE if the column's width was actually changed, and when() is FL_WHEN_CHANGED.

9.131.4.12 col_width_all()

void Fl_Table::col_width_all ( 
    int width ) [inline]
Convenience method to set the width of all columns to the same value, in pixels.  
The screen is redrawn.

9.131.4.13 draw()

void Fl_Table::draw ( 
    void ) [virtual]
Draws the widget.  
Never call this function directly.  FLTK will schedule redrawing whenever needed.  If your widget must be redrawn as soon as possible, call redraw() instead.  
Override this function to draw your own widgets.  
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:  
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar  
s->draw(); // calls Fl_Scrollbar::draw()  
Reimplemented from Fl_Group.

9.131.4.14 draw_cell()

virtual void Fl_Table::draw_cell ( 
    TableContext context, 
    int R = 0,  
    int C = 0,  
    int X = 0,
int Y = 0,
int W = 0,
int H = 0); [inline], [protected], [virtual]

Subclass should override this method to handle drawing the cells. This method will be called whenever the table is redrawn, once per cell. Only cells that are completely (or partially) visible will be told to draw. context will be one of the following:

| Fl_Table::CONTEXT_STARTPAGE | When table, or parts of the table, are about to be redrawn. Use to initialize static data, such as font selections. R/C will be zero, X/Y/W/H will be the dimensions of the table's entire data area. (Useful for locking a database before accessing; see also visible_cells()) |
| Fl_Table::CONTEXT_ENDPAGE | When table has completed being redrawn. R/C will be zero, X/Y/W/H dimensions of table's data area. (Useful for unlocking a database after accessing) |
| Fl_Table::CONTEXT_ROW_HEADER | Whenever a row header cell needs to be drawn. R will be the row number of the header being redrawn, C will be zero, X/Y/W/H will be the fltk drawing area of the row header in the window |
| Fl_Table::CONTEXT_COL_HEADER | Whenever a column header cell needs to be drawn. R will be zero, C will be the column number of the header being redrawn, X/Y/W/H will be the fltk drawing area of the column header in the window |
| Fl_Table::CONTEXT_CELL | Whenever a data cell in the table needs to be drawn. R/C will be the row/column of the cell to be drawn, X/Y/W/H will be the fltk drawing area of the cell in the window |
| Fl_Table::CONTEXT_RC_RESIZE | Whenever table or row/column is resized or scrolled, either interactively or via col_width() or row_height(). R/C/X/Y/W/H will all be zero. Useful for fltk containers that need to resize or move the child fltk widgets. |

row and col will be set to the row and column number of the cell being drawn. In the case of row headers, col will be 0. In the case of column headers, row will be 0.

x/y/w/h will be the position and dimensions of where the cell should be drawn.

In the case of custom widgets, a minimal draw_cell() override might look like the following. With custom widgets it is up to the caller to handle drawing everything within the dimensions of the cell, including handling the selection color. Note all clipping must be handled as well; this allows drawing outside the dimensions of the cell if so desired for 'custom effects'.

```cpp
// This is called whenever Fl_Table wants you to draw a cell
void MyTable::draw_cell(TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0) {
    static char s[40];
    sprintf(s, "%d/%d", R, C);  // text for each cell
    switch (context) {
    case CONTEXT_STARTPAGE: // Fl_Table telling us it's starting to draw page
        fl_font(Fl_HELVETICA, 16);
        return;
    case CONTEXT_ROW_HEADER: // Fl_Table telling us to draw row/col headers
    case CONTEXT_COL_HEADER:
        fl_push_clip(X, Y, W, H);
        {  // draw box
            fl_draw_box(Fl_THIN_UP_BOX, X, Y, W, H, color());
            fl_color(Fl_BLACK);
            fl_draw(s, X, Y, W, H, FL_ALIGN_CENTER);
        }
        fl_pop_clip();
        return;
    case CONTEXT_CELL: // Fl_Table telling us to draw cells
        fl_push_clip(X, Y, W, H);
        // draw cell
    }
    return;
```

// Generated by Doxygen

```c

default:
    return;

// NOTREACHED
}

9.131.4.15  get_selection()

void Fl_Table::get_selection (  
    int & row_top,
    int & col_left,
    int & row_bot,
    int & col_right )

Gets the region of cells selected (highlighted).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>row_top</th>
<th>Returns the top row of selection area</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>col_left</td>
<td>Returns the left column of selection area</td>
</tr>
<tr>
<td>in</td>
<td>row_bot</td>
<td>Returns the bottom row of selection area</td>
</tr>
<tr>
<td>in</td>
<td>col_right</td>
<td>Returns the right column of selection area</td>
</tr>
</tbody>
</table>

9.131.4.16  handle()

int Fl_Table::handle (  
    int event ) [protected], [virtual]

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

| in   | event   | the kind of event received |

Return values

| 0    | if the event was not used or understood |
| 1    | if the event was used and can be deleted |

See also

    Fl_Event

Reimplemented from Fl_Group.
Reimplemented in Fl_Table_Row.
```
is_interactive_resize()

```cpp
int Fl_Table::is_interactive_resize ( ) [inline]
```

Returns 1 if someone is interactively resizing a row or column. You can currently call this only from within your callback().

is_selected()

```cpp
int Fl_Table::is_selected ( int r, int c )
```

See if the cell at row `r` and column `c` is selected.

Returns

- 1 if the cell is selected, 0 if not.

resize()

```cpp
void Fl_Table::resize ( int X, int Y, int W, int H ) [virtual]
```

Changes the size of the Fl_Table, causing it to redraw. Reimplemented from Fl_Group.

row_header()

```cpp
void Fl_Table::row_header ( int flag ) [inline]
```

Enables/disables showing the row headers. 1=enabled, 0=disabled. If changed, the table is redrawn.

row_height()

```cpp
void Fl_Table::row_height ( int row, int height )
```

Sets the height of the specified row in pixels, and the table is redrawn. callback() will be invoked with CONTEXT_RC_RESIZE if the row's height was actually changed, and when() is FL_WHEN_CHANGED.

row_height_all()

```cpp
void Fl_Table::row_height_all ( int height ) [inline]
```

Convenience method to set the height of all rows to the same value, in pixels. The screen is redrawn.

row_resize()

```cpp
void Fl_Table::row_resize ( int flag ) [inline]
```

Allows/disallows row resizing by the user. 1=allow interactive resizing, 0=disallow interactive resizing. Since interactive resizing is done via the row headers, row_header() must also be enabled to allow resizing.
9.131.4.24  row_resize_min()

void Fl_Table::row_resize_min (  
    int val ) [inline]
Sets the current row minimum resize value.
This is used to prevent the user from interactively resizing any row to be smaller than 'pixels'. Must be a value >=1.

9.131.4.25  rows()

void Fl_Table::rows (  
    int val ) [virtual]
Sets the number of rows in the table, and the table is redrawn.
Reimplemented in Fl_Table_Row.

9.131.4.26  scrollbar_size() [1/2]

int Fl_Table::scrollbar_size ( ) const [inline]
Gets the current size of the scrollbars' troughs, in pixels.
If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also

Fl::scrollbar_size(int)

9.131.4.27  scrollbar_size() [2/2]

void Fl_Table::scrollbar_size (  
    int newSize ) [inline]
Sets the pixel size of the scrollbars' troughs to newSize, in pixels.
Normally you should not need this method, and should use Fl::scrollbar_size(int) instead to manage the size of ALL
your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally
what you want.
Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.
Setting newSize to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the
default.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>newSize</th>
<th>Sets the scrollbar size in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If 0 (default), scrollbar size tracks the global Fl::scrollbar_size()</td>
</tr>
</tbody>
</table>

See also

Fl::scrollbar_size()

9.131.4.28  set_selection()

void Fl_Table::set_selection (  
    int row_top,  
    int col_left,  
    int row_bot,  
    int col_right )
Sets the region of cells to be selected (highlighted).
So for instance, set_selection(0,0,0,0) selects the top/left cell in the table. And set_selection(0,0,1,1) selects the four cells in rows 0 and 1, column 0 and 1.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>row_top</th>
<th>Top row of selection area</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>col_left</td>
<td>Left column of selection area</td>
</tr>
<tr>
<td>in</td>
<td>row_bot</td>
<td>Bottom row of selection area</td>
</tr>
<tr>
<td>in</td>
<td>col_right</td>
<td>Right column of selection area</td>
</tr>
</tbody>
</table>

**9.13.1.4.29 tab_cell_nav() [1/2]**

```c
int Fl_Table::tab_cell_nav ( ) const [inline]
```

Get state of table's 'Tab' key cell navigation flag.

**Returns**

- 1 if Tab configured to navigate cells in table
- 0 to navigate widget focus (default)

**See also**

- tab_cell_nav(int)

**9.13.1.4.30 tab_cell_nav() [2/2]**

```c
void Fl_Table::tab_cell_nav (int val ) [inline]
```

Flag to control if Tab navigates table cells or not.

If on, Tab key navigates table cells. If off, Tab key navigates fltk widget focus. (default)

As of fltk 1.3, the default behavior of the Tab key is to navigate focus off of the current widget, and on to the next one. But in some applications, it's useful for Tab to be used to navigate cells in the Fl_Table.

**Parameters**

| in | val | If val is 1, Tab key navigates cells in table, not fltk widgets. If val is 0, Tab key will advance focus to the next fltk widget (default), and does not navigate cells in table. |

**9.13.1.4.31 table_box()**

```c
void Fl_Table::table_box (Fl_Boxtyle val ) [inline]
```

Sets the kind of box drawn around the data table, the default being FL_NO_BOX.

Changing this value will cause the table to redraw.

**9.13.1.4.32 top_row() [1/2]**

```c
int Fl_Table::top_row ( ) [inline]
```

Returns the current top row shown in the table.

This row may be partially obscured.

**9.13.1.4.33 top_row() [2/2]**

```c
void Fl_Table::top_row (int row ) [inline]
```
Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn. If the table cannot be scrolled that far, it is scrolled as far as possible.

### 9.131.4.34 visible_cells()

```cpp
void Fl_Table::visible_cells {
    int & r1,
    int & r2,
    int & c1,
    int & c2 ) [inline]
```

Returns the range of row and column numbers for all visible and partially visible cells in the table. These values can be used e.g. by your `draw_cell()` routine during CONTEXT_STARTPAGE to figure out what cells are about to be redrawn for the purposes of locking the data from a database before it's drawn.

```plaintext
leftcol : rightcol
toprow .. ------------------.
| VISIBLE | Table |
|         |      |
botrow .. '-------------------'
```

e.g. in a table where the visible rows are 5-20, and the visible columns are 100-120, then those variables would be:

- `toprow = 5`
- `botrow = 20`
- `leftcol = 100`
- `rightcol = 120`

### 9.131.4.35 when()

```cpp
void Fl_Table::when ( Fl_When flags )
```

The `Fl_Widget::when()` function is used to set a group of flags, determining when the widget callback is called:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
</table>
| FL_WHEN_CHANGED       | `callback()` will be called when rows or columns are resized (interactively or via `col_width()` or `row_height()`), passing CONTEXT_RC_RESIZE via `callback_context()`.
| FL_WHEN_RELEASE       | `callback()` will be called during FL_RELEASE events, such as when someone releases a mouse button somewhere on the table. |

The `callback()` routine is sent a `TableContext` that indicates the context the event occurred in, such as in a cell, in a header, or elsewhere on the table. When an event occurs in a cell or header, `callback_row()` and `callback_col()` can be used to determine the row and column. The callback can also look at the regular fltk event values (i.e. `Fl::event()` and `Fl::event_button()`) to determine what kind of event is occurring.

The documentation for this class was generated from the following files:

- Fl_Table.H
- Fl_Table.hxx

### 9.132 Fl_Table_Row Class Reference

A table with row selection capabilities.

```cpp
#include <Fl_Table_H.hxx>
```

Inheritance diagram for `Fl_Table_Row`:
Public Types

- enum TableRowSelectMode { SELECT_NONE, SELECT_SINGLE, SELECT_MULTI }

Public Types inherited from Fl_Table

- enum TableContext {
  CONTEXT_NONE = 0, CONTEXT_STARTPAGE = 0x01, CONTEXT_ENDPAGE = 0x02, CONTEXT_ROW_HEADER = 0x04,
  CONTEXT_COL_HEADER = 0x08, CONTEXT_CELL = 0x10, CONTEXT_TABLE = 0x20, CONTEXT_RC_RESIZE = 0x40
}  
  The context bit flags for Fl_Table related callbacks.

Public Member Functions

- void clear ()
  Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.
- Fl_Table_Row (int X, int Y, int W, int H, const char ∗=0)
  The constructor for the Fl_Table_Row.
- int row_selected (int row)
  Checks to see if 'row' is selected.
- int rows ()
- void rows (int val)
  Sets the number of rows in the table, and the table is redrawn.
- void select_all_rows (int flag=1)
  This convenience function changes the selection state for all rows based on 'flag'.
- int select_row (int row, int flag=1)
  Changes the selection state for 'row', depending on the value of 'flag'.
- TableRowSelectMode type () const
  Sets the table selection mode.
- ~Fl_Table_Row ()
  The destructor for the Fl_Table_Row.

Public Member Functions inherited from Fl_Table

- void add (Fl_Widget &wgt)
- void add (Fl_Widget ∗wgt)
- Fl_Widget ∗const ∗ array ()
- void begin ()
- void callback (Fl_Widget ∗, void ∗)
  Callbacks will be called depending on the setting of Fl_Widget::when().
- int callback_col ()
Returns the current column the event occurred on.

- **TableContext callback_context ()**
  Returns the current 'table context'.

- **int callback_row ()**
  Returns the current row the event occurred on.

- **FL_Widget * child (int n) const**
  Returns the child widget by an index.

- **int children () const**
  Returns the number of children in the table.

- **int col_header ()**
  Returns if column headers are enabled or not.

- **void col_header (int flag)**
  Enable or disable column headers.

- **FL_Color col_header_color ()**
  Gets the color for column headers.

- **void col_header_color (FL_Color val)**
  Sets the color for column headers and redraws the table.

- **int col_header_height ()**
  Gets the column header height.

- **void col_header_height (int height)**
  Sets the height in pixels for column headers and redraws the table.

- **int col_position ()**
  Returns the current column scroll position as a column number.

- **void col_position (int col)**
  Sets the column scroll position to column 'col', and causes the screen to redraw.

- **int col_resize ()**
  Returns if column resizing by the user is allowed.

- **void col_resize (int flag)**
  Allows/disallows column resizing by the user.

- **int col_resize_min ()**
  Returns the current column minimum resize value.

- **void col_resize_min (int val)**
  Sets the current column minimum resize value.

- **int col_width (int col)**
  Returns the current width of the specified column in pixels.

- **void col_width (int col, int width)**
  Sets the width of the specified column in pixels, and the table is redrawn.

- **void col_width_all (int width)**
  Convenience method to set the width of all columns to the same value, in pixels.

- **int cols ()**
  Get the number of columns in the table.

- **virtual void cols (int val)**
  Set the number of columns in the table and redraw.

- **void do_callback (TableContext context, int row, int col)**

- **void draw (void)**
  Draws the widget.

- **void end ()**

- **int find (const FL_Widget &wgt) const**

- **int find (const FL_Widget *wgt) const**

- **FL_Table (int X, int Y, int W, int H, const char *l=0)**
  The constructor for the FL_Table.
• void get_selection (int &row_top, int &col_left, int &row_bot, int &col_right)
  
  Gets the region of cells selected (highlighted).
• void init_sizes ()
• void insert (Fl_Widget &wgt, Fl_Widget *w2)
• void insert (Fl_Widget &wgt, int n)
• int is_interactive_resize ()
  
  Returns 1 if someone is interactively resizing a row or column.
• int is_selected (int r, int c)
  
  See if the cell at row r and column c is selected.
• int move_cursor (int R, int C)
• int move_cursor (int R, int C, int shiftselect)
• void remove (Fl_Widget &wgt)
• void resize (int X, int Y, int W, int H)
  
  Changes the size of the Fl_Table, causing it to redraw.
• int row_header ()
  
  Returns if row headers are enabled or not.
• void row_header (int flag)
  
  Enables/disables showing the row headers.
• Fl_Color row_header_color ()
  
  Returns the current row header color.
• void row_header_color (Fl_Color val)
  
  Sets the row header color and causes the screen to redraw.
• int row_header_width ()
  
  Returns the current row header width (in pixels).
• void row_header_width (int width)
  
  Sets the row header width to n and causes the screen to redraw.
• int row_height (int row)
  
  Returns the current height of the specified row as a value in pixels.
• void row_height (int row, int height)
  
  Sets the height of the specified row in pixels, and the table is redrawn.
• void row_height_all (int height)
  
  Convenience method to set the height of all rows to the same value, in pixels.
• int row_position ()
  
  Returns the current row scroll position as a row number.
• void row_position (int row)
  
  Sets the row scroll position to 'row', and causes the screen to redraw.
• int row_resize ()
  
  Returns if row resizing by the user is allowed.
• void row_resize (int flag)
  
  Allows/disallows row resizing by the user.
• int row_resize_min ()
  
  Returns the current row minimum resize value.
• void row_resize_min (int val)
  
  Sets the current row minimum resize value.
• int rows ()
  
  Returns the number of rows in the table.
• int scrollbar_size () const
  
  Gets the current size of the scrollbars' troughs, in pixels.
• void scrollbar_size (int newSize)
  
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.
• void set_selection (int row_top, int col_left, int row_bot, int col_right)
Sets the region of cells to be selected (highlighted).

- int `tab_cell_nav()` const
  
  Get state of table’s ‘Tab’ key cell navigation flag.

- void `tab_cell_nav(int val)`
  
  Flag to control if Tab navigates table cells or not.

- void `table_box(Fl_Boxtype val)`
  
  Sets the kind of box drawn around the data table, the default being `FL_NO_BOX`.

- `Fl_Boxtype table_box()` (void)
  
  Returns the current box type used for the data table.

- int `top_row()`
  
  Returns the current top row shown in the table.

- void `top_row(int row)`
  
  Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.

- void `visible_cells(int &r1, int &r2, int &c1, int &c2)`
  
  Returns the range of row and column numbers for all visible and partially visible cells in the table.

- void `when(Fl_When flags)`
  
  The `FL_Widget::when()` function is used to set a group of flags, determining when the widget callback is called:

  - ~`FL_Table()`
    
    The destructor for the `FL_Table`.

### Public Member Functions inherited from `FL_Group`

- `FL_Widget *& _ddfdesign_kludge()` (void)
  
  This is for forms compatibility only.

- void `add(FL_Widget &)`
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- void `add(FL_Widget *o)`
  
  See void `FL_Group::add(FL_Widget &w)`

- void `add_resizable(FL_Widget &o)`
  
  Adds a widget to the group and makes it the resizable widget.

- `FL_Widget *const * array()` const
  
  Returns a pointer to the array of children.

- virtual `FL_Group * as_group()`
  
  Returns an `FL_Group` pointer if this widget is an `FL_Group`.

- void `begin()`
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- `FL_Widget * child(int n)` const
  
  Returns array()[n].

- int `children()` const
  
  Returns how many child widgets the group has.

- void `clear()`
  
  Deletes all child widgets from memory recursively.

- unsigned int `clip_children()`
  
  Returns the current clipping mode.

- void `clip_children(int c)`
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- void `end()`
  
  Exactly the same as `current(this->parent())`.

- `int find(FL_Widget &o)` const
  
  See int `FL_Group::find(const FL_Widget &w)` const.

- `int find(const FL_Widget *)` const
Searches the child array for the widget and returns the index.

- **Fl_Group** (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void** focus (Fl_Widget *W)
- **void** forms_end ()
  This is for forms compatibility only.

- **void** init_sizes ()
  Resets the internal array of widget sizes and positions.

- **void** insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

- **void** insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).

- **void** remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

- **void** remove (Fl_Widget *o)
  Removes the widget o from the group.

- **void** remove (int index)
  Removes the widget at index from the group but does not delete it.

- **Fl_Widget** *resizable () const
  See void Fl_Group::resizable(Fl_Widget *box)

- **void** resizable (Fl_Widget &o)
  See void Fl_Group::resizable(Fl_Widget *box)

- **void** resizable (Fl_Widget *o)
  The resizable widget defines the resizing box for the group.

- **virtual** ~Fl_Group ()
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- **void** _clear_fullscreen ()
- **void** _set_fullscreen ()
- **void** activate ()
  Activates the widget.

- **unsigned int** active () const
  Returns whether the widget is active.

- **int** active_r () const
  Returns whether the widget and all of its parents are active.

- **Fl_Align** align () const
  Gets the label alignment.

- **void** align (Fl_Align alignment)
  Sets the label alignment.

- **long** argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- **void** argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual** class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual** Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **Fl_Boxtype** box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
  
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
  
• void callback (Fl_Callback +cb)
  Sets the current callback function for the widget.
  
• void callback (Fl_Callback +cb, void +p)
  Sets the current callback function for the widget.
  
• void callback (Fl_Callback0 +cb)
  Sets the current callback function for the widget.
  
• void callback (Fl_Callback1 +cb, long p=0)
  Sets the current callback function for the widget.
  
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
  
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
  
• void clear_changed ()
  Marks the value of the widget as unchanged.
  
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
  
• void clear_output ()
  Sets a widget to accept input.
  
• void clear_visible ()
  Hides the widget.
  
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
  
• Fl_Color color () const
  Gets the background color of the widget.
  
• void color (Fl_Color bg)
  Sets the background color of the widget.
  
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
  
• Fl_Color color2 () const
  For back compatibility only.
  
• void color2 (unsigned a)
  For back compatibility only.
  
• int contains (const Fl_Widget +w) const
  Checks if w is a child of this widget.
  
• void copy_label (const char *new_label)
  Sets the current label.
  
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
  
• uchar damage () const
  Returns non-zero if draw() needs to be called.
  
• void damage (uchar c)
  Sets the damage bits for the widget.
  
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
  
• int damage_resize (int, int, int)
  Internal use only.
  
• void deactivate ()
Deactivates the widget.

- **Fl_Image** `deimage()`
  Gets the image that is used as part of the widget label.

- **const Fl_Image** `deimage()` const
- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label.

- **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label.

- **void do_callback ()**
  Calls the widget callback.

- **void do_callback (Fl_Widget *o, long arg)**
  Calls the widget callback.

- **void do_callback (Fl_Widget *o, void *arg=0)**
  Calls the widget callback.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **Fl_Image** `image ()`
  Gets the image that is used as part of the widget label.

- **const Fl_Image** `image () const`
- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label.

- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of `wgt`.

- **int is_label_copied () const**
  Returns whether the current label was assigned with `copy_label()`.

- **const char * label () const**
  Gets the current label text.

- **void label (const char *text)**
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  Sets the label color.

- **Fl_Font labelfont () const**
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
Sets the widget type.

- **int use_accents_menu()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void *user_data()** const
  
  Gets the user data for this widget.

- **void user_data(void *v)**
  
  Sets the user data for this widget.

- **unsigned int visible()** const
  
  Returns whether a widget is visible.

- **unsigned int visible_focus()**
  
  Checks whether this widget has a visible focus.

- **void visible_focus(int v)**
  
  Modifies keyboard focus navigation.

- **int visible_r()** const
  
  Returns whether a widget and all its parents are visible.

- **int w()** const
  
  Gets the widget width.

- **Fl_When when()** const
  
  Returns the conditions under which the callback is called.

- **void when(uchar i)**
  
  Sets the flags used to decide when a callback is called.

- **Fl_Window *window()** const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x()** const
  
  Gets the widget position in its window.

- **int y()** const
  
  Gets the widget position in its window.

Protected Member Functions

- **int find_cell(TableContext context, int R, int C, int &X, int &Y, int &W, int &H)**
- **int handle(int event)**
  
  Handles the specified event.

Protected Member Functions inherited from Fl_Table

- **void change_cursor(Fl_Cursor newcursor)**
- **long col_scroll_position(int col)**
- **TableContext cursor2rowcol(int &R, int &C, ResizeFlag &resizeflag)**
- **void damage_zone(int r1, int c1, int r2, int c2, int r3=0, int c3=0)**
- **virtual void draw_cell(TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0)**
  
  Subclass should override this method to handle drawing the cells.

- **int find_cell(TableContext context, int R, int C, int &X, int &Y, int &W, int &H)**
- **void get_bounds(TableContext context, int &X, int &Y, int &W, int &H)**
- **int is_fltk_container()**
- **void recalc_dimensions()**
- **void redraw_range(int topRow, int botRow, int leftCol, int rightCol)**
- **int row_col_clamp(TableContext context, int &R, int &C)**
- **long row_scroll_position(int row)**
- **void table_resized()**
- **void table_scrolled()**
Protected Member Functions inherited from Fl_Group

- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus ()
  draws a focus rectangle around the widget
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *cb, void *d)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Table

- enum ResizeFlag {
  RESIZE_NONE = 0, RESIZE_COL_LEFT = 1, RESIZE_COL_RIGHT = 2, RESIZE_ROW ABOVE = 3,
  RESIZE_ROW_BELOW = 4
}

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
  flags possible values enumeration.

• int wiy

9.132.1 Detailed Description

A table with row selection capabilities.
This class implements a simple table with the ability to select rows. This widget is similar to an Fl_Browser
with columns. Most methods of importance will be found in the Fl_Table widget, such as Fl_Table::rows() and
Fl_Table::cols().
To be useful it must be subclassed and at minimum the draw_cell() method must be overridden to provide the
content of the cells. This widget does not manage the cell's data content; it is up to the parent class's draw_cell()
method override to provide this.
Events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events
are generated based on the values you supply for Fl_Table::when().

9.132.2 Constructor & Destructor Documentation

9.132.2.1 Fl_Table_Row()

Fl_Table_Row::Fl_Table_Row ( int X, int Y, int W, int H, const char * l = 0 ) [inline]
The constructor for the Fl_Table_Row.
This creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

9.132.2.2 Fl_Table_Row()

Fl_Table_Row::~Fl_Table_Row ( ) [inline]
The destructor for the Fl_Table_Row.
Destroys the table and its associated widgets.

9.132.3 Member Function Documentation

9.132.3.1 clear()

void Fl_Table_Row::clear ( ) [inline], [virtual]
Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were
added with begin()/end() or add()/insert()/etc.
See also
rows(int), cols(int)
Reimplemented from Fl_Table.

Generated by Doxygen
9.132.3.2 handle()

```cpp
int Fl_Table_Row::handle ( int event ) [protected], [virtual]
```

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>the kind of event received</td>
</tr>
</tbody>
</table>

**Return values**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the event was not used or understood</td>
</tr>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

See also

Fl_Event

Reimplemented from Fl_Table.

9.132.3.3 row_selected()

```cpp
int Fl_Table_Row::row_selected ( int row )
```

Checks to see if 'row' is selected.
Returns 1 if selected, 0 if not. You can change the selection of a row by clicking on it, or by using select_row(row, flag)

9.132.3.4 rows()

```cpp
void Fl_Table_Row::rows ( int val ) [virtual]
```

Sets the number of rows in the table, and the table is redrawn.
Reimplemented from Fl_Table.

9.132.3.5 select_all_rows()

```cpp
void Fl_Table_Row::select_all_rows ( int flag = 1 )
```

This convenience function changes the selection state for all rows based on 'flag'.
0=deselect, 1=select, 2=toggle existing state.

9.132.3.6 select_row()

```cpp
int Fl_Table_Row::select_row ( int row, int flag = 1 )
```

Changes the selection state for 'row', depending on the value of 'flag'.
0=deselected, 1=select, 2=toggle existing state.

9.132.3.7 type()

```cpp
void Fl_Table_Row::type ( TableRowSelectMode val )
```
Sets the table selection mode.

- \texttt{Fl_Table_Row::SELECT_NONE} - \textit{No selection allowed}
- \texttt{Fl_Table_Row::SELECT_SINGLE} - \textit{Only single rows can be selected}
- \texttt{Fl_Table_Row::SELECT_MULTI} - \textit{Multiple rows can be selected}

The documentation for this class was generated from the following files:

- \texttt{Fl_Table_Row.H}
- \texttt{Fl_Table_Row.cxx}

\section*{9.133 Fl_Tabs Class Reference}

The \texttt{Fl_Tabs} widget is the "file card tabs" interface that allows you to put lots and lots of buttons and switches in a panel, as popularized by many toolkits.

\begin{verbatim}
#include <Fl_Tabs.H>
\end{verbatim}

Inheritance diagram for \texttt{Fl_Tabs}:

```
Fl_Widget
   
Fl_Group
   
Fl_Tabs
```

### Public Member Functions

- \texttt{void client_area (int &rx, int &ry, int &rw, int &rh, int tabh=0)}
  
  \textit{Returns the position and size available to be used by its children.}

- \texttt{Fl_Tabs (int, int, int, const char ∗=0)}

  \textit{Creates a new \texttt{Fl_Tabs} widget using the given position, size, and label string.}

- \texttt{int handle (int)}

  \textit{Handles the specified event.}

- \texttt{Fl_Widget ∗ push () const}

  \textit{Returns the tab group for the tab the user has currently down-clicked on and remains over until FL_RELEASE.}

- \texttt{int push (Fl_Widget ∗)}

  \textit{This is called by the tab widget's handle() method to set the tab group widget the user last FL_PUSH'ed on.}

- \texttt{Fl_Widget ∗ value ()}

  \textit{GETS the currently visible widget/tab.}

- \texttt{int value (Fl_Widget ∗)}

  \textit{Sets the widget to become the current visible widget/tab.}

- \texttt{Fl_Widget ∗ which (int event_x, int event_y)}

  \textit{Return the widget of the tab the user clicked on at event_x/event_y.}

### Public Member Functions inherited from \texttt{Fl_Group}

- \texttt{Fl_Widget ∗ √ dddfdesign_kludge ()}

  \textit{This is for forms compatibility only.}

- \texttt{void add (Fl_Widget ∗)}

  \textit{The widget is removed from its current group (if any) and then added to the end of this group.}

- \texttt{void add (Fl_Widget ∗)}

  \textit{See void \texttt{Fl_Group::add(Fl_Widget ∗w)}}

\[\text{Generated by Doxygen}\]
• **void** add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

• **Fl_Widget** ∗const ∗ array () const
  Returns a pointer to the array of children.

• virtual **Fl_Group** ∗ as_group ()
  Returns an **Fl_Group** pointer if this widget is an **Fl_Group**.

• **void** begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

• **Fl_Widget** ∗ child (int n) const
  Returns array()[n].

• **int** children () const
  Returns how many child widgets the group has.

• **void** clear ()
  Deletes all child widgets from memory recursively.

• **unsigned int** clip_children ()
  Returns the current clipping mode.

• **void** clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• **void** end ()
  Exactly the same as current(this->parent()).

• **int** find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget ∗w) const.

• **int** find (const Fl_Widget ∗)
  Searches the child array for the widget and returns the index.

• **Fl_Group** (int, int, int, int, const char ∗=0)
  Creates a new **Fl_Group** widget using the given position, size, and label string.

• **void** focus (Fl_Widget ∗W)

• **void** forms_end ()
  This is for forms compatibility only.

• **void** init_sizes ()
  Resets the internal array of widget sizes and positions.

• **void** insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

• **void** insert (Fl_Widget &o, Fl_Widget ∗before)
  This does insert(w, find(before)).

• **void** remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

• **void** remove (Fl_Widget ∗o)
  Removes the widget o from the group.

• **void** remove (int index)
  Removes the widget at index from the group but does not delete it.

• **Fl_Widget** ∗ resizable () const
  See void Fl_Group::resizable(Fl_Widget ∗box)

• **void** resizable (Fl_Widget &o)
  See void Fl_Group::resizable(Fl_Widget ∗box)

• **void** resizable (Fl_Widget ∗o)
  The resizable widget defines the resizing box for the group.

• **void** resize (int, int, int, int)
  Resizes the **Fl_Group** widget and all of its children.

• virtual **∼Fl_Group** ()
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  
  Activates the widget.
- unsigned int active () const
  
  Returns whether the widget is active.
- int active_r () const
  
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  
  Gets the label alignment.
- void align (Fl_Align alignment)
  
  Sets the label alignment.
- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- Fl_Boxtype box () const
  
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback0 ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  
  Sets the current callback function for the widget.
- unsigned int changed () const
  
  Checks if the widget value changed since the last callback.
- void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.
- void clear_output ()
  
  Sets a widget to accept input.
- void clear_visible ()
  
  Hides the widget.
- void clear_visible_focus ()
  
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
Gets the background color of the widget.

- void color (Fl_Color bg)
  
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  
  For back compatibility only.

- void color2 (unsigned a)
  
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  
  Sets the current label.

- void copy_tooltip (const char *text)
  
  Sets the current tooltip text.

- uchar damage () const
  
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  
  Internal use only.

- void deactivate ()
  
  Deactivates the widget.

- Fl_Image *deimage ()
  
  Gets the image that is used as part of the widget label.

- const Fl_Image *deimage () const
  
  void deimage (Fl_Image &img)
  
  Sets the image to use as part of the widget label.

- void deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label.

- void do_callback ()
  
  Calls the widget callback.

- void do_callback (Fl_Widget *o, long arg)
  
  Calls the widget callback.

- void do_callback (Fl_Widget *o, void *arg=0)
  
  Calls the widget callback.

- void draw_label (int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int h () const
  
  Gets the widget height.

- void hide ()
  
  Makes a widget invisible.

- virtual void hide ()
  
  virtual do_callback ()

  Calls the widget callback.

- Fl_Image *image ()
  
  Gets the image that is used as part of the widget label.

- const Fl_Image *image () const
  
  void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label.

- void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `virtual void show ()`
  Makes a widget visible.

- `void size (int W, int H)`
  Changes the size of the widget.

- `int take_focus ()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.

- `int test_shortcut ()`
  Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.

- `void tooltip (const char * text)`
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.

- `int use_accents_menu ()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void * user_data () const`
  Gets the user data for this widget.

- `void user_data (void * v)`
  Sets the user data for this widget.

- `unsigned int visible () const`
  Returns whether a widget is visible.

- `unsigned int visible_focus ()`
  Checks whether this widget has a visible focus.

- `void visible_focus (int v)`
  Modifies keyboard focus navigation.

- `int visible_r () const`
  Returns whether a widget and all its parents are visible.

- `int w () const`
  Gets the widget width.

- `Fl_When when () const`
  Returns the conditions under which the callback is called.

- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- `virtual ~Fl_Widget ()`
  Destroys the widget.
Protected Member Functions

- void **draw** ()
  
  Draws the widget.

- void **redraw_tabs** ()

Protected Member Functions inherited from Fl_Group

- void **draw_child** (Fl_Widget &widget) const
  
  Forces a child to redraw.

- void **draw_children** ()
  
  Draws all children of the group.

- void **draw_outside_label** (const Fl_Widget &widget) const
  
  Parents normally call this to draw outside labels of child widgets.

- int ∗ **sizes** ()
  
  Returns the internal array of widget sizes and positions.

- void **update_child** (Fl_Widget &widget) const
  
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

- void **draw_backdrop** () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box** () const
  
  Draws the widget box according its box style.

- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus** ()
  
  draws a focus rectangle around the widget

- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h) const
  
  Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  
  Draws the widget's label at the defined label position.

- void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- Fl_Widget **(int x, int y, int w, int h, const char *label=0L)**
  
  Creates a widget at the given position and size.

- unsigned int **flags** () const
  
  Gets the widget flags mask.

- void **h** (int v)
  
  Internal use only.

- void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

- void **w** (int v)
  
  Internal use only.

- void **x** (int v)
  
  Internal use only.

- void **y** (int v)
  
  Internal use only.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

• static Fl_Group * current ()
  
  Returns the currently active group.
• static void current (Fl_Group *g)
  
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *cb, void *d)
  
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int test_shortcut (const char *, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,

  flags possible values enumeration.

9.133.1 Detailed Description

The Fl_Tabs widget is the “file card tabs” interface that allows you to put lots and lots of buttons and switches in a
panel, as popularized by many toolkits.

![Figure 9.37 Fl_Tabs](image)

Clicking the tab makes a child visible() by calling show() on it, and all other children are made invisible by calling
hide() on them. Usually the children are Fl_Group widgets containing several widgets themselves.

Each child makes a card, and its label() is printed on the card tab, including the label font and style. The selection
color of that child is used to color the tab, while the color of the child determines the background color of the pane.
The size of the tabs is controlled by the bounding box of the children (there should be some space between the children and the edge of the Fl Tabs), and the tabs may be placed "inverted" on the bottom - this is determined by which gap is larger. It is easiest to lay this out in fluid, using the fluid browser to select each child group and resize them until the tabs look the way you want them to.

The background area behind and to the right of the tabs is "transparent", exposing the background detail of the parent. The value of Fl Tabs::box() does not affect this area. So if Fl Tabs is resized by itself without the parent, force the appropriate parent (visible behind the tabs) to redraw() to prevent artifacts.

See "Resizing Caveats" below on how to keep tab heights constant. See "Callback's Use Of when()" on how to control the details of how clicks invoke the callback().

A typical use of the Fl Tabs widget:

```c++
// Typical use of Fl_Tabs
Fl_Tabs *tabs = new Fl_Tabs(10,10,300,200);
{
    Fl_Group *grp1 = new Fl_Group(20,30,280,170,"Tab1");
    { ..widgets that go in tab#1..
    }
    grp1->end();
    Fl_Group *grp2 = new Fl_Group(20,30,280,170,"Tab2");
    { ..widgets that go in tab#2..
    }
    grp2->end();
}
tabs->end();
```

**Default Appearance**

The appearance of each "tab" is taken from the label() and color() of the child group corresponding to that "tab" and panel. Where the "tabs" appear depends on the position and size of the child groups that make up the panels within the Fl_Tab, i.e. whether there is more space above or below them. The height of the "tabs" depends on how much free space is available.

![Figure 9.38 Fl_Tabs Default Appearance](image)

**Highlighting The Selected Tab**

The selected "tab" can be highlighted further by setting the selection_color() of the Fl_Tab itself, e.g.

```c++
..
tabs = new Fl_Tabs(..);
tabs->selection_color(FL_DARK3);
..```

The result of the above looks like:

![Figure 9.39 Highlighting the selected tab](image)

**Uniform Tab and Panel Appearance**

In order to have uniform tab and panel appearance, not only must the color() and selection_color() for each child group be set, but also the selection_color() of the Fl_Tab itself any time a new "tab" is selected. This can be achieved within the Fl_Tab callback, e.g.
**void MyTabCallback(Fl_Widget *w, void*)**

```c
Fl_Tabs *tabs = (Fl_Tabs*)w;
// When tab changed, make sure it has same color as its group
tabs->selection_color( (tab->value())->color() );

int main(...) {
  // Define tabs widget
  tabs = new Fl_Tabs(...);
tabs->callback(MyTabCallback);

  // Create three tabs each colored differently
  grp1 = new Fl_Group(.. "One" );
  grp1->color(9);
  grp1->selection_color(9);
  grp1->end();

  grp2 = new Fl_Group(.. "Two" );
  grp2->color(10);
  grp2->selection_color(10);
  grp2->end();

  grp3 = new Fl_Group(.. "Three" );
  grp3->color(14);
  grp3->selection_color(14);
  grp3->end();

  // Make sure default tab has same color as its group
  tabs->selection_color( (tab->value())->color() );
  ....
  return Fl::run();

```

The result of the above looks like:

![Figure 9.40 Fl_Tabs with uniform colors](image)

**Resizing Caveats**

When `Fl_Tabs` is resized vertically, the default behavior scales the tab's height as well as its children. To keep the tab height constant during resizing, set the tab widget's `resizable()` to one of the tab's child groups, i.e.

```c
tabs = new Fl_Tabs(...);
grp1 = new Fl_Group(...);
  ...
  grp2 = new Fl_Group(...);
  ...
tabs->end();
tabs->resizable(grp1); // keeps tab height constant
```

**Callback's Use Of when()**

As of FLTK 1.3.3, `Fl_Tabs()` supports the following flags for `when()`:

- **FL_WHEN_NEVER** – callback never invoked (all flags off)
- **FL_WHEN_CHANGED** – if flag set, invokes callback when a tab has been changed (on click or keyboard navigation)
- **FL_WHEN_NOT_CHANGED** – if flag set, invokes callback when the tabs remain unchanged (on click or keyboard navigation)
- **FL_WHEN_RELEASE** – if flag set, invokes callback on RELEASE of mouse button or keyboard navigation

**Notes:**

Generated by Doxygen
1. The above flags can be logically OR-ed (|) or added (+) to combine behaviors.

2. The default value for when() is FL_WHEN_RELEASE (inherited from Fl_Widget).

3. If FL_WHEN_RELEASE is the only flag specified, the behavior will be as if (FL_WHEN_RELEASE|FL_WHEN_CHANGED) was specified.

4. The value of changed() will be valid during the callback.

5. If both FL_WHEN_CHANGED and FL_WHEN_NOT_CHANGED are specified, the callback is invoked whether the tab has been changed or not. The changed() method can be used to determine the cause.

6. FL_WHEN_NOT_CHANGED can happen if someone clicks on an already selected tab, or if a keyboard navigation attempt results in no change to the tabs, such as using the arrow keys while at the left or right end of the tabs.

9.133.2 Constructor & Destructor Documentation

9.133.2.1 Fl_Tabs()

Fl_Tabs::Fl_Tabs (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ l = 0 )

Creates a new Fl_Tabs widget using the given position, size, and label string. The default boxtype is FL_THIN_UP_BOX. Use add(Fl_Widget ∗) to add each child, which are usually Fl_Group widgets. The children should be sized to stay away from the top or bottom edge of the Fl_Tabs widget, which is where the tabs will be drawn. All children of Fl_Tabs should have the same size and exactly fit on top of each other. They should only leave space above or below where the tabs will go, but not on the sides. If the first child of Fl_Tabs is set to "resizable()", the riders will not resize when the tabs are resized. The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the Fl_Tabs and all of its children can be automatic (local) variables, but you must declare the Fl_Tabs widget first so that it is destroyed last.

9.133.3 Member Function Documentation

9.133.3.1 client_area()

void Fl_Tabs::client_area (  
    int & rx,  
    int & ry,  
    int & rw,  
    int & rh,  
    int tabh = 0 )

Returns the position and size available to be used by its children. If there isn't any child yet the tabh parameter will be used to calculate the return values. This assumes that the children's labelsize is the same as the Fl_Tabs' labelsize and adds a small border. If there are already children, the values of child(0) are returned, and tabh is ignored.

Note

Children should always use the same positions and sizes.

tabh can be one of

• 0: calculate label size, tabs on top
• -1: calculate label size, tabs on bottom
• > 0: use given tabh value, tabs on top (height = tabh)
• < -1: use given tabh value, tabs on bottom (height = -tabh)
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>tabh</th>
<th>position and optional height of tabs (see above)</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>rx,ry,rw,rh</td>
<td>(x,y,w,h) of client area for children</td>
</tr>
</tbody>
</table>

Since

FLTK 1.3.0

9.133.3.2 draw()

```cpp
void Fl_Tabs::draw ( ) [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded
scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from `Fl_Group`.

9.133.3.3 handle()

```cpp
int Fl_Tabs::handle ( int event ) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don’t short-
circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

| in  | event | the kind of event received |

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

See also

`Fl_Event`

Reimplemented from `Fl_Group`.

9.133.3.4 push() [1/2]

```cpp
Fl_Widget * Fl_Tabs::push ( ) const [inline]
```

Returns the tab group for the tab the user has currently down-clicked on and remains over until FL_RELEASE.

Otherwise, returns NULL.

While the user is down-clicked on a tab, the return value is the tab group for that tab. But as soon as the user
releases, or drags off the tab with the button still down, the return value will be NULL.

See also

`push(Fl_Widget*)`.
9.133.3.5 push() [2/2]

```c
int Fl_Tabs::push (Fl_Widget * o)
```
This is called by the tab widget's handle() method to set the tab group widget the user last FL_PUSH'ed on.  
Set back to zero on FL_RELEASE.  
As of this writing, the value is mainly used by draw_tab() to determine whether or not to draw a 'down' box for the  
tab when it's clicked, and to turn it off if the user drags off it.

See also

click() 

9.133.3.6 value() [1/2]

```c
Fl_Widget * Fl_Tabs::value ( )
```
Gets the currently visible widget/tab.  
The value() is the first visible child (or the last child if none are visible) and this also hides any other children. This  
allows the tabs to be deleted, moved to other groups, and show()/hide() called without it screwing up.

9.133.3.7 value() [2/2]

```c
int Fl_Tabs::value (Fl_Widget * newvalue)
```
Sets the widget to become the current visible widget/tab.  
Setting the value hides all other children, and makes this one visible, if it is really a child.

Returns

1 if there was a change (new value different from previous),  
0 if there was no change (new value already set)

9.133.3.8 which()

```c
Fl_Widget * Fl_Tabs::which (int event_x, int event_y)
```
Return the widget of the tab the user clicked on at event_x/event_y.  
This is used for event handling (clicks) and by fluid to pick tabs.

Returns

The child widget of the tab the user clicked on, or  
0 if there are no children or if the event is outside of the tabs area.

The documentation for this class was generated from the following files:

- Fl_Tabs.H
- Fl_Tabs.cxx

9.134 Fl_Text_Buffer Class Reference

This class manages Unicode text displayed in one or more Fl_Text_Display widgets.  
#include <Fl_Text_Buffer.H>

Public Member Functions

- void add_modify_callback (Fl_Text_Modify_Cb bufModifiedCB, void *cbArg)  
  Adds a callback function that is called whenever the text buffer is modified.  
- void add_predelete_callback (Fl_Text_Predelete_Cb bufPredelCB, void *cbArg)
Adds a callback routine to be called before text is deleted from the buffer.

- **char ∗ address (int pos)**
  
  Convert a byte offset in buffer into a memory address.

- **const char ∗ address (int pos) const**
  
  Convert a byte offset in buffer into a memory address.

- **void append (const char ∗) const**
  
  Appends the text string to the end of the buffer.

- **int appendfile (const char ∗file, int buflen=128 ∗1024) const**
  
  Appends the named file to the end of the buffer.

- **char byte_at (int pos) const**
  
  Returns the raw byte at the specified position pos in the buffer.

- **void call_modify_callbacks () const**
  
  Calls all modify callbacks that have been registered using the add_modify_callback() method.

- **void call_predelete_callbacks () const**
  
  Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.

- **void canUndo (char flag=1)**
  
  Lets the undo system know if we can undo changes.

- **unsigned int char_at (int pos) const**
  
  Returns the character at the specified position pos in the buffer.

- **void copy (Fl_Text_Buffer ∗fromBuf, int fromStart, int fromEnd, int toPos)**
  
  Copies text from another Fl_Text_Buffer to this one.

- **int count_displayed_characters (int lineStartPos, int targetPos) const**
  
  Count the number of displayed characters between buffer position lineStartPos and targetPos.

- **int count_lines (int startPos, int endPos) const**
  
  Counts the number of newlines between startPos and endPos in buffer.

- **int findchar_backward (int startPos, unsigned int searchChar, int ∗foundPos) const**
  
  Search backwards in buffer buf for character searchChar, starting with the character before startPos, returning the result in foundPos.

- **int findchar_forward (int startPos, unsigned searchChar, int ∗foundPos) const**
  
  Finds the next occurrence of the specified character.

- **Fl_Text_Buffer (int requestedSize=0, int preferredGapSize=1024)**
  
  Create an empty text buffer of a pre-determined size.

- **int highlight ()**
  
  Returns the highlighted text.

- **void highlight (int start, int end)**
  
  Highlights the specified text within the buffer.

- **int highlight_position (int ∗start, int ∗end)**
  
  Highlights the specified text between start and end within the buffer.

- **const Fl_Text_Selection ∗ highlight_selection () const**
  
  Returns the current highlight selection.

- **char ∗ highlight_text ()**
  
  Returns the highlighted text.

- **void insert (int pos, const char ∗text)**
  
  Inserts null-terminated string text at position pos.

- **int insertfile (const char ∗file, int pos, int buflen=128 ∗1024)**
  
  Inserts a file at the specified position.

- **int length () const**
  
  Returns the number of bytes in the buffer.

- **int line_end (int pos) const**
  
  Returns the raw byte at the specified position pos in the buffer.
Finds and returns the position of the end of the line containing position \texttt{pos} (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).

\begin{itemize}
\item \texttt{int line_start (int pos) const}
\hspace{1em}Returns the position of the start of the line containing position \texttt{pos}.
\item \texttt{char \* line_text (int pos) const}
\hspace{1em}Returns the text from the entire line containing the specified character position.
\item \texttt{int loadfile (const char \* file, int buflen=128 \*1024)}
\hspace{1em}Loads a text file into the buffer.
\item \texttt{int next_char (int ix) const}
\hspace{1em}Returns the index of the next character.
\item \texttt{int next_char \_clipped (int ix) const}
\item \texttt{int outputfile (const char \* file, int start, int end, int buflen=128 \*1024)}
\hspace{1em}Writes the specified portions of the text buffer to a file.
\item \texttt{int prev_char (int ix) const}
\hspace{1em}Returns the index of the previous character.
\item \texttt{int prev_char \_clipped (int ix) const}
\item \texttt{FL\_Text\_Selection \* primary_selection ()}
\hspace{1em}Returns the primary selection.
\item \texttt{const FL\_Text\_Selection \* primary_selection () const}
\hspace{1em}Returns the primary selection.
\item \texttt{void remove (int start, int end)}
\hspace{1em}Deletes a range of characters in the buffer.
\item \texttt{void remove\_modify\_callback (FL\_Text\_Modify\_Cb bufModifiedCB, void \* cbArg)}
\hspace{1em}Removes a modify callback.
\item \texttt{void remove\_predelete\_callback (FL\_Text\_Predelete\_Cb predelCB, void \* cbArg)}
\hspace{1em}Removes a callback routine \texttt{bufPreDeleteCB} associated with argument \texttt{cbArg} to be called before text is deleted from the buffer.
\item \texttt{void remove\_secondary\_selection ()}
\hspace{1em}Removes the text from the buffer corresponding to the secondary text selection object.
\item \texttt{void remove\_selection ()}
\hspace{1em}Removes the text in the primary selection.
\item \texttt{void replace (int start, int end, const char \* text)}
\hspace{1em}Deletes the characters between \texttt{start} and \texttt{end}, and inserts the null-terminated string \texttt{text} in their place in the buffer.
\item \texttt{void replace\_secondary\_selection (const char \* text)}
\hspace{1em}Replaces the text from the buffer corresponding to the secondary text selection object with the new string \texttt{text}.
\item \texttt{void replace\_selection (const char \* text)}
\hspace{1em}Replaces the text in the primary selection.
\item \texttt{int rewind\_lines (int startPos, int nLines)}
\hspace{1em}Finds and returns the position of the first character of the line \texttt{nLines} backwards from \texttt{startPos} (not counting the character pointed to by \texttt{startpos} if that is a newline) in the buffer.
\item \texttt{int savefile (const char \* file, int buflen=128 \*1024)}
\hspace{1em}Saves a text file from the current buffer.
\item \texttt{int search\_backward (int startPos, const char \* searchString, int \* foundPos, int matchCase=0) const}
\hspace{1em}Search backwards in buffer for string \texttt{searchString}, starting with the character at \texttt{startPos}, returning the result in \texttt{foundPos}.
\item \texttt{int search\_forward (int startPos, const char \* searchString, int \* foundPos, int matchCase=0) const}
\hspace{1em}Search forwards in buffer for string \texttt{searchString}, starting with the character \texttt{startPos}, and returning the result in \texttt{foundPos}.
\item \texttt{void secondary\_select (int start, int end)}
\hspace{1em}Selects a range of characters in the secondary selection.
\item \texttt{int secondary\_selected ()}
\end{itemize}
Returns a non-zero value if text has been selected in the secondary text selection, 0 otherwise.

- `const Fl_Text_Selection ∗ secondary_selection () const`
  Returns the secondary selection.

- `int secondary_selection_position (int ∗start, int ∗end)`
  Returns the current selection in the secondary text selection object.

- `char ∗ secondary_selection_text ()`
  Returns the text in the secondary selection.

- `void secondary_unselect ()`
  Clears any selection in the secondary text selection object.

- `void select (int start, int end)`
  Selects a range of characters in the buffer.

- `int selected () const`
  Returns a non-zero value if text has been selected, 0 otherwise.

- `int selection_position (int ∗start, int ∗end)`
  Gets the selection position.

- `char ∗ selection_text ()`
  Returns the currently selected text.

- `int skip_displayed_characters (int lineStartPos, int nChars)`
  Count forward from buffer position startPos in displayed characters.

- `int skip_lines (int startPos, int nLines)`
  Finds the first character of the line nLines forward from startPos in the buffer and returns its position.

- `int tab_distance () const`
  Gets the tab width.

- `void tab_distance (int tabDist)`
  Set the hardware tab distance (width) used by all displays for this buffer, and used in computing offsets for rectangular selection operations.

- `char ∗ text () const`
  Get a copy of the entire contents of the text buffer.

- `void text (const char ∗text)`
  Replaces the entire contents of the text buffer.

- `char ∗ text_range (int start, int end) const`
  Get a copy of a part of the text buffer.

- `int undo (int ∗cp=0)`
  Undo text modification according to the undo variables or insert text from the undo buffer.

- `void unhighlight ()`
  Unhighlights text in the buffer.

- `void unselect ()`
  Cancels any previous selection on the primary text selection object.

- `int utf8_align (int) const`
  Align an index into the buffer to the current or previous UTF-8 boundary.

- `int word_end (int pos) const`
  Returns the position corresponding to the end of the word.

- `int word_start (int pos) const`
  Returns the position corresponding to the start of the word.

- `∼Fl_Text_Buffer ()`
  Frees a text buffer.

Public Attributes

- `int input_file_was_transcoded`
  true if the loaded file has been transcoded to UTF-8.

- `void (∗transcoding_warning_action )(Fl_Text_Buffer ∗)`
  Pointer to a function called after reading a non UTF-8 encoded file.
Static Public Attributes

- static const char * file_encoding_warning_message
  
  This message may be displayed using the fl_alert() function when a file which was not UTF-8 encoded is input.

Protected Member Functions

- void call_modify_callbacks (int pos, int nDeleted, int nInserted, int nRestyled, const char *deletedText) const
  
  Calls the stored modify callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.

- void call_predelete_callbacks (int pos, int nDeleted) const
  
  Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.

- int insert_ (int pos, const char *text)
  
  Internal (non-redisplaying) version of insert().

- void move_gap (int pos)
  
  Move the gap to start at a new position.

- void reallocate_with_gap (int newGapStart, int newGapLen)
  
  Reallocates the text storage in the buffer to have a gap starting at newGapStart and a gap size of newGapLen, preserving the buffer’s current contents.

- void redisplay_selection (Fl_Text_Selection *oldSelection, Fl_Text_Selection *newSelection) const
  
  Calls the stored redisplay procedure(s) for this buffer to update the screen for a change in a selection.

- void remove_ (int start, int end)
  
  Internal (non-redisplaying) version of remove().

- void remove_selection_ (Fl_Text_Selection *sel)
  
  Removes the text from the buffer corresponding to sel.

- void replace_selection_ (Fl_Text_Selection *sel, const char *text)
  
  Replaces the text in selection sel.

- char * selection_text_ (Fl_Text_Selection *sel) const

- void update_selections (int pos, int nDeleted, int nInserted)
  
  Updates all of the selections in the buffer for changes in the buffer’s text.

Protected Attributes

- char * mBuf
  
  allocated memory where the text is stored

- char mCanUndo
  
  if this buffer is used for attributes, it must not do any undo calls

- void ** mCbArgs
  
  caller arguments for modifyProcs above

- int mCursorPosHint
  
  hint for reasonable cursor position after a buffer modification operation

- int mGapEnd
  
  points to the first character after the gap

- int mGapStart
  
  points to the first character of the gap

- Fl_Text_Selection mHighlight
  
  highlighted areas

- int mLength
  
  length of the text in the buffer (the length of the buffer itself must be calculated: gapEnd - gapStart + length)

- Fl_Text_Modify_Cb * mModifyProcs
  
  procedures to call when buffer is modified to redisplay contents
• int mNModifyProcs
  number of modify-redisplay procs attached
• int mNPredeleteProcs
  number of pre-delete procs attached
• void ** mPredeleteCbArgs
  caller argument for pre-delete proc above
• Fl_Text_Predelete_CB * mPredeleteProcs
  procedure to call before text is deleted from the buffer; at most one is supported.
• int mPreferredGapSize
  the default allocation for the text gap is 1024 bytes and should only be increased if frequent and large changes in buffer size are expected
• Fl_Text_Selection mPrimary
  highlighted areas
• Fl_Text_Selection mSecondary
  highlighted areas
• int mTabDist
  equiv.

9.134.1 Detailed Description

This class manages Unicode text displayed in one or more Fl_Text_Display widgets. All text in Fl_Text_Buffer must be encoded in UTF-8. All indices used in the function calls must be aligned to the start of a UTF-8 sequence. All indices and pointers returned will be aligned. All functions that return a single character will return that in an unsiged int in UCS-4 encoding.

The Fl_Text_Buffer class is used by the Fl_Text_Display and Fl_Text_Editor to manage complex text data and is based upon the excellent NEdit text editor engine - see http://www.nedit.org/.

9.134.2 Constructor & Destructor Documentation

9.134.2.1 Fl_Text_Buffer()

Fl_Text_Buffer::Fl_Text_Buffer (  
  int requestedSize = 0,  
  int preferredGapSize = 1024 )

Create an empty text buffer of a pre-determined size.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestedSize</td>
<td>use this to avoid unnecessary re-allocation if you know exactly how much the buffer will need to hold</td>
</tr>
<tr>
<td>preferredGapSize</td>
<td>Initial size for the buffer gap (empty space in the buffer where text might be inserted if the user is typing sequential characters)</td>
</tr>
</tbody>
</table>

9.134.3 Member Function Documentation

9.134.3.1 add_modify_callback()  

void Fl_Text_Buffer::add_modify_callback (  
  Fl_Text_Modify_Cb bufModifiedCB,  
  void * cbArg )

Adds a callback function that is called whenever the text buffer is modified. The callback function is declared as follows:

```c
typedef void (*Fl_Text_Modify_Cb)(int pos, int nInserted, int nDeleted,  
  int nRestyled, const char* deletedText,  
  void* cbArg);
```
9.134.3.2 address() [1/2]

```cpp
cchar * Fl_Text_Buffer::address (int pos) [inline]
```

Convert a byte offset in buffer into a memory address.

**Parameters**

| pos | byte offset into buffer |

**Returns**

byte offset converted to a memory address

9.134.3.3 address() [2/2]

```cpp
cconst char * Fl_Text_Buffer::address (int pos) const [inline]
```

Convert a byte offset in buffer into a memory address.

**Parameters**

| pos | byte offset into buffer |

**Returns**

byte offset converted to a memory address

9.134.3.4 append()

```cpp
cvoid Fl_Text_Buffer::append (const char * t) [inline]
```

Appends the text string to the end of the buffer.

**Parameters**

| t | UTF-8 encoded and null terminated text |

9.134.3.5 appendfile()

```cpp
cint Fl_Text_Buffer::appendfile (const char * file,
    int buflen = 128*1024) [inline]
```

Appends the named file to the end of the buffer.
See also `insertfile()`.

9.134.3.6 byte_at()

```cpp
cchar Fl_Text_Buffer::byte_at (int pos) const
```

Returns the raw byte at the specified position pos in the buffer.
Positions start at 0.

**Parameters**

| pos | byte offset into buffer |
9.134.3.7 char_at()

unsigned int Fl_Text_Buffer::char_at ( int pos ) const

Returns the character at the specified position pos in the buffer. Positions start at 0.

Parameters

| pos | byte offset into buffer, pos must be at a UTF-8 character boundary |

Returns

Unicode UCS-4 encoded character

9.134.3.8 copy()

void Fl_Text_Buffer::copy ( Fl_Text_Buffer * fromBuf, int fromStart, int fromEnd, int toPos )

Copies text from another Fl_Text_Buffer to this one.

Parameters

| fromBuf | source text buffer, may be the same as this |
| fromStart | byte offset into buffer |
| fromEnd | byte offset into buffer |
| toPos | destination byte offset into buffer |

9.134.3.9 countDisplayed_characters()

int Fl_Text_Buffer::count_displayed_characters ( int lineStartPos, int targetPos ) const

Count the number of displayed characters between buffer position lineStartPos and targetPos. Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and control characters are expanded.

9.134.3.10 count_lines()

int Fl_Text_Buffer::count_lines ( int startPos, int endPos ) const

Counts the number of newlines between startPos and endPos in buffer. The character at position endPos is not counted.

9.134.3.11 findchar_backward()

int Fl_Text_Buffer::findchar_backward ( int startPos,
Search backwards in buffer buf for character searchChar, starting with the character before startPos, returning the result in foundPos.

Returns 1 if found, 0 if not. The difference between this and search_backward() is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: newline.

**Parameters**

| startPos | byte offset to start position |
| searchChar | UCS-4 character that we want to find |
| foundPos | byte offset where the character was found |

**Returns**

1 if found, 0 if not

### 9.134.3.12 findchar_forward()

```cpp
int Fl_Text_Buffer::findchar_forward (
    int startPos,
    unsigned searchChar,
    int * foundPos ) const
```

Finds the next occurrence of the specified character. Search forwards in buffer for character searchChar, starting with the character startPos, and returning the result in foundPos. Returns 1 if found, 0 if not. The difference between this and search_forward() is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: newline.

**Parameters**

| startPos | byte offset to start position |
| searchChar | UCS-4 character that we want to find |
| foundPos | byte offset where the character was found |

**Returns**

1 if found, 0 if not

### 9.134.3.13 highlight()

```cpp
int Fl_Text_Buffer::highlight ( ) [inline]
```

Returns the highlighted text.
When you are done with the text, free it using the free() function.

### 9.134.3.14 highlight_text()

```cpp
char * Fl_Text_Buffer::highlight_text ( )
```

Returns the highlighted text.
When you are done with the text, free it using the free() function.

### 9.134.3.15 insert()

```cpp
void Fl_Text_Buffer::insert ( 
    int pos,
    const char * text )
```
Inserts null-terminated string \texttt{text} at position \texttt{pos}.

**Parameters**

| \texttt{pos} | insertion position as byte offset (must be UTF-8 character aligned) |
| \texttt{text} | UTF-8 encoded and nul terminated text |

**9.134.3.16 insert()**

```cpp
int Fl_Text_Buffer::insert_ (int pos, const char * text) [protected]
```

Internal (non-redisplaying) version of \texttt{insert()}. Returns the length of text inserted (this is just \texttt{strlen(text)}, however this calculation can be expensive and the length will be required by any caller who will continue on to call redisplay). \texttt{pos} must be contiguous with the existing text in the buffer (i.e. not past the end).

Returns the number of bytes inserted.

**9.134.3.17 insertfile()**

```cpp
int Fl_Text_Buffer::insertfile (const char * file, int pos, int buflen = 128*1024 )
```

 Inserts a file at the specified position.

Returns

- 0 on success
- non-zero on error (\texttt{strerror()}) contains reason
- 1 indicates open for read failed (no data loaded)
- 2 indicates error occurred while reading data (data was partially loaded)

File can be UTF-8 or CP1252 encoded. If the input file is not UTF-8 encoded, the \texttt{Fl_Text_Buffer} widget will contain data transcoded to UTF-8. By default, the message \texttt{Fl_Text_Buffer::file_encoding_warning_message} will warn the user about this.

See also \texttt{input_file_was_transcoded} and \texttt{transcoding_warning_action}.

**9.134.3.18 length()**

```cpp
int Fl_Text_Buffer::length ( ) const [inline]
```

Returns the number of bytes in the buffer.

Returns

size of text in bytes

**9.134.3.19 line_end()**

```cpp
int Fl_Text_Buffer::line_end (int pos) const
```

Finds and returns the position of the end of the line containing position \texttt{pos} (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).
Parameters

\texttt{pos} \hspace{1em} \text{byte index into buffer}

Returns

byte offset to line end

\textbf{9.134.3.20} \texttt{line_start()}

\begin{verbatim}
int Fl_Text_Buffer::line_start(int pos) const
\end{verbatim}

Returns the position of the start of the line containing position \texttt{pos}.

Parameters

\texttt{pos} \hspace{1em} \text{byte index into buffer}

Returns

byte offset to line start

\textbf{9.134.3.21} \texttt{line_text()}

\begin{verbatim}
char * Fl_Text_Buffer::line_text(int pos) const
\end{verbatim}

Returns the text from the entire line containing the specified character position.
When you are done with the text, free it using the \texttt{free()} function.

Parameters

\texttt{pos} \hspace{1em} \text{byte index into buffer}

Returns

copy of UTF-8 text, must be free'd

\textbf{9.134.3.22} \texttt{loadfile()}

\begin{verbatim}
int Fl_Text_Buffer::loadfile(const char * file, int buflen = 128*1024) [inline]
\end{verbatim}

Loads a text file into the buffer.
See also \texttt{insertfile()}.

\textbf{9.134.3.23} \texttt{next_char()}

\begin{verbatim}
int Fl_Text_Buffer::next_char(int ix) const
\end{verbatim}

Returns the index of the next character.

Parameters

\texttt{ix} \hspace{1em} \text{index to the current character}
9.134.3.24  outputfile()

int Fl_Text_Buffer::outputfile (  
    const char * file,  
    int start,  
    int end,  
    int buflen = 128*1024 )

Writes the specified portions of the text buffer to a file.

Returns

• 0 on success
• non-zero on error (strerror() contains reason)
• 1 indicates open for write failed (no data saved)
• 2 indicates error occurred while writing data (data was partially saved)

See also

    savefile(const char +file, int buflen)

9.134.3.25  prev_char()

int Fl_Text_Buffer::prev_char (  
    int ix ) const

Returns the index of the previous character.

Parameters

ix  |  index to the current character

9.134.3.26  remove()

void Fl_Text_Buffer::remove (  
    int start,  
    int end )

Deletes a range of characters in the buffer.

Parameters

start  |  byte offset to first character to be removed
end    |  byte offset to character after last character to be removed

9.134.3.27  remove_()

void Fl_Text_Buffer::remove_ (  
    int start,  
    int end ) [protected]

Internal (non-redisplaying) version of remove().

Removes the contents of the buffer between start and end (and moves the gap to the site of the delete).

9.134.3.28  replace()

void Fl_Text_Buffer::replace (  
    int start,  
    int end,  
    const char * text )
Deletes the characters between `start` and `end`, and inserts the null-terminated string `text` in their place in the buffer.

Parameters

<table>
<thead>
<tr>
<th>start</th>
<th>byte offset to first character to be removed and new insert position</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>byte offset to character after last character to be removed</td>
</tr>
<tr>
<td>text</td>
<td>UTF-8 encoded and nul terminated text</td>
</tr>
</tbody>
</table>

### 9.134.3.29 rewind_lines()

```cpp
int Fl_Text_Buffer::rewind_lines (int startPos, int nLines )
```

Finds and returns the position of the first character of the line `nLines` backwards from `startPos` (not counting the character pointed to by `startpos` if that is a newline) in the buffer. `nLines == 0` means find the beginning of the line.

### 9.134.3.30 savefile()

```cpp
int Fl_Text_Buffer::savefile (const char * file, int buflen = 128*1024 ) [inline]
```

Saves a text file from the current buffer. Returns

- 0 on success
- non-zero on error (strerror() contains reason)
- 1 indicates open for write failed (no data saved)
- 2 indicates error occurred while writing data (data was partially saved)

See also

`outputfile(const char *file, int start, int end, int buflen)`

### 9.134.3.31 search_backward()

```cpp
int Fl_Text_Buffer::search_backward (int startPos, const char * searchString, int * foundPos, int matchCase = 0 ) const
```

Search backwards in buffer for string `searchString`, starting with the character at `startPos`, returning the result in `foundPos`. Returns 1 if found, 0 if not.

Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>byte offset to start position</th>
</tr>
</thead>
<tbody>
<tr>
<td>searchString</td>
<td>UTF-8 string that we want to find</td>
</tr>
<tr>
<td>foundPos</td>
<td>byte offset where the string was found</td>
</tr>
<tr>
<td>matchCase</td>
<td>if set, match character case</td>
</tr>
</tbody>
</table>

Generated by Doxygen
Returns

1 if found, 0 if not

9.134.3.32 search_forward()

int Fl_Text_Buffer::search_forward {
    int startPos,
    const char * searchString,
    int * foundPos,
    int matchCase = 0 ) const

Search forwards in buffer for string searchString, starting with the character startPos, and returning the result in foundPos.
Returns 1 if found, 0 if not.

Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>byte offset to start position</th>
</tr>
</thead>
<tbody>
<tr>
<td>searchString</td>
<td>UTF-8 string that we want to find</td>
</tr>
<tr>
<td>foundPos</td>
<td>byte offset where the string was found</td>
</tr>
<tr>
<td>matchCase</td>
<td>if set, match character case</td>
</tr>
</tbody>
</table>

Returns

1 if found, 0 if not

9.134.3.33 secondary_selection_text()

char * Fl_Text_Buffer::secondary_selection_text ( )

Returns the text in the secondary selection.
When you are done with the text, free it using the free() function.

9.134.3.34 selection_text()

char * Fl_Text_Buffer::selection_text ( )

Returns the currently selected text.
When you are done with the text, free it using the free() function.

9.134.3.35 skip_displayed_characters()

int Fl_Text_Buffer::skip_displayed_characters {
    int lineStartPos,
    int nChars )

Count forward from buffer position startPos in displayed characters.
Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and control characters are expanded.

Parameters

<table>
<thead>
<tr>
<th>lineStartPos</th>
<th>byte offset into buffer</th>
</tr>
</thead>
<tbody>
<tr>
<td>nChars</td>
<td>number of bytes that are sent to the display</td>
</tr>
</tbody>
</table>

Returns

byte offset in input after all output bytes are sent
9.134.3.36  tab_distance()

int Fl_Text_Buffer::tab_distance ( ) const  [inline]
Gets the tab width.
The tab width is measured in characters. The pixel position is calculated using an average character width.

9.134.3.37  text() [1/2]

char * Fl_Text_Buffer::text ( ) const
Get a copy of the entire contents of the text buffer.
Memory is allocated to contain the returned string, which the caller must free.

Returns
newly allocated text buffer - must be free'd, text is UTF-8

9.134.3.38  text() [2/2]

void Fl_Text_Buffer::text ( const char * text )
Replaces the entire contents of the text buffer.

Parameters

| text | Text must be valid UTF-8. If null, an empty string is substituted. |

9.134.3.39  text_range()

char * Fl_Text_Buffer::text_range ( int start, int end ) const
Get a copy of a part of the text buffer.
Return a copy of the text between start and end character positions from text buffer buf. Positions start at 0, and the range does not include the character pointed to by end. When you are done with the text, free it using the free() function.

Parameters

| start | byte offset to first character |
| end   | byte offset after last character in range |

Returns
newly allocated text buffer - must be free'd, text is UTF-8

9.134.3.40  word_end()

int Fl_Text_Buffer::word_end ( int pos ) const
Returns the position corresponding to the end of the word.

Parameters

| pos   | byte index into buffer |
Returns

byte offset to word end

9.134.3.41 word_start()

int Fl_Text_Buffer::word_start (  
    int pos ) const  
Returns the position corresponding to the start of the word.

Parameters

| pos | byte index into buffer |

Returns

byte offset to word start

9.134.4 Member Data Documentation

9.134.4.1 file_encoding_warning_message

const char * Fl_Text_Buffer::file_encoding_warning_message  [static]  
Initial value:

=  
"Displayed text contains the UTF-8 transcoding\n"  
"of the input file which was not UTF-8 encoded.\n"  
"Some changes may have occurred."

This message may be displayed using the fl_alert() function when a file which was not UTF-8 encoded is input.

9.134.4.2 mTabDist

int Fl_Text_Buffer::mTabDist  [protected]  
equiv.  
number of characters in a tab

9.134.4.3 transcoding_warning_action

void(* Fl_Text_Buffer::transcoding_warning_action) (Fl_Text_Buffer *)  
Pointer to a function called after reading a non UTF-8 encoded file.  
This function is called after reading a file if the file content was transcoded to UTF-8. Its default implementation calls  
fl_alert() with the text of file_encoding_warning_message. No warning message is displayed if this pointer is set to  
NULL. Use input_file_was_transcoded to be informed if file input required transcoding to UTF-8.  
The documentation for this class was generated from the following files:

• Fl_Text_Buffer.H  
• Fl_Text_Buffer.cxx

9.135 Fl_Text_Display Class Reference

Rich text display widget.

#include <Fl_Text_Display.H>  
Inheritance diagram for Fl_Text_Display:
Classes

• struct Style_Table_Entry

  This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.

Public Types

• enum {
  NORMAL_CURSOR, CARET_CURSOR, DIM_CURSOR, BLOCK_CURSOR, HEAVY_CURSOR, SIMPLE_CURSOR
}

text display cursor shapes enumeration

• enum { CURSOR_POS, CHARACTER_POS }

  the character position is the left edge of a character, whereas the cursor is thought to be between the centers of two consecutive characters.

• enum {
  DRAG_NONE = -2, DRAG_START_DND = -1, DRAG_CHAR = 0, DRAG_WORD = 1, DRAG_LINE = 2
}

drag types - they match Fl::event_clicks() so that single clicking to start a collection selects by character, double clicking selects by word and triple clicking selects by line.

• enum { WRAP_NONE, WRAP_AT_COLUMN, WRAP_AT_PIXEL, WRAP_AT_BOUNDS }

  wrap types - used in wrap_mode()

  • typedef void(* Unfinished_Style_Cb) (int, void *)

Public Member Functions

• Fl_Text_Buffer * buffer () const

  Gets the current text buffer associated with the text widget.

• void buffer (Fl_Text_Buffer &buf)

  Sets the current text buffer associated with the text widget.

• void buffer (Fl_Text_Buffer *buf)

  Attach a text buffer to display, replacing the current buffer (if any)

• double col_to_x (double col) const

  Convert a column number into an x pixel position.

• int count_lines (int start, int end, bool start_pos_is_line_start) const

  Count the number of lines between two positions.

• Fl_Color cursor_color () const

  Gets the text cursor color.

• void cursor_color (Fl_Color n)

  Sets the text cursor color.

• void cursor_style (int style)

  Sets the text cursor style.

• Fl_Text_Display (int X, int Y, int W, int H, const char *l=0)

  Creates a new text display widget.
• virtual int handle (int e)
  
  Event handling.
• void hide_cursor ()
  
  Hides the text cursor.
• void highlight_data (Fl_Text_Buffer ∗styleBuffer, const Style_Table_Entry ∗styleTable, int nStyles, char unfinishedStyle, Unfinished_Style_Cb unfinishedHighlightCB, void ∗cbArg)
  
  Attach (or remove) highlight information in text display and redisplay.
• int in_selection (int x, int y) const
  
  Check if a pixel position is within the primary selection.
• void insert (const char ∗text)
  
  Inserts "text" at the current cursor location.
• int insert_position () const
  
  Gets the position of the text insertion cursor for text display.
• void insert_position (int newPos)
  
  Sets the position of the text insertion cursor for text display.
• int line_end (int startPos, bool startPosIsLineStart) const
  
  Returns the end of a line.
• int line_start (int pos) const
  
  Return the beginning of a line.
• Fl_Align linenumber_align () const
  
  Returns the alignment used for line numbers (if enabled).
• void linenumber_align (Fl_Align val)
  
  Set alignment for line numbers (if enabled).
• Fl_Color linenumberbgcolor () const
  
  Returns the background color used for line numbers (if enabled).
• void linenumberbgcolor (Fl_Color val)
  
  Set the background color used for line numbers (if enabled).
• Fl_Color linenumberfgcolor () const
  
  Return the foreground color used for line numbers (if enabled).
• void linenumberfgcolor (Fl_Color val)
  
  Set the foreground color used for line numbers (if enabled).
• Fl_Font linenumber_font () const
  
  Return the font used for line numbers (if enabled).
• void linenumber_font (Fl_Font val)
  
  Set the font used for line numbers (if enabled).
• const char ∗linenumber_format () const
  
  Returns the line number printf() format string.
• void linenumber_format (const char ∗val)
  
  Sets the printf() style format string used for line numbers.
• Fl_Fontsize linenumber_size () const
  
  Return the font size used for line numbers (if enabled).
• void linenumber_size (Fl_Fontsize val)
  
  Set the font size used for line numbers (if enabled).
• int linenumber_width () const
  
  Return the screen area width provided for line numbers.
• void linenumber_width (int width)
  
  Set width of screen area for line numbers.
• int move_down ()
  
  Moves the current insert position down one line.
• int move_left ()
  
  Moves the current insert position left one character.
• int move_right ()
  Moves the current insert position right one character.
• int move_up ()
  Moves the current insert position up one line.
• void next_word (void)
  Moves the current insert position right one word.
• void overstrike (const char ∗text)
  Replaces text at the current insert position.
• int position_style (int lineStartPos, int lineLen, int lineIndex) const
  Find the correct style for a character.
• int position_to_xy (int pos, int ∗x, int ∗y) const
  Convert a character index into a pixel position.
• void previous_word (void)
  Moves the current insert position left one word.
• void redisplay_range (int start, int end)
  Marks text from start to end as needing a redraw.
• virtual void resize (int X, int Y, int W, int H)
  Change the size of the displayed text area.
• int rewind_lines (int startPos, int nLines)
  Skip a number of lines back.
• void scroll (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.
• Fl_Align scrollbar_align () const
  Gets the scrollbar alignment type.
• void scrollbar_align (Fl_Align a)
  Sets the scrollbar alignment type.
• int scrollbar_width () const
  Gets the width/height of the scrollbars.
• void scrollbar_width (int W)
  Sets the width/height of the scrollbars.
• int shortcut () const
• void shortcut (int s)
• void show_cursor (int b=1)
  Shows the text cursor.
• void show_insert_position ()
  Scrolls the text buffer to show the current insert position.
• int skip_lines (int startPos, int nLines, bool startPosIsLineStart)
  Skip a number of lines forward.
• Fl_Color textcolor () const
  Gets the default color of text in the widget.
• void textcolor (Fl_Color n)
  Sets the default color of text in the widget.
• Fl_Font textfont () const
  Gets the default font used when drawing text in the widget.
• void textfont (Fl_Font s)
  Sets the default font used when drawing text in the widget.
• Fl_Fontsize textsize () const
  Gets the default size of text in the widget.
• void textsize (Fl_Fontsize s)
  Sets the default size of text in the widget.
• int word_end (int pos) const
Moves the insert position to the end of the current word.

- int word_start (int pos) const
  Moves the insert position to the beginning of the current word.

- void wrap_mode (int wrap, int wrap_margin)
  Set the new text wrap mode.

- int wrapped_column (int row, int column) const
  Nobody knows what this function does.

- int wrapped_row (int row) const
  Nobody knows what this function does.

- double x_to_col (double x) const
  Convert an x pixel position into a column number.

- ~Fl_Text_Display ()
  Free a text display and release its associated memory.

Public Member Functions inherited from Fl_Group

- Fl_Widget * & dddfdesign_kludge ()
  This is for forms compatibility only.

- void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

- void add (Fl_Widget &o)
  See void Fl_Group::add(Fl_Widget &w)

- void addResizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

- Fl_Widget * & const * array () const
  Returns a pointer to the array of children.

- virtual Fl_Group * & as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

- Fl_Widget * & child (int n) const
  Returns array()[n].

- int children () const
  Returns how many child widgets the group has.

- void clear ()
  Deletes all child widgets from memory recursively.

- unsigned int clip_children ()
  Returns the current clipping mode.

- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- void end ()
  Exactly the same as current(this->parent()).

- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget &w) const.

- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.

- Fl_Group (int, int, int, int, const char * =0)
  Creates a new Fl_Group widget using the given position, size, and label string.

- void focus (Fl_Widget &W)
  void forms_end ()
  This is for forms compatibility only.
• void init_sizes ()
  Resets the internal array of widget sizes and positions.
• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
• void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
• void remove (Fl_Widget *o)
  Removes the widget o from the group.
• void remove (int index)
  Removes the widget at index from the group but does not delete it.
• Fl_Widget * resizable () const
  See void Fl_Group::resizable(Fl_Widget *box)
• void resizable (Fl_Widget &o)
  See void Fl_Group::resizable(Fl_Widget *box)
• void resizable (Fl_Widget *o)
  The resizable widget defines the resizing box for the group.
• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function for the widget.
• void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗ w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗ new_label)
  Sets the current label.
• void copy_tooltip (const char ∗ text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label.
• const Fl_Image ∗ deimage () const
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void **deimage** (**Fl__Image** img)
  
  Sets the image to use as part of the widget label.

• void **do_callback** ()
  
  Calls the widget callback.

• void **do_callback** (**Fl__Widget** w, long arg)
  
  Calls the widget callback.

• void **do_callback** (**Fl__Widget** w, void **arg=**0)
  
  Calls the widget callback.

• void **draw_label** (int, int, int, int, **Fl__Align** ) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int **h** () const
  
  Gets the widget height.

• virtual void **hide** ()
  
  Makes a widget invisible.

• **Fl__Image** * **image** ()
  
  Gets the image that is used as part of the widget label.

• const **Fl__Image** * **image** () const
  
  Sets the image to use as part of the widget label.

• void **image** (**Fl__Image** &img)
  
  Sets the image to use as part of the widget label.

• void **image** (**Fl__Image** img)
  
  Sets the image to use as part of the widget label.

• int **inside** (**const** **Fl__Widget** wgt) const
  
  Checks if this widget is a child of wgt.

• int **is_label_copied** () const
  
  Returns whether the current label was assigned with copy_label().

• **const** char * **label** () const
  
  Gets the current label text.

• void **label** (**const** char * text)
  
  Sets the current label pointer.

• void **label** (**Fl__Labeltype** a, **const** char * b)
  
  Shortcut to set the label text and type in one call.

• **Fl__Color** **labelcolor** () const
  
  Gets the label color.

• void **labelcolor** (**Fl__Color** c)
  
  Sets the label color.

• **Fl__Font** **labelfont** () const
  
  Gets the font to use.

• void **labelfont** (**Fl__Font** f)
  
  Sets the font to use.

• **Fl__Fontsize** **labelsiz**e () const
  
  Gets the font size in pixels.

• void **labelsiz**e (**Fl__Fontsize** pix)
  
  Sets the font size in pixels.

• **Fl__Labeltype** **labeltype** () const
  
  Gets the label type.

• void **labeltype** (**Fl__Labeltype** a)
  
  Sets the label type.

• void **measure_label** (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• unsigned int **output** () const
  
  Returns if a widget is used for output only.
• **FL_Group** * parent () const
  Returns a pointer to the parent widget.

• void parent (**FL_Group** &p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• **FL_Color** selection_color () const
  Gets the selection color.

• void selection_color (**FL_Color** a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• virtual void show ()
  Makes a widget visible.

• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• **FL_Window** * top_window () const
  Returns a pointer to the top-level window for the widget.

• **FL_Window** * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (void *v)
Sets the user data for this widget.

- unsigned int visible() const
  Returns whether a widget is visible.
- unsigned int visible_focus()
  Checks whether this widget has a visible focus.
- void visible_focus(int v)
  Modifies keyboard focus navigation.
- int visible_r() const
  Returns whether a widget and all its parents are visible.
- int w() const
  Gets the widget width.
- Fl_When when() const
  Returns the conditions under which the callback is called.
- void when(uchar i)
  Sets the flags used to decide when a callback is called.
- Fl_Window* window() const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- int x() const
  Gets the widget position in its window.
- int y() const
  Gets the widget position in its window.
- virtual ~Fl_Widget()
  Destroys the widget.

Protected Types

- enum { DRAW_LINE, FIND_INDEX, FIND_INDEX_FROM_ZERO, GET_WIDTH }

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12,_TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions

- void absolute_top_line_number(int oldFirstChar)
  Line numbering stuff, currently unused.
- void calc_last_char()
  Update last display character index.
- void calc_line_starts(int startLine, int endLine)
  Update the line start arrays.
- void clear_rect(int style, int x, int y, int width, int height) const
  Clear a rectangle with the appropriate background color for style.
- void display_insert()
Scroll the display to bring insertion cursor into view.

- **virtual void draw ()**
  
  Draw the widget.

- **void draw_cursor (int, int)**
  
  Draw a cursor with top center at \( x, y \).

- **void draw_line_numbers (bool clearAll)**
  
  Refresh the line number area.

- **void draw_range (int start, int end)**
  
  Draw a range of text.

- **void draw_string (int style, int x, int y, int toX, const char ∗string, int nChars) const**
  
  Draw a text segment in a single style.

- **void draw_text (int X, int Y, int W, int H)**
  
  Refresh a rectangle of the text display.

- **void draw_vline (int visLineNum, int leftClip, int rightClip, int leftCharIndex, int rightCharIndex)**
  
  Draw a single line of text.

- **int empty_vlines () const**
  
  Return true if there are lines visible with no corresponding buffer text.

- **void extend_range_for_styles (int ∗start, int ∗end)**
  
  I don't know what this does!

- **void find_line_end (int pos, bool start_pos_is_line_start, int ∗lineEnd, int ∗nextLineStart) const**
  
  Finds both the end of the current line and the start of the next line.

- **void find_wrap_range (const char ∗deletedText, int pos, int nInserted, int nDeleted, int ∗modRangeStart, int ∗modRangeEnd, int ∗linesInserted, int ∗linesDeleted)**
  
  Wrapping calculations.

- **int find_x (const char ∗s, int len, int style, int x) const**
  
  Find the index of the character that lies at the given \( x \) position.

- **int get_absolute_top_line_number () const**
  
  Line numbering stuff, currently unused.

- **int handle_vline (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const**
  
  Universal pixel machine.

- **int longest_vline () const**
  
  Find the longest line of all visible lines.

- **void maintain_absolute_top_line_number (int state)**
  
  Line numbering stuff, currently unused.

- **int maintaining_absolute_top_line_number () const**
  
  Line numbering stuff, currently unused.

- **void measure_deleted_lines (int pos, int nDeleted)**
  
  Wrapping calculations.

- **double measure_proportional_character (const char ∗s, int colNum, int pos) const**
  
  Wrapping calculations.

- **int measure_vline (int visLineNum) const**
  
  Returns the width in pixels of the displayed line pointed to by "visLineNum".

- **void offset_line_starts (int newTopLineNum)**
  
  Offset line start counters for a new vertical scroll position.

- **int position_to_line (int pos, int ∗lineNum) const**
  
  Convert a position index into a line number offset.

- **int position_to_linecol (int pos, int ∗lineNum, int ∗column) const**
  
  Find the line and column number of position \( pos \).

- **void reset_absolute_top_line_number ()**
  
  Line numbering stuff, probably unused.
• int scroll_ (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.
• double string_width (const char *string, int length, int style) const
  Find the width of a string in the font of a particular style.
• void update_h_scrollbar ()
  Update horizontal scrollbar.
• void update_line_starts (int pos, int charsInserted, int charsDeleted, int linesInserted, int linesDeleted, int *scrolled)
  Update line start arrays and variables.
• void update_v_scrollbar ()
  Update vertical scrollbar.
• int vline_length (int visLineNum) const
  Count number of bytes in a visible line.
• int wrap_uses_character (int lineEndPos) const
  Check if the line break is caused by a \n or by line wrapping.
• void wrapped_line_counter (Fl_Text_Buffer *buf, int startPos, int maxPos, int maxLines, bool startPosIs← LineStart, int styleBufOffset, int *retPos, int *retLines, int *retLineStart, int *retLineEnd, bool countLast← LineMissingNewLine=true) const
  Wrapping calculations.
• int xy_to_position (int x, int y, int PosType=CHARACTER_POS) const
  Translate a pixel position into a character index.
• void xy_to_rowcol (int x, int y, int *row, int *column, int PosType=CHARACTER_POS) const
  Translate pixel coordinates into row and column.

Protected Member Functions inherited from Fl_Group

• void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
• void draw_children ()
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (FL_Fboxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (FL_Fboxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus ()
  draws a focus rectangle around the widget
• void draw_focus (FL_Fboxtype t, int x, int y, int w, int h) const

Generated by Doxygen
Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  Draws the widget’s label at the defined label position.

- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- **Fl_Widget** (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int **flags** () const
  Gets the widget flags mask.

- void **h** (int v)
  Internal use only.

- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.

- void **w** (int v)
  Internal use only.

- void **x** (int v)
  Internal use only.

- void **y** (int v)
  Internal use only.

### Static Protected Member Functions

- static void **buffer_modified_cb** (int pos, int nInserted, int nDeleted, int nRestyled, const char *deletedText, void *cbArg)
  This is called whenever the buffer is modified.

- static void **buffer_predelete_cb** (int pos, int nDeleted, void *cbArg)
  This is called before any characters are deleted.

- static void **h_scrollbar_cb** (Fl_Scrollbar *w, Fl_Text_Display *d)
  Callbacks for drag or valueChanged on horizontal scrollbar.

- static void **scroll_timer_cb** (void *cbArg)
  Timer callback for scroll events.

- static void **v_scrollbar_cb** (Fl_Scrollbar *w, Fl_Text_Display *d)
  Callbacks for drag or valueChanged on vertical scrollbar.

### Protected Attributes

- int **damage_range1_end**
- int **damage_range1_start**
- int **damage_range2_end**
- int **damage_range2_start**
- int **display_insert_position_hint**
- int **dragging**
- int **dragPos**
- int **dragType**
- **Fl_Align** **linenumber_align_**
- **Fl_Color** **linenumberbgcolor_**

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

• static Fl_Group∗ current ()
  Returns the currently active group.

• static void current (Fl_Group∗ g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget∗ cb, void∗ d)
  The default callback for all widgets that don’t set a callback.

• static unsigned int label_shortcut (const char∗ t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int test_shortcut (const char∗ t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

9.135.1 Detailed Description

Rich text display widget.
This is the FLTK text display widget. It allows the user to view multiple lines of text and supports highlighting, word wrap, mixes of font faces and colors, line numbers and scrolling. The buffer that is displayed in the widget is managed by the Fl_Text_Buffer class. A single Text Buffer can be displayed by multiple Text Displays.

Example Use
```cpp
#include <FL/FL_Text_Display.H>
..:
int main() {
  Fl_Text_Buffer *buff = new Fl_Text_Buffer();
  Fl_Text_Display *disp = new Fl_Text_Display(10, 10, 640, 480);
  disp->buffer(buff); // attach text buffer to display widget
  buff->text("line one\nline two"); // add some text to buffer
  ..
}
```

**Features**

- Word wrap: `wrap_mode()`, `wrapped_column()`, `wrapped_row()`
- Font control: `textfont()`, `textsize()`, `textcolor()`
- Font styling: `highlight_data()`
- Cursor: `cursor_style()`, `show_cursor()`, `hide_cursor()`, `cursor_color()`
- Line numbers: `linenumber_width()`, `linenumber_font()`, `linenumber_size()`, `linenumber_fgcolor()`, `linenumberbgcolor()`, `linenumber_align()`, `linenumber_format()`

Note that other features may be available via `Fl_Text_Editor` and `Fl_Text_Buffer` classes.

**Note**

Line numbers were added in 1.3.3. To avoid breaking ABI, many of its options are read only. To adjust these features in 1.3.x, you must build FLTK with FLTK_ABI_VERSION set to 10303 or higher.

### 9.135.2 Member Enumeration Documentation

#### 9.135.2.1 anonymous enum

<table>
<thead>
<tr>
<th>Enumerators</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>NORMAL_CURSOR</code></td>
<td>I-beam.</td>
</tr>
<tr>
<td><code>CARET_CURSOR</code></td>
<td>caret under the text</td>
</tr>
<tr>
<td><code>DIM_CURSOR</code></td>
<td>dim I-beam</td>
</tr>
<tr>
<td><code>BLOCK_CURSOR</code></td>
<td>unfilled box under the current character</td>
</tr>
<tr>
<td><code>HEAVY_CURSOR</code></td>
<td>thick I-beam</td>
</tr>
<tr>
<td><code>SIMPLE_CURSOR</code></td>
<td>as cursor as <code>Fl_Input</code> cursor</td>
</tr>
</tbody>
</table>

<tr>
<td><code>WRAP_AT_BOUNDS</code></td>
<td>wrap text so that it fits into the widget width</td>
</tr>
</tbody>
</table>
9.135.3 Constructor & Destructor Documentation

9.135.3.1 Fl_Text_Display()

Fl_Text_Display::Fl_Text_Display (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char * l = 0  )

Creates a new text display widget.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>X, Y, W, H</td>
</tr>
<tr>
<td>l</td>
</tr>
</tbody>
</table>

9.135.3.2 ~Fl_Text_Display()

Fl_Text_Display::~Fl_Text_Display ( )

Free a text display and release its associated memory.
Note, the text BUFFER that the text display displays is a separate entity and is not freed, nor are the style buffer or style table.

9.135.4 Member Function Documentation

9.135.4.1 absolute_top_line_number()

void Fl_Text_Display::absolute_top_line_number (  
    int oldFirstChar  ) [protected]

Re-calculate absolute top line number for a change in scroll position.

9.135.4.2 buffer() [1/3]

Fl_Text_Buffer * Fl_Text_Display::buffer ( ) const [inline]

Sets the current text buffer associated with the text widget.
Multiple text widgets can be associated with the same text buffer.

Returns

    current text buffer

9.135.4.3 buffer() [2/3]

void Fl_Text_Display::buffer (  
    Fl_Text_Buffer & buf  ) [inline]

Sets the current text buffer associated with the text widget.
Multiple text widgets can be associated with the same text buffer.

Parameters

| buf | new text buffer |

9.135.4.4 buffer() [3/3]

void Fl_Text_Display::buffer (  
    Fl_Text_Buffer * buf  )
Attach a text buffer to display, replacing the current buffer (if any)

Parameters

| buf | attach this text buffer |

9.135.4.5 buffer_modified_cb()

```c
void Fl_Text_Display::buffer_modified_cb (        
    int pos,                                          
    int nInserted,                                     
    int nDeleted,                                      
    int nRestyled,                                    
    const char * deletedText,                         
    void * cbArg ) [static], [protected]             
```

This is called whenever the buffer is modified.
Callback attached to the text buffer to receive modification information
This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or text in this callback, or line counting may get out of sync.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>starting index of modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>nInserted</td>
<td>number of bytes we inserted (must be UTF-8 aligned!)</td>
</tr>
<tr>
<td>nDeleted</td>
<td>number of bytes deleted (must be UTF-8 aligned!)</td>
</tr>
<tr>
<td>nRestyled</td>
<td>??</td>
</tr>
<tr>
<td>deletedText</td>
<td>this is what was removed, must not be NULL if nDeleted is set</td>
</tr>
<tr>
<td>cbArg</td>
<td>&quot;this&quot; pointer for static callback function</td>
</tr>
</tbody>
</table>

9.135.4.6 buffer_predelete_cb()

```c
void Fl_Text_Display::buffer_predelete_cb (    
    int pos,                                          
    int nDeleted,                                      
    void * cbArg ) [static], [protected]             
```

This is called before any characters are deleted.
Callback attached to the text buffer to receive delete information before the modifications are actually made.
This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or text in this callback, or line counting may get out of sync.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>starting index of deletion</th>
</tr>
</thead>
<tbody>
<tr>
<td>nDeleted</td>
<td>number of bytes we will delete (must be UTF-8 aligned!)</td>
</tr>
<tr>
<td>cbArg</td>
<td>&quot;this&quot; pointer for static callback function</td>
</tr>
</tbody>
</table>

9.135.4.7 calc_last_char()

```c
void Fl_Text_Display::calc_last_char ( ) [protected]                      
```

Update last display character index.
Given a Fl_Text_Display with a complete, up-to-date lineStarts array, update the lastChar entry to point to the last buffer position displayed.
9.135.4.8 calc_line_starts()

void Fl_Text_Display::calc_line_starts (  
    int startLine,  
    int endLine   ) [protected]

Update the line start arrays.  
Scan through the text in the "textD"s buffer and recalculate the line starts array values beginning at index "startLine" and continuing through (including) "endLine".  It assumes that the line starts entry preceding "startLine" (or mFirstChar if startLine is 0) is good, and re-counts newlines to fill in the requested entries.  Out of range values for "startLine" and "endLine" are acceptable.

Parameters

| startLine,endLine | range of lines to scan as line numbers |

9.135.4.9 clear_rect()

void Fl_Text_Display::clear_rect (  
    int style,  
    int X,  
    int Y,  
    int width,  
    int height ) const [protected]

Clear a rectangle with the appropriate background color for style.

Parameters

<table>
<thead>
<tr>
<th>style</th>
<th>index into style table</th>
</tr>
</thead>
<tbody>
<tr>
<td>X,Y,width,height</td>
<td>size and position of background area</td>
</tr>
</tbody>
</table>

9.135.4.10 col_to_x()

double Fl_Text_Display::col_to_x (  
    double col ) const

Convert a column number into an x pixel position.

Parameters

| col | an approximate column number based on the main font |

Returns

number of pixels from the left margin to the left of an average sized character

9.135.4.11 count_lines()

int Fl_Text_Display::count_lines (  
    int startPos,  
    int endPos,  
    bool startPosIsLineStart ) const

Count the number of lines between two positions.  
Same as Fl_Text_Buffer::count_lines(), but takes into account wrapping if wrapping is turned on.  If the caller knows that startPos is at a line start, it can pass startPosIsLineStart as True to make the call more efficient by avoiding the additional step of scanning back to the last newline.
Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>index to first character</th>
</tr>
</thead>
<tbody>
<tr>
<td>endPos</td>
<td>index after last character</td>
</tr>
<tr>
<td>startPosIsLineStart</td>
<td>avoid scanning back to the line start</td>
</tr>
</tbody>
</table>

Returns

number of lines

9.135.4.12 cursor_color() [1/2]

Fl_Color Fl_Text_Display::cursor_color ( ) const [inline]

Gets the text cursor color.

Returns

cursor color

9.135.4.13 cursor_color() [2/2]

void Fl_Text_Display::cursor_color ( Fl_Color n ) [inline]

Sets the text cursor color.

Parameters

| n | new cursor color |

9.135.4.14 cursor_style()

void Fl_Text_Display::cursor_style ( int style )

Sets the text cursor style.

Sets the text cursor style to one of the following:

- Fl_Text_Display::NORMAL_CURSOR - Shows an I beam.
- Fl_Text_Display::CARET_CURSOR - Shows a caret under the text.
- Fl_Text_Display::DIM_CURSOR - Shows a dimmed I beam.
- Fl_Text_Display::BLOCK_CURSOR - Shows an unfilled box around the current character.
- Fl_Text_Display::HEAVY_CURSOR - Shows a thick I beam.

This call also switches the cursor on and may trigger a redraw.

Parameters

| style | new cursor style |

9.135.4.15 display_insert()

void Fl_Text_Display::display_insert ( ) [protected]
Scroll the display to bring insertion cursor into view.
Note: it would be nice to be able to do this without counting lines twice (scroll_() counts them too) and/or to count
from the most efficient starting point, but the efficiency of this routine is not as important to the overall performance
of the text display.

**Todo** Unicode?

### 9.135.4.16 draw()

```cpp
def draw():
    # [protected], [virtual]
    # Draw the widget.
    # This function tries to limit drawing to smaller areas if possible.
    # Reimplemented from Fl_Group.
```

### 9.135.4.17 draw_cursor()

```cpp
def draw_cursor(x, y):
    # [protected]
    # Draw a cursor with top center at X, Y.
```

**Parameters**

| X, Y | cursor position in pixels |

### 9.135.4.18 draw_line_numbers()

```cpp
def draw_line_numbers(clearAll):
    # [protected]
    # Refresh the line number area.
```

**Parameters**

| clearAll | (currently unused) If False, only draws the line number text, does not clear the area behind it. If True, clears the area and redraws the text. Use False to avoid a ‘flash’ for single buffered windows. |

### 9.135.4.19 draw_range()

```cpp
def draw_range(startpos, endpos):
    # [protected]
    # Draw a range of text.
    # Refresh all of the text between buffer positions startpos and endpos not including the character at the position endpos.
    # If endpos points beyond the end of the buffer, refresh the whole display after startpos, including blank lines which are not technically part of any range of characters.
```

**Parameters**

| startpos | index of first character to draw |
| endpos   | index after last character to draw |
9.135.4.20 draw_string()

```cpp
void Fl_Text_Display::draw_string (  
    int style,  
    int X,  
    int Y,  
    int toX,  
    const char * string,  
    int nChars ) const [protected]
```

Draw a text segment in a single style.
Draw a string or blank area according to parameter `style`, using the appropriate colors and drawing method for that style, with top left corner at `X, Y`. If style says to draw text, use `string` as source of characters, and draw `nChars`. If style is `FILL`, erase rectangle where text would have drawn from `X` to `toX` and from `Y` to the maximum `y` extent of the current font(s).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>style</code></td>
<td>index into style lookup table</td>
</tr>
<tr>
<td><code>X,Y</code></td>
<td>drawing origin</td>
</tr>
<tr>
<td><code>toX</code></td>
<td>rightmost position if this is a fill operation</td>
</tr>
<tr>
<td><code>string</code></td>
<td>text if this is a drawing operation</td>
</tr>
<tr>
<td><code>nChars</code></td>
<td>number of characters to draw</td>
</tr>
</tbody>
</table>

9.135.4.21 draw_text()

```cpp
void Fl_Text_Display::draw_text (  
    int left,  
    int top,  
    int width,  
    int height ) [protected]
```

Refresh a rectangle of the text display.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>left,top</code></td>
<td>are in coordinates of the text drawing window.</td>
</tr>
<tr>
<td><code>width,height</code></td>
<td>size in pixels</td>
</tr>
</tbody>
</table>

9.135.4.22 draw_vline()

```cpp
void Fl_Text_Display::draw_vline (  
    int visLineNum,  
    int leftClip,  
    int rightClip,  
    int leftCharIndex,  
    int rightCharIndex ) [protected]
```

Draw a single line of text.
Draw the text on a single line represented by `visLineNum` (the number of lines down from the top of the display), limited by `leftClip` and `rightClip` window coordinates and `leftCharIndex` and `rightCharIndex` character positions (not including the character at position `rightCharIndex`).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>visLineNum</code></td>
<td>index of line in the visible line number lookup</td>
</tr>
<tr>
<td><code>leftClip,rightClip</code></td>
<td>pixel position of clipped area</td>
</tr>
<tr>
<td><code>leftCharIndex,rightCharIndex</code></td>
<td>index into line of segment that we want to draw</td>
</tr>
</tbody>
</table>
9.135.4.23 empty_vlines()

```cpp
text_list::empty_vlines ( ) const [protected]
```

Return true if there are lines visible with no corresponding buffer text.

Returns

1 if there are empty lines

9.135.4.24 extend_range_for_styles()

```cpp
void Fl_Text_Display::extend_range_for_styles (int *startpos, int *endpos) [protected]
```

I don't know what this does!

Extend the range of a redraw request (from `startpos` to `endpos`) with additional redraw requests resulting from changes to the attached style buffer (which contains auxiliary information for coloring or styling text).

Parameters

| startPos | ?? |
| endpos   | ?? |

Todo Unicode?

9.135.4.25 find_line_end()

```cpp
void Fl_Text_Display::find_line_end (int startPos, bool startPosIsLineStart, int *lineEnd, int *nextLineStart) const [protected]
```

Finds both the end of the current line and the start of the next line.

Why? In continuous wrap mode, if you need to know both, figuring out one from the other can be expensive or error prone. The problem comes when there's a trailing space or tab just before the end of the buffer. To translate an end of line value to or from the next lines start value, you need to know whether the trailing space or tab is being used as a line break or just a normal character, and to find that out would otherwise require counting all the way back to the beginning of the line.

Parameters

| startPos | ??? |
| startPosIsLineStart | |
| lineEnd | |
| nextLineStart | |

9.135.4.26 find_wrap_range()

```cpp
void Fl_Text_Display::find_wrap_range (const char *deletedText, int pos, int nInserted, int nDeleted, int *modRangeStart, int *modRangeEnd,
```

Generated by Doxygen
Wrapping calculations.
When continuous wrap is on, and the user inserts or deletes characters, wrapping can happen before and beyond
the changed position. This routine finds the extent of the changes, and counts the deleted and inserted lines over
that range. It also attempts to minimize the size of the range to what has to be counted and re-displayed, so the
results can be useful both for delimiting where the line starts need to be recalculated, and for deciding what part of
the text to redisplay.

### Parameters

- `deletedText`
- `pos`
- `nInserted`
- `nDeleted`
- `modRangeStart`
- `modRangeEnd`
- `linesInserted`
- `linesDeleted`

#### 9.135.4.27 find_x()

```cpp
int Fl_Text_Display::find_x (const char * s, int len, int style, int x) const [protected]
```

Find the index of the character that lies at the given x position.

**Parameters**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>s</code></td>
<td>UTF-8 text string</td>
</tr>
<tr>
<td><code>len</code></td>
<td>length of string</td>
</tr>
<tr>
<td><code>style</code></td>
<td>index into style lookup table</td>
</tr>
<tr>
<td><code>x</code></td>
<td>position in pixels</td>
</tr>
</tbody>
</table>

**Returns**

index into buffer

#### 9.135.4.28 get_absolute_top_line_number()

```cpp
int Fl_Text_Display::get_absolute_top_line_number () const [protected]
```

Line numbering stuff, currently unused.

Returns the absolute (non-wrapped) line number of the first line displayed. Returns 0 if the absolute top line number
is not being maintained.

#### 9.135.4.29 handle()

```cpp
int Fl_Text_Display::handle (int e) [virtual]
```

Event handling.

Reimplemented from `Fl_Group`.

Reimplemented in `Fl_Text_Editor`.
9.135.4.30 handle_vline()

```cpp
int Fl_Text_Display::handle_vline ( 
    int mode, 
    int lineStartPos, 
    int len, 
    int leftChar, 
    int rightChar, 
    int Y, 
    int bottomClip, 
    int leftClip, 
    int rightClip ) const [protected]
```

Universal pixel machine.
We use a single function that handles all line layout, measuring, and drawing
• draw a text range
• return the width of a text range in pixels
• return the index of a character that is at a pixel position

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>mode</th>
<th>DRAW_LINE, GET_WIDTH, FIND_INDEX</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>lineStartPos</td>
<td>index of first character</td>
</tr>
<tr>
<td>in</td>
<td>len</td>
<td>size of string in bytes</td>
</tr>
<tr>
<td>in</td>
<td>leftChar, rightChar</td>
<td>drawing position</td>
</tr>
<tr>
<td>in</td>
<td>Y</td>
<td></td>
</tr>
<tr>
<td>in</td>
<td>bottomClip, leftClip, rightClip</td>
<td>stop work when we reach the clipped area. rightClip is the X position that we search in FIND_INDEX.</td>
</tr>
</tbody>
</table>

**Return values**

| DRAW_LINE | index of last drawn character |
| GET_WIDTH | width in pixels of text segment if we would draw it |
| FIND_INDEX | index of character at given x position in window coordinates |
| FIND_INDEX_FROM_ZERO | index of character at given x position without scrolling and widget offsets |

**Todo** we need to handle hidden hyphens and tabs here!
we handle all styles and selections
we must provide code to get pixel positions of the middle of a character as well

9.135.4.31 highlight_data()

```cpp
void Fl_Text_Display::highlight_data ( 
    Fl_Text_Buffer *styleBuffer, 
    const Style_Table_Entry *styleTable, 
    int nStyles, 
    char unfinishedStyle, 
    Unfinished_Style_Cb unfinishedHighlightCB, 
    void *cbArg )
```

Attach (or remove) highlight information in text display and redisplay.
Highlighting information consists of a style buffer which parallels the normal text buffer, but codes font and color information for the display; a style table which translates style buffer codes (indexed by buffer character - 'A') into fonts
and colors; and a callback mechanism for as-needed highlighting, triggered by a style buffer entry of "unfinished → Style". Style buffer can trigger additional redisplay during a normal buffer modification if the buffer contains a primary Fl_Text_Selection (see extendRangeForStyleMods for more information on this protocol). Style buffers, tables and their associated memory are managed by the caller. Styles are ranged from 65 ('A') to 126.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>styleBuffer</td>
<td>this buffer works in parallel to the text buffer. For every character in the text buffer, the style buffer has a byte at the same offset that contains an index into an array of possible styles.</td>
</tr>
<tr>
<td>styleTable</td>
<td>a list of styles indexed by the style buffer</td>
</tr>
<tr>
<td>nStyles</td>
<td>number of styles in the style table</td>
</tr>
<tr>
<td>unfinishedStyle</td>
<td>if this style is found, the callback below is called</td>
</tr>
<tr>
<td>unfinishedHighlightCB</td>
<td>if a character with an unfinished style is found, this callback will be called</td>
</tr>
<tr>
<td>cbArg</td>
<td>and optional argument for the callback above, usually a pointer to the Text Display.</td>
</tr>
</tbody>
</table>

9.135.4.32 in_selection()

```cpp
int Fl_Text_Display::in_selection ( int X, int Y ) const
```

Check if a pixel position is within the primary selection.

Parameters

| X,Y | pixel position to test |

Returns

1 if position (X, Y) is inside of the primary Fl_Text_Selection

9.135.4.33 insert()

```cpp
void Fl_Text_Display::insert ( const char* text )
```

Inserts "text" at the current cursor location.
This has the same effect as inserting the text into the buffer using BufInsert and then moving the insert position after the newly inserted text, except that it's optimized to do less redrawing.

Parameters

| text | new text in UTF-8 encoding. |

9.135.4.34 insert_position() [1/2]

```cpp
int Fl_Text_Display::insert_position ( ) const [inline]
```

Gets the position of the text insertion cursor for text display.

Returns

insert position index into text buffer
### 9.135.4.35 insert_position() [2/2]

```cpp
text
    void Fl_Text_Display::insert_position (int newPos)
```

Sets the position of the text insertion cursor for text display. Move the insertion cursor in front of the character at `newPos`. This function may trigger a redraw.

**Parameters**
- `newPos`: new caret position

### 9.135.4.36 line_end()

```cpp
text
    int Fl_Text_Display::line_end (int startPos, bool startPosIsLineStart) const
```

Returns the end of a line. Same as `BufEndOfLine`, but takes into account line breaks when wrapping is turned on. If the caller knows that `startPos` is at a line start, it can pass `true` for `startPosIsLineStart` as True to make the call more efficient by avoiding the additional step of scanning back to the last newline.

Note that the definition of the end of a line is less clear when continuous wrap is on. With continuous wrap off, it's just a pointer to the newline that ends the line. When it's on, it's the character beyond the last displayable character on the line, where a whitespace character which has been "converted" to a newline for wrapping is not considered displayable. Also note that a line can be wrapped at a non-whitespace character if the line had no whitespace. In this case, this routine returns a pointer to the start of the next line. This is also consistent with the model used by `visLineLength`.

**Parameters**
- `startPos`: index to starting character
- `startPosIsLineStart`: avoid scanning back to the line start

Returns
- new position as index

### 9.135.4.37 line_start()

```cpp
text
    int Fl_Text_Display::line_start (int pos) const
```

Return the beginning of a line. Same as `BufStartOfLine`, but returns the character after last wrap point rather than the last newline.

**Parameters**
- `pos`: index to starting character

Returns
- new position as index

### 9.135.4.38 linenumber_align()

```cpp
text
    void Fl_Text_Display::linenumber_align (Fl_Align val)
```

Set alignment for line numbers (if enabled).
Valid values are FL_ALIGN_LEFT, FL_ALIGN_CENTER or FL_ALIGN_RIGHT.

Version

1.3.3 ABI feature (ignored in 1.3.x unless FLTK_ABI_VERSION is 10303 or higher)

9.135.4.39 linenumberbgcolor()

void Fl_Text_Display::linenumberbgcolor ( 
   Fl_Color val )

Set the background color used for line numbers (if enabled).

Version

1.3.3 ABI feature (ignored in 1.3.x unless FLTK_ABI_VERSION is 10303 or higher)

9.135.4.40 linenumberfgcolor()

void Fl_Text_Display::linenumberfgcolor ( 
   Fl_Color val )

Set the foreground color used for line numbers (if enabled).

Version

1.3.3 ABI feature (ignored in 1.3.x unless FLTK_ABI_VERSION is 10303 or higher)

9.135.4.41 linenumberfont()

void Fl_Text_Display::linenumberfont ( 
   Fl_Font val )

Set the font used for line numbers (if enabled).

Version

1.3.3 ABI feature (ignored in 1.3.x unless FLTK_ABI_VERSION is 10303 or higher)

9.135.4.42 linenumberformat()

void Fl_Text_Display::linenumberformat ( 
   const char ∗ val )

Sets the printf() style format string used for line numbers. 
Default is "%d" for normal unpadded decimal integers. 
An internal copy of val is allocated and managed; it is automatically freed whenever a new value is assigned, or when the widget is destroyed.
The value of val must not be NULL.
Example values:
- "%d" -- For normal line numbers without padding (Default)
- "%03d" -- For 000 padding
- "%x" -- For hexadecimal line numbers
- "%o" -- For octal line numbers

Version

1.3.3 ABI feature (ignored in 1.3.x unless FLTK_ABI_VERSION is 10303 or higher)

9.135.4.43 linenumbersize()

void Fl_Text_Display::linenumbersize ( 
   Fl_Fontsize val )

Set the font size used for line numbers (if enabled).

Version

1.3.3 ABI feature (ignored in 1.3.x unless FLTK_ABI_VERSION is 10303 or higher)
9.135.4.44 linenumber_width()

```cpp
void Fl_Text_Display::linenumber_width ( int width )
```

Set width of screen area for line numbers.
Use to also enable/disable line numbers. A value of 0 disables line numbering, values >0 enable the line number display.

**Parameters**

- `width` The new width of the area for line numbers to appear, in pixels. 0 disables line numbers (default)

9.135.4.45 longest_vline()

```cpp
int Fl_Text_Display::longest_vline ( ) const [protected]
```

Find the longest line of all visible lines.

**Returns**

the width of the longest visible line in pixels

9.135.4.46 maintain_absolute_top_line_number()

```cpp
void Fl_Text_Display::maintain_absolute_top_line_number ( int state ) [protected]
```

Line numbering stuff, currently unused.
In continuous wrap mode, internal line numbers are calculated after wrapping. A separate non-wrapped line count is maintained when line numbering is turned on. There is some performance cost to maintaining this line count, so normally absolute line numbers are not tracked if line numbering is off. This routine allows callers to specify that they still want this line count maintained (for use via TextDPosToLineAndCol). More specifically, this allows the line number reported in the statistics line to be calibrated in absolute lines, rather than post-wrapped lines.

9.135.4.47 maintaining_absolute_top_line_number()

```cpp
int Fl_Text_Display::maintaining_absolute_top_line_number ( ) const [protected]
```

Line numbering stuff, currently unused.
Return true if a separate absolute top line number is being maintained (for displaying line numbers or showing in the statistics line).

9.135.4.48 measure_deleted_lines()

```cpp
void Fl_Text_Display::measure_deleted_lines ( int pos, int nDeleted ) [protected]
```

Wrapping calculations.
This is a stripped-down version of the findWrapRange() function above, intended to be used to calculate the number of "deleted" lines during a buffer modification. It is called before the modification takes place.
This function should only be called in continuous wrap mode with a non-fixed font width. In that case, it is impossible to calculate the number of deleted lines, because the necessary style information is no longer available after the modification. In other cases, we can still perform the calculation afterwards (possibly even more efficiently).

**Parameters**

- `pos`
- `nDeleted`
9.135.4.49 measure_proportional_character()

double Fl_Text_Display::measure_proportional_character (  
    const char * s,  
    int xPix,  
    int pos ) const  
[protected]

Wrapping calculations.
Measure the width in pixels of the first character of string "s" at a particular column "colNum" and buffer position "pos". This is for measuring characters in proportional or mixed-width highlighting fonts.

A note about proportional and mixed-width fonts: the mixed width and proportional font code in nedit does not get much use in general editing, because nedit doesn't allow per-language-mode fonts, and editing programs in a proportional font is usually a bad idea, so very few users would choose a proportional font as a default. There are still probably mixed-width syntax highlighting cases where things don't redraw properly for insertion/deletion, though static display and wrapping and resizing should now be solid because they are now used for online help display.

Parameters

<table>
<thead>
<tr>
<th>s</th>
<th>text string</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPix</td>
<td>x pixel position needed for calculating tab widths</td>
</tr>
<tr>
<td>pos</td>
<td>offset within string</td>
</tr>
</tbody>
</table>

Returns

width of character in pixels

9.135.4.50 measure_vline()

int Fl_Text_Display::measure_vline (  
    int visLineNum ) const  
[protected]

Returns the width in pixels of the displayed line pointed to by "visLineNum".

Parameters

| visLineNum | index into visible lines array |

Returns

width of line in pixels

9.135.4.51 move_down()

int Fl_Text_Display::move_down ( )

Moves the current insert position down one line.

Returns

1 if the cursor moved, 0 if the beginning of the text was reached

9.135.4.52 move_left()

int Fl_Text_Display::move_left ( )

Moves the current insert position left one character.

Returns

1 if the cursor moved, 0 if the beginning of the text was reached
9.135.4.53 move_right()

int Fl_Text_Display::move_right ( )
Moves the current insert position right one character.

Returns

1 if the cursor moved, 0 if the end of the text was reached

9.135.4.54 move_up()

int Fl_Text_Display::move_up ( )
Moves the current insert position up one line.

Returns

1 if the cursor moved, 0 if the beginning of the text was reached

9.135.4.55 offset_line_starts()

void Fl_Text_Display::offset_line_starts ( int newTopLineNum ) [protected]
Offset line start counters for a new vertical scroll position.
Offset the line starts array, mTopLineNum, mFirstChar and lastChar, for a new vertical scroll position given by newTopLineNum. If any currently displayed lines will still be visible, salvage the line starts values, otherwise, count lines from the nearest known line start (start or end of buffer, or the closest value in the mLineStarts array)

Parameters

newTopLineNum | index into buffer

9.135.4.56 overstrike()

void Fl_Text_Display::overstrike ( const char ∗ text )
Replaces text at the current insert position.

Parameters

text | new text in UTF-8 encoding

Todo  Unicode? Find out exactly what we do here and simplify.

9.135.4.57 position_style()

int Fl_Text_Display::position_style ( int lineStartPos,
        int lineLen,
        int lineIndex ) const
Find the correct style for a character.
Determine the drawing method to use to draw a specific character from "buf". lineStartPos gives the character index where the line begins, lineIndex, the number of characters past the beginning of the line, and lineLen the number of displayed characters past the beginning of the line. Passing lineStartPos of -1 returns the drawing style for "no text".
Why not just: position_style(pos)? Because style applies to blank areas of the window beyond the text boundaries, and because this routine must also decide whether a position is inside of a rectangular Fl_Text_Selection, and do so efficiently, without re-counting character positions from the start of the line.
Note that style is a somewhat incorrect name, drawing method would be more appropriate.

Parameters

<table>
<thead>
<tr>
<th>lineStartPos</th>
<th>beginning of this line</th>
</tr>
</thead>
<tbody>
<tr>
<td>lineLen</td>
<td>number of bytes in line</td>
</tr>
<tr>
<td>lineIndex</td>
<td>position of character within line</td>
</tr>
</tbody>
</table>

Returns

style for the given character

9.135.4.58 position_to_line()

int Fl_Text_Display::position_to_line (  
  int pos,  
  int * lineNum ) const [protected]  
Convert a position index into a line number offset.  
Find the line number of position pos relative to the first line of displayed text. Returns 0 if the line is not displayed.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>??</th>
</tr>
</thead>
<tbody>
<tr>
<td>lineNum</td>
<td>??</td>
</tr>
</tbody>
</table>

Returns

??

Todo  What does this do?

9.135.4.59 position_to_linecol()

int Fl_Text_Display::position_to_linecol (  
  int pos,  
  int * lineNum,  
  int * column ) const [protected]  
Find the line and column number of position pos.  
This only works for displayed lines. If the line is not displayed, the function returns 0 (without the mLineStarts array it could turn in to very long calculation involving scanning large amounts of text in the buffer). If continuous wrap mode is on, returns the absolute line number (as opposed to the wrapped line number which is used for scrolling).

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>character index</th>
</tr>
</thead>
<tbody>
<tr>
<td>lineNum</td>
<td>absolute (unwrapped) line number</td>
</tr>
<tr>
<td>column</td>
<td>character offset to the beginning of the line</td>
</tr>
</tbody>
</table>

Returns

0 if pos is off screen, line number otherwise

Todo  a column number makes little sense in the UTF-8/variable font width environment. We will have to further define what exactly we want to return. Please check the functions that call this particular function.
### 9.135.4.60 position_to_xy()

```cpp
int Fl_Text_Display::position_to_xy ( int pos, int * X, int * Y ) const
```

Convert a character index into a pixel position. Translate a buffer text position to the XY location where the top left of the cursor would be positioned to point to that character. Returns 0 if the position is not displayed because it is vertically out of view. If the position is horizontally out of view, returns the X coordinate where the position would be if it were visible.

**Parameters**

<table>
<thead>
<tr>
<th>pos</th>
<th>character index</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>X,Y</td>
</tr>
<tr>
<td></td>
<td>pixel position of character on screen</td>
</tr>
</tbody>
</table>

**Returns**

0 if character vertically out of view, X & Y positions otherwise

### 9.135.4.61 redisplay_range()

```cpp
void Fl_Text_Display::redisplay_range ( int startpos, int endpos )
```

Marks text from start to end as needing a redraw. This function will trigger a damage event and later a redraw of parts of the widget.

**Parameters**

<table>
<thead>
<tr>
<th>startpos</th>
<th>index of first character needing redraw</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpos</td>
<td>index after last character needing redraw</td>
</tr>
</tbody>
</table>

### 9.135.4.62 reset_absolute_top_line_number()

```cpp
void Fl_Text_Display::reset_absolute_top_line_number ( ) [protected]
```

Line numbering stuff, probably unused. Count lines from the beginning of the buffer to reestablish the absolute (non-wrapped) top line number. If mode is not continuous wrap, or the number is not being maintained, does nothing.

### 9.135.4.63 resize()

```cpp
void Fl_Text_Display::resize ( int X, int Y, int W, int H ) [virtual]
```

Change the size of the displayed text area. Calling this function will trigger a recalculation of all lines visible and of all scrollbar sizes.

**Parameters**

| X,Y,W,H | new position and size of this widget |

Reimplemented from Fl_Group.
9.135.4.64  rewind_lines()

int Fl_Text_Display::rewind_lines (  
    int startPos,  
    int nLines )

Skip a number of lines back.  
Same as BufCountBackwardNLines, but takes into account line breaks when wrapping is turned on.

Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>index to starting character</th>
</tr>
</thead>
<tbody>
<tr>
<td>nLines</td>
<td>number of lines to skip back</td>
</tr>
</tbody>
</table>

Returns

new position as index

9.135.4.65  scroll()

void Fl_Text_Display::scroll (  
    int topLineNum,  
    int horizOffset )

Scrolls the current buffer to start at the specified line and column.

Parameters

<table>
<thead>
<tr>
<th>topLineNum</th>
<th>top line number</th>
</tr>
</thead>
<tbody>
<tr>
<td>horizOffset</td>
<td>column number</td>
</tr>
</tbody>
</table>

Todo  
Column numbers make little sense here.

9.135.4.66  scroll_()

int Fl_Text_Display::scroll_ (  
    int topLineNum,  
    int horizOffset ) [protected]

Scrolls the current buffer to start at the specified line and column.

Parameters

<table>
<thead>
<tr>
<th>topLineNum</th>
<th>top line number</th>
</tr>
</thead>
<tbody>
<tr>
<td>horizOffset</td>
<td>in pixels</td>
</tr>
</tbody>
</table>

Returns

0 if nothing changed, 1 if we scrolled

9.135.4.67  scroll_timer_cb()

void Fl_Text_Display::scroll_timer_cb (  
    void * user_data ) [static], [protected]

Timer callback for scroll events.
This timer event scrolls the text view proportionally to how far the mouse pointer has left the text area. This allows for smooth scrolling without "wiggeling" the mouse.
9.135.4.68 scrollbar_align() [1/2]

Fl_Align Fl_Text_Display::scrollbar_align ( ) const [inline]

Gets the scrollbar alignment type.

Returns

scrollbar alignment

9.135.4.69 scrollbar_align() [2/2]

void Fl_Text_Display::scrollbar_align ( Fl_Align a ) [inline]

Sets the scrollbar alignment type.

Parameters

<table>
<thead>
<tr>
<th>a</th>
<th>new scrollbar alignment</th>
</tr>
</thead>
</table>

9.135.4.70 scrollbar_width() [1/2]

int Fl_Text_Display::scrollbar_width ( ) const [inline]

Gets the width/height of the scrollbars.

Returns

width of scrollbars

9.135.4.71 scrollbar_width() [2/2]

void Fl_Text_Display::scrollbar_width ( int W ) [inline]

Sets the width/height of the scrollbars.

Parameters

<table>
<thead>
<tr>
<th>W</th>
<th>width of scrollbars</th>
</tr>
</thead>
</table>

9.135.4.72 shortcut() [1/2]

int Fl_Text_Display::shortcut ( ) const [inline]

Todo FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!

Returns

the current shortcut key

9.135.4.73 shortcut() [2/2]

void Fl_Text_Display::shortcut ( int s ) [inline]

Todo FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!
Parameters

\( s \) the new shortcut key

### 9.135.4.74 show_cursor()

```cpp
void Fl_Text_Display::show_cursor ( int b = 1 )
```

Shows the text cursor.
This function may trigger a redraw.

Parameters

\( b \) show(1) or hide(0) the text cursor (caret).

### 9.135.4.75 show_insert_position()

```cpp
void Fl_Text_Display::show_insert_position ( )
```

Scrolls the text buffer to show the current insert position.
This function triggers a complete recalculation, ending in a call to Fl_Text_Display::display_insert()

### 9.135.4.76 skip_lines()

```cpp
int Fl_Text_Display::skip_lines ( int startPos, int nLines, bool startPosIsLineStart )
```

Skip a number of lines forward.
Same as BufCountForwardNLines, but takes into account line breaks when wrapping is turned on. If the caller
knows that startPos is at a line start, it can pass "startPosIsLineStart" as True to make the call more efficient by
avoiding the additional step of scanning back to the last newline.

Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>index to starting character</th>
</tr>
</thead>
<tbody>
<tr>
<td>nLines</td>
<td>number of lines to skip ahead</td>
</tr>
<tr>
<td>startPosIsLineStart</td>
<td>avoid scanning back to the line start</td>
</tr>
</tbody>
</table>

Returns

new position as index

### 9.135.4.77 string_width()

```cpp
double Fl_Text_Display::string_width ( const char * string, int length, int style ) const {protected}
```

Find the width of a string in the font of a particular style.

Parameters

<table>
<thead>
<tr>
<th>string</th>
<th>the text</th>
</tr>
</thead>
<tbody>
<tr>
<td>length</td>
<td>number of bytes in string</td>
</tr>
<tr>
<td>style</td>
<td>index into style table</td>
</tr>
</tbody>
</table>
Returns

width of text segment in pixels

9.135.4.78 textcolor() [1/2]

Fl_Color Fl_Text_Display::textcolor ( ) const [inline]
Gets the default color of text in the widget.

Returns
text color unless overridden by a style

9.135.4.79 textcolor() [2/2]

void Fl_Text_Display::textcolor ( Fl_Color n ) [inline]
Sets the default color of text in the widget.

Parameters

n new text color

9.135.4.80 textfont() [1/2]

Fl_Font Fl_Text_Display::textfont ( ) const [inline]
Gets the default font used when drawing text in the widget.

Returns
current text font face unless overridden by a style

9.135.4.81 textfont() [2/2]

void Fl_Text_Display::textfont ( Fl_Font s ) [inline]
Sets the default font used when drawing text in the widget.

Parameters

s default text font face

9.135.4.82 textsize() [1/2]

Fl_Fontsize Fl_Text_Display::textsize ( ) const [inline]
Gets the default size of text in the widget.

Returns
current text height unless overridden by a style

9.135.4.83 textsize() [2/2]

void Fl_Text_Display::textsize ( Fl_Fontsize s ) [inline]
Sets the default size of text in the widget.
Parameters

\[ s \quad \text{new text size} \]

9.135.4.84  \texttt{update\_h\_scrollbar()}

\texttt{void Fl\_Text\_Display::update\_h\_scrollbar ( ) [protected]}

Update horizontal scrollbar.
Update the minimum, maximum, slider size, page increment, and value for the horizontal scrollbar.

9.135.4.85  \texttt{update\_line\_starts()}

\texttt{void Fl\_Text\_Display::update\_line\_starts (}
\begin{verbatim}
    int pos,
    int charsInserted,
    int charsDeleted,
    int linesInserted,
    int linesDeleted,
    int \* scrolled \) [protected]
\end{verbatim}

Update line start arrays and variables.
Update the line starts array, mTopLineNum, mFirstChar and lastChar for this text display after a modification to the text buffer, given by the position \texttt{pos} where the change began, and the numbers of characters and lines inserted and deleted.

Parameters

\begin{tabular}{|c|c|}
\hline
\texttt{pos} & index into buffer of recent changes \\
\hline
\texttt{charsInserted} & number of bytes(!) inserted \\
\hline
\texttt{charsDeleted} & number of bytes(!) deleted \\
\hline
\texttt{linesInserted} & number of lines \\
\hline
\texttt{linesDeleted} & number of lines \\
\hline
\texttt{scrolled} & set to 1 if the text display needs to be scrolled \\
\hline
\end{tabular}

9.135.4.86  \texttt{update\_v\_scrollbar()}

\texttt{void Fl\_Text\_Display::update\_v\_scrollbar ( ) [protected]}

Update vertical scrollbar.
Update the minimum, maximum, slider size, page increment, and value for the vertical scrollbar.

9.135.4.87  \texttt{vline\_length()}

\texttt{int Fl\_Text\_Display::vline\_length (}
\begin{verbatim}
    int visLineNum \) const [protected]
\end{verbatim}

Count number of bytes in a visible line.
Return the length of a line (number of bytes) by examining entries in the line starts array rather than by scanning for newlines.

Parameters

\begin{tabular}{|c|c|}
\hline
\texttt{visLineNum} & index of line in visible line array \\
\hline
\end{tabular}

Returns

number of bytes in this line
9.135.4.88 word_end()

```cpp
int Fl_Text_Display::word_end ( int pos ) const [inline]
```

Moves the insert position to the end of the current word.

**Parameters**

- `pos` start calculation at this index

**Returns**

- index of first character after the end of the word

9.135.4.89 word_start()

```cpp
int Fl_Text_Display::word_start ( int pos ) const [inline]
```

Moves the insert position to the beginning of the current word.

**Parameters**

- `pos` start calculation at this index

**Returns**

- beginning of the words

9.135.4.90 wrap_mode()

```cpp
void Fl_Text_Display::wrap_mode ( int wrap, int wrapMargin )
```

Set the new text wrap mode.

If `wrap` mode is not zero, this call enables automatic word wrapping at column `wrapMargin`. Word-wrapping does not change the text buffer itself, only the way the text is displayed. Different Text Displays can have different wrap modes, even if they share the same Text Buffer.

**Parameters**

<table>
<thead>
<tr>
<th>wrap</th>
<th>new wrap mode is WRAP_NONE (don't wrap text at all), WRAP_AT_COLUMN (wrap text at the given text column), WRAP_AT_PIXEL (wrap text at a pixel position), or WRAP_AT_BOUNDS (wrap text so that it fits into the widget width)</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapMargin</td>
<td>in WRAP_AT_COLUMN mode, text will wrap at the n'th character. For variable width fonts, an average character width is calculated. The column width is calculated using the current textfont or the first style when this function is called. If the font size changes, this function must be called again. In WRAP_AT_PIXEL mode, this is the pixel position.</td>
</tr>
</tbody>
</table>

**Todo** we need new wrap modes to wrap at the window edge and based on pixel width or average character width.

9.135.4.91 wrap_uses_character()

```cpp
int Fl_Text_Display::wrap_uses_character ( int lineEndPos ) const [protected]
```

Check if the line break is caused by a \n or by line wrapping.
Line breaks in continuous wrap mode usually happen at newlines or whitespace. This line-terminating character is not included in line width measurements and has a special status as a non-visible character. However, lines with no whitespace are wrapped without the benefit of a line terminating character, and this distinction causes endless trouble with all of the text display code which was originally written without continuous wrap mode and always expects to wrap at a newline character.

Given the position of the end of the line, as returned by TextDEndOfLine or BufEndOfLine, this returns true if there is a line terminating character, and false if there’s not. On the last character in the buffer, this function can’t tell for certain whether a trailing space was used as a wrap point, and just guesses that it wasn’t. So if an exact accounting is necessary, don’t use this function.

Parameters

- `lineEndPos` index of character where the line wraps

Returns

- 1 if a \n character causes the line wrap

9.135.4.92 wrapped_column()

```cpp
int Fl_Text_Display::wrapped_column ( int row, int column ) const
```

Nobody knows what this function does.

Correct a column number based on an unconstrained position (as returned by TextDXYToUnconstrainedPosition) to be relative to the last actual newline in the buffer before the row and column position given, rather than the last line start created by line wrapping. This is an adapter for rectangular selections and code written before continuous wrap mode, which thinks that the unconstrained column is the number of characters from the last newline. Obviously this is time consuming, because it involves character re-counting.

Parameters

- `row`
- `column`

Returns

- something unknown

Todo What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one?

Todo Unicode?

9.135.4.93 wrapped_line_counter()

```cpp
void Fl_Text_Display::wrapped_line_counter ( Fl_Text_Buffer * buf, int startPos, int maxPos, int maxLines, bool startPosIsLineStart, int styleBufOffset, int * retPos, int * retLines, int * retLineStart, int * retLineEnd, bool countLastLineMissingNewLine = true ) const [protected]
```

Generated by Doxygen
Wrapping calculations.
Count forward from startPos to either maxPos or maxLines (whichever is reached first), and return all relevant positions and line count. The provided textBuffer may differ from the actual text buffer of the widget. In that case it must be a (partial) copy of the actual text buffer and the styleBufOffset argument must indicate the starting position of the copy, to take into account the correct style information.

Parameters

| in  | buf          | The text buffer to operate on |
| in  | startPos     | Starting index position into the buffer |
| in  | maxPos       | Maximum index position into the buffer we'll reach |
| in  | maxLines     | Maximum number of lines we'll reach |
| in  | startPosIsLineStart | Flag indicating if startPos is start of line. (If set, prevents our having to find the line start) |
| in  | styleBufOffset | Offset index position into style buffer. |
| out | retPos       | Position where counting ended. When counting lines, the position returned is the start of the line "maxLines" lines beyond "startPos". |
| out | retLines     | Number of line breaks counted |
| out | retLineStart | Start of the line where counting ended |
| out | retLineEnd   | End position of the last line traversed |
| out | countLastLineMissingNewLine | |

9.135.4.94  wrapped_row()

```cpp
int Fl_Text_Display::wrapped_row ( int row ) const
```

Nobody knows what this function does.
Correct a row number from an unconstrained position (as returned by TextDXYToUnconstrainedPosition) to a straight number of newlines from the top line of the display. Because rectangular selections are based on newlines, rather than display wrapping, and anywhere a rectangular selection needs a row, it needs it in terms of un-wrapped lines.

Parameters

| row | |

Returns

something unknown

Todo  What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one?

9.135.4.95  x_to_col()

```cpp
double Fl_Text_Display::x_to_col ( double x ) const
```

Convert an x pixel position into a column number.

Parameters

| x | number of pixels from the left margin |
Returns

an approximate column number based on the main font

9.135.4.96  xy_to_position()

int Fl_Text_Display::xy_to_position (  
    int X,
    int Y,
    int posType = CHARACTER_POS ) const [protected]

Translate a pixel position into a character index.  
Translate window coordinates to the nearest (insert cursor or character cell) text position.  
The parameter posType specifies how to interpret the position: CURSOR_POS means translate the coordinates to the nearest cursor position, and CHARACTER_POS means return the position of the character closest to \((X, Y)\).

Parameters

<table>
<thead>
<tr>
<th>X, Y</th>
<th>pixel position</th>
</tr>
</thead>
<tbody>
<tr>
<td>posType</td>
<td>CURSOR_POS or CHARACTER_POS</td>
</tr>
</tbody>
</table>

Returns

index into text buffer

9.135.4.97  xy_to_rowcol()

void Fl_Text_Display::xy_to_rowcol (  
    int X,
    int Y,
    int * row,
    int * column,
    int posType = CHARACTER_POS ) const [protected]

Translate pixel coordinates into row and column.  
Translate window coordinates to the nearest row and column number for positioning the cursor.  
This, of course, makes no sense when the font is proportional, since there are no absolute columns.  
The parameter posType specifies how to interpret the position: CURSOR_POS means translate the coordinates to the nearest position between characters, and CHARACTER_POS means translate the position to the nearest character cell.

Parameters

<table>
<thead>
<tr>
<th>X, Y</th>
<th>pixel coordinates</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>row, column</td>
</tr>
<tr>
<td>posType</td>
<td>CURSOR_POS or CHARACTER_POS</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Text_Display.H
- Fl_Text_Display.cxx

9.136  Fl_Text_Editor Class Reference

This is the FLTK text editor widget.
#include <Fl_Text_Editor.H>

Inheritance diagram for Fl_Text_Editor:
Classes

- struct Key_Binding

  Simple linked list item associating a key/state to a function.

Public Types

- typedef int(*Key_Func)(int key, Fl_Text_Editor*editor)

  Key function binding callback type.

Public Types inherited from Fl_Text_Display

- enum {
      NORMAL_CURSOR, CARET_CURSOR, DIM_CURSOR, BLOCK_CURSOR,
      HEAVY_CURSOR, SIMPLE_CURSOR
    }

  text display cursor shapes enumeration

- enum {CURSOR_POS, CHARACTER_POS}

  the character position is the left edge of a character, whereas the cursor is thought to be between the centers of two consecutive characters.

- enum {
      DRAG_NONE = -2,
      DRAG_START_DND = -1,
      DRAG_CHAR = 0,
      DRAG_WORD = 1,
      DRAG_LINE = 2
    }

  drag types - they match Fl::event_clicks() so that single clicking to start a collection selects by character, double clicking selects by word and triple clicking selects by line.

- enum {WRAP_NONE, WRAP_AT_COLUMN, WRAP_AT_PIXEL, WRAP_AT_BOUNDS}

  wrap types - used in wrap_mode()

- typedef void(*Unfinished_Style_Cb)(int, void*)

Public Member Functions

- void add_default_key_bindings(Key_Binding**list)

  Adds all of the default editor key bindings to the specified key binding list.

- void add_key_binding(int key, int state, Key_Func f)

  Adds a key of state state with the function f.

- void add_key_binding(int key, int state, Key_Func f, Key_Binding**list)

  Adds a key of state state with the function function to an arbitrary key binding list list.

- Key_Func bound_key_function(int key, int state) const

  Returns the function associated with a key binding.

- Key_Func bound_key_function(int key, int state, Key_Binding**list) const

  Returns the function associated with a key binding.

- void default_key_function(Key_Func f)

  Sets the default key function for unassigned keys.

- Fl_Text_Editor(int X, int Y, int W, int H, const char*="")

  The constructor creates a new text editor widget.
virtual int handle (int e)  
Event handling.

int insert_mode ()  
Gets the current insert mode; if non-zero, new text is inserted before the current cursor position.

void insert_mode (int b)  
Sets the current insert mode; if non-zero, new text is inserted before the current cursor position.

void remove_all_key_bindings ()  
Removes all of the key bindings associated with the text editor or list.

void remove_all_key_bindings (Key_Binding **list)  
Removes all of the key bindings associated with the text editor or list.

void remove_key_binding (int key, int state)  
Removes the key binding associated with the key "key" of state "state".

void remove_key_binding (int key, int state, Key_Binding **list)  
Removes the key binding associated with the key key of state state from the Key_Binding list list.

int tab_nav () const  
Check if Tab focus navigation is enabled.

void tab_nav (int val)  
Enables or disables Tab key focus navigation.

Public Member Functions inherited from Fl_Text_Display

Fl_Text_Buffer * buffer () const  
Gets the current text buffer associated with the text widget.

void buffer (Fl_Text_Buffer &buf)  
Sets the current text buffer associated with the text widget.

void buffer (Fl_Text_Buffer *buf)  
Attach a text buffer to display, replacing the current buffer (if any)

double col_to_x (double col) const  
Convert a column number into an x pixel position.

int count_lines (int start, int end, bool start_pos_is_line_start) const  
Count the number of lines between two positions.

Fl_Color cursor_color () const  
Gets the text cursor color.

void cursor_color (Fl_Color n)  
Sets the text cursor color.

void cursor_style (int style)  
Sets the text cursor style.

Fl_Text_Display (int X, int Y, int W, int H, const char *l=0)  
Creates a new text display widget.

void hide_cursor ()  
Hides the text cursor.

void highlight_data (Fl_Text_Buffer *styleBuffer, const Style_Table_Entry *styleTable, int nStyles, char unfinishedStyle, Unfinished_Style_Cb unfinishedHighlightCB, void *cbArg)  
Attach (or remove) highlight information in text display and redisplay.

int in_selection (int x, int y) const  
Check if a pixel position is within the primary selection.

void insert (const char *text)  
Inserts "text" at the current cursor location.

int insert_position () const  
Gets the position of the text insertion cursor for text display.

void insert_position (int newPos)
Sets the position of the text insertion cursor for text display.

- **int** line_end (int startPos, bool startPosIsLineStart) const
  Returns the end of a line.

- **int** line_start (int pos) const
  Return the beginning of a line.

- **Fl_Align** linenumber_align () const
  Returns the alignment used for line numbers (if enabled).

- void linenumber_align (Fl_Align val)
  Set alignment for line numbers (if enabled).

- **Fl_Color** linenumberbgcolor () const
  Returns the background color used for line numbers (if enabled).

- void linenumberbgcolor (Fl_Color val)
  Set the background color used for line numbers (if enabled).

- **Fl_Color** linenumberfgcolor () const
  Return the foreground color used for line numbers (if enabled).

- void linenumberfgcolor (Fl_Color val)
  Set the foreground color used for line numbers (if enabled).

- **Fl_Font** linenumberfont () const
  Return the font used for line numbers (if enabled).

- void linenumberfont (Fl_Font val)
  Set the font used for line numbers (if enabled).

- const char ∗ linenumberformat () const
  Returns the line number printf() format string.

- void linenumberformat (const char ∗ val)
  Sets the printf() style format string used for line numbers.

- **Fl_Fontsize** linenumbersize () const
  Return the font size used for line numbers (if enabled).

- void linenumbersize (Fl_Fontsize val)
  Set the font size used for line numbers (if enabled).

- **int** linenumberwidth () const
  Return the screen area width provided for line numbers.

- void linenumberwidth (int width)
  Set width of screen area for line numbers.

- int move_down ()
  Moves the current insert position down one line.

- int move_left ()
  Moves the current insert position left one character.

- int move_right ()
  Moves the current insert position right one character.

- int move_up ()
  Moves the current insert position up one line.

- void next_word (void)
  Moves the current insert position right one word.

- void overstrike (const char ∗ text)
  Replaces text at the current insert position.

- int position_style (int lineStartPos, int lineLen, int lineIndex) const
  Find the correct style for a character.

- int position_to_xy (int pos, int ∗x, int ∗y) const
  Convert a character index into a pixel position.

- void previous_word (void)
  Moves the current insert position left one word.
• void redisplay_range (int start, int end)
   Marks text from start to end as needing a redraw.
• virtual void resize (int X, int Y, int W, int H)
   Change the size of the displayed text area.
• int rewind_lines (int startPos, int nLines)
   Skip a number of lines back.
• void scroll (int topLineNum, int horizOffset)
   Scrolls the current buffer to start at the specified line and column.
• Fl_Align scrollbar_align () const
   Gets the scrollbar alignment type.
• void scrollbar_align (Fl_Align a)
   Sets the scrollbar alignment type.
• int scrollbar_width () const
   Gets the width/height of the scrollbars.
• void scrollbar_width (int W)
   Sets the width/height of the scrollbars.
• int shortcut () const
• void shortcut (int s)
• void show_cursor (int b=1)
   Shows the text cursor.
• void show_insert_position ()
   Scrolls the text buffer to show the current insert position.
• int skip_lines (int startPos, int nLines, bool startPosIsLineStart)
   Skip a number of lines forward.
• Fl_Color textcolor () const
   Gets the default color of text in the widget.
• void textcolor (Fl_Color n)
   Sets the default color of text in the widget.
• Fl_Font textfont () const
   Gets the default font used when drawing text in the widget.
• void textfont (Fl_Font s)
   Sets the default font used when drawing text in the widget.
• Fl_Fontsize textsize () const
   Gets the default size of text in the widget.
• void textsize (Fl_Fontsize s)
   Sets the default size of text in the widget.
• int word_end (int pos) const
   Moves the insert position to the end of the current word.
• int word_start (int pos) const
   Moves the insert position to the beginning of the current word.
• void wrap_mode (int wrap, int wrap_margin)
   Set the new text wrap mode.
• int wrapped_column (int row, int column) const
   Nobody knows what this function does.
• int wrapped_row (int row) const
   Nobody knows what this function does.
• double x_to_col (double x) const
   Convert an x pixel position into a column number.
• ~Fl_Text_Display ()
   Free a text display and release its associated memory.
Public Member Functions inherited from Fl_Group

- **Fl_Widget * & _ddfdesign_kludge ()**
  This is for forms compatibility only.
- **void add (Fl_Widget &)**
  The widget is removed from its current group (if any) and then added to the end of this group.
- **void add (Fl_Widget *)**
  See void Fl_Group::add(Fl_Widget &w)
- **void add_resizable (Fl_Widget &o)**
  Adds a widget to the group and makes it the resizable widget.
- **Fl_Widget * const * array () const**
  Returns a pointer to the array of children.
- **virtual Fl_Group * as_group ()**
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- **void begin ()**
  Sets the current group so you can build the widget tree by just constructing the widgets.
- **Fl_Widget * child (int n) const**
  Returns array()[n].
- **int children () const**
  Returns how many child widgets the group has.
- **void clear ()**
  Deletes all child widgets from memory recursively.
- **unsigned int clip_children ()**
  Returns the current clipping mode.
- **void clip_children (int c)**
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- **void end ()**
  Exactly the same as current(this->parent()).
- **int find (const Fl_Widget &o) const**
  See int Fl_Group::find(const Fl_Widget *w) const.
- **int find (const Fl_Widget *)**
  Searches the child array for the widget and returns the index.
- **Fl_Group (int, int, int, int, const char * = 0)**
  Creates a new Fl_Group widget using the given position, size, and label string.
- **void focus (Fl_Widget *)**
- **void forms_end ()**
  This is for forms compatibility only.
- **void init_sizes ()**
  Resets the internal array of widget sizes and positions.
- **void insert (Fl_Widget &, int i)**
  The widget is removed from its current group (if any) and then inserted into this group.
- **void insert (Fl_Widget &o, Fl_Widget *)**
  This does insert(w, find(before)).
- **void remove (Fl_Widget *)**
  Removes a widget from the group but does not delete it.
- **void remove (Fl_Widget &o)**
  Removes the widget o from the group.
- **void remove (int index)**
  Removes the widget at index from the group but does not delete it.
- **Fl_Widget * resizable () const**
  See void Fl_Group::resizable(Fl_Widget * box)
void resizable (Fl_Widget &o)
See void Fl_Group::resizable(Fl_Widget *box)

void resizable (Fl_Widget *o)
The resizable widget defines the resizing box for the group.

virtual ~Fl_Group ()
The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

void _clear_fullscreen ()
void _set_fullscreen ()
void activate ()
Activates the widget.

unsigned int active () const
Returns whether the widget is active.

int active_r () const
Returns whether the widget and all of its parents are active.

Fl_Align align () const
Gets the label alignment.

void align (Fl_Align alignment)
Sets the label alignment.

long argument () const
Gets the current user data (long) argument that is passed to the callback function.

void argument (long v)
Sets the current user data (long) argument that is passed to the callback function.

virtual class Fl_Gl_Window * as_gl_window ()
Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

virtual Fl_Window * as_window ()
Returns an Fl_Window pointer if this widget is an Fl_Window.

Fl_Boxtype box () const
Gets the box type of the widget.

void box (Fl_Boxtype new_box)
Sets the box type for the widget.

Fl_Callback_p callback () const
Gets the current callback function for the widget.

void callback (Fl_Callback *cb)
Sets the current callback function for the widget.

void callback (Fl_Callback *cb, void *p)
Sets the current callback function for the widget.

void callback (Fl_Callback0 *cb)
Sets the current callback function for the widget.

void callback (Fl_Callback1 *cb, long p=0)
Sets the current callback function for the widget.

unsigned int changed () const
Checks if the widget value changed since the last callback.

void clear_active ()
Marks the widget as inactive without sending events or changing focus.

void clear_changed ()
Marks the value of the widget as unchanged.

void clear_damage (uchar c=0)
Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label.
• const Fl_Image *deimage () const
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void deimage (Fl_IMAGE *img)
  Sets the image to use as part of the widget label.
• void do_callback ()
  Calls the widget callback.
• void do_callback (Fl_Widget *o, long arg)
  Calls the widget callback.
• void do_callback (Fl_Widget *o, void *arg=0)
  Calls the widget callback.
• void draw_label (int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• **Fl_Image *image ()**
  
  Gets the image that is used as part of the widget label.

• **const Fl_Image *image () const**

• **void image (Fl_Image &img)**

  Sets the image to use as part of the widget label.

• **void image (Fl_Image *img)**

  Sets the image to use as part of the widget label.

• **int inside (const Fl_Widget *wgt) const**

  Checks if this widget is a child of wgt.

• **int is_label_copied () const**

  Returns whether the current label was assigned with copy_label().

• **const char *label () const**

  Gets the current label text.

• **void label (const char *text)**

  Sets the current label pointer.

• **void label (Fl_Labeltype a, const char *b)**

  Shortcut to set the label text and type in one call.

• **Fl_Color labelcolor () const**

  Gets the label color.

• **void labelcolor (Fl_Color c)**

  Sets the label color.

• **Fl_Font labelfont () const**

  Gets the font to use.

• **void labelfont (Fl_Font f)**

  Sets the font to use.

• **Fl_Fontsize labelsize () const**

  Gets the font size in pixels.

• **void labelsize (Fl_Fontsize pix)**

  Sets the font size in pixels.

• **Fl_Labeltype labeltype () const**

  Gets the label type.

• **void labeltype (Fl_Labeltype a)**

  Sets the label type.

• **void measure_label (int &ww, int &hh) const**

  Sets width ww and height hh accordingly with the label size.

• **unsigned int output () const**

  Returns if a widget is used for output only.

• **Fl_Group *parent () const**

  Returns a pointer to the parent widget.

• **void parent (Fl_Group *p)**

  Internal use only - "for hacks only".

• **void position (int X, int Y)**

  Repositions the window or widget.

• **void redraw ()**

  Schedules the drawing of the widget.

• **void redraw_label ()**

  Schedules the drawing of the label.

• **Fl_Color selection_color () const**

  Gets the selection color.

• **void selection_color (Fl_Color a)**

  Sets the selection color.
• void **set_active** ()
  Marks the widget as active without sending events or changing focus.
• void **set_changed** ()
  Marks the value of the widget as changed.
• void **set_output** ()
  Sets a widget to output only.
• void **set_visible** ()
  Makes the widget visible.
• void **set_visible_focus** ()
  Enables keyboard focus navigation with this widget.
• virtual void **show** ()
  Makes a widget visible.
• void **size** (int W, int H)
  Changes the size of the widget.
• int **take_focus** ()
  Gives the widget the keyboard focus.
• unsigned int **takesevents** () const
  Returns if the widget is able to take events.
• int **test_shortcut** ()
  Returns true if the widget's label contains the entered `&x` shortcut.
• const char ∗ **tooltip** () const
  Gets the current tooltip text.
• void **tooltip** (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ **top_window** () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar **type** () const
  Gets the widget type.
• void **type** (uchar t)
  Sets the widget type.
• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ **user_data** () const
  Gets the user data for this widget.
• void **user_data** (void ∗v)
  Sets the user data for this widget.
• unsigned int **visible** () const
  Returns whether a widget is visible.
• unsigned int **visible_focus** ()
  Checks whether this widget has a visible focus.
• void **visible_focus** (int v)
  Modifies keyboard focus navigation.
• int **visible_r** () const
  Returns whether a widget and all its parents are visible.
• int **w** () const
  Gets the widget width.
• Fl_When **when** () const
  Returns the conditions under which the callback is called.
• void **when** (uchar i)
Sets the flags used to decide when a callback is called.

- **Fl_Window** ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- int x () const
  Gets the widget position in its window.
- int y () const
  Gets the widget position in its window.
- virtual ∼Fl_Widget ()
  Destroys the widget.

**Static Public Member Functions**

- static int kf_backspace (int c, Fl_Text_Editor ∗e)
  Does a backspace for key 'c' in the current buffer of editor 'e'.
- static int kf_c_s_move (int c, Fl_Text_Editor ∗e)
  Extends the current selection in the direction indicated by control key 'c' in editor 'e'.
- static int kf_copy (int c, Fl_Text_Editor ∗e)
  Does a copy of selected text or the current character in the current buffer of editor 'e'.
- static int kf_ctrl_move (int c, Fl_Text_Editor ∗e)
  Moves the current text cursor in the direction indicated by control key 'c' in editor 'e'.
- static int kf_cut (int c, Fl_Text_Editor ∗e)
  Does a cut of selected text in the current buffer of editor 'e'.
- static int kf_default (int c, Fl_Text_Editor ∗e)
  Inserts the text associated with key 'c' in editor 'e'.
- static int kf_delete (int c, Fl_Text_Editor ∗e)
  Does a delete of selected text or the current character in the current buffer of editor 'e'.
- static int kf_down (int c, Fl_Text_Editor ∗e)
  Moves the text cursor one line down for editor 'e'.
- static int kf_end (int c, Fl_Text_Editor ∗e)
  Moves the text cursor to the end of the current line in editor 'e'.
- static int kf_enter (int c, Fl_Text_Editor ∗e)
  Inserts a newline for key 'c' at the current cursor position in editor 'e'.
- static int kf_home (int, Fl_Text_Editor ∗e)
  Moves the text cursor to the beginning of the current line in editor 'e'.
- static int kf_ignore (int c, Fl_Text_Editor ∗e)
  Ignores the key 'c' in editor 'e'.
- static int kf_insert (int c, Fl_Text_Editor ∗e)
  Toggles the insert mode for editor 'e'.
- static int kf_left (int c, Fl_Text_Editor ∗e)
  Moves the text cursor one character to the left in editor 'e'.
- static int kf_m_s_move (int c, Fl_Text_Editor ∗e)
  Extends the current selection in the direction indicated by meta key 'c' in editor 'e'.
- static int kf_meta_move (int c, Fl_Text_Editor ∗e)
  Moves the current text cursor in the direction indicated by meta key 'c' in editor 'e'.
- static int kf_move (int c, Fl_Text_Editor ∗e)
  Moves the text cursor in the direction indicated by key 'c' in editor 'e'.
- static int kf_page_down (int c, Fl_Text_Editor ∗e)
  Moves the text cursor down one page for editor 'e'.
- static int kf_page_up (int c, Fl_Text_Editor ∗e)
  Moves the text cursor up one page for editor 'e'.
- static int kf_paste (int c, Fl_Text_Editor ∗e)
Does a paste of selected text in the current buffer of editor `e`.

- static int kf_right (int c, Fl_Text_Editor *e)
  Moves the text cursor one character to the right for editor `e`.

- static int kf_select_all (int c, Fl_Text_Editor *e)
  Selects all text in the current buffer in editor `e`.

- static int kf_shift_move (int c, Fl_Text_Editor *e)
  Extends the current selection in the direction of key `c` in editor `e`.

- static int kf_undo (int c, Fl_Text_Editor *e)
  Undo last edit in the current buffer of editor `e`.

- static int kf_up (int c, Fl_Text_Editor *e)
  Moves the text cursor one line up for editor `e`.

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.

- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *cb, void *d)
  The default callback for all widgets that don’t set a callback.

- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text `t` contains the entered ‘&x’ shortcut.

Protected Member Functions

- int handle_key ()
  Handles a key press in the editor.

- void maybe_do_callback ()
  does or does not a callback according to changed() and when() settings.

Protected Member Functions inherited from Fl_Text_Display

- void absolute_top_line_number (int oldFirstChar)
  Line numbering stuff, currently unused.

- void calc_last_char ()
  Update last display character index.

- void calc_line_starts (int startLine, int endLine)
  Update the line start arrays.

- void clear_rect (int style, int x, int y, int width, int height) const
  Clear a rectangle with the appropriate background color for style.

- void display_insert ()
  Scroll the display to bring insertion cursor into view.

- virtual void draw ()
  Draw the widget.

- void draw_cursor (int, int)
  Draw a cursor with top center at x, y.

- void draw_line_numbers (bool clearAll)
  Refresh the line number area.
• void **draw_range** (int start, int end)
  Draw a range of text.

• void **draw_string** (int style, int x, int y, int toX, const char *string, int nChars) const
  Draw a text segment in a single style.

• void **draw_text** (int X, int Y, int W, int H)
  Refresh a rectangle of the text display.

• void **draw_vline** (int visLineNum, int leftClip, int rightClip, int leftCharIndex, int rightCharIndex)
  Draw a single line of text.

• int **empty_vlines** () const
  Return true if there are lines visible with no corresponding buffer text.

• void **extend_range_for_styles** (int *start, int *end)
  I don't know what this does!

• void **find_line_end** (int pos, bool start_pos_is_line_start, int *lineEnd, int *nextLineStart) const
  Finds both the end of the current line and the start of the next line.

• void **find_wrap_range** (const char *deletedText, int pos, int nInserted, int nDeleted, int *modRangeStart, int *modRangeEnd, int *linesInserted, int *linesDeleted)
  Wrapping calculations.

• int **find_x** (const char *s, int len, int style, int x) const
  Find the index of the character that lies at the given x position.

• int **get_absolute_top_line_number** () const
  Line numbering stuff, currently unused.

• int **handle_vline** (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const
  Universal pixel machine.

• int **longest_vline** () const
  Find the longest line of all visible lines.

• void **maintain_absolute_top_line_number** (int state)
  Line numbering stuff, currently unused.

• int **maintaining_absolute_top_line_number** () const
  Line numbering stuff, currently unused.

• void **measure_deleted_lines** (int pos, int nDeleted)
  Wrapping calculations.

• double **measure_proportional_character** (const char *s, int colNum, int pos) const
  Wrapping calculations.

• int **measure_vline** (int visLineNum) const
  Returns the width in pixels of the displayed line pointed to by "visLineNum".

• void **offset_line_starts** (int newTopLineNum)
  Offset line start counters for a new vertical scroll position.

• int **position_to_line** (int pos, int *lineNum) const
  Convert a position index into a line number offset.

• int **position_to_linecol** (int pos, int *lineNum, int *column) const
  Find the line and column number of position pos.

• void **reset_absolute_top_line_number** ()
  Line numbering stuff, probably unused.

• int **scroll_** (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

• double **string_width** (const char *string, int length, int style) const
  Find the width of a string in the font of a particular style.

• void **update_h_scrollbar** ()
  Update horizontal scrollbar.
• **void update_line_starts** (int pos, int charsInserted, int charsDeleted, int linesInserted, int linesDeleted, int *scrolled)
  Update line start arrays and variables.

• **void update_v_scrollbar** ()
  Update vertical scrollbar.

• **int vline_length** (int visLineNum) const
  Count number of bytes in a visible line.

• **int wrap_uses_character** (int lineEndPos) const
  Check if the line break is caused by a \n or by line wrapping.

• **void wrapped_line_counter** (Fl_Text_Buffer *buf, int startPos, int maxPos, int maxLines, bool startPosIs←LineStart, int *retPos, int *retLines, int *retLineStart, int *retLineEnd, bool countLast←LineMissingNewLine=true) const
  Wrapping calculations.

• **int xy_to_position** (int x, int y, int PosType=CHARACTER_POS) const
  Translate a pixel position into a character index.

• **void xy_to_rowcol** (int x, int y, int *row, int *column, int PosType=CHARACTER_POS) const
  Translate pixel coordinates into row and column.

**Protected Member Functions inherited from Fl_Group**

• **void draw_child** (Fl_Widget &widget) const
  Forces a child to redraw.

• **void draw_children** ()
  Draws all children of the group.

• **void draw_outside_label** (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.

• **int * sizes** ()
  Returns the internal array of widget sizes and positions.

• **void update_child** (Fl_Widget &widget) const
  Draws a child only if it needs it.

**Protected Member Functions inherited from Fl_Widget**

• **void clear_flag** (unsigned int c)
  Clears a flag in the flags mask.

• **void draw_backdrop** () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• **void draw_box** () const
  Draws the widget box according its box style.

• **void draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• **void draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• **void draw_focus** ()
  Draws a focus rectangle around the widget

• **void draw_focus** (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.

• **void draw_label** () const
  Draws the widget's label at the defined label position.

• **void draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

• **Fl_Widget** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.

- `unsigned int flags()` const
  Gets the widget flags mask.
- `void h(int v)`—Internal use only.
- `void set_flag(unsigned int c)`—Sets a flag in the flags mask.
- `void w(int v)`—Internal use only.
- `void x(int v)`—Internal use only.
- `void y(int v)`—Internal use only.

Static Protected Attributes

- `static Key_Binding * global_key_bindings`
  Global key binding list.

Additional Inherited Members

Protected Types inherited from `Fl_Text_Display`

- `enum { DRAW_LINE, FIND_INDEX, FIND_INDEX_FROM_ZERO, GET_WIDTH }`

Protected Types inherited from `Fl_Widget`

- Fl_Font textfont_
- Fl_Fontsize textsize_

9.136.1 Detailed Description

This is the FLTK text editor widget. It allows the user to edit multiple lines of text and supports highlighting and scrolling. The buffer that is displayed in the widget is managed by the Fl_Text_Buffer class.

9.136.2 Member Function Documentation

9.136.2.1 add_key_binding()

```cpp
void Fl_Text_Editor::add_key_binding ( 
  int key,
  int state,
  Key_Func function,
  Key_Binding ** list )
```

Adds a key of state state with the function function to an arbitrary key binding list list. This can be used in derived classes to add global key bindings by using the global (static) Key_Binding list Fl_Text_Editor::global_keyBindings.

9.136.2.2 handle()

```cpp
int Fl_Text_Editor::handle ( 
  int e ) [virtual]
```

Event handling.
Reimplemented from Fl_Text_Display.

9.136.2.3 insert_mode() [1/2]

```cpp
int Fl_Text_Editor::insert_mode ( ) [inline]
```

Gets the current insert mode; if non-zero, new text is inserted before the current cursor position. Otherwise, new text replaces text at the current cursor position.

9.136.2.4 insert_mode() [2/2]

```cpp
void Fl_Text_Editor::insert_mode ( 
  int b ) [inline]
```

Sets the current insert mode; if non-zero, new text is inserted before the current cursor position. Otherwise, new text replaces text at the current cursor position.

9.136.2.5 kf_backspace()

```cpp
int Fl_Text_Editor::kf_backspace ( 
  int c,
  Fl_Text_Editor * e ) [static]
```

Does a backspace for key 'c' in the current buffer of editor 'e'. Any current selection is deleted. Otherwise, the character left is deleted and the cursor moved. The key value 'c' is currently unused.
9.136.2.6  \texttt{kf\_c\_s\_move()}

\begin{verbatim}
int Fl_Text_Editor::kf_c_s_move (  
    int c,  
    Fl_Text_Editor * e) [static]
\end{verbatim}

Extends the current selection in the direction indicated by control key \texttt{c} in editor \texttt{e}.

See also \texttt{kf\_ctrl\_move()}.

9.136.2.7  \texttt{kf\_copy()}

\begin{verbatim}
int Fl_Text_Editor::kf_copy (  
    int c,  
    Fl_Text_Editor * e) [static]
\end{verbatim}

Does a copy of selected text or the current character in the current buffer of editor \texttt{e}.

The key value \texttt{c} is currently unused.

9.136.2.8  \texttt{kf\_ctrl\_move()}

\begin{verbatim}
int Fl_Text_Editor::kf_ctrl_move (  
    int c,  
    Fl_Text_Editor * e) [static]
\end{verbatim}

Moves the current text cursor in the direction indicated by control key \texttt{c} in editor \texttt{e}.

Supported values for \texttt{c} are currently:
\begin{itemize}
    \item \texttt{FL\_Home} -- moves the cursor to the beginning of the document
    \item \texttt{FL\_End} -- moves the cursor to the end of the document
    \item \texttt{FL\_Left} -- moves the cursor left one word
    \item \texttt{FL\_Right} -- moves the cursor right one word
    \item \texttt{FL\_Up} -- scrolls up one line, without moving cursor
    \item \texttt{FL\_Down} -- scrolls down one line, without moving cursor
    \item \texttt{FL\_Page\_Up} -- moves the cursor to the beginning of the top line on the current page
    \item \texttt{FL\_Page\_Down} -- moves the cursor to the beginning of the last line on the current page
\end{itemize}

9.136.2.9  \texttt{kf\_cut()}

\begin{verbatim}
int Fl_Text_Editor::kf_cut (  
    int c,  
    Fl_Text_Editor * e) [static]
\end{verbatim}

Does a cut of selected text in the current buffer of editor \texttt{e}.

The key value \texttt{c} is currently unused.

9.136.2.10  \texttt{kf\_default()}

\begin{verbatim}
int Fl_Text_Editor::kf_default (  
    int c,  
    Fl_Text_Editor * e) [static]
\end{verbatim}

Inserts the text associated with key \texttt{c} in editor \texttt{e}.

Honors the current selection and insert/overstrike mode.

9.136.2.11  \texttt{kf\_delete()}

\begin{verbatim}
int Fl_Text_Editor::kf_delete (  
    int c,  
    Fl_Text_Editor * e) [static]
\end{verbatim}

Does a delete of selected text or the current character in the current buffer of editor \texttt{e}.

The key value \texttt{c} is currently unused.
9.136.2.12 `kf_down()`

```c
int Fl_Text_Editor::kf_down (  
    int c,  
    Fl_Text_Editor * e ) [static]
```
Moves the text cursor one line down for editor 'e'.
Same as `kf_move(FL_Down, e)`. The key value 'c' is currently unused.

9.136.2.13 `kf_end()`

```c
int Fl_Text_Editor::kf_end (  
    int c,  
    Fl_Text_Editor * e ) [static]
```
Moves the text cursor to the end of the current line in editor 'e'.
Same as `kf_move(FL_End, e)`. The key value 'c' is currently unused.

9.136.2.14 `kf_enter()`

```c
int Fl_Text_Editor::kf_enter (  
    int c,  
    Fl_Text_Editor * e ) [static]
```
Inserts a newline for key 'c' at the current cursor position in editor 'e'.
The key value 'c' is currently unused.

9.136.2.15 `kf_home()`

```c
int Fl_Text_Editor::kf_home (  
    int c,  
    Fl_Text_Editor * e ) [static]
```
Moves the text cursor to the beginning of the current line in editor 'e'.
Same as `kf_move(FL_Home, e)`. The key value 'c' is currently unused.

9.136.2.16 `kf_ignore()`

```c
int Fl_Text_Editor::kf_ignore (  
    int c,  
    Fl_Text_Editor * e ) [static]
```
Ignores the key 'c' in editor 'e'.
This method can be used as a keyboard binding to disable a key that might otherwise be handled or entered as text.
An example would be disabling FL_Escape, so that it isn't added to the buffer when invoked by the user.

9.136.2.17 `kf_insert()`

```c
int Fl_Text_Editor::kf_insert (  
    int c,  
    Fl_Text_Editor * e ) [static]
```
Toggles the insert mode for editor 'e'.
The key value 'c' is currently unused.

9.136.2.18 `kf_left()`

```c
int Fl_Text_Editor::kf_left (  
    int c,  
    Fl_Text_Editor * e ) [static]
```
Moves the text cursor one character to the left in editor 'e'.
Same as `kf_move(FL_Left, e)`. The key value 'c' is currently unused.
9.136.2.19  

**kf_m_s_move()**

```c
int Fl_Text_Editor::kf_m_s_move ( 
    int c,  
    Fl_Text_Editor * e ) [static]
```

Extends the current selection in the direction indicated by meta key 'c' in editor 'e'.

See also:

**kf_meta_move().**

9.136.2.20  

**kf_meta_move()**

```c
int Fl_Text_Editor::kf_meta_move ( 
    int c,  
    Fl_Text_Editor * e ) [static]
```

Moves the current text cursor in the direction indicated by meta key 'c' in editor 'e'.

Supported values for 'c' are currently:

- **FL_Up** -- moves cursor to the beginning of the current document
- **FL_Down** -- moves cursor to the end of the current document
- **FL_Left** -- moves the cursor to the beginning of the current line
- **FL_Right** -- moves the cursor to the end of the current line

9.136.2.21  

**kf_move()**

```c
int Fl_Text_Editor::kf_move ( 
    int c,  
    Fl_Text_Editor * e ) [static]
```

Moves the text cursor in the direction indicated by key 'c' in editor 'e'.

Supported values for 'c' are currently:

- **FL_Home** -- moves the cursor to the beginning of the current line
- **FL_End** -- moves the cursor to the end of the current line
- **FL_Left** -- moves the cursor left one character
- **FL_Right** -- moves the cursor right one character
- **FL_Up** -- moves the cursor up one line
- **FL_Down** -- moves the cursor down one line
- **FL_Page_Up** -- moves the cursor up one page
- **FL_Page_Down** -- moves the cursor down one page

9.136.2.22  

**kf_page_down()**

```c
int Fl_Text_Editor::kf_page_down ( 
    int c,  
    Fl_Text_Editor * e ) [static]
```

Moves the text cursor down one page for editor 'e'.

Same as kf_move(FL_Page_Down, e). The key value 'c' is currently unused.

9.136.2.23  

**kf_page_up()**

```c
int Fl_Text_Editor::kf_page_up ( 
    int c,  
    Fl_Text_Editor * e ) [static]
```

Moves the text cursor up one page for editor 'e'.

Same as kf_move(FL_Page_Up, e). The key value 'c' is currently unused.

9.136.2.24  

**kf_paste()**

```c
int Fl_Text_Editor::kf_paste ( 
    int c,  
    Fl_Text_Editor * e ) [static]
```

Does a paste of selected text in the current buffer of editor 'e'.

Any current selection is replaced with the pasted content. The key value 'c' is currently unused.
9.136.2.25 kf_right()

```
int Fl_Text_Editor::kf_right (  
    int c,  
    Fl_Text_Editor * e ) [static]
```

Moves the text cursor one character to the right for editor 'e'.
Same as kf_move(FL_Right, e). The key value 'c' is currently unused.

9.136.2.26 kf_select_all()

```
int Fl_Text_Editor::kf_select_all (  
    int c,  
    Fl_Text_Editor * e ) [static]
```

Selects all text in the current buffer in editor 'e'.
The key value 'c' is currently unused.

9.136.2.27 kf_shift_move()

```
int Fl_Text_Editor::kf_shift_move (  
    int c,  
    Fl_Text_Editor * e ) [static]
```

Extends the current selection in the direction of key 'c' in editor 'e'.

See also

```
kf_move()
```

9.136.2.28 kf_undo()

```
int Fl_Text_Editor::kf_undo (  
    int c,  
    Fl_Text_Editor * e ) [static]
```

Undo last edit in the current buffer of editor 'e'.
Also deselects previous selection. The key value 'c' is currently unused.

9.136.2.29 kf_up()

```
int Fl_Text_Editor::kf_up (  
    int c,  
    Fl_Text_Editor * e ) [static]
```

Moves the text cursor one line up for editor 'e'.
Same as kf_move(FL_Up, e). The key value 'c' is currently unused.

9.136.2.30 remove_key_binding()

```
void Fl_Text_Editor::remove_key_binding (  
    int key,  
    int state,  
    Key_Binding ** list )
```

Removes the key binding associated with the key key of state state from the Key_Binding list list.
This can be used in derived classes to remove global key bindings by using the global (static) Key_Binding list Fl_Text_Editor::global_keyBindings.

9.136.2.31 tab_nav() [1/2]

```
int Fl_Text_Editor::tab_nav ( ) const
```

Check if Tab focus navigation is enabled.
If disabled (default), hitting Tab inserts a tab character into the editor buffer.
If enabled, hitting Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget.

---

Generated by Doxygen
Returns

if Tab inserts tab characters or moves the focus

Return values

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Tab inserts tab characters (default)</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Tab navigation is enabled.</td>
<td></td>
</tr>
</tbody>
</table>

See also

tab_nav(int), Fl::OPTION_ARROW_FOCUS.

Version

1.3.4 ABI feature

9.136.32  tab_nav() [2/2]

void Fl_Text_Editor::tab_nav ( int val )

Enables or disables Tab key focus navigation.

When disabled (default), tab characters are inserted into Fl_Text_Editor. Only the mouse can change focus. This behavior is desirable when Fl_Text_Editor is used, e.g. in a source code editor. When enabled, Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget. This behavior is desirable when Fl_Text_Editor is used e.g. in a database input form.

Currently, this method is implemented as a convenience method that adjusts the key bindings for the Tab key. This implementation detail may change in the future. Know that changing the editor's key bindings for Tab and Shift-Tab may affect tab navigation.

Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
</table>
| in | val | If val is 0, Tab inserts a tab character (default).  
If val is 1, Tab navigates widget focus. |   |

9.136.3  Member Data Documentation

9.136.3.1  global_key_bindings

Key_Binding* Fl_Text_Editor::global_key_bindings [static], [protected]

Global key binding list.

Derived classes can add key bindings for all Fl_Text_Editor widgets by adding a Key_Binding to this list.

See also

add_key_binding(int key, int state, Key_Func f, Key_Binding** list);

The documentation for this class was generated from the following files:

- Fl_Text_Editor.H
- Fl_Text_Editor.cxx

Generated by Doxygen
9.137 Fl_Text_Selection Class Reference

This is an internal class for Fl_Text_Buffer to manage text selections.  
#include <Fl_Text_Buffer.H>

Public Member Functions

- int end () const
  Return the byte offset to the character after the last selected character.

- int includes (int pos) const
  Return true if position pos with indentation dispIndex is in the Fl_Text_Selection.

- int position (int *start, int *end) const
  Return the positions of this selection.

- bool selected () const
  Returns true if any text is selected.

- void selected (bool b)
  Modify the 'selected' flag.

- void set (int start, int end)
  Set the selection range.

- int start () const
  Return the byte offset to the first selected character.

- void update (int pos, int nDeleted, int nInserted)
  Updates a selection after text was modified.

Protected Attributes

- int mEnd
  byte offset to the character after the last selected character

- bool mSelected
  this flag is set if any text is selected

- int mStart
  byte offset to the first selected character

Friends

- class Fl_Text_Buffer

9.137.1 Detailed Description

This is an internal class for Fl_Text_Buffer to manage text selections.  
This class works correctly with UTF-8 strings assuming that the parameters for all calls are on character boundaries.

9.137.2 Member Function Documentation

9.137.2.1 end()

int Fl_Text_Selection::end ( ) const [inline]
Return the byte offset to the character after the last selected character.

Returns

  byte offset
9.137.2.2 position()

```cpp
int Fl_Text_Selection::position (  
    int * start,  
    int * end ) const
```

Return the positions of this selection.
Parameters

<table>
<thead>
<tr>
<th>start</th>
<th>return byte offset to first selected character</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>return byte offset pointing after last selected character</td>
</tr>
</tbody>
</table>

Returns

true if selected

9.137.2.3 selected() [1/2]

bool Fl_Text_Selection::selected ( ) const [inline]

Returns true if any text is selected.

Returns

a non-zero number if any text has been selected, or 0 if no text is selected.

9.137.2.4 selected() [2/2]

void Fl_Text_Selection::selected ( bool b ) [inline]

Modify the 'selected' flag.

Parameters

| b          | new flag |

9.137.2.5 set()

void Fl_Text_Selection::set ( int start, int end )

Set the selection range.

Parameters

<table>
<thead>
<tr>
<th>start</th>
<th>byte offset to first selected character</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>byte offset pointing after last selected character</td>
</tr>
</tbody>
</table>

9.137.2.6 start()

int Fl_Text_Selection::start ( ) const [inline]

Return the byte offset to the first selected character.

Returns

byte offset

9.137.2.7 update()

void Fl_Text_Selection::update ( int pos, int nDeleted, int nInserted )
Updates a selection after text was modified.
Updates an individual selection for changes in the corresponding text

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>byte offset into text buffer at which the change occurred</th>
</tr>
</thead>
<tbody>
<tr>
<td>nDeleted</td>
<td>number of bytes deleted from the buffer</td>
</tr>
<tr>
<td>nInserted</td>
<td>number of bytes inserted into the buffer</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:
- FL_Text_Buffer.H
- FL_Text_Buffer.cxx

9.138 FlTile Class Reference

The FlTile class lets you resize its children by dragging the border between them.

Inheritance diagram for FlTile:

```
Fl_Widget
   ↓
Fl_Group
   ↓
Fl_Tile
```

Public Member Functions

- **FlTile** (int X, int Y, int W, int H, const char ∗L=0)
  Creates a new FlTile widget using the given position, size, and label string.
- **int handle** (int event)
  Handles the specified event.
- **void position** (int oldx, int oldy, int newx, int newy)
  Drags the intersection at (oldx, oldy) to (newx, newy).
- **void resize** (int X, int Y, int W, int H)
  Resizes the FlTile widget and its children.

Public Member Functions inherited from FlGroup

- **Fl_Widget ∗_ddfdesign_kludge** ()
  This is for forms compatibility only.
- **void add** (Fl_Widget ∗)
  The widget is removed from its current group (if any) and then added to the end of this group.
- **void add**(Fl_Widget ∗o)
  See void FlGroup::add(Fl_Widget ∗w)
- **void add_resizable** (Fl_Widget ∗o)
  Adds a widget to the group and makes it the resizable widget.
- **Fl_Widget ∗const ∗array** () const
  Returns a pointer to the array of children.
- **virtual FlGroup ∗as_group** ()
  Returns an FlGroup pointer if this widget is an FlGroup.
- **void begin** ()
Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget** `+child` (int n) const
  Returns array()[n].
- **int** `children()` const
  Returns how many child widgets the group has.
- **void** `clear()`
  Deletes all child widgets from memory recursively.
- **unsigned int** `clip_children()`
  Returns the current clipping mode.
- **void** `clip_children(int c)`
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- **void** `end()`
  Exactly the same as current(this->parent()).
- **int** `find(const Fl_Widget &o)` const
  See int Fl_Group::find(const Fl_Widget *w) const.
- **int** `find(const Fl_Widget *)` const
  Searches the child array for the widget and returns the index.
- **Fl_Group** (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.
- **void** `focus(Fl_Widget *)`
- **void** `forms_end()`
  This is for forms compatibility only.
- **void** `init_sizes()`
  Resets the internal array of widget sizes and positions.
- **void** `insert(Fl_Widget &, int i)`
  The widget is removed from its current group (if any) and then inserted into this group.
- **void** `insert(Fl_Widget &o, Fl_Widget *)` before)
  This does insert(w, find(before)).
- **void** `remove(Fl_Widget &)`
  Removes a widget from the group but does not delete it.
- **void** `remove(Fl_Widget *)`
  Removes the widget o from the group.
- **void** `remove(int index)`
  Removes the widget at index from the group but does not delete it.
- **Fl_Widget** `+resizable()` const
  See void Fl_Group::resizable(Fl_Widget *box)
- **void** `resizable(Fl_Widget &o)`
  See void Fl_Group::resizable(Fl_Widget *box)
- **void** `resizable(Fl_Widget *o)`
  The resizable widget defines the resizing box for the group.
- **virtual** `~Fl_Group()`
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- **void** `_clear_fullscreen()`
- **void** `_set_fullscreen()`
- **void** `activate()`
  Activates the widget.
- **unsigned int** `active()` const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback * cb, void * p)
  Sets the current callback function for the widget.

• void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image *deimage ()**
  Gets the image that is used as part of the widget label.

- **const Fl_Image *deimage () const**
  void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.

- **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label.

- **void do_callback ()**
  Calls the widget callback.

- **void do_callback (Fl_Widget *o, long arg)**
  Calls the widget callback.

- **void do_callback (Fl_Widget *o, void *arg=0)**
  Calls the widget callback.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **Fl_Image *image ()**
  Gets the image that is used as part of the widget label.

- **const Fl_Image *image () const**
  void image (Fl_Image &img)
  Sets the image to use as part of the widget label.

- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

- **const char *label () const**
  Gets the current label text.

- **void label (const char *text)**
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  
  Gets the label color.

• void labelcolor (Fl_Color c)
  
  Sets the label color.

• Fl_Font labelfont () const
  
  Gets the font to use.

• void labelfont (Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize labelsiz...
Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.

- `int test_shortcut ()`
  Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.

- `void tooltip (const char *text)`
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.

- `int use_accents_menu ()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void * user_data () const`
  Gets the user data for this widget.

- `void user_data (void * v)`
  Sets the user data for this widget.

- `unsigned int visible () const`
  Returns whether a widget is visible.

- `unsigned int visible_focus () const`
  Checks whether this widget has a visible focus.

- `void visible_focus (int v)`
  Modifies keyboard focus navigation.

- `int visible_r () const`
  Returns whether a widget and all its parents are visible.

- `int w () const`
  Gets the widget width.

- `Fl_When when () const`
  Returns the conditions under which the callback is called.

- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- `virtual ~Fl_Widget ()`
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Group`

- `static Fl_Group * current ()`
  Returns the currently active group.

- `static void current (Fl_Group *g)`
  Sets the current group.
Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗cb, void ∗d)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Group

- void draw ()
  Draws the widget.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- int ∗ sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus ()
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
9.138 Fl_Tile Class Reference

Draws a focus box for the widget at the given position and size.

- `void draw_label ();` const
  Draws the widget’s label at the defined label position.

- `void draw_label (int, int, int, int) const`
  Draws the label in an arbitrary bounding box.

- `FL_Widget (int x, int y, int w, int h, const char *label=0L)`
  Creates a widget at the given position and size.

- `unsigned int flags () const`
  Gets the widget flags mask.

- `void h (int v)`
  Internal use only.

- `void set_flag (unsigned int c)`
  Sets a flag in the flags mask.

- `void w (int v)`
  Internal use only.

- `void x (int v)`
  Internal use only.

- `void y (int v)`
  Internal use only.

9.138.1 Detailed Description

The Fl_Tile class lets you resize its children by dragging the border between them.

![Figure 9.43 Fl_Tile](image)

For the tiling to work correctly, the children of an Fl_Tile must cover the entire area of the widget, but not overlap. This means that all children must touch each other at their edges, and no gaps can be left inside the Fl_Tile. Fl_Tile does not normally draw any graphics of its own. The "borders" which can be seen in the snapshot above are actually part of the children. Their boxtypes have been set to FL_DOWN_BOX creating the impression of "ridges" where the boxes touch. What you see are actually two adjacent FL_DOWN_BOX's drawn next to each other. All neighboring widgets share the same edge - the widget’s thick borders make it appear as though the widgets aren't actually touching, but they are. If the edges of adjacent widgets do not touch, then it will be impossible to drag the corresponding edges.

Fl_Tile allows objects to be resized to zero dimensions. To prevent this you can use the resizable() to limit where corners can be dragged to. For more information see note below.

Even though objects can be resized to zero sizes, they must initially have non-zero sizes so the Fl_Tile can figure out their layout. If desired, call position() after creating the children but before displaying the window to set the borders where you want.

**Note on resizable(FL_Widget &w):** The "resizable" child widget (which should be invisible) limits where the borders can be dragged to. All dragging will be limited inside the resizable widget's borders. If you don't set it, it will be possible to drag the borders right to the edges of the Fl_Tile widget, and thus resize objects on the edges to zero width or height. When the entire Fl_Tile widget is resized, the resizable() widget will keep its border distance
to all borders the same (this is normal resize behavior), so that you can effectively set a border width that will
never change. To ensure correct event delivery to all child widgets the resizable() widget must be the first child
of the Fl_Tile widget group. Otherwise some events (e.g. FL_MOVE and FL_ENTER) might be consumed by the
resizable() widget so that they are lost for widgets covered (overlapped) by the resizable() widget.

**Note**

You can still resize widgets **inside** the resizable() to zero width and/or height, i.e. box **2b** above to zero width
and box **3a** to zero height.

See also

void Fl_Group::resizable(Fl_Widget &w)

Example for resizable with 20 pixel border distance:

```c
int dx = 20, dy = dx;
Fl_Tile tile{50,50,300,300};
// create resizable() box first
Fl_Box r(tile.x()+dx,tile.y()+dy,tile.w()-2*dx,tile.h()-2*dy);
tile.resizable(r);
// ... create widgets inside tile (see test/tile.cxx) ...
tile.end();
```

See also the complete example program in test/tile.cxx.

### 9.138.2 Constructor & Destructor Documentation

#### 9.138.2.1 Fl_Tile()

Fl_Tile::Fl_Tile (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char * L = 0 )

Creates a new Fl_Tile widget using the given position, size, and label string. 
The default boxtype is FL_NO_BOX. 
The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a
pointer to all the children in the user code. A kludge has been done so the Fl_Tile and all of its children can be
automatic (local) variables, but you must declare the Fl_Tile first, so that it is destroyed last.

See also

class Fl_Group

### 9.138.3 Member Function Documentation

#### 9.138.3.1 handle()

```c
int Fl_Tile::handle (  
  int event ) [virtual]
```

Handles the specified event.
You normally don’t call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. 
Most of the time, you want to call the inherited handle() method in your overridden method so that you don’t short-
circuit events that you don’t handle. In this last case you should return the callee retval.

**Parameters**

| in | event | the kind of event received |

**Return values**

| 0 | if the event was not used or understood |
Return values

| t | if the event was used and can be deleted |

See also

- Fl_Event

Reimplemented from Fl_Group.

### 9.138.3.2 position()

```cpp
void Fl_Tile::position (int oldx, int oldy, int newx, int newy)
```

Drags the intersection at (oldx, oldy) to (newx, newy).

This redraws all the necessary children.

Pass zero as oldx or oldy to disable drag in that direction.

### 9.138.3.3 resize()

```cpp
void Fl_Tile::resize (int X, int Y, int W, int H) [virtual]
```

Resizes the Fl_Tile widget and its children.

Fl_Tile implements its own resize() method. It does not use Fl_Group::resize() to resize itself and its children.

Enlarging works by just moving the lower-right corner and resizing the bottom and right border widgets accordingly.

Shrinking the Fl_Tile works in the opposite way by shrinking the bottom and right border widgets, unless they are reduced to zero width or height, resp. or to their minimal sizes defined by the resizable() widget.

In this case other widgets will be shrunk as well.

See the Fl_Tile class documentation about how the resizable() works.

Reimplemented from Fl_Group.

The documentation for this class was generated from the following files:

- Fl_Tile.H
- Fl_Tile.cxx

### 9.139 Fl_Tiled_Image Class Reference

This class supports tiling of images over a specified area.

```cpp
#include <Fl_Tiled_Image.H>
```

Inheritance diagram for Fl_Tiled_Image:

```
Fl_Tiled_Image
   |   Fl_Tile
   |   Fl_Image
```

**Public Member Functions**

- virtual void `color_average (Fl_Color c, float i)`

  The `color_average()` method averages the colors in the image with the FLTK color value `c`. 
• **Fl_Image **\* copy ()

  *virtual Fl_Image \* copy (int W, int H)*

  The copy() method creates a copy of the specified image.

• virtual void desaturate ()

  *The desaturate() method converts an image to grayscale.*

• void draw (int X, int Y)

  *virtual void draw (int X, int Y, int W, int H, int cx, int cy)*

  Draws a tiled image.

• **Fl_Tiled_Image (Fl_Image \* i, int W=0, int H=0)**

  *The constructors create a new tiled image containing the specified image.*

• **Fl_Image \* image ()**

  *Gets The image that is tiled.*

• virtual ~**Fl_Tiled_Image ()**

  *The destructor frees all memory and server resources that are used by the tiled image.*

**Public Member Functions inherited from Fl_Image**

• **Fl_Image \* copy ()**

  *The copy() method creates a copy of the specified image.*

• int count () const

  *The count() method returns the number of data values associated with the image.*

• int d () const

  *Returns the current image depth.*

• const char \* const \* data () const

  *Returns a pointer to the current image data array.*

• void draw (int X, int Y)

  *Draws the image.*

• int fail ()

  *Returns a value that is not 0 if there is currently no image available.*

• **Fl_Image (int W, int H, int D)**

  *The constructor creates an empty image with the specified width, height, and depth.*

• int h () const

  *Returns the current image height in pixels.*

• void inactive ()

  *The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.*

• virtual void label (Fl_Menu_Item \* m)

  *The label() methods are an obsolete way to set the image attribute of a widget or menu item.*

• virtual void label (Fl_Widget \* w)

  *The label() methods are an obsolete way to set the image attribute of a widget or menu item.*

• int ld () const

  *Returns the current line data size in bytes.*

• virtual void uncache ()

  *If the image has been cached for display, delete the cache data.*

• int w () const

  *Returns the current image width in pixels.*

• virtual ~**Fl_Image ()**

  *The destructor is a virtual method that frees all memory used by the image.*

**Protected Attributes**

• int alloc_image_

• **Fl_Image \* image_**
Additional Inherited Members

Static Public Member Functions inherited from Fl_Image

- static Fl_RGB_Scaling RGB_scaling()
  Returns the currently used RGB image scaling method.
- static void RGB_scaling(Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_NO_IMAGE = -1

Protected Member Functions inherited from Fl_Image

- void d(int D)
  Sets the current image depth.
- void data(const char *const *p, int c)
  Sets the current array pointer and count of pointers in the array.
- void draw_empty(int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- void h(int H)
  Sets the current image height in pixels.
- void ld(int LD)
  Sets the current line data size in bytes.
- void w(int W)
  Sets the current image width in pixels.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype(const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure(const Fl_Label *lo, int &lw, int &lh)

9.139.1 Detailed Description

This class supports tiling of images over a specified area. The source (tile) image is not copied unless you call the color_average(), desaturate(), or inactive() methods.

9.139.2 Constructor & Destructor Documentation

9.139.2.1 Fl_Tiled_Image()

Fl_Tiled_Image::Fl_Tiled_Image (Fl_Image * i, int W = 0, int H = 0)

The constructors create a new tiled image containing the specified image. Use a width and height of 0 to tile the whole window/widget.
Note

Due to implementation constraints in FLTK 1.3.3 and later width and height of 0 may not work as expected when used as background image in widgets other than windows. You may need to center and clip the image (label) and set the label type to FL_NORMAL_LABEL. Doing so will let the tiled image fill the whole widget as its background image. Other combinations of label flags may or may not work.

```cpp
#include "bg.xpm"
Fl_Pixmap *bg_xpm = new Fl_Pixmap(bg_xpm);
Fl_Tiled_Image *bg_tiled = new Fl_Tiled_Image(bg_xpm,0,0);
Fl_Box *box = new Fl_Box(40,40,300,100,"");
box->box(FL_UP_BOX);
box->labeltype(FL_NORMAL_LABEL);
box->align(FL_ALIGN_INSIDE | FL_ALIGN_CENTER | FL_ALIGN_CLIP);
box->image(bg_tiled);
```

Note

Setting an image (label) for a window may not work as expected due to implementation constraints in FLTK 1.3.x and maybe later. The reason is the way Fl::scheme() initializes the window's label type and image. A possible workaround is to use another Fl_Group as the only child widget and to set the background image for this group as described above.

Todo Fix Fl_Tiled_Image as background image for widgets and windows and fix the implementation of Fl::scheme(const char *)

9.139.3 Member Function Documentation

9.139.3.1 color_average()

```cpp
void Fl_Tiled_Image::color_average (Fl_Color c, float i) [virtual]
```

The `color_average()` method averages the colors in the image with the FLTK color value `c`. The `i` argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color. An internal copy is made of the original image before changes are applied, to avoid modifying the original image. Reimplemented from Fl_Image.

9.139.3.2 copy()

```cpp
Fl_Image * Fl_Tiled_Image::copy (int W, int H) [virtual]
```

The `copy()` method creates a copy of the specified image. If the width and height are provided, the image is resized to the specified size. The image should be deleted (or in the case of Fl_Shared_Image, released) when you are done with it. Reimplemented from Fl_Image.

9.139.3.3 desaturate()

```cpp
void Fl_Tiled_Image::desaturate ( ) [virtual]
```

The `desaturate()` method converts an image to grayscale. If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image before changes are applied, to avoid modifying the original image. Reimplemented from Fl_Image.

9.139.3.4 draw()

```cpp
void Fl_Tiled_Image::draw (int X, int Y, int W,
```

```cpp
Generated by Doxygen
```
Draws a tiled image.
Tiled images can be used as background images for widgets and windows. However, due to implementation con-
straints, you must take care when setting label types and alignment flags. Only certain combinations work as
expected, others may yield unexpected results and undefined behavior.
This draw method can draw multiple copies of one image in an area given by X, Y, W, H.
The optional arguments cx and cy can be used to crop the image starting at offsets (cx, cy). cx and cy must be
\geq 0 (negative values are ignored). If one of the values is greater than the image width or height resp. (cx \geq
image()-w() or cy \geq image()-h()) nothing is drawn, because the resulting image would be empty.
After calculating the resulting image size the image is drawn as often as necessary to fill the given area, starting at
the top left corner.
If both W and H are 0 the image is repeated as often as necessary to fill the entire window, unless there is a valid
clip region. If you want to fill only one particular widget's background, then you should either set a clip region in your
draw() method or use the label alignment flags FL_ALIGN_INSIDE|FL_ALIGN_CLIP to make sure the image
is clipped.
This may be improved in a later version of the library.
Reimplemented from Fl_Image.
The documentation for this class was generated from the following files:

- Fl_Tiled_Image.H
- Fl_Tiled_Image.cxx

9.140 Fl_Timer Class Reference

This is provided only to emulate the Forms Timer widget.

```c
#include <Fl_Timer.H>
```

Inheritance diagram for Fl_Timer:

```
Fl_Widget

Fl_Timer
```

Public Member Functions

- char direction () const
  
  Gets or sets the direction of the timer.
- void direction (char d)
  
  Gets or sets the direction of the timer.
- Fl_Timer (uchar t, int x, int y, int w, int h, const char *l)
  
  Creates a new Fl_Timer widget using the given type, position, size, and label string.
- int handle (int)
  
  Handles the specified event.
- char suspended () const
  
  Gets or sets whether the timer is suspended.
- void suspended (char d)
  
  Gets or sets whether the timer is suspended.
- double value () const
  
  See void Fl_Timer::value(double)
- void value (double)
  
  Sets the current timer value.
• \texttt{\textasciitilde\texttt{Fl\_Timer} ()}

   Destroys the timer and removes the timeout.

**Public Member Functions inherited from Fl\_Widget**

- void \_clear_fullscreen ()
- void \_set_fullscreen ()
- void activate ()

   Activates the widget.

- unsigned int active () const

   Returns whether the widget is active.

- int active\_r () const

   Returns whether the widget and all of its parents are active.

- Fl\_Align align () const

   Gets the label alignment.

- void align (Fl\_Align alignment)

   Sets the label alignment.

- long argument () const

   Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)

   Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl\_Gl\_Window * as\_gl\_window ()

   Returns an Fl\_Gl\_Window pointer if this widget is an Fl\_Gl\_Window.

- virtual Fl\_Group * as\_group ()

   Returns an Fl\_Group pointer if this widget is an Fl\_Group.

- virtual Fl\_Window * as\_window ()

   Returns an Fl\_Window pointer if this widget is an Fl\_Window.

- Fl\_Boxtype box () const

   Gets the box type of the widget.

- void box (Fl\_Boxtype new\_box)

   Sets the box type for the widget.

- Fl\_Callback\_p callback () const

   Gets the current callback function for the widget.

- void callback (Fl\_Callback cb)

   Sets the current callback function for the widget.

- void callback (Fl\_Callback cb, void *p)

   Sets the current callback function for the widget.

- void callback (Fl\_Callback0 cb)

   Sets the current callback function for the widget.

- void callback (Fl\_Callback1 cb, long p=0)

   Sets the current callback function for the widget.

- unsigned int changed () const

   Checks if the widget value changed since the last callback.

- void clear\_active ()

   Marks the widget as inactive without sending events or changing focus.

- void clear\_changed ()

   Marks the value of the widget as unchanged.

- void clear\_damage (uchar c=0)

   Clears or sets the damage flags.

- void clear\_output ()

   Sets a widget to accept input.
• **void clear_visible ()**
  
  Hides the widget.

• **void clear_visible_focus ()**
  
  Disables keyboard focus navigation with this widget.

• **Fl_Color color () const**
  
  Gets the background color of the widget.

• **void color (Fl_Color bg)**
  
  Sets the background color of the widget.

• **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

• **Fl_Color color2 () const**
  
  For back compatibility only.

• **void color2 (unsigned a)**
  
  For back compatibility only.

• **int contains (const Fl_Widget ∗w) const**
  
  Checks if w is a child of this widget.

• **void copy_label (const char ∗new_label)**
  
  Sets the current label.

• **void copy_tooltip (const char ∗text)**
  
  Sets the current tooltip text.

• **uchar damage () const**
  
  Returns non-zero if draw() needs to be called.

• **void damage (uchar c)**
  
  Sets the damage bits for the widget.

• **void damage (uchar c, int x, int y, int w, int h)**
  
  Sets the damage bits for an area inside the widget.

• **int damage_resize (int, int, int, int)**
  
  Internal use only.

• **void deactivate ()**
  
  Deactivates the widget.

• **Fl_Image ∗deimage ()**
  
  Gets the image that is used as part of the widget label.

• **const Fl_Image ∗deimage () const**
  
  **void deimage (Fl_Image &img)**
  
  Sets the image to use as part of the widget label.

• **void deimage (Fl_Image ∗img)**
  
  Sets the image to use as part of the widget label.

• **void do_callback ()**
  
  Calls the widget callback.

• **void do_callback (Fl_Widget ∗o, long arg)**
  
  Calls the widget callback.

• **void do_callback (Fl_Widget ∗o, void ∗arg=0)**
  
  Calls the widget callback.

• **void draw_label (int, int, int, Fl_Align) const**
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• **int h () const**
  
  Gets the widget height.

• **virtual void hide ()**
  
  Makes a widget invisible.

• **Fl_Image ∗image ()**
  
  Gets the image that is used as part of the widget label.
• const F Image *image () const
  
  Sets the image to use as part of the widget label.
• void image (F Image &img)
  
  Sets the image to use as part of the widget label.
• int inside (const F_Widget *wgt) const
  
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  
  Gets the current label text.
• void label (const char *text)
  
  Sets the current label pointer.
• void label (F Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.
• F Color labelcolor () const
  
  Gets the label color.
• void labelcolor (F Color c)
  
  Sets the label color.
• F Font labelfont () const
  
  Gets the font to use.
• void labelfont (F Font f)
  
  Sets the font to use.
• F Fontsize labelsize () const
  
  Gets the font size in pixels.
• void labelsize (F Fontsize pix)
  
  Sets the font size in pixels.
• F Labeltype labeltype () const
  
  Gets the label type.
• void labeltype (F Labeltype a)
  
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  
  Returns if a widget is used for output only.
• F_Group * parent () const
  
  Returns a pointer to the parent widget.
• void parent (F_Group *p)
  
  Internal use only - "for hacks only".
• void position (int X, int Y)
  
  Repositions the window or widget.
• void redraw ()
  
  Schedules the drawing of the widget.
• void redraw_label ()
  
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  
  Changes the size or position of the widget.
• F Color selection_color () const
  
  Gets the selection color.
• void selection_color (F Color a)
  
  Sets the selection color.
void set_active ()

Marks the widget as active without sending events or changing focus.

void set_changed ()

Marks the value of the widget as changed.

void set_output ()

Sets a widget to output only.

void set_visible ()

Makes the widget visible.

void set_visible_focus ()

Enables keyboard focus navigation with this widget.

virtual void show ()

Makes a widget visible.

void size (int W, int H)

Changes the size of the widget.

int take_focus ()

Gives the widget the keyboard focus.

unsigned int takesevents () const

Returns if the widget is able to take events.

int test_shortcut ()

Returns true if the widget's label contains the entered ‘&x’ shortcut.

const char * tooltip () const

Gets the current tooltip text.

void tooltip (const char * text)

Sets the current tooltip text.

Fl_Window * top_window () const

Returns a pointer to the top-level window for the widget.

Fl_Window * top_window_offset (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.

uchar type () const

Gets the widget type.

void type (uchar t)

Sets the widget type.

int use_accents_menu ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

void * user_data () const

Gets the user data for this widget.

void user_data (void * v)

Sets the user data for this widget.

unsigned int visible () const

Returns whether a widget is visible.

unsigned int visible_focus ()

Checks whether this widget has a visible focus.

void visible_focus (int v)

Modifies keyboard focus navigation.

int visible_r () const

Returns whether a widget and all its parents are visible.

int w () const

Gets the widget width.

Fl_When when () const

Returns the conditions under which the callback is called.
Sets the flags used to decide when a callback is called.

- `Fl_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x () const`
  Gets the widget position in its window.
- `int y () const`
  Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
  Destroys the widget.

Protected Member Functions

- `void draw ()`
  Draws the widget.

Protected Member Functions inherited from Fl_Widget

- `void clear_flag (unsigned int c)`
  Clears a flag in the flags mask.
- `void draw_backdrop () const`
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
  Draws the widget box according its box style.
- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget’s position and size.
- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.
- `void draw_focus ()`
  Draws a focus rectangle around the widget
- `void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const`
  Draws a focus box for the widget at the given position and size.
- `void draw_label () const`
  Draws the widget’s label at the defined label position.
- `void draw_label (int, int, int, int) const`
  Draws the label in an arbitrary bounding box.
- `Fl_Widget (int x, int y, int w, int h, const char * label=0L)`
  Creates a widget at the given position and size.
- `unsigned int flags () const`
  Gets the widget flags mask.
- `void h (int v)`
  Internal use only.
- `void set_flag (unsigned int c)`
  Sets a flag in the flags mask.
- `void w (int v)`
  Internal use only.
- `void x (int v)`
  Internal use only.
- `void y (int v)`
  Internal use only.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗cb, void ∗d)
  
  The default callback for all widgets that don’t set a callback.

- static unsigned int label_shortcut (const char ∗t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int test_shortcut (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

- enum {
  
  INACTIVE = 1<0 , INVISIBLE = 1<1 , OUTPUT = 1<2 , NOBORDER = 1<3 ,
  FORCE_POSITION = 1<4 , NON_MODAL = 1<5 , SHORTCUT_LABEL = 1<6 , CHANGED = 1<7
  ,
  OVERRIDE = 1<8 , VISIBLE_FOCUS = 1<9 , COPIED_LABEL = 1<10 , CLIP_CHILDREN = 1<11
  ,
  MENU_WINDOW = 1<12 , TOOLTIP_WINDOW = 1<13 , MODAL = 1<14 , NO_OVERLAY = 1<15
  ,

  = 1<19 ,
  USERFLAG3 = 1<29 , USERFLAG2 = 1<30 , USERFLAG1 = 1<31 }

  flags possible values enumeration.

9.140.1 Detailed Description

This is provided only to emulate the Forms Timer widget.
It works by making a timeout callback every 1/5 second. This is wasteful and inaccurate if you just want something
to happen a fixed time in the future. You should directly call Fl::add_timeout() instead.

9.140.2 Constructor & Destructor Documentation

9.140.2.1 Fl_Timer()

Fl_Timer::Fl_Timer ( 
  uchar t,
  int X,
  int Y,
  int W,
  int H,
  const char ∗l )

Creates a new Fl_Timer widget using the given type, position, size, and label string.
The type parameter can be any of the following symbolic constants:

- FL_NORMAL_TIMER - The timer just does the callback and displays the string "Timer" in the widget.
- FL_VALUE_TIMER - The timer does the callback and displays the current timer value in the widget.
- FL_HIDDEN_TIMER - The timer just does the callback and does not display anything.

9.140.3 Member Function Documentation

9.140.3.1 direction() [1/2]

char Fl_Timer::direction ( ) const [inline]

Gets or sets the direction of the timer.
If the direction is zero then the timer will count up, otherwise it will count down from the initial value().
void Fl_Timer::direction (char d) [inline]

Gets or sets the direction of the timer.
If the direction is zero then the timer will count up, otherwise it will count down from the initial value().

void Fl_Timer::draw () [protected], [virtual]

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Implements Fl_Widget.

int Fl_Timer::handle (int event) [virtual]

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

| in  | event | the kind of event received |

Return values

| 0   | if the event was not used or understood |
| 1   | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Widget.

char Fl_Timer::suspended () const [inline]

Gets or sets whether the timer is suspended.

The documentation for this class was generated from the following files:

- Fl_Timer.H
- forms_timer.cxx

Fl_Toggle_Button Class Reference

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off.
#include <Fl_Toggle_Button.H>

```

Public Member Functions

- **Fl_Toggle_Button** (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new Fl_Toggle_Button widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Button

- int **clear**()
  
  *Same as value(0).*

- **Fl_Boxtype down_box** () const
  
  *Returns the current down box type, which is drawn when value() is non-zero.*

- void down_box (Fl_Boxtype b)
  
  *Sets the down box type.*

- **Fl_Color down_color** () const
  
  *(for backwards compatibility)*

- void down_color (unsigned c)
  
  *(for backwards compatibility)*

- **Fl_Button** (int X, int Y, int W, int H, const char *L=0)
  
  *The constructor creates the button using the given position, size, and label.*

- virtual int **handle** (int)
  
  *Handles the specified event.*

- int **set**()
  
  *Same as value(1).*

- void setonly ()
  
  *Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).*

- int shortcut () const
  
  *Returns the current shortcut key for the button.*

- void shortcut (const char *s)
  
  *(for backwards compatibility)*

- void shortcut (int s)
  
  *Sets the shortcut key to s.*

- char **value** () const
  
  *Returns the current value of the button (0 or 1).*

- int **value** (int v)
  
  *Sets the current value of the button.*
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
Disables keyboard focus navigation with this widget.

- `FL_Color color () const`  
  Gets the background color of the widget.

- `void color (FL_Color bg)`  
  Sets the background color of the widget.

- `void color (FL_Color bg, FL_Color sel)`  
  Sets the background and selection color of the widget.

- `FL_Color color2 () const`  
  For back compatibility only.

- `void color2 (unsigned a)`  
  For back compatibility only.

- `int contains (const Fl_Widget ∗ w) const`  
  Checks if w is a child of this widget.

- `void copy_label (const char ∗ new_label)`  
  Sets the current label.

- `void copy_tooltip (const char ∗ text)`  
  Sets the current tooltip text.

- `uchar damage () const`  
  Returns non-zero if draw() needs to be called.

- `void damage (uchar c)`  
  Sets the damage bits for the widget.

- `void damage (uchar c, int x, int y, int w, int h)`  
  Sets the damage bits for an area inside the widget.

- `int damage_resize (int, int, int, int)`  
  Internal use only.

- `void deactivate ()`  
  Deactivates the widget.

- `FL_Image ∗ deimage ()`  
  Gets the image that is used as part of the widget label.

- `const FL_Image ∗ deimage () const`  
  void deimage (FL_Image &img)`  
  Sets the image to use as part of the widget label.

- `void deimage (const Fl_Image ∗ img)`  
  Sets the image to use as part of the widget label.

- `void do_callback ()`  
  Calls the widget callback.

- `void do_callback (FL_Widget ∗ o, long arg)`  
  Calls the widget callback.

- `void do_callback (FL_Widget ∗ o, void ∗ arg=0)`  
  Calls the widget callback.

- `void draw_label (int, int, int, Fl_Align) const`  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h () const`  
  Gets the widget height.

- `virtual void hide ()`  
  Makes a widget invisible.

- `FL_Image ∗ image ()`  
  Gets the image that is used as part of the widget label.

- `const FL_Image ∗ image () const`  
  void image (FL_Image &img)`  
  Sets the image to use as part of the widget label.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
Marks the value of the widget as changed.

- **void** set_output ()
  
  Sets a widget to output only.

- **void** set_visible ()
  
  Makes the widget visible.

- **void** set_visible_focus ()
  
  Enables keyboard focus navigation with this widget.

- **virtual void** show ()
  
  Makes a widget visible.

- **void** size (int W, int H)
  
  Changes the size of the widget.

- **int** take_focus ()
  
  Gives the widget the keyboard focus.

- **unsigned int** takesevents () const
  
  Returns if the widget is able to take events.

- **int** test_shortcut ()
  
  Returns true if the widget's label contains the entered `&x` shortcut.

- **const char ∗** tooltip () const
  
  Gets the current tooltip text.

- **void** tooltip (const char ∗text)
  
  Sets the current tooltip text.

- **Fl_Window ∗** top_window () const
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window ∗** top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar** type () const
  
  Gets the widget type.

- **void** type (uchar t)
  
  Sets the widget type.

- **int** use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void ∗** user_data () const
  
  Gets the user data for this widget.

- **void** user_data (void ∗v)
  
  Sets the user data for this widget.

- **unsigned int** visible () const
  
  Checks whether this widget has a visible focus.

- **unsigned int** visible_focu() const
  
  Checks whether this widget has a visible focus.

- **void** visible_focus (int v)
  
  Modifies keyboard focus navigation.

- **int** visible_r () const
  
  Returns whether a widget and all its parents are visible.

- **int** w () const
  
  Gets the widget width.

- **Fl_When** when () const
  
  Returns the conditions under which the callback is called.

- **void** when (uchar i)
  
  Sets the flags used to decide when a callback is called.

- **Fl_Window ∗** window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *cb, void *d)
  
  The default callback for all widgets that don't set a callback.

• static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char *, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,

}

flags possible values enumeration.

Protected Member Functions inherited from Fl_Button

• virtual void draw ()
  
  Draws the widget.

• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.

• void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus ()
  
  draws a focus rectangle around the widget

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const

Generated by Doxygen
Draws a focus box for the widget at the given position and size.

- `void draw_label () const`
  
  Draws the widget's label at the defined label position.

- `void draw_label (int, int, int, int) const`
  
  Draws the label in an arbitrary bounding box.

- `Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)`
  
  Creates a widget at the given position and size.

- `unsigned int flags () const`
  
  Gets the widget flags mask.

- `void h (int v)`
  
  Internal use only.

- `void set_flag (unsigned int c)`
  
  Sets a flag in the flags mask.

- `void w (int v)`
  
  Internal use only.

- `void x (int v)`
  
  Internal use only.

- `void y (int v)`
  
  Internal use only.

**Static Protected Attributes inherited from Fl_Button**

- `static Fl_Widget_Tracker ∗key_release_tracker = 0`

### 9.141.1 Detailed Description

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off. The `Fl_Toggle_Button` subclass displays the "on" state by drawing a pushed-in button. Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for `type()` and `when()`.

### 9.141.2 Constructor & Destructor Documentation

#### 9.141.2.1 Fl_Toggle_Button()

```cpp
Fl_Toggle_Button::Fl_Toggle_Button ( int X, int Y, int W, int H, const char ∗L = 0 )
```

Creates a new `Fl_Toggle_Button` widget using the given position, size, and label string.

The constructor creates the button using the given position, size, and label.

The inherited destructor deletes the toggle button. The `Button type()` is set to `FL_TOGGLE_BUTTON`.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X,Y,W,H</td>
</tr>
<tr>
<td>in</td>
<td>L</td>
</tr>
</tbody>
</table>
The documentation for this class was generated from the following files:

- Fl_Button.cxx

9.142 Fl_Tooltip Class Reference

The Fl_Tooltip class provides tooltip support for all FLTK widgets.

```
#include <Fl_Tooltip.H>
```

### Static Public Member Functions

- static Fl_Color color ()
  
  Gets the background color for tooltips.
- static void color (Fl_Color c)
  
  Sets the background color for tooltips.
- static Fl_Widget * current ()
  
  Gets the current widget target.
- static void current (Fl_Widget *)
  
  Sets the current widget target.
- static float delay ()
  
  Gets the tooltip delay.
- static void delay (float f)
  
  Sets the tooltip delay.
- static void disable ()
  
  Same as enable(0), disables tooltips on all widgets.
- static void enable (int b=1)
  
  Enables tooltips on all widgets (or disables if b is false).
- static int enabled ()
  
  Returns non-zero if tooltips are enabled.
- static void enter_area (Fl_Widget *, int X, int Y, int W, int H, const char *)
  
  You may be able to use this to provide tooltips for internal pieces of your widget.
- static Fl_Font font ()
  
  Gets the typeface for the tooltip text.
- static void font (Fl_Font i)
  
  Sets the typeface for the tooltip text.
- static float hoverdelay ()
  
  Gets the tooltip hover delay, the delay between tooltips.
- static void hoverdelay (float f)
  
  Sets the tooltip hover delay, the delay between tooltips.
- static int margin_height ()
  
  Gets the amount of extra space above and below the tooltip's text.
- static void margin_height (int v)
  
  Sets the amount of extra space above and below the tooltip's text.
- static int margin_width ()
  
  Gets the amount of extra space left/right of the tooltip's text.
- static void margin_width (int v)
  
  Sets the amount of extra space left/right of the tooltip's text.
- static Fl_Fontsize size ()
  
  Gets the size of the tooltip text.
- static void size (Fl_Fontsize s)
  
  Sets the size of the tooltip text.
9.142 Fl_Tooltip Class Reference

- static Fl_Color textcolor()
  
  Gets the color of the text in the tooltip.
- static void textcolor(Fl_Color c)
  
  Sets the color of the text in the tooltip.
- static int wrap_width()
  
  Gets the maximum width for tooltip’s text before it word wraps.
- static void wrap_width(int v)
  
  Sets the maximum width for tooltip’s text before it word wraps.

Static Public Attributes

- static void(∗enter)(Fl_Widget ∗w) = nothing
- static void(∗exit)(Fl_Widget ∗w) = nothing

Friends

- void Fl_Widget::copy_tooltip(const char ∗)
- void Fl_Widget::tooltip(const char ∗)

9.142.1 Detailed Description

The Fl_Tooltip class provides tooltip support for all FLTK widgets. It contains only static methods.

9.142.2 Member Function Documentation

9.142.2.1 color() [1/2]

static Fl_Color Fl_Tooltip::color() { inline }, [static]

Gets the background color for tooltips.
The default background color is a pale yellow.

9.142.2.2 color() [2/2]

static void Fl_Tooltip::color(Fl_Color c ) { inline }, [static]

Sets the background color for tooltips.
The default background color is a pale yellow.
9.142.3 current()

void Fl_Tooltip::current ( 
    Fl_Widget ∗ w ) [static]

Sets the current widget target.
Acts as though enter(widget) was done but does not pop up a tooltip. This is useful to prevent a tooltip from
reappearing when a modal overlapping window is deleted. FLTK does this automatically when you click the mouse
button.

9.142.4 delay() [1/2]

static float Fl_Tooltip::delay ( ) [inline], [static]

Gets the tooltip delay.
The default delay is 1.0 seconds.

9.142.5 delay() [2/2]

static void Fl_Tooltip::delay ( 
    float f ) [inline], [static]

Sets the tooltip delay.
The default delay is 1.0 seconds.

9.142.6 disable()

static void Fl_Tooltip::disable ( ) [inline], [static]

Same as enable(0), disables tooltips on all widgets.

9.142.7 enable()

static void Fl_Tooltip::enable ( 
    int b = 1 ) [inline], [static]

Enables tooltips on all widgets (or disables if b is false).

9.142.8 enabled()

static int Fl_Tooltip::enabled ( ) [inline], [static]

Returns non-zero if tooltips are enabled.

9.142.9 enter_area()

void Fl_Tooltip::enter_area ( 
    Fl_Widget ∗ wid, 
    int x, 
    int y, 
    int w, 
    int h, 
    const char ∗ t ) [static]

You may be able to use this to provide tooltips for internal pieces of your widget.
Call this after setting Fl::belowmouse() to your widget (because that calls the above enter() method). Then figure
out what thing the mouse is pointing at, and call this with the widget (this pointer is used to remove the tooltip if
the widget is deleted or hidden, and to locate the tooltip), the rectangle surrounding the area, relative to the top-left
corner of the widget (used to calculate where to put the tooltip), and the text of the tooltip (which must be a pointer to static data as it is not copied).

9.142.2.10 font() [1/2]

static Fl_Font Fl_Tooltip::font ( ) [inline], [static]
Gets the typeface for the tooltip text.

9.142.2.11 font() [2/2]

static void Fl_Tooltip::font ( Fl_Font i ) [inline], [static]
Sets the typeface for the tooltip text.

9.142.2.12 hoverdelay() [1/2]

static float Fl_Tooltip::hoverdelay ( ) [inline], [static]
Gets the tooltip hover delay, the delay between tooltips.
The default delay is 0.2 seconds.

9.142.2.13 hoverdelay() [2/2]

static void Fl_Tooltip::hoverdelay ( float f ) [inline], [static]
Sets the tooltip hover delay, the delay between tooltips.
The default delay is 0.2 seconds.

9.142.2.14 margin_height() [1/2]

static int Fl_Tooltip::margin_height ( ) [inline], [static]
Gets the amount of extra space above and below the tooltip's text.
Default is 3.

9.142.2.15 margin_height() [2/2]

static void Fl_Tooltip::margin_height ( int v ) [inline], [static]
Sets the amount of extra space above and below the tooltip's text.
Default is 3.

9.142.2.16 margin_width() [1/2]

static int Fl_Tooltip::margin_width ( ) [inline], [static]
Gets the amount of extra space left/right of the tooltip's text.
Default is 3.

9.142.2.17 margin_width() [2/2]

static void Fl_Tooltip::margin_width ( int v ) [inline], [static]
Sets the amount of extra space left/right of the tooltip's text.
Default is 3.
9.142.18 size() [1/2]
static Fl_Fontsize Fl_Tooltip::size ( ) [inline], [static]
  Gets the size of the tooltip text.

9.142.19 size() [2/2]
static void Fl_Tooltip::size ( Fl_Fontsize s ) [inline], [static]
  Sets the size of the tooltip text.

9.142.20 textcolor() [1/2]
static Fl_Color Fl_Tooltip::textcolor ( ) [inline], [static]
  Gets the color of the text in the tooltip.
  The default is black.

9.142.21 textcolor() [2/2]
static void Fl_Tooltip::textcolor ( Fl_Color c ) [inline], [static]
  Sets the color of the text in the tooltip.
  The default is black.

9.142.22 wrap_width() [1/2]
static int Fl_Tooltip::wrap_width ( ) [inline], [static]
  Gets the maximum width for tooltip's text before it word wraps.
  Default is 400.

9.142.23 wrap_width() [2/2]
static void Fl_Tooltip::wrap_width ( int v ) [inline], [static]
  Sets the maximum width for tooltip's text before it word wraps.
  Default is 400.

The documentation for this class was generated from the following files:
- Fl_Tooltip.H
- Fl.cxx
- Fl_Tooltip.cxx

9.143 Fl_Tree Class Reference

Tree widget.
#include <Fl_Tree.H>

Inheritance diagram for Fl_Tree:

```
Fl_Widget
  ↓
Fl_Group
  ↓
Fl_Tree
```
Public Member Functions

- **FL_Tree_Item * add** (const char *path, FL_Tree_Item *newitem=0)
  
  Adds a new item, given a menu style 'path'.

- **FL_Tree_Item * add** (FL_Tree_Item *parent_item, const char *name)
  
  Add a new child item labeled 'name' to the specified 'parent_item'.

- **void calc_dimensions ()**
  
  Recalculate widget dimensions and scrollbar visibility, normally managed automatically.

- **void calc_tree ()**
  
  Recalculates the tree's sizes and scrollbar visibility, normally managed automatically.

- **FL_Tree_Item * callback_item ()**
  
  Gets the item that caused the callback.

- **void callback_item (FL_Tree_Item *item)**
  
  Sets the item that was changed for this callback.

- **FL_Tree_Reason callback_reason () const**
  
  Gets the reason for this callback.

- **void callback_reason (FL_Tree_Reason reason)**
  
  Sets the reason for this callback.

- **void clear ()**
  
  Clear the entire tree's children, including the root.

- **void clear_children (FL_Tree_Item *item)**
  
  Clear all the children for 'item'.

- **int close (const char *path, int docallback=1)**
  
  Closes the item specified by 'path'.

- **int close (FL_Tree_Item *item, int docallback=1)**
  
  Closes the specified 'item'.

- **FL_Image * closeicon () const**
  
  Returns the icon to be used as the 'close' icon.

- **void closeicon (FL_Image *val)**
  
  Sets the icon to be used as the 'close' icon.

- **FL_Color connectorcolor () const**
  
  Get the connector color used for tree connection lines.

- **void connectorcolor (FL_Color val)**
  
  Set the connector color used for tree connection lines.

- **FL_Tree_Connector connectorstyle () const**
  
  Returns the line drawing style for inter-connecting items.

- **void connectorstyle (FL_Tree_Connector val)**
  
  Sets the line drawing style for inter-connecting items.

- **int connectorwidth () const**
  
  Gets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.

- **void connectorwidth (int val)**
  
  Sets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.

- **int deselect (const char *path, int docallback=1)**
  
  Deselect an item specified by 'path'.

- **int deselect (FL_Tree_Item *item, int docallback=1)**
  
  Deselect the specified item.

- **int deselect_all (FL_Tree_Item *item=0, int docallback=1)**
  
  Deselect 'item' and all its children.

- **void display (FL_Tree_Item *item)**
  
  Displays 'item', scrolling the tree as necessary.
See if 'item' is currently displayed on-screen (visible within the widget).

- void draw()
  Standard FLTK draw() method, handles drawing the tree widget.
- int extend_selection (Fl_Tree_Item *from, Fl_Tree_Item *to, int val=1, bool visible=false)
  Extend a selection between 'from' and 'to' depending on 'visible'.
- int extend_selection_dir (Fl_Tree_Item *from, Fl_Tree_Item *to, int dir, int val, bool visible)
  Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.
- Fl_Tree_Item *find_clicked (int yonly=0)
  Non-const version of Fl_Tree::find_clicked(int yonly) const.
- const Fl_Tree_Item *find_clicked (int yonly=0) const
  Find the item that was last clicked on.
- Fl_Tree_Item *find_item (const char *path)
  Non-const version of Fl_Tree::find_item(const char *path) const.
- const Fl_Tree_Item *find_item (const char *path) const
  Find the item, given a menu style path, e.g.
- Fl_Tree_Item *first ()
  Returns the first item in the tree, or 0 if none.
- Fl_Tree_Item *first_selected_item ()
  Returns the first selected item in the tree.
- Fl_Tree_Item *first_visible ()
  Returns the first open(), visible item in the tree, or 0 if none.
- Fl_Tree_Item *first_visible_item ()
  Returns the first open(), visible item in the tree, or 0 if none.
- Fl_Tree (int X, int Y, int W, int H, const char *L=0)
  Constructor.
- Fl_Tree_Item *get_item_focus () const
  Get the item that currently has keyboard focus.
- int get_selected_items (Fl_Tree_Item_Array &ret_items)
  Returns the currently selected items as an array of 'ret_items'.
- int handle (int e)
  Standard FLTK event handler for this widget.
- int hposition () const
  Returns the horizontal scroll position as a pixel offset.
- void hposition (int pos)
  Sets the horizontal scroll offset to position 'pos'.
- Fl_Tree_Item *insert (Fl_Tree_Item *item, const char *name, int pos)
  Insert a new item 'name' into 'item's children at position 'pos'.
- Fl_Tree_Item *insert_above (Fl_Tree_Item *above, const char *name)
  Inserts a new item 'name' above the specified Fl_Tree_Item 'above'.
- int is_close (const char *path) const
  See if item specified by 'path' is closed.
- int is_close (Fl_Tree_Item *item) const
  See if the specified 'item' is closed.
- int is_hscroll_visible () const
  See if the horizontal scrollbar is currently visible.
- int is_open (const char *path) const
  See if item specified by 'path' is open.
- int is_open (Fl_Tree_Item *item) const
  See if 'item' is open.
- int is_scrollbar (Fl_Widget *w)
See if widget 'w' is one of the Fl_Tree widget's scrollbars.

- int is_selected (const char *path)
  
  See if item specified by 'path' is selected.

- int is_selected (Fl_Tree_Item *item) const
  
  See if the specified 'item' is selected.

- int is_vscroll_visible () const
  
  See if the vertical scrollbar is currently visible.

- Fl_Tree_Item * item_clicked ()
  
  Return the item that was last clicked.

- Fl_Tree_Item_Draw_Mode item_draw_mode () const
  
  Get the 'item draw mode' used for the tree.

- void item_draw_mode (Fl_Tree_Item_Draw_Mode mode)
  
  Set the 'item draw mode' used for the tree to 'mode'.

- void item_draw_mode (int mode)
  
  Set the 'item draw mode' used for the tree to integer 'mode'.

- void item_labelbgcolor (Fl_Color val)
  
  Set the default label background color used for creating new items.

- Fl_Color item_labelbgcolor (void) const
  
  Get the default label background color used for creating new items.

- void item_labelbgcolor (Fl_Color val)
  
  Set the default label foreground color used for creating new items.

- Fl_Color item_labelfcolor (void) const
  
  Get the default label foreground color used for creating new items.

- Fl_Font item_labelfcolor () const
  
  Get the default font face used for creating new items.

- void item_labelfcolor (Fl_Font val)
  
  Set the default font face used for creating new items.

- Fl_Fontsize item_labelsize () const
  
  Get the default label fontsize used for creating new items.

- void item_labelsize (Fl_Fontsize val)
  
  Set the default label font size used for creating new items.

- int item_pathname (char *pathname, int pathnamelen, const Fl_Tree_Item *item) const
  
  Return 'pathname' of size 'pathnamelen' for the specified 'item'.

- Fl_Tree_Item_Reselect_Mode item_reselect_mode () const
  
  Returns the current item re/selection mode.

- void item_reselect_mode (Fl_Tree_Item_Reselect_Mode mode)
  
  Sets the item re/selection mode.

- int labelmarginleft () const
  
  Get the amount of white space (in pixels) that should appear to the left of the label text.

- void labelmarginleft (int val)
  
  Set the amount of white space (in pixels) that should appear to the left of the label text.

- Fl_Tree_Item * last ()
  
  Returns the last item in the tree.

- Fl_Tree_Item * last_selected_item ()
  
  Returns the last selected item in the tree.

- Fl_Tree_Item * last_visible ()
  
  Returns the last open(), visible item in the tree.

- Fl_Tree_Item * last_visible_item ()
  
  Returns the last open(), visible item in the tree.

- int linespacing () const
  
  Get the amount of white space (in pixels) that should appear between items in the tree.
- **void** **linespacing**(int val)
  
  Sets the amount of white space (in pixels) that should appear between items in the tree.

- **void** **load**(class **FL_Preferences** &)
  
  Load FLTK preferences.

- **int** **marginbottom**() const
  
  Get the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.

- **void** **marginbottom**(int val)
  
  Sets the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.

- **int** **marginleft**() const
  
  Get the amount of white space (in pixels) that should appear between the widget's left border and the tree's contents.

- **void** **marginleft**(int val)
  
  Set the amount of white space (in pixels) that should appear between the widget's left border and the left side of the tree's contents.

- **int** **margintop**() const
  
  Get the amount of white space (in pixels) that should appear between the widget's top border and the top of the tree's contents.

- **void** **margintop**(int val)
  
  Sets the amount of white space (in pixels) that should appear between the widget's top border and the top of the tree's contents.

- **Fl_Tree_Item** *next**(Fl_Tree_Item *item=0)
  
  Return the next item after 'item', or 0 if no more items.

- **Fl_Tree_Item** *next**(Fl_Tree_Item *item, int dir=FL_Down, bool visible=false)
  
  Returns next item after 'item' in direction 'dir' depending on 'visible'.

- **Fl_Tree_Item** *next_selected_item*(Fl_Tree_Item *item=0, int dir=FL_Down)
  
  Returns the next selected item above or below 'item', depending on 'dir'.

- **Fl_Tree_Item** *next_visible_item*(Fl_Tree_Item *start, int dir)
  
  Returns next open(), visible item above (dir==FL_Up) or below (dir==FL_Down) the specified 'item', or 0 if no more items.

- **int** **open**(const char *path, int docallback=1)
  
  Opens the item specified by 'path'.

- **int** **open**(Fl_Tree_Item *item, int docallback=1)
  
  Open the specified 'item'.

- **void** **open_toggle**(Fl_Tree_Item *item, int docallback=1)
  
  Toggle the open state of 'item'.

- **int** **openchild_marginbottom**() const
  
  Get the amount of white space (in pixels) that should appear below an open child tree's contents.

- **void** **openchild_marginbottom**(int val)
  
  Set the amount of white space (in pixels) that should appear below an open child tree's contents.

- **Fl_Image** *openicon**() const
  
  Returns the icon to be used as the 'open' icon.

- **void** **openicon**(Fl_Image *val)
  
  Sets the icon to be used as the 'open' icon.

- **const** **Fl_Tree_Prefs** & **prefs**() const
  
  Return the specified 'item', or 0 if no more items.

- **void** **recalc_tree**()
  
  Schedule tree to recalc the entire tree size.

- **int** **remove**(Fl_Tree_Item *item)
  
  Remove the specified 'item' from the tree.

- **void** **resize**(int, int, int, int)
Resizes the Fl_Group widget and all of its children.

- **FL_Tree_Item * root ()**
  Returns the root item.
- **void root (FL_Tree_Item *newitem)**
  Sets the root item to `newitem`.
- **void root_label (const char *new_label)**
  Set the label for the root item to `new_label`.
- **int scrollbar_size () const**
  Gets the default size of scrollbars' troughs for this widget in pixels.
- **void scrollbar_size (int size)**
  Sets the pixel size of the scrollbars' troughs to `size` for this widget, in pixels.
- **int select (const char *path, int docallback=1)**
  Select the item specified by `path`.
- **int select (FL_Tree_Item *item, int docallback=1)**
  Select the specified `item`.
- **int select_all (FL_Tree_Item *item=0, int docallback=1)**
  Select `item` and all its children.
- **int select_only (FL_Tree_Item *selitem, int docallback=1)**
  Select only the specified item, deselecting all others that might be selected.
- **void select_toggle (FL_Tree_Item *item, int docallback=1)**
  Toggle the select state of the specified `item`.
- **FL_Boxtype selectbox () const**
  Sets the style of box used to draw selected items.
- **void selectbox (FL_Boxtype val)**
  Gets the style of box used to draw selected items.
- **FL_Tree_Select selectmode () const**
  Gets the tree's current selection mode.
- **void selectmode (FL_Tree_Select val)**
  Sets the tree's selection mode.
- **void set_item_focus (FL_Tree_Item *item)**
  Set the item that currently should have keyboard focus.
- **void show_item (FL_Tree_Item *item)**
  Adjust the vertical scrollbar to show `item` at the top of the display IF it is currently off-screen (for instance show_item_top()).
- **void show_item (FL_Tree_Item *item, int yoff)**
  Adjust the vertical scrollbar so that `item` is visible `yoff` pixels from the top of the Fl_Tree widget's display.
- **void show_item_bottom (FL_Tree_Item *item)**
  Adjust the vertical scrollbar so that `item` is at the bottom of the display.
- **void show_item_middle (FL_Tree_Item *item)**
  Adjust the vertical scrollbar so that `item` is in the middle of the display.
- **void show_item_top (FL_Tree_Item *item)**
  Adjust the vertical scrollbar so that `item` is at the top of the display.
- **void show_self ()**
  Print the tree as 'ascii art' to stdout.
- **int showcollapse () const**
  Returns 1 if the collapse icon is enabled, 0 if not.
- **void showcollapse (int val)**
  Set if we should show the collapse icon or not.
- **int showroot () const**
  Returns 1 if the root item is to be shown, 0 if not.
- **void showroot (int val)**
Set if the root item should be shown or not.

- **FL_Tree_Sort sortorder () const**
  Set the default sort order used when items are added to the tree.

- **void sortorder (FL_Tree_Sort val)**
  Gets the sort order used to add items to the tree.

- **FL_Image * usericon () const**
  Returns the FL_Image being used as the default user icon for all newly created items.

- **void usericon (FL_Image *=val)**
  Sets the FL_Image to be used as the default user icon for all newly created items.

- **int usericonmarginleft () const**
  Get the amount of white space (in pixels) that should appear to the left of the usericon.

- **void usericonmarginleft (int val)**
  Set the amount of white space (in pixels) that should appear to the left of the usericon.

- **int vposition () const**
  Returns the vertical scroll position as a pixel offset.

- **void vposition (int pos)**
  Sets the vertical scroll offset to position *pos*.

- **int widgetmarginleft () const**
  Get the amount of white space (in pixels) that should appear to the left of the child Fltk widget (if any).

- **void widgetmarginleft (int val)**
  Set the amount of white space (in pixels) that should appear to the left of the child Fltk widget (if any).

- **~FL_Tree ()**
  Destructor.

**Public Member Functions inherited from FL_Group**

- **FL_Widget *& _ddfdesign_kludge ()**
  This is for forms compatibility only.

- **void add (FL_Widget &)**
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void add (FL_Widget *o)**
  See void FL_Group::add(FL_Widget &w)

- **void add_resizable (FL_Widget &o)**
  Adds a widget to the group and makes it the resizable widget.

- **FL_Widget *const * array () const**
  Returns a pointer to the array of children.

- **virtual FL_Group * as_group ()**
  Returns an FL_Group pointer if this widget is an FL_Group.

- **void begin ()**
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **FL_Widget * child (int n) const**
  Returns array() [n].

- **int children () const**
  Returns how many child widgets the group has.

- **void clear ()**
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()**
  Returns the current clipping mode.

- **void clip_children (int c)**
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **void end ()**
Exactly the same as current(this->parent()).

- **int find (const Fl_Widget &o) const**
  
  *See int Fl_Group::find(const Fl_Widget *w) const.*

- **int find (const Fl_Widget *w) const**
  
  Searches the child array for the widget and returns the index.

- **Fl_Group (int, int, int, int, const char * = 0)**
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus (Fl_Widget *W)**

- **void forms_end ()**
  
  This is for forms compatibility only.

- **void init_sizes ()**
  
  Resets the internal array of widget sizes and positions.

- **void insert (Fl_Widget &, int i)**
  
  The widget is removed from its current group (if any) and then inserted into this group.

- **void insert (Fl_Widget &, Fl_Widget *before)**
  
  This does insert(w, find(before)).

- **void remove (Fl_Widget &)**
  
  Removes a widget from the group but does not delete it.

- **void remove (Fl_Widget *o)**
  
  Removes the widget *o* from the group.

- **void remove (int index)**
  
  Removes the widget at index from the group but does not delete it.

- **Fl_Widget * resizable () const**
  
  *See void Fl_Group::resizable(Fl_Widget *box)*

- **void resizable (Fl_Widget &o)**
  
  *See void Fl_Group::resizable(Fl_Widget *box)*

- **void resizable (Fl_Widget *o)**
  
  The resizable widget defines the resizing box for the group.

- **virtual ~Fl_Group ()**
  
  The destructor also deletes all the children.

**Public Member Functions inherited from Fl_Widget**

- **void _clear_fullscreen ()**

- **void _set_fullscreen ()**

- **void activate ()**
  
  Activates the widget.

- **unsigned int active () const**
  
  Returns whether the widget is active.

- **int active_r () const**
  
  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**
  
  Gets the label alignment.

- **void align (Fl_Align alignment)**
  
  Sets the label alignment.

- **long argument () const**
  
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**
  
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window * as_gl_window ()**
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
virtual Fl_Window * as_window ()

Returns an Fl_Window pointer if this widget is an Fl_Window.

Fl_Boxtype box () const

Gets the box type of the widget.

void box (Fl_Boxtype new_box)

Sets the box type for the widget.

Fl_Callback_p callback () const

Gets the current callback function for the widget.

void callback (Fl_Callback *cb)

Sets the current callback function for the widget.

void callback (Fl_Callback *cb, void *p)

Sets the current callback function for the widget.

void callback (Fl_Callback0 *cb)

Sets the current callback function for the widget.

void callback (Fl_Callback1 *cb, long p=0)

Sets the current callback function for the widget.

unsigned int changed () const

Checks if the widget value changed since the last callback.

void clear_active ()

Marks the widget as inactive without sending events or changing focus.

void clear_changed ()

Marks the value of the widget as unchanged.

void clear_damage (uchar c=0)

Clears or sets the damage flags.

void clear_output ()

Sets a widget to accept input.

void clear_visible ()

Hides the widget.

void clear_visible_focus ()

Disables keyboard focus navigation with this widget.

Fl_Color color () const

Gets the background color of the widget.

void color (Fl_Color bg)

Sets the background color of the widget.

void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.

Fl_Color color2 () const

For back compatibility only.

void color2 (unsigned a)

For back compatibility only.

int contains (const Fl_Widget *w) const

Checks if w is a child of this widget.

void copy_label (const char *new_label)

Sets the current label.

void copy_tooltip (const char *text)

Sets the current tooltip text.

uchar damage () const

Returns non-zero if draw() needs to be called.

void damage (uchar c)

Sets the damage bits for the widget.

void damage (uchar c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.

- **int** **damage_resize**(int, int, int, int)
  
  Internal use only.

- **void** **deactivate**()
  
  Deactivates the widget.

- **FL_Image** **deimage**( )
  
  Gets the image that is used as part of the widget label.

  - **const FL_Image** **deimage**( ) const
  
  Sets the image to use as part of the widget label.

  - **void deimage**(FL_Image &img)
    
    Sets the image to use as part of the widget label.

  - **void deimage**(FL_Image *img)
    
    Sets the image to use as part of the widget label.

- **void** **do_callback**()
  
  Calls the widget callback.

  - **void do_callback**(FL_Widget *o, long arg)
  
    Calls the widget callback.

  - **void do_callback**(FL_Widget *o, void *arg=0)
  
    Calls the widget callback.

- **void draw_label**(int, int, int, int, FL_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int** **h**( ) const
  
  Gets the widget height.

- **virtual void** **hide**( )
  
  Makes a widget invisible.

- **FL_Image** **image**( )
  
  Gets the image that is used as part of the widget label.

  - **const FL_Image** **image**( ) const
  
  Sets the image to use as part of the widget label.

  - **void image**(FL_Image &img)
  
    Sets the image to use as part of the widget label.

  - **void image**(FL_Image *img)
  
    Sets the image to use as part of the widget label.

- **int** **inside**(const FL_Widget *wgt) const
  
  Checks if this widget is a child of wgt.

- **int** **is_label_copied**( ) const
  
  Returns whether the current label was assigned with copy_label().

- **const char** **label**( ) const
  
  Gets the current label text.

- **void label**(const char *text)
  
  Sets the current label pointer.

  - **void label**(FL_Labeltype a, const char *b)
    
    Shortcut to set the label text and type in one call.

- **FL_Color** **labelcolor**( ) const
  
  Gets the label color.

  - **void labelcolor**(FL_Color c)
    
    Sets the label color.

- **FL_Font** **labelfont**( ) const
  
  Gets the font to use.

  - **void labelfont**(FL_Font f)
    
    Sets the font to use.

- **FL_Fontsize** **labelsize**( ) const
  
  Gets the font size in pixels.
- void **labelsize** (Fl_Fontsize pix)
  
  Sets the font size in pixels.
- Fl_Labeltype **labeltype** () const
  
  Gets the label type.
- void **labeltype** (Fl_Labeltype a)
  
  Sets the label type.
- void **measure_label** (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.
- unsigned int **output** () const
  
  Returns if a widget is used for output only.
- Fl_Group * **parent** () const
  
  Returns a pointer to the parent widget.
- void **parent** (Fl_Group * p)
  
  Internal use only - "for hacks only".
- void **position** (int X, int Y)
  
  Repositions the window or widget.
- void **redraw** ()
  
  Schedules the drawing of the widget.
- void **redraw_label** ()
  
  Schedules the drawing of the label.
- Fl_Color **selection_color** () const
  
  Gets the selection color.
- void **selection_color** (Fl_Color a)
  
  Sets the selection color.
- void **set_active** ()
  
  Marks the widget as active without sending events or changing focus.
- void **set_changed** ()
  
  Marks the value of the widget as changed.
- void **set_output** ()
  
  Sets a widget to output only.
- void **set_visible** ()
  
  Makes the widget visible.
- void **set_visible_focus** ()
  
  Enables keyboard focus navigation with this widget.
- virtual void **show** ()
  
  Makes a widget visible.
- void **size** (int W, int H)
  
  Changes the size of the widget.
- int **take_focus** ()
  
  Gives the widget the keyboard focus.
- unsigned int **takeevents** () const
  
  Returns if the widget is able to take events.
- int **testShortcut** ()
  
  Returns true if the widget's label contains the entered '"x' shortcut.
- const char * **tooltip** () const
  
  Gets the current tooltip text.
- void **tooltip** (const char *text)
  
  Sets the current tooltip text.
- Fl_Window * **top_window** () const
  
  Returns a pointer to the top-level window for the widget.
- Fl_Window * **top_window_offset** (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.

- **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void *user_data () const**
  Gets the user data for this widget.

- **void user_data (void *v)**
  Sets the user data for this widget.

- **unsigned int visible () const**
  Checks whether this widget has a visible focus.

- **void visible_focus (int v)**
  Modifies keyboard focus navigation.

- **int visible_r () const**
  Returns whether a widget and all its parents are visible.

- **int w () const**
  Gets the widget width.

- **Fl_When when () const**
  Returns the conditions under which the callback is called.

- **void when (uchar i)**
  Sets the flags used to decide when a callback is called.

- **Fl_Window *window () const**
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  Gets the widget position in its window.

- **int y () const**
  Gets the widget position in its window.

- **virtual ~Fl_Widget ()**
  Destroys the widget.

### Protected Member Functions

- **void do_callback_for_item (Fl_Tree_Item *item, Fl_Tree_Reason reason)**
  Do the callback for the specified ‘item’ using ‘reason’, setting the callback_item() and callback_reason().

- **void item_clicked (Fl_Tree_Item *val)**
  Set the item that was last clicked.

### Protected Member Functions inherited from Fl_Group

- **void draw_child (Fl_Widget &widget) const**
  Forces a child to redraw.

- **void draw_children ()**
  Draws all children of the group.

- **void draw_outside_label (const Fl_Widget &widget) const**
  Parents normally call this to draw outside labels of child widgets.

- **int *sizes ()**
  Returns the internal array of widget sizes and positions.

- **void update_child (Fl_Widget &widget) const**
  Draws a child only if it needs it.
Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus ()
  Draws a focus rectangle around the widget
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Protected Attributes

• Fl_Scrollbar ∗_hscroll
  Horizontal scrollbar.
• int _tih
  Tree widget inner xywh dimension: inside borders + scrollbars.
• int _tiw
• int _tix
• int _tiy
• int _toh
  Tree widget outer xywh dimension: outside scrollbars, inside widget border.
• int _tow
• int _tox
• int _toy
• int _tree_h
  the calculated height of the entire tree hierarchy. See calc_tree()
• int _tree_w
  the calculated width of the entire tree hierarchy. See calc_tree()
• Fl_Scrollbar ∗_vscroll
  Vertical scrollbar.
Friends

- class Fl_Tree_Item

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *cb, void *d)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,

}
flags possible values enumeration.

9.143.1 Detailed Description

Tree widget.

Similar to Fl_Browser, Fl_Tree is a browser of Fl_Tree_Item's arranged in a parented hierarchy, or 'tree'. Subtrees
can be expanded or closed. Items can be added, deleted, inserted, sorted and re-ordered.
The tree items may also contain other FLTK widgets, like buttons, input fields, or even "custom" widgets.
The callback() is invoked depending on the value of when():

- FL_WHEN_RELEASE -- callback invoked when left mouse button is released on an item
- FL_WHEN_CHANGED -- callback invoked when left mouse changes selection state

The simple way to define a tree:

```c
#include <FL/Fl_Tree.H>

Fl_Tree tree(X,Y,W,H);
```

Generated by Doxygen
tree.begin();
tree.add("Flintstones/Fred");
tree.add("Flintstones/Wilma");
tree.add("Flintstones/Pebbles");
tree.add("Simpsons/Homer");
tree.add("Simpsons/Marge");
tree.add("Simpsons/Bart");
tree.add("Simpsons/Lisa");
tree.end();

FEATURES

Items can be added with add(), removed with remove(), completely cleared with clear(), inserted with insert() and insert_above(), selected/deselected with select() and deselect(), open/closed with open() and close(), positioned on the screen with show_item_top(), show_item_middle() and show_item_bottom(), item children can be swapped around with Fl_Tree_Item::swap_children(), sorting can be controlled when items are add()ed via sortorder(). You can walk the entire tree with first() and next(). You can walk visible items with first_visible_item() and next_visible_item(). You can walk selected items with first_selected_item() and next_selected_item(). Items can be found by their pathname using find_item(const char ∗), and an item's pathname can be found with item_pathname(). The selected items' colors are controlled by selection_color() (inherited from Fl_Widget). A hook is provided to allow you to redefine how item's labels are drawn via Fl_Tree::item_draw_callback().

SELECTION OF ITEMS

The tree can have different selection behaviors controlled by selectmode(). The background color used for selected items is the Fl_Tree::selection_color(). The foreground color for selected items is controlled internally with fl_contrast().

CHILD WIDGETS

FLTK widgets (including custom widgets) can be assigned to tree items via Fl_Tree_Item::widget().

When an Fl_Tree_Item::widget() is defined, the default behavior is for the widget() to be shown in place of the item's label (if it has one). Only the widget()’s width will be used; the widget()’s x() and y() position will be managed by the tree, and the h() will track the item's height. This default behavior can be altered (ABI 1.3.1): Setting Fl_Tree::item_draw_mode()’s FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET flag causes the label + widget to be displayed together in that order, and adding the FL_TREE_ITEM_HEIGHT_FROM_WIDGET flag causes widget's height to define the widget()'s height.

ICONS

The tree's open/close icons can be redefined with Fl_Tree::openicon(), Fl_Tree::closeicon(). User icons can either be changed globally with Fl_Tree::usericon(), or on a per-item basis with Fl_Tree_Item::usericon().

Various default preferences can be globally manipulated via Fl_Tree_Prefs, including colors, margins, icons, connection lines, etc.

FONTS AND COLORS

When adding new items to the tree, the new items get the defaults for fonts and colors from:
• **Fl_Tree::item_labelfont()** – The default item label font (default: FL_HELVETICA)
• **Fl_Tree::item_labelsize()** – The default item label size (default: FL_NORMAL_SIZE)
• **Fl_Tree::item_labelfgcolor()** – The default item label foreground color (default: FL_FOREGROUND_COLOR)
• **Fl_Tree::item_labelbgcolor()** – The default item label background color (default: 0xffffffff, which tree uses as 'transparent')

Each item (Fl_Tree_Item) inherits a copy of these font/color attributes when created, and each item has its own methods to let the app change these values on a per-item basis using methods of the same name:

• **Fl_Tree_Item::labelfont()** – The item's label font (default: FL_HELVETICA)
• **Fl_Tree_Item::labelsize()** – The item's label size (default: FL_NORMAL_SIZE)
• **Fl_Tree_Item::labelfgcolor()** – The item's label foreground color (default: FL_FOREGROUND_COLOR)
• **Fl_Tree_Item::labelbgcolor()** – The item's label background color (default: 0xffffffff, which uses the tree's own bg color)

**CALLBACKS**

The tree's callback() will be invoked when items change state or are open/closed. when() controls when mouse/keyboard events invoke the callback. callback_item() and callback_reason() can be used to determine the cause of the callback. e.g.

```c
void MyTreeCallback(Fl_Widget *w, void *data) {
    Fl_Tree    *tree = (Fl_Tree*)w;
    Fl_Tree_Item *item = (Fl_Tree_Item*)tree->callback_item(); // get selected item
    switch ( tree->callback_reason() ) {
        case FL_TREE_REASON_SELECTED: [...] case FL_TREE_REASON_DESELECTED: [...] case FL_TREE_REASON_RESELECTED: [...] case FL_TREE_REASON_OPENED: [...] case FL_TREE_REASON_CLOSED: [...] }
}
```

**SIMPLE EXAMPLES**

To find all the selected items:
```
for ( Fl_Tree_Item *i=first_selected_item(); i; i=next_selected_item(i) )
    printf("Item %s is selected\n", i->label());
```

To get an item's full menu pathname, use Fl_Tree::item_pathname(), e.g.
```
char pathname[256] = "???";
tree->item_pathname(pathname, sizeof(pathname), item); // eg. "Parent/Child/Item"
```

To walk all the items of the tree from top to bottom:
```
// Walk all the items in the tree, and print their labels
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) )
    printf("Item: %s\n", item->label());
```

To recursively walk all the children of a particular item, define a function that uses recursion:
```
void my_print_all_children(Fl_Tree_Item *item, int indent=0) {
    printf("%s\n", item->child(t)->label());
    my_print_all_children(item->child(t), indent+4); // recurse
}
```
To change the default label font and color when creating new items:

```cpp
tree = new Fl_Tree(..);
tree->item_labelfont(FL_COURIER); // Use Courier font for all new items
tree->item_labelfgcolor(FL_RED);  // Use red color for labels of all new items
[..]
// Now create the items in the tree using the above defaults.
tree->add("Aaa");
tree->add("Bbb");
[..]
```

To change the font and color of all existing items in the tree:

```cpp
// Change the font and color of all items currently in the tree
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) ) {
    item->labelfont(FL_COURIER);
    item->labelcolor(FL_RED);
}
```

DISPLAY DESCRIPTION

The following image shows the tree's various visual elements and the methods that control them:

![Figure 9.45 Fl_Tree elements](image)

The following shows the protected dimension variables 'tree inner' (tix..) and 'tree outer' (tox..):

![Figure 9.46 Fl_Tree inner/outer dimensions](image)

KEYBOARD BINDINGS

The following table lists keyboard bindings for navigating the tree:
Table 9.466 Keyboard bindings.

<table>
<thead>
<tr>
<th>Keyboard</th>
<th>FL_TREE_SELECT_LEFT</th>
<th>FL_TREE_SELECT_RIGHT</th>
<th>FL_TREE_SELECT_UP</th>
<th>FL_TREE_SELECT_DOWN</th>
</tr>
</thead>
<tbody>

9.143.2 Member Function Documentation

9.143.2.1 add() [1/2]

```cpp
Fl_Tree_Item * Fl_Tree::add (const char * path,
               Fl_Tree_Item * item = 0 )
```

Adds a new item, given a menu style 'path'. Any parent nodes that don't already exist are created automatically. Adds the item based on the value of sortorder(). If 'item' is NULL, a new item is created.

To specify items or submenus that contain slashes ('/' or '\') use an escape character to protect them, e.g.
```
tree->add("/Holidays/Photos/12\25\2010"); // Adds item "12/25/2010"
tree->add("/Pathnames/c:\\\Program Files\\MyApp"); // Adds item "c:\Program Files\MyApp"
```

**Parameters**

<table>
<thead>
<tr>
<th>in path</th>
<th>The path to the item, e.g. &quot;Flintstone/Fred&quot;.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in item</td>
<td>The new item to be added. If NULL, a new item is created with a name that is the last element in 'path'.</td>
</tr>
</tbody>
</table>

**Returns**

The new item added, or 0 on error.

**Version**

1.3.3

9.143.2.2 add() [2/2]

```cpp
Fl_Tree_Item * Fl_Tree::add (Fl_Tree_Item * parent_item,
               const char * name )
```

Generated by Doxygen
Add a new child item labeled 'name' to the specified 'parent_item'.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>parent_item</th>
<th>The parent item the new child item will be added to. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>name</td>
<td>The label for the new item</td>
</tr>
</tbody>
</table>

Returns

The new item added.

Version

1.3.0 release

### 9.143.2.3 calc_dimensions()

```cpp
def void Fl_Tree::calc_dimensions:
Recalculate widget dimensions and scrollbar visibility, normally managed automatically. Low overhead way to update the tree widget's outer/inner dimensions and re-determine scrollbar visibility based on these changes without recalculating the entire size of the tree data. Assumes that either the tree's size in `_tree_w/_tree_h` are correct so that scrollbar visibility can be calculated easily, or are both zero indicating scrollbar visibility can't be calculated yet. This method is called when the widget is resized or if the scrollbar's sizes are changed (affects tree widget's inner dimensions tix/y/w/h), and also used by `calc_tree()`.
```

Version

1.3.3 ABI feature

### 9.143.2.4 calc_tree()

```cpp
def void Fl_Tree::calc_tree:
Recalculates the tree's sizes and scrollbar visibility, normally managed automatically. On return:
- `_tree_w` will be the overall pixel width of the entire viewable tree
- `_tree_h` will be the overall pixel height
- scrollbar visibility and pan sizes are updated
- internal _tix/_tiy/_tiw/_tih dimensions are updated
```

_trees_w/_tree_h_ include the tree's margins (e.g. `marginleft()`), whether items are open or closed, label contents and font sizes, etc.
The tree hierarchy's size is managed separately from the widget's size as an optimization; this way `resize()` on the widget doesn't involve recalculating the tree's hierarchy needlessly, as widget size has no bearing on the tree hierarchy.
The tree hierarchy's size only changes when items are added/removed, open/closed, label contents or font sizes changed, margins changed, etc.
This calculation involves walking the entire tree from top to bottom, potentially a slow calculation if the tree has many items (potentially hundreds of thousands), and should therefore be called sparingly.
For this reason, `recalc_tree()` is used as a way to /schedule/ calculation when changes affect the tree hierarchy's size.
Apps may want to call this method directly if the app makes changes to the tree's geometry, then immediately needs to work with the tree's new dimensions before an actual redraw (and recalc) occurs. (This use by an app should only rarely be needed)

### 9.143.2.5 callback_item() [1/2]

```cpp
Fl_Tree_Item * Fl_Tree::callback_item:
Gets the item that caused the callback.
The callback() can use this value to see which item changed.
```
9.143.2.6 callback_item() [2/2]

void Fl_Tree::callback_item (  
    Fl_Tree_Item * item  )
Sets the item that was changed for this callback.
Used internally to pass the item that invoked the callback.

9.143.2.7 callback_reason() [1/2]

Fl_Tree_Reason Fl_Tree::callback_reason ( ) const
Gets the reason for this callback.
The callback() can use this value to see why it was called. Example:
void MyTreeCallback(Fl_Widget *w, void *userdata) {
    Fl_Tree *tree = (Fl_Tree*)w;
    Fl_Tree_Item *item = tree->callback_item(); // the item changed (can be NULL if more than one item
    switch ( tree->callback_reason() ) { // reason callback was invoked
      case FL_TREE_REASON_OPENED: ..item was opened..
      case FL_TREE_REASON_CLOSED: ..item was closed..
      case FL_TREE_REASON_SELECTED: ..item was selected..
      case FL_TREE_REASON_RESELECTED: ..item was reselected (double-clicked, etc)..
      case FL_TREE_REASON_DESELECTED: ..item was deselected..
    }
  }
See also
  item_reselect_mode() – enables FL_TREE_REASON_RESELECTED events

9.143.2.8 callback_reason() [2/2]

void Fl_Tree::callback_reason (  
    Fl_Tree_Reason reason  )
Sets the reason for this callback.
Used internally to pass the reason the callback was invoked.

9.143.2.9 clear()

void Fl_Tree::clear ( )
Clear the entire tree's children, including the root.
The tree will be left completely empty.

9.143.2.10 clear_children()

void Fl_Tree::clear_children (  
    Fl_Tree_Item * item  )
Clear all the children for 'item'.
Item may not be NULL.

9.143.2.11 close() [1/2]

int Fl_Tree::close (  
    const char * path,  
    int docallback = 1 )
Closes the item specified by 'path'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. close("Holidays/12\25\2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the
reason the callback was called.

Parameters

| path | – the tree item's pathname (e.g. "Flintstones/Fred") |
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>docallback</th>
<th>– A flag that determines if the callback() is invoked or not:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• 0 - callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_CLOSED</td>
</tr>
</tbody>
</table>

Returns

• 1 – OK: item closed
• 0 – OK: item was already closed, no change
• -1 – ERROR: item was not found

See also

    open(), close(), is_open(), is_close(), callback_item(), callback_reason()

9.143.2.12 close() [2/2]

    int Fl_Tree::close (Fl_Tree_Item *item, int docallback = 1)

Closes the specified 'item'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>– the item to be closed. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>docallback</td>
<td>– A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_CLOSED</td>
</tr>
</tbody>
</table>

Returns

• 1 – item was closed
• 0 – item was already closed, no change

See also

    open(), close(), is_open(), is_close(), callback_item(), callback_reason()

9.143.2.13 closeicon() [1/2]

    Fl_Image * Fl_Tree::closeicon () const

Returns the icon to be used as the 'close' icon.
If none was set, the internal default is returned, a simple '[-]' icon.
9.143.2.14 closeicon() [2/2]

```cpp
void Fl_Tree::closeicon ( 
    Fl_Image * val
)
```

Sets the icon to be used as the 'close' icon.
This overrides the built in default ['-'] icon.

**Parameters**

| in  | val | — The new image, or zero to use the default [-] icon. |

9.143.2.15 connectorstyle()

```cpp
void Fl_Tree::connectorstyle ( 
    Fl_Tree_Connector val
)
```

Sets the line drawing style for inter-connecting items.
See Fl_Tree_Connector for possible values.

9.143.2.16 deselect() [1/2]

```cpp
int Fl_Tree::deselect ( 
    const char * path, 
    int docallback = 1
)
```

Deselect an item specified by 'path'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. deselect("Holidays/12\25/2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

**Parameters**

| in  | path | — the tree item's pathname (e.g. "Flintstones/Fred") |
| in  | docallback | — A flag that determines if the callback() is invoked or not: |
|     |     | • 0 - the callback() is not invoked |
|     |     | • 1 - the callback() is invoked if item changed state (default), callback_reason() will be FL_TREE_REASON_DESELECTED |

**Returns**

• 1 - OK: item's state was changed
• 0 - OK: item was already deselected, no change was made
• -1 - ERROR: item was not found

9.143.2.17 deselect() [2/2]

```cpp
int Fl_Tree::deselect ( 
    Fl_Tree_Item * item, 
    int docallback = 1
)
```

Deselect the specified item.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>- the item to be deselected. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>- A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - the callback() is invoked if item changed state (default), callback_reason() will be FL_TREE_REASON_DESELECTED</td>
</tr>
</tbody>
</table>

Returns

- 0 - item was already deselected, no change was made
- 1 - item's state was changed

9.143.2.18 deselect_all()

```cpp
int Fl_Tree::deselect_all (Fl_Tree_Item *item = 0, int docallback = 1)
```

Deselect 'item' and all its children. If item is NULL, first() is used. Invokes the callback depending on the value of optional parameter 'docallback'. Handles calling redraw() if anything changed. The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item that will be deselected (along with all its children). If NULL, first() is used.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>- A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - the callback() is invoked for each item that changed state (default), callback_reason() will be FL_TREE_REASON_DESELECTED</td>
</tr>
</tbody>
</table>

Returns

Count of how many items were actually changed to the deselected state.

9.143.2.19 display()

```cpp
void Fl_Tree::display (Fl_Tree_Item *item)
```

Displays 'item', scrolling the tree as necessary.

Parameters

| in  | item         | The item to be displayed. If NULL, first() is used. |

9.143.2.20 displayed()

```cpp
int Fl_Tree::displayed (Fl_Tree_Item *item)
```
See if 'item' is currently displayed on-screen (visible within the widget).
This can be used to detect if the item is scrolled off-screen. Checks to see if the item's vertical position is within the
top and bottom edges of the display window. This does NOT take into account the hide() / show() or open() / close()
status of the item.

Parameters

|   | item | The item to be checked. If NULL, first() is used. |

Returns

1 if displayed, 0 if scrolled off screen or no items are in tree.

### 9.143.2.21 draw()

```cpp
void Fl_Tree::draw ( void ) [virtual]
```

Standard FLTK draw() method, handles drawing the tree widget.
Reimplemented from Fl_Group.

### 9.143.2.22 extend_selection()

```cpp
int Fl_Tree::extend_selection ( Fl_Tree_Item * from,
                                Fl_Tree_Item * to,
                                int val = 1,
                                bool visible = false )
```

Extend a selection between 'from' and 'to' depending on 'visible'.
Similar to the more efficient extend_selection_dir(Fl_Tree_Item*,Fl_Tree_Item*,int dir,int val,bool vis) method, but
direction (up or down) doesn't need to be known.
We're less efficient because we search the tree for to/from, then operate on items in between. The more efficient
method avoids the "search", but necessitates a direction to be specified to find 'to'.
Used by SHIFT-click to extend a selection between two items inclusive.
Handles calling redraw() if anything changed.

Parameters

|   | from | Starting item |
|   | to   | Ending item |
|   | val  | Select or deselect items (0=deselect, 1=select, 2=toggle) |
|   | visible | true=affect only open(), visible items, false=affect open or closed items (default) |

Returns

The number of items whose selection states were changed, if any.

Version

1.3.3 ABI feature

### 9.143.2.23 extend_selection_dir()

```cpp
int Fl_Tree::extend_selection_dir ( Fl_Tree_Item * from,
                                   Fl_Tree_Item * co,
```
int dir,
int val,
bool visible }

Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.

Efficient: does not walk entire tree; starts with 'from' and stops at 'to' while moving in direction 'dir'. Dir must be specified though. If dir cannot be known in advance, such as during SHIFT-click operations, the method extend_selection(Fl_Tree_Item*,Fl_Tree_Item*,int,bool) should be used. Handles calling redraw() if anything changed.

Parameters

| in  | from   | Starting item |
| in  | to     | Ending item   |
| in  | dir    | Direction to extend selection (FL_Up or FL_Down) |
| in  | val    | 0=deselect, 1=select, 2=toggle |
| in  | visible | true=affect only open(), visible items, false=affect open or closed items (default) |

Returns

The number of items whose selection states were changed, if any.

Version

1.3.3

9.143.2.24 find_clicked()

const Fl_Tree_Item * Fl_Tree::find_clicked ( int yonly = 0 ) const

Find the item that was last clicked on.

You should use callback_item() instead, which is fast, and is meant to be used within a callback to determine the item clicked.

This method walks the entire tree looking for the first item that is under the mouse. (The value of the 'yonly' flag affects whether both x and y events are checked, or just y)

Use this method /only/ if you've subclassed Fl_Tree, and are receiving events before Fl_Tree has been able to process and update callback_item().

Parameters

| in  | yonly | – 0: check both event's X and Y values. – 1: only check event's Y value, don't care about X. |

Returns

The item clicked, or NULL if no item was under the current event.

Version

1.3.0

1.3.3 ABI feature: added yonly parameter

9.143.2.25 find_item()

const Fl_Tree_Item * Fl_Tree::find_item ( const char * path ) const
Find the item, given a menu style path, e.g. "/Parent/Child/item". There is both a const and non-const version of this method. Const version allows pure const methods to use this method to do lookups without causing compiler errors.

To specify items or submenus that contain slashes ("/" or "\") use an escape character to protect them, e.g.

```cpp
tree->add("/Holidays/Photos/12\25/2010"); // Adds item "12/25/2010"
tree->add("/[Pathnames/c:\Program Files\MyApp""); // Adds item "c:\Program Files\MyApp"
```

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>path</th>
</tr>
</thead>
<tbody>
<tr>
<td>– the tree item's pathname to be found (e.g. &quot;Flintstones/Fred&quot;)</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

The item, or NULL if not found.

See also

- `item_pathname()`

### 9.143.2.26 first()

```cpp
Fl_Tree_Item* Fl_Tree::first() 
```

Returns the first item in the tree, or 0 if none.

Use this to walk the tree in the forward direction, e.g.

```cpp
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) )
  printf("Item: %s
", item->label());
```

**Returns**

First item in tree, or 0 if none (tree empty).

See also

- `first()`, `next()`, `last()`, `prev()`

### 9.143.2.27 first_selected_item()

```cpp
Fl_Tree_Item* Fl_Tree::first_selected_item() 
```

Returns the first selected item in the tree.

Use this to walk the tree from top to bottom looking for all the selected items, e.g.

```cpp
// Walk tree forward, from top to bottom
for ( Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i) )
  printf("Selected item: %s
", i->label());
```

**Returns**

The first selected item, or 0 if none.

See also

- `first_selected_item()`, `last_selected_item()`, `next_selected_item()`

### 9.143.2.28 first_visible()

```cpp
Fl_Tree_Item* Fl_Tree::first_visible() 
```

Returns the first open(), visible item in the tree, or 0 if none.

**Deprecated** in 1.3.3 ABI – use `first_visible_item()` instead.
9.143.29  first_visible_item()

`Fl_Tree_Item * Fl_Tree::first_visible_item ( )`

Returns the first open(), visible item in the tree, or 0 if none.

Returns

First visible item in tree, or 0 if none.

See also

`first_visible_item(), last_visible_item(), next_visible_item()`

Version

1.3.3

9.143.30  get_selected_items()

`int Fl_Tree::get_selected_items ( Fl_Tree_Item_Array & ret_items )`

Returns the currently selected items as an array of `ret_items`.

Example:

```cpp
// Get selected items as an array
Fl_Tree_Item_Array items;
tree->get_selected_items(items);
// Manipulate the returned array
for ( int t=0; t<items.total(); t++ ) {
    Fl_Tree_Item &item = items[t];
    ..do stuff with each selected item..
}
```

Parameters

| out | ret_items | The returned array of selected items. |

Returns

The number of items in the returned array.

See also

`first_selected_item(), next_selected_item()`

Version

1.3.3 ABI feature

9.143.31  handle()

`int Fl_Tree::handle ( int e ) [virtual]`

Standard FLTK event handler for this widget.

Todo  add Fl_Widget_Tracker (see Fl_Browser_.cxx::handle())

Reimplemented from Fl_Group.

9.143.32  hposition() [1/2]

`int Fl_Tree::hposition ( ) const`

Returns the horizontal scroll position as a pixel offset.

The position returned is how many pixels of the tree are scrolled off the left edge of the screen.
See also

hposition(int), vposition(), vposition(int)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

9.143.2.33 hposition() [2/2]

void Fl_Tree::hposition (  
int pos )

Sets the horizontal scroll offset to position 'pos'.
The position is how many pixels of the tree are scrolled off the left edge of the screen.

Parameters

| in  | pos | The vertical position (in pixels) to scroll the tree to. |

See also

hposition(), vposition(), vposition(int)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

9.143.2.34 insert()

Fl_Tree_Item * Fl_Tree::insert (  
Fl_Tree_Item * item,  
const char * name,  
int pos )

Insert a new item 'name' into 'item's children at position 'pos'.
If pos is out of range the new item is

* prepended if pos < 0 or

* appended if pos > item->children().

Note: pos == children() is not considered out of range: the item is appended to the child list. Example:

```cpp
// How to use insert() to insert a new item between Aaa/111 + Aaa/222
Fl_Tree_Item *item = tree->find_item("Aaa"); // get parent item Aaa
if (item) tree->insert(item, "New item", 2); // insert as a child of Aaa at index #2
```

Parameters

| in  | item | The existing item to insert new child into. Must not be NULL. |
| in  | name | The label for the new item |
| in  | pos  | The position of the new item in the child list |

Returns

The new item added.
9.143 Fl_Tree Class Reference

See also

\[ \text{insert_above()} \]

9.143.2.35 insert_above()

\[
\text{Fl_Tree_Item} \ast \text{Fl_Tree::insert_above (}
    \text{Fl_Tree_Item} \ast \text{name,}
    \text{const char} \ast \text{above}
)\]

Inserts a new item 'name' above the specified Fl_Tree_Item 'above'.

Example:

- tree->add("Aaa/000"); // "000" is index 0 in Aaa's children
- tree->add("Aaa/111"); // "111" is index 1 in Aaa's children
- tree->add("Aaa/222"); // "222" is index 2 in Aaa's children

// How to use insert_above() to insert a new item above Aaa/222
Fl_Tree_Item \ast item = tree->find_item("Aaa/222"); // get item Aaa/222
if (item) tree->insert_above(item, "New item"); // insert new item above it

Parameters

- in above – the item above which to insert the new item. Must not be NULL.
- in name – the name of the new item

Returns

- The new item added, or 0 if 'above' could not be found.

See also

\[ \text{insert()} \]

9.143.2.36 is_close() [1/2]

\[
\text{int Fl_Tree::is_close (}
    \text{const char} \ast \text{path}) \text{ const}
\]

See if item specified by 'path' is closed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. \( \text{is_close("←Holidays/12\slash25\slash2010")} \).

Parameters

- in path – the tree item's pathname (e.g. "Flintstones/Fred")

Returns

- 1 - OK: item is closed
- 0 - OK: item is open
- -1 - ERROR: item was not found

9.143.2.37 is_close() [2/2]

\[
\text{int Fl_Tree::is_close (}
    \text{Fl_Tree_Item} \ast \text{item}) \text{ const}
\]

See if the specified 'item' is closed.

Parameters

- in item – the item to be tested. Must not be NULL.
Returns

- 1 : item is closed
- 0 : item is open

9.143.2.38 is_hscroll_visible()

int Fl_Tree::is_hscroll_visible ( ) const

See if the horizontal scrollbar is currently visible.

Returns

1 if scrollbar visible, 0 if not.

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

9.143.2.39 is_open() [1/2]

int Fl_Tree::is_open ( const char * path ) const

See if item specified by 'path' is open.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. is_open("Holidays/12/25/2010"). Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

Parameters

| in  | path | — the tree item's pathname (e.g. "Flintstones/Fred") |

Returns

- 1 : OK: item is open
- 0 : OK: item is closed
- -1 : ERROR: item was not found

See also

Fl_Tree_Item::visible_r()

9.143.2.40 is_open() [2/2]

int Fl_Tree::is_open ( Fl_Tree_Item * item ) const

See if 'item' is open.

Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

Parameters

| in | item | — the item to be tested. Must not be NULL. |

Returns

- 1 : item is open
- 0 : item is closed
9.143.2.41 is_scrollback()

int Fl_Tree::is_scrollback ( Fl_Widget * w )
See if widget 'w' is one of the Fl_Tree widget's scrollbars.
Use this to skip over the scrollbars when walking the child() array. Example:
for ( int i=0; i<tree->children(); i++ ) { // walk children
    Fl_Widget *w = tree->child(i);
    if ( tree->is_scrollback(w) ) continue; // skip scrollbars
    ..do work here..
}

Parameters

| in  | w | Widget to test |

Returns

1 if w is a scrollbar, 0 if not.

Todo should be const

9.143.2.42 is_selected() [1/2]

int Fl_Tree::is_selected ( const char * path )
See if item specified by 'path' is selected.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. is_selected("Holidays/12/25/2010").

Parameters

| in  | path | the tree item's pathname (e.g. "Flintstones/Fred") |

Returns

• 1 : item selected
• 0 : item deselected
• -1 : item was not found

9.143.2.43 is_selected() [2/2]

int Fl_Tree::is_selected ( Fl_Tree_Item * item ) const
See if the specified 'item' is selected.

Parameters

| in  | item | the item to be tested. Must not be NULL. |

Returns

• 1 : item selected
• 0 : item deselected

9.143.2.44 is_vscroll_visible()

int Fl_Tree::is_vscroll_visible ( ) const
See if the vertical scrollbar is currently visible.

Returns
1 if scrollbar visible, 0 if not.

9.143.2.45 item_clicked() [1/2]

Fl_Tree_Item * Fl_Tree::item_clicked ( )

Return the item that was last clicked.
Valid only from within the callback().

Returns
The item clicked, or 0 if none. 0 may also be used to indicate several items were clicked/changed.

 Deprecated in 1.3.3 ABI – use callback_item() instead.

9.143.2.46 item_clicked() [2/2]

void Fl_Tree::item_clicked ( ) [protected]

Set the item that was last clicked.
Should only be used by subclasses needing to change this value. Normally Fl_Tree manages this value.

 Deprecated in 1.3.3 ABI – use callback_item() instead.

9.143.2.47 item_draw_mode() [1/3]

Fl_Tree_Item_Draw_Mode Fl_Tree::item_draw_mode ( ) const

Get the 'item draw mode' used for the tree.

 Version
1.3.1 ABI feature

9.143.2.48 item_draw_mode() [2/3]

void Fl_Tree::item_draw_mode ( Fl_Tree_Item_Draw_Mode mode )

Set the 'item draw mode' used for the tree to 'mode'.
This affects how items in the tree are drawn, such as when a widget() is defined. See Fl_Tree_Item_Draw_Mode for possible values.

 Version
1.3.1 ABI feature

9.143.2.49 item_draw_mode() [3/3]

void Fl_Tree::item_draw_mode ( int mode )

Set the 'item draw mode' used for the tree to integer 'mode'.
This affects how items in the tree are drawn, such as when a widget() is defined. See Fl_Tree_Item_Draw_Mode for possible values.

 Version
1.3.1 ABI feature
9.143.2.50 item_labelbgcolor() [1/2]

void Fl_Tree::item_labelbgcolor ( 
    Fl_Color val )

Set the default label background color used for creating new items.
A special case is made for color 0xffffffff (default) which is treated as 'transparent'. To change the background color
on a per-item basis, use Fl_Tree_Item::labelbgcolor(Fl_Color)

9.143.2.51 item_labelbgcolor() [2/2]

Fl_Color Fl_Tree::item_labelbgcolor ( 
    void ) const

Get the default label background color used for creating new items.
If the color is 0xffffffff, it is 'transparent'.

9.143.2.52 item_labelfgcolor()

void Fl_Tree::item_labelfgcolor ( 
    Fl_Color val )

Set the default label foreground color used for creating new items.
To change the foreground color on a per-item basis, use Fl_Tree_Item::labelfgcolor(Fl_Color)

9.143.2.53 item_labelfont()  

void Fl_Tree::item_labelfont ( 
    Fl_Font val )

Set the default font face used for creating new items.
To change the font face on a per-item basis, use Fl_Tree_Item::labelfont(Fl_Font)

9.143.2.54 item_labelsize()  

void Fl_Tree::item_labelsize ( 
    Fl_Fontsize val )

Set the default label font size used for creating new items.
To change the font size on a per-item basis, use Fl_Tree_Item::labelsizel(Fl_Fontsize)

9.143.2.55 item_pathname()  

int Fl_Tree::item_pathname (  
    char ∗ pathname,
    int pathnamelen,
    const Fl_Tree_Item ∗ item ) const

Return 'pathname' of size 'pathnamelen' for the specified 'item'.
If 'item' is NULL, root() is used.
The tree's root will be included in the pathname if showroot() is on.
Menu items or submenus that contain slashes ('/' or '\') in their names will be escaped with a backslash. This is
symmetrical with the add() function which uses the same escape pattern to set names.

Parameters

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out</td>
<td><strong>pathname</strong> The string to use to return the pathname</td>
</tr>
<tr>
<td>In</td>
<td><strong>pathnamelen</strong> The maximum length of the string (including NULL). Must not be zero.</td>
</tr>
<tr>
<td>In</td>
<td><strong>item</strong> The item whose pathname is to be returned.</td>
</tr>
</tbody>
</table>

Returns

- 0 : OK (pathname returns the item's pathname)
- -1 : item not found (pathname="")
- -2 : pathname not large enough (pathname="")
See also

find_item()

9.143.2.56 item_reselect_mode() [1/2]

Fl_Tree_Item_Reselect_Mode Fl_Tree::item_reselect_mode ( ) const
Returns the current item re/selection mode.

Version

1.3.1 ABI feature

9.143.2.57 item_reselect_mode() [2/2]

void Fl_Tree::item_reselect_mode ( Fl_Tree_Item_Reselect_Mode mode )
Sets the item re/selection mode.
See Fl_Tree_Item_Reselect_Mode for possible values.

Version

1.3.1 ABI feature

9.143.2.58 last()

Fl_Tree_Item * Fl_Tree::last ( )
Returns the last item in the tree.
This can be used to walk the tree in reverse, e.g.
for ( Fl_Tree_Item *item = tree->last(); item; item = tree->prev() )
  printf("Item: %s\n", item->label());

Returns

Last item in the tree, or 0 if none (tree empty).

See also

first(), next(), last(), prev()

9.143.2.59 last_selected_item()

Fl_Tree_Item * Fl_Tree::last_selected_item ( )
Returns the last selected item in the tree.
Use this to walk the tree in reverse from bottom to top looking for all the selected items, e.g.
// Walk tree in reverse, from bottom to top
for ( Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up) )
  printf("Selected item: %s\n", i->label());

Returns

The last selected item, or 0 if none.

See also

first_selected_item(), last_selected_item(), next_selected_item()

Version

1.3.3
9.143.2.60 last_visible()

Fl_Tree_Item * Fl_Tree::last_visible ( )

Returns the last open(), visible item in the tree.

Deprecated in 1.3.3 – use last_visible_item() instead.

9.143.2.61 last_visible_item()

Fl_Tree_Item * Fl_Tree::last_visible_item ( )

Returns the last open(), visible item in the tree.

Returns

Last visible item in the tree, or 0 if none.

See also

first_visible_item(), last_visible_item(), next_visible_item()

Version

1.3.3

9.143.2.62 load()

void Fl_Tree::load ( class Fl_Preferences & prefs )

Load FLTK preferences.
Read a preferences database into the tree widget.
A preferences database is a hierarchical collection of data which can be directly loaded into the tree view for inspection.

Parameters

in prefs the Fl_Preferences database

9.143.2.63 next()

Fl_Tree_Item * Fl_Tree::next ( Fl_Tree_Item * item = 0 )

Return the next item after 'item', or 0 if no more items.
Use this code to walk the entire tree:
for ( Fl_Tree_Item *i = tree->first(); i; i = tree->next(i) )
  printf("Item: %s\n", i->label());

Parameters

in item The item to use to find the next item. If NULL, returns 0.

Returns

Next item in tree, or 0 if at last item.

See also

first(), next(), last(), prev()
9.143.2.64  next_item()

**Fl_Tree_Item** * Fl_Tree::next_item ( 
    Fl_Tree_Item * item,
    int dir = FL_Down,
    bool visible = false )

Returns next item after 'item' in direction 'dir' depending on 'visible'.
Next item will be above (if dir==FL_Up) or below (if dir==FL_Down). If 'visible' is true, only items whose parents are open() will be returned. If 'visible' is false, even items whose parents are close()ed will be returned.
If item is 0, the return value will be the result of this truth table:

<table>
<thead>
<tr>
<th>visible=true</th>
<th>visible=false</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir=FL_Up:</td>
<td>last_visible_item()</td>
</tr>
<tr>
<td>dir=FL_Down:</td>
<td>first_visible_item()</td>
</tr>
</tbody>
</table>

Example use:

```c
// Walk down the tree showing open(), visible items
for ( Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_item(i, FL_Down, true) )
    printf("Item: %s\n", i->label());

// Walk up the tree showing open(), visible items
for ( Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_item(i, FL_Up, true) )
    printf("Item: %s\n", i->label());

// Walk down the tree showing all items (open or closed)
for ( Fl_Tree_Item *i=tree->first(); i; i=tree->next_item(i, FL_Down, false) )
    printf("Item: %s\n", i->label());

// Walk up the tree showing all items (open or closed)
for ( Fl_Tree_Item *i=tree->last(); i; i=tree->next_item(i, FL_Up, false) )
    printf("Item: %s\n", i->label());
```

**Parameters**

- **in item** The item to use to find the next item. If NULL, returns 0.
- **in dir** Can be FL_Up or FL_Down (default=FL_Down or 'next')
- **in visible** true=return only open(), visible items, false=return open or closed items (default)

**Returns**

Next item in tree in the direction and visibility specified, or 0 if no more items of specified visibility in that direction.

**See also**

- first(), last(), next(), first_visible_item(), last_visible_item(), next_visible_item(),
- first_selected_item(), last_selected_item(), next_selected_item()

**Version**

1.3.3

9.143.2.65  next_selected_item()

**Fl_Tree_Item** * Fl_Tree::next_selected_item ( 
    Fl_Tree_Item * item = 0,
    int dir = FL_Down )

Returns the next selected item above or below 'item', depending on 'dir'.
If 'item' is 0, search starts at either first() or last(), depending on 'dir': first() if 'dir' is FL_Down (default), last() if 'dir' is FL_Up.

Use this to walk the tree looking for all the selected items, e.g.

// Walk down the tree (forwards)
for ( Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i, FL_Down) )
  printf("Item: %s\n", i->label());

// Walk up the tree (backwards)
for ( Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up) )
  printf("Item: %s\n", i->label());

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item above or below which we'll find the next selected item. If NULL, first() is used if FL_Down, last() if FL_Up. (default=NULL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>dir</td>
<td>The direction to go. FL_Up for moving up the tree, FL_Down for down the tree (default)</td>
</tr>
</tbody>
</table>

Returns

The next selected item, or 0 if there are no more selected items.

See also

first_selected_item(), last_selected_item(), next_selected_item()

Version

1.3.3

9.143.2.66 next_visible_item()

Fl_Tree_Item * Fl_Tree::next_visible_item (Fl_Tree_Item *item, int dir)

Returns next open(), visible item above (dir==FL_Up) or below (dir==FL_Down) the specified 'item', or 0 if no more items.

If 'item' is 0, returns last() if 'dir' is FL_Up, or first() if dir is FL_Down.

// Walk down the tree (forwards)
for ( Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_visible_item(i, FL_Down) )
  printf("Item: %s\n", i->label());

// Walk up the tree (backwards)
for ( Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_visible_item(i, FL_Up) )
  printf("Item: %s\n", i->label());

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item above/below which we'll find the next visible item</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>dir</td>
<td>The direction to search. Can be FL_Up or FL_Down.</td>
</tr>
</tbody>
</table>

Returns

The item found, or 0 if there's no visible items above/below the specified item.

Version

1.3.3

9.143.2.67 open() [1/2]

int Fl_Tree::open (const char * path, int docalback = 1)
Opens the item specified by 'path'.
This causes the item's children (if any) to be shown.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. open("Holidays/12\25\2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>path</th>
<th>the tree item's pathname (e.g. &quot;Flintstones/Fred&quot;)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_OPENED</td>
</tr>
</tbody>
</table>

Returns

• 1 – OK: item opened
• 0 – OK: item was already open, no change
• -1 – ERROR: item was not found

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

9.143.2.68 open() [2/2]

int Fl_Tree::open (  
    Fl_Tree_Item * item,  
    int docallback = 1 )

Open the specified 'item'.
This causes the item's children (if any) to be shown.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>the item to be opened. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_OPENED</td>
</tr>
</tbody>
</table>

Returns

• 1 – item was opened
• 0 – item was already open, no change
9.143 Fl_Tree Class Reference

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

9.143.2.69 open_toggle()

void Fl_Tree::open_toggle ( 
    Fl_Tree_Item * item,
    int docallback = 1 )

Toggle the open state of 'item'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the
reason the callback was called.

Parameters

| in  | item       | -- the item whose open state is to be toggled. Must not be NULL. |
| in  | docallback | -- A flag that determines if the callback() is invoked or not: |
|     |            | • 0 - callback() is not invoked |
|     |            | • 1 - callback() is invoked (default), callback_reason() will be either FL_TREE_REASON_OPENED or FL_TREE_REASON_CLOSED |

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

9.143.2.70 openicon() [1/2]

Fl_Image * Fl_Tree::openicon ( ) const

Returns the icon to be used as the 'open' icon.
If none was set, the internal default is returned, a simple '[+]' icon.

9.143.2.71 openicon() [2/2]

void Fl_Tree::openicon ( 
    Fl_Image * val )

Sets the icon to be used as the 'open' icon.
This overrides the built in default '[+] icon.

Parameters

| in  | val       | -- The new image, or zero to use the default [+ ] icon. |

9.143.2.72 prev()

Fl_Tree_Item * Fl_Tree::prev ( 
    Fl_Tree_Item * item = 0 )

Return the previous item before 'item', or 0 if no more items.
This can be used to walk the tree in reverse, e.g.
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->prev(item) )
    printf("Item: %s\n", item->label());

Parameters

| in  | item       | The item to use to find the previous item. If NULL, returns 0. |

Generated by Doxygen
Returns

Previous item in tree, or 0 if at first item.

See also

first(), next(), last(), prev()

9.143.2.73 recalc_tree()

void Fl_Tree::recalc_tree ( )
Schedule tree to recalc the entire tree size.

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

9.143.2.74 remove()

int Fl_Tree::remove ( Fl_Tree_Item * item )
Remove the specified 'item' from the tree.
item may not be NULL. If it has children, all those are removed too. If item being removed has focus, no item will
have focus.

Returns

0 if done, -1 if 'item' not found.

9.143.2.75 resize()

void Fl_Tree::resize ( int X, int Y, int W, int H ) [virtual]
Resizes the Fl_Group widget and all of its children.
The Fl_Group widget first resizes itself, and then it moves and resizes all its children according to the rules docu-
mented for Fl_Group::resizable(Fl_Widget*)

See also

Fl_Group::resizable(Fl_Widget*)
Fl_Group::resizable()
Fl_Widget::resize(int,int,int,int)

Reimplemented from Fl_Group.

9.143.2.76 root()

void Fl_Tree::root ( Fl_Tree_Item * newitem )
Sets the root item to 'newitem'.
If a root item already exists, clear() is called first to clear it before replacing it with newitem. Use this to install a
custom item (derived from Fl_Tree_Item) as the root of the tree. This allows the derived class to implement custom
drawing by overriding Fl_Tree_Item::draw_item_content().

Version

1.3.3
9.143.2.77  root_label()

void Fl_Tree::root_label (const char * new_label)
Set the label for the root item to 'new_label'.
Makes an internally managed copy of 'new_label'.

9.143.2.78  scrollbar_size()[1/2]

int Fl_Tree::scrollbar_size ( ) const
Gets the default size of scrollbars' troughs for this widget in pixels.
If this value is zero (default), this widget will use the global Fl::scrollbar_size() value as the scrollbar's width.

Returns
    Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also
    Fl::scrollbar_size(int)

9.143.2.79  scrollbar_size()[2/2]

void Fl_Tree::scrollbar_size (int size)
Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.
Normally you should not need this method, and should use the global Fl::scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, and is the default behavior.
Normally this is what you want.
Only use this method if you really need to override just THIS instance of the widget's scrollbar size. (This need should be rare.)
Setting size to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the default.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>size</th>
<th>Sets the scrollbar size in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If 0 (default), scrollbar size tracks the global Fl::scrollbar_size()</td>
</tr>
</tbody>
</table>

See also
    Fl::scrollbar_size()

9.143.2.80  select()[1/2]

int Fl_Tree::select (const char * path, int docallback = 1)
Select the item specified by 'path'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. select("Holidays/12\25\2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

| in  | path  | the tree item's pathname (e.g. "Flintstones/Fred") |

Generated by Doxygen
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>docallback</th>
<th>— A flag that determines if the callback() is invoked or not:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• 0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - the callback() is invoked if item changed state (default), callback_reason() will be FL_TREE_REASON_SELECTED</td>
</tr>
</tbody>
</table>

Returns

- 1 : OK: item's state was changed
- 0 : OK: item was already selected, no change was made
- -1 : ERROR: item was not found

9.143.2.81 select() [2/2]

```c
int Fl_Tree::select ( 
    Fl_Tree_Item * item, 
    int docallback = 1 
)
```

Select the specified 'item'.
Use 'deselect()' to deselect it.
Invokes the callback depending on the value of optional parameter docallback.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>— the item to be selected. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>— A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - the callback() is invoked if item changed state, callback_reason() will be FL_TREE_REASON_SELECTED</td>
</tr>
</tbody>
</table>

Returns

- 1 - item's state was changed  
- 0 - item was already selected, no change was made 

9.143.2.82 select_all()

```c
int Fl_Tree::select_all ( 
    Fl_Tree_Item * item = 0, 
    int docallback = 1 
)
```

Select 'item' and all its children. 
If item is NULL, first() is used.
Invokes the callback depending on the value of optional parameter 'docallback'. 
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.
Parameters

| in | item | The item that will be selected (along with all its children). If NULL, first() is used. |
| in | docallback | A flag that determines if the callback() is invoked or not: |
| | | • 0 - the callback() is not invoked |
| | | • 1 - the callback() is invoked for each item that changed state (default), callback_reason() will be FL_TREE_REASON_SELECTED |

Returns

Count of how many items were actually changed to the selected state.

9.143.2.83 select_only()

```c
int Fl_Tree::select_only ( Fl_Tree_Item * selitem, int docallback = 1 )
```

Select only the specified item, deselecting all others that might be selected. If 'selitem' is 0, first() is used.

Invokes the callback depending on the value of optional parameter 'docallback'. Handles calling redraw() if anything changed.

The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

| in | selitem | The item to be selected. If NULL, first() is used. |
| in | docallback | A flag that determines if the callback() is invoked or not: |
| | | • 0 - the callback() is not invoked |
| | | • 1 - the callback() is invoked for each item that changed state (default), callback_reason() will be either FL_TREE_REASON_SELECTED or FL_TREE_REASON_DESELECTED |

Returns

The number of items whose selection states were changed, if any.

9.143.2.84 select_toggle()

```c
void Fl_Tree::select_toggle ( Fl_Tree_Item * item, int docallback = 1 )
```

Toggle the select state of the specified 'item'.

Invokes the callback depending on the value of optional parameter 'docallback'. Handles calling redraw() if anything changed.

The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

| in | item | the item to be selected. Must not be NULL. |
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>docallback</th>
<th>– A flag that determines if the callback() is invoked or not:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0 - the callback() is not invoked</td>
<td></td>
</tr>
<tr>
<td></td>
<td>1 - the callback() is invoked (default), callback_reason() will be either FL_TREE_REASON_SELECTED or FL_TREE_REASON_DESELECTED</td>
<td></td>
</tr>
</tbody>
</table>

9.143.2.85 selectbox() [1/2]

Fl_Boxtype Fl_Tree::selectbox ( ) const

Sets the style of box used to draw selected items.

This is an fltk Fl_Boxtype. The default is influenced by FLTK’s current Fl::scheme()

9.143.2.86 selectbox() [2/2]

void Fl_Tree::selectbox ( Fl_Boxtype val )

Gets the style of box used to draw selected items.

This is an fltk Fl_Boxtype. The default is influenced by FLTK’s current Fl::scheme()

9.143.2.87 selectmode() [1/2]

Fl_Tree_Select Fl_Tree::selectmode ( ) const

Gets the tree’s current selection mode.

See Fl_Tree_Select for possible values.

9.143.2.88 selectmode() [2/2]

void Fl_Tree::selectmode ( Fl_Tree_Select val )

Sets the tree’s selection mode.

See Fl_Tree_Select for possible values.

9.143.2.89 set_item_focus()

void Fl_Tree::set_item_focus ( Fl_Tree_Item * item )

Set the item that currently should have keyboard focus. Handles calling redraw() to update the focus box (if it is visible).

Parameters

| in  | item | The item that should take focus. If NULL, none will have focus. |

9.143.2.90 show_item() [1/2]

void Fl_Tree::show_item ( Fl_Tree_Item * item )

Adjust the vertical scrollbar to show ‘item’ at the top of the display IF it is currently off-screen (for instance show_item_top()).

If it is already on-screen, no change is made.

Parameters

| in  | item | The item to be shown. If NULL, first() is used. |
See also
    show_item_top(), show_item_middle(), show_item_bottom()

9.143.2.91  show_item() [2/2]

void Fl_Tree::show_item (  
    Fl_Tree_Item * item,  
    int yoff )

Adjust the vertical scrollbar so that 'item' is visible 'yoff' pixels from the top of the Fl_Tree widget's display. For instance, yoff=0 will position the item at the top. If yoff is larger than the vertical scrollbar's limit, the value will be clipped. So if yoff=100, but scrollbar's max is 50, then 50 will be used.

Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>item</td>
<td>The item to be shown. If NULL, first() is used.</td>
</tr>
<tr>
<td>in</td>
<td>yoff</td>
<td>The pixel offset from the top for the displayed position.</td>
</tr>
</tbody>
</table>

See also
    show_item_top(), show_item_middle(), show_item_bottom()

9.143.2.92  show_item_bottom()  

void Fl_Tree::show_item_bottom (  
    Fl_Tree_Item * item )

Adjust the vertical scrollbar so that 'item' is at the bottom of the display.

Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>item</td>
<td>The item to be shown. If NULL, first() is used.</td>
</tr>
</tbody>
</table>

9.143.2.93  show_item_middle()  

void Fl_Tree::show_item_middle (  
    Fl_Tree_Item * item )

Adjust the vertical scrollbar so that 'item' is in the middle of the display.

Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>item</td>
<td>The item to be shown. If NULL, first() is used.</td>
</tr>
</tbody>
</table>

9.143.2.94  show_item_top()  

void Fl_Tree::show_item_top (  
    Fl_Tree_Item * item )

Adjust the vertical scrollbar so that 'item' is at the top of the display.

Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>item</td>
<td>The item to be shown. If NULL, first() is used.</td>
</tr>
</tbody>
</table>
9.143.2.95  show_self()

```cpp
void Fl_Tree::show_self ( )
```
Print the tree as 'ascii art' to stdout.
Used mainly for debugging.

**Todo** should be const

**Version**

1.3.0

9.143.2.96  showcollapse() [1/2]

```cpp
int Fl_Tree::showcollapse ( ) const
```
Returns 1 if the collapse icon is enabled, 0 if not.

See also

`showcollapse(int)`

9.143.2.97  showcollapse() [2/2]

```cpp
void Fl_Tree::showcollapse ( int val )
```
Set if we should show the collapse icon or not.
If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via `open()` and `close()`.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>val</th>
</tr>
</thead>
</table>
|     | 1: shows collapse icons (default),
|     | 0: hides collapse icons. |

9.143.2.98  showroot()

```cpp
void Fl_Tree::showroot ( int val )
```
Set if the root item should be shown or not.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>val</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 – show the root item (default)</td>
</tr>
<tr>
<td></td>
<td>0 – hide the root item.</td>
</tr>
</tbody>
</table>

9.143.2.99  sortorder()

```cpp
Fl_Tree_Sort Fl_Tree::sortorder ( ) const
```
Set the default sort order used when items are added to the tree.
See `Fl_Tree_Sort` for possible values.

9.143.2.100  usericon() [1/2]

```cpp
Fl_Image Fl_Tree::usericon ( ) const
```
Returns the `Fl_Image` being used as the default user icon for all newly created items.
Returns zero if no icon has been set, which is the default.
9.143.2.101 usericon()  [2/2]

void Fl_Tree::usericon {  
    Fl_Image ∗ val  
}

Sets the Fl_Image to be used as the default user icon for all newly created items.  
If you want to specify user icons on a per-item basis, use Fl_Tree_Item::usericon() instead.  

Parameters  

| in  | val  | – The new image to be used, or zero to disable user icons.

9.143.2.102 vposition()  [1/2]

int Fl_Tree::vposition( ) const  

Returns the vertical scroll position as a pixel offset.  
The position returned is how many pixels of the tree are scrolled off the top edge of the screen.  
See also  

vposition(int), hposition(), hposition(int)

9.143.2.103 vposition()  [2/2]

void Fl_Tree::vposition( )  

Sets the vertical scroll offset to position 'pos'.  
The position is how many pixels of the tree are scrolled off the top edge of the screen.  

Parameters  

| in | pos | The vertical position (in pixels) to scroll the tree to.

See also  

vposition(), hposition(), hposition(int)

• Fl_Tree.H  
• Fl_Tree.cxx

9.144 Fl_Tree_Item Class Reference

Tree widget item.  
#include <Fl_Tree_Item.H>

Public Member Functions

• void activate (int val=1)
    Change the item's activation state to the optionally specified 'val'.

• Fl_Tree_Item * add (const Fl_Tree_Prefs &prefs, char ∗ ∗arr)
    Descend into the path specified by 'arr', and add a new child there.

• Fl_Tree_Item * add (const Fl_Tree_Prefs &prefs, char ∗ ∗arr, Fl_Tree_Item ∗newitem)
    Descend into path specified by 'arr' and add 'newitem' there.

• Fl_Tree_Item * add (const Fl_Tree_Prefs &prefs, const char ∗ new_label)
    Add a new child to this item with the name 'new_label' and defaults from 'prefs'.

Generated by Doxygen
• **Fl_Tree_Item** * add (const Fl_Tree_Prefs &prefs, const char *new_label, Fl_Tree_Item *newitem)

  Add 'item' as immediate child with 'new_label' and defaults from 'prefs'.

• **Fl_Tree_Item** * child (int index)

  Return the child item for the given 'index'.

• const Fl_Tree_Item * child (int t) const

  Return the const child item for the given 'index'.

• int children () const

  Return the number of children this item has.

• void clear_children ()

  Clear all the children for this item.

• void close ()

  Close this item and all its children.

• void deactivate ()

  Deactivate the item; the callback() won't be invoked when clicked.

• **Fl_Tree_Item** * deparent (int index)

  Deparent child at index position 'pos'.

• int depth () const

  Returns how many levels deep this item is in the hierarchy.

• void deselect ()

  Disable the item's selection state.

• int deselect_all ()

  Deselect item and all its children.

• void draw (int X, int &Y , int W, Fl_Tree_Item *itemfocus, int &tree_item_xmax, int lastchild=1, int render=1)

  Draw this item and its children.

• virtual int draw_item_content (int render)

  Draw the item content.

• int event_on_collapse_icon (const Fl_Tree_Prefs &prefs) const

  Was the event on the 'collapse' button of this item?

• int event_on_label (const Fl_Tree_Prefs &prefs) const

  Was event on the label() of this item?

• int find_child (const char * name)

  Return the index of the immediate child of this item that has the label 'name'.

• int find_child (Fl_Tree_Item *item)

  Find the index number for the specified 'item' in the current item's list of children.

• **Fl_Tree_Item** * find_child_item (const char **arr)

  Non-const version of Fl_Tree_Item::find_child_item(char **arr) const.

• const Fl_Tree_Item * find_child_item (char **arr) const

  Find child item by descending array 'arr' of names.

• **Fl_Tree_Item** * find_child_item (const char *name)

  Non-const version of Fl_Tree_Item::find_child_item(char *name) const.

• const Fl_Tree_Item * find_child_item (const char *name) const

  Return the /immediate/ child of current item that has the label 'name'.

• **Fl_Tree_Item** * find_clicked (const Fl_Tree_Prefs &prefs, int yonly=0)

  Non-const version of Fl_Tree_Item::find_clicked(const Fl_Tree_Prefs&, int yonly) const.

• const Fl_Tree_Item * find_clicked (const Fl_Tree_Prefs &prefs, int yonly=0) const

  Find the item that the last event was over.

• **Fl_Tree_Item** * find_item (const Fl_Tree_Item *o)

  Non-const version of Fl_Tree_Item::find_item(char **names) const.

• const Fl_Tree_Item * find_item (char **arr) const

  Find item by descending array of 'names'.

• **Fl_Tree_Item** (const Fl_Tree_Item *o)
Copy constructor.
- `Fl_Tree_Item (const Fl_Tree_Prefs &prefs)`
  Constructor.
- `Fl_Tree_Item (Fl_Tree *tree)`
  Constructor.
- `int h () const`
  The item's height.
- `int has_children () const`
  See if this item has children.
- `Fl_Tree_Item * insert (const Fl_Tree_Prefs &prefs, const char *new_label, int pos=0)`
  Insert a new item named `new_label` into current item's children at a specified position `pos`.
- `Fl_Tree_Item * insert_above (const Fl_Tree_Prefs &prefs, const char *new_label)`
  Insert a new item named `new_label` above this item.
- `char is_activated () const`
  See if the item is activated.
- `char is_active () const`
  See if the item is activated. Alias for is_activated().
- `int is_close () const`
  See if the item is 'closed'.
- `int is_open () const`
  See if the item is 'open'.
- `int is_root () const`
  Is this item the root of the tree?
- `char is_selected () const`
  See if the item is selected.
- `int is_visible () const`
  See if the item is visible.
- `const char * label () const`
  Return the label.
- `void label (const char *val)`
  Set the label to `name`.
- `int label_h () const`
  The item's label height.
- `int label_w () const`
  The item's maximum label width to right edge of Fl_Tree's inner width within scrollbars.
- `int label_x () const`
  The item's label x position relative to the window.
- `int label_y () const`
  The item's label y position relative to the window.
- `Fl_Color labelbgcolor () const`
  Return item's label background text color.
- `void labelbgcolor (Fl_Color val)`
  Set item's label background color.
- `Fl_Color labelcolor () const`
  Return item's label text color. Alias for labelfgcolor() const).
- `void labelcolor (Fl_Color val)`
  Set item's label text color. Alias for labelfgcolor(Fl_Color)).
- `Fl_Color labelfgcolor () const`
  Return item's label foreground text color.
- `void labelfgcolor (Fl_Color val)`
  Set item's label foreground text color.
• **Fl_Font** labelfont () const
  
  Get item's label font face.

• **void** labelfont (Fl_Font val)

  Set item's label font face.

• **Fl_Fontsize** labelsize () const

  Get item's label font size.

• **void** labelsize (Fl_Fontsize val)

  Set item's label font size.

• int move (Fl_Tree_Item ∗item, int op=0, int pos=0)

  Move the current item above/below/into the specified 'item', where 'op' determines the type of move:

  - **int** move (int to, int from)

    Move the item 'from' to sibling position of 'to'.

  - **int** move_above (Fl_Tree_Item ∗item)

    Move the current item above the specified 'item'.

  - **int** move_below (Fl_Tree_Item ∗item)

    Move the current item below the specified 'item'.

  - **int** move_into (Fl_Tree_Item ∗item, int pos=0)

    Parent the current item as a child of the specified 'item'.

• **Fl_Tree_Item** ∗next ()

  Return the next item in the tree.

• **Fl_Tree_Item** ∗next_displayed (Fl_Tree_Prefs &prefs)

  Same as next_visible().

• **Fl_Tree_Item** ∗next_sibling ()

  Return this item's next sibling.

• **Fl_Tree_Item** ∗next_visible (Fl_Tree_Prefs &prefs)

  Return the next open(), visible() item.

• **void** open ()

  Open this item and all its children.

• **void** open_toggle ()

  Toggle the item's open/closed state.

• **Fl_Tree_Item** ∗parent ()

  Return the parent for this item. Returns NULL if we are the root.

• const Fl_Tree_Item ∗parent () const

  Return the const parent for this item. Returns NULL if we are the root.

• **void** parent (Fl_Tree_Item ∗val)

  Set the parent for this item.

• const Fl_Tree_Prefs & prefs () const

  Return the parent tree's prefs.

• **Fl_Tree_Item** ∗prev ()

  Return the previous item in the tree.

• **Fl_Tree_Item** ∗prev_displayed (Fl_Tree_Prefs &prefs)

  Same as prev_visible().

• **Fl_Tree_Item** ∗prev_sibling ()

  Return this item's previous sibling.

• **Fl_Tree_Item** ∗prev_visible (Fl_Tree_Prefs &prefs)

  Return the previous open(), visible() item.

• int remove_child (const char ∗new_label)

  Remove immediate child (and its children) by its label 'name'.

• int remove_child (Fl_Tree_Item ∗item)

  Remove 'item' from the current item's children.

• int reparent (Fl_Tree_Item ∗newchild, int index)
Reparent specified item as a child of ourself at position 'pos'.

- **Fl_Tree_Item** ∗ replace (Fl_Tree_Item ∗new_item)
  Replace the current item with a new item.
- **Fl_Tree_Item** ∗ replace_child (Fl_Tree_Item ∗olditem, Fl_Tree_Item ∗newitem)
  Replace existing child 'olditem' with 'newitem'.
- void select (int val=1)
  Change the item’s selection state to the optionally specified ‘val’.
  - int select_all ()
    Select item and all its children.
  - void select_toggle ()
    Toggle the item’s selection state.
  - void show_self (const char ∗indent="") const
    Print the tree as ‘ascii art’ to stdout.
- int swap_children (Fl_Tree_Item ∗a, Fl_Tree_Item ∗b)
  Swap two of our immediate children, given item pointers.
- void swap_children (int ax, int bx)
  Swap two of our children, given two child index values ‘ax’ and ‘bx’.
- **Fl_Tree** ∗ tree ()
  Return the tree for this item.
- const **Fl_Tree** ∗ tree () const
  Return the tree for this item.
- void update_prev_next (int index)
  Update our _prev_sibling and _next_sibling pointers to point to neighbors given index as being our current position in the parent’s item array.
- void ∗ user_data () const
  Retrieve the user-data value that has been assigned to the item.
- void user_data (void ∗data)
  Set a user-data value for the item.
- **Fl_Image** ∗ userdeicon () const
  Return the deactivated version of the user icon, if any.
- void userdeicon (Fl_Image ∗val)
  Set the usericon to draw when the item is deactivated.
- **Fl_Image** ∗ usericon () const
  Get the item’s user icon as an **Fl_Image**. Returns ‘0’ if disabled.
- void usericon (Fl_Image ∗val)
  Set the item’s user icon to an **Fl_Image**.
- int visible () const
  See if the item is visible. Alias for is_visible().
- int visible_r () const
  See if item and all its parents are open() and visible().
- int w () const
  The entire item’s width to right edge of **Fl_Tree**’s inner width within scrollbars.
- **Fl_Widget** ∗ widget () const
  Return FLTK widget assigned to this item.
- void widget (Fl_Widget ∗val)
  Assign an FLTK widget to this item.
- int x () const
  The item’s x position relative to the window.
- int y () const
  The item’s y position relative to the window.
Protected Member Functions

- `void _Init (const Fl_Tree_Prefs &prefs, Fl_Tree *tree)`
  - Returns the item's 'visible' height.
- `int calc_item_height (const Fl_Tree_Prefs &prefs) const`
  - Internal: Horizontal connector line based on preference settings.
- `void draw_horizontal_connector (int x1, int x2, int y, const Fl_Tree_Prefs &prefs)`
  - Internal: Vertical connector line based on preference settings.
- `Fl_Color drawbgcolor () const`
  - Returns the recommended background color used for drawing this item.
- `Fl_Color drawfgcolor () const`
  - Returns the recommended foreground color used for drawing this item.
- `void hide_widgets ()`
  - Internal: Hide the FLTK widget() for this item and all children.
- `int is_flag (unsigned short val) const`
  - See if flag set. Returns 0 or 1.
- `void recalc_tree ()`
  - Call this when our geometry is changed.
- `void set_flag (unsigned short flag, int val)`
  - Set a flag to an on or off value. val is 0 or 1.
- `void show_widgets ()`
  - Internal: Show the FLTK widget() for this item and all children.

9.144.1 Detailed Description

Tree widget item.
This class is a single tree item, and manages all of the item's attributes. `Fl_Tree_Item` is used by `Fl_Tree`, which is comprised of many instances of `Fl_Tree_Item`. `Fl_Tree_Item` is hierarchical; it dynamically manages an `Fl_Tree_Item_Array` of children that are themselves instances of `Fl_Tree_Item`. Each item can have zero or more children. When an item has children, `close()` and `open()` can be used to hide or show them.

Items have their own attributes; font size, face, color. Items maintain their own hierarchy of children.

When you make changes to items, you'll need to tell the tree to redraw() for the changes to show up.

New 1.3.3 ABI feature: You can define custom items by either adding a custom widget to the item with `Fl_Tree_Item::widget()`, or override the `draw_item_content()` method if you want to just redefine how the label is drawn.

The following shows the `Fl_Tree_Item`'s dimensions, useful when overriding the `draw_item_content()` method:

![Figure 9.47 Fl_Tree_Item's internal dimensions.](image)

9.144.2 Constructor & Destructor Documentation

9.144.2.1 `Fl_Tree_Item()` [1/2]

`Fl_Tree_Item::Fl_Tree_Item (const Fl_Tree_Prefs &prefs)`

Constructor.
Makes a new instance of `Fl_Tree_Item` using defaults from `prefs`. 

Generated by Doxygen
**Deprecated** in 1.3.3 ABI – you must use `Fl_Tree_Item(Fl_Tree*)` for proper horizontal scrollbar behavior.

### 9.144.2.2 Fl_Tree_Item() [2/2]

```cpp
Fl_Tree_Item::Fl_Tree_Item ( 
    Fl_Tree * tree )
```

Constructor.
Makes a new instance of `Fl_Tree_Item` for 'tree'.
This must be used instead of the older, deprecated `Fl_Tree_Item(Fl_Tree_Prefs)` constructor for proper horizontal scrollbar calculation.

Version
1.3.3 ABI feature

### 9.144.3 Member Function Documentation

#### 9.144.3.1 activate()

```cpp
void Fl_Tree_Item::activate ( 
    int val = 1 ) { inline }
```

Change the item's activation state to the optionally specified 'val'.
When deactivated, the item will be 'grayed out'; the callback() won't be invoked if the user clicks on the label. If a `widget()` is associated with the item, its activation state will be changed as well.
If 'val' is not specified, the item will be activated.

#### 9.144.3.2 add() [1/4]

```cpp
Fl_Tree_Item * Fl_Tree_Item::add ( 
    const Fl_Tree_Prefs & prefs, 
    char ** arr )
```

Descend into the path specified by 'arr', and add a new child there.
Should be used only by `Fl_Tree`'s internals. Adds the item based on the value of `prefs.sortorder()`.

Returns
the item added.

Version
1.3.0 release

#### 9.144.3.3 add() [2/4]

```cpp
Fl_Tree_Item * Fl_Tree_Item::add ( 
    const Fl_Tree_Prefs & prefs, 
    char ** arr, 
    Fl_Tree_Item * newitem )
```

Descend into path specified by 'arr' and add 'newitem' there.
Should be used only by `Fl_Tree`'s internals. If item is NULL, a new item is created. Adds the item based on the value of `prefs.sortorder()`.

Returns
the item added.

Version
1.3.3 ABI feature

Generated by Doxygen

9.144.3.4  **add() [3/4]**

```cpp
Fl_Tree_Item * Fl_Tree_Item::add (  
    const Fl_Tree_PREFS & prefs,  
    const char * new_label )
```

Add a new child to this item with the name 'new_label' and defaults from 'prefs'.
An internally managed copy is made of the label string. Adds the item based on the value of prefs.sortorder().

Returns

the item added

Version

1.3.0 release

---

9.144.3.5  **add() [4/4]**

```cpp
Fl_Tree_Item * Fl_Tree_Item::add (  
    const Fl_Tree_PREFS & prefs,  
    const char * new_label,  
    Fl_Tree_Item * item )
```

Add 'item' as immediate child with 'new_label' and defaults from 'prefs'.
If 'item' is NULL, a new item is created. An internally managed copy is made of the label string. Adds the item based on the value of prefs.sortorder().

Returns

the item added

Version

1.3.3

---

9.144.3.6  **calc_item_height()**

```cpp
int Fl_Tree_Item::calc_item_height (  
    const Fl_Tree_PREFS & prefs ) const [protected]
```

Return the item's 'visible' height.
Takes into account the item's:

- visibility (if !is_visible(), returns 0)
- labelfont() height: if label() != NULL
- widget() height: if widget() != NULL
- openicon() height (if not NULL)
- usericon() height (if not NULL) Does NOT include Fl_Tree::linespacing();

Returns

maximum pixel height

---

9.144.3.7  **child()**

```cpp
const Fl_Tree_Item * Fl_Tree_Item::child (  
    int t ) const
```

Return the const child item for the given 'index'.
Return const child item for the specified 'index'.
9.144.3.8 deactivate()

void Fl_Tree_Item::deactivate ( ) [inline]
Deactivate the item; the callback() won't be invoked when clicked.
Same as activate(0)

9.144.3.9 deparent()

Fl_Tree_Item * Fl_Tree_Item::deparent ( int pos )
Deparent child at index position 'pos'.
This creates an "orphaned" item that is still allocated, but has no parent or siblings. Normally the caller would want
to immediately reparent the orphan elsewhere.
A successfully orphaned item will have its parent() and prev_sibling()/next_sibling() set to NULL.

Returns
- pointer to orphaned item on success
- NULL on error (could not deparent the item)

9.144.3.10 depth()

int Fl_Tree_Item::depth ( ) const
Returns how many levels deep this item is in the hierarchy.
For instance; root has a depth of zero, and its immediate children would have a depth of 1, and so on. Use e.g. for
determining the horizontal indent of this item during drawing.

9.144.3.11 deselect_all()

int Fl_Tree_Item::deselect_all ( ) [inline]
Deselect item and all its children.
Returns count of how many items were in the 'selected' state, ie. how many items were "changed".

9.144.3.12 draw()

void Fl_Tree_Item::draw ( int X, int & Y, int W, Fl_Tree_Item * itemfocus, int & tree_item_xmax, int lastchild = 1, int render = 1 )
Draw this item and its children.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X</td>
</tr>
<tr>
<td>in, out</td>
<td>Y</td>
</tr>
<tr>
<td>in</td>
<td>W</td>
</tr>
<tr>
<td>in, out</td>
<td>itemfocus</td>
</tr>
<tr>
<td>in, out</td>
<td>tree_item_xmax</td>
</tr>
<tr>
<td>in</td>
<td>lastchild</td>
</tr>
<tr>
<td>in</td>
<td>render</td>
</tr>
</tbody>
</table>

Generated by Doxygen
**9.144.3.13 draw_horizontal_connector()**

```cpp
void Fl_Tree_Item::draw_horizontal_connector ( int x1, int x2, int y, const Fl_Tree_Prefs & prefs ) [protected]
```

Internal: Horizontal connector line based on preference settings.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x1</td>
<td>The left hand X position of the horizontal connector</td>
</tr>
<tr>
<td>x2</td>
<td>The right hand X position of the horizontal connector</td>
</tr>
<tr>
<td>y</td>
<td>The vertical position of the horizontal connector</td>
</tr>
<tr>
<td>prefs</td>
<td>The Fl_Tree prefs</td>
</tr>
</tbody>
</table>

**9.144.3.14 draw_item_content()**

```cpp
int Fl_Tree_Item::draw_item_content ( int render ) [virtual]
```

Draw the item content.

This method can be overridden to implement custom drawing by filling the label_[xywh]() area with content.

A minimal example of how to override draw_item_content() and draw just a normal item's background and label ourselves:

```cpp
class MyTreeItem : public Fl_Tree_Item {
public:
  MyTreeItem() { }
  ~MyTreeItem() { }
  // DRAW OUR CUSTOM CONTENT FOR THE ITEM
  int draw_item_content(int render) {
    // Our item's dimensions + text content
    int X=label_x(), Y=label_y(), W=label_w(), H=label_h();
    const char *text = label() ? label() : "";
    // Rendering? Do any drawing that's needed
    if ( render ) {
      // Draw bg -- a filled rectangle
      fl_color(drawbgcolor()); fl_rectf(X,Y,W,H);
      // Draw label
      fl_font(labelfont(), labelsize()); // use item's label font/size
      fl_color(drawfgcolor()); // use recommended fg color
      fl_draw(text, X,Y,W,H, FL_ALIGN_LEFT); // draw the item's label
    }
    // Rendered or not, we must calculate content's max X position
    int lw=0, lh=0;
    fl_measure(text, lw, lh); // get width of label text
    return X + lw; // return X + label width
  }
};
```

You can draw anything you want inside draw_item_content() using any of the fl_draw.H functions, as long as it's within the label's xywh area.

To add instances of your custom item to the tree, you can use:

```cpp
// Example #1: using add()
MyTreeItem *bart = new MyTreeItem(..); // class derived from Fl_Tree_Item
tree->add("/Simpsons/Bart", bart); // Add item as /Simpsons/Bart
```

...or you can insert or replace existing items:

```cpp
// Example #2: using replace()
MyTreeItem *marge = new MyTreeItem(..); // class derived from Fl_Tree_Item
item = tree->add("/Simpsons/Marge"); // create item
item->replace(mi); // replace it with our own
```

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>render</td>
<td>Whether we should render content (1), or just tally the geometry (0). Fl_Tree may want only to find the widest item in the tree for scrollbar calculations.</td>
</tr>
</tbody>
</table>
Returns

the right-most X coordinate, or 'xmax' of content we drew, i.e. the "scrollable" content. The tree uses the largest xmax to determine the maximum width of the tree's content (needed for e.g. computing the horizontal scrollbar's size).

Version

1.3.3 ABI feature

9.144.3.15 draw_vertical_connector()

void Fl_Tree_Item::draw_vertical_connector (  
    int x,  
    int y1,  
    int y2,  
    const Fl_Tree_Prefs & prefs ) [protected]

Internal: Vertical connector line based on preference settings.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x</th>
<th>The x position of the vertical connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>y1</td>
<td>The top of the vertical connector</td>
</tr>
<tr>
<td>in</td>
<td>y2</td>
<td>The bottom of the vertical connector</td>
</tr>
<tr>
<td>in</td>
<td>prefs</td>
<td>The Fl_Tree prefs</td>
</tr>
</tbody>
</table>

9.144.3.16 drawbgcolor()

Fl_Color Fl_Tree_Item::drawbgcolor () const [protected]

Returns the recommended background color used for drawing this item.

See also
draw_item_content()

Version

1.3.3 ABI

9.144.3.17 drawfgcolor()

Fl_Color Fl_Tree_Item::drawfgcolor () const [protected]

Returns the recommended foreground color used for drawing this item.

See also
draw_item_content()

Version

1.3.3 ABI ABI

9.144.3.18 find_child() [1/2]

int Fl_Tree_Item::find_child (  
    const char * name )

Return the index of the immediate child of this item that has the label 'name'.

Generated by Doxygen
Returns

index of found item, or -1 if not found.

Version

1.3.0 release

9.144.3.19 find_child() [2/2]

int Fl_Tree_Item::find_child ( Fl_Tree_Item * item )

Find the index number for the specified 'item' in the current item's list of children.

Returns

the index, or -1 if not found.

9.144.3.20 find_child_item() [1/2]

const Fl_Tree_Item * Fl_Tree_Item::find_child_item ( char ** arr ) const

Find child item by descending array 'arr' of names. Does not include self in search. Only Fl_Tree should need this method.

Returns

item, or 0 if not found

Version

1.3.0 release

9.144.3.21 find_child_item() [2/2]

const Fl_Tree_Item * Fl_Tree_Item::find_child_item ( const char * name ) const

Return the immediate child of current item that has the label 'name'.

Returns

const found item, or 0 if not found.

Version

1.3.3

9.144.3.22 find_clicked()

const Fl_Tree_Item * Fl_Tree_Item::find_clicked ( const Fl_Tree_Prefs & prefs, int yonly = 0 ) const

Find the item that the last event was over. If 'yonly' is 1, only check event's y value, don't care about x.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>prefs</th>
<th>The parent tree's Fl_Tree_Prefs</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>yonly</td>
<td>0: check both event's X and Y values. – 1: only check event's Y value, don't care about X.</td>
</tr>
</tbody>
</table>
9.144 Fl_Tree_Item Class Reference

Returns

pointer to clicked item, or NULL if none found

Version

1.3.3 ABI feature

9.144.3.23 find_item()

const Fl_Tree_Item * Fl_Tree_Item::find_item ( const char ** names ) const

Find item by descending array of 'names'.
Includes self in search. Only Fl_Tree should need this method. Use Fl_Tree::find_item() instead.

Returns

const item, or 0 if not found

9.144.3.24 hide_widgets()

void Fl_Tree_Item::hide_widgets ( ) [protected]

Internal: Hide the FLTK widget() for this item and all children. Used by close() to hide widgets.

9.144.3.25 insert()

Fl_Tree_Item * Fl_Tree_Item::insert ( const Fl_Tree_Prefs & prefs, const char * new_label, int pos = 0 )

Insert a new item named 'new_label' into current item's children at a specified position 'pos'.
If pos is out of range the new item is

• prepended if pos < 0 or
• appended if pos > item->children().

Returns

the new item inserted

See also

Fl_Tree::insert()

9.144.3.26 insert_above()

Fl_Tree_Item * Fl_Tree_Item::insert_above ( const Fl_Tree_Prefs & prefs, const char * new_label )

Insert a new item named 'new_label' above this item.

Returns

the new item inserted, or 0 if an error occurred.

9.144.3.27 label()

void Fl_Tree_Item::label ( const char * name )

Set the label to 'name'.
Makes and manages an internal copy of 'name'.

Generated by Doxygen
9.144.3.28  label_h()

int Fl_Tree_Item::label_h ( ) const [inline]
The item's label height.
Version
1.3.3

9.144.3.29  label_w()

int Fl_Tree_Item::label_w ( ) const [inline]
The item's maximum label width to right edge of Fl_Tree's inner width within scrollbars.
Version
1.3.3

9.144.3.30  label_x()

int Fl_Tree_Item::label_x ( ) const [inline]
The item's label x position relative to the window.
Version
1.3.3

9.144.3.31  label_y()

int Fl_Tree_Item::label_y ( ) const [inline]
The item's label y position relative to the window.
Version
1.3.3

9.144.3.32  labelbgcolor() [1/2]

Fl_Color Fl_Tree_Item::labelbgcolor ( ) const [inline]
Return item's label background text color.
If the color is 0xffffffff, the default behavior is the parent tree's bg color will be used. (An overloaded
draw_item_content() can override this behavior.)

9.144.3.33  labelbgcolor() [2/2]

void Fl_Tree_Item::labelbgcolor ( Fl_Color val ) [inline]
Set item's label background color.
A special case is made for color 0xffffffff which uses the parent tree's bg color.

9.144.3.34  move() [1/2]

int Fl_Tree_Item::move ( Fl_Tree_Item * item,
    int op = 0,
    int pos = 0 )
Move the current item above/below/into the specified 'item', where 'op' determines the type of move:

• 0: move above 'item' ('pos' ignored)
• 1: move below 'item' ('pos' ignored)
• 2: move into 'item' as a child (at optional position 'pos')
Returns

0 on success. a negative number on error:

-1: one of the items has no parent
-2: item’s index could not be determined
-3: bad ‘op’
-4: index range error
-5: could not deparent
-6: could not reparent at 'pos'
(Other return values reserved for future use.)

9.144.3.35 move() [2/2]

int Fl_Tree_Item::move (  
    int to,  
    int from )
Move the item ‘from’ to sibling position of ‘to’.
Returns

• 0: Success
• -1: range error (e.g. if 'to' or 'from' out of range).
• (Other return values reserved for future use)

9.144.3.36 move_above()

int Fl_Tree_Item::move_above (  
    Fl_Tree_Item * item )
Move the current item above the specified 'item'.
This is the equivalent of calling move(item,0,0).
Returns

0 on success.
On error returns a negative value; see move(Fl_Tree_Item*,int,int) for possible error codes.

9.144.3.37 move_below()

int Fl_Tree_Item::move_below (  
    Fl_Tree_Item * item )
Move the current item below the specified 'item'.
This is the equivalent of calling move(item,1,0).
Returns

0 on success.
On error returns a negative value; see move(Fl_Tree_Item*,int,int) for possible error codes.

9.144.3.38 move_into()

int Fl_Tree_Item::move_into (  
    Fl_Tree_Item * item,  
    int pos = 0 )
Parent the current item as a child of the specified 'item'.
This is the equivalent of calling move(item,2,pos).
Returns

0 on success.
On error returns a negative value; see move(Fl_Tree_Item*,int,int) for possible error codes.
9.144.3.39  next()

Fl_Tree_Item * Fl_Tree_Item::next ( )
Return the next item in the tree.
This method can be used to walk the tree forward. For an example of how to use this method, see Fl_Tree::first().
Returns
the next item in the tree, or 0 if there's no more items.

9.144.3.40  next_displayed()

Fl_Tree_Item * Fl_Tree_Item::next_displayed ( Fl_Tree_Prefs & prefs )
Same as next_visible().
Deprecation in 1.3.3 for confusing name, use next_visible() instead.

9.144.3.41  next_sibling()

Fl_Tree_Item * Fl_Tree_Item::next_sibling ( )
Return this item's next sibling.
Moves to the next item below us at the same level (sibling). Use this to move down the tree without changing depth(). effectively skipping over this item's children/descendents.
Returns
item's next sibling, or 0 if none.

9.144.3.42  next_visible()

Fl_Tree_Item * Fl_Tree_Item::next_visible ( Fl_Tree_Prefs & prefs )
Return the next open(), visible() item.
(If this item has children and is closed, children are skipped)
This method can be used to walk the tree forward, skipping items that are not currently open/visible to the user.
Returns
the next open() visible() item below us, or 0 if there's no more items.

Version
1.3.3

9.144.3.43  parent()

void Fl_Tree_Item::parent ( Fl_Tree_Item * val ) [inline]
Set the parent for this item.
Should only be used by Fl_Tree's internals.

9.144.3.44  prefs()

const Fl_Tree_Prefs & Fl_Tree_Item::prefs ( ) const
Return the parent tree's prefs.
Returns
a reference to the parent tree's Fl_Tree_Prefs

Version
1.3.3 ABI feature
9.144.3.45 prev()

Fl_Tree_Item * Fl_Tree_Item::prev ( )

Return the previous item in the tree.
This method can be used to walk the tree backwards. For an example of how to use this method, see Fl_Tree::last().

Returns

the previous item in the tree, or 0 if there's no item above this one (hit the root).

9.144.3.46 prev_displayed()

Fl_Tree_Item * Fl_Tree_Item::prev_displayed ( Fl_Tree_Prefs & prefs )

Same as prev_visible().
Deprecation in 1.3.3 for confusing name, use prev_visible()

9.144.3.47 prev_sibling()

Fl_Tree_Item * Fl_Tree_Item::prev_sibling ( )

Return this item's previous sibling.
Moves to the previous item above us at the same level (sibling). Use this to move up the tree without changing depth().

Returns

This item's previous sibling, or 0 if none.

9.144.3.48 prev_visible()

Fl_Tree_Item * Fl_Tree_Item::prev_visible ( Fl_Tree_Prefs & prefs )

Return the previous open(), visible() item.
(If this item above us has children and is closed, its children are skipped)
This method can be used to walk the tree backward, skipping items that are not currently open/visible to the user.

Returns

the previous open() visible() item above us, or 0 if there's no more items.

9.144.3.49 recalc_tree()

void Fl_Tree_Item::recalc_tree ( ) [protected]

Call this when our geometry is changed.
(Font size, label contents, etc) Schedules tree to recalculate itself, as changes to us may affect tree widget's scrollbar visibility and tab sizes.

Version

1.3.3 ABI

9.144.3.50 remove_child() [1/2]

int Fl_Tree_Item::remove_child ( const char * name )

Remove immediate child (and its children) by its label 'name'.
If more than one item matches 'name', only the first matching item is removed.
Parameters

|    | name | The label name of the immediate child to remove |

Returns

0 if removed, -1 if not found.

Version

1.3.3

9.144.3.51 remove_child() [2/2]

int Fl_Tree_Item::remove_child (Fl_Tree_Item * item)

Remove 'item' from the current item's children.

Returns

0 if removed, -1 if item not an immediate child.

9.144.3.52 reparent()

int Fl_Tree_Item::reparent (Fl_Tree_Item * newchild, int pos)

Reparent specified item as a child of ourself at position 'pos'.
Typically 'newchild' was recently orphaned with deparent().

Returns

• 0: on success
• -1: on error (e.g. if 'pos' out of range) with no changes made.

9.144.3.53 replace()

Fl_Tree_Item * Fl_Tree_Item::replace (Fl_Tree_Item * newitem)

Replace the current item with a new item.
The current item is destroyed if successful. No checks are made to see if an item with the same name exists.
This method can be used to, for example, install 'custom' items into the tree derived from Fl_Tree_Item; see draw_item_content().

Parameters

|    | newitem | The new item to replace the current item |

Returns

newitem on success, NULL if could not be replaced.

See also

Fl_Tree_Item::draw_item_content(), Fl_Tree::root(Fl_Tree_Item*)
9.144 Fl_Tree_Item Class Reference

Version

1.3.3 ABI feature

9.144.3.54 replace_child()

```cpp
Fl_Tree_Item * Fl_Tree_Item::replace_child ( Fl_Tree_Item * olditem, Fl_Tree_Item * newitem )
```

Replace existing child 'olditem' with 'newitem'. The 'olditem' is destroyed if successful. Can be used to put custom items (derived from Fl_Tree_Item) into the tree. No checks are made to see if an item with the same name exists.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>olditem</th>
<th>The item to be found and replaced</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>newitem</td>
<td>The new item to take the place of 'olditem'</td>
</tr>
</tbody>
</table>

Returns

newitem on success and 'olditem' is destroyed. NULL on error if 'olditem' was not found as an immediate child.

See also

replace(), Fl_Tree_Item::draw()

Version

1.3.3 ABI feature

9.144.3.55 select()

```cpp
void Fl_Tree_Item::select ( int val = 1 ) [inline]
```

Change the item's selection state to the optionally specified 'val'. If 'val' is not specified, the item will be selected.

9.144.3.56 select_all()

```cpp
int Fl_Tree_Item::select_all ( ) [inline]
```

Select item and all its children.

Returns count of how many items were in the 'deselected' state, ie. how many items were "changed".

9.144.3.57 show_self()

```cpp
void Fl_Tree_Item::show_self ( const char * indent = "" ) const
```

Print the tree as 'ascii art' to stdout.

Used mainly for debugging.

9.144.3.58 show_widgets()

```cpp
void Fl_Tree_Item::show_widgets ( ) [protected]
```

Internal: Show the FLTK widget() for this item and all children.

Used by open() to re-show widgets that were hidden by a previous close()
9.144.3.59  swap_children() [1/2]

int Fl_Tree_Item::swap_children (  
   Fl_Tree_Item * a,  
   Fl_Tree_Item * b )

Swap two of our immediate children, given item pointers.  
Use e.g. for sorting.  
This method is SLOW because it involves linear lookups.  
For speed, use swap_children(int,int) instead.

Parameters

\begin{verbatim}
in  a,b  The item ptrs of the two items to swap. Both must be immediate children of the current item.
\end{verbatim}

Returns

- 0 : OK
- -1 : failed: item 'a' or 'b' is not our child.

9.144.3.60  swap_children() [2/2]

void Fl_Tree_Item::swap_children (  
   int ax,  
   int bx )

Swap two of our children, given two child index values 'ax' and 'bx'.  
Use e.g. for sorting.  
This method is FAST, and does not involve lookups.  
No range checking is done on either index value.

Parameters

\begin{verbatim}
in  ax,bx  the index of the items to swap
\end{verbatim}

9.144.3.61  tree() [1/2]

Fl_Tree * Fl_Tree_Item::tree ( ) [inline]
Return the tree for this item.
Version

1.3.4 (ABI feature)

9.144.3.62  tree() [2/2]

const Fl_Tree * Fl_Tree_Item::tree ( ) const [inline]
Return the tree for this item.
Version

1.3.3 (ABI feature)

9.144.3.63  update_prev_next()

void Fl_Tree_Item::update_prev_next (  
    int index )

Update our _prev_sibling and _next_sibling pointers to point to neighbors given index as being our current position in the parent's item array.  
Call this whenever items in the array are added/removed/moved/swapped/etc.
Parameters

| index | Our index# in the parent. Special case if index=-1: become an orphan; null out all parent/sibling associations. |

9.144.3.64  userdeicon() [1/2]

```c
Fl_Image * Fl_Tree_Item::userdeicon ( ) const [inline]
```

Return the deactivated version of the user icon, if any.
Returns 0 if none.

9.144.3.65  userdeicon() [2/2]

```c
void Fl_Tree_Item::userdeicon ( Fl_Image * val ) [inline]
```

Set the usericon to draw when the item is deactivated.
Use '0' to disable. No internal copy is made; caller must manage icon's memory.
To create a typical 'grayed out' version of your usericon image, you can do the following:
```c
// Create tree + usericon for items
Fl_Tree *tree = new Fl_Tree(..);
Fl_Image *usr_icon = new Fl_Pixmap(..); // your usericon
Fl_Image *de_icon = usr_icon->copy(); // make a copy, and..
de_icon->inactive(); // make it 'grayed out'
```

```
... for ( .. ) { // item loop..
  item = tree->add("..."); // create new item
  item->usericon(usr_icon); // assign usericon to items
  item->userdeicon(de_icon); // assign userdeicon to items
  ...
}
```

In the above example, the app should 'delete' the two icons when they're no longer needed (e.g. after the tree is destroyed)

Version

1.3.4

9.144.3.66  usericon()

```c
void Fl_Tree_Item::usericon ( Fl_Image * val ) [inline]
```

Set the item's user icon to an Fl_Image.
Use '0' to disable. No internal copy is made, caller must manage icon's memory.
Note, if you expect your items to be deactivated(), use userdeicon(Fl_Image*) to set up a 'grayed out' version of your icon to be used for display.

See also

userdeicon(Fl_Image*)

9.144.3.67  visible_r()

```c
int Fl_Tree_Item::visible_r ( ) const
```

See if item and all its parents are open() and visible().

Returns

1 – item and its parents are open() and visible() 0 – item (or one of its parents) are invisible or closed().

The documentation for this class was generated from the following files:

- Fl_Tree_Item.H
- Fl_Tree_Item.cxx

Generated by Doxygen
9.145  Fl_Tree_Item_Array Class Reference

Manages an array of Fl_Tree_Item pointers.
#include <Fl_Tree_Item_Array.H>

Public Member Functions

• void add (Fl_Tree_Item ∗val)
  Add an item* to the end of the array.
• void clear ()
  Clear the entire array.
• int deparent (int pos)
  Deparent item at 'pos' from our list of children.
• Fl_Tree_Item_Array (const Fl_Tree_Item_Array ∗o)
  Copy constructor. Makes new copy of array, with new instances of each item.
• Fl_Tree_Item_Array (int new_chunksize=10)
  Constructor; creates an empty array.
• void insert (int pos, Fl_Tree_Item ∗new_item)
  Insert an item at index position pos.
• int manage_item_destroy () const
• void manage_item_destroy (int val)
  Option to control if Fl_Tree_Item_Array's destructor will also destroy the Fl_Tree_Item's.
• int move (int to, int from)
  Move item at 'from' to new position 'to' in the array.
• Fl_Tree_Item ∗operator[] (int i)
  Return the item and index i.
• const Fl_Tree_Item ∗operator[] (int i) const
  Const version of operator[](int i)
• int remove (Fl_Tree_Item ∗item)
  Remove the item from the array.
• void remove (int index)
  Remove the item at.
• int reparent (Fl_Tree_Item ∗item, Fl_Tree_Item ∗newparent, int pos)
  Reparent specified item as a child of ourself.
• void replace (int pos, Fl_Tree_Item ∗new_item)
  Replace the item at index with newitem.
• void swap (int ax, int bx)
  Swap the two items at index positions ax and bx.
• int total () const
  Return the total items in the array, or 0 if empty.
• ~Fl_Tree_Item_Array ()
  Destructor. Calls each item's destructor, destroys internal_items array.

9.145.1  Detailed Description

Manages an array of Fl_Tree_Item pointers.
Because FLTK 1.x.x. has mandated that templates and STL not be used, we use this class to dynamically manage
the arrays.
None of the methods do range checking on index values; the caller must be sure that index values are within the
range 0<index<total() (unless otherwise noted).
### 9.145.2 Constructor & Destructor Documentation

#### 9.145.2.1 Fl_Tree_Item_Array()

```cpp
Fl_Tree_Item_Array::Fl_Tree_Item_Array ( int new_chunksize = 10 )
```

Constructor; creates an empty array.

The optional 'chunksize' can be specified to optimize memory allocation for potentially large arrays. Default chunksize is 10.

### 9.145.3 Member Function Documentation

#### 9.145.3.1 add()

```cpp
void Fl_Tree_Item_Array::add ( Fl_Tree_Item * val )
```

Add an item* to the end of the array.

Assumes the item was created with ‘new’, and will remain allocated. Fl_Tree_Item_Array will handle calling the item’s destructor when the array is cleared or the item remove()’ed.

#### 9.145.3.2 clear()

```cpp
void Fl_Tree_Item_Array::clear ( )
```

Clear the entire array.

Each item will be deleted (destructors will be called), and the array will be cleared. total() will return 0.

#### 9.145.3.3 deparent()

```cpp
int Fl_Tree_Item_Array::deparent ( int pos )
```

Deparent item at 'pos' from our list of children.

Similar to a remove() without the destruction of the item. This creates an orphaned item (still allocated, has no parent) which soon after is typically reparented elsewhere.

\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

#### 9.145.3.4 insert()

```cpp
void Fl_Tree_Item_Array::insert ( int pos, Fl_Tree_Item * new_item )
```

Insert an item at index position pos.

Handles enlarging array if needed, total increased by 1.

If \p pos \>= total(), the item is appended to the array.

If \p pos \< 0, the item is prepended (works like pos == 0).

#### 9.145.3.5 manage_item_destroy()

```cpp
void Fl_Tree_Item_Array::manage_item_destroy ( int val ) [inline]
```

Option to control if Fl_Tree_Item_Array’s destructor will also destroy the Fl_Tree_Item’s. If set: items and item array is destroyed. If clear: only the item array is destroyed, not items themselves.
9.145.3.6 move()

```cpp
int Fl_Tree_Item_Array::move ( int to, int from )
```

Move item at 'from' to new position 'to' in the array.

Due to how the moving an item shuffles the array around, a positional 'move' implies things that may not be obvious:

- When 'from' moved lower in tree, appears BELOW item that was at 'to'.
- When 'from' moved higher in tree, appears ABOVE item that was at 'to'.

Returns

0 on success, -1 on range error (e.g. if 'to' or 'from' out of range)

9.145.3.7 remove() [1/2]

```cpp
int Fl_Tree_Item_Array::remove ( Fl_Tree_Item * item )
```

Remove the item from the array.

\returns 0 if removed, or -1 if the item was not in the array.

9.145.3.8 remove() [2/2]

```cpp
void Fl_Tree_Item_Array::remove ( int index )
```

Remove the item at.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>index</th>
<th>from the array.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>The item will be delete'd (if non-NULL), so its destructor will be called.</td>
</tr>
</tbody>
</table>

9.145.3.9 reparent()

```cpp
int Fl_Tree_Item_Array::reparent ( Fl_Tree_Item * item, Fl_Tree_Item * newparent, int pos )
```

Reparent specified item as a child of ourself.

Typically 'newchild' was recently orphaned with `deparent()`.

\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

9.145.3.10 replace()

```cpp
void Fl_Tree_Item_Array::replace ( int index, Fl_Tree_Item * newitem )
```

Replace the item at `index` with `newitem`.

Old item at `index` position will be destroyed, and the new item will take it's place, and stitched into the linked list.

The documentation for this class was generated from the following files:

- Fl_Tree_Item_Array.H
- Fl_Tree_Item_Array.cxx
9.146 Fl_TreeNode Prefs Class Reference

Tree widget’s preferences.

#include <Fl_TreeNodePrefs.H>

Public Member Functions

- **Fl_Image * closedeicon () const**
  
  Return the deactivated version of the close icon, if any.

- **Fl_Image * closeicon () const**
  
  Gets the default 'close' icon. Returns the Fl_Image of the icon, or 0 if none.

- **void closeicon (Fl_Image *val)**
  
  Sets the icon to be used as the 'close' icon.

- **Fl_Color connectorcolor () const**
  
  Get the connector color used for tree connection lines.

- **void connectorcolor (Fl_Color val)**
  
  Set the connector color used for tree connection lines.

- **Fl_Tree_Connector connectorstyle () const**
  
  Get the connector style.

- **void connectorstyle (Fl_Tree_Connector val)**
  
  Set the connector style.

- **void connectorstyle (int val)**
  
  Set the connector style [integer].

- **int connectorwidth () const**
  
  Get the tree connection line's width.

- **void connectorwidth (int val)**
  
  Set the tree connection line's width.

- **void do_item_draw_callback (Fl_Tree_Item *o) const**

- **Fl_TreeNodePrefs ()**
  
  **Fl_TreeNodePrefs constructor.**

- **Fl_Tree_Item_Draw_Callback *item_draw_callback () const**

- **void item_draw_callback (Fl_Tree_Item_Draw_Callback *cb, void *data=0)**

- **Fl_Tree_Item_Draw_Mode item_draw_mode () const**
  
  Get the 'item draw mode' used for the tree.

- **void item_draw_mode (Fl_Tree_Item_Draw_Mode val)**
  
  Set the 'item draw mode' used for the tree to val.

- **void *item_draw_user_data () const**

- **Fl_Color item_labelbgcolor () const**
  
  Get the default label background color.

- **void item_labelbgcolor (Fl_Color val)**
  
  Set the default label background color.

- **Fl_Color item_labelfgcolor () const**
  
  Get the default label foreground color.

- **void item_labelfgcolor (Fl_Color val)**
  
  Set the default label foreground color.

- **Fl_Font item_labelfont () const**
  
  Return the label's font.

- **void item_labelfont (Fl_Font val)**
  
  Set the label's font to val.

- **Fl_Fontsize item_labelsize () const**
  
  Return the label's size in pixels.

- **void item_labelsize (Fl_Fontsize val)**

Generated by Doxygen
Set the label's size in pixels to \texttt{val}.

- \texttt{FI_Tree_Item_Reselect_Mode item_reselect_mode() const}
  
  Returns the current item re/selection mode.

- \texttt{void item_reselect_mode(FI_Tree_Item_Reselect_Mode mode)}
  
  Sets the item re/selection mode.

- \texttt{FI_Color labelbgcolor() const}
  
  \texttt{Obsoleted: Get the default label background color. Please use item_labelbgcolor() instead.}

- \texttt{void labelbgcolor(FI_Color val)}
  
  \texttt{Obsoleted: Set the default label background color. Please use item_labelbgcolor(FI_Color) instead.}

- \texttt{FI_Color labelfgcolor() const}
  
  \texttt{Obsoleted: Get the default label foreground color. Please use item_labelfgcolor() instead.}

- \texttt{void labelfgcolor(FI_Color val)}
  
  \texttt{Obsoleted: Set the default label foreground color. Please use item_labelfgcolor(FI_Color) instead.}

- \texttt{FI_Font labelfont() const}
  
  \texttt{Obsoleted: Return the label's font. Please use item_labelfont() instead.}

- \texttt{void labelfont(FI_Font val)}
  
  \texttt{Obsoleted: Set the label's font to \texttt{val}. Please use item_labelfont(FI_Font) instead.}

- \texttt{int labelmarginleft() const}
  
  Get the label's left margin value in pixels.

- \texttt{void labelmarginleft(int val)}
  
  Set the label's left margin value in pixels.

- \texttt{FI_Fontsize labelsize() const}
  
  \texttt{Obsoleted: Return the label's size in pixels. Please use item_labelsize() instead.}

- \texttt{void labelsize(FI_Fontsize val)}
  
  \texttt{Obsoleted: Set the label's size in pixels to \texttt{val}. Please use item_labelsize(FI_Fontsize) instead.}

- \texttt{int linespacing() const}
  
  Get the line spacing value in pixels.

- \texttt{void linespacing(int val)}
  
  Set the line spacing value in pixels.

- \texttt{int marginbottom() const}
  
  Get the bottom margin's value in pixels.

- \texttt{void marginbottom(int val)}
  
  Set the bottom margin's value in pixels. \texttt{This is the extra distance the vertical scroller lets you travel.}

- \texttt{int margintop() const}
  
  Get the top margin's value in pixels.

- \texttt{void margintop(int val)}
  
  Set the top margin's value in pixels.

- \texttt{int openchild_marginbottom() const}
  
  Get the margin below an open child in pixels.

- \texttt{void openchild_marginbottom(int val)}
  
  Set the margin below an open child in pixels.

- \texttt{FI_Image * opendeicon() const}
  
  Return the deactivated version of the open icon, if any.

- \texttt{FI_Image * openicon() const}
  
  Get the current default 'open' icon.

- \texttt{void openicon(FI_Image *val)}
  
  Sets the default icon to be used as the 'open' icon when items are add\texttt{ed} to the tree.
• **Fl_Boxtype** selectbox () const
  
  Get the default selection box's box drawing style as an **Fl_Boxtype**.

• void selectbox (Fl_Boxtype val)
  
  Set the default selection box's box drawing style to **val**.

• **Fl_Tree_Select** selectmode () const
  
  Get the selection mode used for the tree.

• void selectmode (Fl_Tree_Select val)
  
  Set the selection mode used for the tree to **val**.

• char showcollapse () const
  
  Returns 1 if the collapse icon is enabled, 0 if not.

• void showcollapse (int val)
  
  Set if we should show the collapse icon or not.

• int showroot () const
  
  Returns 1 if the root item is to be shown, or 0 if not.

• void showroot (int val)
  
  Set if the root item should be shown or not.

• **Fl_Tree_Sort** sortorder () const
  
  Get the default sort order value.

• void sortorder (Fl_Tree_Sort val)
  
  Set the default sort order value.

• **Fl_Image** * userdeicon () const
  
  Return the deactivated version of the user icon, if any.

• **Fl_Image** * usericon () const
  
  Gets the default 'user icon' (default is 0)

• void usericon (Fl_Image *val)
  
  Sets the default 'user icon' Returns the **Fl_Image** of the icon, or 0 if none (default).

• int usericonmarginleft () const
  
  Get the user icon's left margin value in pixels.

• void usericonmarginleft (int val)
  
  Set the user icon's left margin value in pixels.

• int widgetmarginleft () const
  
  Get the widget()'s left margin value in pixels.

• void widgetmarginleft (int val)
  
  Set the widget's left margin value in pixels.

• ~Fl_Tree_Prefs ()
  
  **Fl_Tree_Prefs** destructor.

### 9.146.1 Detailed Description

Tree widget's preferences.

**Fl_Tree**'s Preferences class.

This class manages the **Fl_Tree**'s defaults. You should probably be using the methods in **Fl_Tree** instead of trying to accessing tree's preferences settings directly.

### 9.146.2 Member Function Documentation

#### 9.146.2.1 closedeicon()

**Fl_Image** * Fl_Tree_Prefs::closedeicon ( ) const [inline]

Return the deactivated version of the close icon, if any.

Returns 0 if none.
9.146.2.2 closeicon()

void Fl_Tree_Prefs::closeicon (Fl_Image * val)

Sets the icon to be used as the 'close' icon. This overrides the built in default '[ ]' icon.

Parameters

| in | val | – The new image, or zero to use the default '[ ]' icon. |

9.146.2.3 item_draw_mode()

void Fl_Tree_Prefs::item_draw_mode (Fl_Tree_Item_Draw_Mode val) [inline]

Set the 'item draw mode' used for the tree to val. This affects how items in the tree are drawn, such as when a widget() is defined. See Fl_Tree_Item_Draw_Mode for possible values.

9.146.2.4 item_labelbgcolor() [1/2]

Fl_Color Fl_Tree_Prefs::item_labelbgcolor () const [inline]

Get the default label background color. This returns the Fl_Tree::color() unless item_labelbgcolor() has been set explicitly.

9.146.2.5 item_labelbgcolor() [2/2]

void Fl_Tree_Prefs::item_labelbgcolor (Fl_Color val) [inline]

Set the default label background color. Once set, overrides the default behavior of using Fl_Tree::color().

9.146.2.6 marginbottom()

int Fl_Tree_Prefs::marginbottom () const [inline]

Get the bottom margin's value in pixels. This is the extra distance the vertical scroller lets you travel.

9.146.2.7 opendeicon()

Fl_Image * Fl_Tree_Prefs::opendeicon () const [inline]

Return the deactivated version of the open icon, if any. Returns 0 if none.

9.146.2.8 openicon() [1/2]

Fl_Image * Fl_Tree_Prefs::openicon () const [inline]

Get the current default 'open' icon. Returns the Fl_Image* of the icon, or 0 if none.

9.146.2.9 openicon() [2/2]

void Fl_Tree_Prefs::openicon (Fl_Image * val)

Sets the default icon to be used as the 'open' icon when items are add()ed to the tree. This overrides the built in default '[+] icon.
Parameters

| in  | val | – The new image, or zero to use the default [+] icon. |

### 9.146.2.10 selectmode()

```cpp
void Fl_Tree_Prefs::selectmode (Fl_Tree_Select val) [inline]
```

Set the selection mode used for the tree to `val`. This affects how items in the tree are selected when clicked on and dragged over by the mouse. See `Fl_Tree_Select` for possible values.

### 9.146.2.11 showcollapse()

```cpp
void Fl_Tree_Prefs::showcollapse (int val) [inline]
```

Set if we should show the collapse icon or not. If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via `open()` and `close()`.

Parameters

| in  | val | 1: shows collapse icons (default), 0: hides collapse icons. |

### 9.146.2.12 showroot()

```cpp
void Fl_Tree_Prefs::showroot (int val) [inline]
```

Set if the root item should be shown or not.

Parameters

| in  | val | 1 – show the root item (default), 0 – hide the root item. |

### 9.146.2.13 sortorder()

```cpp
void Fl_Tree_Prefs::sortorder (Fl_Tree_Sort val) [inline]
```

Set the default sort order value. Defines the order new items appear when `add()`ed to the tree. See `Fl_Tree_Sort` for possible values.

### 9.146.2.14 userdeicon()

```cpp
Fl_Image * Fl_Tree_Prefs::userdeicon () const [inline]
```

Return the deactivated version of the user icon, if any. Returns 0 if none.

The documentation for this class was generated from the following files:

- `Fl_Tree_Prefs.H`
- `Fl_Tree_Prefs.cxx`
The **Fl_Valuator** class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

```c
#include <Fl_Valuator.H>
```

Inheritance diagram for Fl_Valuator:

Public Member Functions

- **void bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp** (double)
  
  Clamps the passed value to the valuator range.

- **virtual int format** (char ∗)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment** (double, int)
  
  Adds n times the step value to the passed value.

- **double maximum** () const
  
  Gets the maximum value for the valuator.

- **void maximum** (double a)
  
  Sets the maximum value for the valuator.

- **double minimum** () const
  
  Gets the minimum value for the valuator.

- **void minimum** (double a)
  
  Sets the minimum value for the valuator.

- **void precision** (int digits)
  
  Sets the step value to $10^{-digits}$.

- **void range** (double a, double b)
  
  Sets the minimum and maximum values for the valuator.

- **double round** (double)
  
  Round the passed value to the nearest step increment.

- **double step** () const
  
  Gets or sets the step value.

- **void step** (double a, int b)
  
  See double Fl_Valuator::step() const

- **void step** (double s)
  
  See double Fl_Valuator::step() const.
• **void step**(int a)
  
  See double Fl_Valuator::step() const
  
• **double value**() const
  
  Gets the floating point(double) value.
  
• **int value**(double)
  
  Sets the current value.

**Public Member Functions inherited from Fl_Widget**

• **void _clear_fullscreen**()
  
  Activates the widget.
  
• **void _set_fullscreen**()
  
• **void activate**()
  
  Activates the widget.
  
• **unsigned int active**() const
  
  Returns whether the widget is active.
  
• **int active_r**() const
  
  Returns whether the widget and all of its parents are active.
  
• **Fl_Align align**() const
  
  Gets the label alignment.
  
• **void align(Fl_Align alignment)**
  
  Sets the label alignment.
  
• **long argument**() const
  
  Gets the current user data (long) argument that is passed to the callback function.
  
• **void argument**(long v)
  
  Sets the current user data (long) argument that is passed to the callback function.
  
• **virtual class Fl_Gl_Window * as_gl_window**()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
  
• **virtual Fl_Group * as_group**()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.
  
• **virtual Fl_Window * as_window**()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
  
• **Fl_Boxtype box**() const
  
  Gets the box type of the widget.
  
• **void box(Fl_Boxtype new_box)**
  
  Sets the box type for the widget.
  
• **Fl_Callback_p callback**() const
  
  Gets the current callback function for the widget.
  
• **void callback(Fl_Callback *cb)**
  
  Sets the current callback function for the widget.
  
• **void callback(Fl_Callback *cb, void *p)**
  
  Sets the current callback function for the widget.
  
• **void callback(Fl_Callback0 *cb)**
  
  Sets the current callback function for the widget.
  
• **void callback(Fl_Callback1 *cb, long p=0)**
  
  Sets the current callback function for the widget.
  
• **unsigned int changed**() const
  
  Checks if the widget value changed since the last callback.
  
• **void clear_active**()
  
  Marks the widget as inactive without sending events or changing focus.
  
• **void clear_changed**()
Marks the value of the widget as unchanged.

- `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.

- `void clear_output ()`
  Sets a widget to accept input.

- `void clear_visible ()`
  Hides the widget.

- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.

- `Fl_Color color () const`
  Gets the background color of the widget.

- `void color (Fl_Color bg)`
  Sets the background color of the widget.

- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- `Fl_Color color2 () const`
  For back compatibility only.

- `void color2 (unsigned a)`
  For back compatibility only.

- `int contains (const Fl_Widget ∗w) const`
  Checks if `w` is a child of this widget.

- `void copy_label (const char ∗new_label)`
  Sets the current label.

- `void copy_tooltip (const char ∗text)`
  Sets the current tooltip text.

- `uchar damage () const`
  Returns non-zero if `draw()` needs to be called.

- `void damage (uchar c)`
  Sets the damage bits for the widget.

- `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.

- `int damage_resize (int, int, int, int)`
  Internal use only.

- `void deactivate ()`
  Deactivates the widget.

- `Fl_Image ∗deimage ()`
  Gets the image that is used as part of the widget label.

- `const Fl_Image ∗deimage () const`
  Gets the image that is used as part of the widget label.

- `void deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label.

- `void deimage (Fl_Image ∗img)`
  Sets the image to use as part of the widget label.

- `void do_callback ()`
  Calls the widget callback.

- `void do_callback (Fl_Widget ∗o, long arg)`
  Calls the widget callback.

- `void do_callback (Fl_Widget ∗o, void ∗arg=0)`
  Calls the widget callback.

- `virtual void draw ()=0`
  Draws the widget.

- `void draw_label (int, int, int, Fl_Align) const`
Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  
  Gets the widget height.

- **virtual int handle (int event)**
  
  Handles the specified event.

- **virtual void hide ()**
  
  Makes a widget invisible.

- **Fl_Image * image ()**
  
  Gets the image that is used as part of the widget label.

- **const Fl_Image * image () const**
  
  Sets the image to use as part of the widget label.

- **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label.

- **int inside (const Fl_Widget *wgt) const**
  
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  
  Returns whether the current label was assigned with copy_label().

- **const char * label () const**
  
  Gets the current label text.

- **void label (const char *text)**
  
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  
  Sets the label color.

- **Fl_Font labelfont () const**
  
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width ww and height hh accordingly with the label size.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
Schedules the drawing of the widget.

- **void** redraw_label ()
  Schedules the drawing of the label.

- **virtual void** resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- **FL_Color** selection_color () const
  Gets the selection color.

- **void** selection_color (FL_Color a)
  Sets the selection color.

- **void** set_active ()
  Marks the widget as active without sending events or changing focus.

- **void** set_changed ()
  Marks the value of the widget as changed.

- **void** set_output ()
  Sets a widget to output only.

- **void** set_visible ()
  Makes the widget visible.

- **void** set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- **virtual void** show ()
  Makes a widget visible.

- **void** size (int W, int H)
  Changes the size of the widget.

- **int** take_focus ()
  Gives the widget the keyboard focus.

- **unsigned int** takesevents () const
  Returns if the widget is able to take events.

- **int** test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char ** ∗ tooltip () const
  Gets the current tooltip text.

- **void** tooltip (const char ∗ text)
  Sets the current tooltip text.

- **FL_Window ** ∗ top_window () const
  Returns a pointer to the top-level window for the widget.

- **FL_Window ** ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar** type () const
  Gets the widget type.

- **void** type (uchar t)
  Sets the widget type.

- **int** use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void ∗** user_data () const
  Gets the user data for this widget.

- **void** user_data (void ∗ v)
  Sets the user data for this widget.

- **unsigned int** visible () const
  Returns whether a widget is visible.

- **unsigned int** visible_focus ()
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  
  Modifies keyboard focus navigation.
• int visible_r () const
  
  Returns whether a widget and all its parents are visible.
• int w () const
  
  Gets the widget width.
• Fl_When when () const
  
  Returns the conditions under which the callback is called.
• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  
  Gets the widget position in its window.
• int y () const
  
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  
  Destroys the widget.

Protected Member Functions

• Fl_Valuator (int X, int Y, int W, int H, const char *L)
  
  Creates a new Fl_Valuator widget using the given position, size, and label string.
• void handle_drag (double newvalue)
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
• void handle_push ()
  
  Stores the current value in the previous value.
• void handle_release ()
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.
• int horizontal () const
  
  Tells if the valuator is an FL_HORIZONTAL one.
• double previous_value () const
  
  Gets the previous floating point value before an event changed it.
• void set_value (double v)
  
  Sets the current floating point value.
• double softclamp (double)
  
  Clamps the value, but accepts v if the previous value is not already out of range.
• virtual void value_damage ()
  
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.
• void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (FL_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus ()
  draws a focus rectangle around the widget
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget’s label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗cb, void ∗d)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.
9.147 Fl_Valuator Class Reference

9.147.1 Detailed Description

The Fl_Valuator class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

There are probably more of these classes in FLTK than any others:

In the above diagram each box surrounds an actual subclass. These are further differentiated by setting the type() of the widget to the symbolic value labeling the widget. The ones labelled "0" are the default versions with a type(0).

For consistency the symbol FL_VERTICAL is defined as zero.

9.147.2 Constructor & Destructor Documentation

9.147.2.1 Fl_Valuator()

Fl_Valuator::Fl_Valuator (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ L ) [protected]

Creates a new Fl_Valuator widget using the given position, size, and label string. The default boxtype is FL_NO_BOX.

9.147.3 Member Function Documentation

9.147.3.1 format()

int Fl_Valuator::format (  
    char ∗ buffer ) [virtual]

Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter. The actual format used depends on the current step value. If the step value has been set to zero then a %g format is used. If the step value is non-zero, then a %.∗f format is used, where the precision is calculated to show sufficient digits for the current step value. An integer step value, such as 1 or 1.0, gives a precision of 0, so the formatted value will appear as an integer.
This method is used by the Fl Valuator group of widgets to format the current value into a text string. The return value is the length of the formatted text. The formatted value is written into buffer. buffer should have space for at least 128 bytes.
You may override this function to create your own text formatting.

9.147.3.2 increment()

double Fl_Valuator::increment ( double v, int n )

Adds n times the step value to the passed value.
If step was set to zero it uses fabs(maximum() - minimum()) / 100.

9.147.3.3 maximum() [1/2]
double Fl_Valuator::maximum ( ) const [inline]

Gets the maximum value for the valuator.

9.147.3.4 maximum() [2/2]

void Fl_Valuator::maximum ( double a ) [inline]

Sets the maximum value for the valuator.

9.147.3.5 minimum() [1/2]
double Fl_Valuator::minimum ( ) const [inline]

Gets the minimum value for the valuator.

9.147.3.6 minimum() [2/2]

void Fl_Valuator::minimum ( double a ) [inline]

Sets the minimum value for the valuator.

9.147.3.7 precision()

void Fl_Valuator::precision ( int digits )

Sets the step value to 1.0 / 10^digits.
Precision digits is limited to 0...9 to avoid internal overflow errors. Values outside this range are clamped.

Note

For negative values of digits the step value is set to A = 1.0 and B = 1, i.e. 1.0/1 = 1.

9.147.3.8 range()

void Fl_Valuator::range ( double a, double b ) [inline]

Sets the minimum and maximum values for the valuator.
When the user manipulates the widget, the value is limited to this range. This clamping is done after rounding to the step value (this makes a difference if the range is not a multiple of the step).

The minimum may be greater than the maximum. This has the effect of "reversing" the object so the larger values are in the opposite direction. This also switches which end of the filled sliders is filled.

Some widgets consider this a "soft" range. This means they will stop at the range, but if the user releases and grabs the control again and tries to move it further, it is allowed.

The range may affect the display. You must `redraw()` the widget after changing the range.

### 9.147.3.9 round()

double Fl_Valuator::round ( double v )

Round the passed value to the nearest step increment.

Does nothing if step is zero.

### 9.147.3.10 step()

double Fl_Valuator::step ( ) const [inline]

Gets or sets the step value.

As the user moves the mouse the value is rounded to the nearest multiple of the step value. This is done before clamping it to the range. For most widgets the default step is zero.

For precision the step is stored as the ratio of a double $A$ and an integer $B = A/B$. You can set these values directly. Currently setting a floating point value sets the nearest $A/1$ or $1/B$ value possible.

### 9.147.3.11 value()[1/2]

double Fl_Valuator::value ( ) const [inline]

Gets the floating point(double) value.

See int `value(double)`

### 9.147.3.12 value()[2/2]

int Fl_Valuator::value ( double v )

Sets the current value.

The new value is not clamped or otherwise changed before storing it. Use `clamp()` or `round()` to modify the value before calling `value()`. The widget is redrawn if the new value is different than the current one. The initial value is zero.

`changed()` will return true if the user has moved the slider, but it will be turned off by `value(x)` and just before doing a callback (the callback can turn it back on if desired).

### 9.147.3.13 value_damage()

void Fl_Valuator::value_damage ( ) [protected], [virtual]

Asks for partial redraw.

Reimplemented in Fl_Adjuster.

The documentation for this class was generated from the following files:

- Fl_Valuator.H
- Fl_Valuator.cxx

---

### 9.148 Fl_Value_Input Class Reference

The `Fl_Value_Input` widget displays a numeric value.

```cpp
#include <Fl_Value_Input.H>
```

Inheritance diagram for `Fl_Value_Input`:
Public Member Functions

- **Fl_Color cursor_color () const**
  Gets the color of the text cursor.
- **void cursor_color (Fl_Color n)**
  Sets the color of the text cursor.
- **Fl_Value_Input (int x, int y, int w, int h, const char ∗l=0)**
  Creates a new Fl_Value_Input widget using the given position, size, and label string.
- **int handle (int)**
  Handles the specified event.
- **void resize (int, int, int, int)**
  Changes the size or position of the widget.
- **int shortcut () const**
  Returns the current shortcut key for the Input.
- **void shortcut (int s)**
  Sets the shortcut key to s.
- **char soft () const**
  If "soft" is turned on, the user is allowed to drag the value outside the range.
- **void soft (char s)**
  See void Fl_Value_Input::soft(char s)
- **Fl_Color textcolor () const**
  Gets the color of the text in the value box.
- **void textcolor (Fl_Color n)**
  Sets the color of the text in the value box.
- **Fl_Font textfont () const**
  Gets the typeface of the text in the value box.
- **void textfont (Fl_Font s)**
  Sets the typeface of the text in the value box.
- **Fl_Fontsize textsize () const**
  Gets the size of the text in the value box.
- **void textsize (Fl_Fontsize s)**
  Sets the size of the text in the value box.

Public Member Functions inherited from Fl_Valuator

- **void bounds (double a, double b)**
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- **double clamp (double)**
  Clamps the passed value to the valuator range.
- **virtual int format (char ∗)***
  Uses内部 rules to format the fields numerical value into the character array pointed to by the passed parameter.
- **double increment (double, int)**
  Adds n times the step value to the passed value.
- **double maximum () const**
Gets the maximum value for the valuator.

- void maximum (double a)

Sets the maximum value for the valuator.

- double minimum () const

Gets the minimum value for the valuator.

- void minimum (double a)

Sets the minimum value for the valuator.

- void precision (int digits)

Sets the step value to $1.0 / 10^\text{digits}$.

- void range (double a, double b)

Sets the minimum and maximum values for the valuator.

- double round (double)

Round the passed value to the nearest step increment.

- double step () const

Gets or sets the step value.

- void step (double a, int b)

See double Fl_Valuator::step() const

- void step (double s)

See double Fl_Valuator::step() const.

- void step (int a)

See double Fl_Valuator::step() const

- double value () const

Gets the floating point(double) value.

- int value (double)

Sets the current value.

**Public Member Functions inherited from Fl_Widget**

- void _clear_fullscreen ()

Activates the widget.

- unsigned int active () const

Returns whether the widget is active.

- int active_r () const

Returns whether the widget and all of its parents are active.

- Fl_Align align () const

Gets the label alignment.

- void align (Fl_Align alignment)

Sets the label alignment.

- long argument () const

Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)

Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window ∗ as_gl_window ()

Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual Fl_Group ∗ as_group ()

Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Window ∗ as_window ()

Returns an Fl_Window pointer if this widget is an Fl_Window.
• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback +cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback +cb, void +p)
  Sets the current callback function for the widget.

• void callback (Fl_Callback0 +cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 +cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget +w) const
  Checks if w is a child of this widget.

• void copy_label (const char +new_label)
  Sets the current label.

• void copy_tooltip (const char +text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
• void deactivate ()
  Deactivates the widget.

• Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label.

• const Fl_Image ∗ deimage () const
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.

• void deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label.

• void do_callback ()
  Calls the widget callback.

• void do_callback (Fl_Widget ∗o, long arg)
  Calls the widget callback.

• void do_callback (Fl_Widget ∗o, void ∗arg=0)
  Calls the widget callback.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image ∗ image ()
  Gets the image that is used as part of the widget label.

• const Fl_Image ∗ image () const
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label.

• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label.

• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char ∗ label () const
  Gets the current label text.

• void label (const char ∗text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• **Fl_Labeltype** labeltype () const
  
  Gets the label type.

• void labeltype (Fl_Labeltype a)

  Sets the label type.

• void measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• unsigned int output () const
  
  Returns if a widget is used for output only.

• **Fl_Group** ∗ parent () const
  
  Returns a pointer to the parent widget.

• void parent (Fl_Group ∗p)

  *Internal use only* - “for hacks only”.

• void position (int X, int Y)

  Repositions the window or widget.

• void redraw ()

  Schedules the drawing of the widget.

• void redraw_label ()

  Schedules the drawing of the label.

• **Fl_Color** selection_color () const

  Gets the selection color.

• void selection_color (Fl_Color a)

  Sets the selection color.

• void set_active ()

  Marks the widget as active without sending events or changing focus.

• void set_changed ()

  Marks the value of the widget as changed.

• void set_output ()

  Sets a widget to output only.

• void set_visible ()

  Makes the widget visible.

• void set_visible_focus ()

  Enables keyboard focus navigation with this widget.

• virtual void show ()

  Makes a widget visible.

• void size (int W, int H)

  Changes the size of the widget.

• int take_focus ()

  Gives the widget the keyboard focus.

• unsigned int takesevents () const

  Returns if the widget is able to take events.

• int testShortcut ()

  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

• const char ∗ tooltip () const

  Gets the current tooltip text.

• void tooltip (const char ∗text)

  Sets the current tooltip text.

• **Fl_Window** ∗ top_window () const

  Returns a pointer to the top-level window for the widget.

• **Fl_Window** ∗ top_window_offset (int &xoff, int &yoff) const

  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
Gets the widget type.

- void type (uchar t)
  Sets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void * user_data () const
  Gets the user data for this widget.

- void user_data (void *v)
  Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus ()
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  Modifies keyboard focus navigation.

- int visible_r () const
  Returns whether a widget and all its parents are visible.

- int w () const
  Gets the widget width.

- Fl_When when () const
  Returns the conditions under which the callback is called.

- void when (uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x () const
  Gets the widget position in its window.

- int y () const
  Gets the widget position in its window.

- virtual ~Fl_Widget ()
  Destroys the widget.

Public Attributes

- Fl_Input input

Protected Member Functions

- void draw ()
  Draws the widget.

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.

- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- void handle_push ()
  Stores the current value in the previous value.

- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.

- int horizontal () const
Tells if the valuator is an FL_HORIZONTAL one.

- `double previous_value() const`
  Gets the previous floating point value before an event changed it.

- `void set_value(double v)`
  Sets the current floating point value.

- `double softclamp(double)`
  Clamps the value, but accepts v if the previous value is not already out of range.

**Protected Member Functions inherited from Fl_Widget**

- `void clear_flag(unsigned int c)`
  Clears a flag in the flags mask.

- `void draw_backdrop()` const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- `void draw_box()` const
  Draws the widget box according its box style.

- `void draw_box(Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget’s position and size.

- `void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.

- `void draw_focus()`
  draws a focus rectangle around the widget

- `void draw_focus(Fl_Boxtype t, int x, int y, int w, int h) const`
  Draws a focus box for the widget at the given position and size.

- `void draw_label()` const
  Draws the widget’s label at the defined label position.

- `void draw_label(int, int, int, int) const`
  Draws the label in an arbitrary bounding box.

- `Fl_Widget(int x, int y, int w, int h, const char *label=0L)`
  Creates a widget at the given position and size.

- `unsigned int flags() const`
  Gets the widget flags mask.

- `void h(int v)`
  Internal use only.

- `void set_flag(unsigned int c)`
  Sets a flag in the flags mask.

- `void w(int v)`
  Internal use only.

- `void x(int v)`
  Internal use only.

- `void y(int v)`
  Internal use only.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

- `static void default_callback(Fl_Widget *cb, void *d)`
  The default callback for all widgets that don’t set a callback.

- `static unsigned int label_shortcut(const char *t)`
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- `static int test_shortcut(const char *, const bool require_alt=false)`
  Returns true if the given text contains the entered ‘&x’ shortcut.
Protected Types inherited from Fl_Widget

• enum {
    INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
    FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,

    USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.

9.148.1 Detailed Description

The Fl_Value_Input widget displays a numeric value. The user can click in the text field and edit it - there is in fact a hidden Fl_Input widget with type(FL_FLOAT_INPUT) or type(FL_INT_INPUT) in there - and when they hit return or tab the value updates to what they typed and the callback is done.

If step() is non-zero and integral, then the range of numbers is limited to integers instead of floating point numbers. As well as displaying the value as an integer, typed input is also limited to integer values, even if the hidden Fl_Input widget is of type(FL_FLOAT_INPUT).

If step() is non-zero, the user can also drag the mouse across the object and thus slide the value. The left button moves one step() per pixel, the middle by 10 step(), and the right button by 100 * step(). It is therefore impossible to select text by dragging across it, although clicking can still move the insertion cursor.

If step() is non-zero and integral, then the range of numbers are limited to integers instead of floating point values.

![Figure 9.49 Fl_Value_Input](image)

9.148.2 Constructor & Destructor Documentation

9.148.2.1 Fl_Value_Input()

Fl_Value_Input::Fl_Value_Input ( int X, int Y, int W, int H, const char * l = 0 )

Creates a new Fl_Value_Input widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

9.148.3 Member Function Documentation

9.148.3.1 cursor_color() [1/2]

Fl_Color Fl_Value_Input::cursor_color ( ) const [inline]

Gets the color of the text cursor. The text cursor is black by default.

9.148.3.2 cursor_color() [2/2]

void Fl_Value_Input::cursor_color ( Fl_Color n ) [inline]
Sets the color of the text cursor.
The text cursor is black by default.

### 9.148.3.3 draw()

```cpp
doctor{void Fl_Value_Input::draw ( ) [protected], [virtual]}
Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget’s draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:
```cpp
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```Implements Fl_Widget.

### 9.148.3.4 handle()

```cpp
doctor{int Fl_Value_Input::handle (int event) [virtual]}
Handles the specified event.
You normally don’t call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don’t short-
circuit events that you don’t handle. In this last case you should return the callee retval.
```

**Parameters**

| in event | the kind of event received |

**Return values**

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

**See also**

Fl_Event

Reimplemented from Fl_Widget.

### 9.148.3.5 resize()

```cpp
doctor{void Fl_Value_Input::resize (int x, int y, int w, int h) [virtual]}
Changes the size or position of the widget.
This is a virtual function so that the widget may implement its own handling of resizing. The default version does not
call the redraw() method, but instead relies on the parent widget to do so because the parent may know a faster
way to update the display, such as scrolling from the old position.

Some window managers under X11 call resize() a lot more often than needed. Please verify that the position or
size of a widget did actually change before doing any extensive calculations.
position(X, Y) is a shortcut for resize(X, Y, w(), h()), and size(W, H) is a shortcut for resize(x(), y(), W, H).
Parameters

| in | x, y | new position relative to the parent window |
| in | w, h | new size |

See also

position(int, int), size(int, int)

Reimplemented from Fl_Widget.

9.148.3.6 shortcut() [1/2]

int Fl_Value_Input::shortcut ( ) const [inline]

Returns the current shortcut key for the Input.

See also

Fl_Value_Input::shortcut(int)

9.148.3.7 shortcut() [2/2]

void Fl_Value_Input::shortcut ( int s ) [inline]

Sets the shortcut key to s.

Setting this overrides the use of ‘&’ in the label(). The value is a bitwise OR of a key and a set of shift flags, for example FL_ALT | 'a', FL_ALT | (FL_F + 10), or just ‘a’. A value of 0 disables the shortcut.

The key can be any value returned by Fl::event_key(), but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.

The shift flags can be any set of values accepted by Fl::event_state(). If the bit is on that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

9.148.3.8 soft()

char Fl_Value_Input::soft ( ) const [inline]

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value.

The default is true.

9.148.3.9 textcolor()

Fl_Color Fl_Value_Input::textcolor ( ) const [inline]

Gets the color of the text in the value box.

9.148.3.10 textfont() [1/2]

Fl_Font Fl_Value_Input::textfont ( ) const [inline]

Gets the typeface of the text in the value box.

9.148.3.11 textfont() [2/2]

void Fl_Value_Input::textfont ( Fl_Font s ) [inline]

Sets the typeface of the text in the value box.
9.148.3.12  `textsize()` [1/2]

*Fl_Fontsize* `Fl_Value_Input::textsize ( ) const [inline]`

Gets the size of the text in the value box.

9.148.3.13  `textsize()` [2/2]

```cpp
void Fl_Value_Input::textsize ( Fl_Fontsize s ) [inline]
```

Sets the size of the text in the value box.

The documentation for this class was generated from the following files:

- *Fl_Value_Input.H*
- *Fl_Value_Input.cxx*

### Fl_Value_Output Class Reference

The *Fl_Value_Output* widget displays a floating point value.

```c
#include <Fl_Value_Output.H>
```

Inheritance diagram for *Fl_Value_Output*:

```
Fl_Value_Output
  |   
  V   
Fl_Valuator
  |   
  V   
Fl_Widget
```

#### Public Member Functions

- **`Fl_Value_Output (int x, int y, int w, int h, const char *l=0)`**
  
  Creates a new *Fl_Value_Output* widget using the given position, size, and label string.

- **`int handle (int)`**
  
  Handles the specified event.

- **`uchar soft () const`**
  
  If "soft" is turned on, the user is allowed to drag the value outside the range.

- **`void soft (uchar s)`**
  
  If "soft" is turned on, the user is allowed to drag the value outside the range.

- **`Fl_Color textcolor () const`**
  
  Sets the color of the text in the value box.

- **`void textcolor (Fl_Color s)`**
  
  Gets the color of the text in the value box.

- **`Fl_Font textfont () const`**
  
  Gets the typeface of the text in the value box.

- **`void textfont (Fl_Font s)`**
  
  Sets the typeface of the text in the value box.

- **`Fl_Fontsize textsize () const`**
  
  Gets the size of the text in the value box.

- **`void textsize (Fl_Fontsize s)`**
  
  Sets the size of the text in the value box.
Public Member Functions inherited from Fl_Valuator

- void `bounds` (double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- double `clamp` (double)
  Clamps the passed value to the valuator range.

- virtual int `format` (char ∗)
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- double `increment` (double, int)
  Adds n times the step value to the passed value.

- double `maximum` () const
  Gets the maximum value for the valuator.

- void `maximum` (double a)
  Sets the maximum value for the valuator.

- double `minimum` () const
  Gets the minimum value for the valuator.

- void `minimum` (double a)
  Sets the minimum value for the valuator.

- void `precision` (int digits)
  Sets the step value to \(1.0 / 10^{\text{digits}}\).

- void `range` (double a, double b)
  Sets the minimum and maximum values for the valuator.

- double `round` (double)
  Round the passed value to the nearest step increment.

- double `step` () const
  Gets or sets the step value.

- void `step` (double a, int b)
  See double Fl_Valuator::step() const

- void `step` (double s)
  See double Fl_Valuator::step() const.

- void `step` (int a)
  See double Fl_Valuator::step() const.

- double `value` () const
  Gets the floating point(double) value.

- int `value` (double)
  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
  Activates the widget.

- unsigned int `active` () const
  Returns whether the widget is active.

- int `active_r` () const
  Returns whether the widget and all of its parents are active.

- Fl_Align `align` () const
  Gets the label alignment.

- void `align` (Fl_Align alignment)
Sets the label alignment.

- **long argument () const**
  
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**
  
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window * as_gl_window ()**
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual Fl_Group * as_group ()**
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **virtual Fl_Window * as_window ()**
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **Fl_Boxtype box () const**
  
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  
  Gets the current callback function for the widget.

- **void callback (Fl_Callback *cb)**
  
  Sets the current callback function for the widget.

- **void callback (Fl_Callback *cb, void *p)**
  
  Sets the current callback function for the widget.

- **void callback (Fl_Callback0 *cb)**
  
  Sets the current callback function for the widget.

- **void callback (Fl_Callback1 *cb, long p=0)**
  
  Sets the current callback function for the widget.

- **unsigned int changed () const**
  
  Checks if the widget value changed since the last callback.

- **void clear_active ()**
  
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  
  Clears or sets the damage flags.

- **void clear_output ()**
  
  Sets a widget to accept input.

- **void clear_visible ()**
  
  Hides the widget.

- **void clear_visible_focus ()**
  
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  
  For back compatibility only.

- **void color2 (unsigned a)**
  
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  
  Checks if w is a child of this widget.
• void **copy_label** (const char *new_label)
  Sets the current label.
• void **copy_tooltip** (const char *text)
  Sets the current tooltip text.
• uchar **damage** () const
  Returns non-zero if **draw()** needs to be called.
• void **damage** (uchar c)
  Sets the damage bits for the widget.
• void **damage** (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int **damage_resize** (int, int, int, int)
  Internal use only.
• void **deactivate** ()
  Deactivates the widget.
• FL_IMAGE * **deimage** ()
  Gets the image that is used as part of the widget label.
• const FL_IMAGE * **deimage** () const
• void **deimage** (FL_IMAGE &img)
  Sets the image to use as part of the widget label.
• void **deimage** (FL_IMAGE *img)
  Sets the image to use as part of the widget label.
• void **do_callback** ()
  Calls the widget callback.
• void **do_callback** (FL_Widget *o, long arg)
  Calls the widget callback.
• void **do_callback** (FL_Widget *o, void *arg=0)
  Calls the widget callback.
• void **draw_label** (int, int, int, int, FLAlign) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int **h** () const
  Gets the widget height.
• virtual void **hide** ()
  Makes a widget invisible.
• FL_IMAGE * **image** ()
  Gets the image that is used as part of the widget label.
• const FL_IMAGE * **image** () const
• void **image** (FL_IMAGE &img)
  Sets the image to use as part of the widget label.
• void **image** (FL_IMAGE *img)
  Sets the image to use as part of the widget label.
• int **inside** (const FL_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int **is_label_copied** () const
  Returns whether the current label was assigned with **copy_label()**.
• const char * **label** () const
  Gets the current label text.
• void **label** (const char *text)
  Sets the current label pointer.
• void **label** (FL_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• FL_COLOR **labelcolor** () const
• void labelcolor (Fl_Color c)
  
  Sets the label color.

• Fl_Font labelfont () const
  
  Gets the font to use.

• void labelfont (Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize labelsizes () const
  
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• unsigned int output () const
  
  Returns if a widget is used for output only.

• Fl_Group * parent () const
  
  Returns a pointer to the parent widget.

• void parent (Fl_Group *p)
  
  Internal use only - "for hacks only".

• void position (int X, int Y)
  
  Repositions the window or widget.

• void redraw ()
  
  Schedules the drawing of the widget.

• void redraw_label ()
  
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  
  Gets the selection color.

• void selection_color (Fl_Color a)
  
  Sets the selection color.

• void set_active ()
  
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  
  Marks the value of the widget as changed.

• void set_output ()
  
  Sets a widget to output only.

• void set_visible ()
  
  Makes the widget visible.

• void set_visible_focus ()
  
  Enables keyboard focus navigation with this widget.

• virtual void show ()
  
  Makes a widget visible.

• void size (int W, int H)
  
  Changes the size of the widget.

• int take_focus ()
  
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * topWindow () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * topWindow_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * userData () const
  Gets the user data for this widget.
• void userData (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus ()
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw ()
  Draws the widget.
Protected Member Functions inherited from Fl_Valuator

- **Fl_Valuator** (int X, int Y, int W, int H, const char ∗L)
  
  Creates a new Fl_Valuator widget using the given position, size, and label string.

- void **handle_drag** (double newvalue)
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- void **handle_push** ()
  
  Stores the current value in the previous value.

- void **handle_release** ()
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.

- int **horizontal** () const
  
  Tells if the valuator is an FL_HORIZONTAL one.

- double **previous_value** () const
  
  Gets the previous floating point value before an event changed it.

- void **set_value** (double v)
  
  Sets the current floating point value.

- double **softclamp** (double)
  
  Clamps the value, but accepts v if the previous value is not already out of range.

- virtual void **value_damage** ()
  
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

- void **draw_backdrop** () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box** () const
  
  Draws the widget box according its box style.

- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus** ()
  
  draws a focus rectangle around the widget

- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h) const
  
  Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  
  Draws the widget's label at the defined label position.

- void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

- unsigned int **flags** () const
  
  Gets the widget flags mask.

- void **h** (int v)
  
  Internal use only.

- void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

- void **w** (int v)
  
  Internal use only.

- void **x** (int v)
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *cb, void *d)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

}

flags possible values enumeration.

9.149.1 Detailed Description

The Fl_Value_Output widget displays a floating point value.

If step() is not zero, the user can adjust the value by dragging the mouse left and right. The left button moves one
step() per pixel, the middle by 10 * step(), and the right button by 100 * step().

This is much lighter-weight than Fl_Value_Input because it contains no text editing code or character buffer.

9.149.2 Constructor & Destructor Documentation

9.149.2.1 Fl_Value_Output()

Fl_Value_Output::Fl_Value_Output (int X,
  int Y,
  int W,
  int H,
  const char * l = 0
)

Creates a new Fl_Value_Output widget using the given position, size, and label string.

The default boxtype is FL_NO_BOX.

Inherited destructor destroys the Valuator.
9.149.3 Member Function Documentation

9.149.3.1 draw()

```cpp
void Fl_Value_Output::draw ( ) [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's `draw()` method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

9.149.3.2 handle()

```cpp
int Fl_Value_Output::handle ( int event ) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

**Parameters**

- `event` the kind of event received

**Return values**

- 0 if the event was not used or understood
- 1 if the event was used and can be deleted

See also

- `Fl_Event`

Reimplemented from `Fl_Widget`.

9.149.3.3 soft() [1/2]

```cpp
uchar Fl_Value_Output::soft ( ) const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value.

Default is one.

9.149.3.4 soft() [2/2]

```cpp
void Fl_Value_Output::soft ( uchar s ) [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value.

Default is one.

9.149.3.5 textcolor() [1/2]

```cpp
Fl_Color Fl_Value_Output::textcolor ( ) const [inline]
```

Sets the color of the text in the value box.
9.149.3.6  `textcolor()` [2/2]

```c
void Fl_Value_Output::textcolor (Fl_Color s) [inline]
```

Gets the color of the text in the value box.

9.149.3.7  `textfont()` [1/2]

```c
Fl_Font Fl_Value_Output::textfont () const [inline]
```

Gets the typeface of the text in the value box.

9.149.3.8  `textfont()` [2/2]

```c
void Fl_Value_Output::textfont (Fl_Font s) [inline]
```

Sets the typeface of the text in the value box.

9.149.3.9  `textsize()`

```c
Fl_Fontsize Fl_Value_Output::textsize () const [inline]
```

Gets the size of the text in the value box.

The documentation for this class was generated from the following files:

- Fl_Value_Output.H
- Fl_Value_Output.cxx

9.150  **Fl_Value_Slider Class Reference**

The `Fl_Value_Slider` widget is a `Fl_Slider` widget with a box displaying the current value.

```c
#include <Fl_Value_Slider.H>
```

Inheritance diagram for `Fl_Value_Slider`:

```
Fl_Widget

            \|-- Fl_Value_Slider
                \|-- Fl_Hor_Value_Slider
```
Public Member Functions

- `Fl_Value_Slider (int x, int y, int w, int h, const char *l=0)`
  Creates a new `Fl_Value_Slider` widget using the given position, size, and label string.
- `int handle (int)`
  Handles the specified event.
- `Fl_Color textcolor () const`
  Gets the color of the text in the value box.
- `void textcolor (Fl_Color s)`
  Sets the color of the text in the value box.
- `Fl_Font textfont () const`
  Gets the typeface of the text in the value box.
- `void textfont (Fl_Font s)`
  Sets the typeface of the text in the value box.
- `Fl_Fontsize textsize () const`
  Gets the size of the text in the value box.
- `void textsize (Fl_Fontsize s)`
  Sets the size of the text in the value box.

Public Member Functions inherited from `Fl_Slider`

- `void bounds (double a, double b)`
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- `Fl_Slider (int X, int Y, int W, int H, const char *L=0)`
  Creates a new `Fl_Slider` widget using the given position, size, and label string.
- `Fl_Slider (uchar t, int X, int Y, int W, int H, const char *L)`
  Creates a new `Fl_Slider` widget using the given type, position, size, and label string.
- `int scrollvalue (int pos, int size, int first, int total)`
  Sets the size and position of the sliding knob in the box.
- `Fl_Boxtype slider () const`
  Gets the slider box type.
- `void slider (Fl_Boxtype c)`
  Sets the slider box type.
- `float slider_size () const`
  Get the dimensions of the moving piece of slider.
- `void slider_size (double v)`
  Set the dimensions of the moving piece of slider.

Public Member Functions inherited from `Fl_Valuator`

- `void bounds (double a, double b)`
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- `double clamp (double)`
  Clamps the passed value to the valuator range.
- `virtual int format (char *)`  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- `double increment (double, int)`
  Adds n times the step value to the passed value.
- `double maximum () const`
  Gets the maximum value for the valuator.
- `void maximum (double a)`
  Sets the maximum value for the valuator.
• double minimum () const
  Gets the minimum value for the valuator.
• void minimum (double a)
  Sets the minimum value for the valuator.
• void precision (int digits)
  Sets the step value to \(1.0 / 10^\text{digits}\).
• void range (double a, double b)
  Sets the minimum and maximum values for the valuator.
• double round (double)
  Round the passed value to the nearest step increment.
• double step () const
  Gets or sets the step value.
• void step (double a, int b)
  See double Fl_Valuator::step() const
• void step (double s)
  See double Fl_Valuator::step() const.
• void step (int a)
  See double Fl_Valuator::step() const
• double value () const
  Gets the floating point(double) value.
• int value (double)
  Sets the current value.

**Public Member Functions inherited from Fl_Widget**

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
Sets the box type for the widget.

• `FL_Callback_p callback () const`
  Gets the current callback function for the widget.

• `void callback (FL_Callback ∗cb)`
  Sets the current callback function for the widget.

• `void callback (FL_Callback ∗cb, void ∗p)`
  Sets the current callback function for the widget.

• `void callback (FL_Callback0 ∗cb)`
  Sets the current callback function for the widget.

• `void callback (FL_Callback1 ∗cb, long p=0)`
  Sets the current callback function for the widget.

• `unsigned int changed () const`
  Checks if the widget value changed since the last callback.

• `void clear_active ()`
  Marks the widget as inactive without sending events or changing focus.

• `void clear_changed ()`
  Marks the value of the widget as unchanged.

• `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.

• `void clear_output ()`
  Sets a widget to accept input.

• `void clear_visible ()`
  Hides the widget.

• `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.

• `FL_Color color () const`
  Gets the background color of the widget.

• `void color (FL_Color bg)`
  Sets the background color of the widget.

• `void color (FL_Color bg, FL_Color sel)`
  Sets the background and selection color of the widget.

• `FL_Color color2 () const`
  For back compatibility only.

• `void color2 (unsigned a)`
  For back compatibility only.

• `int contains (const Fl_Widget ∗w) const`
  Checks if w is a child of this widget.

• `void copy_label (const char ∗new_label)`
  Sets the current label.

• `void copy_tooltip (const char ∗text)`
  Sets the current tooltip text.

• `uchar damage () const`
  Returns non-zero if draw() needs to be called.

• `void damage (uchar c)`
  Sets the damage bits for the widget.

• `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.

• `int damage_resize (int, int, int, int)`
  Internal use only.

• `void deactivate ()`
  Deactivates the widget.
- **FL_Image * deimage ()**
  
  Gets the image that is used as part of the widget label.

- **const FL_Image * deimage () const**

- **void deimage (FL_Image &img)**
  
  Sets the image to use as part of the widget label.

- **void deimage (FL_Image *img)**
  
  Sets the image to use as part of the widget label.

- **void do_callback ()**
  
  Calls the widget callback.

- **void do_callback (FL_Widget *o, long arg)**
  
  Calls the widget callback.

- **void do_callback (FL_Widget *o, void *arg=0)**
  
  Calls the widget callback.

- **void draw_label (int, int, int, int, Fl_Align) const**
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  
  Gets the widget height.

- **virtual void hide ()**
  
  Makes a widget invisible.

- **FL_Image * image ()**
  
  Gets the image that is used as part of the widget label.

- **const FL_Image * image () const**

- **void image (FL_Image &img)**
  
  Sets the image to use as part of the widget label.

- **void image (FL_Image *img)**
  
  Sets the image to use as part of the widget label.

- **int inside (const FL_Widget *wgt) const**
  
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  
  Returns whether the current label was assigned with copy_label().

- **const char * label () const**
  
  Gets the current label text.

- **void label (const char * text)**
  
  Sets the current label pointer.

- **void label (FL_Labeltype a, const char *b)**
  
  Shortcut to set the label text and type in one call.

- **FL_Color labelcolor () const**
  
  Gets the label color.

- **void labelcolor (FL_Color c)**
  
  Sets the label color.

- **FL_Font labelfont () const**
  
  Gets the font to use.

- **void labelfont (FL_Font f)**
  
  Sets the font to use.

- **FL_Fontsize labelsize () const**
  
  Gets the font size in pixels.

- **void labelsize (FL_FontSize pix)**
  
  Sets the font size in pixels.

- **FL_Labeltype labelftype () const**
  
  Gets the label type.

- **void labelftype (FL_Labeltype a)**
Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active()
  Marks the widget as active without sending events or changing focus.

- void set_changed()
  Marks the value of the widget as changed.

- void set_output()
  Sets a widget to output only.

- void set_visible()
  Makes the widget visible.

- void set_visible_focus()
  Enables keyboard focus navigation with this widget.

- virtual void show()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char * tooltip () const
  Gets the current tooltip text.

- void tooltip (const char *text)
  Sets the current tooltip text.

- Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus ()
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• FL_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• FL_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~ Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw ()
  Draws the widget.

Protected Member Functions inherited from Fl_Slider

• void draw (int, int, int, int)
• int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
• void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
• void handle_push ()
  Stores the current value in the previous value.
• void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
• int horizontal () const
Tells if the valuator is an FL_HORIZONTAL one.

- **double previous_value () const**
  Gets the previous floating point value before an event changed it.

- **void set_value (double v)**
  Sets the current floating point value.

- **double softclamp (double)**
  Clamps the value, but accepts v if the previous value is not already out of range.

- **virtual void value_damage ()**
  Asks for partial redraw.

### Protected Member Functions inherited from Fl_Widget

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

- **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box () const**
  Draws the widget box according its box style.

- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus ()**
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const**
  Draws a focus box for the widget at the given position and size.

- **void draw_label () const**
  Draws the widget's label at the defined label position.

- **void draw_label (int, int, int, int) const**
  Draws the label in an arbitrary bounding box.

- **Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)**
  Creates a widget at the given position and size.

- **unsigned int flags () const**
  Gets the widget flags mask.

- **void h (int v)**
  Internal use only.

- **void set_flag (unsigned int c)**
  Sets a flag in the flags mask.

- **void w (int v)**
  Internal use only.

- **void x (int v)**
  Internal use only.

- **void y (int v)**
  Internal use only.

### Additional Inherited Members

### Static Public Member Functions inherited from Fl_Widget

- **static void default_callback (Fl_Widget ∗ cb, void ∗ d)**
  The default callback for all widgets that don’t set a callback.

- **static unsigned int label_shortcut (const char ∗ t)**
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- **static int test_shortcut (const char ∗ t, const bool require_alt=false)**
  Returns true if the given text t contains the entered ‘&x’ shortcut.
Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.

9.150.1 Detailed Description

The Fl_Value_Slider widget is a Fl_Slider widget with a box displaying the current value.

Figure 9.51 Fl_Value_Slider

9.150.2 Constructor & Destructor Documentation

9.150.2.1 Fl_Value_Slider()

Fl_Value_Slider::Fl_Value_Slider ( 
  int X, 
  int Y, 
  int W, 
  int H, 
  const char ∗ l = 0 )
Creates a new Fl_Value_Slider widget using the given position, size, and label string. 
The default boxtype is FL_DOWN_BOX.

9.150.3 Member Function Documentation

9.150.3.1 draw()

void Fl_Value_Slider::draw ( ) [protected], [virtual]
Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead. 
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
Reimplemented from Fl_Slider.

9.150.3.2 handle()

int Fl_Value_Slider::handle ( 
  int event ) [virtual]
Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don’t short-circuit events that you don't handle. In this last case you should return the callee retval.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>event</th>
<th>the kind of event received</th>
</tr>
</thead>
</table>

**Return values**

| 0    | if the event was not used or understood |
| 1    | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Slider.

9.150.3.3 textcolor() [1/2]

`Fl_Color Fl_Value_Slider::textcolor ( ) const [inline]`

Gets the color of the text in the value box.

9.150.3.4 textcolor() [2/2]

`void Fl_Value_Slider::textcolor ( Fl_Color s ) [inline]`

Sets the color of the text in the value box.

9.150.3.5 textfont() [1/2]

`Fl_Font Fl_Value_Slider::textfont ( ) const [inline]`

Gets the typeface of the text in the value box.

9.150.3.6 textfont() [2/2]

`void Fl_Value_Slider::textfont ( Fl_Font s ) [inline]`

Sets the typeface of the text in the value box.

9.150.3.7 textsize() [1/2]

`Fl_Fontsize Fl_Value_Slider::textsize ( ) const [inline]`

Gets the size of the text in the value box.
### Fl_Widget Class Reference

**Fl_Widget** is the base class for all widgets in FLTK.

#### Public Member Functions

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
  
  *Activates the widget.*
- unsigned int active () const
  
  *Returns whether the widget is active.*
- int active_r () const

The documentation for this class was generated from the following files:

- `Fl_Value_Slider.H`
- `Fl_Value_Slider.cxx`
Returns whether the widget and all of its parents are active.

- **Fl_Align align() const**
  Gets the label alignment.

- **void align(Fl_Align alignment)**
  Sets the label alignment.

- **long argument() const**
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument(long v)**
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window * as_gl_window()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual Fl_Group * as_group()**
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **virtual Fl_Window * as_window()**
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **Fl_Boxtype box() const**
  Gets the box type of the widget.

- **void box(Fl_Boxtype new_box)**
  Sets the box type for the widget.

- **Fl_Callback_p callback() const**
  Gets the current callback function for the widget.

- **void callback(Fl_Callback * cb)**
  Sets the current callback function for the widget.

- **void callback(Fl_Callback * cb, void * p)**
  Sets the current callback function for the widget.

- **void callback(Fl_Callback0 * cb)**
  Sets the current callback function for the widget.

- **void callback(Fl_Callback1 * cb, long p=0)**
  Sets the current callback function for the widget.

- **unsigned int changed() const**
  Checks if the widget value changed since the last callback.

- **void clear_active()**
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed()**
  Marks the value of the widget as unchanged.

- **void clear_damage(uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output()**
  Sets a widget to accept input.

- **void clear_visible()**
  Hides the widget.

- **void clear_visible_focus()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color() const**
  Gets the background color of the widget.

- **void color(Fl_Color bg)**
  Sets the background color of the widget.

- **void color(Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

- **Fl_Color color2() const**
  For back compatibility only.
- void color2 (unsigned a)
  
  For back compatibility only.
- int contains (const Fl_Widget *w) const
  
  Checks if w is a child of this widget.
- void copy_label (const char *new_label)
  
  Sets the current label.
- void copy_tooltip (const char *text)
  
  Sets the current tooltip text.
- uchar damage () const
  
  Returns non-zero if draw() needs to be called.
- void damage (uchar c)
  
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.
- int damage_resize (int, int, int, int)
  
  Internal use only.
- void deactivate ()
  
  Deactivates the widget.
- Fl_Image *deimage ()
  
  Gets the image that is used as part of the widget label.
- const Fl_Image *deimage () const
- void deimage (Fl_Image &img)
  
  Sets the image to use as part of the widget label.
- void deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label.
- void do_callback ()
  
  Calls the widget callback.
- void do_callback (Fl_Widget *o, long arg)
  
  Calls the widget callback.
- void do_callback (Fl_Widget *o, void *arg=0)
  
  Calls the widget callback.
- virtual void draw ()=0
  
  Draws the widget.
- void draw_label (int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int h () const
  
  Gets the widget height.
- virtual int handle (int event)
  
  Handles the specified event.
- virtual void hide ()
  
  Makes a widget invisible.
- Fl_Image *image ()
  
  Gets the image that is used as part of the widget label.
- const Fl_Image *image () const
- void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label.
- void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label.
- int inside (const Fl_Widget *wgt) const
  
  Checks if this widget is a child of wgt.
- int is_label_copied () const
Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`  
  Gets the current label text.
- `void label (const char *text)`  
  Sets the current label pointer.
- `void label (Fl_Labeltype a, const char *b)`  
  Shortcut to set the label text and type in one call.
- `Fl_Color labelcolor () const`  
  Gets the label color.
- `void labelcolor (Fl_Color c)`  
  Sets the label color.
- `Fl_Font labelfont () const`  
  Gets the font to use.
- `void labelfont (Fl_Font f)`  
  Sets the font to use.
- `Fl_Fontsize labelsize () const`  
  Gets the font size in pixels.
- `void labelsize (Fl_Fontsize pix)`  
  Sets the font size in pixels.
- `Fl_Labeltype labeltype () const`  
  Gets the label type.
- `void labeltype (Fl_Labeltype a)`  
  Sets the label type.
- `void measure_label (int &ww, int &hh) const`  
  Sets width `ww` and height `hh` accordingly with the label size.
- `unsigned int output () const`  
  Returns if a widget is used for output only.
- `Fl_Group * parent () const`  
  Returns a pointer to the parent widget.
- `void parent (Fl_Group *p)`  
  Internal use only - “for hacks only”.
- `void position (int X, int Y)`  
  Repositions the window or widget.
- `void redraw ()`  
  Schedules the drawing of the widget.
- `void redraw_label ()`  
  Schedules the drawing of the label.
- `virtual void resize (int x, int y, int w, int h)`  
  Changes the size or position of the widget.
- `Fl_Color selection_color () const`  
  Gets the selection color.
- `void selection_color (Fl_Color a)`  
  Sets the selection color.
- `void set_active ()`  
  Marks the widget as active without sending events or changing focus.
- `void set_changed ()`  
  Marks the value of the widget as changed.
- `void set_output ()`  
  Sets a widget to output only.
- `void set_visible ()`  
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takeevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• FL_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• FL_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int useAccents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus ()
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• FL_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• FL_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~FL_Widget ()
  Destroys the widget.
Static Public Member Functions

• static void default_callback (Fl_Widget ∗cb, void ∗d)
  The default callback for all widgets that don't set a callback.

• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPYED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,
  USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus ()
  draws a focus rectangle around the widget

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget's label at the given position and size.

• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

• unsigned int flags () const
  Gets the widget flags mask.

• void h (int v)
  Internal use only.

• void set_flag (unsigned int c)
  Sets a flag in the flags mask.

• void w (int v)
  Internal use only.
9.151 Fl_Widget Class Reference

• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Friends

• class Fl_Group

9.151.1 Detailed Description

Fl_Widget is the base class for all widgets in FLTK.

You can't create one of these because the constructor is not public. However you can subclass it.

All "property" accessing methods, such as color(), parent(), or argument() are implemented as trivial inline functions and thus are as fast and small as accessing fields in a structure. Unless otherwise noted, the property setting methods such as color(n) or label(s) are also trivial inline functions, even if they change the widget's appearance. It is up to the user code to call redraw() after these.

9.151.2 Member Enumeration Documentation

9.151.2.1 anonymous enum

anonymous enum [protected]
flags possible values enumeration.
See activate(), output(), visible(), changed(), set_visible_focus()

Enumerator

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INACTIVE</td>
<td>the widget can't receive focus, and is disabled but potentially visible</td>
</tr>
<tr>
<td>INVISIBLE</td>
<td>the widget is not drawn, but can receive a few special events</td>
</tr>
<tr>
<td>OUTPUT</td>
<td>for output only</td>
</tr>
<tr>
<td>NOBORDER</td>
<td>don't draw a decoration (Fl_Window)</td>
</tr>
<tr>
<td>FORCE_POSITION</td>
<td>don't let the window manager position the window (Fl_Window)</td>

### 9.151.3 Constructor & Destructor Documentation

#### 9.151.3.1 Fl_Widget()

Fl_Widget::Fl_Widget (  
    int x,  
    int y,  
    int w,  
    int h,  
    const char ∗ label = 0L ) [protected]

Creates a widget at the given position and size. The Fl_Widget is a protected constructor, but all derived widgets have a matching public constructor. It takes a value for x(), y(), w(), h(), and an optional value for label().

#### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x,y</th>
<th>the position of the widget relative to the enclosing window</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>w,h</td>
<td>size of the widget in pixels</td>
</tr>
<tr>
<td>in</td>
<td>label</td>
<td>optional text for the widget label</td>
</tr>
</tbody>
</table>

#### 9.151.3.2 ∼Fl_Widget()

Fl_Widget::~Fl_Widget ( ) [virtual]

Destroys the widget. Destroys the widget, taking care of throwing focus before if any. Destroying single widgets is not very common. You almost always want to destroy the parent group instead, which will destroy all of the child widgets and groups in that group.

Since FLTK 1.3, the widget's destructor removes the widget from its parent group, if it is member of a group.

Destruction removes the widget from any parent group! And groups when destroyed destroy all their children. This is convenient and fast.

### 9.151.4 Member Function Documentation

#### 9.151.4.1 activate()

void Fl_Widget::activate ( )

Activates the widget. Changing this value will send FL_ACTIVATE to the widget if active_r() is true.

See also

activate(), active_r(), deactivate()

#### 9.151.4.2 active()

unsigned int Fl_Widget::active ( ) const [inline]

Returns whether the widget is active.
Return values

0 if the widget is inactive

See also

active_r(), activate(), deactivate()

9.151.4.3 active_r()

int Fl_Widget::active_r ( ) const

Returns whether the widget and all of its parents are active.

Return values

0 if this or any of the parent widgets are inactive

See also

active(), activate(), deactivate()

9.151.4.4 align()[1/2]

Fl_Align Fl_Widget::align ( ) const [inline]

Gets the label alignment.

Returns

label alignment

See also

label(), align(Fl_Align), Fl_Align

9.151.4.5 align()[2/2]

void Fl_Widget::align ( Fl_Align alignment ) [inline]

Sets the label alignment.

This controls how the label is displayed next to or inside the widget. The default value is FL_ALIGN Center, which centers the label inside the widget.

Parameters

| in | alignment | new label alignment |

See also

align(), Fl_Align

9.151.4.6 argument()[1/2]

long Fl_Widget::argument ( ) const [inline]

Gets the current user data (long) argument that is passed to the callback function.

Todo  The user data value must be implemented using intptr_t or similar to avoid 64-bit machine incompatibilities
9.151.4.7 argument() [2/2]

void Fl_Widget::argument ( 
    long v ) [inline]
Sets the current user data (long) argument that is passed to the callback function.

Todo  The user data value must be implemented using intptr_t or similar to avoid 64-bit machine incompatibilities.

9.151.4.8 as_gl_window()

virtual class Fl_Gl_Window * Fl_Widget::as_gl_window ( ) [inline], [virtual]
Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
Use this method if you have a widget (pointer) and need to know whether this widget is derived from Fl_Gl_Window.
If it returns non-NULL, then the widget in question is derived from Fl_Gl_Window.

Return values

| NULL | if this widget is not derived from Fl_Gl_Window. |

Note
This method is provided to avoid dynamic_cast.

See also

Fl_Widget::as_group(), Fl_Widget::as_window()

Reimplemented in Fl_Gl_Window.

9.151.4.9 as_group()

virtual Fl_Group * Fl_Widget::as_group ( ) [inline], [virtual]
Returns an Fl_Group pointer if this widget is an Fl_Group.
Use this method if you have a widget (pointer) and need to know whether this widget is derived from Fl_Group. If it returns non-NULL, then the widget in question is derived from Fl_Group, and you can use the returned pointer to access its children or other Fl_Group-specific methods.

Example:

```c
void my_callback (Fl_Widget *w, void *) {
    Fl_Group *g = w->as_group();
    if (g)
        printf ("This group has %d children\n",g->children());
    else
        printf ("This widget is not a group!\n");
}
```

Return values

| NULL | if this widget is not derived from Fl_Group. |

Note
This method is provided to avoid dynamic_cast.

See also

Fl_Widget::as_window(), Fl_Widget::as_gl_window()

Reimplemented in Fl_Group.

9.151.4.10 as_window()

virtual Fl_Window * Fl_Widget::as_window ( ) [inline], [virtual]
Returns an Fl_Widget pointer if this widget is an Fl_Window. Use this method if you have a widget (pointer) and need to know whether this widget is derived from Fl_Window. If it returns non-NULL, then the widget in question is derived from Fl_Window, and you can use the returned pointer to access its children or other Fl_Window-specific methods.

Return values

| NULL | if this widget is not derived from Fl_Window. |

Note

This method is provided to avoid dynamic_cast.

See also

Fl_Widget::as_group(), Fl_Widget::as_gl_window()

Reimplemented in Fl_Window.

9.151.4.11 box() [1/2]

Fl_Boxtype Fl_Widget::box ( ) const [inline]

Gets the box type of the widget.

Returns

the current box type

See also

box(Fl_Boxtype), Fl_Boxtype

9.151.4.12 box() [2/2]

void Fl_Widget::box ( Fl_Boxtype new_box ) [inline]

Sets the box type for the widget.

This identifies a routine that draws the background of the widget. See Fl_Boxtype for the available types. The default depends on the widget, but is usually FL_NO_BOX or FL_UP_BOX.

Parameters

| in  | new_box | the new box type |

See also

box(), Fl_Boxtype

9.151.4.13 callback() [1/5]

Fl_Callback_p Fl_Widget::callback ( ) const [inline]

Gets the current callback function for the widget.

Each widget has a single callback.

Returns

current callback
**9.151.4.14 callback() [2/5]**

```cpp
void Fl_Widget::callback (
    Fl_Callback ∗ cb ) [inline]
```

Sets the current callback function for the widget. Each widget has a single callback.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>cb</th>
<th>new callback</th>
</tr>
</thead>
</table>

**9.151.4.15 callback() [3/5]**

```cpp
void Fl_Widget::callback (
    Fl_Callback ∗ cb,
    void ∗ p ) [inline]
```

Sets the current callback function for the widget. Each widget has a single callback.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>cb</th>
<th>new callback</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>p</td>
<td>user data</td>
</tr>
</tbody>
</table>

**9.151.4.16 callback() [4/5]**

```cpp
void Fl_Widget::callback (
    Fl_Callback0 ∗ cb ) [inline]
```

Sets the current callback function for the widget. Each widget has a single callback.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>cb</th>
<th>new callback</th>
</tr>
</thead>
</table>

**9.151.4.17 callback() [5/5]**

```cpp
void Fl_Widget::callback (
    Fl_Callback1 ∗ cb,
    long p = 0 ) [inline]
```

Sets the current callback function for the widget. Each widget has a single callback.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>cb</th>
<th>new callback</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>p</td>
<td>user data</td>
</tr>
</tbody>
</table>

**9.151.4.18 changed()**

```cpp
unsigned int Fl_Widget::changed ( ) const [inline]
```

Checks if the widget value changed since the last callback.

"Changed" is a flag that is turned on when the user changes the value stored in the widget. This is only used by subclasses of Fl_Widget that store values, but is in the base class so it is easier to scan all the widgets in a panel.
and `do_callback()` on the changed ones in response to an "OK" button. Most widgets turn this flag off when they do the callback, and when the program sets the stored value.

Return values

| 0 | if the value did not change |

See also

- `set_changed()`, `clear_changed()`

### 9.151.4.19 clear_active()

```c
void Fl_Widget::clear_active();
```

Marks the widget as inactive without sending events or changing focus. This is mainly for specialized use, for normal cases you want `deactivate()`.

See also

- `deactivate()`

### 9.151.4.20 clear_changed()

```c
void Fl_Widget::clear_changed();
```

Marks the value of the widget as unchanged.

See also

- `changed()`, `set_changed()`

### 9.151.4.21 clear_damage()

```c
void Fl_Widget::clear_damage(uchar c = 0);
```

Clears or sets the damage flags. Damage flags are cleared when parts of the widget drawing is repaired.

The optional argument `c` specifies the bits that are set after the call (default: 0) and not the bits that are cleared!

Note

Therefore it is possible to set damage bits with this method, but this should be avoided. Use `damage(uchar)` instead.

Parameters

| in  | c | new bitmask of damage flags (default: 0) |

See also

- `damage(uchar)`, `damage()`

### 9.151.4.22 clear_output()

```c
void Fl_Widget::clear_output();
```

Sets a widget to accept input.
9.151.4.23 clear_visible()

void Fl_Widget::clear_visible ( ) [inline]
Hides the widget.
You must still redraw the parent to see a change in the window. Normally you want to use the hide() method instead.

9.151.4.24 clear_visible_focus()

void Fl_Widget::clear_visible_focus ( ) [inline]
Disables keyboard focus navigation with this widget.
Normally, all widgets participate in keyboard focus navigation.
See also
set_visible_focus(), visible_focus(), visible_focus(int)

9.151.4.25 color() [1/3]

Fl_Color Fl_Widget::color ( ) const [inline]
Gets the background color of the widget.

Returns
current background color

See also
color(Fl_Color), color(Fl_Color, Fl_Color)

9.151.4.26 color() [2/3]

void Fl_Widget::color ( Fl_Color bg ) [inline]
Sets the background color of the widget.
The color is passed to the box routine. The color is either an index into an internal table of RGB colors or an RGB
color value generated using fl_rgb_color().
The default for most widgets is FL_BACKGROUND_COLOR. Use Fl::set_color() to redefine colors in the color map.
Parameters

| in  | bg   | background color |

See also
color(), color(Fl_Color, Fl_Color), selection_color(Fl_Color)

9.151.4.27 color() [3/3]

void Fl_Widget::color ( Fl_Color bg,
                        Fl_Color sel ) [inline]
Sets the background and selection color of the widget.
The two color form sets both the background and selection colors.
Parameters

| in       | **bg** | background color |
| in       | **sel** | selection color |

See also

- color(unsigned), selection_color(unsigned)

---

### 9.151.4.28 color2() [1/2]

```cpp
Fl_Color Fl_Widget::color2 () const [inline]
```

For back compatibility only.

**Deprecated** Use selection_color() instead.

### 9.151.4.29 color2() [2/2]

```cpp
void Fl_Widget::color2 (unsigned a ) [inline]
```

For back compatibility only.

**Deprecated** Use selection_color(unsigned) instead.

---

### 9.151.4.30 contains()

```cpp
int Fl_Widget::contains (const Fl_Widget * w ) const
```

Checks if w is a child of this widget.

**Parameters**

| in       | **w** | potential child widget |

**Returns**

Returns 1 if w is a child of this widget, or is equal to this widget. Returns 0 if w is NULL.

---

### 9.151.4.31 copy_label()

```cpp
void Fl_Widget::copy_label (const char * new_label )
```

Sets the current label.

Unlike `label()`, this method allocates a copy of the label string instead of using the original string pointer.

The internal copy will automatically be freed whenever you assign a new label or when the widget is destroyed.

**Parameters**

| in       | **new_label** | the new label text |

See also

- `label()`

---

Generated by Doxygen
9.151.4.32 copy_tooltip()

```c
void Fl_Widget::copy_tooltip (const char * text)
```

Sets the current tooltip text.
Unlike tooltip(), this method allocates a copy of the tooltip string instead of using the original string pointer. The internal copy will automatically be freed whenever you assign a new tooltip or when the widget is destroyed. If no tooltip is set, the tooltip of the parent is inherited. Setting a tooltip for a group and setting no tooltip for a child will show the group's tooltip instead. To avoid this behavior, you can set the child's tooltip to an empty string ("").

Parameters

| in  | text | New tooltip text (an internal copy is made and managed) |

See also

- tooltip(const char*), tooltip()

9.151.4.33 damage() [1/3]

```c
uchar Fl_Widget::damage ( ) const [inline]
```

Returns non-zero if draw() needs to be called.
The damage value is actually a bit field that the widget subclass can use to figure out what parts to draw.

Returns

- a bitmap of flags describing the kind of damage to the widget

See also

- damage(uchar), clear_damage(uchar)

9.151.4.34 damage() [2/3]

```c
void Fl_Widget::damage (uchar c)
```

Sets the damage bits for the widget.
Setting damage bits will schedule the widget for the next redraw.

Parameters

| in  | c | bitmask of flags to set |

See also

- damage(), clear_damage(uchar)

9.151.4.35 damage() [3/3]

```c
void Fl_Widget::damage (uchar c, int x, int y, int w, int h)
```

Sets the damage bits for an area inside the widget.
Setting damage bits will schedule the widget for the next redraw.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>c</th>
<th>bitmask of flags to set</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x,y,w,h</td>
<td>size of damaged area</td>
</tr>
</tbody>
</table>

See also

damage(), clear_damage(uchar)

9.151.4.36 deactivate()

```cpp
void Fl_Widget::deactivate ()
```

Deactivates the widget.

Inactive widgets will be drawn "grayed out", e.g. with less contrast than the active widget. Inactive widgets will not receive any keyboard or mouse button events. Other events (including FL_ENTER, FL_MOVE, FL_LEAVE, FL_SHORTCUT, and others) will still be sent. A widget is only active if active() is true on it and all of its parents.

Changing this value will send FL_DEACTIVATE to the widget if active_r() is true.

Currently you cannot deactivate Fl_Window widgets.

See also

activate(), active(), active_r()

9.151.4.37 default_callback()

```cpp
void Fl_Widget::default_callback ( Fl_Widget * cb, void * d ) [static]
```

The default callback for all widgets that don't set a callback.

This callback function puts a pointer to the widget on the queue returned by Fl::readqueue().

Relying on the default callback and reading the callback queue with Fl::readqueue() is not recommended. If you need a callback, you should set one with Fl_Widget::callback(Fl_Callback * cb, void * data) or one of its variants.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>cb</th>
<th>the widget given to the callback</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>d</td>
<td>user data associated with that callback</td>
</tr>
</tbody>
</table>

See also

callback(), do_callback(), Fl::readqueue()

9.151.4.38 deimage() [1/3]

```cpp
Fl_Image * Fl_Widget::deimage () [inline]
```

Gets the image that is used as part of the widget label.

This image is used when drawing the widget in the inactive state.

Returns

the current image for the deactivated widget

9.151.4.39 deimage() [2/3]

```cpp
void Fl_Widget::deimage ( Fl_Image & img ) [inline]
```
Sets the image to use as part of the widget label. This image is used when drawing the widget in the inactive state.

Parameters

| in  | img | the new image for the deactivated widget |

9.151.4.40 deimage() [3/3]

```c
void Fl_Widget::deimage ( Fl_Image * img ) [inline]
```

Sets the image to use as part of the widget label.

This image is used when drawing the widget in the inactive state.

Parameters

| in  | img | the new image for the deactivated widget |

9.151.4.41 do_callback() [1/3]

```c
void Fl_Widget::do_callback ( ) [inline]
```

Calls the widget callback.
Causes a widget to invoke its callback function with default arguments.

See also

callback()

9.151.4.42 do_callback() [2/3]

```c
void Fl_Widget::do_callback ( Fl_Widget * o, long arg ) [inline]
```

Calls the widget callback.
Causes a widget to invoke its callback function with arbitrary arguments.

Parameters

| in  | o   | call the callback with o as the widget argument |
| in  | arg | call the callback with arg as the user data argument |

See also

callback()

9.151.4.43 do_callback() [3/3]

```c
void Fl_Widget::do_callback ( Fl_Widget * o, void * arg = 0 )
```

Calls the widget callback.
Causes a widget to invoke its callback function with arbitrary arguments.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>o</th>
<th>call the callback with o as the widget argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>arg</td>
<td>use arg as the user data argument</td>
</tr>
</tbody>
</table>

See also

callback()

9.151.4.44 draw()

```cpp
virtual void Fl_Widget::draw() [pure virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```cpp
Fl_Widget *s = &scroll; // scroll is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

9.151.4.45 draw_label() [1/3]

```cpp
void Fl_Widget::draw_label() const [protected]
```

Draws the widget's label at the defined label position.

This is the normal call for a widget's draw() method.

9.151.4.46 draw_label() [2/3]

```cpp
void Fl_Widget::draw_label(int X, int Y, int W, int H) const [protected]
```

Draws the label in an arbitrary bounding box.

draw() can use this instead of draw_label(void) to change the bounding box.

9.151.4.47 draw_label() [3/3]

```cpp
void Fl_Widget::draw_label(int X, int Y, int W, int H, Fl_Align a) const
```

Draws the label in an arbitrary bounding box with an arbitrary alignment.

Anybody can call this to force the label to draw anywhere.

9.151.4.48 h() [1/2]

```cpp
int Fl_Widget::h() const [inline]
```

Gets the widget height.
Returns

the height of the widget in pixels.

9.151.4.49 h() [2/2]

void Fl_Widget::h ( int v ) [inline], [protected]

Internal use only.
Use position(int,int), size(int,int) or resize(int,int,int,int) instead.

9.151.4.50 handle()

int Fl_Widget::handle ( int event ) [virtual]

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

| in  | event | the kind of event received |

Return values

| 0   | if the event was not used or understood |
| 1   | if the event was used and can be deleted |

See also

- Fl_Event

9.151.4.51 hide()

void Fl_Widget::hide ( ) [virtual]

Makes a widget invisible.

See also

- show(), visible(), visible_r()

Reimplemented in Fl_Browser, Fl_Double Window, Fl_GL_WINDOW, Fl_MENU_WINDOW, Fl_OVERLAY_WINDOW, and Fl_WINDOW.

9.151.4.52 image() [1/3]

Fl_Image * Fl_Widget::image ( ) [inline]

Gets the image that is used as part of the widget label.
This image is used when drawing the widget in the active state.
9.151.4.53  image() [2/3]

void Fl_Widget::image (  
    Fl_Image & img  
) [inline]

Sets the image to use as part of the widget label.  
This image is used when drawing the widget in the active state.

Parameters

  in  img  the new image for the label

9.151.4.54  image() [3/3]

void Fl_Widget::image (  
    Fl_Image * img  
) [inline]

Sets the image to use as part of the widget label.  
This image is used when drawing the widget in the active state.

Parameters

  in  img  the new image for the label

9.151.4.55  inside()

int Fl_Widget::inside (  
    const Fl_Widget * wgt  
) const [inline]

Checks if this widget is a child of wgt.  
Returns 1 if this widget is a child of wgt, or is equal to wgt. Returns 0 if wgt is NULL.

Parameters

  in  wgt  the possible parent widget.

See also

  contains()

9.151.4.56  is_label_copied()

int Fl_Widget::is_label_copied ( ) const [inline]

Returns whether the current label was assigned with copy_label().  
This can be useful for temporarily overwriting the widget's label and restoring it later.

Return values

  0  current label was assigned with label().  
  1  current label was assigned with copy_label().
9.151.4.57  label() [1/3]

`const char * Fl_Widget::label ( ) const [inline]`

Gets the current label text.

Returns

a pointer to the current label text

See also

`label(const char *), copy_label(const char *)`

9.151.4.58  label() [2/3]

`void Fl_Widget::label ( const char * text )`

Sets the current label pointer.
The label is shown somewhere on or next to the widget. The passed pointer is stored unchanged in the widget (the string is not copied), so if you need to set the label to a formatted value, make sure the buffer is static, global, or allocated. The `copy_label()` method can be used to make a copy of the label string automatically.

Parameters

| in | text | pointer to new label text |

See also

`copy_label()`

9.151.4.59  label() [3/3]

`void Fl_Widget::label ( Fl_Labeltype a, const char * b ) [inline]`

Shortcut to set the label text and type in one call.

See also

`label(const char *), labeltype(Fl_Labeltype)`

9.151.4.60  label_shortcut()

`unsigned int Fl_Widget::label_shortcut ( const char * t ) [static]`

Returns the Unicode value of the '&x' shortcut in a given text.
The given text `t` (usually a widget's label or a menu text) is searched for a '&x' shortcut label, and if found, the Unicode value (code point) of the '&x' shortcut is returned.

Parameters

| t | text or label to search for '&x' shortcut. |

Returns

Unicode (UCS-4) value of shortcut in `t` or 0.
Note
Internal use only.

9.151.4.61 labelcolor() [1/2]

\texttt{Fl\_Color Fl\_Widget::labelcolor ( ) const [inline]}

Gets the label color.
The default color is FL\_FOREGROUND\_COLOR.

Returns
the current label color

9.151.4.62 labelcolor() [2/2]

\texttt{void Fl\_Widget::labelcolor ( Fl\_Color c ) [inline]}

Sets the label color.
The default color is FL\_FOREGROUND\_COLOR.

Parameters
\begin{itemize}
  \item \texttt{in c} the new label color\end{itemize}

9.151.4.63 labelfont() [1/2]

\texttt{Fl\_Font Fl\_Widget::labelfont ( ) const [inline]}

Gets the font to use.
Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft®
Windows®). The function \texttt{Fl::set\_font()} can define new typefaces.

Returns
the current font used by the label

See also
\texttt{Fl\_Font}

9.151.4.64 labelfont() [2/2]

\texttt{void Fl\_Widget::labelfont ( Fl\_Font f ) [inline]}

Sets the font to use.
Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft®
Windows®). The function \texttt{Fl::set\_font()} can define new typefaces.

Parameters
\begin{itemize}
  \item \texttt{in f} the new font for the label\end{itemize}
See also

\texttt{Fl_Font}

\subsection{labelsize() [1/2]}

\begin{verbatim}
Fl_Fontsize Fl_Widget::labelsize ( ) const [inline]
\end{verbatim}

Gets the font size in pixels.
The default size is 14 pixels.

Returns

the current font size

\subsection{labelsize() [2/2]}

\begin{verbatim}
void Fl_Widget::labelsize ( Fl_Fontsize pix ) [inline]
\end{verbatim}

Sets the font size in pixels.

Parameters

\begin{verbatim}
in pix the new font size
\end{verbatim}

See also

\texttt{Fl_Fontsize labelsize()}

\subsection{labeltype() [1/2]}

\begin{verbatim}
Fl_Labeltype Fl_Widget::labeltype ( ) const [inline]
\end{verbatim}

Gets the label type.

Returns

the current label type.

See also

\texttt{Fl_Labeltype}

\subsection{labeltype() [2/2]}

\begin{verbatim}
void Fl_Widget::labeltype ( Fl_Labeltype a ) [inline]
\end{verbatim}

Sets the label type.
The label type identifies the function that draws the label of the widget. This is generally used for special effects such as embossing or for using the label() pointer as another form of data such as an icon. The value \texttt{FL_NORMAL\_LABEL} prints the label as plain text.

Parameters

\begin{verbatim}
in a new label type
\end{verbatim}

See also

\texttt{Fl_Labeltype}
9.151.4.69 measure_label()

    void Fl_Widget::measure_label ( int & ww, int & hh ) const [inline]

Sets width ww and height hh accordingly with the label size. Labels with images will return w() and h() of the image.
This calls fl_measure() internally. For more information about the arguments ww and hh and word wrapping

See also

    fl_measure(const char *, int&, int&, int)

9.151.4.70 output()

    unsigned int Fl_Widget::output ( ) const [inline]

Returns if a widget is used for output only.
output() means the same as active() except it does not change how the widget is drawn. The widget will not receive
any events. This is useful for making scrollbars or buttons that work as displays rather than input devices.

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the widget is used for input and output</td>
</tr>
</tbody>
</table>

See also

    set_output(), clear_output()

9.151.4.71 parent() [1/2]

    Fl_Group * Fl_Widget::parent ( ) const [inline]

Returns a pointer to the parent widget.

Usually this is a Fl_Group or Fl_Window.

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>if the widget has no parent</td>
</tr>
</tbody>
</table>

See also

    Fl_Group::add(Fl_Widget*)

9.151.4.72 parent() [2/2]

    void Fl_Widget::parent ( Fl_Group * p ) [inline]

Internal use only - "for hacks only". It is **STRONGLY recommended** not to use this method, because it short-circuits Fl_Group's normal widget adding and removing methods, if the widget is already a child widget of another Fl_Group. Use Fl_Group::add(Fl_Widget*) and/or Fl_Group::remove(Fl_Widget*) instead.

9.151.4.73 position()

    void Fl_Widget::position ( int X, int Y ) [inline]
Repositions the window or widget. position(X, Y) is a shortcut for resize(X, Y, w(), h()).

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X, Y</td>
</tr>
</tbody>
</table>

See also

resize(int, int), size(int, int)

9.151.4.74 redraw()

void Fl_Widget::redraw ()
Schedules the drawing of the widget. Marks the widget as needing its draw() routine called.

9.151.4.75 redraw_label()

void Fl_Widget::redraw_label ()
Schedules the drawing of the label. Marks the widget or the parent as needing a redraw for the label area of a widget.

9.151.4.76 resize()

void Fl_Widget::resize {
    int x,
    int y,
    int w,
    int h ) [virtual]
Changes the size or position of the widget. This is a virtual function so that the widget may implement its own handling of resizing. The default version does not call the redraw() method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call resize() a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations. position(X, Y) is a shortcut for resize(X, Y, w(), h()), and size(W, H) is a shortcut for resize(x(), y(), W, H).

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x, y</td>
</tr>
<tr>
<td>in</td>
<td>w, h</td>
</tr>
</tbody>
</table>

See also

position(int, int), size(int, int)

9.151.4.77 selection_color() [1/2]

Fl_Color Fl_Widget::selection_color () const [inline]
Gets the selection color.
Returns

the current selection color

See also

selection_color(Fl_Color), color(Fl_Color, Fl_Color)

9.151.4.78 selection_color() [2/2]

void Fl_Widget::selection_color ( Fl_Color a ) [inline]

Sets the selection color.
The selection color is defined for Forms compatibility and is usually used to color the widget when it is se-
lected, although some widgets use this color for other purposes. You can set both colors at once with
color(Fl_Color bg, Fl_Color sel).

Parameters

in a the new selection color

See also

selection_color(), color(Fl_Color, Fl_Color)

9.151.4.79 set_active()

void Fl_Widget::set_active ( ) [inline]
Marks the widget as active without sending events or changing focus.
This is mainly for specialized use, for normal cases you want activate().

See also

activate()

9.151.4.80 set_changed()

void Fl_Widget::set_changed ( ) [inline]
Marks the value of the widget as changed.

See also

changed(), clear_changed()

9.151.4.81 set_output()

void Fl_Widget::set_output ( ) [inline]
Sets a widget to output only.

See also

output(), clear_output()

9.151.4.82 set_visible()

void Fl_Widget::set_visible ( ) [inline]
Makes the widget visible.
You must still redraw the parent widget to see a change in the window. Normally you want to use the show() method
instead.
9.151.4.83  set_visible_focus()

void Fl_Widget::set_visible_focus ( ) [inline]
Enables keyboard focus navigation with this widget.
Note, however, that this will not necessarily mean that the widget will accept focus, but for widgets that can accept
focus, this method enables it if it has been disabled.
See also
   visible_focus(), clear_visible_focus(), visible_focus(int)

9.151.4.84  show()

void Fl_Widget::show ( ) [virtual]
Makes a widget visible.
An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other
events like FL_SHOW.
The visible() method returns true if the widget is set to be visible. The visible_r() method returns true if the widget
and all of its parents are visible. A widget is only visible if visible() is true on it and all of its parents.
Changing it will send FL_SHOW or FL_HIDE events to the widget. Do not change it if the parent is not visible, as
this will send false FL_SHOW or FL_HIDE events to the widget. redraw() is called if necessary on this or the parent.
See also
   hide(), visible(), visible_r()
Reimplemented in Fl_Browser, Fl_Double_Window, Fl_Gl_Window, Fl_Menu_Window, Fl_Overlay_Window,
   Fl_Single_Window, and Fl_Window.

9.151.4.85  size()

void Fl_Widget::size ( int W, int H ) [inline]
Changes the size of the widget.
size(W, H) is a shortcut for resize(x(), y(), W, H).
Parameters
   in   W/H new size
See also
   position(int,int), resize(int,int,int,int)

9.151.4.86  take_focus()

int Fl_Widget::take_focus ( )
Gives the widget the keyboard focus.
Tries to make this widget be the Fl::focus() widget, by first sending it an FL_FOCUS event, and if it returns non-zero,
setting Fl::focus() to this widget. You should use this method to assign the focus to a widget.
Returns
   true if the widget accepted the focus.

9.151.4.87  takesevents()

unsigned int Fl_Widget::takesevents ( ) const [inline]
Returns if the widget is able to take events. This is the same as (active() && !output() && visible()) but is faster.
Return values

| 0 | if the widget takes no events |

9.151.4.88  test_shortcut() [1/2]

```cpp
int Fl_Widget::test_shortcut ( )
```

Returns true if the widget's label contains the entered '&x' shortcut.
This method must only be called in handle() methods or callbacks after a keypress event (usually FL_KEYDOWN or FL_SHORTCUT). The widget's label is searched for a '&x' shortcut, and if found, this is compared with the entered key value.

Fl::event_text() is used to get the entered key value.

Returns

true, if the entered text matches the widget's '&x' shortcut, false (0) otherwise.

Note

Internal use only.

9.151.4.89  test_shortcut() [2/2]

```cpp
int Fl_Widget::test_shortcut ( const char * t, const bool require_alt = false ) [static]
```

Returns true if the given text t contains the entered '&x' shortcut.
This method must only be called in handle() methods or callbacks after a keypress event (usually FL_KEYDOWN or FL_SHORTCUT). The given text t (usually a widget's label or menu text) is searched for a '&x' shortcut, and if found, this is compared with the entered key value.

Fl::event_text() is used to get the entered key value. Fl::event_state() is used to get the Alt modifier, if require←_alt is true.

Parameters

<table>
<thead>
<tr>
<th>t</th>
<th>text or label to search for '&amp;x' shortcut.</th>
</tr>
</thead>
<tbody>
<tr>
<td>require_alt</td>
<td>if true: match only if Alt key is pressed.</td>
</tr>
</tbody>
</table>

Returns

true, if the entered text matches the '&x' shortcut in t; false (0) otherwise.

Note

Internal use only.

9.151.4.90  tooltip() [1/2]

```cpp
const char * Fl_Widget::tooltip ( ) const [inline]
```

Gets the current tooltip text.

Returns

a pointer to the tooltip text or NULL

See also

tooltip(const char*), copy_tooltip(const char*)
9.151.4.91 tooltip() [2/2]

void Fl_Widget::tooltip(const char * text)

Sets the current tooltip text.
Sets a string of text to display in a popup tooltip window when the user hovers the mouse over the widget. The string is not copied, so make sure any formatted string is stored in a static, global, or allocated buffer. If you want a copy made and managed for you, use the copy_tooltip() method, which will manage the tooltip string automatically. If no tooltip is set, the tooltip of the parent is inherited. Setting a tooltip for a group and setting no tooltip for a child will show the group's tooltip instead. To avoid this behavior, you can set the child's tooltip to an empty string ("").

Parameters

| in | text | New tooltip text (no copy is made) |

See also

copy_tooltip(const char*), tooltip()

9.151.4.92 top_window()

Fl_Window * Fl_Widget::top_window() const

Returns a pointer to the top-level window for the widget.
In other words, the 'window manager window' that contains this widget. This method differs from window() in that it won't return sub-windows (if there are any).

Returns

the top-level window, or NULL if no top-level window is associated with this widget.

See also

window()

9.151.4.93 top_window_offset()

Fl_Window * Fl_Widget::top_window_offset(int & xoff, int & yoff) const

Finds the x/y offset of the current widget relative to the top-level window.

Parameters

| out | xoff,yoff | Returns the x/y offset |

Returns

the top-level window (or NULL for a widget that's not in any window)

9.151.4.94 type() [1/2]

uchar Fl_Widget::type() const [inline]

Gets the widget type.
Returns the widget type value, which is used for Forms compatibility and to simulate RTTI.

Todo Explain "simulate RTTI" (currently only used to decide if a widget is a window, i.e. type() >= FL_WINDOW ?). Is type() really used in a way that ensures "Forms compatibility"?
9.151.4.95  type() [2/2]

void Fl_Widget::type (uchar t) [inline]

Sets the widget type.
This is used for Forms compatibility.

9.151.4.96  user_data() [1/2]

void Fl_Widget::user_data ( ) const [inline]

Gets the user data for this widget.
Gets the current user data (void *) argument that is passed to the callback function.

Returns
user data as a pointer

9.151.4.97  user_data() [2/2]

void Fl_Widget::user_data (void *v) [inline]

Sets the user data for this widget.
Sets the new user data (void *) argument that is passed to the callback function.

Parameters

|   | v   | new user data |

9.151.4.98  visible()

unsigned int Fl_Widget::visible ( ) const [inline]

Returns whether a widget is visible.

Return values

|   | if the widget is not drawn and hence invisible. |

See also
show(), hide(), visible_r()

9.151.4.99  visible_focus() [1/2]

unsigned int Fl_Widget::visible_focus ( ) [inline]

Checks whether this widget has a visible focus.

Return values

|   | if this widget has no visible focus. |
See also

visible_focus(int), set_visible_focus(), clear_visible_focus()

9.151.4.100 visible_focus() [2/2]

void Fl_Widget::visible_focus ( int v ) [inline]

Modifies keyboard focus navigation.

Parameters

| in v | set or clear visible focus |

See also

set_visible_focus(), clear_visible_focus(), visible_focus()

9.151.4.101 visible_r()

int Fl_Widget::visible_r ( ) const

Returns whether a widget and all its parents are visible.

Return values

0 if the widget or any of its parents are invisible.

See also

show(), hide(), visible()

9.151.4.102 w() [1/2]

int Fl_Widget::w ( ) const [inline]

Gets the widget width.

Returns

the width of the widget in pixels.

9.151.4.103 w() [2/2]

void Fl_Widget::w ( int v ) [inline], [protected]

Internal use only. Use position(int,int), size(int,int) or resize(int,int,int,int) instead.

9.151.4.104 when() [1/2]

Fl_When Fl_Widget::when ( ) const [inline]

Returns the conditions under which the callback is called. You can set the flags with when(uchar), the default value is FL_WHEN_RELEASE.

Returns

set of flags

See also

when(uchar)
**when()** [2/2]

```cpp
void Fl_Widget::when (uchar i) [inline]
```

Sets the flags used to decide when a callback is called. This controls when callbacks are done. The following values are useful, the default value is FL_WHEN_RELEASE:

- 0: The callback is not done, but changed() is turned on.
- FL_WHEN_CHANGED: The callback is done each time the text is changed by the user.
- FL_WHEN_RELEASE: The callback will be done when this widget loses the focus, including when the window is unmapped. This is a useful value for text fields in a panel where doing the callback on every change is wasteful. However the callback will also happen if the mouse is moved out of the window, which means it should not do anything visible (like pop up an error message). You might do better setting this to zero, and scanning all the items for changed() when the OK button on a panel is pressed.
- FL_WHEN_ENTER_KEY: If the user types the Enter key, the entire text is selected, and the callback is done if the text has changed. Normally the Enter key will navigate to the next field (or insert a newline for a Fl_Multiline_Input) - this changes the behavior.
- FL_WHEN_ENTER_KEY | FL_WHEN_NOT_CHANGED: The Enter key will do the callback even if the text has not changed. Useful for command fields. Fl_Widget::when() is a set of bitflags used by subclasses of Fl_Widget to decide when to do the callback.

If the value is zero then the callback is never done. Other values are described in the individual widgets. This field is in the base class so that you can scan a panel and do_callback() on all the ones that don't do their own callbacks in response to an "OK" button.

**Parameters**

| in | i | set of flags |

**window()**

```cpp
Fl_Window * Fl_Widget::window () const
```

Returns a pointer to the nearest parent window up the widget hierarchy. This will return sub-windows if there are any, or the parent window if there's no sub-windows. If this widget IS the top-level window, NULL is returned.

**Return values**

| NULL | if no window is associated with this widget. |

**Note**

for an Fl_Window widget, this returns its parent window (if any), not this window.

**See also**

`top_window()`

**x()** [1/2]

```cpp
int Fl_Widget::x () const [inline]
```

Gets the widget position in its window.

**Returns**

the x position relative to the window
9.151.4.108 x() [2/2]
void Fl_Widget::x (int v) [inline], [protected]
Internal use only.
Use position(int,int), size(int,int) or resize(int,int,int,int) instead.

9.151.4.109 y() [1/2]
int Fl_Widget::y ( ) const [inline]
Gets the widget position in its window.
Returns
the y position relative to the window

9.151.4.110 y() [2/2]
void Fl_Widget::y (int v) [inline], [protected]
Internal use only.
Use position(int,int), size(int,int) or resize(int,int,int,int) instead.
The documentation for this class was generated from the following files:
• Fl_Widget.H
• Fl.cxx
• fl_boxtype.cxx
• fl_labeltype.cxx
• fl_shortcut.cxx
• Fl_Tooltip.cxx
• Fl_Widget.cxx
• Fl_Window.cxx

9.152 Fl_Widget_Tracker Class Reference

This class should be used to control safe widget deletion.
#include <Fl.H>

Public Member Functions
• int deleted ()
  Returns 1, if the watched widget has been deleted.
• int exists ()
  Returns 1, if the watched widget exists (has not been deleted).
• Fl_Widget_Tracker (Fl_Widget *wi)
The constructor adds a widget to the watch list.
• Fl_Widget * widget ()
  Returns a pointer to the watched widget.
• ~Fl_Widget_Tracker ()
The destructor removes a widget from the watch list.
9.152.1 Detailed Description

This class should be used to control safe widget deletion. You can use an Fl_Widget_Tracker object to watch another widget, if you need to know, if this widget has been deleted during a callback. This simplifies the use of the "safe widget deletion" methods Fl::watch_widget_pointer() and Fl::release_widget_pointer() and makes their use more reliable, because the destructor automatically releases the widget pointer from the widget watch list.

It is intended to be used as an automatic (local/stack) variable, such that the automatic destructor is called when the object's scope is left. This ensures that no stale widget pointers are left in the widget watch list (see example below).

You can also create Fl_Widget_Tracker objects with new, but then it is your responsibility to delete the object (and thus remove the widget pointer from the watch list) when it is not needed any more.

Example:

```c
int MyClass::handle (int event) {
  if (...) {
    Fl_Widget_Tracker wp(this); // watch myself
    do_callback(); // call the callback
    if (wp.deleted()) return 1; // exit, if deleted
    // Now we are sure that the widget has not been deleted.
    // It is safe to access the widget
    clear_changed(); // access the widget
  }
}
```

9.152.2 Member Function Documentation

9.152.2.1 deleted()

```c
int Fl_Widget_Tracker::deleted ( ) [inline]
```

Returns 1, if the watched widget has been deleted. This is a convenience method. You can also use something like

```c
if (wp.widget() == 0) // ...
```

where wp is an Fl_Widget_Tracker object.

9.152.2.2 exists()

```c
int Fl_Widget_Tracker::exists ( ) [inline]
```

Returns 1, if the watched widget exists (has not been deleted). This is a convenience method. You can also use something like

```c
if (wp.widget() != 0) // ...
```

where wp is an Fl_Widget_Tracker object.

9.152.2.3 widget()

```c
Fl_Widget * Fl_Widget_Tracker::widget ( ) [inline]
```

Returns a pointer to the watched widget. This pointer is NULL, if the widget has been deleted.

The documentation for this class was generated from the following files:

- Fl.H
- Fl.cxx

9.153 Fl_Window Class Reference

This widget produces an actual window.

```c
#include <Fl_Window.H>
```

Inheritance diagram for Fl_Window:
Classes

- struct shape_data_type
  
  Data supporting a non-rectangular window shape.

Public Member Functions

- virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- unsigned int border () const
  
  See void Fl_Window::border(int)
- void border (int b)
  
  Sets whether or not the window manager border is around the window.
- void clear_border ()
  
  Fast inline function to turn the window manager border off.
- void clear_modal_states ()
  
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
- void copy_label (const char ∗a)
  
  Sets the window titlebar label to a copy of a character string.
- void cursor (const Fl_RGB_Image ∗, int, int)
  
  Changes the cursor for this window.
- void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.
- void cursor (Fl_Cursor)
  
  Changes the cursor for this window.
- int decorated_h ()
  
  Returns the window height including any window title bar and any frame added by the window manager.
- int decorated_w ()
  
  Returns the window width including any frame added by the window manager.
- void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.
- void default_cursor (Fl_Cursor)
  
  Sets the default window cursor.
- Fl_Window (int w, int h, const char ∗title=0)
  
  Creates a window from the given size and title.
- Fl_Window (int x, int y, int w, int h, const char ∗title=0)
  
  Creates a window from the given position, size and title.
- void free_position ()
  
  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.
- **void** **fullscreen** ()
  Makes the window completely fill one or more screens, without any window manager border visible.

- **unsigned int** **fullscreen_active** () const
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.

- **void** **fullscreen_off** ()
  Turns off any side effects of **fullscreen()**

- **void** **fullscreen_off** (int X, int Y, int W, int H)
  Turns off any side effects of **fullscreen()** and does **resize(x,y,w,h)**.

- **void** **fullscreen_screens** (int top, int bottom, int left, int right)
  Sets which screens should be used when this window is in fullscreen mode.

- **virtual** **int** **handle** (int)
  Handles the specified event.

- **virtual void** **hide** ()
  Removes the window from the screen.

- **void** **hotspot** (const Fl_Widget &p, int offscreen=0)
  See **void Fl_Window::hotspot(int x, int y, int offscreen = 0)**

- **void** **hotspot** (const Fl_Widget *, int offscreen=0)
  See **void Fl_Window::hotspot(int x, int y, int offscreen = 0)**

- **void** **hotspot** (int x, int y, int offscreen=0)
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- **const void** * **icon()** const
  Gets the current icon window target dependent data.

- **void** **icon** (const Fl_RGB_Image *)
  Sets or resets a single window icon.

- **void** **icon** (const void *ic)
  Sets the current icon window target dependent data.

- **void** **iconize** ()
  Iconifies the window.

- **const char** * **iconlabel()** const
  See **void Fl_Window::iconlabel(const char *)**

- **void** **iconlabel** (const char *)
  Sets the icon label.

- **void** **icons** (const Fl_RGB_Image *[ ], int)
  Sets the window icons.

- **const char** * **label()** const
  See **void Fl_Window::label(const char *)**

- **void** **label** (const char *)
  Sets the window title bar label.

- **void** **label** (const char *label, const char *iconlabel)
  Sets the icon label.

- **void** **make_current** ()
  Sets things up so that the drawing functions in `<FL/fl_draw.H>` will go into this window.

- **unsigned int** **menu_window()** const
  Returns true if this window is a menu window.

- **unsigned int** **modal()** const
  Returns true if this window is modal.

- **unsigned int** **non_modal()** const
  Returns true if this window is modal or non-modal.
• unsigned int **override** () const  
  Returns non zero if FL_OVERRIDE flag is set, 0 otherwise.

• virtual void **resize** (int X, int Y, int W, int H)  
  Changes the size and position of the window.

• void **set_menu_window** ()  
  Marks the window as a menu window.

• void **set_modal** ()  
  A "modal" window, when **shown()**, will prevent any events from being delivered to other windows in the same program, 
  and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

• void **set_non_modal** ()  
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a **modal()** one in that it remains on 
  top, but it has no effect on event delivery.

• void **set_override** ()  
  Activates the flags NOBORDER|FL_OVERRIDE.

• void **set_tooltip_window** ()  
  Marks the window as a tooltip window.

• void **shape** (const Fl_Image &b)  
  Set the window's shape with an Fl_Image.

• void **shape** (const Fl_Image *img)  
  Assigns a non-rectangular shape to the window.

• virtual void **show** ()  
  Puts the window on the screen.

• void **show** (int argc, char **argv)  
  Puts the window on the screen and parses command-line arguments.

• int **shown** ()  
  Returns non-zero if **show()** has been called (but not **hide()**).

• void **size_range** (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)  
  Sets the allowable range the user can resize this window to.

• unsigned int **tooltip_window** () const  
  Returns true if this window is a tooltip window.

• void **wait_forExpose** ()  
  Waits for the window to be displayed after calling **show()**.

• int **x_root** () const  
  Gets the x position of the window on the screen.

• const char * **xclass** () const  
  Returns the xclass for this window, or a default.

• void **xclass** (const char *c)  
  Sets the xclass for this window.

• int **y_root** () const  
  Gets the y position of the window on the screen.

• virtual **~Fl_Window** ()  
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Group

• **Fl_Widget** *& _ddfdesign_ kludge ()  
  This is for forms compatibility only.

• void **add** (Fl_Widget &)  
  The widget is removed from its current group (if any) and then added to the end of this group.

• void **add** (Fl_Widget *)  
  See void Fl_Group::add(Fl_Widget &w)
• void **add_resizable** (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget *const * array () const
  Returns a pointer to the array of children.

• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• void **begin** ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

• Fl_Widget * child (int n) const
  Returns array()[n].

• int **children** () const
  Returns how many child widgets the group has.

• void **clear** ()
  Deletes all child widgets from memory recursively.

• unsigned int **clip_children** ()
  Returns the current clipping mode.

• void **clip_children** (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• void **end** ()
  Exactly the same as current(this->parent()).

• int **find** (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.

• int **find** (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.

• Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.

• void **focus** (Fl_Widget +W)

• void **forms_end** ()
  This is for forms compatibility only.

• void **init_sizes** ()
  Resets the internal array of widget sizes and positions.

• void **insert** (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

• void **insert** (Fl_Widget &o, Fl_Widget * before)
  This does insert(w, find(before)).

• void **remove** (Fl_Widget &)
  Removes a widget from the group but does not delete it.

• void **remove** (Fl_Widget +o)
  Removes the widget o from the group.

• void **remove** (int index)
  Removes the widget at index from the group but does not delete it.

• Fl_Widget * resizable () const
  See void Fl_Group::resizable(Fl_Widget +box)

• void **resizable** (Fl_Widget &o)
  See void Fl_Group::resizable(Fl_Widget +box)

• void **resizable** (Fl_Widget +o)
  The resizable widget defines the resizing box for the group.

• virtual ~Fl_Group ()
  The destructor also defines the resizing box for the group.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback * cb, void * p)
  Sets the current callback function for the widget.
- void callback (Fl_Callback0 * cb)
- void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
Sets the background color of the widget.

- **void** `color (Fl_Color bg, Fl_Color sel)`
  
  Sets the background and selection color of the widget.

- **Fl_Color** `color2 () const`
  
  For back compatibility only.

- **void** `color2 (unsigned a)`
  
  For back compatibility only.

- **int** `contains (const Fl_Widget *w) const`
  
  Checks if `w` is a child of this widget.

- **void** `copy_label (const char *new_label)`
  
  Sets the current label.

- **void** `copy_tooltip (const char *text)`
  
  Sets the current tooltip text.

- **uchar** `damage () const`
  
  Returns non-zero if `draw()` needs to be called.

- **void** `damage (uchar c)`
  
  Sets the damage bits for the widget.

- **void** `damage (uchar c, int x, int y, int w, int h)`
  
  Sets the damage bits for an area inside the widget.

- **int** `damage_resize (int, int, int, int)`
  
  Internal use only.

- **void** `deactivate ()`
  
  Deactivates the widget.

- **Fl_Image** `* deimage ()`
  
  Gets the image that is used as part of the widget label.

- **const Fl_Image** `* deimage () const`

- **void** `deimage (Fl_Image &img)`
  
  Sets the image to use as part of the widget label.

- **void** `deimage (Fl_Image *img)`
  
  Sets the image to use as part of the widget label.

- **void** `do_callback ()`
  
  Calls the widget callback.

- **void** `do_callback (Fl_Widget *o, long arg)`
  
  Calls the widget callback.

- **void** `do_callback (Fl_Widget *o, void *arg=0)`
  
  Calls the widget callback.

- **void** `draw_label (int, int, int, int, Fl_Align) const`
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int** `h () const`
  
  Gets the widget height.

- **Fl_Image** `* image ()`
  
  Gets the image that is used as part of the widget label.

- **const Fl_Image** `* image () const`

- **void** `image (Fl_Image &img)`
  
  Sets the image to use as part of the widget label.

- **void** `image (Fl_Image *img)`
  
  Sets the image to use as part of the widget label.

- **int** `inside (const Fl_Widget *wgt) const`
  
  Checks if this widget is a child of `wgt`.

- **int** `is_label_copied () const`
  
  Returns whether the current label was assigned with `copy_label()`.
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (FL_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• FL_Color labelcolor () const
  Gets the label color.
• void labelcolor (FL_Color c)
  Sets the label color.
• FL_Font labelfont () const
  Gets the font to use.
• void labelfont (FL_Font f)
  Sets the font to use.
• FL_Fontsize labelszize () const
  Gets the font size in pixels.
• void labelszize (FL_Fontsize pix)
  Sets the font size in pixels.
• FL_Labeltype labeltype () const
  Gets the label type.
• void labeltype (FL_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• FL_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (FL_Group *p)
  Internal use only - “for hacks only”.
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• FL_Color selection_color () const
  Gets the selection color.
• void selection_color (FL_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• void size (int W, int H)
Changes the size of the widget.

- int take_focus()
  Gives the widget the keyboard focus.

- unsigned int takesevents() const
  Returns if the widget is able to take events.

- int test_shortcut()
  Returns true if the widget's label contains the entered 'x' shortcut.

- const char * tooltip() const
  Gets the current tooltip text.

- void tooltip(const char *text)
  Sets the current tooltip text.

- Fl_Window * top_window() const
  Returns a pointer to the top-level window for the widget.

- Fl_Window * top_window_offset(int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type() const
  Gets the widget type.

- void type(uchar t)
  Sets the widget type.

- int use_accents_menu()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void * user_data() const
  Gets the user data for this widget.

- void user_data(void *v)
  Sets the user data for this widget.

- unsigned int visible() const
  Returns whether a widget is visible.

- unsigned int visible_focus()
  Checks whether this widget has a visible focus.

- void visible_focus(int v)
  Modifies keyboard focus navigation.

- int visible_r() const
  Returns whether a widget and all its parents are visible.

- int w() const
  Gets the widget width.

- Fl_When when() const
  Returns the conditions under which the callback is called.

- void when(uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window * window() const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x() const
  Gets the widget position in its window.

- int y() const
  Gets the widget position in its window.

- virtual ~Fl_Widget()
  Destroys the widget.
Static Public Member Functions

- static Fl_Window * current ()
  Returns the last window that was made current.
- static void default_callback (Fl_Window *, void *)
  Back compatibility: Sets the default callback v for win to call on close event.
- static void default_icon (const Fl_RGB_Image *)
  Sets a single default window icon.
- static void default_icons (const Fl_RGB_Image *[], int)
  Sets the default window icons.
- static const char * default_xclass ()
  Returns the default xclass.
- static void default_xclass (const char *)
  Sets the default window xclass.

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *, void *)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Member Functions

- virtual void draw ()
  Draws the widget.
- virtual void flush ()
  Forces the window to be drawn, this window is also made current and calls draw().
- int force_position () const
  Returns the internal state of the window’s FORCE_POSITION flag.
- void force_position (int force)
  Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void free_icons ()
  Deletes all icons previously attached to the window.

Protected Member Functions inherited from Fl_Group

- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- int * sizes ()
Returns the internal array of widget sizes and positions.

- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const
  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus ()
  Draws a focus rectangle around the widget

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

Protected Attributes

- shape_data_type ∗ shape_data
  non-null means the window has a non-rectangular shape

Static Protected Attributes

- static Fl_Window ∗ current_
  Stores the last window that was made current.

Friends

- class Fl_X
Additional Inherited Members

}

flags possible values enumeration.

9.153.1 Detailed Description

This widget produces an actual window. This can either be a main window, with a border and title and all the window management controls, or a "subwindow" inside a window. This is controlled by whether or not the window has a parent().

Once you create a window, you usually add children Fl_Widget's to it by using window->add(child) for each new widget. See Fl_Group for more information on how to add and remove children.

There are several subclasses of Fl_Window that provide double-buffering, overlay, menu, and OpenGL support.

The window’s callback is done if the user tries to close a window using the window manager and Fl::modal() is zero or equal to the window. Fl_Window has a default callback that calls Fl_Window::hide().

9.153.2 Constructor & Destructor Documentation

9.153.2.1 Fl_Window() [1/2]

Fl_Window::Fl_Window (int w, int h, const char * title = 0)

Creates a window from the given size and title.

If Fl_Group::current() is not NULL, the window is created as a subwindow of the parent window.

The (w,h) form of the constructor creates a top-level window and asks the window manager to position the window. The (x,y,w,h) form of the constructor either creates a subwindow or a top-level window at the specified location (x,y) subject to window manager configuration. If you do not specify the position of the window, the window manager will pick a place to show the window or allow the user to pick a location. Use position(x,y) or hotspot() before calling show() to request a position on the screen. See Fl_Window::resize() for some more details on positioning windows.

Top-level windows initially have visible() set to 0 and parent() set to NULL. Subwindows initially have visible() set to 1 and parent() set to the parent window pointer.

Fl_Widget::box() defaults to FL_FLAT_BOX. If you plan to completely fill the window with children widgets you should change this to FL_NO_BOX. If you turn the window border off you may want to change this to FL_UP_BOX.

See also

Fl_Window(int x, int y, int w, int h, const char * title)

9.153.2.2 Fl_Window() [2/2]

Fl_Window::Fl_Window (int x, int y, int w, int h, const char * title = 0)
Creates a window from the given position, size and title.

See also

\texttt{Fl\_Window(int \ w, int \ h, const char \* \ title)}

9.153.2.3 \texttt{\sim Fl\_Window()}

\texttt{Fl\_Window::\sim Fl\_Window();} \texttt{[virtual]}

The destructor also deletes all the children.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code.

A kludge has been done so the \texttt{Fl\_Window} and all of its children can be automatic (local) variables, but you must declare the \texttt{Fl\_Window} first so that it is destroyed last.

9.153.3 Member Function Documentation

9.153.3.1 \texttt{as\_window()}

\texttt{virtual Fl\_Window* Fl\_Window::as\_window();} \texttt{[virtual]}

Returns an \texttt{Fl\_Window} pointer if this widget is an \texttt{Fl\_Window}.

Use this method if you have a widget (pointer) and need to know whether this widget is derived from \texttt{Fl\_Window}. If it returns non-NULL, then the widget in question is derived from \texttt{Fl\_Window}, and you can use the returned pointer to access its children or other \texttt{Fl\_Window}-specific methods.

Return values

\texttt{NULL} if this widget is not derived from \texttt{Fl\_Window}.

Note

This method is provided to avoid \texttt{dynamic\_cast}.

See also

\texttt{Fl\_Widget::as\_group(), Fl\_Widget::as\_gl\_window()}

Reimplemented from \texttt{Fl\_Widget}.

9.153.3.2 \texttt{border()}

\texttt{void Fl\_Window::border(int \ b);} \texttt{[inline]}

Sets whether or not the window manager border is around the window.

The default value is true. \texttt{void border(int)} can be used to turn the border on and off. \textit{Under most X window managers this does not work after show() has been called, although SGI's 4DWM does work.}

9.153.3.3 \texttt{clear\_border()}

\texttt{void Fl\_Window::clear\_border();} \texttt{[inline]}

Fast inline function to turn the window manager border off.

It only works before \texttt{show()} is called.

9.153.3.4 \texttt{clear\_modal\_states()}

\texttt{void Fl\_Window::clear\_modal\_states();} \texttt{[inline]}

Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

Note that there are \texttt{three} states for a window: modal, non-modal, and normal.

You can not change the "modality" of a window whilst it is shown, so it is necessary to first \texttt{hide()} the window, change its "modality" as required, then re-show the window for the new state to take effect.
This method can also be used to change a "modal" window into a "non-modal" one. On several supported platforms, the "modal" state over-rides the "non-modal" state, so the "modal" state must be cleared before the window can be set into the "non-modal" state. In general, the following sequence should work:

```cpp
win->hide();
win->clear_modal_states();
// Set win to new state as desired, or leave "normal", e.g....
win->set_non_modal();
win->show();
```

**Note**

Under some window managers, the sequence of hiding the window and changing its modality will often cause it to be re-displayed at a different position when it is subsequently shown. This is an irritating feature but appears to be unavoidable at present. As a result we would advise to use this method only when absolutely necessary.

See also

- `void set_modal()`, `void set_non_modal()`

### 9.153.3.5 current()

**FL_Window** ∗ **FL_Window:** current ( ) [static]

Returns the last window that was made current.

See also

- `FL_Window::make_current()`

### 9.153.3.6 cursor() [1/3]

```cpp
void FL_Window::cursor ( 
    const FL_RGB_Image ∗ image,
    int hotx,
    int hoty )
```

Changes the cursor for this window.

This always calls the system, if you are changing the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor is different.

The default cursor will be used if the provided image cannot be used as a cursor.

See also

- `cursor(Fl_Cursor), default_cursor()`

### 9.153.3.7 cursor() [2/3]

```cpp
void FL_Window::cursor ( 
    Fl_Cursor c,
    Fl_Color ,
    Fl_Color = FL_WHITE )
```

For back compatibility only.

Same as `FL_Window::cursor(Fl_Cursor)`

### 9.153.3.8 cursor() [3/3]

```cpp
void FL_Window::cursor ( 
    Fl_Cursor c )
```

Changes the cursor for this window.

This always calls the system, if you are changing the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor is different.

The type `Fl_Cursor` is an enumeration defined in `<FL/Enumerations.H>`.
See also

cursor(const Fl_RGB_Image*, int, int), default_cursor()

9.153.3.9  decorated_h()

int Fl_Window::decorated_h ( )
Returns the window height including any window title bar and any frame added by the window manager.
Same as h() if applied to a subwindow.

9.153.3.10  decorated_w()

int Fl_Window::decorated_w ( )
Returns the window width including any frame added by the window manager.
Same as w() if applied to a subwindow.

9.153.3.11  default_cursor() [1/2]

void Fl_Window::default_cursor ( 
  Fl_Cursor c,
  Fl_Color ,
  Fl_Color = FL_WHITE )
For back compatibility only.
same as Fl_Window::default_cursor(Fl_Cursor)

9.153.3.12  default_cursor() [2/2]

void Fl_Window::default_cursor ( 
  Fl_Cursor c )
Sets the default window cursor.
This is the cursor that will be used after the mouse pointer leaves a widget with a custom cursor set.

See also

cursor(const Fl_RGB_Image*, int, int), default_cursor()

9.153.3.13  default_icon()

void Fl_Window::default_icon ( 
  const Fl_RGB_Image* icon ) [static]
Sets a single default window icon.
If icon is NULL the current default icons are removed.

Parameters

| in | icon | default icon for all windows subsequently created or NULL |

See also

Fl_Window::default_icons(const Fl_RGB_Image*[], int)
Fl_Window::icon(const Fl_RGB_Image*)
Fl_Window::icons(const Fl_RGB_Image*[], int)

9.153.3.14  default_icons()

void Fl_Window::default_icons ( 
  const Fl_RGB_Image* icons[],
  int count ) [static]
Sets the default window icons. The default icons are used for all windows that don’t have their own icons set before `show()` is called. You can change the default icons whenever you want, but this only affects windows that are created (and shown) after this call. The given images in `icons` are copied. You can use a local variable or free the images immediately after this call.

**Parameters**

```
<table>
<thead>
<tr>
<th>in</th>
<th>icons</th>
<th>default icons for all windows subsequently created</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>count</td>
<td>number of images in <code>icons</code>. Set to 0 to remove the current default icons</td>
</tr>
</tbody>
</table>
```

See also

- `Fl_Window::default_icon(const Fl_RGB_Image *)`
- `Fl_Window::icon(const Fl_RGB_Image *)`
- `Fl_Window::icons(const Fl_RGB_Image *[ ], int)`

### 9.153.3.15 default_xclass() [1/2]

```
const char * Fl_Window::default_xclass ( ) [static]
```

Returns the default xclass.

See also

```
Fl_Window::default_xclass(const char *)
```

### 9.153.3.16 default_xclass() [2/2]

```
void Fl_Window::default_xclass ( 
    const char * xc ) [static]
```

Sets the default window xclass.
The default xclass is used for all windows that don’t have their own xclass set before `show()` is called. You can change the default xclass whenever you want, but this only affects windows that are created (and shown) after this call. The given string `xc` is copied. You can use a local variable or free the string immediately after this call. If you don’t call this, the default xclass for all windows will be “FLTK”. You can reset the default xclass by specifying NULL for `xc`. If you call `Fl_Window::xclass(const char *)` for any window, then this also sets the default xclass, unless it has been set before.

**Parameters**

```
|    in | xc | default xclass for all windows subsequently created |
```

See also

```
Fl_Window::xclass(const char *)
```

### 9.153.3.17 draw()

```
void Fl_Window::draw ( ) [protected], [virtual]
```

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead. Override this function to draw your own widgets. If you ever need to call another widget’s draw method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:
FL_Widget *s = &scroll;  // scroll is an embedded Fl_Scrollbar
s->draw();       // calls Fl_Scrollbar::draw()

Reimplemented from Fl_Group.
Reimplemented in Fl_Cairo_Window, Fl_GL_Window, and Fl_Glut_Window.

### 9.153.3.18 flush()

```c
void Fl_Window::flush ( ) [protected], [virtual]
```
Forces the window to be drawn, this window is also made current and calls draw().
Reimplemented in Fl_Double_Window, Fl_GL_Window, Fl_Menu_Window, Fl_Overlay_Window, and Fl_Single_Window.

### 9.153.3.19 force_position() [1/2]

```c
int Fl_Window::force_position ( ) const [inline], [protected]
```
Returns the internal state of the window's FORCE_POSITION flag.

**Return values**

- 1 if flag is set
- 0 otherwise

See also

- force_position(int)

### 9.153.3.20 force_position() [2/2]

```c
void Fl_Window::force_position ( int force ) [inline], [protected]
```
Sets an internal flag that tells FLTK and the window manager to honor position requests.
This is used internally and should not be needed by user code.

**Parameters**

| in  | force | 1 to set the FORCE_POSITION flag, 0 to clear it |

### 9.153.3.21 free_icons()

```c
void Fl_Window::free_icons ( ) [protected]
```
Deletes all icons previously attached to the window.

See also

- Fl_Window::icons(const Fl_RGB_Image *icons[], int count)

### 9.153.3.22 free_position()

```c
void Fl_Window::free_position ( ) [inline]
```
Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.
This is for Forms compatibility only.

**Deprecated** please use force_position(0) instead
9.153.23  fullscreen()

void Fl_Window::fullscreen ( )
Makes the window completely fill one or more screens, without any window manager border visible. You must use fullscreen_off() to undo this.

Note
On some platforms, this can result in the keyboard being grabbed. The window may also be recreated, meaning hide() and show() will be called.

See also
void Fl_Window::fullscreen_screens()

9.153.24  fullscreen_screens()

void Fl_Window::fullscreen_screens ( int top, int bottom, int left, int right )
Sets which screens should be used when this window is in fullscreen mode. The window will be resized to the top of the screen with index top, the bottom of the screen with index bottom, etc.
If this method is never called, or if any argument is < 0, then the window will be resized to fill the screen it is currently on.

See also
void Fl_Window::fullscreen()

9.153.25  handle()

int Fl_Window::handle ( int event ) [virtual]
Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

Parameters

| in event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also
Fl_Event

Reimplemented from Fl_Group.
Reimplemented in Fl_Gl_Window, and Fl_Glut_Window.
9.153.3.26  hide()

void Fl_Window::hide ( ) [virtual]
Removes the window from the screen.
If the window is already hidden or has not been shown then this does nothing and is harmless.
Reimplemented from Fl_Widget.
Reimplemented in Fl_Double_Window, Fl_Gl_Window, Fl_Menu_Window, and Fl_Overlay_Window.

9.153.3.27  hotspot()

void Fl_Window::hotspot ( int x, int y, int offscreen = 0 )
Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which
may be the window itself.
If the optional offscreen parameter is non-zero, then the window is allowed to extend off the screen (this does not
work with some X window managers).

See also

position()

9.153.3.28  icon() [1/3]

const void * Fl_Window::icon ( ) const
Gets the current icon window target dependent data.

Deprecated in 1.3.3

9.153.3.29  icon() [2/3]

void Fl_Window::icon ( const Fl_RGB_Image * icon )
Sets or resets a single window icon.
A window icon can be changed while the window is shown, but this may be platform and/or window manager
dependent. To be sure that the window displays the correct window icon you should always set the icon before the
window is shown.
If a window icon has not been set for a particular window, then the default window icon (see links below) or the
system default icon will be used.

Parameters

| in  | icon | icon for this window, NULL to reset window icon. |

See also

Fl_Window::default_icon(const Fl_RGB_Image * )
Fl_Window::default_icons(const Fl_RGB_Image *[], int)
Fl_Window::icons(const Fl_RGB_Image *[], int)

9.153.3.30  icon() [3/3]

void Fl_Window::icon ( const void * ic )
Sets the current icon window target dependent data.

Deprecated in 1.3.3
9.153.31 iconize()

```
void Fl_Window::iconize ( )
```

Iconifies the window.
If you call this when shown() is false it will show() it as an icon. If the window is already iconified this does nothing. Call show() to restore the window.
When a window is iconified/restored (either by these calls or by the user) the handle() method is called with FL_HIDE and FL_SHOW events and visible() is turned on and off.
There is no way to control what is drawn in the icon except with the string passed to Fl_Window::xclass(). You should not rely on window managers displaying the icons.

9.153.32 icons()

```
void Fl_Window::icons ( const Fl_RGB_Image ∗ icons[], int count )
```

Sets the window icons.
You may set multiple window icons with different sizes. Dependent on the platform and system settings the best (or the first) icon will be chosen.
The given images in icons are copied. You can use a local variable or free the images immediately after this call.
If count is zero, current icons are removed. If count is greater than zero (must not be negative), then icons[] must contain at least count valid image pointers (not NULL). Otherwise the behavior is undefined.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>icons</th>
<th>icons for this window</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>count</td>
<td>number of images in icons. Set to 0 to remove the current icons</td>
</tr>
</tbody>
</table>

Fl_Window::default_icons(const Fl_RGB_Image ∗[], int)
Fl_Window::icon(const Fl_RGB_Image ∗)

9.153.33 make_current()

```
void Fl_Window::make_current ( )
```

Sets things up so that the drawing functions in `<FL/fl_draw.H>` will go into this window.
This is useful for incremental update of windows, such as in an idle callback, which will make your program behave much better if it draws a slow graphic. **Danger: incremental update is very hard to debug and maintain!**
This method only works for the Fl_Window and Fl_Gl_Window derived classes.

9.153.34 modal()

```
unsigned int Fl_Window::modal ( ) const [inline]
```

Returns true if this window is modal.

9.153.35 resize()

```
virtual void Fl_Window::resize ( int X, int Y, int W, int H ) [virtual]
```

Changes the size and position of the window.
If `shown()` is true, these changes are communicated to the window server (which may refuse that size and cause a further resize). If `shown()` is false, the size and position are used when `show()` is called. See `Fl_Group` for the effect of resizing on the child widgets.

You can also call the `Fl_Widget` methods `size(x,y)` and `position(w,h)`, which are inline wrappers for this virtual function.

A top-level window can not force, but merely suggest a position and size to the operating system. The window manager may not be willing or able to display a window at the desired position or with the given dimensions. It is up to the application developer to verify window parameters after the resize request.

Reimplemented from `Fl_Group`.

Reimplemented in `Fl_Double_Window`, `Fl_Gl_Window`, and `Fl_Overlay_Window`.

### 9.153.3.36 set_menu_window()

```cpp
void Fl_Window::set_menu_window ( ) [inline]
```

Marks the window as a menu window.

This is intended for internal use, but it can also be used if you write your own menu handling. However, this is not recommended.

This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window managers can use different flags to distinguish menu and tooltip windows from normal windows.

This must be called before the window is shown and cannot be changed later.

### 9.153.3.37 set_modal()

```cpp
void Fl_Window::set_modal ( ) [inline]
```

A "modal" window, when `shown()`, will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

Several modal windows may be shown at once, in which case only the last one shown gets events. You can see which window (if any) is modal by calling `Fl::modal()`.

### 9.153.3.38 set_non_modal()

```cpp
void Fl_Window::set_non_modal ( ) [inline]
```

A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a `modal()` one in that it remains on top, but it has no effect on event delivery.

There are three states for a window: modal, non-modal, and normal.

### 9.153.3.39 set_tooltip_window()

```cpp
void Fl_Window::set_tooltip_window ( ) [inline]
```

Marks the window as a tooltip window.

This is intended for internal use, but it can also be used if you write your own tooltip handling. However, this is not recommended.

This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window managers can use different flags to distinguish menu and tooltip windows from normal windows.

This must be called before the window is shown and cannot be changed later.

Note

Since `Fl_Tooltip_Window` is derived from `Fl_Menu_Window`, this also clears the `menu_window()` state.

### 9.153.3.40 shape() [1/2]

```cpp
void Fl_Window::shape ( const Fl_Image & b ) [inline]
```

Set the window's shape with an `Fl_Image`.

See also

```cpp
void shape(const Fl_Image* img)
```
9.153.3.41 shape() [2/2]

void Fl_Window::shape(const Fl_Image * img)

Assigns a non-rectangular shape to the window.
This function gives an arbitrary shape (not just a rectangular region) to an Fl_Window. An Fl_Image of any dimension can be used as mask; it is rescaled to the window's dimension as needed.
The layout and widgets inside are unaware of the mask shape, and most will act as though the window's rectangular bounding box is available to them. It is up to you to make sure they adhere to the bounds of their masking shape.

The `img` argument can be an Fl_Bitmap, Fl_Pixmap, Fl_RGB_Image or Fl_Shared_Image:
- With Fl_Bitmap or Fl_Pixmap, the shaped window covers the image part where bitmap bits equal one, or where the pixmap is not fully transparent.
- With an Fl_RGB_Image with an alpha channel (depths 2 or 4), the shaped window covers the image part that is not fully transparent.
- With an Fl_RGB_Image of depth 1 (gray-scale) or 3 (RGB), the shaped window covers the non-black image part.
- With an Fl_Shared_Image, the shape is determined by rules above applied to the underlying image. The shared image should not have been scaled through Fl_Shared_Image::scale().

Platform details:
- On the unix/linux platform, the SHAPE extension of the X server is required. This function does control the shape of Fl_Gl_Window instances.
- On the MSWindows platform, this function does nothing with class Fl_Gl_Window.
- On the Mac platform, OS version 10.4 or above is required. An 8-bit shape-mask is used when `img` is an Fl_RGB_Image: with depths 2 or 4, the image alpha channel becomes the shape mask such that areas with alpha = 0 are out of the shaped window; with depths 1 or 3, white and black are in and out of the shaped window, respectively, and other colors give intermediate masking scores. This function does nothing with class Fl_Gl_Window.

The window borders and caption created by the window system are turned off by default. They can be re-enabled by calling Fl_Window::border(1).
A usage example is found at example/shapedwindow.cxx.

Version
1.3.3 (and requires compilation with FLTK_ABI_VERSION >= 10303)

9.153.3.42 show() [1/2]

virtual void Fl_Window::show() [virtual]

Puts the window on the screen.
Usually (on X) this has the side effect of opening the display.
If the window is already shown then it is restored and raised to the top. This is really convenient because your program can call `show()` at any time, even if the window is already up. It also means that `show()` serves the purpose of `raise()` in other toolkits.

Fl_Window::show(int argc, char ** argv) is used for top-level windows and allows standard arguments to be parsed from the command-line.

Note
For some obscure reasons Fl_Window::show() resets the current group by calling Fl_Group::current(0). The comments in the code say "get rid of very common user bug: forgot end()". Although this is true it may have unwanted side effects if you `show()` an unrelated window (maybe for an error message or warning) while building a window or any other group widget.

Todo Check if we can remove resetting the current group in a later FLTK version (after 1.3.x). This may break "already broken" programs though if they rely on this "feature".
See also

\texttt{Fl\_Window::show(int argc, char \ast\ast argv)}

Reimplemented from \texttt{Fl\_Widget}.
Reimplemented in \texttt{Fl\_Double\_Window}, \texttt{Fl\_Gl\_Window}, \texttt{Fl\_Menu\_Window}, \texttt{Fl\_Overlay\_Window}, and \texttt{Fl\_Single\_Window}.

### 9.153.3.43 \texttt{show()} [2/2]

void \texttt{Fl\_Window::show (}
\begin{verbatim}
   int argc,
   char \ast\ast argv)
\end{verbatim}

Puts the window on the screen and parses command-line arguments.
Usually (on X) this has the side effect of opening the display.
This form should be used for top-level windows, at least for the first (main) window. It allows standard arguments to
be parsed from the command-line. You can use \texttt{argc} and \texttt{argv} from \texttt{main(int argc, char \ast\ast argv)} for this call.
The first call also sets up some system-specific internal variables like the system colors.

\textbf{Todo} explain which system parameters are set up.

#### Parameters

<table>
<thead>
<tr>
<th>\texttt{argc}</th>
<th>command-line argument count, usually from main()</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{argv}</td>
<td>command-line argument vector, usually from main()</td>
</tr>
</tbody>
</table>

See also

\texttt{virtual void Fl\_Window::show()}

### 9.153.3.44 \texttt{shown()}

int \texttt{Fl\_Window::shown ( )} [inline]

Returns non-zero if \texttt{show()} has been called (but not \texttt{hide()}).
You can tell if a window is iconified with \texttt{(w->shown() && !w->visible())}.

### 9.153.3.45 \texttt{size\_range()}

void \texttt{Fl\_Window::size\_range (}
\begin{verbatim}
   int minw,
   int minh,
   int maxw = 0,
   int maxh = 0,
   int dw = 0,
   int dh = 0,
   int aspect = 0) [inline]
\end{verbatim}

Sets the allowable range the user can resize this window to.
This only works for top-level windows.

- \texttt{minw} and \texttt{minh} are the smallest the window can be. Either value must be greater than 0.
- \texttt{maxw} and \texttt{maxh} are the largest the window can be. If either is \texttt{equal} to the minimum then you cannot
  resize in that direction. If either is zero then FLTK picks a maximum size in that direction such that the window will
  fill the screen.
- \texttt{dw} and \texttt{dh} are size increments. The window will be constrained to widths of \texttt{minw + N \times dw}, where \texttt{N} is any
  non-negative integer. If these are less or equal to 1 they are ignored (this is ignored on WIN32).
- \texttt{aspect} is a flag that indicates that the window should preserve its aspect ratio. This only works if both the
  maximum and minimum have the same aspect ratio (ignored on WIN32 and by many X window managers).
If this function is not called, FLTK tries to figure out the range from the setting of \texttt{resizable()}:

- If \texttt{resizable()} is \texttt{NULL} (this is the default) then the window cannot be resized and the resize border and max-size control will not be displayed for the window.

- If either dimension of \texttt{resizable()} is less than 100, then that is considered the minimum size. Otherwise the \texttt{resizable}() has a minimum size of 100.

- If either dimension of \texttt{resizable()} is zero, then that is also the maximum size (so the window cannot resize in that direction).

It is undefined what happens if the current size does not fit in the constraints passed to \texttt{size_range()}.

### 9.153.3.46 \texttt{wait_for_expose()}

```cpp
void Fl_Window::wait_for_expose ( )
```

Waits for the window to be displayed after calling \texttt{show()}. \texttt{Fl_Window::show()} is not guaranteed to show and draw the window on all platforms immediately. Instead this is done in the background; particularly on X11 it will take a few messages (client server roundtrips) to display the window. Usually this small delay doesn't matter, but in some cases you may want to have the window instantiated and displayed synchronously.

Currently (as of FLTK 1.3.4) this method has an effect on X11 and Mac OS. On Windows, \texttt{show()} is always synchronous. The effect of \texttt{show()} varies with versions of Mac OS X: early versions have the window appear on the screen when \texttt{show()} returns, later versions don't. If you want to write portable code and need this synchronous \texttt{show()} feature, add \texttt{win->wait_for_expose()} on all platforms, and FLTK will just do the right thing.

This method can be used for displaying splash screens before calling \texttt{Fl::run()} or for having exact control over which window has the focus after calling \texttt{show()}. If the window is not \texttt{shown()}, this method does nothing.

**Note**

Depending on the platform and window manager \texttt{wait_for_expose()} may not guarantee that the window is fully drawn when it is called. Under X11 it may only make sure that the window is \texttt{mapped}, i.e. the internal (OS dependent) window object was created (and maybe shown on the desktop as an empty frame or something like that). You may need to call \texttt{Fl::flush()} after \texttt{wait_for_expose()} to make sure the window and all its widgets are drawn and thus visible.

FLTK does the best it can do to make sure that all widgets get drawn if you call \texttt{wait_for_expose()} and \texttt{Fl::flush()}. However, dependent on the window manager it can not be guaranteed that this does always happen synchronously. The only guaranteed behavior that all widgets are eventually drawn is if the FLTK event loop is run continuously, for instance with \texttt{Fl::run()}.

**See also**

- \texttt{virtual void Fl_Window::show()}
- Example code for displaying a window before calling \texttt{Fl::run()}
  ```cpp
  Fl_Double_Window win = new Fl_Double_Window(...);
  // do more window initialization here ...
  win->show(); // show window
  win->wait_for_expose(); // wait, until displayed
  Fl::flush(); // make sure everything gets drawn
  // do more initialization work that needs some time here ...
  Fl::run(); // start FLTK event loop
  ```

Note that the window will not be responsive until the event loop is started with \texttt{Fl::run()}.

### 9.153.3.47 \texttt{xclass()} [1/2]

```cpp
const char * Fl_Window::xclass ( ) const
```

Returns the xclass for this window, or a default.

**See also**

- \texttt{Fl_Window::default_xclass(const char *)}
- \texttt{Fl_Window::xclass(const char *)}
9.153.48  xclass() [2/2]

void Fl_Window::xclass (const char * xc)

Sets the xclass for this window.
A string used to tell the system what type of window this is. Mostly this identifies the picture to draw in the icon. This only works if called before calling show().

Under X, this is turned into a XA_WM_CLASS pair by truncating at the first non-alphanumeric character and capitalizing the first character, and the second one if the first is 'x'. Thus "foo" turns into "foo, Foo", and "xprog.1" turns into "xprog, XProg".

Under Microsoft Windows, this string is used as the name of the WNDCLASS structure, though it is not clear if this can have any visible effect.

Since

FLTK 1.3 the passed string is copied. You can use a local variable or free the string immediately after this call.
Note that FLTK 1.1 stores the pointer without copying the string.

If the default xclass has not yet been set, this also sets the default xclass for all windows created subsequently.

Fl_Window::default_xclass(const char *)

9.153.4  Member Data Documentation

9.153.4.1  current_

Fl_Window* Fl_Window::current_ [static], [protected]
Stores the last window that was made current.
See current() const

The documentation for this class was generated from the following files:

- Fl_Window.H
- Fl.cxx
- Fl_arg.cxx
- fl_cursor.cxx
- Fl_Window.cxx
- Fl_Window_fullscreen.cxx
- Fl_Window_hotspot.cxx
- Fl_Window_iconize.cxx
- Fl_Window_shape.cxx

9.154  Fl_Wizard Class Reference

This widget is based off the Fl_Tabs widget, but instead of displaying tabs it only changes "tabs" under program control.
#include <Fl_Wizard.H>

Inheritance diagram for Fl_Wizard:

```
Fl_Widget
   |
   v
Fl_Group
   |
   v
Fl_Wizard
```
Public Member Functions

- **Fl_Wizard** (int, int, int, int, const char ∗=0)
  
  The constructor creates the *Fl_Wizard* widget at the specified position and size.

- **void** next ()
  
  This method shows the next child of the wizard.

- **void** prev ()
  
  Shows the previous child.

- **Fl_Widget ∗** value ()
  
  Gets the current visible child widget.

- **void** value (Fl_Widget ∗)
  
  Sets the child widget that is visible.

Public Member Functions inherited from *Fl_Group*

- **Fl_Widget ∗& _ddfdesign_kludge ()**
  
  This is for forms compatibility only.

- **void** add (Fl_Widget ∗)
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void** add (Fl_Widget ∗o)
  
  See void *Fl_Group::add(Fl_Widget ∗w)*

- **void** add resizable (Fl_Widget ∗o)
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget ∗const ∗ array () const**
  
  Returns a pointer to the array of children.

- **virtual Fl_Group ∗ as_group ()**
  
  Returns an *Fl_Group* pointer if this widget is an *Fl_Group*.

- **void** begin ()
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget ∗ child (int n) const**
  
  Returns array()[n].

- **int** children () const
  
  Returns how many child widgets the group has.

- **void** clear ()
  
  Deletes all child widgets from memory recursively.

- **unsigned int** clip_children ()
  
  Returns the current clipping mode.

- **void** clip_children (int c)
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **void** end ()
  
  Exactly the same as current(this->parent()).

- **int** find (const Fl_Widget &o) const
  
  See int *Fl_Group::find(const Fl_Widget ∗w) const*.

- **int** find (const Fl_Widget ∗) const
  
  Searches the child array for the widget and returns the index.

- **Fl_Group (int, int, int, int, const char ∗=0)**
  
  Creates a new *Fl_Group* widget using the given position, size, and label string.

- **void** focus (Fl_Widget ∗W)

- **void** forms_end ()
  
  This is for forms compatibility only.

- **int** handle (int)
  
  Handles the specified event.
• void init_sizes ()
  
  Resets the internal array of widget sizes and positions.

• void insert (Fl_Widget &, int i)
  
  The widget is removed from its current group (if any) and then inserted into this group.

• void insert (Fl_Widget &w, Fl_Widget *before)
  
  This does insert(w, find(before)).

• void remove (Fl_Widget &w)
  
  Removes a widget from the group but does not delete it.

• void remove (Fl_Widget *o)
  
  Removes the widget o from the group.

• void remove (int index)
  
  Removes the widget at index from the group but does not delete it.

• Fl_Widget *resizable () const
  
  See void Fl_Group::resizable(Fl_Widget *box)

• void resizable (Fl_Widget &o)
  
  See void Fl_Group::resizable(Fl_Widget *box)

• void resizable (Fl_Widget *o)
  
  The resizable widget defines the resizing box for the group.

  void resize (int, int, int, int)

  Resizes the Fl_Group widget and all of its children.

• virtual ~Fl_Group ()
  
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()

• void _set_fullscreen ()

• void activate ()

  Activates the widget.

• unsigned int active () const

  Returns whether the widget is active.

• int active_r () const

  Returns whether the widget and all of its parents are active.

• Fl_Align align () const

  Gets the label alignment.

• void align (Fl_Align alignment)

  Sets the label alignment.

• long argument () const

  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)

  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window *as_gl_window ()

  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual Fl_Window *as_window ()

  Returns an Fl_Window pointer if this widget is an Fl_Window.

• Fl_Boxtype box () const

  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)

  Sets the box type for the widget.

• Fl_Callback_p callback () const

  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, void *p)
  
  Sets the current callback function for the widget.
• void callback (Fl_Callback0 *cb)
  
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  
  Sets the current callback function for the widget.
• unsigned int changed () const
  
  Checks if the widget value changed since the last callback.
• void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.
• void clear_output ()
  
  Sets a widget to accept input.
• void clear_visible ()
  
  Hides the widget.
• void clear_visible_focus ()
  
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  
  Gets the background color of the widget.
• void color (Fl_Color bg)
  
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  
  For back compatibility only.
• void color2 (unsigned a)
  
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  
  Sets the current label.
• void copy_tooltip (const char *text)
  
  Sets the current tooltip text.
• uchar damage () const
  
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  
  Internal use only.
• void deactivate ()
  
  Deactivates the widget.
• Fl_Image *deimage ()
  
  Gets the image that is used as part of the widget label.
• const Fl_Image *deimage () const
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label.
• void do_callback()
  Calls the widget callback.
• void do_callback (Fl_Widget *o, long arg)
  Calls the widget callback.
• void do_callback (Fl_Widget *o, void *arg=0)
  Calls the widget callback.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label.
• const Fl_Image *image () const
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char *label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
Gets the user data for this widget.

- void user_data (void ∗v)
  
  Sets the user data for this widget.

- unsigned int visible () const
  
  Returns whether a widget is visible.

- unsigned int visible_focus ()
  
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  
  Modifies keyboard focus navigation.

- int visible_r () const
  
  Returns whether a widget and all its parents are visible.

- int w () const
  
  Gets the widget width.

- Fl_When when () const
  
  Returns the conditions under which the callback is called.

- void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

- Fl_Window ∗window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x () const
  
  Gets the widget position in its window.

- int y () const
  
  Gets the widget position in its window.

- virtual ∼Fl_Widget ()
  
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group ∗current ()
  
  Returns the currently active group.

- static void current (Fl_Group ∗g)
  
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗cb, void ∗d)
  
  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15
};
GROUP_RELATIVE = 1 << 16, COPIED_TOOLTIP = 1 << 17, FULLSCREEN = 1 << 18, MAC_USE_ACCENTS_MENU = 1 << 19,
USERFLAG3 = 1 << 29, USERFLAG2 = 1 << 30, USERFLAG1 = 1 << 31
}
flags possible values enumeration.

Protected Member Functions inherited from Fl_Group

• void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
• void draw_children ()
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus ()
  Draws a focus rectangle around the widget
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.
9.154.1 Detailed Description

This widget is based off the Fl_Tabs widget, but instead of displaying tabs it only changes “tabs” under program control. Its primary purpose is to support “wizards” that step a user through configuration or troubleshooting tasks. As with Fl_Tabs, wizard panes are composed of child (usually Fl_Group) widgets. Navigation buttons must be added separately.

9.154.2 Constructor & Destructor Documentation

9.154.2.1 Fl_Wizard()

Fl_Wizard::Fl_Wizard (  
    int xx,  
    int yy,  
    int ww,  
    int hh,  
    const char ∗ l = 0  
  )

The constructor creates the Fl_Wizard widget at the specified position and size. The inherited destructor destroys the widget and its children.

9.154.3 Member Function Documentation

9.154.3.1 next()

void Fl_Wizard::next ( )

This method shows the next child of the wizard. If the last child is already visible, this function does nothing.

The documentation for this class was generated from the following files:

- Fl_Wizard.H
- Fl_Wizard.cxx

9.155 Fl_XBM_Image Class Reference

The Fl_XBM_Image class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.

#include <Fl_XBM_Image.H>

Inheritance diagram for Fl_XBM_Image:

```
Fl_XBM_Image
   ↓  ↓
Fl_Bitmap  Fl_Image
   ↓
Fl_XBM_Image
```

Public Member Functions

- Fl_XBM_Image (const char ∗filename)

  The constructor loads the named XBM file from the given name filename.

Public Member Functions inherited from Fl_Bitmap

- Fl_Image ∗ copy ()
- virtual Fl_Image ∗ copy (int W, int H)

  The copy() method creates a copy of the specified image.
• void **draw** (int X, int Y)
  
  Draws the image with a bounding box.

• **Fl_Bitmap** (const char *bits, int W, int H)
  
  The constructors create a new bitmap from the specified bitmap data.

• **Fl_Bitmap** (const uchar *bits, int W, int H)
  
  The constructors create a new bitmap from the specified bitmap data.

• virtual void **label** (Fl_Menu_Item *m)
  
  The **label()** methods are an obsolete way to set the image attribute of a widget or menu item.

• virtual void **label** (Fl_Widget *w)
  
  The **label()** methods are an obsolete way to set the image attribute of a widget or menu item.

• virtual void **uncache** ()
  
  If the image has been cached for display, delete the cache data.

• virtual ~**Fl_Bitmap** ()
  
  The destructor frees all memory and server resources that are used by the bitmap.

**Public Member Functions inherited from Fl_Image**

• virtual void **color_average** (Fl_Color c, float i)
  
  The **color_average()** method averages the colors in the image with the FLTK color value c.

• **Fl_Image** *copy ()
  
  The **copy()** method creates a copy of the specified image.

• int **count** () const
  
  The **count()** method returns the number of data values associated with the image.

• int **d** () const
  
  Returns the current image depth.

• const char *const *data () const
  
  Returns a pointer to the current image data array.

• virtual void **desaturate** ()
  
  The **desaturate()** method converts an image to grayscale.

• void **draw** (int X, int Y)
  
  Draws the image.

• int **fail** ()
  
  Returns a value that is not 0 if there is currently no image available.

• **Fl_Image** (int W, int H, int D)
  
  The constructor creates an empty image with the specified width, height, and depth.

• int **h** () const
  
  Returns the current image height in pixels.

• void **inactive** ()
  
  The **inactive()** method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

• int **id** () const
  
  Returns the current line data size in bytes.

• int **w** () const
  
  Returns the current image width in pixels.

• virtual ~**Fl_Image** ()
  
  The destructor is a virtual method that frees all memory used by the image.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Image

- static Fl_RGB_Scaling RGB_scaling ()
  
  Returns the currently used RGB image scaling method.

- static void RGB_scaling (Fl_RGB_Scaling)
  
  Sets the RGB image scaling method used for copy(int, int).

Public Attributes inherited from Fl_Bitmap

- int alloc_array
  
  Non-zero if array points to bitmap data allocated internally.

- const uchar * array
  
  Pointer to raw bitmap data.

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_NO_IMAGE = -1

Protected Member Functions inherited from Fl_Image

- void d (int D)
  
  Sets the current image depth.

- void data (const char *const *p, int c)
  
  Sets the current array pointer and count of pointers in the array.

- void draw_empty (int X, int Y)
  
  The protected method draw_empty() draws a box with an X in it.

- void h (int H)
  
  Sets the current image height in pixels.

- void ld (int LD)
  
  Sets the current line data size in bytes.

- void w (int W)
  
  Sets the current image width in pixels.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

9.155.1 Detailed Description

The Fl_XBM_Image class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.

9.155.2 Constructor & Destructor Documentation

9.155.2.1 Fl_XBM_Image()

Fl_XBM_Image::Fl_XBM_Image (const char * name )

The constructor loads the named XBM file from the given name filename.
The destructor frees all memory and server resources that are used by the image.
The documentation for this class was generated from the following files:

- Fl_XBM_Image.H
- Fl_XBM_Image.cxx
9.156 Fl_XColor Struct Reference

Public Attributes

- unsigned char b
- unsigned char g
- unsigned char mapped
- unsigned long pixel
- unsigned char r

The documentation for this struct was generated from the following file:

- FL_XColor.H

9.157 Fl_Xlib_Graphics_Driver Class Reference

The Xlib-specific graphics class.

#include <Fl_Device.H>

Inheritance diagram for Fl_Xlib_Graphics_Driver:

```
  Fl_Device
   └── Fl_Graphics_Driver
       └── Fl_Xlib_Graphics_Driver
```

Public Member Functions

- const char * class_name ()
  Returns the name of the class of this object.
- void color (Fl_Color c)
  see fl_color(Fl_Color c).
- void color (uchar r, uchar g, uchar b)
  see fl_color(uchar r, uchar g, uchar b).
- void copy_offscreen (int x, int y, int w, int h, Fl_Offscreen pixmap, int srcx, int srcy)
  see fl_copy_offscreen()
- int descent ()
  see fl_descent().
- void draw (const char *str, int n, int x, int y)
  see fl_draw(const char *str, int n, int x, int y).
- void draw (Fl_Bitmap *pxm, int XP, int YP, int WP, int HP, int cx, int cy)
  Draws an Fl_Bitmap object to the device.
- void draw (Fl_Pixmap *pxm, int XP, int YP, int WP, int HP, int cx, int cy)
  Draws an Fl_Pixmap object to the device.
- void draw (Fl_RGB_Image *img, int XP, int YP, int WP, int HP, int cx, int cy)
  Draws an Fl_RGB_Image object to the device.
- void draw (int angle, const char *str, int n, int x, int y)
  see fl_draw(int angle, const char *str, int n, int x, int y).
- void draw_image (const uchar *buf, int X, int Y, int W, int H, int D=3, int L=0)
  see fl_draw_image(const uchar* buf, int X, int Y, int W, int H, int D, int L).
- void draw_image (Fl_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=3)
  see fl_draw_image(Fl_Draw_Image_Cb cb, void* data, int X, int Y, int W, int H, int D).

Generated by Doxygen
• void draw_image_mono (const uchar *buf, int X, int Y, int W, int H, int D=1, int L=0)

• double width (unsigned int c)
  see fl_width(unsigned int n).

Public Member Functions inherited from Fl_Graphics_Driver

• Fl_Color color ()
  see fl_color(void).
• virtual int draw_scaled (Fl_Image *img, int X, int Y, int W, int H)
  Draws an Fl_Image scaled to width W & height H with top-left corner at X,Y.
• Fl_Font font ()
  see fl_font(void).
• Fl_Font_Descriptor * font_descriptor ()
  Returns a pointer to the current Fl_Font_Descriptor for the graphics driver.
• void font_descriptor (Fl_Font_Descriptor *d)
  Sets the current Fl_Font_Descriptor for the graphics driver.
• Fl_Fontsize size ()
  see fl_size().
• virtual ~Fl_Graphics_Driver ()
  The destructor.

Public Member Functions inherited from Fl_Device

• virtual ~Fl_Device ()
  Virtual destructor.

Static Public Attributes

• static const char * class_id = "Fl_Xlib_Graphics_Driver"

Static Public Attributes inherited from Fl_Graphics_Driver

• static const char * class_id = "Fl_Graphics_Driver"

Static Public Attributes inherited from Fl_Device

• static const char * class_id = "Fl_Device"
  A string that identifies each subclass of Fl_Device.

  see \texttt{fl}_\texttt{yxline}(\texttt{x, y, y1, x2, y3}).

Protected Attributes inherited from \texttt{FL_Graphics_Driver}
  • \texttt{matrix} * \texttt{fl_matrix}
    Points to the current coordinate transformation matrix.

9.157.1 Detailed Description
The Xlib-specific graphics class.
This class is implemented only on the Xlib platform.

9.157.2 Member Function Documentation

9.157.2.1 \texttt{class_name()}
\begin{verbatim}
const char * Fl_Xlib_Graphics_Driver::class_name ( ) [inline], [virtual]
\end{verbatim}
Returns the name of the class of this object.
Use of the \texttt{class_name()} function is discouraged because it will be removed from future FLTK versions.
The class of an instance of an \texttt{FL_Device} subclass can be checked with code such as:
\begin{verbatim}
if ( instance->class_name() == Fl_Printer::class_id ) {...}
\end{verbatim}
Reimplemented from \texttt{FL_Graphics_Driver}.

9.157.2.2 \texttt{color() [1/2]}
\begin{verbatim}
void Fl_Xlib_Graphics_Driver::color ( 
    Fl_Color c ) [virtual]
\end{verbatim}
see \texttt{fl}_\texttt{color}(\texttt{Fl_Color c}).
Reimplemented from \texttt{FL_Graphics_Driver}.

9.157.2.3 \texttt{color() [2/2]}
\begin{verbatim}
void Fl_Xlib_Graphics_Driver::color ( 
    uchar r, 
    uchar g, 
    uchar b ) [virtual]
\end{verbatim}
see \texttt{fl}_\texttt{color}(uchar r, uchar g, uchar b).
Reimplemented from \texttt{FL_Graphics_Driver}.

9.157.2.4 \texttt{copy_offscreen()}
\begin{verbatim}
void Fl_Xlib_Graphics_Driver::copy_offscreen ( 
    int x, 
    int y, 
    int w, 
    int h, 
    Fl_Offscreen pixmap, 
    int srcx, 
    int srcy ) [virtual]
\end{verbatim}
see \texttt{fl}_\texttt{copy_offscreen()}
Reimplemented from \texttt{FL_Graphics_Driver}.

Generated by Doxygen
9.157.2.5 descent()

int Fl_Xlib_Graphics_Driver::descent() [virtual]
see fl_descent()
Reimplemented from Fl_Graphics_Driver.

9.157.2.6 draw() [1/5]

void Fl_Xlib_Graphics_Driver::draw(const char *str, int n, int x, int y) [virtual]
see fl_draw(const char *str, int n, int x, int y).
Reimplemented from Fl_Graphics_Driver.

9.157.2.7 draw() [2/5]

void Fl_Xlib_Graphics_Driver::draw(Fl_Bitmap *bm, int XP, int YP, int WP, int HP, int cx, int cy) [virtual]
Draws an Fl_Bitmap object to the device.
Specifies a bounding box for the image, with the origin (upper left-hand corner) of the image offset by the cx and cy arguments.
Reimplemented from Fl_Graphics_Driver.

9.157.2.8 draw() [3/5]

void Fl_Xlib_Graphics_Driver::draw(Fl_Pixmap *pxm, int XP, int YP, int WP, int HP, int cx, int cy) [virtual]
Draws an Fl_Pixmap object to the device.
Specifies a bounding box for the image, with the origin (upper left-hand corner) of the image offset by the cx and cy arguments.
Reimplemented from Fl_Graphics_Driver.

9.157.2.9 draw() [4/5]

void Fl_Xlib_Graphics_Driver::draw(Fl_RGB_Image *rgb, int XP, int YP, int WP, int HP, int cx, int cy) [virtual]
Draws an Fl_RGB_Image object to the device.
Specifies a bounding box for the image, with the origin (upper left-hand corner) of the image offset by the cx and cy arguments.
Reimplemented from Fl_Graphics_Driver.
9.157.2.10  draw() [5/5]

```cpp
void Fl_Xlib_Graphics_Driver::draw (  
    int angle,  
    const char * str,  
    int n,  
    int x,  
    int y ) [virtual]
```

See `fl_draw(int angle, const char * str, int n, int x, int y)`.
Reimplemented from `Fl_Graphics_Driver`.

9.157.2.11  draw_image() [1/2]

```cpp
void Fl_Xlib_Graphics_Driver::draw_image (  
    const uchar * buf,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 3,  
    int L = 0 ) [virtual]
```

See `fl_draw_image(const uchar * buf, int X, int Y, int W, int H, int D, int L)`.
Reimplemented from `Fl_Graphics_Driver`.

9.157.2.12  draw_image() [2/2]

```cpp
void Fl_Xlib_Graphics_Driver::draw_image (  
    Fl_Draw_Image_Cb cb,  
    void * data,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 3 ) [virtual]
```

See `fl_draw_image(Fl_Draw_Image_Cb cb, void * data, int X, int Y, int W, int H, int D)`.
Reimplemented from `Fl_Graphics_Driver`.

9.157.2.13  draw_image_mono() [1/2]

```cpp
void Fl_Xlib_Graphics_Driver::draw_image_mono (  
    const uchar * buf,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 1,  
    int L = 0 ) [virtual]
```

See `fl_draw_image_mono(const uchar * buf, int X, int Y, int W, int H, int D, int L)`.
Reimplemented from `Fl_Graphics_Driver`.

9.157.2.14  draw_image_mono() [2/2]

```cpp
void Fl_Xlib_Graphics_Driver::draw_image_mono (  
    Fl_Draw_Image_Cb cb,  
    void * data,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 1,  
    int L = 0 ) [virtual]
```

See `fl_draw_image_mono(Fl_Draw_Image_Cb cb, void * data, int X, int Y, int W, int H, int D, int L)`.
Reimplemented from `Fl_Graphics_Driver`.

Generated by Doxygen
int H,
int D = 1 ) [virtual]
see fl_draw_image_mono(Fl_Draw_Image_Cb cb, void* data, int X,int Y,int W,int H, int D). Reimplemented from Fl_Graphics_Driver.

9.157.2.15 font()

void Fl_Xlib_Graphics_Driver::font {
  Fl_Font face,
  Fl_Fontsize fsize } [virtual]
see fl_font(Fl_Font face, Fl_Fontsize size).
Reimplemented from Fl_Graphics_Driver.

9.157.2.16 height()

int Fl_Xlib_Graphics_Driver::height ( ) [virtual]
see fl_height().
Reimplemented from Fl_Graphics_Driver.

9.157.2.17 rtl_draw()

void Fl_Xlib_Graphics_Driver::rtl_draw {
  const char * str, 
  int n, 
  int x, 
  int y ) [virtual]
see fl_rtl_draw(const char *str, int n, int x, int y).
Reimplemented from Fl_Graphics_Driver.

9.157.2.18 text_extents()

void Fl_Xlib_Graphics_Driver::text_extents {
  const char * t, 
  int n, 
  int & dx, 
  int & dy, 
  int & w, 
  int & h } [virtual]
see fl_text_extents(const char*, int n, int& dx, int& dy, int& w, int& h).
Reimplemented from Fl_Graphics_Driver.

9.157.2.19 width() [1/2]

double Fl_Xlib_Graphics_Driver::width {
  const char * str, 
  int n ) [virtual]
see fl_width(const char *str, int n).
Reimplemented from Fl_Graphics_Driver.

9.157.2.20 width() [2/2]

double Fl_Xlib_Graphics_Driver::width {
  unsigned int c ) [virtual]
see fl_width(unsigned int n).
Reimplemented from Fl_Graphics_Driver.
The documentation for this class was generated from the following files:

- Fl_Device.H
- Fl_Bitmap.cxx
- fl_color.cxx
9.158 Fl_XPM_Image Class Reference

The Fl_XPM_Image class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.

`#include <Fl_XPM_Image.H>`

Inheritance diagram for Fl_XPM_Image:

```
Fl_Image
Fl_Pixmap
Fl_XPM_Image
```

Public Member Functions

- `Fl_XPM_Image (const char *filename)`
  
  The constructor loads the XPM image from the name filename.

Public Member Functions inherited from Fl_Pixmap

- `virtual void color_average (Fl_Color c, float i)`
  
  The color_average() method averages the colors in the image with the FLTK color value c.

- `Fl_Image * copy ()`
  
  The copy() method creates a copy of the specified image.

- `virtual Fl_Image * copy (int W, int H)`
  
  The copy() method creates a copy of the specified image.

- `virtual void desaturate ()`
  
  The desaturate() method converts an image to grayscale.

- `void draw (int X, int Y)`
  
  Draws the image with a bounding box.

- `Fl_Pixmap (char *const *D)`
  
  The constructors create a new pixmap from the specified XPM data.

- `Fl_Pixmap (const char *const *D)`
  
  The constructors create a new pixmap from the specified XPM data.

- `Fl_Pixmap (const uchar *const *D)`
  
  The constructors create a new pixmap from the specified XPM data.

- `Fl_Pixmap (uchar *const *D)`
  
  The constructors create a new pixmap from the specified XPM data.

- `virtual void label (Fl_Menu_Item *m)`
  
  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

- `virtual void label (Fl_Widget *w)`
  
  The label() methods are an obsolete way to set the image attribute of a widget or menu item.

- `virtual void uncache ()`
  
  If the image has been cached for display, delete the cache data.

- `virtual ~Fl_Pixmap ()`
  
  The destructor frees all memory and server resources that are used by the pixmap.
Public Member Functions inherited from Fl/Image

- Fl/Image * copy ()
  The copy() method creates a copy of the specified image.
- int count () const
  The count() method returns the number of data values associated with the image.
- int d () const
  Returns the current image depth.
- const char * const * data () const
  Returns a pointer to the current image data array.
- void draw (int X, int Y)
  Draws the image.
- int fail ()
  Returns a value that is not 0 if there is currently no image available.
- Fl/Image (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.
- int h () const
  Returns the current image height in pixels.
- void inactive ()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.
- int ld () const
  Returns the current line data size in bytes.
- int w () const
  Returns the current image width in pixels.
- virtual ~Fl/Image ()
  The destructor is a virtual method that frees all memory used by the image.

Additional Inherited Members

Static Public Member Functions inherited from Fl/Image

- static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
- static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).

Public Attributes inherited from Fl/Pixmap

- int alloc_data

Static Public Attributes inherited from Fl/Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_NO_IMAGE = -1

Protected Member Functions inherited from Fl/Pixmap

- void measure ()
### Protected Member Functions inherited from Fl_Image

- **void d (int D)**
  - Sets the current image depth.
- **void data (const char *const *p, int c)**
  - Sets the current array pointer and count of pointers in the array.
- **void draw_empty (int X, int Y)**
  - The protected method `draw_empty()` draws a box with an X in it.
- **void h (int H)**
  - Sets the current image height in pixels.
- **void ld (int LD)**
  - Sets the current line data size in bytes.
- **void w (int W)**
  - Sets the current image width in pixels.

### Static Protected Member Functions inherited from Fl_Image

- static **void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)**
- static **void measure (const Fl_Label *lo, int &lw, int &lh)**

### 9.158.1 Detailed Description

The Fl_XPM_Image class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.

### 9.158.2 Constructor & Destructor Documentation

#### 9.158.2.1 Fl_XPM_Image()

`Fl_XPM_Image::Fl_XPM_Image (const char * name)`

The constructor loads the XPM image from the name filename.
The destructor frees all memory and server resources that are used by the image.
The documentation for this class was generated from the following files:

- Fl_XPM_Image.H
- Fl_XPM_Image.hxx

### 9.159 Fl_Text_Editor::Key_Binding Struct Reference

Simple linked list item associating a key/state to a function.
#include <Fl_Text_Editor.H>

#### Public Attributes

- **Key_Func function**
  - associated function
- **int key**
  - the key pressed
- **Key_Binding = next**
  - next key binding in the list
- **int state**
  - the state of key modifiers
9.159.1 Detailed Description

Simple linked list item associating a key/state to a function.
The documentation for this struct was generated from the following file:

- Fl_Text_Editor.H

9.160 Fl_Graphics_Driver::matrix Struct Reference

A 2D coordinate transformation matrix.
#include <Fl_Device.H>

Public Attributes

- double a
- double b
- double c
- double d
- double x
- double y

9.160.1 Detailed Description

A 2D coordinate transformation matrix.
The documentation for this struct was generated from the following file:

- Fl_Device.H

9.161 Fl_Preferences::Name Class Reference

'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.
#include <Fl_Preferences.H>

Public Member Functions

- Name (const char *format,...)
  Creates a group name or entry name on the fly.
- Name (unsigned int n)
  Creates a group name or entry name on the fly.
- operator const char * ()
  Return the Name as a "C" string.

9.161.1 Detailed Description

'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.
Example: prefs.set(Fl_Preferences::Name("File%d",i),file[i]);.
See test/preferences.cxx as a sample for writing arrays into preferences.
'Name' is actually implemented as a class inside Fl_Preferences. It casts into const char* and gets automatically destroyed after the enclosing call ends.
9.161.2 Constructor & Destructor Documentation

9.161.2.1 Name() [1/2]

```cpp
Fl_Preferences::Name::Name (unsigned int n)
```

Creates a group name or entry name on the fly.
This version creates a simple unsigned integer as an entry name.

```cpp
int n, i;
Fl_Preferences prev( appPrefs, "PreviousFiles" );
prev.get( "n", 0 );
for ( i=0; i<n; i++ )
  prev.get( Fl_Preferences::Name(i), prevFile[i], "" );
```

9.161.2.2 Name() [2/2]

```cpp
Fl_Preferences::Name::Name (const char ∗ format, ... )
```

Creates a group name or entry name on the fly.
This version creates entry names as in 'printf'.

```cpp
int n, i;
Fl_Preferences prefs( USER, "matthiasm.com", "test" );
prefs.get( "nFiles", 0 );
for ( i=0; i<n; i++ )
  prev.get( Fl_Preferences::Name( "File%d", i ), prevFile[i], "" );
```

The documentation for this class was generated from the following files:

- Fl_Preferences.H
- Fl_Preferences.cxx

9.162 Fl_Preferences::Node Class Reference

Public Member Functions

- void add (const char ∗line)
- Node ∗addChild (const char ∗path)
- const char ∗child (int ix)
- Node ∗childNode (int ix)
- void deleteAllChildren ()
- void deleteAllEntries ()
- char deleteEntry (const char ∗name)
- char dirty ()
- Entry ∗entry (int i)
- Node ∗find (const char ∗path)
- RootNode ∗findRoot ()
- const char ∗get (const char ∗name)
- int getEntry (const char ∗name)
- const char ∗name ()
- int nChildren ()
- int nEntry ()
- Node (const char ∗path)
- Node ∗parent ()
- const char ∗path ()
- char remove ()
- Node ∗search (const char ∗path, int offset=0)
- void set (const char ∗line)
- void set (const char ∗name, const char ∗value)
- void setParent (Node ∗parent)
- void setRoot (RootNode ∗r)
- int write (FILE ∗f)

Generated by Doxygen
Static Public Attributes

- static int lastEntrySet = -1

The documentation for this class was generated from the following files:

- FL_Preferences.H
- FL_Preferences.cxx

9.163 Fl_Paged_Device::page_format Struct Reference

width, height and name of a page format
#include <Fl_Paged_Device.H>

Public Attributes

- int height
  height in points
- const char * name
  format name
- int width
  width in points

9.163.1 Detailed Description

width, height and name of a page format
The documentation for this struct was generated from the following file:

- Fl_Paged_Device.H

9.164 Fl_Preferences::RootNode Class Reference

Public Member Functions

- char getPath (char *path, int pathlen)
- int read ()
- RootNode (Fl_Preferences *)
- RootNode (Fl_Preferences *, const char *path, const char *vendor, const char *application)
- RootNode (Fl_Preferences *, Root root, const char *vendor, const char *application)
- int write ()

The documentation for this class was generated from the following files:

- FI_Preferences.H
- FI_Preferences.cxx

9.165 Fl_Scroll::ScrollInfo Struct Reference

Structure to manage scrollbar and widget interior sizes.
#include <Fl_Scroll.H>
Public Attributes

- `Fl.Region_LRTB child`
  child bounding box: left/right/top/bottom
- `int hneeded`
  horizontal scrollbar visibility
- `Fl.Scrollbar_Data hscroll`
  horizontal scrollbar region + values
- `Fl.Region_XYWH innerbox`
  widget's inner box, excluding scrollbars
- `Fl.Region_XYWH innerchild`
  widget's inner box, including scrollbars
- `int scrollsize`
  the effective scrollbar thickness (local or global)
- `int vneeded`
  vertical scrollbar visibility
- `Fl.Scrollbar_Data vscroll`
  vertical scrollbar region + values

9.165.1 Detailed Description

Structure to manage scrollbar and widget interior sizes. This is filled out by `recalc_scrollbars()` for use in calculations that need to know the visible scroll area size, etc.

Note

Availability in FLTK_ABI_VERSION 10303 or higher.

The documentation for this struct was generated from the following file:

- `Fl_Scroll.H`

9.166 Fl_Window::shape_data_type Struct Reference

Data supporting a non-rectangular window shape.

#include <Fl_Window.H>

Public Attributes

- `int lh_`
  height of shape image
- `int lw_`
  width of shape image
- `Fl_Image * shape_`
  shape image
- `Fl_Bitmap * todelete_`
  auxiliary bitmap image

9.166.1 Detailed Description

Data supporting a non-rectangular window shape. The documentation for this struct was generated from the following file:

- `Fl_Window.H`
9.167  Fl_Text_Display::Style_Table_Entry Struct Reference

This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.

```c
#include <Fl_Text_Display.H>
```

Public Attributes

- `unsigned attr`  
  currently unused (this may be change in the future)
- `Fl_Color color`  
  text color
- `Fl_Font font`  
  text font
- `Fl_Fontsize size`  
  text font size

9.167.1  Detailed Description

This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.

There must be one entry for each style that can be used in an Fl_Text_Display for displaying text. The style table is an array of struct `Style_Table_Entry`. The style table is associated with an Fl_Text_Display by using Fl_Text_Display::highlight_data().

```

10.3 Enumerations.H File Reference

This file contains type definitions and general enumerations.

```c
#include <FL/abi-version.h>
#include "Fl_Export.H"
#include "fl_types.h"
```

Macros

Mouse and Keyboard Events
This and the following constants define the non-ASCII keys on the keyboard for FL_KEYBOARD and FL_SHORTCUT events.

\todo FL_Button and FL_key... constants could be structured better (use an enum or some doxygen grouping ?)

\sa Fl::event_key() and Fl::get_key(int) (use ascii letters for all other keys):

- \#define FL_Alt_L 0xffe9
  The left alt key.
- \#define FL_Alt_R 0xffea
  The right alt key.
- \#define FL_Back 0xEF26 /* Like back on a browser */
- \#define FL_BackSpace 0xff08
  The backspace key.
- \#define FL_Button 0xfee8
  A mouse button; use Fl_Button + n for mouse button n.
- \#define FL_Caps_Lock 0xffe5
  The caps lock key.
- \#define FL_Control_L 0xffe3
  The lefthand control key.
- \#define FL_Control_R 0xffe4
  The righthand control key.
- \#define FL_Delete 0xffff
  The delete key.
- \#define FL_Down 0xff54
  The down arrow key.
- \#define FL_Eisu 0xff2f
  The Eisu key of JIS keyboards.
- \#define FL_End 0xff57
  The end key.
- \#define FL_Enter 0xff0d
  The enter key.
- \#define FL_Escape 0xff1b
  The escape key.
- \#define FL_F 0xffbd
  One of the function keys; use FL_F + n for function key n.
- \#define FL_F_Last 0xffe0
  The last function key; use to range-check function keys.
- \#define FL_Favorites 0xEF30 /* Show favorite locations */
- \#define FL_Forward 0xEF27 /* Like forward on a browser */
- \#define FL_Help 0xff68
  The 'help' key on Mac keyboards.
- \#define FL_Home 0xff50
  The home key.
- \#define FL_Home_Page 0xEF18 /* Display user's home page */
- \#define FL_Insert 0xff63
  The insert key.
- \#define FL_Isu_Key 0xff0c
  The additional key of ISO keyboards.
- \#define FL_Kana 0xff2e
  The Kana key of JIS keyboards.
- \#define FL_KP 0xff80
  One of the keypad numbers; use FL_KP + 'n' for digit n.
- \#define FL_KP_Enter 0xff8d
  The enter key on the keypad, same as Fl_KP+'r'.
- \#define FL_KP_Last 0xffbd
  The last keypad key; use to range-check keypad.
- \#define FL_Left 0xff51
The left arrow key.
- `#define FL_Mail 0xEF19 /* Invoke user's mail program */`
- `#define FL_Media_Next 0xEF17 /* Next track */`
- `#define FL_Media_Play 0xEF14 /* Start playing of audio */`
- `#define FL_Media_Prev 0xEF16 /* Previous track */`
- `#define FL_Media_Stop 0xEF15 /* Stop playing audio */`
- `#define FL_Menu 0xff67`
  The menu key.
- `#define FL_Meta_L 0xffe7`
  The left meta/Windows key.
- `#define FL_Meta_R 0xffe8`
  The right meta/Windows key.
- `#define FL_Num_Lock 0xff7f`
  The num lock key.
- `#define FL_Page_Down 0xff56`
  The page-down key.
- `#define FL_Page_Up 0xff55`
  The page-up key.
- `#define FL_Pause 0xff13`
  The pause key.
- `#define FL_Print 0xff61`
  The print (or print-screen) key.
- `#define FL_Refresh 0xEF29 /* Refresh the page */`
- `#define FL_Right 0xff53`
  The right arrow key.
- `#define FL_Scroll_Lock 0xff14`
  The scroll lock key.
- `#define FL_Search 0xEF1B /* Search */`
- `#define FL_Shift_L 0xffe1`
  The lefthand shift key.
- `#define FL_Shift_R 0xffe2`
  The righthand shift key.
- `#define FL_Sleep 0xEF2F /* Put system to sleep */`
- `#define FL_Stop 0xEF28 /* Stop current operation */`
- `#define FL_Tab 0xff09`
  The tab key.
- `#define FL_Up 0xff52`
  The up arrow key.
- `#define FL_Volume_Down 0xEF11 /* Volume control down */`
- `#define FL_Volume_Mute 0xEF12 /* Mute sound from the system */`
- `#define FL_Volume_Up 0xEF13 /* Volume control up */`
- `#define FL_Yen 0xff30`
  The Yen key of JIS keyboards.

Mouse Buttons

These constants define the button numbers for FL_PUSH and FL_RELEASE events.

```
\sa Fl::event_button()
```

- `#define FL_LEFT_MOUSE 1`
  The left mouse button.
- `#define FL_MIDDLE_MOUSE 2`
  The middle mouse button.
- `#define FL_RIGHT_MOUSE 3`
  The right mouse button.

Event States

The following constants define bits in the Fl::event_state() value.

- `#define FL_ALT 0x00080000`
One of the alt keys is down.

- `#define FL_BUTTON(n) (0x00800000<<n)`
  Mouse button n (n > 0) is pushed.
- `#define FL_BUTTON1 0x01000000`
  Mouse button 1 is pushed.
- `#define FL_BUTTON2 0x02000000`
  Mouse button 2 is pushed.
- `#define FL_BUTTON3 0x04000000`
  Mouse button 3 is pushed.
- `#define FL_BUTTONS 0x7f000000`
  Any mouse button is pushed.
- `#define FL_CAPS_LOCK 0x00020000`
  The caps lock is on.
- `#define FL_COMMAND FL_CTRL`
  An alias for FL_CTRL on WIN32 and X11, or FL_META on MacOS X.
- `#define FL_CONTROL FL_META`
  An alias for FL_META on WIN32 and X11, or FL_CTRL on MacOS X.
- `#define FL_CTRL 0x00040000`
  One of the ctrl keys is down.
- `#define FL_KEY_MASK 0x0000ffff`
  All keys are 16 bit for now.
- `#define FL_META 0x00400000`
  One of the meta/Windows keys is down.
- `#define FL_NUM_LOCK 0x00100000`
  The num lock is on.
- `#define FL_SCROLL_LOCK 0x00800000`
  The scroll lock is on.
- `#define FL_SHIFT 0x00010000`
  One of the shift keys is down.

Enumerations

When Conditions

```c
enum Fl_When {
    FL_WHEN_NEVER = 0 , FL_WHEN_CHANGED = 1 , FL_WHEN_NOT_CHANGED = 2 ,
    FL_WHEN_RELEASE = 4 ,
    FL_WHEN_RELEASE_ALWAYS = 6 , FL_WHEN_ENTER_KEY = 8 ,
    FL_WHEN_ENTER_KEY_ALWAYS =10 , FL_WHEN_ENTER_KEY_CHANGED =11 }
```

These constants determine when a callback is performed.

Version Numbers

FLTK defines some constants to help the programmer to find out, for which FLTK version a program is compiled. The following constants are defined:

- `#define FL_ABI_VERSION FL_API_VERSION`
  The FLTK ABI (Application Binary Interface) version number as an int.
- `#define FL_API_VERSION (FL_MAJOR_VERSION∗10000 + FL_MINOR_VERSION∗100 + FL_PATCH_VERSION)`
  The FLTK API version number as an int.

```c
enum Fl_Event {
    FL_NO_EVENT = 0 , FL_PUSH = 1 , FL_RELEASE = 2 , FL_ENTER = 3 ,
    FL_LEAVE = 4 , FL_DRAG = 5 , FL_FOCUS = 6 , FL_UNFOCUS = 7 ,
    FL_KEYDOWN = 8 , FL_KEYBOARD = 8 , FL_KEYUP = 9 , FL_CLOSE = 10 ,
    FL_MOVE = 11 , FL_SHORTCUT = 12 , FL_DEACTIVATE = 13 ,
    FL_ACTIVATE = 14 , FL_HIDE = 15 ,
    FL_SHOW = 16 , FL_PASTE = 17 , FL_SELECTIONCLEAR = 18 ,
    FL_MOUSEWHEEL = 19 , FL_DND_ENTER = 20 , FL_DND_DRAG = 21 ,
    FL_DND_LEAVE = 22 , FL_DND_RELEASE = 23 , FL_SCREEN_CONFIGURATION_CHANGED = 24 ,
    FL_FULLSCREEN = 25 ,
    FL_ZOOM_GESTURE = 26 }
```
Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application.

- `#define FL_MAJOR_VERSION 1`
  The major release version of this FLTK library.
- `#define FL_MINOR_VERSION 3`
  The minor release version for this library.
- `#define FL_PATCH_VERSION 9`
  The patch version for this library.
- `#define FL_VERSION`
  The FLTK version number as a double.
- `#define FLTK_ABI_VERSION FL_ABI_VERSION`

**Box Types**

FLTK standard box types

This enum defines the standard box types included with FLTK. FL_NO_BOX means nothing is drawn at all, so whatever is already on the screen remains. The FL_..._FRAME types only draw their edges, leaving the interior unchanged. The blue color in Figure 1 is the area that is not drawn by the frame types.

![Figure 10.1 FLTK standard box types](image)

**Todo** Description of box types is incomplete. See below for the defined enum Fl_Boxtype.

- `#define FL_SHADOW_LABEL fl_define_FL_SHADOW_LABEL()
- `#define FL_SYMBOL_LABEL FL_NORMAL_LABEL

Sets the current label type and return its corresponding `Fl_Labeltype` value.

## Colors

The `Fl_Color` type holds an FLTK color value. Colors are either 8-bit indexes into a virtual colormap or 24-bit RGB color values. (See Colors for the default FLTK colormap)

Color indices occupy the lower 8 bits of the value, while RGB colors occupy the upper 24 bits, for a byte organization of RGBI.

\[
Fl\_Color \rightarrow 0xrrggbbii
\]

| | | |
| | | +---- index between 0 and 255
| | +----- blue color component (8 bit)
| +------- green component (8 bit)
| +-------- red component (8 bit)

A color can have either an index or an rgb value. Colors with rgb set and an index >0 are reserved for special use.

- `const Fl_Color FLBACKGROUND2_COLOR = 7`
  the default background color for text, list, and valuator widgets
- `const Fl_Color FLBACKGROUND_COLOR = 49`
- `const Fl_Color FLBLACK = 56`
- `const Fl_Color FLBLUE = 216`
- `typedef unsigned int Fl\_Color`

An FLTK color value; see also Colors

- `FL_EXPORT Fl\_Color fl\_color\_average (Fl\_Color c1, Fl\_Color c2, float weight)`
Returns the weighted average color between the two given colors.

- `#define FL_COLOR_CUBE (Fl_Color)56`
- `Fl_Color fl_color_cube (int r, int g, int b)`
  Returns a color out of the color cube.
- `FL_EXPORT Fl_Color fl_contrast (Fl_Color fg, Fl_Color bg)`
  Returns a color that contrasts with the background color.
- `const Fl_Color FL_CYAN = 223`
- `const Fl_Color FL_DARK1 = 47`
- `const Fl_Color FL_DARK2 = 45`
- `const Fl_Color FL_DARK3 = 39`
- `const Fl_Color FL_DARK_BLUE = 136`
- `const Fl_Color FL_DARK_CYAN = 140`
- `const Fl_Color FL_DARK_GREEN = 60`
- `const Fl_Color FL_DARK_MAGENTA = 152`
- `const Fl_Color FL_DARK_RED = 72`
- `const Fl_Color FL_DARK_YELLOW = 76`
- `Fl_Color fl_darker (Fl_Color c)`
  Returns a darker version of the specified color.
- `const Fl_Color FL_FOREGROUND_COLOR = 0`
  the default foreground color (0) used for labels and text
- `#define FL_FREE_COLOR (Fl_Color)16`
- `#define FL_GRAY FL_BACKGROUND_COLOR`
- `const Fl_Color FL_GRAY0 = 32`
- `#define FL_GRAY_RAMP (Fl_Color)32`
- `Fl_Color fl_gray_ramp (int i)`
  Returns a gray color value from black (i == 0) to white (i == FL_NUM_GRAY - 1).
- `const Fl_Color FL_GREEN = 63`
- `FL_EXPORT Fl_Color fl_inactive (Fl_Color c)`
  Returns the inactive, dimmed version of the given color.
- `const Fl_Color FL_INACTIVE_COLOR = 8`
  the inactive foreground color.
- `const Fl_Color FL_LIGHT1 = 50`
- `const Fl_Color FL_LIGHT2 = 52`
- `const Fl_Color FL_LIGHT3 = 54`
- `Fl_Color fl_lighter (Fl_Color c)`
  Returns a lighter version of the specified color.
- `const Fl_Color FL_MAGENTA = 248`
- `#define FL_NUM_BLUE 5`
- `#define FL_NUM_FREE_COLOR 16`
- `#define FL_NUM_GRAY 24`
- `#define FL_NUM_GREEN 8`
- `#define FL_NUM_RED 5`
- `const Fl_Color FL_RED = 88`
- `Fl_Color fl_rgb_color (uchar g)`
  Returns the 24-bit color value closest to g (grayscale).
- `Fl_Color fl_rgb_color (uchar r, uchar g, uchar b)`
  Returns the 24-bit color value closest to r, g, b.
- `const Fl_Color FL_SELECTION_COLOR = 15`
  the default selection/highlight color.
- `const Fl_Color FL_WHITE = 255`
- `const Fl_Color FL_YELLOW = 95`
Cursors

- enum { FL_READ = 1, FL_WRITE = 4, FL_EXCEPT = 8 }
  
  "when" conditions.

- enum Fl_Cursor {
  FL_CURSOR_DEFAULT = 0, FL_CURSOR_ARROW = 35, FL_CURSOR_CROSS = 66, FL_CURSOR_WAIT = 76,
  FL_CURSOR_INSERT = 77, FL_CURSOR_HAND = 31, FL_CURSOR_HELP = 47, FL_CURSOR_MOVE = 27,
  FL_CURSOR_NS = 78, FL_CURSOR_WE = 79, FL_CURSOR_NWSE = 80, FL_CURSOR_NESW = 81,
  FL_CURSOR_N = 70, FL_CURSOR_NE = 69, FL_CURSOR_E = 49, FL_CURSOR_SE = 8,
  FL_CURSOR_S = 9, FL_CURSOR_SW = 7, FL_CURSOR_W = 36, FL_CURSOR_NW = 68,
  FL_CURSOR_NONE = 255
}

The following constants define the mouse cursors that are available in FLTK.

- enum Fl_Damage {
  FL_DAMAGE_CHILD = 0x01, FL_DAMAGE_EXPOSE = 0x02, FL_DAMAGE_SCROLL = 0x04,
  FL_DAMAGE_OVERLAY = 0x08,
  FL_DAMAGE_USER1 = 0x10, FL_DAMAGE_USER2 = 0x20, FL_DAMAGE_ALL = 0x80
}

Damage masks.

- #define FL_IMAGE_WITH_ALPHA 0x40000000

- enum Fl_Mode {
  FL_RGB = 0, FL_INDEX = 1, FL_SINGLE = 0, FL_DOUBLE = 2,
  FL_ACCUM = 4, FL_ALPHA = 8, FL_DEPTH = 16, FL_STENCIL = 32,
  FL_RGB8 = 64, FL_MULTISAMPLE = 128, FL_STEREO = 256, FL_FAKE_SINGLE = 512,
  FL_OPENGL3 = 1024
}

visual types and FI_Gl_Window::mode() (values match Glut)

Alignment Flags

Flags to control the label alignment.
This controls how the label is displayed next to or inside the widget. The default value is FL_ALIGN_CENTER (0) for most widgets, which centers the label inside the widget.

Flags can be or’d to achieve a combination of alignments, but there are some "magic values" (e.g. combinations of TOP and BOTTOM and of LEFT and RIGHT) that have special meanings (see below). For instance:

\[
\text{FL.ALIGN\_TOP\_LEFT} == (\text{FL.ALIGN\_TOP} | \text{FL.ALIGN\_LEFT}) \neq \text{FL.ALIGN\_LEFT\_TOP}
\]

Outside alignments (FL_ALIGN\_INSIDE is not set):

```
+---------------------------------+
<table>
<thead>
<tr>
<th>TOP_LEFT</th>
<th>TOP</th>
<th>TOP_RIGHT</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEFT_TOP</td>
<td>RIGHT_TOP</td>
<td></td>
</tr>
<tr>
<td>--------</td>
<td>--------</td>
<td></td>
</tr>
<tr>
<td>LEFT</td>
<td>CENTER</td>
<td>RIGHT</td>
</tr>
<tr>
<td>--------</td>
<td>--------</td>
<td></td>
</tr>
<tr>
<td>LEFT_BOTTOM</td>
<td>RIGHT_BOTTOM</td>
<td></td>
</tr>
</tbody>
</table>
+---------------------------------+
```

Inside alignments (FL_ALIGN\_INSIDE is set):

```
+---------------------------------+
<table>
<thead>
<tr>
<th>TOP_LEFT</th>
<th>TOP</th>
<th>TOP_RIGHT</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEFT</td>
<td>CENTER</td>
<td>RIGHT</td>
</tr>
<tr>
<td>--------</td>
<td>--------</td>
<td></td>
</tr>
<tr>
<td>BOTTOM_LEFT</td>
<td>BOTTOM</td>
<td>BOTTOM_RIGHT</td>
</tr>
</tbody>
</table>
+---------------------------------+
```

See also

FL_ALIGN\_CENTER, etc.

- typedef unsigned Fl_Align
  
  FLTK type for alignment control.

- const Fl_Align FL_ALIGN\_BOTTOM = (Fl_Align)2
  
  Align the label at the bottom of the widget.
• const Fl_Align FL_ALIGN_BOTTOM_LEFT = FL_ALIGN_BOTTOM | FL_ALIGN_LEFT
  Align the label horizontally in the middle.
• const Fl_Align FL_ALIGN_BOTTOM_RIGHT = FL_ALIGN_BOTTOM | FL_ALIGN_RIGHT
• const Fl_Align FL_ALIGN_CENTER = (Fl_Align)0
  Align the label horizontally in the middle.
• const Fl_Align FL_ALIGN_CLIP = (Fl_Align)64
  All parts of the label that are larger than the widget will not be drawn.
• const Fl_Align FL_ALIGN_IMAGE_BACKDROP = (Fl_Align)0x0200
  If the label contains an image, draw the image or deimage in the background.
• const Fl_Align FL_ALIGN_IMAGE_MASK = 0x0320
• const Fl_Align FL_ALIGN_IMAGE_NEXT_TO_TEXT = (Fl_Align)0x0100
  If the label contains an image, draw the text to the right of the image.
• const Fl_Align FL_ALIGN_IMAGE_OVER_TEXT = (Fl_Align)0x0000
  If the label contains an image, draw the text below the image.
• const Fl_Align FL_ALIGN_INSIDE = (Fl_Align)16
  Draw the label inside of the widget.
• const Fl_Align FL_ALIGN_LEFT = (Fl_Align)4
  Align the label at the left of the widget.
• const Fl_Align FL_ALIGN_LEFT_BOTTOM = 0x000d
• const Fl_Align FL_ALIGN_LEFT_TOP = 0x0007
• const Fl_Align FL_ALIGN_NOWRAP = (Fl_Align)0
• const Fl_Align FL_ALIGN_POSITION_MASK = 0x000f
• const Fl_Align FL_ALIGN_RIGHT = (Fl_Align)8
  Align the label to the right of the widget.
• const Fl_Align FL_ALIGN_RIGHT_BOTTOM = 0x000e
• const Fl_Align FL_ALIGN_RIGHT_TOP = 0x000b
• const Fl_Align FL_ALIGN_TEXT_NEXT_TO_IMAGE = (Fl_Align)0x0120
  If the label contains an image, draw the text to the left of the image.
• const Fl_Align FL_ALIGN_TEXT_OVER_IMAGE = (Fl_Align)0x0020
  If the label contains an image, draw the text on top of the image.
• const Fl_Align FL_ALIGN_TOP = (Fl_Align)1
  Align the label at the top of the widget.
• const Fl_Align FL_ALIGN_TOP_LEFT = FL_ALIGN_TOP | FL_ALIGN_LEFT
• const Fl_Align FL_ALIGN_TOP_RIGHT = FL_ALIGN_TOP | FL_ALIGN_RIGHT
• const Fl_Align FL_ALIGN_WRAP = (Fl_Align)128
  Wrap text that does not fit the width of the widget.

Font Numbers

The following constants define the standard FLTK fonts:

• const Fl_Font FL_BOLD = 1
  add this to helvetica, courier, or times
• const Fl_Font FL_BOLD_ITALIC = 3
  add this to helvetica, courier, or times
• const Fl_Font FL_COURIER = 4
  Courier normal.
• const Fl_Font FL_COURIER_BOLD = 5
  Courier bold.
• const Fl_Font FL_COURIER_BOLD_ITALIC = 7
  Courier bold-italic.
• const Fl_Font FL_COURIER_ITALIC = 6
  Courier italic.
• typedef int Fl_Font
A font number is an index into the internal font table.

- **typedef int Fl_Fontsize**
  Size of a font in pixels.
- **const Fl_Font FL_FREE_FONT = 16**
  first one to allocate
- **const Fl_Font FL_HELVETICA = 0**
  Helvetica (or Arial) normal (0)
- **const Fl_Font FL_HELVETICA_BOLD = 1**
  Helvetica (or Arial) bold.
- **const Fl_Font FL_HELVETICA_BOLD_ITALIC = 3**
  Helvetica (or Arial) bold-oblique.
- **const Fl_Font FL_HELVETICA_ITALIC = 2**
  Helvetica (or Arial) oblique.
- **const Fl_Font FL_ITALIC = 2**
  add this to helvetica, courier, or times
- **FL_EXPORT Fl_Fontsize FL_NORMAL_SIZE**
  normal font size
- **const Fl_Font FL_SCREEN = 13**
  Default monospaced screen font.
- **const Fl_Font FL_SCREEN_BOLD = 14**
  Default monospaced bold screen font.
- **const Fl_Font FL_SYMBOL = 12**
  Standard symbol font.
- **const Fl_Font FL_TIMES = 8**
  Times roman.
- **const Fl_Font FL_TIMES_BOLD = 9**
  Times roman bold.
- **const Fl_Font FL_TIMES_BOLD_ITALIC = 11**
  Times roman bold-italic.
- **const Fl_Font FL_TIMES_ITALIC = 10**
  Times roman italic.
- **const Fl_Font FL_ZAPF_DINGBATS = 15**
  Zapf-dingbats font.

### 10.3.1 Detailed Description

This file contains type definitions and general enumerations.

### 10.3.2 Macro Definition Documentation

#### 10.3.2.1 FL_ABI_VERSION

```c
#define FL_ABI_VERSION FL_API_VERSION
```

The FLTK ABI (Application Binary Interface) version number as an int.

FL_ABI_VERSION is an int that describes the major, minor, and patch ABI version numbers in the same format as FL_API_VERSION.

The ABI version number FL_ABI_VERSION is usually the same as the API version FL_API_VERSION with the last two digits set to '00'.

FLTK retains the ABI (Application Binary Interface) during patch releases of the same major and minor versions. Examples:

<table>
<thead>
<tr>
<th>FLTK Version</th>
<th>FL_API_VERSION</th>
<th>FL_ABI_VERSION</th>
<th>FL_VERSION (deprecated)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.3.0</td>
<td>10300</td>
<td>10300</td>
<td>1.0300</td>
</tr>
<tr>
<td>1.3.4</td>
<td>10304</td>
<td>10300</td>
<td>1.0304</td>
</tr>
</tbody>
</table>

Generated by Doxygen
Version 1.2.3 is actually stored as 10203 to allow for more than 9 minor and patch releases. The FL_MAJOR_VERSION, FL_MINOR_VERSION, and FL_PATCH_VERSION constants give the integral values for the major, minor, and patch releases respectively. To enable new ABI-breaking features in patch releases you can configure FLTK to use a higher FL_ABI_VERSION.

See also

README.abi-version.txt

10.3.2.2 FL_API_VERSION

#define FL_API_VERSION (FL_MAJOR_VERSION*10000 + FL_MINOR_VERSION*100 + FL_PATCH_VERSION)
The FLTK API version number as an int.
FL_API_VERSION is an int that describes the major, minor, and patch version numbers.
Version 1.2.3 is actually stored as 10203 to allow for more than 9 minor and patch releases. The FL_MAJOR_VERSION, FL_MINOR_VERSION, and FL_PATCH_VERSION constants give the integral values for the major, minor, and patch releases respectively.

Note

FL_API_VERSION is intended to replace the deprecated double FL_VERSION.

See also

Fl::api_version()

10.3.2.3 FL_MAJOR_VERSION

#define FL_MAJOR_VERSION 1
The major release version of this FLTK library.
See also

FL_VERSION

10.3.2.4 FL_MINOR_VERSION

#define FL_MINOR_VERSION 3
The minor release version for this library.
FLTK remains mostly source-code compatible between minor version changes.

10.3.2.5 FL_PATCH_VERSION

#define FL_PATCH_VERSION 9
The patch version for this library.
FLTK remains binary compatible between patches.

10.3.2.6 FL_VERSION

#define FL_VERSION
Value:

 ( (double)FL_MAJOR_VERSION + \n  (double)FL_MINOR_VERSION * 0.01 + \n  (double)FL_PATCH_VERSION * 0.0001 )

The FLTK version number as a double.
FL_VERSION is a double that describes the major, minor, and patch version numbers.
Version 1.2.3 is actually stored as 1.0203 to allow for more than 9 minor and patch releases.

Deprecated This double version number is retained for compatibility with existing program code. New code should use int FL_API_VERSION instead. FL_VERSION is deprecated because comparisons of floating point values may fail due to rounding errors. However, there are currently no plans to remove this deprecated constant.

FL_VERSION is equivalent to (double)FL_API_VERSION / 10000.
10.3 Enumerations.H File Reference

10.3.3 Typedef Documentation

10.3.3.1 Fl_Fontsize
typedef int Fl_Fontsize
Size of a font in pixels.
This is the approximate height of a font in pixels.

10.3.4 Enumeration Type Documentation

10.3.4.1 anonymous enum
anonymous enum
FD "when" conditions.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_READ</td>
<td>Call the callback when there is data to be read.</td>
</tr>
<tr>
<td>FL_WRITE</td>
<td>Call the callback when data can be written without blocking.</td>
</tr>
<tr>
<td>FL_EXCEPT</td>
<td>Call the callback if an exception occurs on the file.</td>
</tr>
</tbody>
</table>

10.3.4.2 Fl_Boxtype
enum Fl_Boxtype

<table>
<thead>
<tr>

10.3.4.3 Fl_Cursor

**enum Fl_Cursor**

The following constants define the mouse cursors that are available in FLTK. Cursors are provided by the system when available, or bitmaps built into FLTK as a fallback.

**Todo** enum Fl_Cursor needs maybe an image.
10.3Enumerations.H File Reference

10.3.4.4 Fl_Damage

enum Fl_Damage
Damage masks.

10.3.4.5 Fl_Event

enum Fl_Event
Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application.

Events can also come from other programs like the window manager. Events are identified by the integer argument passed to the Fl_Widget::handle() virtual method. Other information about the most recent event is stored in static locations and acquired by calling the Fl::event_*() methods. This static information remains valid until the next event is read from the window system, so it is ok to look at it outside of the handle() method.

Event numbers can be converted to their actual names using the fl_eventnames[] array defined in #include <FL/names.h>

`Fl::event_text()`, `Fl::event_key()`, class `Fl::`

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_NO_EVENT</td>
<td>No event.</td>
</tr>
</tbody>
</table>
| FL_PUSH              | A mouse button has gone down with the mouse pointing at this widget. You can find out what button by calling `Fl::event_button()`. You find out the mouse position by calling `Fl::event_x()` and `Fl::event_y()`.

A widget indicates that it “wants” the mouse click by returning non-zero from its `Fl_Widget::handle()` method. It will then become the `Fl::pushed()` widget and will get FL_DRAG and the matching FL_RELEASE events.

If `Fl_Widget::handle()` returns zero then FLTK will try sending the FL_PUSH to another widget. |
| FL_RELEASE           | A mouse button has been released. You can find out what button by calling `Fl::event_button()`. In order to receive the FL_RELEASE event, the widget must return non-zero when handling FL_PUSH. |
| FL_ENTER             | The mouse has been moved to point at this widget. This can be used for highlighting feedback. If a widget wants to highlight or otherwise track the mouse, it indicates this by returning non-zero from its handle() method. It then becomes the `Fl::belowmouse()` widget and will receive FL_MOVE and FL_LEAVE events. |
| FL_LEAVE             | The mouse has moved out of the widget. In order to receive the FL_LEAVE event, the widget must return non-zero when handling FL_ENTER.                                                                 |
| FL_DRAG              | The mouse has moved with a button held down. The current button state is in `Fl::event_state()`. The mouse position is in `Fl::event_x()` and `Fl::event_y()`.

In order to receive FL_DRAG events, the widget must return non-zero when handling FL_PUSH. |
| FL_FOCUS             | This indicates an attempt to give a widget the keyboard focus. If a widget wants the focus, it should change itself to display the fact that it has the focus, and return non-zero from its handle() method. It then becomes the `Fl::focus()` widget and gets FL_KEYDOWN, FL_KEYUP, and FL_UNFOCUS events.

The focus will change either because the window manager changed which window gets the focus, or because the user tried to navigate using tab, arrows, or other keys. You can check `Fl::event_key()` to figure out why it moved. For navigation it will be the key pressed and for interaction with the window manager it will be zero. |
<p>| FL_UNFOCUS           | This event is sent to the previous <code>Fl::focus()</code> widget when another widget gets the focus or the window loses focus.                                                                                         |</p>
<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_KEYDOWN</td>
<td>A key was pressed (FL_KEYDOWN) or released (FL_KEYUP). FL_KEYBOARD is a synonym for FL_KEYDOWN. The key can be found in Fl::event_key(). The text that the key should insert can be found with Fl::event_text() and its length is in Fl::event_length(). If you use the key handle() should return 1. If you return zero then FLTK assumes you ignored the key and will then attempt to send it to a parent widget. If none of them want it, it will change the event into a FL_SHORTCUT event. To receive FL_KEYBOARD events you must also respond to the FL_FOCUS and FL_UNFOCUS events. If you are writing a text-editing widget you may also want to call the Fl::compose() function to translate individual keystrokes into non-ASCII characters. FL_KEYUP events are sent to the widget that currently has focus. This is not necessarily the same widget that received the corresponding FL_KEYDOWN event because focus may have changed between events.</td>
</tr>
<tr>
<td>FL_KEYBOARD</td>
<td>Equivalent to FL_KEYDOWN. See also FL_KEYDOWN.</td>
</tr>
<tr>
<td>FL_KEYUP</td>
<td>Key release event. See also FL_KEYDOWN.</td>
</tr>
<tr>
<td>FL_CLOSE</td>
<td>The user clicked the close button of a window. This event is used internally only to trigger the callback of Fl_Window derived classed. The default callback closes the window calling Fl_Window::hide().</td>
</tr>
<tr>
<td>FL_MOVE</td>
<td>The mouse has moved without any mouse buttons held down. This event is sent to the Fl::belowmouse() widget. In order to receive FL_MOVE events, the widget must return non-zero when handling FL_ENTER.</td>
</tr>
<tr>
<td>FL_SHORTCUT</td>
<td>If the Fl::focus() widget is zero or ignores an FL_KEYBOARD event then FLTK tries sending this event to every widget it can, until one of them returns non-zero. FL_SHORTCUT is first sent to the Fl::belowmouse() widget, then its parents and siblings, and eventually to every widget in the window, trying to find an object that returns non-zero. FLTK tries really hard to not to ignore any keystrokes! You can also make &quot;global&quot; shortcuts by using Fl::add_handler(). A global shortcut will work no matter what windows are displayed or which one has the focus.</td>
</tr>
<tr>
<td>FL_DEACTIVATE</td>
<td>This widget is no longer active, due to Fl_Widget::deactivate() being called on it or one of its parents. Fl_Widget::active() may still be true after this, the widget is only active if Fl_Widget::active() is true on it and all its parents (use Fl_Widget::active_r() to check this).</td>
</tr>
<tr>
<td>FL_ACTIVATE</td>
<td>This widget is now active, due to Fl_Widget::activate() being called on it or one of its parents.</td>
</tr>
</tbody>
</table>
### FL_HIDE
This widget is no longer visible, due to `Fl_Widget::hide()` being called on it or one of its parents, or due to a parent window being minimized. `Fl_Widget::visible()` may still be true after this, but the widget is visible only if `visible()` is true for it and all its parents (use `Fl_Widget::visible_r()` to check this).

### FL_SHOW
This widget is visible again, due to `Fl_Widget::show()` being called on it or one of its parents, or due to a parent window being restored. Child `Fl_Widget` objects respond to this by actually creating the window if not done already, so if you subclass a window, be sure to pass `FL_SHOW` to the base class `Fl_Widget::handle()` method!

### FL_PASTE
You should get this event some time after you call `Fl::paste()`. The contents of `Fl::event_text()` is the text to insert and the number of characters is in `Fl::event_length()`.

### FL_SELECTIONCLEAR
The `Fl::selection_owner()` will get this event before the selection is moved to another widget. This indicates that some other widget or program has claimed the selection. Motif programs used this to clear the selection indication. Most modern programs ignore this.

### FL_MOUSEWHEEL
The user has moved the mouse wheel. The `Fl::event_dx()` and `Fl::event_dy()` methods can be used to find the amount to scroll horizontally and vertically.

### FL_DND_ENTER
The mouse has been moved to point at this widget. A widget that is interested in receiving drag'n'drop data must return 1 to receive `FL_DND_DRAG`, `FL_DND_LEAVE` and `FL_DND_RELEASE` events.

### FL_DND_DRAG
The mouse has been moved inside a widget while dragging data. A widget that is interested in receiving drag'n'drop data should indicate the possible drop position.

### FL_DND_LEAVE
The mouse has moved out of the widget.

### FL_DND_RELEASE
The user has released the mouse button dropping data into the widget. If the widget returns 1, it will receive the data in the immediately following `FL_PASTE` event.

### FL_SCREEN_CONFIGURATION_CHANGED
The screen configuration (number, positions) was changed. Use `Fl::add_handler()` to be notified of this event.

### FL_FULLSCREEN
The fullscreen state of the window has changed.

### FL_ZOOM_GESTURE
The user has made a zoom/pinch/magnification gesture. The `Fl::event_dy()` method can be used to find magnification amount, `Fl::event_x()` and `Fl::event_y()` are set as well.

### 10.3.4.6 Fl_Labeltype

The `labeltype()` method sets the type of the label.

The following standard label types are included:

**Todo** The doxygen comments are incomplete, and some labeltypes start with an underscore. Also, there are three external functions undocumented (yet):

- `fl_define_FL_SHADOW_LABEL()
- `fl_define_FL_ENGRAVED_LABEL()
- `fl_define_FL_EMBOSSED_LABEL()`
10.3 Enumerations.H File Reference

### Enumerator

<td>Do the callback when the user presses the ENTER key, even if the value doesn't change.</td>
</tr>
<tr>
<td>FL_WHEN_ENTER_KEY_CHANGED</td>
<td>?</td>
</tr>
</tbody>
</table>

### 10.3.5 Function Documentation

#### 10.3.5.1 fl_box()

**Fl_Boxtype fl_box ( Fl_Boxtype b )** [inline]

Get the filled version of a frame. If no filled version of a given frame exists, the behavior of this function is undefined and some random box or frame is returned.
10.3.5.2 fl_color_cube()

Fl_Color fl_color_cube (  
    int r,  
    int g,  
    int b ) [inline]

Returns a color out of the color cube.

r must be in the range 0 to FL_NUM_RED (5) minus 1, g must be in the range 0 to FL_NUM_GREEN (8) minus 1,  
and b must be in the range 0 to FL_NUM_BLUE (5) minus 1.

To get the closest color to a 8-bit set of R,G,B values use:

fl_color_cube(R * (FL_NUM_RED - 1) / 255,      
    G * (FL_NUM_GREEN - 1) / 255,      
    B * (FL_NUM_BLUE - 1) / 255);      

10.3.5.3 fl_down()

Fl_Boxtype fl_down (  
    Fl_Boxtype b ) [inline]

Get the "pressed" or "down" version of a box.

If no "down" version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

10.3.5.4 fl_frame()

Fl_Boxtype fl_frame (  
    Fl_Boxtype b ) [inline]

Get the unfilled, frame only version of a box.

If no frame version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

10.3.5.5 fl_gray_ramp()

Fl_Color fl_gray_ramp (  
    int i ) [inline]

Returns a gray color value from black (i == 0) to white (i == FL_NUM_GRAY - 1).

FL_NUM_GRAY is defined to be 24 in the current FLTK release. To get the closest FLTK gray value to an 8-bit grayscale color 'I' use:

fl_gray_ramp(I * (FL_NUM_GRAY - 1) / 255)

10.3.6 Variable Documentation

10.3.6.1 FL_ALIGN_LEFT

const Fl_Align FL_ALIGN_LEFT = (Fl_Align)4

Align the label at the left of the widget.

Inside labels appear left-justified starting at the left side of the widget, outside labels are right-justified and drawn to the left of the widget.

10.3.6.2 FL_ALIGN_TOP

const Fl_Align FL_ALIGN_TOP = (Fl_Align)1

Align the label at the top of the widget.

Inside labels appear below the top, outside labels are drawn on top of the widget.

10.3.6.3 FL_NORMAL_SIZE

FL_EXPORT Fl_Fontsize FL_NORMAL_SIZE [extern]

normal font size

normal font size

---

```c
#ifndef Fl_Enumerations_H
#define Fl_Enumerations_H

#include <FL/abi-version.h>

#include "Fl_Export.H"
#include "fl_types.h"

#define FL_MAJOR_VERSION 1
#define FL_MINOR_VERSION 3
#define FL_PATCH_VERSION 9

#define FL_VERSION ( (double)FL_MAJOR_VERSION +
                   (double)FL_MINOR_VERSION * 0.01 +
                   (double)FL_PATCH_VERSION * 0.0001 )

#define FL_API_VERSION (FL_MAJOR_VERSION*10000 + FL_MINOR_VERSION*100 + FL_PATCH_VERSION)

#ifndef FL_ABI_VERSION
#define FL_ABI_VERSION (FL_MAJOR_VERSION*10000 + FL_MINOR_VERSION*100)
#endif

/*
 * Notes on FL_ABI_VERSION and deprecated (obsolete) FLTK_ABI_VERSION:
 * (1) FLTK_ABI_VERSION is deprecated, but still defined below.
 * Do NOT define FLTK_ABI_VERSION here - it would be overwritten later.
 * (2) FL_ABI_VERSION is now (as of FLTK 1.3.4) defined by configure
 * or CMake. Do NOT define it here. Its definition will be included
 * below by "#include <FL/abi-version.h>".
 * (3) If you use the provided IDE files (Windows VC++ or Xcode) you should
 * edit the definition in the provided file abi-version.ide. The correct
 * file is '/path/to/fltk/abi-version.ide'.
 *
 * For more informations on FL_ABI_VERSION see README.abi-version.txt.
 *
 * For more informations on FL_ABI_VERSION see README.abi-version.txt.
 */
```

---

Check if FL_ABI_VERSION is out of allowed range; redefine if necessary.

This is done to prevent users from defining an illegal ABI version.

Rule: FL_MAJOR_VERSION + 10000 + FL_MINOR_VERSION + 100 <= FL_ABI_VERSION <= FL_API_VERSION.

Example (FLTK 1.3.4):

```
10300 <= FL_ABI_VERSION <= 10304
```

Note: configure + CMake can be used to define FL_ABI_VERSION, but they do not check validity. This is done here.

10.5 filename.H File Reference

File names and URI utility functions.
#include "Fl_Export.H"
#include <sys/types.h>
#include <dirent.h>

Macros
• #define fl_dirent_h_cyclic_include
• #define FL_FILENAME_H
• #define FL_PATH_MAX 2048
  all path buffers should use this length

Typedefs
• typedef int() Fl_File_Sort_F(struct dirent **, struct dirent **)
  File sorting function.

Functions
• FL_EXPORT void fl_decode_uri (char *uri)
  Decodes a URL-encoded string.
• FL_EXPORT int fl_filename_absolute (char *to, int tolen, const char *from)
  Makes a filename absolute from a relative filename.
• FL_EXPORT int fl_filename_expand (char *to, int tolen, const char *from)
  Expands a filename containing shell variables and tilde (~).
• FL_EXPORT const char * fl_filename_ext (const char *buf)
  Gets the extensions of a filename.
• FL_EXPORT void fl_filename_free_list (struct dirent ***, int n)
  Free the list of filenames that is generated by fl_filename_list().
• FL_EXPORT int fl_filename_isdir (const char *name)
  Determines if a file exists and is a directory from its filename.
• FL_EXPORT int fl_filename_list (const char *d, struct dirent ***, Fl_File_Sort_F *s=fl_numericsort)
Portable and const-correct wrapper for the scandir() function.

- **FL_EXPORT int fl_filename_match (const char *name, const char *pattern)**
  Checks if a string s matches a pattern p.

- **FL_EXPORT const char * fl_filename_name (const char *filename)**
  Gets the file name from a path.

- **FL_EXPORT int fl_filename_relative (char *to, int tolen, const char *from)**
  Makes a filename relative to the current working directory.

- **FL_EXPORT char * fl_filename_setext (char *to, int tolen, const char *ext)**
  Replaces the extension in buf of max.

- **FL_EXPORT int fl_open_uri (const char *uri, char *msg, int msglen)**
  Opens the specified Uniform Resource Identifier (URI).

### 10.5.1 Detailed Description

File names and URI utility functions.

### 10.6 filename.H

Go to the documentation of this file.

10.7 FL.H File Reference

**FL static class.**

```c
#include <FL/FL_Export.H>
#include <FL/FL_Cairo.H>
#include "fl_utf8.h"
#include "Enumerations.H"
```

**Classes**

- **class Fl**
  
  The Fl is the FLTK global (static) class containing state information and global methods for the current application.

- **class Fl_Widget_Tracker**
  
  This class should be used to control safe widget deletion.

**Macros**

- `#define Fl_Object Fl_Widget`

  for back compatibility - use Fl_Widget!

- `#define FL_SOCKET int`

**Typedefs**

- typedef `void(∗Fl_Abort_Handler)(const char ∗format,...)`

  Signature of set_abort functions passed as parameters.

- typedef `int(∗Fl_Args_Handler)(int argc, char ∗∗argv, int ∗&i)`

  Signature of args functions passed as parameters.

- typedef `void(∗Fl_Atclose_Handler)(Fl_Window ∗window, void ∗data)`

  Signature of set_atclose functions passed as parameters.

- typedef `void(∗Fl_Awake_Handler)(void ∗data)`

  Signature of some wakeup callback functions passed as parameters.

- typedef `void() Fl_Box_Draw_F(int x, int y, int w, int h, Fl_Color color)`

  Signature of some box drawing functions passed as parameters.

- typedef `void(∗Fl_Clipboard_Notify_Handler)(int source, void ∗data)`

  Signature of add_clipboard_notify functions passed as parameters.

- typedef `int(∗Fl_Event_Dispatch)(int event, Fl_Window ∗w)`

  Signature of event_dispatch functions passed as parameters.

- typedef `int(∗Fl_Event_Handler)(int event)`

  Signature of add_handler functions passed as parameters.

- typedef `void(∗Fl_FD_Handler)(FL_SOCKET fd, void ∗data)`

  Signature of add_fd functions passed as parameters.

- typedef `void(∗Fl_Idle_Handler)(void ∗data)`

  Signature of add_idle callback functions passed as parameters.

- typedef `void() Fl_Label_Draw_F(const Fl_Label ∗label, int x, int y, int w, int h, Fl_Align align)`

  Signature of label drawing functions passed as parameters.
Signature of some label drawing functions passed as parameters.
• typedef void( Fl_Label_Measure_F(const Fl_Label *label, int &width, int &height) )

Signature of some label measurement functions passed as parameters.
• typedef void( Fl_Old_Idle_Handler ) ()

Signature of set_idle callback functions passed as parameters.
• typedef int( Fl_System_Handler ) (void *event, void *data)

Signature of add_system_handler functions passed as parameters.
• typedef void( Fl_Timeout_Handler ) (void *data)

Signature of some timeout callback functions passed as parameters.

Variables
• FL_EXPORT const char * fl_local_alt
  string pointer used in shortcuts, you can change it to another language
• FL_EXPORT const char * fl_local_ctrl
  string pointer used in shortcuts, you can change it to another language
• FL_EXPORT const char * fl_local_meta
  string pointer used in shortcuts, you can change it to another language
• FL_EXPORT const char * fl_local_shift
  string pointer used in shortcuts, you can change it to another language

10.7.1 Detailed Description

Fl static class.

10.8 Fl.H

Go to the documentation of this file.
# Fl.H 1627

```cpp
// Keep avoiding having the socket deps at that level but make sure it will work in both 32 & 64 bit builds
#if defined(WIN32) && !defined(_CYGWIN_)
#else
#endif

// Pointers you can use to change FLTK to a foreign language.
// Note: Similar pointers are defined in FL/fl_ask.H and src/fl_ask.cxx

10.10 Fl_ask.H File Reference

API for common dialogs.
#include "Enumerations.H"
Macros

- #define __fl_attr(x)

Enumerations

- enum Fl_Beep {
  FL_BEEP_DEFAULT = 0, FL_BEEP_MESSAGE, FL_BEEP_ERROR, FL_BEEP_QUESTION,
  FL_BEEP_PASSWORD, FL_BEEP_NOTIFICATION
}

Different system beeps available.

Functions

- FL_EXPORT void FL_EXPORT void fl_alert(const char *,...) __fl_attr((__format__(__printf__.)

- FL_EXPORT void FL_EXPORT void FL_EXPORT int fl_ask(const char *,...) __fl_attr((__format__(__printf__.)

- FL_EXPORT void fl_beep (int type=FL_BEEP_DEFAULT)

  Emits a system beep message.

- FL_EXPORT int fl_choice(const char *q, const char *b0, const char *b1, const char *b2,...) __fl_attr((__format__(__printf__.)

- FL_EXPORT int FL_EXPORT const char FL_EXPORT const char FL_EXPORT int fl_choice_n(const char *q, const char *b0, const char *b1, const char *b2,...) __fl_attr((__format__(__printf__.)

- FL_EXPORT int FL_EXPORT const char * fl_input(const char *label, const char *deflt=0,...) __fl_attr((__format__(__printf__.)

- FL_EXPORT void fl_message (const char *,...) __fl_attr((__format__(__printf__.)

- void fl_message_font (Fl_Font f, Fl_Fontsize s)

- FL_EXPORT void fl_message_hotspot (int enable)

  Sets whether or not to move the common message box used in many common dialogs like fl_message(), fl_alert(),
  fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer.

- FL_EXPORT int fl_message_hotspot (void)

  Gets whether or not to move the common message box used in many common dialogs like fl_message(), fl_alert(),
  fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer.

- FL_EXPORT int FL_EXPORT const char FL_EXPORT const char FL_EXPORT int FL_EXPORT Fl_Widget * fl_message_icon ()

  Gets the Fl_Box icon container of the current default dialog used in many common dialogs like fl_message(), fl_alert(),
  fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer.

- FL_EXPORT void fl_message_title (const char *title)

  Sets the title of the dialog window used in many common dialogs.

- FL_EXPORT void fl_message_title_default (const char *title)

  Sets the default title of the dialog window used in many common dialogs.

- FL_EXPORT int FL_EXPORT const char FL_EXPORT const char FL_EXPORT int FL_EXPORT Fl_Widget * fl_password (const char *label, const char *deflt=0,...) __fl_attr((__format__(__printf__.)

Variables

- FL_EXPORT void FL_EXPORT void FL_EXPORT int __deprecated__

- FL_EXPORT const char * fl_cancel

  String pointer used in common dialogs, you can change it to another language

- FL_EXPORT const char * fl_close

  String pointer used in common dialogs, you can change it to another language

- FL_EXPORT Fl_Font fl_message_font__

- FL_EXPORT Fl_Fontsize fl_message_size__

- FL_EXPORT const char * fl_no

  String pointer used in common dialogs, you can change it to another language

- FL_EXPORT const char * fl_ok
• FL_EXPORT const char * fl_yes

string pointer used in common dialogs, you can change it to another language

10.10.1 Detailed Description

API for common dialogs.

10.10.2 Enumeration Type Documentation

10.10.2.1 Fl_Beep

```cpp
enum Fl_Beep
{
    FL_BEEP_DEFAULT = 0,
    FL_BEEP_MESSAGE,
    FL_BEEP_ERROR,
    FL_BEEP_QUESTION,
    FL_BEEP_PASSWORD,
    FL_BEEP_NOTIFICATION
};
```

Different system beeps available.

Classes

• class Fl_Device
  All graphical output devices and all graphics systems.
• class Fl_Device_Plugin
  This plugin socket allows the integration of new device drivers for special window or screen types.
• class Fl_Display_Device
  A display to which the computer can draw.
• class Fl_GDI_Graphics_Driver
  The MSWindows-specific graphics class.
• class Fl_GDI_Printer_Graphics_Driver
  The graphics driver used when printing on MSWindows.
• class Fl_Graphics_Driver
  A virtual class subclassed for each graphics driver FLTK uses.
• class Fl_Quartz_Graphics_Driver
  The Mac OS X-specific graphics class.
• class Fl_Surface_Device
  A drawing surface that's susceptible to receive graphical output.
• class Fl_Xlib_Graphics_Driver
  The Xlib-specific graphics class.
• struct Fl_Graphics_Driver::matrix
  A 2D coordinate transformation matrix.

Macros

• #define FL_MATRIX_STACK_SIZE 32
• #define FL_REGION_STACK_SIZE 10
• #define XPOINT XPoint

Typedefs

• typedef short COORD_T
• typedef void(* Fl_Draw_Image_Callback)(void *data, int x, int y, int w, uchar *buf)
  signature of image generation callback function.
Variables

- FL_EXPORT Fl_Graphics_Driver * fl_graphics_driver

Points to the driver that currently receives all graphics requests.

10.29.1 Detailed Description

10.29.2 Typedef Documentation

10.29.2.1 Fl_Draw_Image_Cb

typedef void(* Fl_Draw_Image_Cb)(void* data, int x, int y, int w, uchar *buf)

Signature of image generation callback function.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>data user data passed to function</td>
</tr>
<tr>
<td>in</td>
<td>x,y,w position and width of scan line in image</td>
</tr>
<tr>
<td>out</td>
<td>buf buffer for generated image data. You must copy w pixels from scanline y, starting at pixel x to this buffer.</td>
</tr>
</tbody>
</table>

00088 //
```

10.33 fl_draw.H File Reference

utility header to pull drawing functions together

```c
#include <FL/x.H>
#include <FL/Enumerations.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Device.H>
```

Macros

- `#define fl_clip fl_push_clip`

---

Generated by Doxygen
Intersects the current clip region with a rectangle and pushes this new region onto the stack (deprecated).

Enumerations

- enum {
  FL_SOLID = 0 , FL_DASH = 1 , FL_DOT = 2 , FL_DASHDOT = 3 ,
  FL_DASHDOTDOT = 4 , FL_CAP_FLAT = 0x100 , FL_CAP_ROUND = 0x200 , FL_CAP_SQUARE = 0x300 ,
  FL_JOIN_MITER = 0x1000 , FL_JOIN_ROUND = 0x2000 , FL_JOIN_BEVEL = 0x3000 }

Functions

- FL_EXPORT int fl_add_symbol (const char *name, void(*drawit)(Fl_Color), int scalable)
  Adds a symbol to the system.
- void fl_arc (double x, double y, double r, double start, double end)
  Adds a series of points to the current path on the arc of a circle.
- void fl_arc (int x, int y, int w, int h, double a1, double a2)
  Draw ellipse sections using integer coordinates.
- void fl_begin_complex_polygon ()
  Starts drawing a complex filled polygon.
- void fl_begin_line ()
  Starts drawing a list of lines.
- void fl_begin_loop ()
  Starts drawing a closed sequence of lines.
- void fl_begin_points ()
  Starts drawing a list of points.
- void fl_begin_polygon ()
  Starts drawing a convex filled polygon.
- FL_EXPORT char fl_can_do_alpha_blending ()
  Checks whether platform supports true alpha blending for RGBA images.
- FL_EXPORT void fl_chord (int x, int y, int w, int h, double a1, double a2)
  fl_chord declaration is a place holder - the function does not yet exist
- void fl_circle (double x, double y, double r)
  fl_circle() is equivalent to fl_arc(x,y,r,0,360), but may be faster.
- int fl_clip_box (int x, int y, int w, int h, int &X, int &Y, int &W, int &H)
  Intersects the rectangle with the current clip region and returns the bounding box of the result.
- Fl_Region fl_clip_region ()
  Returns the current clipping region.
- void fl_clip_region (Fl_Region r)
  Replaces the top of the clipping stack with a clipping region of any shape.
- Fl_Color fl_color ()
  Returns the last fl_color() that was set.
- void fl_color (Fl_Color c)
  Sets the color for all subsequent drawing operations.
- void fl_color (int c)
  for back compatibility - use fl_color(Fl_Color c) instead
- void fl_color (uchar r, uchar g, uchar b)
  Sets the color for all subsequent drawing operations.
- FL_EXPORT void fl_cursor (Fl_Cursor)
  Sets the cursor for the current window to the specified shape and colors.
- FL_EXPORT void fl_cursor (Fl_Cursor, Fl_Color fg, Fl_Color bg=FL_WHITE)
- void fl_curve (double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)
  Adds a series of points on a Bezier curve to the path.
• int fl_descent ()
  Returns the recommended distance above the bottom of a fl_height() tall box to draw the text at so it looks centered vertically in that box.

• void fl_draw (const char *str, int n, int x, int y)
  Draws starting at the given x, y location a UTF-8 string of length n bytes.

• FL_EXPORT void fl_draw (const char *str, int x, int y)
  Draws a null-terminated UTF-8 string starting at the given x, y location.

• FL_EXPORT void fl_draw (const char *str, int x, int y, int w, int h, Fl_Align align, Fl_Image *img=0, int draw_symbols=1)
  Fancy string drawing function which is used to draw all the labels.

• FL_EXPORT void fl_draw (const char *str, int x, int y, int w, int h, Fl_Align align, void(*)(const char *, int, int, int), Fl_Image *img=0, int draw_symbols=1)
  The same as fl_draw(const char*,int,int,int,Fl_Align,Fl_Image*,int) with the addition of the callthis parameter, which is a pointer to a text drawing function such as fl_draw(const char *, int, int, int) to do the real work.

• void fl_draw (int angle, const char *str, int n, int x, int y)
  Draws at the given x, y location a UTF-8 string of length n bytes rotating angle degrees counter-clockwise.

• FL_EXPORT void fl_draw (int angle, const char *str, int x, int y)
  Draws a null-terminated UTF-8 string starting at the given x, y location and rotating angle degrees counter-clockwise.

• FL_EXPORT void fl_draw_box (Fl_Boxtype, int x, int y, int w, int h, Fl_Color)
  Draws a box using given type, position, size and color.

• void fl_draw_image (const uchar *buf, int X, int Y, int W, int H, int D=3, int L=0)
  Draws an 8-bit per color RGB or luminance image.

• void fl_draw_image (Fl_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=3)
  Draws an image using a callback function to generate image data.

• void fl_draw_image_mono (const uchar *buf, int X, int Y, int W, int H, int D=1, int L=0)
  Draws a gray-scale (1 channel) image.

• void fl_draw_image_mono (Fl_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=1)
  Draws a gray-scale image using a callback function to generate image data.

• FL_EXPORT int fl_draw_pixmap (char *const *data, int x, int y, Fl_Color=FL_GRAY)
  Draw XPM image data, with the top-left corner at the given position.

• FL_EXPORT int fl_draw_pixmap (const char *const *cdata, int x, int y, Fl_Color=FL_GRAY)
  Draw XPM image data, with the top-left corner at the given position.

• FL_EXPORT int fl_draw_symbol (const char *label, int x, int y, int w, int h, Fl_Color)
  Draw the named symbol in the given rectangle using the given color.

• void fl_end_complex_polygon ()
  Ends complex filled polygon, and draws.

• void fl_end_line ()
  Ends list of lines, and draws.

• void fl_end_loop ()
  Ends closed sequence of lines, and draws.

• void fl_end_points ()
  Ends list of points, and draws.

• void fl_end_polygon ()
  Ends convex filled polygon, and draws.

• FL_EXPORT const char * fl_expand_text (const char *from, char *buf, int maxbuf, double maxw, int &n, double &width, int wrap, int draw_symbols=0)
  Copy from to buf, replacing control characters with ^X.

• FL_Font fl_font ()
  Returns the face set by the most recent call to fl_font().

• void fl_font (FL_Font face, Fl_Fontsize fsize)
  Sets the current font, which is then used in various drawing routines.
• FL_EXPORT void fl_frame (const char *s, int x, int y, int w, int h)
  Draws a series of line segments around the given box.
• FL_EXPORT void fl_frame2 (const char *s, int x, int y, int w, int h)
  Draws a series of line segments around the given box.
• void fl_gap ()
  Call fl_gap() to separate loops of the path.
• int fl_height ()
  Returns the recommended minimum line spacing for the current font.
• FL_EXPORT int fl_height (int font, int size)
  This function returns the actual height of the specified font and size.
• FL_EXPORT const char * fl_latin1_to_local (const char *t, int n=-1)
  Converts text from Windows/X11 latin1 character set to local encoding.
• void fl_line (int x, int y, int x1, int y1)
  Draws a line from (x,y) to (x1,y1)
• void fl_line (int x, int y, int x1, int y1, int x2, int y2)
  Draws a line from (x,y) to (x1,y1) and another from (x1,y1) to (x2,y2)
• void fl_line_style (int style, int width=0, char * dashes=0)
  Sets how to draw lines (the "pen").
• FL_EXPORT const char * fl_local_to_latin1 (const char *t, int n=-1)
  Converts text from local encoding to Windows/X11 latin1 character set.
• FL_EXPORT const char * fl_local_to_mac_roman (const char *t, int n=-1)
  Converts text from local encoding to Mac Roman character set.
• void fl_loop (int x, int y, int x1, int y1, int x2, int y2)
  Outlines a 3-sided polygon with lines.
• void fl_loop (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
  Outlines a 4-sided polygon with lines.
• FL_EXPORT const char * fl_mac_roman_to_local (const char *t, int n=-1)
  Converts text from Mac Roman character set to local encoding.
• FL_EXPORT void fl_measure (const char *str, int &x, int &y, int draw_symbols=1)
  Measure how wide and tall the string will be when printed by the fl_draw() function with align parameter.
• FL_EXPORT int fl_measure_pixmap (char * const * data, int &w, int &h)
  Get the dimensions of a pixmap.
• FL_EXPORT int fl_measure_pixmap (const char * const * cdata, int &w, int &h)
  Get the dimensions of a pixmap.
• void fl_mult_matrix (double a, double b, double c, double d, double x, double y)
  Concatenates another transformation onto the current one.
• int fl_not_clipped (int x, int y, int w, int h)
  Does the rectangle intersect the current clip region?
• FL_EXPORT unsigned int fl_old_shortcut (const char *s)
  Emulation of XForms named shortcuts.
• FL_EXPORT void fl_overlay_clear ()
  Erase a selection rectangle without drawing a new one.
• FL_EXPORT void fl_overlay_rect (int x, int y, int w, int h)
  Draws a selection rectangle, erasing a previous one by XOR'ing it first.
• void fl_pie (int x, int y, int w, int h, double a1, double a2)
  Draw filled ellipse sections using integer coordinates.
• void fl_point (int x, int y)
  Draws a single pixel at the given coordinates.
• void fl_polygon (int x, int y, int x1, int y1, int x2, int y2)
  Fills a 3-sided polygon.
Fills a 4-sided polygon.

- void fl_pop_clip()
  Restores the previous clip region.

- void fl_pop_matrix()
  Restores the current transformation matrix from the stack.

- void fl_push_clip(int x, int y, int w, int h)
  Intersects the current clip region with a rectangle and pushes this new region onto the stack.

- void fl_push_matrix()
  Saves the current transformation matrix on the stack.

- void fl_push_no_clip()
  Pushes an empty clip region onto the stack so nothing will be clipped.

- FL_EXPORT uchar* fl_read_image(uchar*p, int X, int Y, int W, int H, int alpha=0)
  Reads an RGB(A) image from the current window or off-screen buffer.

- void fl_rect(int x, int y, int w, int h)
  Draws a 1-pixel border inside the given bounding box.

- void fl_rect(int x, int y, int w, int h, Fl_Color c)
  Draws with passed color a 1-pixel border inside the given bounding box.

- void fl_rectf(int x, int y, int w, int h)
  Colors with current color a rectangle that exactly fills the given bounding box.

- void fl_rectf(int x, int y, int w, int h, Fl_Color c)
  Colors with passed color a rectangle that exactly fills the given bounding box.

- FLEXPORT void fl_rectf(int x, int y, int w, int h, uchar r, uchar g, uchar b)
  Colors a rectangle with "exactly" the passed r, g, b color.

- FL_EXPORT void fl_reset_spot()

- void fl_restore_clip()
  Undoes any clobbering of clip done by your program.

- void fl_rotate(double d)
  Concatenates rotation transformation onto the current one.

- void fl_rtl_draw(const char* str, int n, int x, int y)
  Draws a UTF-8 string of length n bytes right to left starting at the given x, y location.

- void fl_scale(double x)
  Concatenates scaling transformation onto the current one.

- void fl_scale(double x, double y)
  Concatenates scaling transformation onto the current one.

- FL_EXPORT void fl_scroll(int X, int Y, int W, int H, int dx, int dy, void(*draw_area)(void*, int, int, int, int), void* data)
  Scroll a rectangle and draw the newly exposed portions.

- FL_EXPORT void fl_set_spot(int font, int size, int X, int Y, int W, int H, Fl_Window* win=0)

- FL_EXPORT void fl_set_status(int X, int Y, int W, int H)

- FL_EXPORT const char* flShortcut_label(unsigned int shortcut)
  Get a human-readable string from a shortcut value.

- FL_EXPORT const char* flShortcut_label(unsigned int shortcut, const char** eom)

- Fl_Fontsize fl_size()
  Returns the size set by the most recent call to fl_font().

- FL_EXPORT void fl_text_extents(const char*, int &dx, int &dy, int &w, int &h)
  Determines the minimum pixel dimensions of a null-terminated string.

- void fl_text_extents(const char*t, int n, int &dx, int &dy, int &w, int &h)
  Determines the minimum pixel dimensions of a sequence of n characters.

- double fl_transform_dx(double x, double y)
  Transforms distance using current transformation matrix.
• double fl_transform_dy (double x, double y)
  Transforms distance using current transformation matrix.
• double fl_transform_x (double x, double y)
  Transforms coordinate using the current transformation matrix.
• double fl_transform_y (double x, double y)
  Transforms coordinate using the current transformation matrix.
• void fl_transformed_vertex (double xf, double yf)
  Adds coordinate pair to the vertex list without further transformations.
• void fl_translate (double x, double y)
  Concatenates translation transformation onto the current one.
• void fl_vertex (double x, double y)
  Adds a single vertex to the current path.
• FL_EXPORT double fl_width (const char *txt)
  Returns the typographical width of a null-terminated string using the current font face and size.
• double fl_width (const char *txt, int n)
  Returns the typographical width of a sequence of \( n \) characters using the current font face and size.
• double fl_width (unsigned int c)
  Returns the typographical width of a single character using the current font face and size.
• void fl_xyline (int x, int y, int x1)
  Draws a horizontal line from \((x,y)\) to \((x1,y)\)
• void fl_xyline (int x, int y, int x1, int y2)
  Draws a horizontal line from \((x,y)\) to \((x1,y)\), then vertical from \((x1,y)\) to \((x1,y2)\)
• void fl_xyline (int x, int y, int x1, int y2, int x3)
  Draws a horizontal line from \((x,y)\) to \((x1,y)\), then a vertical from \((x1,y)\) to \((x1,y2)\) and then another horizontal from \((x1,y2)\) to \((x3,y2)\)
• void fl_yxline (int x, int y, int y1)
  Draws a vertical line from \((x,y)\) to \((x,y1)\)
• void fl_yxline (int x, int y, int y1, int x2)
  Draws a vertical line from \((x,y)\) to \((x,y1)\), then a horizontal from \((x,y1)\) to \((x2,y1)\)
• void fl_yxline (int x, int y, int y1, int x2, int y3)
  Draws a vertical line from \((x,y)\) to \((x,y1)\) then a horizontal from \((x,y1)\) to \((x2,y1)\), then another vertical from \((x2,y1)\) to \((x2,y3)\)

Variables
• FL_EXPORT char fl_drawShortcut

10.33.1 Detailed Description
utility header to pull drawing functions together

10.56  Fl_Image.H File Reference

Fl_Image, Fl_RGB_Image classes.
#include "Enumerations.H"
#include <stdlib.h>
Classes

- class Fl_Image
  Base class for image caching and drawing.
- class Fl_RGB_Image
  The Fl_RGB_Image class supports caching and drawing of full-color images with 1 to 4 channels of color information.

Enumerations

- enum Fl_RGB_Scaling { FL_RGB_SCALING_NEAREST = 0, FL_RGB_SCALING_BILINEAR }
  The scaling algorithm to use for RGB images.

10.56.1 Detailed Description

Fl_Image, Fl_RGB_Image classes.

10.56.2 Enumeration Type Documentation

10.56.2.1 Fl_RGB_Scaling
eenum Fl_RGB_Scaling
The scaling algorithm to use for RGB images.

Enumarator

<table>
<thead>
<tr>
<th>FL_RGB_SCALING_NEAREST</th>
<th>default RGB image scaling algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_RGB_SCALING_BILINEAR</td>
<td>more accurate, but slower RGB image scaling algorithm</td>
</tr>
</tbody>
</table>

#include "Fl_Widget.H"
#include "Fl_Image.H"

Classes

- struct Fl_Menu_Item

  The Fl_Menu_Item structure defines a single menu item that is used by the Fl_Menu_ class.

Typedefs

- typedef Fl_Menu_Item Fl_Menu

Enumerations

```c
enum {
    FL_MENU_INACTIVE = 1 , FL_MENU_TOGGLE = 2 , FL_MENU_VALUE = 4 , FL_MENU_RADIO = 8 ,
    FL_MENU_INVISIBLE = 0x10 , FL_SUBMENU_POINTER = 0x20 , FL_SUBMENU = 0x40 , FL_MENU_DIVIDER
                     = 0x80 ,
    FL_MENU_HORIZONTAL = 0x100
}
```
• enum {
    FL_PUP_NONE = 0 , FL_PUP_GREY = FL_MENU_INACTIVE , FL_PUP_GRAY = FL_MENU_INACTIVE , FL_PUP_BOX = FL_MENU_TOGGLE , FL_PUP_CHECK = FL_MENU_VALUE , FL_PUP_RADIO = FL_MENU_RADIO , FL_PUP_INVISIBLE = FL_MENU_INVISIBLE , FL_PUP_SUBMENU = FL_SUBMENU_POINTER }

Functions

• FL_EXPORT Fl_Shortcut fl_oldShortcut (const char *)

  Emulation of XForms named shortcuts.

10.70.1 Enumeration Type Documentation

10.70.1.1 anonymous enum

anonymous enum

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_MENU_INACTIVE</td>
<td>Deactivate menu item (gray out)</td>
</tr>
<tr>
<td>FL_MENU_TOGGLE</td>
<td>Item is a checkbox toggle (shows checkbox for on/off state)</td>
</tr>
<tr>
<td>FL_MENU_VALUE</td>
<td>The on/off state for checkbox/radio buttons (if set, state is 'on')</td>
</tr>
<tr>
<td>FL_MENU_RADIO</td>
<td>Item is a radio button (one checkbox of many can be on)</td>
</tr>
<tr>
<td>FL_MENU_INVISIBLE</td>
<td>Item will not show up (shortcut will work)</td>
</tr>
<tr>
<td>FL_SUBMENU_POINTER</td>
<td>Indicates user_data() is a pointer to another menu array.</td>
</tr>
<tr>
<td>FL_SUBMENU</td>
<td>This item is a submenu to other items.</td>
</tr>
<tr>
<td>FL_MENU_DIVIDER</td>
<td>Creates divider line below this item. Also ends a group of radio buttons.</td>
</tr>
<tr>
<td>FL_MENU_HORIZONTAL</td>
<td>??? – reserved</td>
</tr>
</tbody>
</table>

Fl_Native_File_Chooser widget.
#include <FL/Fl_Native_File_Chooser.H>

Classes

• class Fl_FLTK_File_Chooser
• class Fl_GTK_File_Chooser
• class Fl_Native_File_Chooser

This class lets an FLTK application easily and consistently access the operating system’s native file chooser.

10.85 Fl_Paged_Device.H File Reference

Declaration of class Fl_Paged_Device.
#include <FL/Fl_Device.H>
#include <FL/Fl_Window.H>

Classes

• class Fl_Paged_Device

  Represents page-structured drawing surfaces.

• struct Fl_Paged_Device::page_format

  width, height and name of a page format

Macros

• #define NO_PAGE_FORMATS 30 /* MSVC6 compilation fix */
  Number of elements in enum Page_Format.

10.85.1 Detailed Description

Declaration of class Fl_Paged_Device.

## 10.111 Fl_Shared_Image.H File Reference

The `Fl_Shared_Image` class.

```c
#include "Fl_Image.H"
```

### Classes
- `class Fl_Shared_Image`
  
  This class supports caching, loading, scaling, and drawing of image files.

### Typedefs
- `typedef Fl_Image *(FL_SHARED_HANDLER) (const char *name, uchar *header, int headerlen)`
Functions

- FL_EXPORT void fl_register_images()
  
  Register the image formats.

10.111.1 Detailed Description

**Fl_Shared_Image** class.

10.111.2 Function Documentation

10.111.2.1 fl_register_images()

```c
FL_EXPORT void fl_register_images () [extern]
```

Register the image formats.

This function is provided in the fltk_images library and registers all of the "extra" image file formats that are not part of the core FLTK library.

10.112 Fl_Shared_Image.H

Go to the documentation of this file.

```
#ifndef Fl_Shared_Image_H
#define Fl_Shared_Image_H

#include "Fl_Image.H"

// Test function for adding new formats
typedef Fl_Image *(*Fl_Shared_Handler)(const char *name, uchar *header,
                                     int headerlen);

// Shared images class.
class FL_EXPORT Fl_Shared_Image : public Fl_Image {
private:
  static Fl_RGB_Scaling scaling_algorithm_; // method used to rescale RGB source images
  static Fl_Shared_Handler *handlers_; // Additional format handlers
public:
  const char *name_; // Name of image file
  int original_; // Original image?
  int refcount_; // Number of times this image has been used
  Fl_Image *image_; // The image that is shared
  int alloc_image_; // Was the image allocated?

  static int compare(Fl_Shared_Image **i0, Fl_Shared_Image **i1);
};
```

10.113  fl_show_colormap.H File Reference

The fl_show_colormap() function hides the implementation classes used to provide the popup window and color selection mechanism.

Functions

• FL_EXPORT Fl_Color fl_show_colormap (Fl_Color oldcol)

  Pops up a window to let the user pick a colormap entry.

10.113.1  Detailed Description

The fl_show_colormap() function hides the implementation classes used to provide the popup window and color selection mechanism.

10.114  fl_show_colormap.H

/* "character size" is the size of a UTF-8 character in bytes
"character width" is the width of a Unicode character in pixels
"column" was originally defined as a character offset from the left margin.
It was identical to the byte offset. In UTF-8, we have neither a byte offset
nor truly fixed width fonts. Column could be a pixel value multiplied with
an average character width (which is a bearable approximation).

* in Unicode, there are no fixed width fonts! Even if the ASCII characters may
happen to be all the same width in pixels, Chinese characters surely are not.
There are plenty of exceptions, like ligatures, that make special handling of
"fixed" character widths a nightmare. I decided to remove all references to
fixed fonts and see "columns" as a multiple of the average width of a
character in the main font.

10.134  Fl_Tree.H File Reference

This file contains the definitions of the Fl_Tree class.

#include <FL/Fl.H>
#include <FL/Fl_Group.H>
#include <FL/Fl_Scrollbar.H>
#include <FL/fl_draw.H>
#include <FL/Fl_Tree_Item.H>
#include <FL/Fl_Tree_Prefs.H>

Classes

  • class Fl_Tree
    
    Tree widget.

Enumerations

  • enum Fl_Tree_Reason {
     FL_TREE_REASON_NONE =0 , FL_TREE_REASON_SELECTED , FL_TREE_REASON_DESELECTED ,
     FL_TREE_REASON_RESELECTED ,
     FL_TREE_REASON_OPENED , FL_TREE_REASON_CLOSED , FL_TREE_REASON_DRAGGED 
   }

   The reason the callback was invoked.
10.134.1 Detailed Description

This file contains the definitions of the Fl_Tree class.

10.134.2 Enumeration Type Documentation

10.134.2.1 Fl_Tree_Reason

enum Fl_Tree_Reason
The reason the callback was invoked.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_TREE_REASON_NONE</td>
<td>unknown reason</td>
</tr>
<tr>
<td>FL_TREE_REASON_SELECTED</td>
<td>an item was selected</td>
</tr>
<tr>
<td>FL_TREE_REASON_DESELECTED</td>
<td>an item was de-selected</td>
</tr>
<tr>
<td>FL_TREE_REASON_RESELECTED</td>
<td>an item was re-selected (e.g. double-clicked)</td>
</tr>
<tr>
<td>FL_TREE_REASON_OPENED</td>
<td>an item was opened</td>
</tr>
<tr>
<td>FL_TREE_REASON_CLOSED</td>
<td>an item was closed</td>
</tr>
<tr>
<td>FL_TREE_REASON_DRAGGED</td>
<td>an item was dragged into a new place</td>
</tr>
</tbody>
</table>

10.140 Fl_Tree_Prefs.H File Reference

This file contains the definitions for Fl_Tree’s preferences.

```c
#include <FL/Fl.H>
```

Classes

- class Fl_Tree_Prefs
  
  Tree widget’s preferences.

Typedefs

- typedef void() Fl_Tree_Item_Draw_Callback(Fl_Tree_Item *, void *)

Enumerations

- enum Fl_Tree_Connector { FL_TREE_CONNECTOR_NONE =0 , FL_TREE_CONNECTOR_DOTTED =1 , FL_TREE_CONNECTOR_SOLID =2 }

  Defines the style of connection lines between items.

- enum Fl_Tree_Item_Draw_Mode { FL_TREE_ITEM_DRAW_DEFAULT =0 , FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET =1 , FL_TREE_ITEM_HEIGHT_FROM_WIDGET =2 }

  Bit flags that control how item’s labels and widget()s are drawn in the tree via item_draw_mode().

- enum Fl_Tree_Item_Reselect_Mode { FL_TREE_SELECTABLE_ONCE =0 , FL_TREE_SELECTABLE_ALWAYS }

  Defines the ways an item can be (re) selected via item_reselect_mode().

- enum Fl_Tree_Sort { FL_TREE_SORT_NONE =0 , FL_TREE_SORT_ASCENDING =1 , FL_TREE_SORT_DESCENDING =2 }

  Sort order options for items added to the tree.

10.140.1 Detailed Description

This file contains the definitions for Fl_Tree’s preferences.

```

    |____ Fl_Tree_Item
```

10.140.2 Enumeration Type Documentation

10.140.2.1 Fl_Tree_Connector

```c
enum Fl_Tree_Connector
```

Defines the style of connection lines between items.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_TREE_CONNECTOR_NONE</td>
<td>Use no lines connecting items.</td>
</tr>
<tr>
<td>FL_TREE_CONNECTOR_DOTTED</td>
<td>Use dotted lines connecting items (default)</td>
</tr>
<tr>
<td>FL_TREE_CONNECTOR_SOLID</td>
<td>Use solid lines connecting items.</td>
</tr>
</tbody>
</table>
10.140.2.2  Fl_Tree_Item_Draw_Mode

enum Fl_Tree_Item_Draw_Mode
Bit flags that control how item's labels and widget()s are drawn in the tree via item_draw_mode().

Enumerator

<table>
<thead>
<tr>
<th>Enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_TREE_ITEM_DRAW_DEFAULT</td>
<td>If widget() defined, draw in place of label, and widget() tracks item height (default)</td>
</tr>
<tr>
<td>FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET</td>
<td>If widget() defined, include label to the left of the widget.</td>
</tr>
<tr>
<td>FL_TREE_ITEM_HEIGHT_FROM_WIDGET</td>
<td>If widget() defined, widget()'s height controls item's height.</td>
</tr>
</tbody>
</table>

10.140.2.3  Fl_Tree_Item_Reselect_Mode

enum Fl_Tree_Item_Reselect_Mode
Defines the ways an item can be (re) selected via item_reselect_mode().

Enumerator

<table>
<thead>
<tr>
<th>Enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_TREE_SELECTABLE_ONCE</td>
<td>Item can only be selected once (default)</td>
</tr>
<tr>
<td>FL_TREE_SELECTABLE_ALWAYS</td>
<td>Enables FL_TREE_REASON_RESELECTED events for callbacks.</td>
</tr>
</tbody>
</table>

10.140.2.4  Fl_Tree_Select

enum Fl_Tree_Select
Tree selection style.

Enumerator

<table>
<thead>
<tr>
<th>Enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_TREE_SELECT_NONE</td>
<td>Nothing selected when items are clicked.</td>
</tr>
<tr>
<td>FL_TREE_SELECT_SINGLE</td>
<td>Single item selected when item is clicked (default)</td>
</tr>
<tr>
<td>FL_TREE_SELECT_MULTI</td>
<td>Multiple items can be selected by clicking with SHIFT, CTRL or mouse drags.</td>
</tr>
<tr>
<td>FL_TREE_SELECT_SINGLE_DRAGGABLE</td>
<td>Single items may be selected, and they may be reordered by mouse drag.</td>
</tr>
</tbody>
</table>

10.140.2.5  Fl_Tree_Sort

enum Fl_Tree_Sort
Sort order options for items added to the tree.

Enumerator

<table>
<thead>
<tr>
<th>Enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_TREE_SORT_NONE</td>
<td>No sorting; items are added in the order defined (default).</td>
</tr>
<tr>
<td>FL_TREE_SORT_ASCENDING</td>
<td>Add items in ascending sort order.</td>
</tr>
<tr>
<td>FL_TREE_SORT_DESCENDING</td>
<td>Add items in descending sort order.</td>
</tr>
</tbody>
</table>

### Typedefs

#### Miscellaneous

- `typedef unsigned int Fl_Char
  24-bit Unicode character - upper 8 bits are unused`
- `typedef const char * Fl_CString
  Flexible length UTF-8 Unicode read-only string.`
- `typedef unsigned int Fl_Shortcut
  24-bit Unicode character + 8-bit indicator for keyboard flags`
• typedef char * Fl_String
  
  Flexible length UTF-8 Unicode text.
• typedef unsigned char uchar
  
  unsigned char
• typedef unsigned long ulong
  
  unsigned long

10.142.1 Detailed Description

This file contains simple "C"-style type definitions.

10.142.2 Typedef Documentation

10.142.2.1 Fl_CString
typedef const char* Fl_CString

Flexible length UTF-8 Unicode read-only string.

See also

  Fl_String

10.142.2.2 Fl_String
typedef char* Fl_String

Flexible length UTF-8 Unicode text.

Todo FIXME: temporary (?) typedef to mark UTF-8 and Unicode conversions

10.143 fl_types.h

Go to the documentation of this file.
10.144 fl_utf8.h File Reference

header for Unicode and UTF-8 character handling

```c
#include "Fl_Export.H"
#include "fl_types.h"
#include <stdio.h>
#include <string.h>
#include <stdlib.h>
#include <sys/types.h>
#include <sys/stat.h>
#include <locale.h>
```

Macros

- `#define xchar unsigned short`

Functions

- `FL_EXPORT int fl_access (const char *f, int mode)`
  
  Cross-platform function to test a files access() with a UTF-8 encoded name or value.

- `FL_EXPORT int fl_chmod (const char *f, int mode)`
  
  Cross-platform function to set a files mode() with a UTF-8 encoded name or value.

- `FL_EXPORT int fl_execvp (const char *file, char **argv)`

  Cross-platform function to open files with a UTF-8 encoded name.

- `FL_EXPORT char * fl_getcwd (char *b, int l)`

  Cross-platform function to get the current working directory as a UTF-8 encoded value.

- `FL_EXPORT char * fl_getenv (const char *v)`

  Cross-platform function to get environment variables with a UTF-8 encoded name or value.

- `FL_EXPORT char fl_make_path (const char *path)`

  Cross-platform function to recursively create a path in the file system.

- `FL_EXPORT void fl_make_path_for_file (const char *path)`

  Cross-platform function to create a path for the file in the file system.

- `FL_EXPORT int fl_mkdir (const char *f, int mode)`

  Cross-platform function to create a directory with a UTF-8 encoded name.

- `FL_EXPORT unsigned int fl_nonspacing (unsigned int ucs)`

  Returns true if the Unicode character ucs is non-spacing.

- `FL_EXPORT int fl_open (const char *f, int oflags,...)`

  Cross-platform function to open files with a UTF-8 encoded name.

- `FL_EXPORT int fl_rename (const char *f, const char *n)`

  Cross-platform function to rename a filesystem object using UTF-8 encoded names.

- `FL_EXPORT int fl_rmdir (const char *f)`

  Cross-platform function to remove a directory with a UTF-8 encoded name.

- `FL_EXPORT int fl_stat (const char *f, struct stat *b)`

  Cross-platform function to stat() a file using a UTF-8 encoded name or value.

- `FL_EXPORT int fl_system (const char *cmd)`

  Cross-platform function to run a system command with a UTF-8 encoded string.

- `FL_EXPORT int fl_tolower (unsigned int ucs)`

  Returns the Unicode lower case value of ucs.

- `FL_EXPORT int fl_toupper (unsigned int ucs)`

  Returns the Unicode upper case value of ucs.

- `FL_EXPORT unsigned fl_ucs_to_Utf16 (const unsigned ucs, unsigned short *dst, const unsigned dstlen)`

- `FL_EXPORT int fl_unlink (const char *f)`

Generated by Doxygen
Cross-platform function to unlink() (that is, delete) a file using a UTF-8 encoded filename.

- FL_EXPORT char * fl_utf2mbcs (const char *s)
  Converts UTF-8 string s to a local multi-byte character string.
- FL_EXPORT const char * fl_utf8back (const char *p, const char *start, const char *end)
  Return the number of bytes needed to encode the given UCS4 character in UTF-8.
- FL_EXPORT unsigned fl_utf8decode (const char *p, const char *end, int *len)
- FL_EXPORT int fl_utf8encode (unsigned ucs, char *buf)
- FL_EXPORT unsigned fl_utf8from_mb (char *dst, unsigned dstlen, const char *src, unsigned srclen)
- FL_EXPORT unsigned fl_utf8froma (char *dst, unsigned dstlen, const char *src, unsigned srclen)
- FL_EXPORT unsigned fl_utf8fromwc (char *dst, unsigned dstlen, const wchar_t *src, unsigned srclen)
- FL_EXPORT const char * fl_utf8fwd (const char *p, const char *start, const char *end)
- FL_EXPORT int fl_utf8len (char c)
  Returns the byte length of the UTF-8 sequence with first byte c, or -1 if c is not valid.
- FL_EXPORT int fl_utf8len1 (char c)
  Returns the byte length of the UTF-8 sequence with first byte c, or 1 if c is not valid.
- FL_EXPORT int fl_utf8locale (void)
- FL_EXPORT int fl_utf8test (const char *src, unsigned len)
- FL_EXPORT unsigned fl_utf8to_mb (const char *src, unsigned srclen, char *dst, unsigned dstlen)
- FL_EXPORT unsigned fl_utf8toa (const char *src, unsigned srclen, char *dst, unsigned dstlen)
- FL_EXPORT unsigned fl_utf8toUtf16 (const char *src, unsigned srclen, unsigned short *dst, unsigned dstlen)
- FL_EXPORT unsigned fl_utf8towc (const char *src, unsigned srclen, wchar_t *dst, unsigned dstlen)
- FL_EXPORT int fl_utf_nb_char (const unsigned char *buf, int len)
  Returns the number of Unicode chars in the UTF-8 string.
- FL_EXPORT int fl_utf_strcasecmp (const char *s1, const char *s2)
  UTF-8 aware strcasecmp - converts to Unicode and tests.
- FL_EXPORT int fl_utf_strncasecmp (const char *s1, const char *s2, int n)
  UTF-8 aware strncasecmp - converts to lower case Unicode and tests.
- FL_EXPORT int fl_utf_tolower (const unsigned char *str, int len, char *buf)
  Converts the string str to its lower case equivalent into buf.
- FL_EXPORT int fl_utf_toupper (const unsigned char *str, int len, char *buf)
  Converts the string str to its upper case equivalent into buf.
- FL_EXPORT int fl_wcwidth (const char *src)
  extended wrapper around fl_wcwidth(unsigned int ucs) function.
- FL_EXPORT int fl_wcwidth_ (unsigned int ucs)
  wrapper to adapt Markus Kuhn's implementation of wcwidth() for FLTK

10.150 Fl_Widget.H File Reference
Typedefs

- typedef void() Fl_Callback(Fl_Widget *, void *)
  Default callback type definition for all fltk widgets (by far the most used)
- typedef void() Fl_Callback0(Fl_Widget *)
  One parameter callback type definition passing only the widget.
- typedef void() Fl_Callback1(Fl_Widget *, long)
  Callback type definition passing the widget and a long data value.
- typedef Fl_Callback * Fl_Callback_p
  Default callback type pointer definition for all fltk widgets.
- typedef long fl_intptr_t
- typedef unsigned long fl_uintptr_t

10.150.1 Detailed Description
Fl_Widget, Fl_Label classes.

10.150.2 Macro Definition Documentation

10.150.2.1 FL_RESERVED_TYPE
#define FL_RESERVED_TYPE 100
Reserved type numbers (necessary for my cheapo RTTI) start here.
Grep the header files for "RESERVED_TYPE" to find the next available number.

10.150.3 Typedef Documentation

10.150.3.1 fl_intptr_t
typedef long fl_intptr_t

Todo: typedef's fl_intptr_t and fl_uintptr_t should be documented.

10.151 Fl_Widget.H

Go to the documentation of this file.

// Stuff from DDForms:

// gl.h File Reference

This file defines wrapper functions for OpenGL in FLTK.
#include "Enumerations.H"
#include <GL/gl.h>

Functions

- FL_EXPORT void gl_color (Fl_Color i)
  
  Sets the current OpenGL color to an FLTK color.

- void gl_color (int c)
  
  back compatibility

- FL_EXPORT int gl_descent ()
  
  Returns the current font's descent.

- FL_EXPORT void gl_draw (const char *)
  
  Draws a null-terminated string in the current font at the current position.

- FL_EXPORT void gl_draw (const char *, float x, float y)

Generated by Doxygen
Draws a nul-terminated string in the current font at the given position.

- FL_EXPORT void gl_draw (const char *, int n)

  Draws an array of n characters of the string in the current font at the current position.

- FL_EXPORT void gl_draw (const char *, int n, float x, float y)

  Draws n characters of the string in the current font at the given position.

- FL_EXPORT void gl_draw (const char *, int n, int x, int y)

  Draws n characters of the string in the current font at the given position.

- FL_EXPORT void gl_draw (const char *, int x, int y)

  Draws a nul-terminated string in the current font at the given position.

- FL_EXPORT void gl_draw (const char *, int x, int y, int w, int h, Fl_Align)

  Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to \^X.

- FL_EXPORT void gl_draw_image (const uchar *, int x, int y, int w, int h, int d=3, int ld=0)

- FL_EXPORT void gl_finish ()

  Releases an OpenGL context.

- FL_EXPORT void gl_font (int fontid, int size)

  Sets the current OpenGL font to the same font as calling fl_font().

- FL_EXPORT int gl_height ()

  Returns the current font’s height.

- FL_EXPORT void gl_measure (const char *, int &x, int &y)

  Measures how wide and tall the string will be when drawn by the gl_draw() function.

- FL_EXPORT void gl_rect (int x, int y, int w, int h)

  Outlines the given rectangle with the current color.

  void gl_rectf (int x, int y, int w, int h)

  Fills the given rectangle with the current color.

- FL_EXPORT void gl_start ()

  Creates an OpenGL context.

- FL_EXPORT double gl_width (const char *)

  Returns the width of the string in the current font.

- FL_EXPORT double gl_width (const char *, int n)

  Returns the width of n characters of the string in the current font.

- FL_EXPORT double gl_width (uchar)

  Returns the width of the character in the current font.

### 10.158.1 Detailed Description

This file defines wrapper functions for OpenGL in FLTK.

To use OpenGL from within an FLTK application you MUST use gl_visual() to select the default visual before doing show() on any windows. Mesa will crash if you try to use a visual not returned by glxChooseVidual. This does not work with Fl_Double_Window’s! It will try to draw into the front buffer. Depending on the system this will either crash or do nothing (when pixmaps are being used as back buffer and GL is being done by hardware), work correctly (when GL is done with software, such as Mesa), or draw into the front buffer and be erased when the buffers are swapped (when double buffer hardware is being used).

### 10.158.2 Function Documentation

#### 10.158.2.1 gl_color()

FL_EXPORT void gl_color (Fl_Color i)

Sets the current OpenGL color to an FLTK color.

For color-index modes it will use fl_xpixel(c), which is only right if the window uses the default colormap!
10.158.2.2 gl_draw() [1/7]

FL_EXPORT void gl_draw(
    const char * str
)

Draws a nul-terminated string in the current font at the current position.

See also

On the Mac OS X platform, see gl_texture_pile_height(int)

10.158.2.3 gl_draw() [2/7]

FL_EXPORT void gl_draw(
    const char * str,
    float x, 
    float y )

Draws a nul-terminated string in the current font at the given position.

See also

On the Mac OS X platform, see gl_texture_pile_height(int)

10.158.2.4 gl_draw() [3/7]

FL_EXPORT void gl_draw(
    const char * str,
    int n )

Draws an array of n characters of the string in the current font at the current position.

See also

On the Mac OS X platform, see gl_texture_pile_height(int)

10.158.2.5 gl_draw() [4/7]

FL_EXPORT void gl_draw(
    const char * str,
    int n, 
    float x, 
    float y )

Draws n characters of the string in the current font at the given position.

See also

On the Mac OS X platform, see gl_texture_pile_height(int)

10.158.2.6 gl_draw() [5/7]

FL_EXPORT void gl_draw(
    const char * str,
    int n, 
    int x, 
    int y )

Draws n characters of the string in the current font at the given position.

See also

On the Mac OS X platform, see gl_texture_pile_height(int)
10.158.2.7  gl_draw() [6/7]

FL_EXPORT void gl_draw (  
    const char * str,  
    int x,  
    int y )

Draws a null-terminated string in the current font at the given position.

See also

On the Mac OS X platform, see gl_texture_pile_height(int)

10.158.2.8  gl_draw() [7/7]

FL_EXPORT void gl_draw (  
    const char * str,  
    int x,  
    int y,  
    int w,  
    int h,  
    Fl_ALIGN align )

Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to \^X. and aligned with the edges or center. Exactly the same output as fl_draw().

10.158.2.9  gl_rect()

FL_EXPORT void gl_rect (  
    int x,  
    int y,  
    int w,  
    int h )

Outlines the given rectangle with the current color.  
If Fl_Gl_Window::ortho() has been called, then the rectangle will exactly fill the given pixel rectangle.

10.158.2.10  gl_rectf()

void gl_rectf (  
    int x,  
    int y,  
    int w,  
    int h ) [inline]

Fills the given rectangle with the current color.

See also

    gl_rect(int x, int y, int w, int h)

10.159  gl.h

Mac OS X-specific symbols.

Classes

- class Fl_Mac_App_Menu
  Mac OS-specific class allowing to customize and localize the application menu.
Functions

- void fl_mac_set_about (Fl_Callback ∗ cb, void ∗ user_data, int shortcut=0)
  
  Attaches a callback to the "About myprog" item of the system application menu.

- void fl_open_callback (void (∗ cb)(const char ∗))
  
  Register a function called for each file dropped onto an application icon.

Variables

- int fl_mac_os_version
  
  The version number of the running Mac OS X (e.g., 100604 for 10.6.4)

- int fl_mac_quit_early
  
  Determines whether cmd-Q or the "Quit xxx" item of application menu terminates the app or only the event loop.

- class Fl_Sys_Menu_Bar ∗ fl_sys_menu_bar
  
  The system menu bar.

10.164.1 Detailed Description

Mac OS X-specific symbols.

00006 // Copyright 1998-2010 by Bill Spitzak and others.
00007 //
00008 // This library is free software. Distribution and use rights are outlined in
00009 // the file "COPYING" which should have been included with this file. If this
00010 // file is missing or damaged, see the license at:
00011 //
00012 // http://www.fltk.org/COPYING.php
00013 //
00014 // Please report all bugs and problems on the following page:
00015 //
00016 // http://www.fltk.org/str.php
00017 //
00018 //
00019 // This file has proven to be tremendously useful in debugging
00020 // code. This file is normally not included into any FLTK builds,
00021 // but since it has proven to be tremendously useful in debugging
00022 // the FLTK port to "Quartz", I decided to add this file in case
00023 // more bugs show up.
00024 //
00025 // This header is activated by adding the following
00026 // line to "config.h"
00027 //
00028 // #include "src/cgdebug.h"
00029 //
00030 // When used erroneously, Core Graphics prints warnings to
00031 // stderr. This is helpful, however it is not possible to
00032 // associate a line number or source file with the warning message.
00033 // This header file outputs a trace of CG calls, interweaving
00034 // them with CG warnings.
00035 //
00036 //
00037 // Matthias

10.173.1 Detailed Description
Utility functions for drawing arcs and circles.

10.174  fl_arci.cxx File Reference
Utility functions for drawing circles using integers.
#include <FL/fl_draw.H>
#include <FL/x.H>
#include <config.h>

10.174.1 Detailed Description
Utility functions for drawing circles using integers.

10.175  fl_ask.cxx File Reference
Utility Functions for Common Dialogs.
#include <stdio.h>
#include <stdarg.h>
#include "flstring.h"
#include <FL/Fl.H>
#include <FL/fl_ask.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_Button.H>
#include <FL/Fl_Return_Button.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Input.H>
#include <FL/Fl_Secret_Input.H>
#include <FL/x.H>
#include <FL/fl_draw.H>

Functions

• void fl_alert (const char *fmt,...)
  Shows an alert message dialog box.

• int fl_ask (const char *fmt,...)
  Shows a dialog displaying the fmt message, this dialog features 2 yes/no buttons.

• void fl_beep (int type)
  Emits a system beep message.

• int fl_choice (const char *fmt, const char *b0, const char *b1, const char *b2,...)
  Shows a dialog displaying the printf style fmt message, this dialog features up to 3 customizable choice buttons.

• int fl_choice_n (const char *fmt, const char *b0, const char *b1, const char *b2,...)
  Like fl_choice() but with extended (negative) return values.

• const char * fl_input (const char *fmt, const char *defstr,...)
  Shows an input dialog displaying the fmt message.
• void fl_message (const char ∗fmt,...)
  Shows an information message dialog box.
• void fl_message_hotspot (int enable)
  Sets whether or not to move the common message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer.
• int fl_message_hotspot (void)
  Gets whether or not to move the common message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer.
• Fl_Widget ∗ fl_message_icon ()
  Gets the Fl_Box icon container of the current default dialog used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().
• void fl_message_title (const char ∗title)
  Sets the title of the dialog window used in many common dialogs.
• void fl_message_title_default (const char ∗title)
  Sets the default title of the dialog window used in many common dialogs.
• const char ∗ fl_password (const char ∗fmt, const char ∗defstr,...)
  Shows an input dialog displaying the fmt message.

Variables
• const char ∗ fl_cancel = "Cancel"
  string pointer used in common dialogs, you can change it to another language
• const char ∗ fl_close = "Close"
  string pointer used in common dialogs, you can change it to another language
• Fl_Font fl_message_font_ = FL_HELVETICA
• Fl_Fontsize fl_message_size_ = -1
• const char ∗ fl_no = "No"
  string pointer used in common dialogs, you can change it to another language
• const char ∗ fl_ok = "OK"
  string pointer used in common dialogs, you can change it to another language
• const char ∗ fl_yes = "Yes"
  string pointer used in common dialogs, you can change it to another language

10.175.1 Detailed Description
Utility Functions for Common Dialogs.

10.176 fl_boxtype.cxx File Reference
drawing code for common box types.
#include <FL/Fl.H>
#include <FL/Fl_Widget.H>
#include <FL/fl_draw.H>
#include <config.h>

Macros
• #define D1 BORDER_WIDTH
• #define D2 (BORDER_WIDTH+BORDER_WIDTH)
• #define fl_border_box fl_rectbound
  allow consistent naming
Functions

- void fl_border_frame (int x, int y, int w, int h, Fl_Color c)
  Draws a frame of type FL_BORDER_FRAME.
- void fl_down_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_DOWN_BOX.
- void fl_down_frame (int x, int y, int w, int h, Fl_Color)
  Draws a frame of type FL_DOWN_FRAME.
- void fl_draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c)
  Draws a box using given type, position, size and color.
- void fl_embossed_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_EMBOSSED_BOX.
- void fl_embossed_frame (int x, int y, int w, int h, Fl_Color)
  Draws a frame of type FL_EMBOSSED_FRAME.
- void fl_engraved_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_ENGRAVED_BOX.
- void fl_engraved_frame (int x, int y, int w, int h, Fl_Color)
  Draws a frame of type FL_ENGRAVED_FRAME.
- void fl_flat_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_FLAT_BOX.
- void fl_frame (const char ∗s, int x, int y, int w, int h)
  Draws a series of line segments around the given box.
- void fl_frame2 (const char ∗s, int x, int y, int w, int h)
  Draws a series of line segments around the given box.
- const uchar ∗fl_gray_ramp ()
  Sets the drawing function for a given box type.
- void fl_internal_boxtype (Fl_Boxtype t, Fl_Box_Draw_F ∗f)
- void fl_no_box (int, int, int, int, Fl_Color)
  Draws a box of type FL_NO_BOX.
- void fl_rectbound (int x, int y, int w, int h, Fl_Color bgcolor)
  Draws a bounded rectangle with a given position, size and color.
- void fl_thin_down_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_THIN_DOWN_BOX.
- void fl_thin_down_frame (int x, int y, int w, int h, Fl_Color)
  Draws a frame of type FL_THIN_DOWN_FRAME.
- void fl_thin_up_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_THIN_UP_BOX.
- void fl_thin_up_frame (int x, int y, int w, int h, Fl_Color)
  Draws a frame of type FL_THIN_UP_FRAME.
- void fl_up_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_UP_BOX.
- void fl_up_frame (int x, int y, int w, int h, Fl_Color)
  Draws a frame of type FL_UP_FRAME.

10.176.1 Detailed Description

drawing code for common box types.

Generated by Doxygen
10.176.2 Function Documentation

10.176.2.1 fl_internal_boxtype()

void fl_internal_boxtype (  
    Fl_Boxtype t,  
    Fl_Box_Draw_F * f )

Sets the drawing function for a given box type.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>f</th>
<th>box type</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>f</td>
<td>box drawing function</td>
</tr>
</tbody>
</table>

10.176.2.2  fl_rectbound()

```c
void fl_rectbound (int x,
                   int y,
                   int w,
                   int h,
                   Fl_Color bgcolor )
```

Draws a bounded rectangle with a given position, size and color.
Equivalent to drawing a box of type FL_BORDER_BOX.

10.177  fl_cmap.h

Color handling.
#include "Fl_XColor.H"
#include <FL/Fl.H>
#include <FL/x.H>
#include <FL/fl_draw.H>
#include "fl_cmap.h"

Macros

• define fl_overlay 0
  
  HAVE_OVERLAY determines whether fl_overlay is variable or defined as 0.

Functions

• Fl_Color fl_color_average (Fl_Color color1, Fl_Color color2, float weight)
  
  Returns the weighted average color between the two given colors.

• Fl_Color fl_contrast (Fl_Color fg, Fl_Color bg)
  
  Returns a color that contrasts with the background color.

• Fl_Color fl_inactive (Fl_Color c)
  
  Returns the inactive, dimmed version of the given color.

• ulong fl_xpixel (Fl_Color i)
  
  Returns the X pixel number used to draw the given FLTK color index.

• ulong fl_xpixel (uchar r, uchar g, uchar b)
  
  Returns the X pixel number used to draw the given rgb color.

Variables

• uchar fl_bluemask
  
  color mask used in current color map handling

• int fl_blueshift
  
  color shift used in current color map handling

• int fl_extrashift
  
  color shift used in current color map handling

• uchar fl_greenmask
  
  color mask used in current color map handling
10.179 Fl_compose.cxx File Reference

Utility functions to support text input.

```c
#include <FL/Fl.H>
#include <FL/x.H>
```

Variables

- XIC fl_xim_ic

10.179.1 Detailed Description

Utility functions to support text input.

10.180 fl_curve.cxx File Reference

Utility for drawing Bezier curves, adding the points to the current fl_begin/fl_vertex/fl_end path.

```c
#include <FL/fl_draw.H>
#include <math.h>
```

10.180.1 Detailed Description

Utility for drawing Bezier curves, adding the points to the current fl_begin/fl_vertex/fl_end path.

Incremental math implementation: I very much doubt this is optimal! From Foley/vanDam page 511. If anybody has a better algorithm, please send it!

10.181 fl_dnd_x.cxx

10.182 Fl_Double_Window.cxx File Reference

Fl_Double_Window implementation.

```c++
#include <config.h>
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Overlay_Window.H>
#include <FL/Fl_Printer.H>
#include <FL/x.H>
#include <FL/fl_draw.H>
```

### Functions

- **void fl_begin_offscreen (Fl_Offscreen ctx)**
  Send all subsequent drawing commands to this offscreen buffer.

- **char fl_can_do_alpha_blending ()**
  Checks whether platform supports true alpha blending for RGBA images.

- **void fl_copy_offscreen (int x, int y, int w, int h, Fl_Offscreen pixmap, int srcx, int srcy)**
  Copy a rectangular area of the given offscreen buffer into the current drawing destination.

- **Fl_Offscreen fl_create_offscreen (int w, int h)**
  Creation of an offscreen graphics buffer.

- **void fl_delete_offscreen (Fl_Offscreen ctx)**
  Deletion of an offscreen graphics buffer.

- **void fl_end_offscreen ()**
  Quit sending drawing commands to the current offscreen buffer.

### Variables

- **const int stack_max = 16**

10.182.1 Detailed Description

Fl_Double_Window implementation.

Internal interface to set up OpenGL.

A "Fl_Gl_Choice" is created from an OpenGL mode and holds information
necessary to create a window (on X) and to create an OpenGL "context"
(on both X and Win32).

The function takes a window (necessary only on Win32) and an
Fl_Gl_Choice and returns a new OpenGL context. All contexts share
display lists with each other.

On X another fl_create_gl_context is provided to create it for any
X visual.

fl_set_gl_context makes the given OpenGL context current and makes
it draw into the passed window. It tracks the current one context
and avoids calling the context switching code when the same context
is used, though it is a mystery to me why the GLX/WGL libraries
don't do this themselves...

fl_no_gl_context clears that cache so the next fl_set_gl_context is
guaranteed to work.

fl_delete_gl_context destroys the context.

This code is used by Fl_Gl_Window, gl_start(), and gl_visual()

// FREE STRING CREATED WITH strnew(), NULLS OUT STRING
// Value can be NULL

// 'DYNAMICALLY' APPEND ONE STRING TO ANOTHER
// Returns newly allocated string, or NULL
// 's' can be NULL; returns a strnew(val).
// 'val' can be NULL; s is returned unmodified.
// Usage:
//  char *s = strnew("foo"); // s = "foo"
//  s = strapp(s, "bar"); // s = "foobar"

// APPEND A CHARACTER TO A STRING
// This does NOT allocate space for the new character.

// End of "$Id$".

0015 //
0016 // http://www.fltk.org/str.php
0017 //
0018 // This function fills in the fltk font table with all the fonts that
0019 // are found on the X server. It tries to place the fonts into families
0020 // and to sort them so the first 4 in a family are normal, bold, italic,
0021 // and bold italic.
0022 //
0023 // Standard X fonts are matched by a pattern that is always of
0024 // this form, and this pattern is put in the table:
0025 // "*-family-weight-slant-width1-style-*-registry-encoding"
0026 //
0027 // Non-standard font names (those not starting with '-') are matched
0028 // by a pattern of the form "prefix*suffix", where the '*' is where
0029 // fltk thinks the point size is, or by the actual font name if no
0030 // point size is found.
0031 //
0032 // Fltk knows how to pull an "attribute" out of a font name, such as
0033 // bold or italic, by matching known x font field values. All words
0034 // that don't match a known attribute are combined into the "name"
0035 // of the font. Names are compared before attributes for sorting, this
0036 // makes the bold and plain version of a font come out next to each
0037 // other despite the poor X font naming scheme.
0038 //
0039 // By default fl_set_fonts() only does iso8859-1 encoded fonts. You can
0040 // do all normal X fonts by passing "-*" or every possible font with "*".
0041 //
0042 // Fl::set_font will take strings other than the ones this stores
0043 // and can identify any font on X that way. You may want to write your
0044 // own system of font management and not use this code.
0045 //
0046 // turn word N of a X font name into either some attribute bits
0047 // (right now 0, FL_BOLD, or FL_ITALIC), or into -1 indicating that
0048 // the word should be put into the name:

```c
/*
 * FLTK: Important!
 * This file should remain as close to Markus Kuhn’s original source
 * as possible for easy checking for changes later, however unlikely.
 * All customisations to work with FLTK shall be annotated!
 */

/*
 * This is an implementation of wcwidth() and wcswidth() (defined in
 * IEEE Std 1002.1-2001) for Unicode.
 */

/*
 * In fixed-width output devices, Latin characters all occupy a single
 * "cell" position of equal width, whereas ideographic CJK characters
 * occupy two such cells. Interoperability between terminal-line
 * applications and (teletype-style) character terminals using the
 * UTF-8 encoding requires agreement on which character should advance
 * the cursor by how many cell positions. No established formal
 * standards exist at present on which Unicode character shall occupy
 * how many cell positions on character terminals. These routines are
 * a first attempt of defining such behavior based on simple rules
 * applied to data provided by the Unicode Consortium.
 */

/*
 * For some graphical characters, the Unicode standard explicitly
 * defines a character-cell width via the definition of the East Asian
 * FullWidth (F), Wide (W), Half-width (H), and Narrow (Na) classes.
 * In all these cases, there is no ambiguity about which width a
 * particular character shall use. For characters in the East Asian Ambiguous (A)
 * class, the width choice depends purely on a preference of backward
 * compatibility with either historic CJK or Western practice.
 * Choosing single-width for these characters is easy to justify as
 * the appropriate long-term solution, as the CJK practice of
 * displaying these characters as double-width comes from historic
 * implementation simplicity (8-bit encoded characters were displayed
 * single-width and 16-bit ones double-width, even for Greek,
 * Cyrillic, etc.) and not any typographic considerations.
 */

/*
 * Much less clear is the choice of width for the Not East Asian
 * (Neutral) class. Existing practice does not dictate a width for any
 * of these characters. It would nevertheless make sense
 * typographically to allocate two character cells to characters such
 * as for instance EM SPACE or VOLUME INTEGRAL, which cannot be
 * represented adequately with a single-width glyph. The following
 * routines at present merely assign a single-cell width to all
 * neutral characters, in the interest of simplicity. This is not
 * entirely satisfactory and should be reconsidered before
 * establishing a formal standard in this area. At the moment, the
 * decision which Not East Asian (Neutral) characters should be
 * represented by double-width glyphs cannot yet be answered by
 * applying a simple rule from the Unicode database content. Setting
 * up a proper standard for the behavior of UTF-8 character terminals
 * will require a careful analysis not only of each Unicode character,
 * but also of each presentation form, something the author of these
 * routines has avoided to do so far.

int mk_wcwidth(const wchar_t *pwcs, size_t n)
int mk_wcwidth(const unsigned int *pwcs, size_t n)

for (; *pwcs && n-- > 0; pwcs++)
    if ((w = mk_wcwidth(*pwcs)) < 0)
        return -1;
else
    width += w;
return width;

The following functions are the same as mk_wcwidth() and
mk_wcswidth(), except that spacing characters in the East Asian
Ambiguous (A) category as defined in Unicode Technical Report #11
have a column width of 2. This variant might be useful for users of
CJK legacy encodings who want to migrate to UCS without changing
the traditional terminal character-width behaviour. It is not
otherwise recommended for general use.
