• virtual int full_width () const
  This method may be provided by the subclass to indicate the full width of the item list, in pixels.
• void inserting (void \*a, void \*b)
  This method should be used when an item is in the process of being inserted into the list.
• virtual int item_quick_height (void \*item) const
  This method may be provided by the subclass to return the height of the item, in pixels.
• int leftedge () const
  This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.
• void new_list ()
  This method should be called when the list data is completely replaced or cleared.
• void redraw_line (void \*item)
  This method should be called when the contents of item has changed, but not its height.
• void redraw_lines ()
  This method will cause the entire list to be redrawn.
• void replacing (void \*a, void \*b)
  This method should be used when item a is being replaced by item b.
• void \* selection () const
Returns the item currently selected, or NULL if there is no selection.

• void **swapping** (void ∗a, void ∗b)
  This method should be used when two items a and b are being swapped.

• void **top** () const
  Returns the item that appears at the top of the list.

Protected Member Functions inherited from Fl_Group

• FL_Rect ∗**bounds** ()
  Returns the internal array of widget sizes and positions.

• void **draw** () FL_OVERRIDE
  Draws the widget.

• void **draw_child** (Fl_Widget &widget) const
  Forces a child to redraw.

• void **draw_children** ()
  Draws all children of the group.

• void **draw_outside_label** (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.

• virtual int on_insert (Fl_Widget ∗, int)
  Allow derived groups to act when a widget is added as a child.

• virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.

• virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.

• int ∗**sizes** ()
  Returns the internal array of widget sizes and positions.

• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void **clear_flag** (unsigned int c)
  Clears a flag in the flags mask.

• void **draw_backdrop** () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void **draw_box** () const
  Draws the widget box according its box style.

• void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const
  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
Create a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

11.65.1 Detailed Description

The Fl_Hold_Browser is a subclass of Fl_Browser which lets the user select a single item, or no items by clicking on the empty space.

![Figure 11.23 Fl_Hold_Browser](image)

As long as the mouse button is held down the item pointed to by it is highlighted, and this highlighting remains on when the mouse button is released. Normally the callback is done when the user releases the mouse, but you can change this with when().

See Fl_Browser for methods to add and remove lines from the browser.

11.65.2 Constructor & Destructor Documentation

11.65.2.1 Fl_Hold_Browser()

Fl_Hold_Browser::Fl_Hold_Browser (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char * L = 0 )

Creates a new Fl_Hold_Browser widget using the given position, size, and label string.

The default boxtype is FL_DOWN_BOX. The constructor specializes Fl_Browser() by setting the type to FL_\rightarrow HOLD_BROWSER. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- Fl_Hold_Browser.H
- Fl_Browser.cxx

11.66 Fl_Hor_Fill_Slider Class Reference

Inheritance diagram for Fl_Hor_Fill_Slider:
Public Member Functions

- **Fl_Hor_Fill_Slider** (int X, int Y, int W, int H, const char *L=0)

Public Member Functions inherited from **Fl_Slider**

- void **bounds** (double a, double b)
  
  *Sets the minimum (a) and maximum (b) values for the valuator widget.*

- **Fl_Slider** (int X, int Y, int W, int H, const char *L=0)
  
  *Creates a new Fl_Slider widget using the given position, size, and label string.*

- **Fl_Slider** (uchar t, int X, int Y, int W, int H, const char *L)
  
  *Creates a new Fl_Slider widget using the given type, position, size, and label string.*

- int **handle** (int) FL_OVERRIDE
  
  *Handles the specified event.*

- int **scrollvalue** (int pos, int size, int first, int total)
  
  *Sets the size and position of the sliding knob in the box.*

- Fl_Boxtype **slider** () const
  
  *Gets the slider box type.*

- void **slider** (Fl_Boxtype c)
  
  *Sets the slider box type.*

- float **slider_size** () const
  
  *Gets the dimensions of the moving piece of slider.*

- void **slider_size** (double v)
  
  *Set the dimensions of the moving piece of slider.*

Public Member Functions inherited from **Fl_Valuator**

- void **bounds** (double a, double b)
  
  *Sets the minimum (a) and maximum (b) values for the valuator widget.*

- double **clamp** (double)
  
  *Clamps the passed value to the valuator range.*

- virtual int **format** (char *)
  
  *Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*

- double **increment** (double, int)
  
  *Adds n times the step value to the passed value.*

- double **maximum** () const
  
  *Gets the maximum value for the valuator.*

- void **maximum** (double a)
  
  *Sets the maximum value for the valuator.*

- double **minimum** () const
  
  *Gets the minimum value for the valuator.*

- void **minimum** (double a)
Sets the minimum value for the valuator.

- void `precision` (int digits)
  
  Sets the step value to \(1.0 / 10^\text{digits}\).

- void `range` (double a, double b)
  
  Sets the minimum and maximum values for the valuator.

- double `round` (double)
  
  Round the passed value to the nearest step increment.

- double `step` () const
  
  Gets or sets the step value.

- void `step` (double a, int b)
  
  See double `Fl_Valuator::step()` const

- void `step` (double s)
  
  See double `Fl_Valuator::step()` const.

- void `step` (int a)
  
  See double `Fl_Valuator::step()` const

- double `value` () const
  
  Gets the floating point(double) value.

- int `value` (double)
  
  Sets the current value.

### Public Member Functions inherited from `Fl_Widget`

- void `_clear_fullscreen` ()

- void `_set_fullscreen` ()

- void `activate` ()
  
  Activates the widget.

- unsigned int `active` () const
  
  Returns whether the widget is active.

- int `active_r` () const
  
  Returns whether the widget and all of its parents are active.

- `Fl_Align` `align` () const
  
  Gets the label alignment.

- `void align` (`Fl_Align` alignment)
  
  Sets the label alignment.

- long `argument` () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- void `argument` (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class `Fl_Gl_Window` * `as_gl_window` ()
  
  Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.

- virtual class `Fl_Gl_Window` const * `as_gl_window` () const

- virtual `Fl_Group` * `as_group` ()
  
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

- virtual `Fl_Group` const * `as_group` () const

- virtual `Fl_Window` * `as_window` ()
  
  Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.

- virtual `Fl_Window` const * `as_window` () const

- void `bind_deimage` (`Fl_Image` * `img`)
  
  Sets the image to use as part of the widget label when in the inactive state.

- void `bind_deimage` (int f)

---

Generated by Doxygen
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- void contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
- void copy_label (const char *new_label)
  Sets the current label.
- void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗wgt, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗wgt, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗ image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗ image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗ label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
Shortcut to set the label text and type in one call.

- Fl_Color labelcolor () const
  Gets the label color.
- void labelcolor (Fl_Color c)
  Sets the label color.
- Fl_Font labelfont () const
  Gets the font to use.
- void labelfont (Fl_Font f)
  Sets the font to use.
- Fl_Fontsize labelsize () const
  Gets the font size in pixels.
- void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
- Fl_Labeltype labeltype () const
  Gets the label type.
- void labeltype (Fl_Labeltype a)
  Sets the label type.
- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
- unsigned int output () const
  Returns if a widget is used for output only.
- Fl_Group * parent () const
  Returns a pointer to the parent widget.
- void parent (Fl_Group * p)
  Internal use only - "for hacks only".
- void position (int X, int Y)
  Repositions the window or widget.
- void redraw ()
  Schedules the drawing of the widget.
- void redraw_label ()
  Schedules the drawing of the label.
- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
- Fl_Color selection_color () const
  Gets the selection color.
- void selection_color (Fl_Color a)
  Sets the selection color.
- void set_active ()
  Marks the widget as active without sending events or changing focus.
- void set_changed ()
  Marks the value of the widget as changed.
- void set_output ()
  Sets a widget to output only.
- void set_visible ()
  Makes the widget visible.
- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '& to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '& to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '\&x' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗ text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗ v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
Gets the widget position in its window.

- int y () const
  Gets the widget position in its window.
- virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.

Protected Member Functions inherited from Fl_Slider

- void draw () FL_OVERRIDE
  Draws the widget.
- void draw (int, int, int, int)
- int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void handle_push ()
  Stores the current value in the previous value.
- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
- double previous_value () const
  Gets the previous floating point value before an event changed it.
• void **set_value** (double v)
  
  Sets the current floating point value.

• double **softclamp** (double)

  Clamps the value, but accepts v if the previous value is not already out of range.

• virtual void **value_damage** ()

  Asks for partial redraw.

**Protected Member Functions inherited from Fl_Widget**

• void **clear_flag** (unsigned int c)

  Clears a flag in the flags mask.

• void **draw_backdrop** () const

  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void **draw_box** () const

  Draws the widget box according its box style.

• void **draw_box** (Fl_Boxtype t, Fl_Color c) const

  Draws a box of type t, of color c at the widget's position and size.

• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const

  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const

  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const

  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const

  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const

  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const

  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char *label=0L)

  Creates a widget at the given position and size.

• unsigned int **flags** () const

  Gets the widget flags mask.

• void **h** (int v)

  *Internal use only.*

• void **set_flag** (unsigned int c)

  Sets a flag in the flags mask.

• void **w** (int v)

  *Internal use only.*

• void **x** (int v)

  *Internal use only.*

• void **y** (int v)

  *Internal use only.*

The documentation for this class was generated from the following files:

• Fl_Hor_Fill_Slider.H

• Fl_Slider.cxx
Fl_Hor_Nice_Slider Class Reference

Single thumb tab slider.

#include <Fl_Hor_Nice_Slider.H>

Inheritance diagram for Fl_Hor_Nice_Slider:

Fl_Hor_Nice_Slider
```

Public Member Functions

- **Fl_Hor_Nice_Slider**(int X, int Y, int W, int H, const char ∗L=0)

Public Member Functions inherited from Fl_Slider

- void **bounds**(double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **Fl_Slider**(int X, int Y, int W, int H, const char ∗L=0)
  
  Creates a new Fl_Slider widget using the given position, size, and label string.

- **Fl_Slider**(uchar t, int X, int Y, int W, int H, const char ∗L)
  
  Creates a new Fl_Slider widget using the given type, position, size, and label string.

- int **handle**(int FL_OVERRIDE
  
  Handles the specified event.

- int **scrollvalue**(int pos, int size, int first, int total)
  
  Sets the size and position of the sliding knob in the box.

- **Fl_Boxtype** slider () const
  
  Gets the slider box type.

- void slider (Fl_Boxtype c)
  
  Sets the slider box type.

- float slider_size () const
  
  Get the dimensions of the moving piece of slider.

- void slider_size (double v)
  
  Set the dimensions of the moving piece of slider.

Public Member Functions inherited from Fl_Valuator

- void **bounds**(double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- double **clamp**(double)
  
  Clamps the passed value to the valuator range.

- virtual int **format**(char ∗)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- double **increment**(double, int)
  
  Adds n times the step value to the passed value.

- double **maximum**(int) const
  
  Gets the maximum value for the valuator.
• void **maximum**(double a)
  Sets the maximum value for the valuator.

• double **minimum**() const
  Gets the minimum value for the valuator.

• void **minimum**(double a)
  Sets the minimum value for the valuator.

• void **precision**(int digits)
  Sets the step value to \(1.0 / 10^\text{digits}\).

• void **range**(double a, double b)
  Sets the minimum and maximum values for the valuator.

• double **round**(double)
  Round the passed value to the nearest step increment.

• double **step**() const
  Gets or sets the step value.

• void **step**(double a, int b)
  See double Fl_Valuator::step() const

• void **step**(double s)
  See double Fl_Valuator::step() const.

• void **step**(int a)
  See double Fl_Valuator::step() const

• double **value**() const
  Gets the floating point(double) value.

• int **value**(double)
  Sets the current value.

**Public Member Functions inherited from Fl_Widget**

• void **_clear_fullscreen**()

• void **_set_fullscreen**()

• void **activate**()
  Activates the widget.

• unsigned int **active**() const
  Returns whether the widget is active.

• int **active_r**() const
  Returns whether the widget and all of its parents are active.

• **Fl_Align** **align**() const
  Gets the label alignment.

• void **align**(**Fl_Align** alignment)
  Sets the label alignment.

• long **argument**() const
  Gets the current user data (long) argument that is passed to the callback function.

• void **argument**(long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual **class Fl_Gl_Window** ∗**as_gl_window**()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual **class Fl_Gl_Window** const ∗**as_gl_window**(long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window ∗**as_group**(long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window const ∗**as_group**(long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual **Fl_Group** ∗**as_group**()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const ∗**as_group**(long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual Fl_Group const ∗**as_group**(long v)
  Sets the current user data (long) argument that is passed to the callback function.
Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const & as_window () const
• void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
• void copy_label (const char∗ new_label)
  Sets the current label.
• void copy_tooltip (const char∗ text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image∗ deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image∗ deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image& img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget∗ widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget∗ widget, void∗ arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image∗ image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image∗ image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image& img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image∗ img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget∗ wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labellabeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
Sets a widget to output only.

- void **set_visible** ()
  
  Makes the widget visible.

- void **set_visible_focus** ()
  
  Enables keyboard focus navigation with this widget.

- int **shortcut_label** () const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void **shortcut_label** (int value)
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void **show** ()
  
  Makes a widget visible.

- void **size** (int W, int H)
  
  Changes the size of the widget.

- int **take_focus** ()
  
  Gives the widget the keyboard focus.

- unsigned int **takeevents** () const
  
  Returns if the widget is able to take events.

- int **test_shortcut** ()
  
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char ∗ **tooltip** () const
  
  Gets the current tooltip text.

- void **tooltip** (const char ∗text)
  
  Sets the current tooltip text.

- **Fl_Window** ∗ **top_window** () const
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window** ∗ **top_window_offset** (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar **type** () const
  
  Gets the widget type.

- void **type** (uchar t)
  
  Sets the widget type.

- int **use_accents_menu** ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void ∗ **user_data** () const
  
  Gets the user data for this widget.

- void **user_data** (**Fl_Callback_User_Data** ∗v, bool auto_free)
  
  Sets the user data for this widget.

- void **user_data** (void ∗v)
  
  Sets the user data for this widget.

- unsigned int **visible** () const
  
  Returns whether a widget is visible.

- unsigned int **visible_focus** () const
  
  Checks whether this widget has a visible focus.

- void **visible_focus** (int v)
  
  Modifies keyboard focus navigation.

- int **visible_r** () const
  
  Returns whether a widget and all its parents are visible.

- int **w** () const
  
  Gets the widget width.

- **Fl_When** **when** () const
  
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.

• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
flags possible values enumeration.

Protected Member Functions inherited from Fl_Slider

• void draw () FL_OVERRIDE
  Draws the widget.

• void draw (int, int, int, int)
• int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.

• void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

• void handle_push ()
  Stores the current value in the previous value.

• void handle_release ()
Called after an FL_WHEN_RELEASE event is received and before the callback.

- `int horizontal() const`
  Tells if the valuator is an FL_HORIZONTAL one.

- `double previous_value() const`
  Gets the previous floating point value before an event changed it.

- `void set_value(double v)`
  Sets the current floating point value.

- `double softclamp(double)`
  Clamps the value, but accepts v if the previous value is not already out of range.

- `virtual void value_damage()`
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- `void clear_flag(unsigned int c)`
  Clears a flag in the flags mask.

- `void draw_backdrop()` const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- `void draw_box()` const
  Draws the widget box according its box style.

- `void draw_box(Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget’s position and size.

- `void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.

- `void draw_focus()` const
  Draws a focus rectangle around the widget.

- `void draw_focus(Fl_Boxtype t, int X, int Y , int W, int H) const`
  Draws a focus rectangle around the widget.

- `void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  Draws a focus box for the widget at the given position and size.

- `void draw_label()` const
  Draws the widget’s label at the defined label position.

- `void draw_label(int, int, int, int)` const
  Draws the label in an arbitrary bounding box.

- `Fl_Widget(int x, int y, int w, int h, const char *label=0L)`
  Creates a widget at the given position and size.

- `unsigned int flags() const`
  Gets the widget flags mask.

- `void h(int v)`
  Internal use only.

- `void set_flag(unsigned int c)`
  Sets a flag in the flags mask.

- `void w(int v)`
  Internal use only.

- `void x(int v)`
  Internal use only.

- `void y(int v)`
  Internal use only.
11.67.1 Detailed Description

Single thumb tab slider.

Public Member Functions

- **Fl_Hor_Slider** (int X, int Y, int W, int H, const char ∗l=0)
  
  Creates a new Fl_Hor_Slider widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Slider

- void **bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- Fl_Slider (int X, int Y, int W, int H, const char ∗L=0)
  
  Creates a new Fl_Slider widget using the given position, size, and label string.

- Fl_Slider (uchar t, int X, int Y, int W, int H, const char ∗L)
  
  Creates a new Fl_Slider widget using the given type, position, size, and label string.

- int **handle** (int) FL_OVERRIDE
  
  Handles the specified event.

- int **scrollvalue** (int pos, int size, int first, int total)
  
  Sets the size and position of the sliding knob in the box.

- Fl_Boxtyp e **slider** () const
  
  Gets the slider box type.

- void **slider** (Fl_Boxtyp e c)
Sets the slider box type.

- float slider_size() const
  Get the dimensions of the moving piece of slider.
- void slider_size(double v)
  Set the dimensions of the moving piece of slider.

Public Member Functions inherited from Fl_Valuator

- void bounds(double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- double clamp(double)
  Clamps the passed value to the valuator range.
- virtual int format(char *)
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double increment(double, int)
  Adds n times the step value to the passed value.
- double maximum() const
  Gets the maximum value for the valuator.
- void maximum(double a)
  Sets the maximum value for the valuator.
- double minimum() const
  Gets the minimum value for the valuator.
- void minimum(double a)
  Sets the minimum value for the valuator.
- void precision(int digits)
  Sets the step value to $1.0 / 10^{\text{digits}}$.
- void range(double a, double b)
  Sets the minimum and maximum values for the valuator.
- double round(double)
  Round the passed value to the nearest step increment.
- double step() const
  Gets or sets the step value.
- void step(double a, int b)
  See double Fl_Valuator::step() const
- void step(double s)
  See double Fl_Valuator::step() const.
- void step(int a)
  See double Fl_Valuator::step() const
- double value() const
  Gets the floating point(double) value.
- int value(double)
  Sets the current value.

Generated by Doxygen
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char ∗label () const
  Gets the current label text.

• void label (const char ∗text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- `unsigned int output() const`
  Returns if a widget is used for output only.

- `Fl_Group * parent() const`
  Returns a pointer to the parent widget.

- `void parent(Fl_Group *p)`
  Internal use only - "for hacks only".

- `void position(int X, int Y)`
  Repositions the window or widget.

- `void redraw()`
  Schedules the drawing of the widget.

- `void redraw_label()`
  Schedules the drawing of the label.

- `virtual void resize(int x, int y, int w, int h)`
  Changes the size or position of the widget.

- `Fl_Color selection_color() const`
  Gets the selection color.

- `void selection_color(Fl_Color a)`
  Sets the selection color.

- `void set_active()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed()`
  Marks the value of the widget as changed.

- `void set_output()`
  Sets a widget to output only.

- `void set_visible()`
  Makes the widget visible.

- `void set_visible_focus()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label() const`
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- `void shortcut_label(int value)`
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- `virtual void show()`
  Makes a widget visible.

- `void size(int W, int H)`
  Changes the size of the widget.

- `int take_focus()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents() const`
  Returns if the widget is able to take events.

- `int testShortcut()`
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- `const char * tooltip() const`
  Gets the current tooltip text.

- `void tooltip(const char *text)`
  Sets the current tooltip text.

- `Fl_Window * top_window()`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset(int &xoff, int &yoff)`
  Finds the x/y offset of the current widget relative to the top-level window.

Generated by Doxygen
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ⋆ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ⋆v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ⋆v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• FL_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• FL_Window ⋆ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ⋆widget, void ⋆data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ⋆t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char ⋆t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

```cpp
enum {
  INACTIVE = 1 << 0, INVISIBLE = 1 << 1, OUTPUT = 1 << 2, NOBORDER = 1 << 3,
  FORCE_POSITION = 1 << 4, NON_MODAL = 1 << 5, SHORTCUT_LABEL = 1 << 6, CHANGED = 1 << 7,

};
```
flags possible values enumeration.

Protected Member Functions inherited from Fl_Slider

- void draw () FL_OVERRIDE
  Draws the widget.
- void draw (int, int, int, int)
- int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void handle_push ()
  Stores the current value in the previous value.
- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
- double previous_value () const
  Gets the previous floating point value before an event changed it.
- void set_value (double v)
  Sets the current floating point value.
- double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void value_damage ()
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

### 11.68.1 Detailed Description

Horizontal Slider class.

See also

- class Fl_Slider.

The documentation for this class was generated from the following files:

- Fl_Hor_Slider.H
- Fl_Slider.cxx

### 11.69 Fl_Hor_Value_Slider Class Reference

Inheritance diagram for Fl_Hor_Value_Slider:
Public Member Functions

- **Fl_Hor_Value_Slider** (int X, int Y, int W, int H, const char *l=0)

Public Member Functions inherited from **Fl_Value_Slider**

- **Fl_Value_Slider** (int x, int y, int w, int h, const char *l=0)
  
  Creates a new Fl_Value_Slider widget using the given position, size, and label string.

- int **handle**(int) FL_OVERRIDE
  
  Handles the specified event.

- Fl_Color **textcolor** () const
  
  Gets the color of the text in the value box.

- void **textcolor**(Fl_Color s)
  
  Sets the color of the text in the value box.

- Fl_Font **textfont** () const
  
  Gets the typeface of the text in the value box.

- void **textfont**(Fl_Font s)
  
  Sets the typeface of the text in the value box.

- Fl_Fontsize **textsize** () const
  
  Gets the size of the text in the value box.

- void **textsize**(Fl_Fontsize s)
  
  Sets the size of the text in the value box.

- int **value_height** () const
  
  Gets the height of the value box in pixels (vertical mode only).

- void **value_height**(int s)
  
  Sets the height of the value box in pixels (vertical mode only).

- int **value_width** () const
  
  Gets the width of the value box in pixels (horizontal mode only).

- void **value_width**(int s)
  
  Sets the width of the value box in pixels (horizontal mode only).

Public Member Functions inherited from **Fl_Slider**

- void **bounds**(double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **Fl_Slider** (int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Slider widget using the given position, size, and label string.

- **Fl_Slider**(uchar t, int X, int Y, int W, int H, const char *L)
  
  Creates a new Fl_Slider widget using the given type, position, size, and label string.

- int **scrollvalue**(int pos, int size, int first, int total)
  
  Sets the size and position of the sliding knob in the box.

- Fl_Boxtype **slider** () const
  
  Gets the slider box type.

- void **slider**(Fl_Boxtype c)
  
  Sets the slider box type.

- float **slider_size** () const
  
  Get the dimensions of the moving piece of slider.

- void **slider_size**(double v)
  
  Set the dimensions of the moving piece of slider.
Public Member Functions inherited from Fl_Valuator

- void **bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- double **clamp** (double)
  
  Clamps the passed value to the valuator range.

- virtual int **format** (char ∗)
  
  Uses internal rules to format the field's numerical value into the character array pointed to by the passed parameter.

- double **increment** (double, int)
  
  Adds n times the step value to the passed value.

- double **maximum** () const
  
  Gets the maximum value for the valuator.

- void **maximum** (double a)
  
  Sets the maximum value for the valuator.

- double **minimum** () const
  
  Gets the minimum value for the valuator.

- void **minimum** (double a)
  
  Sets the minimum value for the valuator.

- void **precision** (int digits)
  
  Sets the step value to 1.0 / 10^digits.

- void **range** (double a, double b)
  
  Sets the minimum and maximum values for the valuator.

- double **round** (double)
  
  Round the passed value to the nearest step increment.

- double **step** () const
  
  Gets or sets the step value.

- void **step** (double a, int b)
  
  See double Fl_Valuator::step() const

- void **step** (double s)
  
  See double Fl_Valuator::step() const.

- void **step** (int a)
  
  See double Fl_Valuator::step() const

- double **value** () const
  
  Gets the floating point(double) value.

- int **value** (double)
  
  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void **_clear_fullscreen** ()

- void **_set_fullscreen** ()

- void **activate** ()
  
  Activates the widget.

- unsigned int **active** () const
  
  Returns whether the widget is active.

- int **active_r** () const
  
  Returns whether the widget and all of its parents are active.

- **Fl_Align** **align** () const
  
  Gets the label alignment.

- void **align** (Fl_Align alignment)
Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_GI_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * as_gl_window () const
  virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const * as_group () const
  virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * as_window () const

• void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback * cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback * cb, void *p)
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
Disables keyboard focus navigation with this widget.

- `Fl_Color color () const`
  Gets the background color of the widget.
- `void color (Fl_Color bg)`
  Sets the background color of the widget.
- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.
- `Fl_Color color2 () const`
  For back compatibility only.
- `void color2 (unsigned a)`
  For back compatibility only.
- `int contains (const Fl_Widget *w) const`
  Checks if `w` is a child of this widget.
- `void copy_label (const char *new_label)`
  Sets the current label.
- `void copy_tooltip (const char *text)`
  Sets the current tooltip text.
- `uchar damage () const`
  Returns non-zero if `draw()` needs to be called.
- `void damage (uchar c)`
  Sets the damage bits for the widget.
- `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.
- `int damage_resize (int, int, int, int)`
  Internal use only.
- `void deactivate ()`
  Deactivates the widget.
- `Fl_Image *deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.
- `const Fl_Image *deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.
- `void deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.
- `void deimage (Fl_IMAGE *img)`
  Sets the image to use as part of the widget label when in the inactive state.
- `int deimage_bound () const`
  Returns whether the inactive image is managed by the widget.
- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.
- `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
- `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
- `void draw_label (int, int, int, int, Fl_Align) const`
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`
  Gets the widget height.
- `virtual void hide ()`
  Makes a widget invisible.
- `Fl_IMAGE *image ()`
  Gets the image that is used as part of the widget label when in the active state.
• **const Fl_Image** ∗ image () const
  
  Gets the image that is used as part of the widget label when in the active state.

• **void** image (Fl_Image &img)

  Sets the image to use as part of the widget label when in the active state.

• **void** image (Fl_Image ∗ img)

  Sets the image to use as part of the widget label when in the active state.

• **int** image_bound () const

  Returns whether the image is managed by the widget.

• **int** inside (const Fl_Widget ∗ wgt) const

  Checks if this widget is a child of wgt.

• **int** is_label_copied () const

  Returns whether the current label was assigned with copy_label().

• **const char ∗** label () const

  Gets the current label text.

• **void** label (const char ∗ text)

  Sets the current label pointer.

• **void** label (Fl_Labeltype a, const char ∗ b)

  Shortcut to set the label text and type in one call.

• **Fl_Color** labelcolor () const

  Gets the label color.

• **void** labelcolor (Fl_Color c)

  Sets the label color.

• **Fl_Font** labelfont () const

  Gets the font to use.

• **void** labelfont (Fl_Font f)

  Sets the font to use.

• **Fl_Fontsize** labelsize () const

  Gets the font size in pixels.

• **void** labelsize (Fl_Fontsize pix)

  Sets the font size in pixels.

• **Fl_Labeltype** labeltype () const

  Gets the label type.

• **void** labeltype (Fl_Labeltype a)

  Sets the label type.

• **void** measure_label (int &ww, int &hh) const

  Sets width ww and height hh accordingly with the label size.

• **bool** needs_keyboard () const

  Returns whether this widget needs a keyboard.

• **void** needs_keyboard (bool needs)

  Sets whether this widget needs a keyboard.

• **unsigned int** output () const

  Returns if a widget is used for output only.

• **FL_Group** ∗ parent () const

  Returns a pointer to the parent widget.

• **void** parent (FL_Group ∗ p)

  Internal use only - “for hacks only”.

• **void** position (int X, int Y)

  Repositions the window or widget.

• **void** redraw ()

  Schedules the drawing of the widget.

• **void** redraw_label ()
Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**
  Changes the size or position of the widget.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char ∗ tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char ∗text)**
  Sets the current tooltip text.

- **Fl_Window ∗ top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.

- **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void ∗ user_data () const**
  Gets the user data for this widget.

- **void user_data (Fl_Callback_User_Data ∗v, bool auto_free)**
  Sets the user data for this widget.

- **void user_data (void ∗v)**
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1 << 0 , INVISIBLE = 1 << 1 , OUTPUT = 1 << 2 , NOBORDER = 1 << 3 ,
  FORCE_POSITION = 1 << 4 , NON_MODAL = 1 << 5 , SHORTCUT_LABEL = 1 << 6 , CHANGED = 1 << 7 ,
  OVERRIDE = 1 << 8 , VISIBLE_FOCUS = 1 << 9 , COPIED_LABEL = 1 << 10 , CLIP_CHILDREN = 1 << 11 ,
  MENU_WINDOW = 1 << 12 , TOOLTIP_WINDOW = 1 << 13 , MODAL = 1 << 14 , NO_OVERLAY = 1 << 15 ,
  GROUP_RELATIVE = 1 << 16 , COPIED_TOOLTIP = 1 << 17 , FULLSCREEN = 1 << 18 , MAC_USE_ACCENTS_MENU = 1 << 19 ,
  NEEDS_KEYBOARD = 1 << 20 , IMAGE_BOUND = 1 << 21 , DEIMAGE_BOUND = 1 << 22 ,
  AUTO_DELETE_USER_DATA = 1 << 23 ,
  MAXIMIZED = 1 << 24 , USERFLAG3 = 1 << 29 , USERFLAG2 = 1 << 30 , USERFLAG1 = 1 << 31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Value_Slider

• void draw () FL_OVERRIDE
  Draws the widget.
Protected Member Functions inherited from `Fl_Slider`

- `void draw(int, int, int, int)`
- `int handle(int, int, int, int)`

Protected Member Functions inherited from `Fl_Valuator`

- `Fl_Valuator(int X, int Y, int W, int H, const char*L)`
  
  Creates a new `Fl_Valuator` widget using the given position, size, and label string.

- `void handle_drag(double newvalue)`
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- `void handle_push()`
  
  Stores the current value in the previous value.

- `void handle_release()`
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.

- `int horizontal() const`
  
  Tells if the valuator is an FL_HORIZONTAL one.

- `double previous_value() const`
  
  Gets the previous floating point value before an event changed it.

- `void set_value(double v)`
  
  Sets the current floating point value.

- `double softclamp(double)`
  
  Clamps the value, but accepts v if the previous value is not already out of range.

- `virtual void value_damage()`
  
  Asks for partial redraw.

Protected Member Functions inherited from `Fl_Widget`

- `void clear_flag(unsigned int c)`
  
  Clears a flag in the flags mask.

- `void draw_backdrop()` const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- `void draw_box()` const
  
  Draws the widget box according its box style.

- `void draw_box(Fl_Boxtype t, Fl_Color c) const`
  
  Draws a box of type t, of color c at the widget's position and size.

- `void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- `void draw_focus()` const
  
  Draws a focus rectangle around the widget.

- `void draw_focus(Fl_Boxtype t, int X, int Y, int W, int H) const`
  
  Draws a focus rectangle around the widget.

- `void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  
  Draws a focus box for the widget at the given position and size.

- `void draw_label()` const
  
  Draws the widget's label at the defined label position.

- `void draw_label(int, int, int, int) const`
  
  Draws the label in an arbitrary bounding box.

- `Fl_Widget(int x, int y, int w, int h, const char* +label=0L)`
  
  Creates a widget at the given position and size.

- `unsigned int flags()` const
  
  Gets the widget flags mask.
The Fl_ICO_Image class supports loading, caching, and drawing of Windows icon (.ico) files.

#include <Fl_ICO_Image.H>

Inheritance diagram for Fl_ICO_Image:

```
Fl_Image
   Fl_RGB_Image
     Fl_BMP_Image
      Fl_ICO_Image
```

Classes

- struct IconDirEntry
  
  Windows ICONDIRENTRY structure

Public Member Functions

- **Fl_ICO_Image** (const char *filename, int id=-1, const unsigned char *data=NULL, const size_t datasize=0)
  
  Loads the named icon image from the given .ico filename or from memory.

- const IconDirEntry *icondirentry() const
  
  Returns the array of idcount() loaded IconDirEntry structures.

- int idcount() const
  
  Returns the number of icons of various resolutions present in the ICO object.

- ~Fl_ICO_Image ()
  
  Destructor.

Public Member Functions inherited from Fl_BMP_Image

- **Fl_BMP_Image** (const char *filename)
  
  This constructor loads the named BMP image from the given BMP filename.

- **Fl_BMP_Image** (const char *imagename, const unsigned char *data, const long length=-1)
  
  This constructor loads a BMP image from memory.
Public Member Functions inherited from Fl_RGB_Image

- virtual Fl_SVG_Image * as_svg_image ()
  
  Returns whether an image is an Fl_SVG_Image or not.
- int cache_h ()
- int cache_w ()
- void color_average (Fl_Color c, float i) FL_OVERRIDE
  
  The color_average() method averages the colors in the image with the provided FLTK color value.
- Fl_Image * copy () const
- Fl_Image * copy (int W, int H) const FL_OVERRIDE
  
  Creates a resized copy of the image.
- void desaturate () FL_OVERRIDE
  
  The desaturate() method converts an image to grayscale.
- void draw (int X, int Y)
- void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  
  Draws the image to the current drawing surface with a bounding box.
- Fl_RGB_Image (const Fl_Pixmap * pm, Fl_Color bg=FL_GRAY)
  
  The constructor creates a new RGBA image from the specified Fl_Pixmap.
- Fl_RGB_Image (const uchar * bits, int bits_length, int W, int H, int D, int LD)
  
  The constructor creates a new image from the specified data.
- Fl_RGB_Image (const uchar * bits, int W, int H, int D=3, int LD=0)
  
  The constructor creates a new image from the specified data.
- void label (Fl_Menu_Item * m) FL_OVERRIDE
  
  This method is an obsolete way to set the image attribute of a menu item.
- void label (Fl_Widget * w) FL_OVERRIDE
  
  This method is an obsolete way to set the image attribute of a widget or menu item.
- virtual void normalize ()
  
  Makes sure the object is fully initialized.
- void uncache () FL_OVERRIDE
  
  If the image has been cached for display, delete the cache data.
- ~Fl_RGB_Image () FL_OVERRIDE
  
  The destructor frees all memory and server resources that are used by the image.

Public Member Functions inherited from Fl_Image

- virtual class Fl_Shared_Image * as_shared_image ()
  
  Returns whether an image is an Fl_Shared_Image or not.
- Fl_Image * copy () const
  
  Creates a copy of the image in the same size.
- int count () const
  
  Returns the number of data values associated with the image.
- int d () const
  
  Returns the image depth.
- const char * const * data () const
  
  Returns a pointer to the current image data array.
- int data_h () const
  
  Returns the height of the image data.
- int data_w () const
  
  Returns the width of the image data.
- void draw (int X, int Y)
  
  Draws the image to the current drawing surface.
- int fail () const
Returns a value that is not 0 if there is currently no image available.

- **Fl::Image (int W, int H, int D)**
  The constructor creates an empty image with the specified width, height, and depth.

- int h () const
  Returns the current image drawing height in FLTK units.

- void inactive ()
  The inactive() method calls color_average(FL_BACKGROUNDD_COLOR, 0.33f) to produce an image that appears grayed out.

- int ld () const
  Returns the current line data size in bytes.

- virtual void release ()
  Releases an Fl::Image - the same as 'delete this'.

- virtual void scale (int width, int height, int proportional=1, int can_expand=0)
  Sets the drawing size of the image.

- int w () const
  Returns the current image drawing width in FLTK units.

- virtual ~Fl::Image ()
  The destructor is a virtual method that frees all memory used by the image.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_RGB_Image**

- static size_t max_size ()
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

- static void max_size (size_t size)
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

**Static Public Member Functions inherited from Fl::Image**

- static Fl::Labeltype define_FL_IMAGE_LABEL ()
- static Fl_RGB::Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.

- static void RGB_scaling (Fl_RGB::Scaling)
  Sets the RGB image scaling method used for copy(int, int).

- static Fl_RGB::Scaling scaling_algorithm ()
  Gets what algorithm is used when resizing a source image to draw it.

- static void scaling_algorithm (Fl_RGB::Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.

**Public Attributes inherited from Fl_RGB_Image**

- int alloc_array
  If non-zero, the object's data array is delete[]'d when deleting the object.

- const uchar * array
  Points to the start of the object's data array.

**Static Public Attributes inherited from Fl::Image**

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  True after fl_register_images() was called, false before.
Protected Member Functions inherited from **Fl_BMP_Image**

- void `load_bmp_` (class Fl_Image_Reader &rdr, int ico_height=0, int ico_width=0)

Protected Member Functions inherited from **Fl_Image**

- void d (int D)  
  *Sets the current image depth.*
- void data (const char ∗const ∗p, int c)  
  *Sets the current data pointer and count of pointers in the array.*
- void draw_empty (int X, int Y)  
  *The protected method `draw_empty()` draws a box with an X in it.*
- int draw_scaled (int X, int Y, int W, int H)  
  *Draw the image to the current drawing surface rescaled to a given width and height.*
- void h (int H)  
  *Sets the height of the image data.*
- void ld (int LD)  
  *Sets the current line data size in bytes.*
- void w (int W)  
  *Sets the width of the image data.*

Static Protected Member Functions inherited from **Fl_Image**

- static void `labeltype` (const Fl_Label ∗lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void `measure` (const Fl_Label ∗lo, int &lw, int &lh)

11.70.1 Detailed Description

The **Fl_ICO_Image** class supports loading, caching, and drawing of Windows icon (.ico) files.

11.70.2 Constructor & Destructor Documentation

11.70.2.1 **Fl_ICO_Image()**

```
Fl_ICO_Image::Fl_ICO_Image (  
  const char ∗ filename,  
  int id = -1,  
  const unsigned char ∗ data = NULL,  
  const size_t datasize = 0 )
```

Loads the named icon image from the given .ico filename or from memory.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filename</code></td>
<td>Name of a .ico file, or of the in-memory image</td>
</tr>
<tr>
<td><code>id</code></td>
<td>When <code>id</code> is -1 (default), the highest-resolution icon is loaded; when <code>id</code> 0, load the icon with this ID; when <code>id</code> = -2, load all IconDirEntry structures but no image.</td>
</tr>
<tr>
<td><code>data</code></td>
<td>NULL, or in-memory icon data</td>
</tr>
<tr>
<td><code>datasize</code></td>
<td>Size in bytes of the data byte array (used when <code>data</code> is not NULL)</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- **Fl_ICO_Image.H**
- **Fl_ICO_Image.hxx**
11.71 Fl_Image Class Reference

Base class for image caching, scaling and drawing.

Public Member Functions

- virtual class Fl_Shared_Image * as_shared_image ()
  Returns whether an image is an Fl_Shared_Image or not.
- virtual void color_average (Fl_Color c, float i)
  The color_average() method averages the colors in the image with the provided FLTK color value.
- Fl_Image * copy () const
  Creates a copy of the image in the same size.
- virtual Fl_Image * copy (int W, int H) const
  Creates a resized copy of the image.
- int count () const
  Returns the number of data values associated with the image.
- int d () const
  Returns the image depth.
- const char * const * data () const
  Returns a pointer to the current image data array.
- int data_h () const
  Returns the height of the image data.
- int data_w () const
  Returns the width of the image data.
- virtual void desaturate ()
  The desaturate() method converts an image to grayscale.
- void draw (int X, int Y)
  Draws the image to the current drawing surface.
- virtual void draw (int X, int Y, int W, int H, int cx=0, int cy=0)
  Draws the image to the current drawing surface with a bounding box.
- int fail () const
  Returns a value that is not 0 if there is currently no image available.
- Fl_Image (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.
- int h () const
  Returns the current image drawing height in FLTK units.
- void inactive ()
The `inactive()` method calls `color_average(FL_BACKGROUND_COLOR, 0.33f)` to produce an image that appears grayed out.

- **virtual void label (Fl_Menu_Item *m)**
  
  This method is an obsolete way to set the image attribute of a menu item.

- **virtual void label (Fl_Widget *w)**
  
  This method is an obsolete way to set the image attribute of a widget or menu item.

- **int ld () const**
  
  Returns the current line data size in bytes.

- **virtual void release ()**
  
  Releases an `Fl_Ima ge` - the same as 'delete this'.

- **virtual void scale (int width, int height, int proportional=1, int can_expand=0)**
  
  Sets the drawing size of the image.

- **virtual void uncache ()**
  
  If the image has been cached for display, delete the cache data.

- **int w () const**
  
  Returns the current image drawing width in FLTK units.

- **virtual ~Fl_Ima ge ()**
  
  The destructor is a virtual method that frees all memory used by the image.

### Static Public Member Functions

- **static Fl_Labeltype define_FL_IMAGE_LABEL ()**
  
  Returns the currently used RGB image scaling method.

- **static Fl_RGB_Scaling RGB_scaling ()**
  
  Sets the RGB image scaling method used for copy(int, int).

- **static Fl_RGB_Scaling scaling_algorithm ()**
  
  Gets what algorithm is used when resizing a source image to draw it.

- **static void scaling_algorithm (Fl_RGB_Scaling algorithm)**
  
  Sets what algorithm is used when resizing a source image to draw it.

### Static Public Attributes

- **static const int ERR_FILE_ACCESS = -2**

- **static const int ERR_FORMAT = -3**

- **static const int ERR_MEMORY_ACCESS = -4**

- **static const int ERR_NO_IMAGE = -1**

- **static bool register_images_done = false**
  
  True after `fl_register_images()` was called, false before.

### Protected Member Functions

- **void d (int D)**
  
  Sets the current image depth.

- **void data (const char *const *p, int c)**
  
  Sets the current data pointer and count of pointers in the array.

- **void draw_empty (int X, int Y)**
  
  The protected method `draw_empty()` draws a box with an X in it.

- **int draw_scaled (int X, int Y, int W, int H)**
  
  Draw the image to the current drawing surface rescaled to a given width and height.

- **void h (int H)**
  
  Sets the height of the image data.

- **void ld (int LD)**
Sets the current line data size in bytes.

- void \textbf{w}(\text{int} \, W)

  Sets the width of the image data.

\section*{Static Protected Member Functions}

- static void \textbf{labeltype}(\text{const \ Fl\_Label \ *} \lo, \text{int} \, lx, \text{int} \, ly, \text{int} \, lw, \text{int} \, lh, \text{Fl\_Align \ la})

- static void \textbf{measure}(\text{const \ Fl\_Label \ *} \lo, \text{int} &lw, \text{int} &lh)

\section*{Friends}

- class \textbf{Fl\_Graphics\_Driver}

\section*{Detailed Description}

Base class for image caching, scaling and drawing. \textbf{Fl\_Image} is the base class used for caching, scaling and drawing all kinds of images in FLTK. This class keeps track of common image data such as the pixels, colormap, width, height, and depth. Virtual methods are used to provide type-specific image handling.

Each image possesses two (width, height) pairs:

1. The width and height of the raw image data are returned by \textbf{data\_w()} and \textbf{data\_h()}. These values are set when the image is created and remain unchanged.

2. The width and height of the area filled by the image when it gets drawn are returned by \textbf{w()} and \textbf{h()}. These values are equal to \textbf{data\_w()} and \textbf{data\_h()} when the image is created and can be changed by the \textbf{scale()} member function.

Since the \textbf{Fl\_Image} class does not support image drawing by itself, calling the \textbf{Fl\_Image::draw()} method results in a box with an X in it being drawn instead.

\section*{Constructor & Destructor Documentation}

\subsection*{Fl\_Image()}

\texttt{Fl\_Image::Fl\_Image ( int \, W, int \, H, int \, D )}

The constructor creates an empty image with the specified width, height, and depth.

The width and height are in pixels. The depth is 0 for bitmaps, 1 for pixmap (colormap) images, and 1 to 4 for color images.

\section*{Member Function Documentation}

\subsection*{as\_shared\_image()}

\texttt{virtual class \textbf{Fl\_Shared\_Image} \* \textbf{Fl\_Image::as\_shared\_image ( )} [inline], [virtual]}

Returns whether an image is an \textbf{Fl\_Shared\_Image} or not.

This virtual method returns a pointer to an \textbf{Fl\_Shared\_Image} if this object is an instance of \textbf{Fl\_Shared\_Image} or NULL if not. This can be used to detect if a given \textbf{Fl\_Image} object is a shared image, i.e. derived from \textbf{Fl\_Shared\_Image}.

Since

1.4.0

Reimplemented in \textbf{Fl\_Shared\_Image}.
11.71.3.2 color_average()

```cpp
void Fl_Image::color_average (Fl_Color c, float i) [virtual]
```

The `color_average()` method averages the colors in the image with the provided FLTK color value. The first argument specifies the FLTK color to be used. The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory. Reimplemented in `Fl_Anim_GIF_Image`, `Fl_RGB_Image`, `Fl_Pixmap`, `Fl_Shared_Image`, `Fl_SVG_Image`, and `Fl_Tiled_Image`.

11.71.3.3 copy()[1/2]

```cpp
Fl_Image * Fl_Image::copy () const [inline]
```

Creates a copy of the image in the same size. The new image should be released when you are done with it. This does exactly the same as `Fl_Image::copy(int W, int H)` const' where `W` and `H` are the width and height of the source image, respectively. This applies also to all subclasses of `Fl_Image` in the FLTK library. The following two `copy()` calls are equivalent:

```cpp
Fl_Image *img1 = new Fl_Image(...);
// ...
Fl_Image *img2 = img1->copy();
Fl_Image *img3 = img1->copy(img1->w(), img1->h())
```

For details see 'Fl_Image::copy(int w, int h) const'.

See also

`Fl_Image::release()`

Note

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from `Fl_Image` or any subclass your overridden methods of 'Fl_Image::copy() const' and 'Fl_Image::copy(int, int) const' must also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

11.71.3.4 copy()[2/2]

```cpp
Fl_Image * Fl_Image::copy (int W, int H) const [virtual]
```

Creates a resized copy of the image. The new image should be released when you are done with it. Note: since FLTK 1.4.0 you can use `Fl_Image::release()` for all types of images (i.e. all subclasses of Fl_Image) instead of operator delete for Fl_Image's and Fl_Image::release() for Fl_Shared_Image's. The new image data will be converted to the requested size. RGB images are resized using the algorithm set by `Fl_Image::RGB_scaling()`. For the new image the following equations are true:

- \( w() == data_w() == W \)
- \( h() == data_h() == H \)

Parameters

| in | W/H | Requested width and height of the new image |

Generated by Doxygen
11.71 Fl_Image Class Reference

Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of Fl_RGB_Image, Fl_SVG_Image, Fl_Pixmap, Fl_Bitmap, Fl_Tiled_Image, Fl_Anim_GIF_Image and Fl_Shared_Image. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an Fl_GIF_Image is an object of class Fl_Pixmap.

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from Fl_Image or any subclass your overridden methods of 'Fl_Image::copy() const' and 'Fl_Image::copy(int, int) const' must also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented in Fl_Anim_GIF_Image, Fl_Bitmap, Fl_RGB_Image, Fl_Pixmap, Fl_Shared_Image, Fl_SVG_Image, and Fl_Tiled_Image.

11.71.3.5 count()

int Fl_Image::count ( ) const [inline]
Returns the number of data values associated with the image.
The value will be 0 for images with no associated data, 1 for bitmap and color images, and greater than 2 for pixmap images.

See also

data()

11.71.3.6 d()

int Fl_Image::d ( ) const [inline]
Returns the image depth.
The return value will be 0 for bitmaps, 1 for pixmaps, and 1 to 4 for color images.

11.71.3.7 data() [1/2]

const char * const * Fl_Image::data ( ) const [inline]
Returns a pointer to the current image data array.
There can be 0, 1, or more pointers to actual image data in an image.
Use the count() method to find the size of the data array. You must not dereference the data() pointer if count() equals zero.

Note
data() may return NULL.

Example:
Fl_RGB_Image has exactly one pointer which points at the R, G, B [, A] data array of the image. The total size of this array depends on several attributes like data_w(), data_h(), di() and ld() and is basically data_w() * data_h() * d() but there are exceptions if ld() is non-zero: see description of ld(). Since FLTK 1.4.0 w() and h() are no longer significant for the image data size if scale() has been called on the image to set a different display size.
Other image types have different numbers and types of data pointers which are implementation details and not documented here.

See also

count(), w(), h(), data_w(), data_h(), d(), ld()

11.71.3.8 data() [2/2]

void Fl_Image::data ( const char * const * p,
   int c ) [inline], [protected]
Sets the current data pointer and count of pointers in the array.
There can be 0, 1, or more pointers to actual image data in an image.
See also

const char* const* data(), count(), w(), h(), data_w(), data_h(), d(), ld()

11.71.3.9 desaturate()

void Fl_Image::desaturate ( ) [virtual]

The desaturate() method converts an image to grayscale.
If the image contains an alpha channel (depth = 4), the alpha channel is preserved.
An internal copy is made of the original image data before changes are applied, to avoid modifying the original
image data in memory.
Reimplemented in Fl_Anim_GIF_Image, Fl_RGB_Image, Fl_Pixmap, Fl_Shared_Image, Fl_SVG_Image, and
Fl_Tiled_Image.

11.71.3.10 draw() [1/2]

void Fl_Image::draw (  
    int X,  
    int Y ) [inline]

Draws the image to the current drawing surface.

Parameters

X, Y specify the upper-lefthand corner of the image.

11.71.3.11 draw() [2/2]

void Fl_Image::draw (  
    int X,  
    int Y,  
    int W,  
    int H,  
    int cx = 0,  
    int cy = 0 ) [virtual]

Draws the image to the current drawing surface with a bounding box.
Arguments X, Y, W, H specify a bounding box for the image, with the origin (upper-left corner) of the image offset
by the cx and cy arguments.
In other words: fl_push_clip(X, Y, W, H) is applied, the image is drawn with its upper-left corner at
X-cx, Y-cy and its own width and height, fl_pop_clip() is applied.
Reimplemented in Fl_Anim_GIF_Image, Fl_Bitmap, Fl_RGB_Image, Fl_Pixmap, Fl_Shared_Image, Fl_SVG_Image,
and Fl_Tiled_Image.

11.71.3.12 draw_empty()

void Fl_Image::draw_empty (  
    int X,  
    int Y ) [protected]

The protected method draw_empty() draws a box with an X in it.
It can be used to draw any image that lacks image data.

11.71.3.13 draw_scaled()

int Fl_Image::draw_scaled (  
    int X,  
    int Y,  
    int W,  
    int H ) [protected]

Draw the image to the current drawing surface rescaled to a given width and height.
Intended for internal use by the FLTK library.

### Parameters

<table>
<thead>
<tr>
<th>X, Y</th>
<th>position of the image's top-left</th>
</tr>
</thead>
<tbody>
<tr>
<td>W, H</td>
<td>width and height for the drawn image</td>
</tr>
</tbody>
</table>

### Returns

1

**Deprecated** Only for API compatibility with FLTK 1.3.4.

#### 11.71.3.14 fail()

```cpp
int Fl_Image::fail ( ) const
```

Returns a value that is not 0 if there is currently no image available.

**Example use:**

```cpp
// ...
Fl_Box box(X, Y, W, H);
Fl_JPEG_Image jpg("/tmp/foo.jpg");
switch (jpg.fail()) {
  case Fl_Image::ERR_NO_IMAGE:
  case Fl_Image::ERR_FILE_ACCESS:
    fl_alert("/tmp/foo.jpg: %s", strerror(errno)); // shows actual os error to user
    exit(1);
  case Fl_Image::ERR_FORMAT:
    fl_alert("/tmp/foo.jpg: couldn't decode image");
    exit(1);
}
box.image(jpg);
```

Returns

Image load failure if non-zero

### Return values

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>the image was loaded successfully</td>
</tr>
<tr>
<td>ERR_NO_IMAGE</td>
<td>no image was found</td>
</tr>
<tr>
<td>ERR_FILE_ACCESS</td>
<td>there was a file access related error (errno should be set)</td>
</tr>
<tr>
<td>ERR_FORMAT</td>
<td>image decoding failed</td>
</tr>
<tr>
<td>ERR_MEMORY_ACCESS</td>
<td>image decoder tried to access memory outside of given memory block</td>
</tr>
</tbody>
</table>

#### 11.71.3.15 h() [1/2]

```cpp
int Fl_Image::h ( ) const [inline]
```

Returns the current image drawing height in FLTK units.

The values of `h()` and `data_h()` are identical unless `scale()` has been called after which they may differ.

#### 11.71.3.16 h() [2/2]

```cpp
void Fl_Image::h ( int H ) [inline], [protected]
```

Sets the height of the image data.

This protected function sets both image heights: the height of the image data returned by `data_h()` and the image drawing height in FLTK units returned by `h()`.
The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.
An internal copy is made of the original image before changes are applied, to avoid modifying the original image.

**Note**
The RGB color of FL_BACKGROUND_COLOR may change when the connection to the display is made. See fl_open_display().

### 11.71.3.18 label() [1/2]

```c
void Fl_Image::label (Fl_Menu_Item ∗m) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

**Deprecated** Please use Fl_Menu_Item::image() instead.

Reimplemented in Fl_Bitmap, Fl_RGB_Image, and Fl_Pixmap.

### 11.71.3.19 label() [2/2]

```c
void Fl_Image::label (Fl_Widget ∗widget) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use Fl_Widget::image() or Fl_Widget::deimage() instead.

Reimplemented in Fl_Bitmap, Fl_RGB_Image, and Fl_Pixmap.

### 11.71.3.20 ld() [1/2]

```c
int Fl_Image::ld ( ) const [inline]
```

Returns the current line data size in bytes.

See also

ld(int)

### 11.71.3.21 ld() [2/2]

```c
void Fl_Image::ld (int LD) [inline], [protected]
```

Sets the current line data size in bytes.
Color images may contain extra data (padding) that is included after every line of color image data and is normally not present.
If LD is zero, then line data size is assumed to be data_w() * d() bytes.
If LD is non-zero, then it must be positive and larger than data_w() * d() to account for the extra data per line.

### 11.71.3.22 release()

```c
virtual void Fl_Image::release ( ) [inline], [virtual]
```

Releases an Fl_Image - the same as 'delete this'.
This virtual method is for almost all image classes the same as calling delete image;
where image is an Fl_Image ∗pointer.
However, for subclass Fl_Shared_Image and its subclasses this virtual method is reimplemented and maintains shared images.
This virtual method makes it possible to destroy all image types in the same way by calling
11.71 Fl_Image Class Reference

image->release();

Reasoning: If you have an `Fl_Image ∗` base class pointer and don’t know if the object is one of the class `Fl_Shared_Image` or any other subclass of `Fl_Image` (for instance `Fl_RGB_Image`) then you can’t just use operator delete since this is not appropriate for `Fl_Shared_Image` objects.

The virtual method `release()` handles this properly.

Since

1.4.0 in the base class Fl_Image and virtual in Fl_Shared_Image

Reimplemented in Fl_Shared_Image.

11.71.3.23 RGB scaling()

```cpp
void Fl_Image::RGB_scaling (Fl_RGB_Scaling method) [static]
```

Sets the RGB image scaling method used for `copy(int, int)`.

Applies to all RGB images, defaults to `FL_RGB_SCALING_NEAREST`.

11.71.3.24 scale()

```cpp
void Fl_Image::scale (int width, int height, int proportional = 1, int can_expand = 0) [virtual]
```

Sets the drawing size of the image.

This function controls the values returned by member functions `w()` and `h()` which in turn control how the image is drawn: the full image data (whose size is given by `data_w()` and `data_h()`) are drawn scaled to an area of the drawing surface sized at `w() x h()` FLTK units. This can make a difference if the drawing surface has more than 1 pixel per FLTK unit because the image can be drawn at the full resolution of the drawing surface. Examples of such drawing surfaces: HiDPI displays, laser printers, PostScript files, PDF printers.

**Parameters**

<table>
<thead>
<tr>
<th>width, height</th>
<th>maximum values, in FLTK units, that <code>w()</code> and <code>h()</code> should return</th>
</tr>
</thead>
<tbody>
<tr>
<td>proportional</td>
<td>if not null, keep the values returned by <code>w()</code> and <code>h()</code> proportional to <code>data_w()</code> and <code>data_h()</code></td>
</tr>
<tr>
<td>can_expand</td>
<td>if null, the values returned by <code>w()</code> and <code>h()</code> will not be larger than <code>data_w()</code> and <code>data_h()</code>, respectively</td>
</tr>
</tbody>
</table>

**Note**

This function generally changes the values returned by the `w()` and `h()` member functions. In contrast, the values returned by `data_w()` and `data_h()` remain unchanged.

**Version**

1.4 (1.3.4 and FL_ABI_VERSION for Fl_Shared_Image only)

**Example code:** scale an image to fit in a box

```cpp
Fl_Box ∗b = ... // a box
Fl_Image ∗img = new Fl_PNG_Image("/path/to/picture.png"); // read a picture file
// set the drawing size of the image to the size of the box keeping its aspect ratio
img->scale(b->w(), b->h());
b->image(img); // use the image as the box image
```

11.71.3.25 scaling_algorithm()

```cpp
static void Fl_Image::scaling_algorithm (Fl_RGB_Scaling algorithm) [inline], [static]
```

Sets what algorithm is used when resizing a source image to draw it.

The default algorithm is `FL_RGB_SCALING_BILINEAR`. Drawing an `Fl_Image` is sometimes performed by first resizing the source image and then drawing the resized copy. This occurs, e.g., when drawing to screen under X11...
without Xrender support after having called `scale()`. This function controls what method is used when the image to be resized is an `Fl_RGB_Image`.

**Version**
1.4

### 11.71.3.26 uncache()

```cpp
void Fl_Image::uncache () [virtual]
```

If the image has been cached for display, delete the cache data. This allows you to change the data used for the image and then redraw it without recreating an image object. Reimplemented in `Fl_Anim_GIF_Image`, `Fl_Bitmap`, `Fl_RGB_Image`, `Fl_Pixmap`, and `Fl_Shared_Image`.

### 11.71.3.27 w() [1/2]

```cpp
int Fl_Image::w ( ) const [inline]
```

Returns the current image drawing width in FLTK units. The values of `w()` and `data_w()` are identical unless `scaled()` has been called after which they may differ.

### 11.71.3.28 w() [2/2]

```cpp
void Fl_Image::w ( int W ) [inline], [protected]
```

Sets the width of the image data. This protected function sets both image widths: the width of the image data returned by `data_w()` and the image drawing width in FLTK units returned by `w()`.

The documentation for this class was generated from the following files:
- `Fl_Image.H`
- `Fl_Image.cxx`

### 11.72 Fl_Image_Reader Class Reference

**Public Member Functions**

- `int error () const`
- `const char ∗ name () const`
- `int open (const char ∗filename)`
- `int open (const char ∗imagename, const unsigned char ∗data)`
- `int open (const char ∗imagename, const unsigned char ∗data, const size_t datasize)`
- `unsigned char read_byte ()`
- `unsigned int read_dword ()`
- `int read_long ()`
- `unsigned short read_word ()`
- `void seek (unsigned int n)`
- `void skip (unsigned int n)`
- `long tell () const`

The documentation for this class was generated from the following files:
- `Fl_Image_Reader.h`
- `Fl_Image_Reader.cxx`
11.73 Fl_Image_Surface Class Reference

Directs all graphics requests to an Fl_Image.
#include <Fl_Image_Surface.H>

Inheritance diagram for Fl_Image_Surface:

- Fl_Surface_Device
- Fl_Widget_Surface
- Fl_Image_Surface

Public Member Functions

- **Fl_Image_Surface**(int w, int h, int high_res=0, Fl_Offscreen off=0)
  Constructor with optional high resolution.
- **Fl_Shared_Image** ∗ **highres_image** ()
  Returns a possibly high resolution image made of all drawings sent to the Fl_Image_Surface object.
- **Fl_RGB_Image** ∗ **image** ()
  Returns a depth 3 image made of all drawings sent to the Fl_Image_Surface object.
- **bool** **is_current** () FL_OVERRIDE
  Is this surface the current drawing surface?
- **Fl_Offscreen** **offscreen** ()
  Returns the Fl_Offscreen object associated to the image surface.
- **void** **origin** (int ∗ x, int ∗ y) FL_OVERRIDE
  Computes the coordinates of the current origin of graphics functions.
- **void** **origin** (int x, int y) FL_OVERRIDE
  Sets the position of the origin of graphics in the drawable part of the drawing surface.
- **int** **printable_rect** (int ∗ w, int ∗ h) FL_OVERRIDE
  Computes the width and height of the drawable area of the drawing surface.
- **void** **rescale** ()
  Adapts the Fl_Image_Surface object to the new value of the GUI scale factor.
- **void** **set_current** () FL_OVERRIDE
  Make this surface the current drawing surface.
- **~Fl_Image_Surface** ()
  The destructor.

Public Member Functions inherited from Fl_Widget_Surface

- **void** **draw** (Fl_Widget ∗ widget, int delta_x=0, int delta_y=0)
  Draws the widget on the drawing surface.
- **void** **draw_decorated_window** (Fl_Window ∗ win, int x_offset=0, int y_offset=0)
  Draws a window with its title bar and frame if any.
- **void** **print_window_part** (Fl_Window ∗ win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  Draws a rectangular part of an on-screen window.

Public Member Functions inherited from Fl_Surface_Device

- **FL_Graphics_Driver** ∗ **driver** ()
  Returns the graphics driver of this drawing surface.
- **virtual** **~Fl_Surface_Device** ()
  The destructor.
Protected Member Functions

- **void** `translate` (int x, int y) **FL_OVERRIDE**
  
  Translates the current graphics origin accounting for the current rotation.

- **void** `untranslate` () **FL_OVERRIDE**
  
  Undoes the effect of a previous `translate()` call.

Protected Member Functions inherited from `Fl_Widget_Surface`

- ```c
      void driver (Fl_Graphics_Driver *graphics_driver)
      
      Sets the graphics driver of this drawing surface.
      ```

- ```c
      virtual void end_current ()
      
      FLTK calls this each time a surface ceases to be the current drawing surface.
      ```

- **Fl_Widget_Surface** (Fl_Graphics_Driver *d)
  
  The constructor.

Protected Member Functions inherited from `Fl_Surface_Device`

- ```c
      void driver (Fl_Graphics_Driver *graphics_driver)
      
      Sets the graphics driver to use for the created surface.
      ```

- ```c
      void end_current ()
      
      FLTK calls this each time a surface ceases to be the current drawing surface.
      ```

- **Fl_Surface_Device** (Fl_Graphics_Driver *graphics_driver)
  
  Constructor that sets the graphics driver to use for the created surface.

Friends

- class **Fl_Graphics_Driver**

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Surface_Device`

- ```c
      static Fl_Surface_Device * pop_current ()
      
      Removes the top element from the current drawing surface stack, and makes the new top element current.
      ```

- ```c
      static void push_current (Fl_Surface_Device *new_current)
      
      Pushes `new_current` on top of the stack of current drawing surfaces, and makes it current.
      ```

- ```c
      static Fl_Surface_Device * surface ()
      
      The current drawing surface.
      ```

Protected Attributes inherited from `Fl_Widget_Surface`

- int **x_offset**
  
  Horizontal offset to the origin of graphics coordinates

- int **y_offset**
  
  Vertical offset to the origin of graphics coordinates

11.73.1 Detailed Description

Directs all graphics requests to an `Fl_Image`

After creation of an `Fl_Image_Surface` object, make it the current drawing surface calling `Fl_Surface_Device::push_current()`, and all subsequent graphics requests will be recorded in the image. It's possible to draw widgets (using `Fl_Image_Surface::draw()`) or to use any of the `Drawing functions` or the `Color & Font functions`. Finally, call `image()` on the object to obtain a newly allocated `Fl_RGB_Image` object. `Fl_Gl_Window` objects can be drawn in the image as well.

Usage example:

```cpp
// this is the widget that you want to draw into an image
Fl_Widget *g = ...;

// create an Fl_Image_Surface object
Fl_Image_Surface *image_surface = new Fl_Image_Surface(g->w(), g->h());

// direct all further graphics requests to the image
```
Fl_Surface_Device::push_current(image_surface);

// draw a white background
fl_color(FL_WHITE);
fl_rectf(0, 0, g->w(), g->h());

// draw the g widget in the image
image_surface->draw(g);

// get the resulting image
Fl_RGB_Image* image = image_surface->image();

// direct graphics requests back to their previous destination
Fl_Surface_Device::pop_current();

// delete the image_surface object, but not the image itself
delete image_surface;

## 11.73.2 Constructor & Destructor Documentation

### 11.73.2.1 Fl_Image_Surface()

```c
Fl_Image_Surface::Fl_Image_Surface (int w, int h, int high_res = 0,
                                        Fl_Offscreen off = 0 )
```

Constructor with optional high resolution.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>w,h</td>
<td>Width and height of the resulting image. The value of the high_res parameter controls whether w and h are interpreted as pixels or FLTK units.</td>
</tr>
<tr>
<td>high_res</td>
<td>If zero, the created image surface is sized at w x h pixels. If non-zero, the pixel size of the created image surface depends on the value of the display scale factor (see Fl::screen_scale(int)): the resulting image has the same number of pixels as an area of the display of size w x h expressed in FLTK units.</td>
</tr>
<tr>
<td>off</td>
<td>If not null, the image surface is constructed around a pre-existing Fl_Offscreen. The caller is responsible for both construction and destruction of this Fl_Offscreen object. Is mostly intended for internal use by FLTK.</td>
</tr>
</tbody>
</table>

**Version**

1.3.4 (1.3.3 without the highres parameter)

## 11.73.3 Member Function Documentation

### 11.73.3.1 highres_image()

```c
Fl_Shared_Image * Fl_Image_Surface::highres_image ( )
```

Returns a possibly high resolution image made of all drawings sent to the Fl_Image_Surface object.

The Fl_Image_Surface object should have been constructed with Fl_Image_Surface(W, H, 1). The returned Fl_Shared_Image object is scaled to a size of WxH FLTK units and may have a pixel size larger than these values. The returned object should be deallocated with Fl_Shared_Image::release() after use.

**Deprecated** Use `image()` instead.

**Version**

1.4 (1.3.4 for MacOS platform only)

### 11.73.3.2 image()

```c
Fl_RGB_Image * Fl_Image_Surface::image ( )
```

Returns a depth 3 image made of all drawings sent to the Fl_Image_Surface object.

The returned object contains its own copy of the RGB data. The caller is responsible for deleting the image.
11.73.3.3 is_current()

`bool Fl_Image_Surface::is_current ( ) [virtual]`

Is this surface the current drawing surface?
Reimplemented from Fl_Surface_Device.

11.73.3.4 offscreen()

`Fl_Offscreen Fl_Image_Surface::offscreen ( )`

Returns the Fl_Offscreen object associated to the image surface.
The returned Fl_Offscreen object is deleted when the Fl_Image_Surface object is deleted, unless the Fl_Image_Surface was constructed with non-null Fl_Offscreen argument.

11.73.3.5 origin() [1/2]

`void Fl_Image_Surface::origin ( int ∗ x, int ∗ y ) [virtual]`

Computes the coordinates of the current origin of graphics functions.

Parameters

| out x,y | If non-null, ∗x and ∗y are set to the horizontal and vertical coordinates of the graphics origin. |

Reimplemented from Fl_Widget_Surface.

11.73.3.6 origin() [2/2]

`void Fl_Image_Surface::origin ( int x, int y ) [virtual]`

Sets the position of the origin of graphics in the drawable part of the drawing surface.
Arguments should be expressed relatively to the result of a previous printable_rect() call. That is, `printable←_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive origin() calls don't combine their effects. Origin() calls are not affected by rotate() calls (for classes derived from Fl_Paged_Device).

Parameters

| in x,y | Horizontal and vertical positions in the drawing surface of the desired origin of graphics. |

Reimplemented from Fl_Widget_Surface.

11.73.3.7 printable_rect()

`int Fl_Image_Surface::printable_rect ( int ∗ w, int ∗ h ) [virtual]`

Computes the width and height of the drawable area of the drawing surface.
Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to origin(). If the object is derived from class Fl_Paged_Device, values account for the user-selected paper type and print orientation and are changed by scale() calls.

Returns

- 0 if OK, non-zero if any error

Reimplemented from Fl_Widget_Surface.
11.73.3.8  rescale()

```cpp
void Fl_Image_Surface::rescale ( )
```

Adapts the Fl_Image_Surface object to the new value of the GUI scale factor. The Fl_Image_Surface object must not be the current drawing surface. This function is useful only for an object constructed with non-zero high_res parameter.

Version

1.4

11.73.3.9  set_current()

```cpp
void Fl_Image_Surface::set_current ( ) [virtual]
```

Make this surface the current drawing surface. This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is Fl_Surface_Device:push_current() / Fl_Surface_Device:pop_current().

Note

It's recommended to use this function only as follows:

- The current drawing surface is the display;
- make current another surface, e.g., an Fl_Printer or an Fl_Image_Surface object, calling set_current() on this object;
- draw to that surface;
- make the display current again with Fl_Display_Device::display_device()-&gt;set_current();. Don't do any other call to set_current() before this one.

Other scenarios of drawing surface changes should be performed via Fl_Surface_Device:push_current() / Fl_Surface_Device:pop_current().

Reimplemented from Fl_Surface_Device.

11.73.3.10  translate()

```cpp
void Fl_Image_Surface::translate ( int x, int y ) [protected], [virtual]
```

Translates the current graphics origin accounting for the current rotation. Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects. Reimplemented from Fl_Widget_Surface.

11.73.3.11  untranslate()

```cpp
void Fl_Image_Surface::untranslate ( ) [protected], [virtual]
```

Undoes the effect of a previous translate() call. Reimplemented from Fl_Widget_Surface.

The documentation for this class was generated from the following files:

- Fl_Image_Surface.H
- Fl_Image_Surface.cxx

11.74  Fl_Input Class Reference

This is the FLTK text input widget.

```
#include &lt;Fl_Input.H&gt;
```

Inheritance diagram for Fl_Input:
Public Member Functions

- **Fl_Input** (int, int, int, int, const char *=0)
  
  Creates a new Fl_Input widget using the given position, size, and label string.

- **int handle** (int) FL_OVERRIDE
  
  Handles the specified event.

Public Member Functions inherited from **Fl_Input_**

- **int append** (const char *=t, int l=0, char keep_selection=0)
  
  Append text at the end.

- **bool can_redo** () const
  
  Check if there is a redo action available.

- **bool can_undo** () const
  
  Check if the last operation can be undone.

- **int copy** (int clipboard)
  
  Put the current selection into the clipboard.

- **int copy_cuts** ()
  
  Copies the yank buffer to the clipboard.

- **Fl_Color cursor_color** () const
  
  Gets the color of the cursor.

- **void cursor_color** (Fl_Color n)
  
  Sets the color of the cursor.

- **int cut** ()
  
  Deletes the current selection.

- **int cut** (int a, int b)
  
  Deletes all characters between index a and b.

- **int cut** (int n)
  
  Deletes the next n bytes rounded to characters before or after the cursor.

- **double dvalue** () const
  
  Returns the widget text interpreted as a floating point number.

- **Fl_Input_** (int, int, int, int, const char *=0)
  
  Creates a new Fl_Input_ widget.

- **unsigned int index** (int i) const
  
  Returns the character at index i.

- **int input_type** () const
  
  Gets the input field type.

- **void input_type** (int t)
  
  Sets the input field type.

- **int insert** (const char *=t, int l=0)
  
  Inserts text at the cursor position.

- **int insert_position** () const
  
  Gets the position of the text cursor.

- **int insert_position** (int p)
  
  Sets the cursor position and mark.
• int `insert_position` (int p, int m)
  Sets the index for the cursor and mark.

• int `ivalue` () const
  Returns the widget text interpreted as a signed integer.

• int `mark` (int m)
  Gets the current selection mark.

• int `mark` (int m)
  Sets the current selection mark.

• int `maximum_size` () const
  Gets the maximum length of the input field in characters.

• void `maximum_size` (int m)
  Sets the maximum length of the input field in characters.

• int `position` () const
• int `position` (int p)
• int `position` (int p, int m)
• int `readonly` () const
  Gets the read-only state of the input field.

• void `readonly` (int b)
  Sets the read-only state of the input field.

• int `redo` ()
  Redo previous undo operation.

• int `replace` (int b, int e, const char ∗text, int ilen=0)
  Deletes text from b to e and inserts the new string text.

• void `resize` (int, int, int, int) FL_OVERRIDEx
  Changes the size of the widget.

• int `shortcut` () const
  Return the shortcut key associated with this widget.

• void `shortcut` (int s)
  Sets the shortcut key associated with this widget.

• int `size` () const
  Returns the number of bytes in value().

• void `size` (int W, int H)
  Sets the width and height of this widget.

• int `static_value` (const char ∗)
  Changes the widget text.

• int `static_value` (const char ∗, int)
  Changes the widget text.

• int `tab_nav` () const
  Gets whether the Tab key causes focus navigation in multilime input fields or not.

• void `tab_nav` (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

• `Fl_Color textcolor` () const
  Gets the color of the text in the input field.

• void `textcolor` (Fl_Color n)
  Sets the color of the text in the input field.

• `Fl_Font textfont` () const
  Gets the font of the text in the input field.

• void `textfont` (Fl_Font s)
  Sets the font of the text in the input field.

• `Fl_Fontsize textsize` () const
  Gets the size of the text in the input field.
• void \texttt{textsize (Fl_Fontsize \ s)}
  \textit{Sets the size of the text in the input field.}

• int \texttt{undo ()}
  \textit{Undoes previous changes to the text buffer.}

• const char \texttt{* value () const}
  \textit{Returns the text displayed in the widget.}

• int \texttt{value (const char *)}
  \textit{Changes the widget text.}

• int \texttt{value (const char *, int)}
  \textit{Changes the widget text.}

• int \texttt{value (double value)}
  \textit{Changes the widget text to a floating point number ("\%g").}

• int \texttt{value (int value)}
  \textit{Changes the widget text to a signed integer number.}

• int \texttt{wrap () const}
  \textit{Gets the word wrapping state of the input field.}

• void \texttt{wrap (int b)}
  \textit{Sets the word wrapping state of the input field.}

• \texttt{~Fl\_Input\_ ()}
  \textit{Destroys the widget.}

\textbf{Public Member Functions inherited from Fl\_Widget}

• void \texttt{\_clear\_fullscreen ()}
  \textit{Activates the widget.}

• void \texttt{\_set\_fullscreen ()}

• void \texttt{activate ()}
  \textit{Activates the widget.}

• unsigned int \texttt{active () const}
  \textit{Returns whether the widget is active.}

• int \texttt{active\_r () const}
  \textit{Returns whether the widget and all of its parents are active.}

• \texttt{Fl\_Align align () const}
  \textit{Gets the label alignment.}

• void \texttt{align (Fl\_Align alignment)}
  \textit{Sets the label alignment.}

• long \texttt{argument () const}
  \textit{Gets the current user data (long) argument that is passed to the callback function.}

• void \texttt{argument (long v)}
  \textit{Sets the current user data (long) argument that is passed to the callback function.}

• virtual class \texttt{Fl\_Gl\_Window * as\_gl\_window ()}
  \textit{Returns an Fl\_Gl\_Window pointer if this widget is an Fl\_Gl\_Window.}

• virtual class \texttt{Fl\_Gl\_Window const * as\_gl\_window () const}

• virtual \texttt{Fl\_Group * as\_group ()}
  \textit{Returns an Fl\_Group pointer if this widget is an Fl\_Group.}

• virtual \texttt{Fl\_Group const * as\_group () const}

• virtual \texttt{Fl\_Window * as\_window ()}
  \textit{Returns an Fl\_Window pointer if this widget is an Fl\_Window.}

• virtual \texttt{Fl\_Window const * as\_window () const}

• void \texttt{bind\_deimage (Fl\_Image *img)}
  \textit{Sets the image to use as part of the widget label when in the inactive state.}

• void \texttt{bind\_deimage (int f)}

Generated by Doxygen
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtyle box () const
  Gets the box type of the widget.
• void box (Fl_Boxtyle new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
Shortcut to set the label text and type in one call.

- `FL_Color labelcolor () const`
  Gets the label color.
- `void labelcolor (FL_Color c)`
  Sets the label color.
- `FL_Font labelfont () const`
  Gets the font to use.
- `void labelfont (FL_Font f)`
  Sets the font to use.
- `FL_Fontsize labelsizesize () const`
  Gets the font size in pixels.
- `void labelsizesize (FL_Fontsize pix)`
  Sets the font size in pixels.
- `FL_Labeltype labeltype () const`
  Gets the label type.
- `void labeltype (FL_Labeltype a)`
  Sets the label type.
- `void measure_label (int &ww, int &hh) const`
  Sets width ww and height hh accordingly with the label size.
- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.
- `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.
- `unsigned int output () const`
  Returns if a widget is used for output only.
- `FL_Group *parent () const`
  Returns a pointer to the parent widget.
- `void parent (FL_Group *p)`
  Internal use only - "for hacks only".
- `void position (int X, int Y)`
  Repositions the window or widget.
- `void redraw ()`
  Schedules the drawing of the widget.
- `void redraw_label ()`
  Schedules the drawing of the label.
- `FL_Color selection_color () const`
  Gets the selection color.
- `void selection_color (FL_Color a)`
  Sets the selection color.
- `void set_active ()`
  Marks the widget as active without sending events or changing focus.
- `void set_changed ()`
  Marks the value of the widget as changed.
- `void set_output ()`
  Sets a widget to output only.
- `void set_visible ()`
  Makes the widget visible.
- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.
- `int shortcut_label () const`
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takeevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Static Public Attributes

- static const char * copy_menu_text = "Copy"
  [this text may be customized at run-time]
- static const char * cut_menu_text = "Cut"
  [this text may be customized at run-time]
- static const char * paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Member Functions

- void draw () FL_OVERRIDE
  Draws the widget.
- int handle_key ()
  Handles a keystroke.
- int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

- int apply_undo ()
  Apply the current undo/redo operation.
- void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
- void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
- void handle_mouse (int, int, int, int, int keepmark=0)
  Handles mouse clicks and mouse moves.
- int handletext (int e, int, int, int, int)
  Handles all kinds of text field related events.
- int line_end (int i) const
  Finds the end of a line.
- int line_start (int i) const
  Finds the start of a line.
- int linesPerPage ()
- void maybe_do_callback (Fl_Callback_REASON reason=FL_REASON_UNKNOWN)
- int up_down_position (int, int keepmark=0)
  Moves the cursor to the column given by up_down_pos.
- int word_end (int i) const
  Finds the end of a word.
- int word_start (int i) const
  Finds the start of a word.
- int xscroll () const
- int yscroll () const
- void yscroll (int yOffset)
Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const
  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

- void w (int v)
  Internal use only.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- unsigned int flags () const
  Gets the widget flags mask.

- class Fl_Screen_Driver

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.

- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '\&x' shortcut in a given text.

- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '\&x' shortcut.

flags possible values enumeration.

### 11.74.1 Detailed Description

This is the FLTK text input widget. It displays a single line of text and lets the user edit it. Normally it is drawn with an inset box and a white background. The text may contain any characters, and will correctly display any UTF text, using \^X notation for unprintable control characters. It assumes the font can draw any characters of the used scripts, which is true for standard fonts under Windows and Mac OS X. Characters can be input using the keyboard or the character palette/map. Character composition is done using dead keys and/or a compose key as defined by the operating system.

<table>
<thead>
<tr>
<th>Mouse button 1</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moves the cursor to this point. Drag selects characters. Double click selects words. Triple click selects all line. Shift+click extends the selection. When you select text it is automatically copied to the selection buffer.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Mouse button 2</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert the selection buffer at the point clicked. You can also select a region and replace it with the selection buffer by selecting the region with mouse button 2.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Mouse button 3</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Currently acts like button 1.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backspace</td>
<td>Deletes one character to the left, or deletes the selected region.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes one character to the right, or deletes the selected region. Combine with Shift for equivalent of ^X (copy+cut).</td>
</tr>
<tr>
<td>Enter</td>
<td>May cause the callback, see when().</td>
</tr>
</tbody>
</table>

### Table 11.295 Platform specific keyboard bindings.

<table>
<thead>
<tr>
<th>Windows/Linux</th>
<th>Mac</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>^A</td>
<td>Command-A</td>
<td>Selects all text in the widget.</td>
</tr>
<tr>
<td>^C</td>
<td>Command-C</td>
<td>Copy the current selection to the clipboard.</td>
</tr>
<tr>
<td>^I</td>
<td>^I</td>
<td>Insert a tab.</td>
</tr>
<tr>
<td>^J</td>
<td>^J</td>
<td>Insert a Line Feed. (Similar to literal 'Enter' character)</td>
</tr>
<tr>
<td>^L</td>
<td>^L</td>
<td>Insert a Form Feed.</td>
</tr>
<tr>
<td>^M</td>
<td>^M</td>
<td>Insert a Carriage Return.</td>
</tr>
</tbody>
</table>
### Constructor & Destructor Documentation

#### Fl_Input()

```cpp
def Fl_Input::Fl_Input (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char * l = 0  
)
```

Creates a new `Fl_Input` widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`. 

---

<table>
<thead>
<tr>
<th>Key Combination</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>^V</code>, Shift-Insert</td>
<td>Command-V</td>
<td>Paste the clipboard. (Macs keyboards don't have &quot;Insert&quot; keys, but if they did, Shift-Insert would work)</td>
</tr>
<tr>
<td><code>^X</code>, Shift-Delete</td>
<td>Command-X, Shift-Delete</td>
<td>Cut. Copy the selection to the clipboard and delete it. (If there's no selection, Shift-Delete acts like Delete)</td>
</tr>
<tr>
<td><code>^Z</code></td>
<td>Command-Z</td>
<td>Undo. This is a single-level undo mechanism, but all adjacent deletions and insertions are concatenated into a single &quot;undo&quot;. Often this will undo a lot more than you expected.</td>
</tr>
<tr>
<td>Arrow Keys</td>
<td>Arrow Keys</td>
<td>Standard cursor movement. Can be combined with Shift to extend selection.</td>
</tr>
<tr>
<td>Home</td>
<td>Command-Up, Command-Left</td>
<td>Move to start of line. Can be combined with Shift to extend selection.</td>
</tr>
<tr>
<td>End</td>
<td>Command-Down, Command-Right</td>
<td>Move to end of line. Can be combined with Shift to extend selection.</td>
</tr>
<tr>
<td>Ctrl-Home</td>
<td>Command-Up, Command-PgUp, Ctrl-Left</td>
<td>Move to top of document/field. In single line input, moves to start of line. In multiline input, moves to start of top line. Can be combined with Shift to extend selection.</td>
</tr>
<tr>
<td>Ctrl-End</td>
<td>Command-End, Command-PgDn, Ctrl-Right</td>
<td>Move to bottom of document/field. In single line input, moves to end of line. In multiline input, moves to end of last line. Can be combined with Shift to extend selection.</td>
</tr>
<tr>
<td>Ctrl-Left</td>
<td>Alt-Left</td>
<td>Word left. Can be combined with Shift to extend selection.</td>
</tr>
<tr>
<td>Ctrl-Right</td>
<td>Alt-Right</td>
<td>Word right. Can be combined with Shift to extend selection.</td>
</tr>
<tr>
<td>Ctrl-Backspace</td>
<td>Alt-Backspace</td>
<td>Delete word left.</td>
</tr>
<tr>
<td>Ctrl-Delete</td>
<td>Alt-Delete</td>
<td>Delete word right.</td>
</tr>
</tbody>
</table>
11.74.3 Member Function Documentation

11.74.3.1 draw()

```cpp
void Fl_Input::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

11.74.3.2 handle()

```cpp
int Fl_Input::handle (int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to `filter` event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>event</th>
<th>the kind of event received</th>
</tr>
</thead>
</table>

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

See also

`Fl_Event`

Reimplemented from `Fl_Widget`.

Reimplemented in `Fl_Spinner::Fl_Spinner_Input`, and `Fl_Secret_Input`.

11.74.3.3 handle_key()

```cpp
int Fl_Input::handle_key () [protected]
```

Handles a keystroke.

This protected method handles a keystroke in an `Fl_Input` or derived class. It handles compose key sequences and can also be used e.g. in `Fl_Multiline_Input`, `Fl_Float_Input` and several more derived classes.

The details are way too complicated to be documented here and can be changed as required. If in doubt, please consult the source code.

Returns

1 if the keystroke is handled by us, 0 if not.
11.74.3.4 handle_rmb()

Handle right mouse button down events.

Returns

1

The documentation for this class was generated from the following files:

- Fl_Input.H
- Fl_Input.cxx

11.75 Fl_Input_ Class Reference

This class provides a low-overhead text input field.

```
#include <Fl_Input_.H>
```

   Fl_Multiline_Output
```

Public Member Functions

- **int append (const char *t, int l=0, char keep_selection=0)**
  Append text at the end.
- **bool can_redo () const**
  Check if there is a redo action available.
- **bool can_undo () const**
  Check if the last operation can be undone.
- **int copy (int clipboard)**
  Put the current selection into the clipboard.
- **int copy_cuts ()**
  Copies the yank buffer to the clipboard.
- **Fl_Color cursor_color () const**
  Gets the color of the cursor.
- **void cursor_color (Fl_Color n)**
  Sets the color of the cursor.
- **int cut ()**
  Deletes the current selection.
- **int cut (int a, int b)**
  Deletes all characters between index a and b.
- **int cut (int n)**
  Deletes the next n bytes rounded to characters before or after the cursor.
- **double dvalue () const**
  Returns the widget text interpreted as a floating point number.
- **Fl_Input_ (int, int, int, int, const char *=0)**
  Creates a new Fl_Input_ widget.
- **unsigned int index (int i) const**
  Returns the character at index i.
• int **input_type** () const
  
  Gets the input field type.

• void **input_type** (int t)
  
  Sets the input field type.

• int **insert** (const char *t, int l=0)
  
  Inserts text at the cursor position.

• int **insert_position** () const
  
  Gets the position of the text cursor.

• int **insert_position** (int p)
  
  Sets the cursor position and mark.

• int **insert_position** (int p, int m)
  
  Sets the index for the cursor and mark.

• int **ivalue** () const
  
  Returns the widget text interpreted as a signed integer.

• int **mark** () const
  
  Gets the current selection mark.

• int **mark** (int m)
  
  Sets the current selection mark.

• int **maximum_size** () const
  
  Gets the maximum length of the input field in characters.

• void **maximum_size** (int m)
  
  Sets the maximum length of the input field in characters.

• int **position** () const
• int **position** (int p)
• int **position** (int p, int m)

• int **readonly** () const
  
  Gets the read-only state of the input field.

• void **readonly** (int b)
  
  Sets the read-only state of the input field.

• int **redo** ()
  
  Redo previous undo operation.

• int **replace** (int b, int e, const char *text, int ilen=0)
  
  Deletes text from b to e and inserts the new string text.

• void **resize** (int, int, int, int) **FL_OVERRIDE**
  
  Changes the size of the widget.

• int **shortcut** () const
  
  Return the shortcut key associated with this widget.

• void **shortcut** (int s)
  
  Sets the shortcut key associated with this widget.

• int **size** () const
  
  Returns the number of bytes in value().

• void **size** (int W, int H)
  
  Sets the width and height of this widget.

• int **static_value** (const char *)
  
  Changes the widget text.

• int **static_value** (const char *, int)
  
  Changes the widget text.

• int **tab_nav** () const
  
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

• void **tab_nav** (int val)
  
  Sets whether the Tab key does focus navigation, or inserts tab characters into **FL_Multiline_Input**.
• **Fl_Color** `textcolor () const`  
  Gets the color of the text in the input field.

• **void** `textcolor (Fl_Color n)`  
  Sets the color of the text in the input field.

• **Fl_Font** `textfont () const`  
  Gets the font of the text in the input field.

• **void** `textfont (Fl_Font s)`  
  Sets the font of the text in the input field.

• **Fl_Fontsize** `textsize () const`  
  Gets the size of the text in the input field.

• **void** `textsize (Fl_Fontsize s)`  
  Sets the size of the text in the input field.

• **int** `undo ()`  
  Undoes previous changes to the text buffer.

• **const char** ∗ `value () const`  
  Returns the text displayed in the widget.

• **int** `value (const char ∗)`  
  Changes the widget text.

• **int** `value (const char ∗, int)`  
  Changes the widget text.

• **int** `value (double value)`  
  Changes the widget text to a floating point number ("%g").

• **int** `value (int value)`  
  Changes the widget text to a signed integer number.

• **int** `wrap () const`  
  Gets the word wrapping state of the input field.

• **void** `wrap (int b)`  
  Sets the word wrapping state of the input field.

• **~Fl_Input_ ()**  
  Destroys the widget.

### Public Member Functions inherited from **Fl_Widget**

• **void** `_clear_fullscreen ()`  
• **void** `_set_fullscreen ()`  
• **void** `activate ()`  
  Activates the widget.

• **unsigned int** `active () const`  
  Returns whether the widget is active.

• **int** `active_r () const`  
  Returns whether the widget and all of its parents are active.

• **Fl_Align** `align () const`  
  Gets the label alignment.

• **void** `align (Fl_Align alignment)`  
  Sets the label alignment.

• **long** `argument () const`  
  Gets the current user data (long) argument that is passed to the callback function.

• **void** `argument (long v)`  
  Sets the current user data (long) argument that is passed to the callback function.

• **virtual class** Fl_Gl_Window ∗ `as_gl_window ()`  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Enables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• **FL_Color color2 () const**
  
  *For back compatibility only.*

• **void color2 (unsigned a)**

  *For back compatibility only.*

• **int contains (const FL_Widget *w) const**

  *Checks if w is a child of this widget.*

• **void copy_label (const char *new_label)**

  *Sets the current label.*

• **void copy_tooltip (const char *text)**

  *Sets the current tooltip text.*

• **uchar damage () const**

  *Returns non-zero if draw() needs to be called.*

• **void damage (uchar c)**

  *Sets the damage bits for the widget.*

• **void damage (uchar c, int x, int y, int w, int h)**

  *Sets the damage bits for an area inside the widget.*

• **int damage_resize (int, int, int, int)**

  *Internal use only.*

• **void deactivate ()**

  *Deactivates the widget.*

• **FL_Image *deimage ()**

  *Gets the image that is used as part of the widget label when in the inactive state.*

• **const FL_Image *deimage () const**

  *Gets the image that is used as part of the widget label when in the inactive state.*

• **void deimage (FL_Image &img)**

  *Sets the image to use as part of the widget label when in the inactive state.*

• **void deimage (FL_Image *img)**

  *Sets the image to use as part of the widget label when in the inactive state.*

• **int deimage_bound () const**

  *Returns whether the inactive image is managed by the widget.*

• **void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**

  *Calls the widget callback function with default arguments.*

• **void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**

  *Calls the widget callback function with arbitrary arguments.*

• **void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**

  *Calls the widget callback function with arbitrary arguments.*

• **virtual void draw ()=0**

  *Draws the widget.*

• **void draw_label (int, int, int, int, FL_Align) const**

  *Draws the label in an arbitrary bounding box with an arbitrary alignment.*

• **int h () const**

  *Gets the widget height.*

• **virtual int handle (int event)**

  *Handles the specified event.*

• **virtual void hide ()**

  *Makes a widget invisible.*

• **FL_Image *image ()**

  *Gets the image that is used as part of the widget label when in the active state.*

• **const FL_Image *image () const**

  *Gets the image that is used as part of the widget label when in the active state.*

• **void image (FL_Image &img)**

  *Sets the image to use as part of the widget label when in the active state.*
Sets the image to use as part of the widget label when in the active state.

- **void image (FL_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const FL_Widget *wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

- **const char * label () const**
  Gets the current label text.

- **void label (const char *text)**
  Sets the current label pointer.

- **void label (FL_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

- **FL_Color labelcolor () const**
  Gets the label color.

- **void labelcolor (FL_Color c)**
  Sets the label color.

- **FL_Font labelfont () const**
  Gets the font to use.

- **void labelfont (FL_Font f)**
  Sets the font to use.

- **FL_Fontsize labelsize () const**
  Gets the font size in pixels.

- **void labelsize (FL_Fontsize pix)**
  Sets the font size in pixels.

- **FL_Labeltype labeltype () const**
  Gets the label type.

- **void labeltype (FL_Labeltype a)**
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  Sets width ww and height hh accordingly with the label size.

- **bool needs_keyboard () const**
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  Returns if a widget is used for output only.

- **FL_Group * parent () const**
  Returns a pointer to the parent widget.

- **void parent (FL_Group *p)**
  Internal use only - “for hacks only”.

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **FL_Color selection_color () const**
  Gets the selection color.
• void **selection_color** (Fl_Color a)
  Sets the selection color.
• void **set_active** ()
  Marks the widget as active without sending events or changing focus.
• void **set_changed** ()
  Marks the value of the widget as changed.
• void **set_output** ()
  Sets a widget to output only.
• void **set_visible** ()
  Makes the widget visible.
• void **set_visible_focus** ()
  Enables keyboard focus navigation with this widget.
• int **shortcut_label** () const
  Returns whether the widget's label uses ' & ' to indicate shortcuts.
• void **shortcut_label** (int value)
  Sets whether the widget's label uses ' & ' to indicate shortcuts.
• virtual void **show** ()
  Changes the size of the widget.
• int **take_focus** ()
  Gives the widget the keyboard focus.
• unsigned int **takesevents** () const
  Returns if the widget is able to take events.
• int **testShortcut** ()
  Returns true if the widget's label contains the entered ' & x ' shortcut.
• const char ∗ **tooltip** () const
  Gets the current tooltip text.
• void **tooltip** (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ **topWindow** () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ **topWindow_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar **type** () const
  Gets the widget type.
• void **type** (uchar t)
  Sets the widget type.
• int **use_accents_menu** ()
  Returns non zero if MAC_USE.Accents_Menu flag is set, 0 otherwise.
Modifies keyboard focus navigation.

- **int visible_r () const**
  Returns whether a widget and all its parents are visible.
- **int w () const**
  Gets the widget width.
- **FL_When when () const**
  Returns the conditions under which the callback is called.
- **void when (uchar i)**
  Sets the flags used to decide when a callback is called.
- **FL_Window * window () const**
  Returns a pointer to the nearest parent window up the widget hierarchy.
- **int x () const**
  Gets the widget position in its window.
- **int y () const**
  Gets the widget position in its window.
- **virtual ~FL_Widget ()**
  Destroys the widget.

Protected Member Functions

- **int apply_undo ()**
  Apply the current undo/redo operation.
- **void drawtext (int, int, int, int)**
  Draws the text in the passed bounding box.
- **void drawtext (int, int, int, int, bool draw_active)**
  Draws the text in the passed bounding box.
- **void handle_mouse (int, int, int, int, int keepmark=0)**
  Handles mouse clicks and mouse moves.
- **int handletext (int e, int, int, int, int)**
  Handles all kinds of text field related events.
- **int line_end (int i) const**
  Finds the end of a line.
- **int line_start (int i) const**
  Finds the start of a line.
- **int linesPerPage ()**
- **void maybe_do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
- **int up_down_position (int, int keepmark=0)**
  Moves the cursor to the column given by up_down_pos.
- **int word_end (int i) const**
  Finds the end of a word.
- **int word_start (int i) const**
  Finds the start of a word.
- **int xscroll () const**
- **int yscroll () const**
- **void yscroll (int yOffset)**
Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget's label at the defined label position.

• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

• unsigned int flags () const
  Gets the widget flags mask.

• void h (int v)
  Internal use only.

• void set_flag (unsigned int c)
  Sets a flag in the flags mask.

• void w (int v)
  Internal use only.

• void x (int v)
  Internal use only.

• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.

• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

11.75.1 Detailed Description

This class provides a low-overhead text input field. This is a virtual base class below Fl_Input. It has all the same interfaces, but lacks the handle() and draw() method. You may want to subclass it if you are one of those people who likes to change how the editing keys work. It may also be useful for adding scrollbars to the input field. This can act like any of the subclasses of Fl_Input, by setting type() to one of the following values:

- #define FL_NORMAL_INPUT 0
- #define FL_FLOAT_INPUT 1
- #define FL_INT_INPUT 2
- #define FL_MULTILINE_INPUT 4
- #define FL_SECRET_INPUT 5
- #define FL_INPUT_TYPE 7
- #define FL_INPUT_READONLY 8
- #define FL_NORMAL_OUTPUT (FL_NORMAL_INPUT | FL_INPUT_READONLY)
- #define FL_FLOAT_OUTPUT (FL_FLOAT_INPUT | FL_INPUT_READONLY)
- #define FL_INT_OUTPUT (FL_INT_INPUT | FL_INPUT_READONLY)
- #define FL_MULTILINE_OUTPUT (FL_MULTILINE_INPUT | FL_INPUT_READONLY)
- #define FL_SECRET_OUTPUT (FL_SECRET_INPUT | FL_INPUT_READONLY)
- #define FL_INPUT_WRAP 16
- #define FL_MULTILINE_INPUT_WRAP (FL_MULTILINE_INPUT | FL_INPUT_READONLY | FL_INPUT_WRAP)
- #define FL_MULTILINE_OUTPUT_WRAP (FL_MULTILINE_INPUT | FL_INPUT_READONLY | FL_INPUT_WRAP)

All variables that represent an index into a text buffer are byte-oriented, not character oriented, counting from 0 (at or before the first character) to size() (at the end of the buffer, after the last byte). Since UTF-8 characters can be up to six bytes long, simply incrementing such an index will not reliably advance to the next character in the text buffer. Indices and pointers into the text buffer should always point at a 7 bit ASCII character or the beginning of a UTF-8 character sequence. Behavior for false UTF-8 sequences and pointers into the middle of a sequence are undefined.

Fl_Text_Display, Fl_Text_Editor for more powerful text handling widgets

11.75.2 Constructor & Destructor Documentation

11.75.2.1 Fl_Input()

Fl_Input_::Fl_Input_ ( int X, int Y, int W, int H, const char * l = 0 )

Creates a new Fl_Input_ widget.
This function creates a new Fl_Input_ widget and adds it to the current Fl_Group. The value() is set to NULL. The default boxtype is FL_DOWN_BOX.

Parameters

| X, Y, W, H | the dimensions of the new widget |

Generated by Doxygen
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>l</code></td>
<td>an optional label text</td>
</tr>
</tbody>
</table>

### 11.75.2.2 \texttt{\textasciitilde \textasciitilde Fl\_Input\_()} \texttt{\textasciitilde \textasciitilde Fl\_Input\_()}(

Destroys the widget. The destructor clears all allocated buffers and removes the widget from the parent \texttt{Fl\_Group}.

### 11.75.3 Member Function Documentation

#### 11.75.3.1 append()

\texttt{int \texttt{Fl\_Input\_}::append (const char * \texttt{t},
\hspace{1em} \texttt{int} \texttt{l = 0},
\hspace{1em} \texttt{char keep\_selection = 0})}

Append text at the end.
This function appends the string in \texttt{t} to the end of the text. It does not moves the new position or mark.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>t</code></td>
<td>text that will be appended</td>
</tr>
<tr>
<td><code>l</code></td>
<td>length of text, or 0 if the string is terminated by nul.</td>
</tr>
<tr>
<td><code>keep_selection</code></td>
<td>if this is 1, the current text selection will remain, if 0, the cursor will move to the end of the inserted text.</td>
</tr>
</tbody>
</table>

Returns

0 if no text was appended

#### 11.75.3.2 apply_undo()

\texttt{int \texttt{Fl\_Input\_}::apply\_undo ( ) [protected]}

Apply the current undo/redo operation.
It's up to \texttt{undo()} and \texttt{redo()} to push and pop actions to and from the lists.

Returns

1 if the current action changed any text.

See also

\texttt{undo()}, \texttt{redo()}

#### 11.75.3.3 can_redo()

\texttt{bool \texttt{Fl\_Input\_}::can\_redo ( ) const}

Check if there is a redo action available.

Returns

true if the widget can redo the last undo action
11.75.3.4 can_undo()

bool Fl_Input_::can_undo ( ) const
Check if the last operation can be undone.

Returns

true if the widget can undo the last change

11.75.3.5 copy()

int Fl_Input_::copy ( int clipboard )
Put the current selection into the clipboard.
This function copies the current selection between mark() and position() into the specified clipboard. This does not replace the old clipboard contents if position() and mark() are equal. Clipboard 0 maps to the current text selection and clipboard 1 maps to the cut/paste clipboard.

Parameters

| clipboard | the clipboard destination 0 or 1 |

Returns

0 if no text is selected, 1 if the selection was copied

See also

Fl::copy(const char *, int, int)

11.75.3.6 copy_cuts()

int Fl_Input_::copy_cuts ( )
Copies the yank buffer to the clipboard.
This method copies all the previous contiguous cuts from the undo information to the clipboard. This function implements the ^K shortcut key.

Returns

0 if the operation did not change the clipboard

See also

copy(int), cut

11.75.3.7 cursor_color() [1/2]

Fl_Color Fl_Input_::cursor_color ( ) const [inline]
Gets the color of the cursor.

Returns

the current cursor color

11.75.3.8 cursor_color() [2/2]

void Fl_Input_::cursor_color ( Fl_Color n ) [inline]
Sets the color of the cursor.
The default color for the cursor is FL_BLACK.
### 11.75.3.9 cut() [1/3]

```cpp
int Fl_Input_::cut ( ) [inline]
```

Deletes the current selection.
This function deletes the currently selected text without storing it in the clipboard. To use the clipboard, you may call `copy()` first or `copy_cuts()` after this call.

Returns
0 if no data was copied

### 11.75.3.10 cut() [2/3]

```cpp
int Fl_Input_::cut ( int a, int b ) [inline]
```

Deletes all characters between index `a` and `b`.
This function deletes the currently selected text without storing it in the clipboard. To use the clipboard, you may call `copy()` first or `copy_cuts()` after this call.

Parameters
- `a,b` range of bytes rounded to full characters and clamped to the buffer

Returns
0 if no data was copied

### 11.75.3.11 cut() [3/3]

```cpp
int Fl_Input_::cut ( int n ) [inline]
```

Deletes the next `n` bytes rounded to characters before or after the cursor.
This function deletes the currently selected text without storing it in the clipboard. To use the clipboard, you may call `copy()` first or `copy_cuts()` after this call.

Parameters
- `n` number of bytes rounded to full characters and clamped to the buffer. A negative number will cut characters to the left of the cursor.

Returns
0 if no data was copied

### 11.75.3.12 drawtext() [1/2]

```cpp
void Fl_Input_::drawtext ( int X, int Y, int W, int H ) [protected]
```

Generated by Doxygen
Draws the text in the passed bounding box. If `damage() & FL_DAMAGE_ALL` is true, this assumes the area has already been erased to `color()`. Otherwise it does minimal update and erases the area itself.

**Parameters**

- X, Y, W, H: area that must be redrawn

### 11.75.3.13 `drawtext()` [2/2]

```cpp
void Fl_Input_::drawtext ( int X, int Y, int W, int H, bool draw_active ) [protected]
```

Draws the text in the passed bounding box. This version of `drawtext` allows the user to control whether the widget is drawn as active, i.e. with the text cursor, or inactive. This is useful for compound widgets where the input should be shown as active when actually the container widget is the active one.

A caller should not draw the widget with `active` set if another text widget may indeed be the active widget.

**Parameters**

- X, Y, W, H: area that must be redrawn
- draw_active: if set, the cursor will be drawn, even if the widget is not active

See also

- `Fl_Input_::drawtext(int X, int Y, int W, int H)`

### 11.75.3.14 `dvalue()`

```cpp
double Fl_Input_::dvalue ( ) const
```

Returns the widget text interpreted as a floating point number.

Returns

- double precision floating point value

See also

- `Fl_Input_::ivalue()`
- `Fl_Input_::value(double)`

### 11.75.3.15 `handle_mouse()`

```cpp
void Fl_Input_::handle_mouse ( int X, int Y, int , int , int drag = 0 ) [protected]
```

Handles mouse clicks and mouse moves.

Todo Add comment and parameters
11.75.3.16 handletext()

```cpp
int Fl_Input_::handletext (  
    int event,  
    int X,  
    int Y,  
    int W,  
    int H ) [protected]
```
Handles all kinds of text field related events. This is called by derived classes.

**Todo** Add comment and parameters

11.75.3.17 index()

```cpp
unsigned int Fl_Input_::index (  
    int i ) const
```
Returns the character at index $i$. This function returns the UTF-8 character at $i$ as a ucs4 character code.

**Parameters**

| in | i | index into the value field |

**Returns**

the character at index $i$

11.75.3.18 input_type() [1/2]

```cpp
int Fl_Input_::input_type ( ) const [inline]
```
Gets the input field type.

**Returns**

the current input type

11.75.3.19 input_type() [2/2]

```cpp
void Fl_Input_::input_type (  
    int t ) [inline]
```
Sets the input field type. A `redraw()` is required to reformat the input field.

**Parameters**

| in | t | new input type |

11.75.3.20 insert()

```cpp
int Fl_Input_::insert (  
    const char * t,  
    int l = 0 ) [inline]
```
Inserts text at the cursor position. This function inserts the string in `t` at the cursor `position()` and moves the new position and mark to the end of the inserted text.
11.75 Fl_Input_ Class Reference

Parameters

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>text that will be inserted</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>t</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>length of text, or 0 if the string is terminated by nul.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>l</td>
<td></td>
</tr>
</tbody>
</table>

Returns

0 if no text was inserted

11.75.3.21 insert_position() [1/3]

int Fl_Input_::insert_position ( ) const [inline]

Gets the position of the text cursor.

Returns

the cursor position as an index in the range 0..size()

See also

insert_position(int, int)

11.75.3.22 insert_position() [2/3]

int Fl_Input_::insert_position ( int p ) [inline]

Sets the cursor position and mark. position(n) is the same as position(n, n).

Parameters

| p  | new index for cursor and mark |

Returns

0 if no positions changed

See also

insert_position(int, int), insert_position(), mark(int)

11.75.3.23 insert_position() [3/3]

int Fl_Input_::insert_position ( int p, int m )

Sets the index for the cursor and mark. The input widget maintains two pointers into the string. The position (p) is where the cursor is. The mark (m) is the other end of the selected text. If they are equal then there is no selection. Changing this does not affect the clipboard (use copy() to do that). Changing these values causes a redraw(). The new values are bounds checked.

Parameters

<table>
<thead>
<tr>
<th>p</th>
<th>index for the cursor position</th>
</tr>
</thead>
<tbody>
<tr>
<td>m</td>
<td>index for the mark</td>
</tr>
</tbody>
</table>
Returns

0 if no positions changed

See also

position(int), position(), mark(int)

11.75.3.24 `ivalue()`

```cpp
int Fl_Input_::ivalue ( ) const
```

Returns the widget text interpreted as a signed integer.

Returns

signed integer value

See also

`Fl_Input_::dvalue()`
`Fl_Input_::value(int)`

11.75.3.25 `line_end()`

```cpp
int Fl_Input_::line_end (int i ) const [protected]
```

Finds the end of a line.
This call calculates the end of a line based on the given index i.

Parameters

in | i  | starting index for the search

Returns

end of the line

11.75.3.26 `line_start()`

```cpp
int Fl_Input_::line_start (int i ) const [protected]
```

Finds the start of a line.
This call calculates the start of a line based on the given index i.

Parameters

in | i  | starting index for the search

Returns

start of the line

11.75.3.27 `mark()` [1/2]

```cpp
int Fl_Input_::mark ( ) const [inline]
```

Gets the current selection mark.
11.75 Fl_Input_ Class Reference

Returns

index into the text

11.75.3.28 mark() [2/2]

int Fl_Input_::mark (  
  int m ) [inline]

Sets the current selection mark.  
mark(n) is the same as insert_position(insert_position(),n).

Parameters

| m | new index of the mark |

Returns

0 if the mark did not change

See also

insert_position(), insert_position(int, int)

11.75.3.29 maximum_size() [1/2]

int Fl_Input_::maximum_size ( ) const [inline]

Gets the maximum length of the input field in characters.

See also

maximum_size(int).

11.75.3.30 maximum_size() [2/2]

void Fl_Input_::maximum_size (  
  int m ) [inline]

Sets the maximum length of the input field in characters.  
This limits the number of characters that can be inserted in the widget.  
Since FLTK 1.3 this is different than the buffer size, since one character can be more than one byte in UTF-8 encoding.  In FLTK 1.1 this was the same (one byte = one character).

11.75.3.31 position() [1/3]

int Fl_Input_::position ( ) const [inline]

 Deprecated "in 1.4.0 - use insert_position() instead"

11.75.3.32 position() [2/3]

int Fl_Input_::position (  
  int p ) [inline]

 Deprecated "in 1.4.0 - use insert_position(p) instead"
11.75.3.33  position() [3/3]

```cpp
int Fl_Input_::position (  
    int p,  
    int m  ) [inline]
```

**Deprecated**  "in 1.4.0 - use insert_position(p, m) or Fl_Widget::position(x, y) instead"

11.75.3.34  readonly() [1/2]

```cpp
int Fl_Input_::readonly ( ) const [inline]
```

Gets the read-only state of the input field.

*Returns*

- non-zero if this widget is read-only

11.75.3.35  readonly() [2/2]

```cpp
void Fl_Input_::readonly (   
    int b  ) [inline]
```

Sets the read-only state of the input field.

*Parameters*

```
<table>
<thead>
<tr>
<th>in</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>if b is 0, the text in this widget can be edited by the user</td>
<td></td>
</tr>
</tbody>
</table>
```

11.75.3.36  redo()

```cpp
int Fl_Input_::redo ( )
```

Redo previous undo operation.

This call reapplies previously executed undo operations.

*Returns*

- non-zero if any change was made.

11.75.3.37  replace()

```cpp
int Fl_Input_::replace (  
    int b,  
    int e,  
    const char ∗ text,  
    int ilen = 0  )
```

Deletes text from b to e and inserts the new string text.

All changes to the text buffer go through this function. It deletes the region between b and e (either one may be less or equal to the other), then inserts the string text at that point and moves the mark() and position() to the end of the insertion. Does the callback if when() & FL_WHEN_CHANGED and there is a change.

Set b and e equal to not delete anything. Set text to NULL to not insert anything.

ilen can be zero or strlen(text), which saves a tiny bit of time if you happen to already know the length of the insertion, or can be used to insert a portion of a string. If ilen is zero, strlen(text) is used instead. b and e are clamped to the 0..size() range, so it is safe to pass any values. b, e, and ilen are used as numbers of bytes (not characters), where b and e count from 0 to size() (end of buffer).

If b and/or e don't point to a valid UTF-8 character boundary, they are adjusted to the previous (b) or the next (e) valid UTF-8 character boundary, resp..

If the current number of characters in the buffer minus deleted characters plus inserted characters in text would overflow the number of allowed characters (maximum_size()), then only the first characters of the string are inserted, so that maximum_size() is not exceeded.
cut() and insert() are just inline functions that call replace().

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>(b)</th>
<th>beginning index of text to be deleted</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>(e)</td>
<td>ending index of text to be deleted and insertion position</td>
</tr>
<tr>
<td>in</td>
<td>(text)</td>
<td>string that will be inserted</td>
</tr>
<tr>
<td>in</td>
<td>(ilen)</td>
<td>length of text or 0 for null terminated strings</td>
</tr>
</tbody>
</table>

Returns

0 if nothing changed

Note

If text does not point to a valid UTF-8 character or includes invalid UTF-8 sequences, the text is inserted nevertheless (counting invalid UTF-8 bytes as one character each).

11.75.3.38 resize()

```cpp
void Fl_Input_::resize (int \(X\), \(Y\), \(W\), \(H\)) [virtual]
```

Changes the size of the widget.
This call updates the text layout so that the cursor is visible.

Parameters

| in  | \(X, Y, W, H\) | new size of the widget |

See also

Fl_Widget::resize(int, int, int)

Reimplemented from Fl_Widget.

11.75.3.39 shortcut() [1/2]

```cpp
int Fl_Input_::shortcut () const [inline]
```

Return the shortcut key associated with this widget.

Returns

shortcut keystroke

See also

Fl_Button::shortcut()

11.75.3.40 shortcut() [2/2]

```cpp
void Fl_Input_::shortcut (int \(s\)) [inline]
```

Sets the shortcut key associated with this widget.
Pressing the shortcut key gives text editing focus to this widget.
Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td><code>s</code></td>
<td>new shortcut keystroke</td>
</tr>
</tbody>
</table>

See also

`Fl_Button::shortcut()`

### 11.75.3.41 size() [1/2]

```cpp
int Fl_Input_::size ( ) const [inline]
```

Returns the number of bytes in `value()`.

This may be greater than `strlen(value())` if there are null characters in the text.

**Returns**

number of bytes in the text

### 11.75.3.42 size() [2/2]

```cpp
void Fl_Input_::size ( int W, int H ) [inline]
```

Sets the width and height of this widget.

**Parameters**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td><code>W,H</code></td>
<td>new width and height</td>
</tr>
</tbody>
</table>

See also

`Fl_Widget::size(int, int)`

### 11.75.3.43 static_value() [1/2]

```cpp
int Fl_Input_::static_value ( const char * str )
```

Changes the widget text.

This function changes the text and sets the mark and the point to the end of it. The string is not copied. If the user edits the string it is copied to the internal buffer then. This can save a great deal of time and memory if your program is rapidly changing the values of text fields, but this will only work if the passed string remains unchanged until either the `Fl_Input` is destroyed or `value()` is called again.

**Parameters**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td><code>str</code></td>
<td>the new text</td>
</tr>
</tbody>
</table>

**Returns**

non-zero if the new value is different than the current one

### 11.75.3.44 static_value() [2/2]

```cpp
int Fl_Input_::static_value ( const char * str, int len )
```

Generated by Doxygen
Changes the widget text. This function changes the text and sets the mark and the point to the end of it. The string is *not* copied. If the user edits the string it is copied to the internal buffer then. This can save a great deal of time and memory if your program is rapidly changing the values of text fields, but this will only work if the passed string remains unchanged until either the `Fl_Input` is destroyed or `value()` is called again.

You can use the `len` parameter to directly set the length if you know it already or want to put null characters in the text.

**Parameters**

<table>
<thead>
<tr>
<th>in <code>str</code></th>
<th>the new text</th>
</tr>
</thead>
<tbody>
<tr>
<td>in <code>len</code></td>
<td>the length of the new text</td>
</tr>
</tbody>
</table>

**Returns**

non-zero if the new value is different than the current one

### 11.75.3.45 `tab_nav()` [1/2]

```cpp
int Fl_Input_::tab_nav ( ) const [inline]
```

Gets whether the Tab key causes focus navigation in multiline input fields or not. If enabled (default), hitting Tab causes focus navigation to the next widget. If disabled, hitting Tab inserts a tab character into the text field.

**Returns**

1 if Tab advances focus (default), 0 if Tab inserts tab characters.

**See also**

`tab_nav(int), Fl::OPTION_ARROW_FOCUS`.

### 11.75.3.46 `tab_nav()` [2/2]

```cpp
void Fl_Input_::tab_nav ( int val ) [inline]
```

Sets whether the Tab key does focus navigation, or inserts tab characters into `Fl_Multiline_Input`. By default this flag is enabled to provide the 'normal' behavior most users expect; Tab navigates focus to the next widget. To inserting an actual Tab character, users can use Ctrl-I or copy/paste. Disabling this flag gives the old FLTK behavior where Tab inserts a tab character into the text field, in which case only the mouse can be used to navigate to the next field.

**History:** This flag was provided for backwards support of FLTK's old 1.1.x behavior where Tab inserts a tab character instead of navigating focus to the next widget. This behavior was unique to `Fl_Multiline_Input`. With the advent of `Fl_Text_Editor`, this old behavior has been deprecated.

**Parameters**

| in `val` | If `val` is 1, Tab advances focus (default). If `val` is 0, Tab inserts a tab character (old FLTK behavior). |

**See also**

`tab_nav(), Fl::OPTION_ARROW_FOCUS`.

### 11.75.3.47 `textcolor()` [1/2]

```cpp
Fl_Color Fl_Input_::textcolor ( ) const [inline]
```

Gets the color of the text in the input field.
Returns

the text color

See also

textcolor(Fl_Color)

11.75.3.48  textcolor()  [2/2]

void Fl_Input_::textcolor ( Fl_Color n ) [inline]
Sets the color of the text in the input field.
The text color defaults to FL_FOREGROUND_COLOR.

Parameters

in  n  new text color

See also

textcolor()

11.75.3.49  textfont()  [1/2]

Fl_Font Fl_Input_::textfont ( ) const [inline]
Gets the font of the text in the input field.

Returns

the current Fl_Font index

11.75.3.50  textfont()  [2/2]

void Fl_Input_::textfont ( Fl_Font s ) [inline]
Sets the font of the text in the input field.
The text font defaults to FL_HELVETICA.

Parameters

in  s  the new text font

11.75.3.51  textsize()  [1/2]

Fl_Fontsize Fl_Input_::textsize ( ) const [inline]
Gets the size of the text in the input field.

Returns

the text height in pixels

11.75.3.52  textsize()  [2/2]

void Fl_Input_::textsize ( Fl_Fontsize s ) [inline]
Sets the size of the text in the input field.
The text height defaults to `FL_NORMAL_SIZE`. 
Parameters

| in  | s   | the new font height in pixel units |

11.75.3.53  undo()

int Fl_Input_::undo ( )
Undoes previous changes to the text buffer.
This call undoes a number of previous calls to replace().
Returns
non-zero if any change was made.

11.75.3.54  up_down_position()

int Fl_Input_::up_down_position ( int i,
int keepmark = 0 ) [protected]
Moves the cursor to the column given by up_down_pos.
This function is helpful when implementing up and down cursor movement. It moves the cursor from the beginning
of a line to the column indicated by the global variable up_down_pos in pixel units.
Parameters

| in  | i   | index into the beginning of a line of text |
|     | in  | keepmark | if set, move only the cursor, but not the mark |

Returns
index to new cursor position

11.75.3.55  value() [1/5]

const char * Fl_Input_::value ( ) const [inline]
Returns the text displayed in the widget.
This function returns the current value, which is a pointer to the internal buffer and is valid only until the next event
is handled.
Returns
pointer to an internal buffer - do not free() this
See also
Fl_Input_::value(const char*)

11.75.3.56  value() [2/5]

int Fl_Input_::value ( const char * str )
Changes the widget text.
This function changes the text and sets the mark and the point to the end of it. The string is copied to the internal
buffer. Passing NULL is the same as " ".

Generated by Doxygen
Parameters

| in | str | the new text |

Returns

non-zero if the new value is different than the current one

See also

Fl_Input_::value(const char * str, int len), Fl_Input_::value()

11.75.3.57 value() [3/5]

int Fl_Input_::value (const char * str, int len)

Changes the widget text. This function changes the text and sets the mark and the point to the end of it. The string is copied to the internal buffer. Passing NULL is the same as "". You can use the length parameter to directly set the length if you know it already or want to put null characters in the text.

Parameters

| in | str | the new text |
| in | len | the length of the new text |

Returns

non-zero if the new value is different than the current one

See also

Fl_Input_::value(const char * str), Fl_Input_::value()

11.75.3.58 value() [4/5]

int Fl_Input_::value (double v)

Changes the widget text to a floating point number (\texttt{\%g}).

Parameters

| in | v | the new value |

Returns

non-zero if the new value is different than the current one

See also

Fl_Input_::value(const char * str), Fl_Input_::ivalue()

11.75.3.59 value() [5/5]

int Fl_Input_::value (int v)
Changes the widget text to a signed integer number.

**Parameters**

| in  | v   | the new value |

**Returns**

non-zero if the new value is different than the current one

**See also**

Fl_Input_::value(const char*, Fl_Input_::ivalue())

### 11.75.3.60 word_end()

```cpp
int Fl_Input_::word_end (const int i) const [protected]
```

Finds the end of a word.
Returns the index after the last byte of a word. If the index is already at the end of a word, it will find the end of the following word, so if you call it repeatedly you will move forwards to the end of the text.
Note that this is inconsistent with line_end().

**Parameters**

| in  | i   | starting index for the search |

**Returns**

end of the word

### 11.75.3.61 word_start()

```cpp
int Fl_Input_::word_start (const int i) const [protected]
```

Finds the start of a word.
Returns the index of the first byte of a word. If the index is already at the beginning of a word, it will find the beginning of the previous word, so if you call it repeatedly you will move backwards to the beginning of the text.
Note that this is inconsistent with line_start().

**Parameters**

| in  | i   | starting index for the search |

**Returns**

start of the word, or previous word

### 11.75.3.62 wrap () [1/2]

```cpp
int Fl_Input_::wrap () const [inline]
```

Gets the word wrapping state of the input field.
Word wrap is only functional with multi-line input fields.

### 11.75.3.63 wrap () [2/2]

```cpp
void Fl_Input_::wrap (const void *
```
Sets the word wrapping state of the input field.
Word wrap is only functional with multi-line input fields.
The documentation for this class was generated from the following files:

- Fl_Input_H
- Fl_Input_cxx

### 11.76 Fl_Input_Choice Class Reference

A combination of the input widget and a menu button.

Inheritance diagram for Fl_Input_Choice:

```
Fl_Widget

Fl_Group

Fl_Input_Choice
```

**Public Member Functions**

- **void** add (const char *s)
  
  Adds an item to the menu.
- **int** changed () const
  
  Returns the combined changed() state of the input and menu button widget.
- **void** clear ()
  
  Removes all items from the menu.
- **void** clear_changed ()
  
  Clears the changed() state of both input and menu button widgets.
- **Fl_Boxtype** down_box () const
  
  Gets the box type of the menu button.
- **void** down_box (Fl_Boxtype b)
  
  Sets the box type of the menu button.
- **Fl_Input_Choice** (int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Input_Choice widget using the given position, size, and label string.
- **Fl_Input * input ()**
  
  Returns a pointer to the internal Fl_Input widget.
- **const Fl_Menu_Item * menu ()**
  
  Gets the Fl_Menu_Item array used for the menu.
- **void** menu (const Fl_Menu_Item *m)
  
  Sets the Fl_Menu_Item array used for the menu.
- **Fl_Menu_Button * menubutton ()**
  
  Returns a pointer to the internal Fl_Menu_Button widget.
- **void** resize (int X, int Y, int W, int H) FL_OVERRIDE
  
  Resizes the Fl_Input_Choice widget.
- **void** set_changed ()
  
  Sets the changed() state of both input and menu button widgets to the specified value.
- **Fl_Color** textcolor () const
  
  Gets the Fl_Input text field's text color.
- **void** textcolor (Fl_Color c)
Sets the Fl_Input text field's text color to c.

- **Fl_Font textfont ()** const
  
  Gets the Fl_Input text field's font style.

- **void textfont (Fl_Font f)**
  
  Sets the Fl_Input text field's font style to f.

- **Fl_Fontsize textsize ()** const
  
  Gets the Fl_Input text field's font size.

- **void textsize (Fl_Fontsize s)**
  
  Sets the Fl_Input text field's font size to s.

- **int update_menubutton ()**
  
  Updates the menubutton with the string value in Fl_Input.

- **const char * value ()** const
  
  Returns the Fl_Input text field's current contents.

- **void value (const char *val)**
  
  Sets the Fl_Input text field's contents to val.

- **void value (int val)**
  
  Chooses item val in the menu, and sets the Fl_Input text field to that value.

### Public Member Functions inherited from Fl_Group

- **Fl_Widget * _ddfdesign_kludge ()**
  This is for forms compatibility only.

- **void add (Fl_Widget &)**
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void add (Fl_Widget *o)**
  
  See void Fl_Group::add(Fl_Widget &w)

- **void add_resizable (Fl_Widget &o)**
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget *const * array ()** const
  
  Returns a pointer to the array of children.

- **Fl_Group *as_group ()** const
  FL_OVERRIDE
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin ()**
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget * child (int n) const**
  
  Returns array()[n].

- **int children () const**
  
  Returns how many child widgets the group has.

- **void clear ()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()**
  
  Returns the current clipping mode.

- **void clip_children (int c)**
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child (int n)**
  
  Removes the widget at index from the group and deletes it.

- **void end ()**
  
  Exactly the same as current(this->parent()).

- **int find (const Fl_Widget &o) const**
  
  See int Fl_Group::find(const Fl_Widget *w) const.
• int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
• Fl_Group (int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.
• void focus (Fl_Widget * W)
• void forms_end ()
  This is for forms compatibility only.
• int handle (int) FL_OVERRIDE
  Handles the specified event.
• void init_sizes ()
  Resets the internal array of widget sizes and positions.
• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
• void insert (Fl_Widget &o, Fl_Widget * before)
  This does insert(w, find(before)).
• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
• void remove (Fl_Widget *o)
  Removes the widget o from the group.
• void remove (int index)
  Removes the widget at index from the group but does not delete it.
• Fl_Widget * resizable () const
  Returns the group's resizable widget.
• void resizable (Fl_Widget &o)
  Sets the group's resizable widget.
• void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget
• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
- **int contains** (const Fl_Widget *w) const
  Checks if w is a child of this widget.
- **void copy_label** (const char *new_label)
  Sets the current label.
- **void copy_tooltip** (const char *text)
  Sets the current tooltip text.
- **uchar damage** () const
  Returns non-zero if draw() needs to be called.
- **void damage** (uchar c)
  Sets the damage bits for the widget.
- **void damage** (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
- **int damage_resize** (int, int, int, int)
  Internal use only.
- **void deactivate** ()
  Deactivates the widget.
- **Fl_Image *deimage** ()
  Gets the image that is used as part of the widget label when in the inactive state.
- **const Fl_Image *deimage** () const
  Gets the image that is used as part of the widget label when in the inactive state.
- **void deimage** (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
- **void deimage** (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- **int deimage_bound** () const
  Returns whether the inactive image is managed by the widget.
- **void do_callback** (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
- **void do_callback** (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
- **void do_callback** (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
- **void draw_label** (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- **int h** () const
  Gets the widget height.
- **virtual void hide** ()
  Makes a widget invisible.
- **Fl_Image *image** ()
  Gets the image that is used as part of the widget label when in the active state.
- **const Fl_Image *image** () const
  Gets the image that is used as part of the widget label when in the active state.
- **void image** (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
- **void image** (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
- **int image_bound** () const
  Returns whether the image is managed by the widget.
- **int inside** (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
- **int is_label_copied** () const
Returns whether the current label was assigned with `copy_label()`.

- **const char ∗ label () const**
  
  Gets the current label text.

- **void label (const char ∗text)**
  
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char ∗b)**
  
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  
  Sets the label color.

- **Fl_Font labelfont () const**
  
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width `ww` and height `hh` accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group ∗ parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group ∗p)**
  
  Internal use only - “for hacks only”.

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '\&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '\&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '\&x' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
Sets the flags used to decide when a callback is called.

- `Fl_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- virtual `~Fl_Widget ()`
  Destroys the widget.

Protected Member Functions

- virtual int `inp_h () const`
  See `inp_x()` for info.

- virtual int `inp_w () const`
  See `inp_x()` for info.

- virtual int `inp_x () const`
  The methods `inp_x()`, `inp_y()`, `inp_w()` and `inp_h()` return the desired position and size of the internal `Fl_Input` widget.

- virtual int `inp_y () const`
  See `inp_x()` for info.

- virtual int `menu_h () const`
  See `menu_x()` for info.

- virtual int `menu_w () const`
  See `menu_x()` for info.

- virtual int `menu_x () const`
  The methods `menu_x()`, `menu_y()`, `menu_w()` and `menu_h()` return the desired position and size of the internal `Fl_Menu_Button` widget.

- virtual int `menu_y () const`
  See `menu_x()` for info.

Protected Member Functions inherited from `Fl_Group`

- `Fl_Rect * bounds ()`
  Returns the internal array of widget sizes and positions.

- void `draw ()` `FL_OVERRIDE`
  Draws the widget.

- void `draw_child (Fl_Widget &widget) const`
  Forces a child to redraw.

- void `draw_children ()`
  Draws all children of the group.

- void `draw_outside_label` (const `Fl_Widget` &widget) const
  Parents normally call this to draw outside labels of child widgets.

- virtual int `on_insert` (`Fl_Widget *`, int)
  Allow derived groups to act when a widget is added as a child.

- virtual int `on_move` (int, int)
  Allow derived groups to act when a widget is moved within the group.

- virtual void `on_remove` (int)
  Allow derived groups to act when a child widget is removed from the group.

- int * `sizes ()`
  Returns the internal array of widget sizes and positions.

- void `update_child` (`Fl_Widget` &widget) const
  Draws a child only if it needs it.
Protected Member Functions inherited from Fl_Widget

- void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

- void **draw_backdrop** () const
  
  If FLALIGNIMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box** () const
  
  Draws the widget box according its box style.

- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  
  Draws the widget's label at the defined label position.

- void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

- unsigned int **flags** () const
  
  Gets the widget flags mask.

- void **h** (int v)
  
  Internal use only.

- void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

- void **w** (int v)
  
  Internal use only.

- void **x** (int v)
  
  Internal use only.

- void **y** (int v)
  
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group ∗current ()
  
  Returns the currently active group.

- static void current (Fl_Group ∗g)
  
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don't set a callback.

- static unsigned int labelShortcut (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int testShortcut (const char ∗, const bool require_alt=false)
  
  Returns true if the given text contains the entered '&x' shortcut.

flags possible values enumeration.

11.76.1 Detailed Description

A combination of the input widget and a menu button.

![Figure 11.25 Fl_Input_Choice widget](image)

The user can either type into the input area, or use the menu button chooser on the right to choose an item which loads the input area with the selected text.

The application can directly access both the internal Fl_Input and Fl_Menu_Button widgets respectively using the input() and menubutton() accessor methods.

The default behavior is to invoke the Fl_Input_Choice::callback() if the user changes the input field’s contents, either by typing, pasting, or clicking a different item in the choice menu.

The callback can determine if an item was picked vs. typing into the input field by checking the value of menubutton()->changed(), which will be:

- 1: the user picked a different item in the choice menu
- 0: the user typed or pasted directly into the input field

Example Use of Fl_Input_Choice

```c
#include <stdio.h>
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Input_Choice.H>

// Fl_Input_Choice callback()
void choice_cb(Fl_Widget *w, void *userdata) {
  // Show info about the picked item
  Fl_Input_Choice *choice = (Fl_Input_Choice*)w;
  printf("*** Choice Callback: \n");
  printf(" widget's text value='%s'\n", choice->value()); // normally all you need
  // Access the menu via menubutton()...
  printf(" item label()='%s'\n", item ? item->label() : "(No item)");
  printf(" input value()='%s'\n", choice->input()->value());
  printf(" The user %s\n", choice->menubutton()->changed()
    ? "picked a menu item"
    : "typed text");
}

int main() {
  Fl_Double_Window win(200,100,"Input Choice");
  win.begin();
  Fl_Input_Choice choice(10,10,100,30);
```
### 11.76 Fl_Input_Choice Class Reference

```cpp
choice.callback(choice_cb, 0);
choice.add("Red");
choice.add("Orange");
choice.add("Yellow");
//choice.value("Red"); // uncomment to make "Red" default
win.end();
win.show();
return Fl::run();
```
11.76.3.2 inp_x()

virtual int Fl_Input_Choice::inp_x () const [inline], [protected], [virtual]
The methods inp_x(), inp_y(), inp_w() and inp_h() return the desired position and size of the internal Fl_Input widget. These can be overridden by a subclass to redefine positioning. See code example in the Description for subclassing details.

11.76.3.3 input()

Fl_Input * Fl_Input_Choice::input ( ) [inline]
Returns a pointer to the internal Fl_Input widget. This can be used to directly access all of the Fl_Input widget's methods.

11.76.3.4 menu_x()

virtual int Fl_Input_Choice::menu_x ( ) const [inline], [protected], [virtual]
The methods menu_x(), menu_y(), menu_w() and menu_h() return the desired position and size of the internal Fl_Menu_Button widget. These can be overridden by a subclass to redefine positioning. See code example in the Description for subclassing details.

11.76.3.5 menubutton()

Fl_Menu_Button * Fl_Input_Choice::menubutton ( ) [inline]
Returns a pointer to the internal Fl_Menu_Button widget. This can be used to access any of the methods of the menu button, e.g.

Fl_Input_Choice * choice = new Fl_Input_Choice(100,10,120,25,"Choice: ");

// Print all the items in the choice menu
for ( int t=0; t<choice->menubutton()->size(); t++ ) {
    const Fl_Menu_Item &item = choice->menubutton()->menu()[t];
    printf("item %d -- label=%s\n", t, item.label() ? item.label() : "(Null)");
}

11.76.3.6 resize()

void Fl_Input_Choice::resize ( int X, int Y, int W, int H ) [virtual]
Resizes the Fl_Input_Choice widget. Reimplemented from Fl_Group.

11.76.3.7 update_menubutton()

int Fl_Input_Choice::update_menubutton ( )
Updates the menubutton with the string value in Fl_Input. If the string value currently in Fl_Input matches one of the menu items in menubutton(), that menu item will become the current item selected. Call this method after setting value(const char*) if you need the menubutton() to be synchronized with the Fl_Input field.

// Add items
choice->add(".25");
choice->add(".50");
choice->add("1.0");
choice->add("2.0");
choice->add("4.0");

choice->value("1.0"); // sets Fl_Input to "1.0"
choice->update_menubutton(); // cause menubutton to reflect this value too
// [returns 1 if match was found, 0 if not]

// Verify menubutton()’s value.
printf("menu button choice index=%d, value=%s\n",
    choice->menubutton()->value(), // would be -1 if update not done
    choice->menubutton()->text()); // would be NULL if update not done
Returns

1 if a matching menuitem was found and value set, 0 if not.

Version

1.4.0

11.76.3.8 value() [1/2]

void Fl_Input_Choice::value (const char * val) [inline]

Sets the Fl_Input text field's contents to val.
Note it is possible to set the value() to one that is not in the menubutton's list of choices.
Setting the value() does NOT affect the menubutton's selection. If that's needed, call update_menubutton() after setting value().

See also

void value(int val), update_menubutton()

11.76.3.9 value() [2/2]

void Fl_Input_Choice::value (int val)

Chooses item# val in the menu, and sets the Fl_Input text field to that value.
Any previous text is cleared.

See also

void value(const char *val)

The documentation for this class was generated from the following files:

• Fl_Input_Choice.H
• Fl_Input_Choice.cxx

11.77 Fl_Int_Input Class Reference

The Fl_Int_Input class is a subclass of Fl_Input that only allows the user to type decimal digits (or hex numbers of
the form 0xabcdef).
#include <Fl_Int_Input.H>

Inheritance diagram for Fl_Int_Input:

[Diagram showing inheritance hierarchy]

Public Member Functions

• Fl_Int_Input (int X, int Y, int W, int H, const char *l=0)

  Creates a new Fl_Int_Input widget using the given position, size, and label string.
Public Member Functions inherited from Fl_Input

• Fl_Input (int, int, int, int, const char ∗=0)
  Creates a new Fl_Input widget using the given position, size, and label string.
• int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Input_

• int append (const char ∗t, int l=0, char keep_selection=0)
  Append text at the end.
• bool can_redo () const
  Check if there is a redo action available.
• bool can_undo () const
  Check if the last operation can be undone.
• int copy (int clipboard)
  Put the current selection into the clipboard.
• int copy_cuts ()
  Copies the yank buffer to the clipboard.
• Fl_Color cursor_color () const
  Gets the color of the cursor.
• void cursor_color (Fl_Color n)
  Sets the color of the cursor.
• int cut ()
  Deletes the current selection.
• int cut (int a, int b)
  Deletes all characters between index a and b.
• int cut (int n)
  Deletes the next n bytes rounded to characters before or after the cursor.
• double dvalue () const
  Returns the widget text interpreted as a floating point number.
• Fl_Input_ (int, int, int, int, const char ∗=0)
  Creates a new Fl_Input_ widget.
• unsigned int index (int i) const
  Returns the character at index i.
• int input_type () const
  Gets the input field type.
• void input_type (int t)
  Sets the input field type.
• int insert (const char ∗t, int l=0)
  Inserts text at the cursor position.
• int insert_position () const
  Gets the position of the text cursor.
• int insert_position (int p)
  Sets the cursor position and mark.
• int insert_position (int p, int m)
  Sets the index for the cursor and mark.
• int ivalue () const
  Returns the widget text interpreted as a signed integer.
• int mark () const
  Gets the current selection mark.
• int mark (int m)
Sets the current selection mark.

- int maximum_size () const
  Gets the maximum length of the input field in characters.

- void maximum_size (int m)
  Sets the maximum length of the input field in characters.

- int position () const
- int position (int p)
- int position (int p, int m)
- int readonly () const
  Gets the read-only state of the input field.

- void readonly (int b)
  Sets the read-only state of the input field.

- int redo ()
  Redo previous undo operation.

- int replace (int b, int e, const char ∗text, int ilen=0)
  Deletes text from b to e and inserts the new string text.

- void resize (int, int, int, int) FL_OVERRIDE
  Changes the size of the widget.

- int shortcut () const
  Returns the shortcut key associated with this widget.

- void shortcut (int s)
  Sets the shortcut key associated with this widget.

- int size () const
  Returns the number of bytes in value().

- void size (int W, int H)
  Sets the width and height of this widget.

- int static_value (const char ∗)
  Changes the widget text.

- int static_value (const char ∗, int)
  Changes the widget text.

- int tab_nav () const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

- void tab_nav (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

- FL_Color textcolor () const
  Gets the color of the text in the input field.

- void textcolor (Fl_Color n)
  Sets the color of the text in the input field.

- FL_Font textfont () const
  Gets the font of the text in the input field.

- void textfont (FL_Font s)
  Sets the font of the text in the input field.

- FL_Fontsize textsize () const
  Gets the size of the text in the input field.

- void textsize (FL_Fontsize s)
  Sets the size of the text in the input field.

- int undo ()
  Undoes previous changes to the text buffer.

- const char ∗value () const
  Returns the text displayed in the widget.

- int value (const char ∗)
Changes the widget text.
- int value (const char *, int)
  Changes the widget text.
- int value (double value)
  Changes the widget text to a floating point number ("%g").
- int value (int value)
  Changes the widget text to a signed integer number.
- int wrap () const
  Gets the word wrapping state of the input field.
- void wrap (int b)
  Sets the word wrapping state of the input field.
- ~Fl_Input_ ()
  Destroys the widget.

Public Member Functions inherited from Fl_Widget
- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group () const
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
• void deactivate ()

Deactivates the widget.

• Fl_Image * deimage ()

Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image * deimage () const

Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)

Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image *img)

Sets the image to use as part of the widget label when in the inactive state.

• void deimage_bound () const

Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const

Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const

Gets the widget height.

• virtual void hide ()

Makes a widget invisible.

• Fl_Image * image ()

Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const

Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)

Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)

Sets the image to use as part of the widget label when in the active state.

• int image_bound () const

Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const

Checks if this widget is a child of wgt.

• int is_label_copied () const

Returns whether the current label was assigned with copy_label().

• const char * label () const

Gets the current label text.

• void label (const char *text)

Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)

Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const

Gets the label color.

• void labelcolor (Fl_Color c)

Sets the label color.

• Fl_Font labelfont () const

Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group ∗ parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group ∗ p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '!' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '!' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *s)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text contains the entered '&x' shortcut.

Static Public Attributes inherited from Fl_Input

- static const char *copy_menu_text = "Copy"
  [this text may be customized at run-time]
- static const char *cut_menu_text = "Cut"
  [this text may be customized at run-time]
- static const char *paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Input

- void draw () FL_OVERRIDE
  Draws the widget.
- int handle_key ()
  Handles a keystroke.
- int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

- int apply_undo ()
  Apply the current undo/redo operation.
- void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
- void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
- void handle_mouse (int, int, int, int keepmark=0)
Handles mouse clicks and mouse moves.

- int handleText (int e, int, int, int, int)
  Handles all kinds of text field related events.

- int line_end (int i) const
  Finds the end of a line.

- int line_start (int i) const
  Finds the start of a line.

- int linesPerPage ()

- void maybe_do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)

- int up_down_position (int, int keepmark=0)
  Moves the cursor to the column given by up_down_pos.

- int word_end (int i) const
  Finds the end of a word.

- int word_start (int i) const
  Finds the start of a word.

- int xscroll () const

- int yscroll () const

- void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- void draw_backdrop () const
  Draws the widget box according its box style.

- void draw_box (FL_Boxtype t, FL_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  Draws a focus rectangle around the widget.

- void draw_focus (FL_Boxtype t, int X, int Y , int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

11.77.1 Detailed Description
The Fl_Int_Input class is a subclass of Fl_Input that only allows the user to type decimal digits (or hex numbers of the form 0xae).

11.77.2 Constructor & Destructor Documentation

11.77.2.1 Fl_Int_Input()

Fl_Int_Input::Fl:Int:Input (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char * l = 0 )  

Creates a new Fl_Int_Input widget using the given position, size, and label string.
The default boxtype is FL_DOWN_BOX.
Inherited destructor destroys the widget and any value associated with it.
The documentation for this class was generated from the following files:
  • Fl_Int_Input.H  
  • Fl_Input.cxx

11.78 Fl_JPEG_Image Class Reference

The Fl_JPEG_Image class supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images.
#include <Fl_JPEG_Image.H>
Inheritance diagram for Fl_JPEG_Image:

```
| Fl_JPEG_Image |
| Fl_RGB_Image   |
| Fl_Image       |
```

Public Member Functions

• Fl_JPEG_Image (const char * filename)
  The constructor loads the JPEG image from the given jpeg filename.

• Fl_JPEG_Image (const char *name, const unsigned char * data, int data_length=-1)
  The constructor loads the JPEG image from memory.

Public Member Functions inherited from Fl_RGB_Image

• virtual Fl_SVG_Image * as_svg_image ()
  Returns whether an image is an Fl_SVG_Image or not.

• int cache_h ()
• int cache_w ()

Generated by Doxygen
• **void** color_average (Fl_Color c, float i) **FL_OVERRIDE**

  The **color_average()** method averages the colors in the image with the provided FLTK color value.

• **Fl_Image * copy ()** const

• **Fl_Image * copy (int W, int H)** const **FL_OVERRIDE**

  Creates a resized copy of the image.

• **void** desaturate () **FL_OVERRIDE**

  The **desaturate()** method converts an image to grayscale.

• **void** draw (int X, int Y)

• **void** draw (int X, int Y, int W, int H, int cx=0, int cy=0) **FL_OVERRIDE**

  Draws the image to the current drawing surface with a bounding box.

• **Fl_RGB_Image (const Fl_Pixmap *pxm, Fl_Color bg=FL_GRAY)**

  The constructor creates a new RGBA image from the specified Fl_Pixmap.

• **Fl_RGB_Image (const uchar *bits, int bits_length, int W, int H, int D, int LD)**

  The constructor creates a new image from the specified data.

• **Fl_RGB_Image (const uchar *bits, int W, int H, int D=3, int LD=0)**

  The constructor creates a new image from the specified data.

• **void** label (Fl_Menu_Item *m) **FL_OVERRIDE**

  This method is an obsolete way to set the image attribute of a menu item.

• **void** label (Fl_Widget *w) **FL_OVERRIDE**

  This method is an obsolete way to set the image attribute of a widget or menu item.

• **virtual void** normalize ()

  Makes sure the object is fully initialized.

• **void** uncache () **FL_OVERRIDE**

  If the image has been cached for display, delete the cache data.

• **~Fl_RGB_Image ()** **FL_OVERRIDE**

  The destructor frees all memory and server resources that are used by the image.

**Public Member Functions inherited from Fl_Image**

• **virtual class Fl_Shared_Image * as_shared_image ()**

  Returns whether an image is an Fl_Shared_Image or not.

• **Fl_Image * copy ()** const

  Creates a copy of the image in the same size.

• **int** count () const

  Returns the number of data values associated with the image.

• **int** d () const

  Returns the image depth.

• **const char *const * data ()** const

  Returns a pointer to the current image data array.

• **int** data_h () const

  Returns the height of the image data.

• **int** data_w () const

  Returns the width of the image data.

• **void** draw (int X, int Y)

  Draws the image to the current drawing surface.

• **int** fail () const

  Returns a value that is not 0 if there is currently no image available.

• **Fl_Image (int W, int H, int D)**

  The constructor creates an empty image with the specified width, height, and depth.

• **int** h () const

  Returns the current image drawing height in FLTK units.
• void inactive ()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears
grayed out.
• int ld () const
  Returns the current line data size in bytes.
• virtual void release ()
  Releases an Fl_image - the same as 'delete this'.
• virtual void scale (int width, int height, int proportional=1, int can_expand=0)
  Sets the drawing size of the image.
• int w () const
  Returns the current image drawing width in FLTK units.
• virtual ~Fl_image ()
  The destructor is a virtual method that frees all memory used by the image.

Protected Member Functions

• void load_jpg_ (const char *filename, const char *sharename, const unsigned char *data, int data_length=-1)

Protected Member Functions inherited from Fl_image

• void d (int D)
  Sets the current image depth.
• void data (const char *const *p, int c)
  Sets the current data pointer and count of pointers in the array.
• void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
• int draw_scaled (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
• void h (int H)
  Sets the height of the image data.
• void ld (int LD)
  Sets the current line data size in bytes.
• void w (int W)
  Sets the width of the image data.

Additional Inherited Members

Static Public Member Functions inherited from Fl_RGB_image

• static size_t max_size ()
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_image object.
• static void max_size (size_t size)
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_image object.

Static Public Member Functions inherited from Fl_image

• static Fl_Labeltype define_FL_IMAGE_LABEL ()
• static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
• static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
• static Fl_RGB_Scaling scaling_algorithm ()
  Gets what algorithm is used when resizing a source image to draw it.
• static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.
Public Attributes inherited from Fl_RGB_Image

- int alloc_array
  If non-zero, the object's data array is delete[]d when deleting the object.
- const uchar * array
  Points to the start of the object’s data array.

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  True after fl_register_images() was called, false before.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

11.78.1 Detailed Description

The Fl_JPEG_Image class supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images. The class supports grayscale and color (RGB) JPEG image files.

11.78.2 Constructor & Destructor Documentation

11.78.2.1 Fl_JPEG_Image()

Fl_JPEG_Image::Fl_JPEG_Image (const char * filename )

The constructor loads the JPEG image from the given jpeg filename. The inherited destructor frees all memory and server resources that are used by the image. Use Fl_Image::fail() to check if Fl_JPEG_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the JPEG format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason. If the image has loaded correctly, w(), h(), and d() should return values greater than zero.

Parameters

| in  | filename | a full path and name pointing to a valid jpeg file. |

See also

Fl_JPEG_Image::Fl_JPEG_Image(const char *imagename, const unsigned char *data)

11.78.2.2 Fl_JPEG_Image()

Fl_JPEG_Image::Fl_JPEG_Image (const char * name, const unsigned char * data, int data_length = -1 )

The constructor loads the JPEG image from memory. Construct an image from a block of memory inside the application. Fluid offers "binary Data" chunks as a great way to add image data into the C++ source code. name_png can be NULL. If a name is given, the image is added to the list of shared images (see: Fl_Shared_Image) and will be available by that name.
The inherited destructor frees all memory and server resources that are used by the image. Use Fl_IMAGE::fail() to check if Fl_JPEG_IMAGE failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the JPEG format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason. If the image has loaded correctly, w(), h(), and d() should return values greater than zero.

Parameters

<table>
<thead>
<tr>
<th>name</th>
<th>A unique name or NULL</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>A pointer to the memory location of the JPEG image</td>
</tr>
<tr>
<td>data_length</td>
<td>optional length of data. This will protect memory outside of the data array from illegal read operations</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_JPEG_IMAGE.H
- Fl_JPEG_IMAGE.cxx

11.79 Fl_Label Struct Reference

This struct stores all information for a text or mixed graphics label.

#include <Fl_Widget.H>

Public Member Functions

- void draw (int, int, int, int, Fl_Align) const
  Draws the label aligned to the given box.
- void measure (int &w, int &h) const
  Measures the size of the label.

Public Attributes

- Fl_Align align_
  alignment of label
- Fl_Color color
  text color
- Fl_Image *deimage
  optional image for a deactivated label
- Fl_Font font
  label font used in text
- Fl_Image *image
  optional image for an active label
- Fl_Fontsize size
  size of label font
- uchar type
  type of label.
- const char *value
  label text

Generated by Doxygen
11.79.1 Detailed Description

This struct stores all information for a text or mixed graphics label.

Todo There is an aspiration that the Fl_Label type will become a widget by itself. That way we will be avoiding a lot of code duplication by handling labels in a similar fashion to widgets containing text. We also provide an easy interface for very complex labels, containing html or vector graphics. However, this re-factoring is not in place in this release.

11.79.2 Member Function Documentation

11.79.2.1 draw()

```cpp
void Fl_Label::draw (
    int X,
    int Y,
    int W,
    int H,
    Fl_Align align) const
```

Draws the label aligned to the given box.
Draws a label with arbitrary alignment in an arbitrary box.

11.79.2.2 measure()

```cpp
void Fl_Label::measure (
    int & W,
    int & H) const
```

Measures the size of the label.

Parameters

| in,out | W,H | : this is the requested size for the label text plus image; on return, this will contain the size needed to fit the label |

11.79.3 Member Data Documentation

11.79.3.1 type

```cpp
uchar Fl_Label::type
```

type of label.

- fl_labeltype.cxx

11.80 Fl_Light_Button Class Reference

This subclass displays the "on" state by turning on a light, rather than drawing pushed in.
```cpp
#include <Fl_Light_Button.H>
```

Inheritance diagram for Fl_Light_Button:
Public Member Functions

- **Fl_Light_Button** (int x, int y, int w, int h, const char ∗l=0)
  Creates a new Fl_Light_Button widget using the given position, size, and label string.
- int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Button

- int clear ()
  Same as value(0).
- uchar compact ()
  Return true if buttons are rendered as compact buttons.
- void compact (uchar v)
  Decide if buttons should be rendered in compact mode.
- Fl_Boxtype down_box () const
  Returns the current down box type, which is drawn when value() is non-zero.
- void down_box (Fl_Boxtype b)
  Sets the down box type.
- Fl_Color down_color () const
  (for backwards compatibility)
- void down_color (unsigned c)
  (for backwards compatibility)
- Fl_Button (int X, int Y , int W, int H, const char ∗L=0)
  The constructor creates the button using the given position, size, and label.
- int set ()
  Same as value(1).
- void setonly ()
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).
- int shortcut () const
  Returns the current shortcut key for the button.
- void shortcut (const char ∗s)
  (for backwards compatibility)
- void shortcut (int s)
  Sets the shortcut key to s.
- char value () const
  Returns the current value of the button (0 or 1).
- int value (int v)
  Sets the current value of the button.
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
  • void _set_fullscreen ()
  • void activate ()
    Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
Checks if the widget value changed since the last callback.

- void clear_active()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output()
  Sets a widget to accept input.

- void clear_visible()
  Hides the widget.

- void clear_visible_focus()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int)
  Internal use only.

- void deactivate()
  Deactivates the widget.

- Fl_Image *deimage()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char *label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- **unsigned int output() const**
  Returns if a widget is used for output only.

- **FL_Group * parent() const**
  Returns a pointer to the parent widget.

- **void parent(FL_Group *p)**
  Internal use only - "for hacks only".

- **void position(int X, int Y)**
  Repositions the window or widget.

- **void redraw()**
  Schedules the drawing of the widget.

- **void redraw_label()**
  Schedules the drawing of the label.

- **virtual void resize(int x, int y, int w, int h)**
  Changes the size or position of the widget.

- **FL_Color selection_color() const**
  Gets the selection color.

- **void selection_color(FL_Color a)**
  Sets the selection color.

- **void set_active()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed()**
  Marks the value of the widget as changed.

- **void set_output()**
  Sets a widget to output only.

- **void set_visible()**
  Makes the widget visible.

- **void set_visible_focus()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label() const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label(int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show()**
  Makes a widget visible.

- **void size(int W, int H)**
  Changes the size of the widget.

- **int take_focus()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents() const**
  Returns if the widget is able to take events.

- **int test_shortcut()**
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char *tooltip() const**
  Gets the current tooltip text.

- **void tooltip(const char *text)**
  Sets the current tooltip text.

- **FL_Window * top_window() const**
  Returns a pointer to the top-level window for the widget.

- **FL_Window * top_window_offset(int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Button

• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void **draw_focus** () const
  Draws a focus rectangle around the widget.
• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void **draw_label** () const
  Draws the widget's label at the defined label position.
• void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
  
  unsigned int **flags** () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

• static void **default_callback** (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int **label_shortcut** (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int **test_shortcut** (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered ’&x’ shortcut.

**Protected Types inherited from Fl_Widget**

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,

11.80.1 Detailed Description

This subclass displays the "on" state by turning on a light, rather than drawing pushed in. The shape of the "light" is initially set to FL_DOWN_BOX. The color of the light when on is controlled with selection_color(), which defaults to FL_YELLOW.

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for type() and when().

Figure 11.26 Fl_Light_Button

11.80.2 Constructor & Destructor Documentation

11.80.2.1 Fl_Light_Button()

Fl_Light_Button::Fl_Light_Button (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char * l = 0)

Creates a new Fl_Light_Button widget using the given position, size, and label string.
The default box type is FL_UP_BOX and the default down box type down_box() is FL_NO_BOX (0).
The selection_color() sets the color of the "light". Default is FL_YELLOW.
The default label alignment is FL_ALIGN_LEFT | FL_ALIGN_INSIDE so the label is drawn inside the button area right of the "light".

Note

Do not change the default box types of Fl_Light_Button. The box types determine how the button is drawn. If you change the down_box() type the drawing behavior is undefined.

11.80.3 Member Function Documentation

11.80.3.1 draw()

void Fl_Light_Button::draw ( ) [protected], [virtual]

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Reimplemented from Fl_Button.

11.80.3.2 handle()

int Fl_Light_Button::handle (  
    int event ) [virtual]
Handles the specified event.
You normally don’t call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don’t short-circuit events that you don’t handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don’t really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may “ring the bell” or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn’t do anything with it.

Parameters

| in   | event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

    v
Fl_Valuator
    |
    v
Fl_Dial
    |
    v
Fl_Line_Dial
```

**Public Member Functions**

- Fl_Line_Dial(int X, int Y, int W, int H, const char *L=0)

**Public Member Functions inherited from Fl_Dial**

- short angle1() const
  
  Sets Or gets the angles used for the minimum and maximum values.
- void angle1(short a)
See short `angle1()` const.

- short `angle2()` const
  See short `angle1()` const.
- void `angle2` (short a)
  See short `angle1()` const.
- void `angles` (short a, short b)
  See short `angle1()` const.
- `Fl_Dial` (int x, int y, int w, int h, const char ∗l=0)
  Creates a new `Fl_Dial` widget using the given position, size, and label string.
- int `handle` (int) FL_OVERRIDE
  Allow subclasses to handle event based on current position and size.

Public Member Functions inherited from `Fl_Valuator`

- void `bounds` (double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- double `clamp` (double)
  Clamps the passed value to the valuator range.
- virtual int `format` (char ∗)
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double `increment` (double, int)
  Adds n times the step value to the passed value.
- double `maximum` () const
  Gets the maximum value for the valuator.
- void `maximum` (double a)
  Sets the maximum value for the valuator.
- double `minimum` () const
  Gets the minimum value for the valuator.
- void `minimum` (double a)
  Sets the minimum value for the valuator.
- void `precision` (int digits)
  Sets the step value to 1.0 / 10^{digits}.
- void `range` (double a, double b)
  Sets the minimum and maximum values for the valuator.
- double `round` (double)
  Round the passed value to the nearest step increment.
- double `step` () const
  Gets or sets the step value.
- void `step` (double a, int b)
  See double `Fl_Valuator::step()` const
- void `step` (double s)
  See double `Fl_Valuator::step()` const.
- void `step` (int a)
  See double `Fl_Valuator::step()` const
- double `value` () const
  Gets the floating point(double) value.
- int `value` (double)
  Sets the current value.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group () const
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
Checks if the widget value changed since the last callback.

- void **clear_active** ()
  Marks the widget as inactive without sending events or changing focus.

- void **clear_changed** ()
  Marks the value of the widget as unchanged.

- void **clear_damage** (uchar c=0)
  Clears or sets the damage flags.

- void **clear_output** ()
  Sets a widget to accept input.

- void **clear_visible** ()
  Hides the widget.

- void **clear_visible_focus** ()
  Disables keyboard focus navigation with this widget.

- **Fl_Color** **color** () const
  Gets the background color of the widget.

- void **color** (**Fl_Color** bg)
  Sets the background color of the widget.

- void **color** (**Fl_Color** bg, **Fl_Color** sel)
  Sets the background and selection color of the widget.

- **Fl_Color** **color2** () const
  For back compatibility only.

- void **color2** (unsigned a)
  For back compatibility only.

- int **contains** (**const** **Fl_Widget** ∗w) const
  Checks if w is a child of this widget.

- void **copy_label** (**const** char ∗new_label)
  Sets the current label.

- void **copy_tooltip** (**const** char ∗text)
  Sets the current tooltip text.

- uchar **damage** () const
  Returns non-zero if **draw()** needs to be called.

- void **damage** (uchar c)
  Sets the damage bits for the widget.

- void **damage** (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int **damage_resize** (int, int, int)
  Internal use only.

- void **deactivate** ()
  Deactivates the widget.

- **Fl_Image** ∗**deimage** ()
  Gets the image that is used as part of the widget label when in the inactive state.

- **const** **Fl_Image** ∗**deimage** () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void **deimage** (**Fl_Image** ∗&img)
  Sets the image to use as part of the widget label when in the inactive state.

- void **deimage** (**Fl_Image** &img)
  Sets the image to use as part of the widget label when in the inactive state.

- int **deimage_bound** () const
  Returns whether the inactive image is managed by the widget.

- void **do_callback** (**Fl_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  Calls the widget callback function with default arguments.
void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with arbitrary arguments.

void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with arbitrary arguments.

void draw_label (int, int, int, int, Fl_Align) const

Draws the label in an arbitrary bounding box with an arbitrary alignment.

int h () const

Gets the widget height.

virtual void hide ()

Makes a widget invisible.

Fl_Image *image ()

Gets the image that is used as part of the widget label when in the active state.

const Fl_Image *image () const

Gets the image that is used as part of the widget label when in the active state.

void image (Fl_Image &img)

Sets the image to use as part of the widget label when in the active state.

void image (Fl_Image *img)

Sets the image to use as part of the widget label when in the active state.

int image_bound () const

Returns whether the image is managed by the widget.

int inside (const Fl_Widget *wgt) const

Checks if this widget is a child of wgt.

int is_label_copied () const

Returns whether the current label was assigned with copy_label().

const char *label () const

Gets the current label text.

void label (const char *text)

Sets the current label pointer.

void label (Fl_Labeltype a, const char *b)

Shortcut to set the label text and type in one call.

Fl_Color labelcolor () const

Gets the label color.

void labelcolor (Fl_Color c)

Sets the label color.

Fl_Font labelfont () const

Gets the font to use.

void labelfont (Fl_Font f)

Sets the font to use.

Fl_Fontsize labelsize () const

Gets the font size in pixels.

void labelsize (Fl_Fontsize pix)

Sets the font size in pixels.

Fl_Labeltype labeltype () const

Gets the label type.

void labeltype (Fl_Labeltype a)

Sets the label type.

void measure_label (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.

bool needs_keyboard () const

Returns whether this widget needs a keyboard.

void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- **unsigned int output()** const
  Returns if a widget is used for output only.

- **Fl_Group *parent()** const
  Returns a pointer to the parent widget.

- **void parent(Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position(int X, int Y)**
  Repositions the window or widget.

- **void redraw()**
  Schedules the drawing of the widget.

- **void redraw_label()**
  Schedules the drawing of the label.

- **virtual void resize(int x, int y, int w, int h)**
  Changes the size or position of the widget.

- **Fl_Color selection_color()** const
  Gets the selection color.

- **void selection_color(Fl_Color a)**
  Sets the selection color.

- **void set_active()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed()**
  Marks the value of the widget as changed.

- **void set_output()**
  Sets a widget to output only.

- **void set_visible()**
  Makes the widget visible.

- **void set_visible_focus()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label()** const
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- **void shortcut_label(int value)**
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- **virtual void show()**
  Makes a widget visible.

- **void size(int W, int H)**
  Changes the size of the widget.

- **int take_focus()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents()** const
  Returns if the widget is able to take events.

- **int testShortcut()**
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- **const char *tooltip()** const
  Gets the current tooltip text.

- **void tooltip(const char *text)**
  Sets the current tooltip text.

- **Fl_Window *top_window()** const
  Returns a pointer to the top-level window for the widget.

- **Fl_Window *top_window_offset(int &xoff, int &yoff)** const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• FL_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• FL_Window ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~FL_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from FL_Widget

• static void default_callback (FL_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

```plaintext
enum {
    INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
    FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
    OVERRIDE = 1<<8, VISIBLE FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
    MENU_WINDOW = 1<<12, TOOLIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
    GROUP_RELATIVE = 1<<16, COPIED_TOOLIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
    NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
    AUTO_DELETE_USER_DATA = 1<<23,
    MAXIMIZED = 1<<24, USERFLAG3 = 1<<25, USERFLAG2 = 1<<26, USERFLAG1 = 1<<27
}
```

flags possible values enumeration.

Protected Member Functions inherited from Fl_Dial

- void draw () FL_OVERRIDE
  Draws dial at current position and size.
- void draw (int X, int Y, int W, int H)
  Draws dial at given position and size.
- int handle (int event, int X, int Y, int W, int H)
  Allows subclasses to handle event based on given position and size.

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y, int W, int H, const char ∗L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void handle_push ()
  Stores the current value in the previous value.
- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
- double previous_value () const
  Gets the previous floating point value before an event changed it.
- void set_value (double v)
  Sets the current floating point value.
- double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void value_damage ()
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
**Fl_Mac_App_Menu Class Reference**

**Draws the widget box according its box style.**

- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus () const**
  
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  
  Draws a focus box for the widget at the given position and size.

- **void draw_label () const**
  
  Draws the widget's label at the defined label position.

- **void draw_label (int, int, int, int) const**
  
  Draws the label in an arbitrary bounding box.

- **Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)**
  
  Creates a widget at the given position and size.

- **unsigned int flags () const**
  
  Gets the widget flags mask.

- **void h (int v)**
  
  Internal use only.

- **void set_flag (unsigned int c)**
  
  Sets a flag in the flags mask.

- **void w (int v)**
  
  Internal use only.

- **void x (int v)**
  
  Internal use only.

- **void y (int v)**
  
  Internal use only.

The documentation for this class was generated from the following files:

- Fl_Line_Dial.H
- Fl_Dial.cxx

**11.82 Fl_Mac_App_Menu Class Reference**

**Static Public Member Functions**

- **static void custom_application_menu_items (const Fl_Menu_Item ∗m)**
  
  Adds custom menu item(s) to the application menu of the system menu bar.

**Static Public Attributes**

- **static const char ∗about**
  
  Localizable text for the "About xxx" application menu item.

- **static const char ∗hide**
  
  Localizable text for the "Hide xxx" application menu item.

- **static const char ∗hide_others**
  
  Localizable text for the "Hide Others" application menu item.

- **static const char ∗print**
  
  Localizable text for the "Print Front Window" application menu item.

- **static const char ∗print_no_titlebar**

Generated by Doxygen
Localizable text for the "Print Front Window" application menu item.
• static const char * quit
  Localizable text for the "Quit xxx" application menu item.
• static const char * services
  Localizable text for the "Services" application menu item.
• static const char * show
  Localizable text for the "Show All" application menu item.
• static const char * toggle_print_titlebar
  Localizable text for the "Toggle print titlebar" application menu item.

11.82.1 Member Function Documentation

11.82.1.1 custom_application_menu_items()

static void Fl_Mac_App_Menu::custom_application_menu_items ( const Fl_Menu_Item * m ) [static]
Adds custom menu item(s) to the application menu of the system menu bar. They are positioned after the "Print Front Window / Toggle printing of titlebar" items, or at their place if they were removed with Fl_Mac_App_Menu::print = " ".

Parameters

- m: zero-ending array of Fl_Menu_Item's.

11.82.2 Member Data Documentation

11.82.2.1 print

const char* Fl_Mac_App_Menu::print [static]
Localizable text for the "Print Front Window" application menu item.
This menu item and next one won't be displayed if Fl_Mac_App_Menu::print is set to an empty string.
The documentation for this class was generated from the following file:

- mac.H

11.83 Fl_Menu_ Class Reference

Base class of all widgets that have a menu in FLTK.
#include <Fl_Menu_.H>
Inheritance diagram for Fl_Menu_:

Fl_Widget

Fl_Menu_

Fl_Choice Fl_Menu_Bar Fl_Menu_Button
Fl_Scheme_Choice Fl_Sys_Menu_Bar

Public Member Functions

- int add (const char *)
This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with ']' separating the menu items, and tab separating the menu item names from an optional shortcut string.

- int add (const char *, int shortcut, Fl_Callback *, void *=0, int=0)
  Adds a new menu item.
- int add (const char *a, const char *b, Fl_Callback *c, void *d=0, int e=0)
  See int Fl_Menu_::add(const char * label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)

- void clear ()
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.
- int clear_submenu (int index)
  Clears the specified submenu pointed to by index of all menu items.
- void copy (const Fl_Menu_Item *m, void *user_data=0)
  Sets the menu array pointer with a copy of m that will be automatically deleted.
- Fl_Boxtype down_box () const
  This box type is used to surround the currently-selected items in the menus.
- void down_box (Fl_Boxtype b)
  Sets the box type used to surround the currently-selected items in the menus.
- Fl_Color down_color () const
  For back compatibility, same as selection_color()
- void down_color (unsigned c)
  For back compatibility, same as selection_color()

- int find_index (const char *name) const
  Find the menu item index for a given menu pathname, such as "Edit/Copy".
- int find_index (const Fl_Menu_Item *item) const
  Find the index into the menu array for a given item.
- int find_index (Fl_Callback *cb) const
  Find the index into the menu array for a given callback cb.
- const Fl_Menu_Item *find_item (const char *name)
  Find the menu item for a given menu pathname, such as "Edit/Copy".
- const Fl_Menu_Item *find_item (Fl_Callback *)
  Find the menu item for the given callback cb.

- const Fl_Menu_Item *find_item_with_argument (long)
  Find the menu item for the given user argument v.
- const Fl_Menu_Item *find_item_with_user_data (void *)
  Find the menu item for the given user data v.
- Fl_Menu_ (int, int, int, int, const char *0)
  Creates a new Fl_Menu_ widget using the given position, size, and label string.

- void global ()
  Make the shortcuts for this menu work no matter what window has the focus when you type it.
- int insert (int index, const char *, int shortcut, Fl_Callback *, void *=0, int=0)
  Inserts a new menu item at the specified index position.
- int insert (int index, const char *a, const char *b, Fl_Callback *c, void *d=0, int e=0)
  See int Fl_Menu_::insert(const char * label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)

- int item_pathname (char *name, int namelen, const Fl_Menu_Item *finditem=0) const
  Get the menu 'pathname' for the specified menuitem.
- const Fl_Menu_Item *menu () const
  Returns a pointer to the array of Fl_Menu_Items.
- void menu (const Fl_Menu_Item *m)
  Sets the menu array pointer directly.
- Fl_Boxtype menu_box () const
  Get the box type for the menu popup windows.
- void menu_box (Fl_Boxtype b)
Set the box type for the menu popup windows.

- const Fl_Menu_Item * menu_end ()
  Finishes menu modifications and returns menu().
- int mode (int i) const
  Gets the flags of item i.
- void mode (int i, int fl)
  Sets the flags of item i.
- const Fl_Menu_Item * mvalue () const
  Returns a pointer to the last menu item that was picked.
- const Fl_Menu_Item * picked (const Fl_Menu_Item *)
  When user picks a menu item, call this.
- const Fl_Menu_Item * prev_mvalue () const
  Returns a pointer to the menu item that was picked before the current one was picked.
- void remove (int)
  Deletes item i from the menu.
- void replace (int, const char *)
  Changes the text of item i.
- void setonly (Fl_Menu_Item *item)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.
- void shortcut (int i, int s)
  Changes the shortcut of item i to s.
- int size () const
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.
- void size (int W, int H)
- const Fl_Menu_Item * test_shortcut ()
  Returns the menu item with the entered shortcut (key value).
- const char * text () const
  Returns the title of the last item chosen.
- const char * text (int i) const
  Returns the title of item i.
- Fl_Color textcolor () const
  Get the current color of menu item labels.
- void textcolor (Fl_Color c)
  Sets the current color of menu item labels.
- Fl_Font textfont () const
  Gets the current font of menu item labels.
- void textfont (Fl_Font c)
  Sets the current font of menu item labels.
- Fl_Fontsize textsize () const
  Gets the font size of menu item labels.
- void textsize (Fl_Fontsize c)
  Sets the font size of menu item labels.
- int value () const
  Returns the index into menu() of the last item chosen by the user.
- int value (const Fl_Menu_Items *)
  The value is the index into menu() of the last item chosen by the user.
- int value (int i)
  The value is the index into menu() of the last item chosen by the user.
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
Checks if the widget value changed since the last callback.

- void `clear_active()`
  Marks the widget as inactive without sending events or changing focus.

- void `clear_changed()`
  Marks the value of the widget as unchanged.

- void `clear_damage(uchar c=0)`
  Clears or sets the damage flags.

- void `clear_output()`
  Sets a widget to accept input.

- void `clear_visible()`
  Hides the widget.

- void `clear_visible_focus()`
  Disables keyboard focus navigation with this widget.

- Fl_Color `color()` const
  Gets the background color of the widget.

- void `color(Fl_Color bg)`
  Sets the background color of the widget.

- void `color(Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- Fl_Color `color2()` const
  For back compatibility only.

- void `color2(unsigned a)`
  For back compatibility only.

- int `contains(const Fl_Widget*w)` const
  Checks if w is a child of this widget.

- void `copy_label(const char* new_label)`
  Sets the current label.

- void `copy_tooltip(const char* text)`
  Sets the current tooltip text.

- uchar `damage()` const
  Returns non-zero if `draw()` needs to be called.

- void `damage(uchar c)`
  Sets the damage bits for the widget.

- void `damage(uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.

- int `damage_resize(int, int, int)`
  Internal use only.

- void `deactivate()`
  Deactivates the widget.

- Fl_Image* `deimage()`
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image* `deimage()` const
  Gets the image that is used as part of the widget label when in the inactive state.

- void `deimage(Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.

- void `deimage(Fl_Image* img)`
  Sets the image to use as part of the widget label when in the inactive state.

- int `deimage_bound()` const
  Returns whether the inactive image is managed by the widget.

- void `do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.
• void `do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

• void `do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

• virtual void `draw ()=0`
  Draws the widget.

• void `draw_label (int, int, int, int, Fl_Align) const`
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int `h () const`
  Gets the widget height.

• virtual int `handle (int event)`
  Handles the specified event.

• virtual void `hide ()`
  Makes a widget invisible.

• Fl_Image ∗`image ()`
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image ∗`image () const`
  Gets the image that is used as part of the widget label when in the active state.

• void `image (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the active state.

• void `image (Fl_Image ∗img)`
  Sets the image to use as part of the widget label when in the active state.

• int `image_bound () const`
  Returns whether the image is managed by the widget.

• int `inside (const Fl_Widget ∗wgt) const`
  Checks if this widget is a child of `wgt`.

• int `is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.

• const char ∗`label () const`
  Gets the current label text.

• void `label (const char ∗text)`
  Sets the current label pointer.

• void `label (Fl_Labeltype a, const char ∗b)`
  Shortcut to set the label text and type in one call.

• Fl_Color `labelcolor () const`
  Gets the label color.

• void `labelcolor (Fl_Color c)`
  Sets the label color.

• Fl_Font `labelfont () const`
  Gets the font to use.

• void `labelfont (Fl_Font f)`
  Sets the font to use.

• Fl_Fontsize `labelsize () const`
  Gets the font size in pixels.

• void `labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

• Fl_Labeltype `labeltype () const`
  Gets the label type.

• void `labeltype (Fl_Labeltype a)`
  Sets the label type.

• void `measure_label (int &ww, int &hh) const`
Sets width $ww$ and height $hh$ accordingly with the label size.

- **bool needs_keyboard()**
  - Returns whether this widget needs a keyboard.

- **void needs_keyboard(bool needs)**
  - Sets whether this widget needs a keyboard.

- **unsigned int output()**
  - Returns if a widget is used for output only.

- **Fl_Group* parent()**
  - Returns a pointer to the parent widget.

- **void parent(Fl_Group*p)**
  - Internal use only – “for hacks only”.

- **void position(int X, int Y)**
  - Repositions the window or widget.

- **void redraw()**
  - Schedules the drawing of the widget.

- **void redraw_label()**
  - Schedules the drawing of the label.

- **virtual void resize(int x, int y, int w, int h)**
  - Changes the size or position of the widget.

- **Fl_Color selection_color()**
  - Gets the selection color.

- **void selection_color(Fl_Color a)**
  - Sets the selection color.

- **void set_active()**
  - Marks the widget as active without sending events or changing focus.

- **void set_changed()**
  - Marks the value of the widget as changed.

- **void set_output()**
  - Sets a widget to output only.

- **void set_visible()**
  - Makes the widget visible.

- **void set_visible_focus()**
  - Enables keyboard focus navigation with this widget.

- **int shortcut_label()**
  - Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- **void shortcut_label(int value)**
  - Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- **virtual void show()**
  - Makes a widget visible.

- **void size(int W, int H)**
  - Changes the size of the widget.

- **int take_focus()**
  - Gives the widget the keyboard focus.

- **unsigned int takesevents()**
  - Returns if the widget is able to take events.

- **int test_shortcut()**
  - Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- **const char* tooltip()**
  - Gets the current tooltip text.

- **void tooltip(const char* text)**
  - Sets the current tooltip text.
• **Fl_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

• **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

• **uchar type () const**
  Gets the widget type.

• **void type (uchar t)**
  Sets the widget type.

• **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void * user_data () const**
  Gets the user data for this widget.

• **void user_data (FI_Calling_Usr_Data *v, bool auto_free)**
  Sets the user data for this widget.

• **void user_data (void *v)**
  Sets the user data for this widget.

• **unsigned int visible () const**
  Returns whether a widget is visible.

• **unsigned int visible_focus () const**
  Checks whether this widget has a visible focus.

• **void visible_focus (int v)**
  Modifies keyboard focus navigation.

• **int visible_r () const**
  Returns whether a widget and all its parents are visible.

• **int w () const**
  Gets the widget width.

• **Fl_When when () const**
  Returns the conditions under which the callback is called.

• **void when (uchar i)**
  Sets the flags used to decide when a callback is called.

• **Fl_Window * window () const**
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int x () const**
  Gets the widget position in its window.

• **int y () const**
  Gets the widget position in its window.

• **virtual ∼Fl_Widget ()**
  Destroys the widget.

Protected Member Functions

• **int item_pathname_ (char *name, int namelen, const Fl_Menu_Item *findItem, const Fl_Menu_Item *menu=0) const**

Protected Member Functions inherited from Fl_Widget

• **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

• **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• **void draw_box () const**
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget's label at the defined label position.

• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

• unsigned int flags () const
  Gets the widget flags mask.

• void h (int v)
  Internal use only.

• void set_flag (unsigned int c)
  Sets a flag in the flags mask.

• void w (int v)
  Internal use only.

• void x (int v)
  Internal use only.

• void y (int v)
  Internal use only.

Protected Attributes

• uchar alloc
• uchar down_box_
• Fl_Boxtype menu_box_
• Fl_Color textcolor_
• Fl_Font textfont_
• Fl_Fontsize textsizes_

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.

• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered 'x' shortcut.
Protected Types inherited from Fl_Widget

} flags possible values enumeration.

11.83.1 Detailed Description

Base class of all widgets that have a menu in FLTK.

Currently FLTK provides you with Fl_Menu_Button, Fl_Menu_Bar, and Fl_Choice.
The class contains a pointer to an array of structures of type Fl_Menu_Item. The array may either be supplied
directly by the user program, or it may be "private": a dynamically allocated array managed by the Fl_Menu_.

When the user clicks a menu item, value() is set to that item and then:

- If the Fl_Menu_Item has a callback set, that callback is invoked with any userdata configured for it. (The
  Fl_Menu_ widget's callback is NOT invoked.)

- For any Fl_Menu_Items that don't have a callback set, the Fl_Menu_ widget's callback is invoked with
  any userdata configured for it. The callback can determine which item was picked using value(), mvalue(),
  item_pathname(), etc.

The line spacing between menu items can be controlled with the global setting Fl::menu_linespacing().

See also

Fl_Widget::shortcut_label(int)

11.83.2 Constructor & Destructor Documentation

11.83.2.1 Fl_Menu_()

Fl_Menu_::Fl_Menu_ ( int X, int Y, int W, int H, const char * l = 0 )

Creates a new Fl_Menu_ widget using the given position, size, and label string.
menu() is initialized to null.

11.83.3 Member Function Documentation

11.83.3.1 add[] [1/2]

int Fl_Menu_::add ( const char * str )

This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu
items, and tab separating the menu item names from an optional shortcut string.
The passed string is split at any '|' characters and then add(s,0,0,0,0) is done with each section. This is often useful
if you are just using the value, and is compatible with Forms and other GL programs. The section strings use the
same special characters as described for the long version of add().
No items must be added to a menu during a callback to the same menu.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>string containing multiple menu labels as described above</td>
</tr>
</tbody>
</table>

Returns

the index into the menu() array, where the entry was added

11.83.3.2 add() [2/2]

```c
int Fl_Menu_::add (  
    const char ∗ label,  
    int shortcut,  
    Fl_Callback ∗ callback,  
    void ∗ userdata = 0,  
    int flags = 0 )
```

Adds a new menu item.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>The text label for the menu item.</td>
</tr>
<tr>
<td>shortcut</td>
<td>Optional keyboard shortcut that can be an int or string: (FL_CTRL+'a') or &quot;^{a}&quot;. Default 0 if none.</td>
</tr>
<tr>
<td>callback</td>
<td>Optional callback invoked when user clicks the item. Default 0 if none.</td>
</tr>
<tr>
<td>userdata</td>
<td>Optional user data passed as an argument to the callback. Default 0 if none.</td>
</tr>
<tr>
<td>flags</td>
<td>Optional flags that control the type of menu item; see below. Default is 0 for none.</td>
</tr>
</tbody>
</table>

Returns

The index into the menu() array, where the entry was added.

Description

If the menu array was directly set with menu(x), then copy() is done to make a private array.

Since this method can change the internal menu array, any menu item pointers or indices the application may have cached can become stale, and should be recalculated/refreshed.

A menu item's callback must not add() items to its parent menu during the callback.

Due to backwards compatibility and historical restrictions we recommend to use either

- static menu arrays that are not extended during runtime or
- dynamic, extendable menu item arrays that are entirely created by using add() or insert().

This ensures that all menu arrays and strings are copied to internal storage and released when required.

Note

If you create menus from static Fl_Menu_Item arrays and add() or insert() more menu items later, then the menu array is copied to local storage but some local (static) strings may appear to "leak memory". This is a known issue and discouraged usage (see description above) but the impact on memory usage should typically be small.

Detailed Description of Parameters

Generated by Doxygen
label

The menu item's label. This argument is required and must not be NULL.

The characters "&, '/', ", and '_' are treated as special characters in the label string. The "&" character
specifies that the following character is an accelerator and will be underlined. The '"' character is used to
escape the next character in the string. Labels starting with the "_' character cause a divider to be placed
after that menu item.

A label of the form "File/Quit" will create the submenu "File" with a menu item called "Quit".

The label string is copied to new memory and can be freed. The other arguments (including the shortcut) are
copied into the menu item unchanged.

If an item exists already with that name then it is replaced with this new one. Otherwise this new one is added
to the end of the correct menu or submenu. The return value is the offset into the array that the new entry was
placed at.

shortcut

The keyboard shortcut for this menu item.

This parameter is optional, and defaults to 0 to indicate no shortcut.

The shortcut can either be a raw integer value (eg. FL_CTRL+'A') or a string (eg. "^c" or "^97").

Raw integer shortcuts can be a combination of keyboard chars (eg. 'A') and optional keyboard modifiers (see
Fl::event_state(), e.g. FL_SHIFT, etc). In addition, FL_COMMAND can be used to denote FL_META under
Mac OS X and FL_CTRL under other platforms.

String shortcuts can be specified in one of two ways:

- \[\text{#} \text{+} \text{^}\langle \text{ascii_value} \rangle\] e.g. "97", "^97", "+97", "#97"
- \[\text{#} \text{+} \text{^}\langle \text{ascii_char} \rangle\] e.g. "a", "^a", "+a", "#a"

...where \langle ascii_value \rangle is a decimal value representing an ASCII character (eg. 97 is the ascii code for 'a'),
and the optional prefixes enhance the value that follows. Multiple prefixes must appear in the order below.

\# - Alt
+ - Shift
^ - Control

Internally, the text shortcuts are converted to integer values using fl_oldShortcut(const char*).
callback

The callback to invoke when this menu item is selected.

This parameter is optional, and defaults to 0 for no callback.

userdata

The callback’s ‘user data’ that is passed to the callback.

This parameter is optional, and defaults to 0.

flags

These are bit flags to define what kind of menu item this is.

This parameter is optional, and defaults to 0 to define a ‘regular’ menu item.

These flags can be ‘OR’ed together:

- FL_MENU_INACTIVE // Deactivate menu item (gray out)
- FL_MENU_TOGGLE // Item is a checkbox toggle (shows checkbox for on/off state)
- FL_MENU_RADIO // Item is a radio button (one checkbox of many can be on)
- FL_SUBMENU_POINTER // Indicates user_data() is a pointer to another menu array
- FL_SUBMENU // This item is a submenu to other items
- FL_MENU_DIVIDER // Creates divider line below this item. Also ends a group of radio buttons.

All other bits in ‘flags’ are reserved and must not be used.

If FL_SUBMENU is set in an item’s flags, then actually two items are added:

- the first item is the menu item (submenu title), as expected, and
- the second item is the submenu terminating item with the label and all other members set to 0.

If you add submenus with the ‘path’ technique, then the corresponding submenu terminators (maybe more than one) are added as well.

Todo Raw integer shortcut needs examples. Dependent on responses to https://www.fltk.org/newsgroups.php?g=fltk.coredev+v:10086 and results of STR#2344

11.83.3.3 clear()

void Fl_Menu_::clear ()

Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.
Menus must not be cleared during a callback to the same menu.

11.83.3.4 clear_submenu()

int Fl_Menu_::clear_submenu ( int index )

Clears the specified submenu pointed to by index of all menu items.
This method is useful for clearing a submenu so that it can be re-populated with new items. Example: a "File/Recent Files/..." submenu that shows the last few files that have been opened.
The specified index must point to a submenu.
The submenu is cleared with remove(). If the menu array was directly set with menu(x), then copy() is done to make a private array.
Warning

Since this method can change the internal menu array, any menu item pointers or indices the application may have cached can become stale, and should be recalculated/refreshed.

Example:

```c
int index = menubar->find_index("File/Recent");  // get index of "File/Recent" submenu
if ( index != -1 ) menubar->clear_submenu(index);  // clear the submenu
menubar->add("File/Recent/Aaa");
menubar->add("File/Recent/Bbb");
[...]
```

Parameters

<table>
<thead>
<tr>
<th>index</th>
<th>The index of the submenu to be cleared</th>
</tr>
</thead>
</table>

Returns

0 on success, -1 if the index is out of range or not a submenu

See also

remove(int)

11.83.3.5 copy()

```c
void Fl_Menu_::copy (const Fl_Menu_Item *m, void *ud = 0 )
```

Sets the menu array pointer with a copy of m that will be automatically deleted.

If userdata ud is not NULL, then all user data pointers are changed in the menus as well. See void Fl_Menu_::menu(const Fl_Menu_Item* m).

11.83.3.6 down_box() [1/2]

```c
Fl_Boxtype Fl_Menu_::down_box ( ) const [inline]
```

This box type is used to surround the currently-selected items in the menus.

If this is FL_NO_BOX then it acts like FL_THIN_UP_BOX and selection_color() acts like FL_WHITE, for back compatibility.

11.83.3.7 down_box() [2/2]

```c
void Fl_Menu_::down_box ( Fl_Boxtype b ) [inline]
```

Sets the box type used to surround the currently-selected items in the menus.

11.83.3.8 find_index() [1/3]

```c
int Fl_Menu_::find_index (const char *pathname ) const
```

Find the menu item index for a given menu pathname, such as "Edit/Copy".

This method finds a menu item's index position for the given menu pathname, also traversing submenus, but not submenu pointers (FL_SUBMENU_POINTER).

To get the menu item pointer for a pathname, use find_item()

Parameters

<table>
<thead>
<tr>
<th>in pathname</th>
<th>The path and name of the menu item to find</th>
</tr>
</thead>
</table>

Generated by Doxygen
Returns

The index of the matching item, or -1 if not found.

See also

item_pathname()

11.83.3.9  find_index() [2/3]

int Fl_Menu_::find_index (const Fl_Menu_Item *item) const

Find the index into the menu array for a given item.
A way to convert a menu item pointer into an index.
Does not handle items that are in submenu pointers (FL_SUBMENU_POINTER).
-1 is returned if the item is not in this menu or is part of an FL_SUBMENU_POINTER submenu.
Current implementation is fast and not expensive.
// Convert an index-to-item
int index = 12;
const Fl_Menu_Item *item = mymenu->menu() + index;
// Convert an item-to-index
int index = mymenu->find_index(item);
if ( index == -1 ) { ..error.. }

Parameters

| in  | item | The item to be found |

Returns

The index of the item, or -1 if not found.

See also

menu()

11.83.3.10  find_index() [3/3]

int Fl_Menu_::find_index (const Fl_Callback *cb) const

Find the index into the menu array for a given callback cb.
This method finds a menu item's index position, also traversing submenus, but not submenu pointers (FL_SUBMENU_POINTER). This is useful if an application uses internationalisation and a menu item can not be found using its label. This search is also much faster.

Parameters

| cb | Find the first item with this callback |

Returns

The index of the item with the specific callback, or -1 if not found
See also

find_index(const char*)

11.83.3.11 find_item() [1/2]

const Fl_Menu_Item * Fl_Menu_::find_item (const char * pathname)

Find the menu item for a given menu pathname, such as “Edit/Copy”.
This method finds a menu item in the menu array, also traversing submenus, but not submenu pointers (FL←SUBMENU_POINTER).
To get the menu item's index, use find_index(const char*)

Example:
Fl_Menu_Bar *menubar = new Fl_Menu_Bar( );
menubar->add("File/&Open");
menubar->add("File/&Save");
menubar->add("Edit/&Copy");
// ...
Fl_Menu_Item *item;
if ( ( item = (Fl_Menu_Item*)menubar->find_item("File/&Open") ) != NULL ) {
  item->labelcolor(FL_RED);
}
if ( ( item = (Fl_Menu_Item*)menubar->find_item("Edit/&Copy") ) != NULL ) {
  item->labelcolor(FL_GREEN);
}

Parameters

| pathname | The path and name of the menu item |

Returns

The item found, or NULL if not found

See also

find_index(const char*), find_item(Fl_Callback*), item_pathname()

11.83.3.12 find_item() [2/2]

const Fl_Menu_Item * Fl_Menu_::find_item (Fl_Callback * cb)

Find the menu item for the given callback cb.
This method finds a menu item in a menu array, also traversing submenus, but not submenu pointers. This is useful if an application uses internationalisation and a menu item can not be found using its label. This search is also much faster.

Parameters

| cb | find the first item with this callback |

Returns

The item found, or NULL if not found

See also

find_item(const char*)

11.83.3.13 find_item_with_argument()

const Fl_Menu_Item * Fl_Menu_::find_item_with_argument (long v)

Generated by Doxygen
Find the menu item for the given user argument \( v \).

**Parameters**

| in | \( v \) | find the first item with this user argument |

**Returns**

The item found, or NULL if not found

See also

find_item(const char+)

### 11.83.3.14 find_item_with_user_data()

```cpp
cnst Fl_Menu_Item * Fl_Menu_::find_item_with_user_data ( 
    void * \( v \) 
)
```

Find the menu item for the given user data \( v \).

**Parameters**

| in | \( v \) | find the first item with this user data |

**Returns**

The item found, or NULL if not found

See also

find_item(const char+)

### 11.83.3.15 global()

```cpp
void Fl_Menu_::global ( )
```

Make the shortcuts for this menu work no matter what window has the focus when you type it. This is done by using Fl::add_handler(). This Fl_Menu_ widget does not have to be visible (ie the window it is in can be hidden, or it does not have to be put in a window at all). Currently there can be only one global() menu. Setting a new one will replace the old one. There is no way to remove the global() setting (so don't destroy the widget!)

### 11.83.3.16 insert()

```cpp
int Fl_Menu_::insert ( 
    int index, 
    const char * label, 
    int shortcut, 
    Fl_Callback * callback, 
    void * userdata = 0, 
    int flags = 0 )
```

Inserts a new menu item at the specified index position. If index is -1, the menu item is appended; same behavior as add(). To properly insert a menu item, label must be the name of the item (eg. "Quit"), and not a 'menu pathname' (eg. "File/Quit"). If a menu pathname is specified, the value of index is ignored, the new item's position defined by the pathname. For more details, see add(). Except for the index parameter, add() has more detailed information on parameters and behavior, and is functionally equivalent.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>index</th>
<th>The menu array's index position where the new item is inserted. If -1, behavior is the same as add().</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>label</td>
<td>The text label for the menu item. If the label is a menu pathname, index is ignored, and the pathname indicates the position of the new item.</td>
</tr>
<tr>
<td>in</td>
<td>shortcut</td>
<td>Optional keyboard shortcut. Can be an int (FL_CTRL+'a') or a string (&quot;^a&quot;). Default is 0.</td>
</tr>
<tr>
<td>in</td>
<td>callback</td>
<td>Optional callback invoked when user clicks the item. Default 0 if none.</td>
</tr>
<tr>
<td>in</td>
<td>userdata</td>
<td>Optional user data passed as an argument to the callback. Default 0 if none.</td>
</tr>
<tr>
<td>in</td>
<td>flags</td>
<td>Optional flags that control the type of menu item; see add() for more info. Default is 0 for none.</td>
</tr>
</tbody>
</table>

Returns

The index into the menu() array, where the entry was added.

See also

add()

11.83.3.17 item_pathname()

int Fl_Menu_::item_pathname (char * name, int namelen, const Fl_Menu_Item * finditem = 0) const

Get the menu 'pathname' for the specified menuitem.
If finditem==NULL, mvalue() is used (the most recently picked menuitem).

Example:

```cpp
Fl_Menu_Bar *menubar = 0;
void my_menu_callback(Fl_Widget*, void*) {
    char name[80];
    if (menubar->item_pathname(name, sizeof(name)-1) == 0) { // recently picked item
        if (strcmp(name, "File/&Open") == 0) { .. } // open invoked
        if (strcmp(name, "File/&Save") == 0) { .. } // save invoked
        if (strcmp(name, "Edit/&Copy") == 0) { .. } // copy invoked
    }
}
int main() {
    ..
    menubar = new Fl_Menu_Bar(..);
    menubar->add("File/&Open", 0, my_menu_callback);
    menubar->add("File/&Save", 0, my_menu_callback);
    menubar->add("Edit/&Copy", 0, my_menu_callback);
    ..
}
```

Returns

- 0 : OK (name has menuitem's pathname)
- -1 : item not found (name="")
- -2 : 'name' not large enough (name="")

See also

find_item()

11.83.3.18 menu() [1/2]

const Fl_Menu_Item * Fl_Menu_::menu () const [inline]

Returns a pointer to the array of Fl_Menu_Items.
This will either be the value passed to menu(value) or the private copy or an internal (temporary) location (see note below).

Generated by Doxygen
Implementation details - may be changed in the future. All modifications of the menu array are done by copying the entire menu array to an internal storage for optimization of memory allocations, for instance when using add() or insert(). While this is done, menu() returns the pointer to this internal location. The entire menu will be copied back to private storage when needed, i.e. when another Fl_Menu_ is modified. You can force this reallocation after you’re done with all menu modifications by calling Fl_Menu_::menu_end() to make sure menu() returns a permanent pointer to private storage (until the menu is modified again). Note also that some menu methods (e.g. Fl_Menu_Button::popup()) call menu_end() internally to ensure a consistent menu array while the menu is open.

See also

size() – returns the size of the Fl_Menu_Item array.

menu_end() – finish menu modifications (optional)

Example: How to walk the array:

```c
for (int t=0; t<menubar->size(); t++) { // walk array of items
    const Fl_Menu_Item &item = menubar->menu()[t]; // get each item
    fprintf(stderr, "item #%d -- label=%s, value=%s type=%s\n", t,
            item.label() ? item.label() : "(Null)", // menu terminators have NULL labels
            (item.flags & FL_MENU_VALUE) ? "set" : "clear", // value of toggle or radio items
            (item.flags & FL_SUBMENU) ? "Submenu" : "Item"); // see if item is a submenu or actual item
}
```

11.83.19 menu() [2/2]

```c
void Fl_Menu_::menu (const Fl_Menu_Item * m )
```

Sets the menu array pointer directly.
If the old menu is private it is deleted. NULL is allowed and acts the same as a zero-length menu. If you try to modify the array (with add(), replace(), or remove()) a private copy is automatically done.

11.83.20 menu_box() [1/2]

```c
Fl_Boxtype Fl_Menu_::menu_box ( ) const [inline]
```

Get the box type for the menu popup windows.

Returns

the box type, or FL_NO_BOX if Fl_Menu_::box() is to be used instead

11.83.21 menu_box() [2/2]

```c
void Fl_Menu_::menu_box ( Fl_Boxtype b ) [inline]
```

Set the box type for the menu popup windows.
If menu_box set to FL_NO_BOX, the menu window will use Fl_Menu_::box() instead.

Parameters

| in | b | new box type or FL_NO_BOX |

11.83.22 menu_end()

```c
const Fl_Menu_Item * Fl_Menu_::menu_end ( )
```

Finishes menu modifications and returns menu().
Call menu_end() after using add(), insert(), remove(), or any other methods that may change the menu array if you want to access the menu array anytime later with menu(). This should be called only once after the last menu modification for performance reasons.
Does nothing if the menu array is already in a private location. Some methods like Fl_Menu_Button::popup() call this method before their menu is opened.

Note

After menu changes like add(), insert(), etc. menu() would return a pointer to a temporary internal menu array that may be relocated at unexpected times. This is due to performance considerations and may be changed w/o further notice.

Since

1.4.0

Returns

New Fl_Menu_Item array pointer.

See also

 Fl_Menu_::menu()

11.83.3.23 mode() [1/2]

int Fl_Menu_::mode ( int i ) const [inline]

Gets the flags of item i.
For a list of the flags, see Fl_Menu_Item.

11.83.3.24 mode() [2/2]

void Fl_Menu_::mode ( int i, int fl ) [inline]

Sets the flags of item i.
For a list of the flags, see Fl_Menu_Item.

11.83.3.25 mvalue()

const Fl_Menu_Item * Fl_Menu_::mvalue ( ) const [inline]

Returns a pointer to the last menu item that was picked.

11.83.3.26 picked()

const Fl_Menu_Item * Fl_Menu_::picked ( const Fl_Menu_Item * v )

When user picks a menu item, call this. It will do the callback. Unfortunately this also casts away const for the checkboxes, but this was necessary so non-checkbox menus can really be declared const...

11.83.3.27 prev_mvalue()

const Fl_Menu_Item * Fl_Menu_::prev_mvalue ( ) const [inline]

Returns a pointer to the menu item that was picked before the current one was picked. This call gives devs additional details how a user changed a choice in the Fl_Choice widget.
11.83.3.28 remove()

```cpp
def Fl_Menu_::remove (int i)
```

Deletes item *i* from the menu. If the menu array was directly set with menu(x) then copy() is done to make a private array. No items must be removed from a menu during a callback to the same menu.

**Parameters**

- **i** index into menu array

11.83.3.29 replace()

```cpp
def Fl_Menu_::replace (int i, const char *str)
```

Changes the text of item *i*. This is the only way to get slash into an add()ed menu item. If the menu array was directly set with menu(x) then copy() is done to make a private array.

**Parameters**

- **i** index into menu array
- **str** new label for menu item at index *i*

11.83.3.30 size()

```cpp
def int Fl_Menu_::size ( ) const
```

This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus. This includes the "terminator" item at the end. To copy a menu array you need to copy size() * sizeof(Fl_Menu_Item) bytes. If the menu is NULL this returns zero (an empty menu will return 1).

11.83.3.31 test_shortcut()

```cpp
def const Fl_Menu_Item * Fl_Menu_::test_shortcut ( ) [inline]
```

Returns the menu item with the entered shortcut (key value). This searches the complete menu() for a shortcut that matches the entered key value. It must be called for a FL_KEYBOARD or FL_SHORTCUT event. If a match is found, the menu's callback will be called.

**Returns**

- matched Fl_Menu_Item or NULL.

11.83.3.32 text [1/2]

```cpp
def const char * Fl_Menu_::text ( ) const [inline]
```

Returns the title of the last item chosen.

11.83.3.33 text [2/2]

```cpp
def const char * Fl_Menu_::text (int i) const [inline]
```

Returns the title of item *i*. 

Generated by Doxygen
11.83.3.34 textcolor()

```cpp
Fl_Color Fl_Menu_::textcolor ( ) const [inline]
```
Get the current color of menu item labels.

11.83.3.35 textfont() [1/2]

```cpp
Fl_Font Fl_Menu_::textfont ( ) const [inline]
```
Gets the current font of menu item labels.

11.83.3.36 textfont() [2/2]

```cpp
void Fl_Menu_::textfont ( Fl_Font c ) [inline]
```
Sets the current font of menu item labels.

11.83.3.37 textsizel [1/2]

```cpp
Fl_Fontsize Fl_Menu_::textsizel ( ) const [inline]
```
Gets the font size of menu item labels.

11.83.3.38 textsizel [2/2]

```cpp
void Fl_Menu_::textsizel ( Fl_Fontsize c ) [inline]
```
Sets the font size of menu item labels.

11.83.3.39 value() [1/3]

```cpp
int Fl_Menu_::value ( ) const [inline]
```
Returns the index into menu() of the last item chosen by the user. It is zero initially.

11.83.3.40 value() [2/3]

```cpp
int Fl_Menu_::value ( const Fl_Menu_Item * m )
```
The value is the index into menu() of the last item chosen by the user. It is zero initially. You can set it as an integer, or set it with a pointer to a menu item. The set routines return non-zero if the new value is different than the old one.

11.83.3.41 value() [3/3]

```cpp
int Fl_Menu_::value ( int i ) [inline]
```
The value is the index into menu() of the last item chosen by the user.
It is zero initially. You can set it as an integer, or set it with a pointer to a menu item. The set routines return non-zero if the new value is different than the old one.

The documentation for this class was generated from the following files:

- Fl_Menu_.H
- Fl_Menu_.cxx
- Fl_Menu_add.cxx
- Fl_Menu_global.cxx

### 11.84 Fl_Menu_Bar Class Reference

This widget provides a standard menubar interface.

```cpp
#include <Fl_Menu_Bar.H>
```

Inheritance diagram for Fl_Menu_Bar:

```
Fl_Widget
|   |
|   |
|   Fl_Menu_
|   |
|   |
|   Fl_Menu_Bar
|   |
|   |
|   Fl_Sys_Menu_Bar
```

#### Public Member Functions

- **Fl_Menu_Bar** (int X, int Y, int W, int H, const char ∗l=0)
  
  Creates a new Fl_Menu_Bar widget using the given position, size, and label string.

- **int handle** (int) FL_OVERRIDE
  
  Handles the specified event.

- **virtual void update ()**
  
  Updates the menu bar after any change to its items.

#### Public Member Functions inherited from Fl_Menu_

- **int add** (const char ∗)
  
  This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with | separating the menu items, and tab separating the menu item names from an optional shortcut string.

- **int add** (const char ∗, int shortcut, Fl_Callback ∗, void ∗=0, int=0)
  
  Adds a new menu item.

- **int add** (const char ∗a, const char ∗b, Fl_Callback ∗c, void ∗d=0, int e=0)
  
  See int Fl_Menu_::add(const char∗ label, int shortcut, Fl_Callback∗, void ∗user_data=0, int flags=0)

- **void clear ()**
  
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

- **int clear_submenu** (int index)
  
  Clears the specified submenu pointed to by index of all menu items.

- **void copy** (const Fl_Menu_Item ∗m, void ∗user_data=0)
  
  Sets the menu array pointer with a copy of m that will be automatically deleted.

- **Fl_Boxtype down_box () const**
  
  This box type is used to surround the currently-selected items in the menus.

- **void down_box** (Fl_Boxtype b)
  
  Sets the box type used to surround the currently-selected items in the menus.
- `Fl_Color down_color()` const
  
  For back compatibility, same as `selection_color()`.

- void `down_color(unsigned c)`
  
  For back compatibility, same as `selection_color()`.

- int `find_index(const char *name)` const
  
  Find the menu item index for a given menu pathname, such as "Edit/Copy".

- int `find_index(Fl_Menu_Item *item)` const
  
  Find the index into the menu array for a given item.

- int `find_index(Fl_Callback *cb)` const
  
  Find the index into the menu array for a given callback `cb`.

- const `Fl_Menu_Item * find_item(const char *name)`
  
  Find the menu item for a given menu pathname, such as "Edit/Copy".

- const `Fl_Menu_Item * find_item(Fl_Callback *)`
  
  Find the menu item for the given callback.

- const `Fl_Menu_Item * find_item_with_argument(long)`
  
  Find the menu item for the given user argument `v`.

- const `Fl_Menu_Item * find_item_with_user_data(void *)`
  
  Find the menu item for the given user data `v`.

- `Fl_Menu_Item(int, int, int, int, const char *label=0)`
  
  Creates a new `Fl_Menu_Item` widget using the given position, size, and label string.

- void `global()`
  
  Make the shortcuts for this menu work no matter what window has the focus when you type it.

- int `insert(int index, const char *a, int shortcut, Fl_Callback *, void *, int=0)`
  
  Inserts a new menu item at the specified index position.

- int `insert(int index, const char *a, const char *b, Fl_Callback *, void *, int=0)`
  
  See int `Fl_Menu_Item::insert(const char *label, int shortcut, Fl_Callback *, void *, int flags=0)`

- int `item_pathname(char *name, int namelen, const Fl_Menu_Item *finditem=0)` const
  
  Get the menu `pathname` for the specified menuitem.

- const `Fl_Menu_Item * menu()` const
  
  Returns a pointer to the array of `Fl_Menu_Item`s.

- void `menu(const Fl_Menu_Item *m)`
  
  Sets the menu array pointer directly.

- `Fl_Boxtype menu_box()` const
  
  Get the box type for the menu popup windows.

- void `menu_box(Fl_Boxtype b)`
  
  Set the box type for the menu popup windows.

- const `Fl_Menu_Item * menu_end()`
  
  Finishes menu modifications and returns `menu()`.

- int `mode(int i)` const
  
  Gets the flags of item `i`.

- void `mode(int i, int fl)`
  
  Sets the flags of item `i`.

- const `Fl_Menu_Item * mvalue()` const
  
  Returns a pointer to the last menu item that was picked.

- const `Fl_Menu_Item * picked(const Fl_Menu_Item *)`
  
  When user picks a menu item, call this.

- const `Fl_Menu_Item * prev_mvalue()` const
  
  Returns a pointer to the menu item that was picked before the current one was picked.

- void `remove(int)`
  
  Deletes item `i` from the menu.

- void `replace(int, const char *)`
Changes the text of item \( i \).

- **void** **setonly** *(Fl_Menu_Item *item)*  
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

- **void** **shortcut** *(int i, int s)*  
  Changes the shortcut of item \( i \) to \( s \).

- **int** **size** () const  
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.

- **void** **size** *(int W, int H)*  

- **const Fl_Menu_Item * test_shortcut ()**  
  Returns the menu item with the entered shortcut (key value).

- **const char * text () const**  
  Returns the title of the last item chosen.

- **const char * text (int i) const**  
  Returns the title of item \( i \).

- **Fl_Color textcolor () const**  
  Get the current color of menu item labels.

- **void** **textcolor** *(Fl_Color c)*  
  Sets the current color of menu item labels.

- **Fl_Font textfont () const**  
  Gets the current font of menu item labels.

- **void** **textfont** *(Fl_Font c)*  
  Sets the current font of menu item labels.

- **Fl_Fontsize textsize () const**  
  Gets the font size of menu item labels.

- **void** **textsize** *(Fl_Fontsize c)*  
  Sets the font size of menu item labels.

- **int** **value** () const  
  Returns the index into menu() of the last item chosen by the user.

- **int** **value** *(const Fl_Menu_Item * )*  
  The value is the index into menu() of the last item chosen by the user.

- **int** **value** *(int i)*  
  The value is the index into menu() of the last item chosen by the user.

Public Member Functions inherited from Fl_Widget

- **void** **_clear_fullscreen ()**  

- **void** **_set_fullscreen ()**  

- **void** **activate ()**  
  Activates the widget.

- **unsigned int** **active () const**  
  Returns whether the widget is active.

- **int** **active_r () const**  
  Returns whether the widget and all of its parents are active.

- **Fl_Align** **align () const**  
  Gets the label alignment.

- **void** **align** *(Fl_Align alignment)*  
  Sets the label alignment.

- **long** **argument () const**  
  Gets the current user data (long) argument that is passed to the callback function.

- **void** **argument** *(long v)*  
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

• **Fl_Color color2 () const**
  
  For back compatibility only.

• **void color2 (unsigned a)**
  
  For back compatibility only.

• **int contains (const Fl_Widget *w) const**
  
  Checks if w is a child of this widget.

• **void copy_label (const char *new_label)**
  
  Sets the current label.

• **void copy_tooltip (const char *text)**
  
  Sets the current tooltip text.

• **uchar damage () const**
  
  Returns non-zero if draw() needs to be called.

• **void damage (uchar c)**
  
  Sets the damage bits for the widget.

• **void damage (uchar c, int x, int y, int w, int h)**
  
  Sets the damage bits for an area inside the widget.

• **int damage_resize (int, int, int, int)**
  
  Internal use only.

• **void deactivate ()**
  
  Deactivates the widget.

• **Fl_Image * deimage ()**
  
  Gets the image that is used as part of the widget label when in the inactive state.

• **const Fl_Image * deimage () const**
  
  Gets the image that is used as part of the widget label when in the inactive state.

• **void deimage (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

• **void deimage (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

• **int deimage_bound () const**
  
  Returns whether the inactive image is managed by the widget.

• **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with default arguments.

• **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

• **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

• **void draw_label (int, int, int, int, Fl_Align) const**
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• **int h () const**
  
  Gets the widget height.

• **virtual void hide ()**
  
  Makes a widget invisible.

• **Fl_Image * image ()**
  
  Gets the image that is used as part of the widget label when in the active state.

• **const Fl_Image * image () const**
  
  Gets the image that is used as part of the widget label when in the active state.

• **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

• **void image (Fl_Image *img)**
Sets the image to use as part of the widget label when in the active state.

- `int image_bound () const`
  Returns whether the image is managed by the widget.

- `int inside (const Fl_Widget *wgt) const`
  Checks if this widget is a child of `wgt`.

- `int is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`
  Gets the current label text.

- `void label (const char *text)`
  Sets the current label pointer.

- `void label (Fl_Labeltype a, const char *b)`
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  Gets the label color.

- `void labelcolor (Fl_Color c)`
  Sets the label color.

- `Fl_Font labelfont () const`
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

- `void labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  Internal use only - “for hacks only”.

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  Gets the selection color.
• void **selection_color**(Fl_Color a)
  Sets the selection color.

• void **set_active**()
  Marks the widget as active without sending events or changing focus.

• void **set_changed**()
  Marks the value of the widget as changed.

• void **set_output**()
  Sets a widget to output only.

• void **set_visible**()
  Makes the widget visible.

• void **set_visible_focus**()
  Enables keyboard focus navigation with this widget.

• int **shortcut_label** () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void **shortcut_label** (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void **show**()
  Changes the size of the widget.

• int **take_focus** ()
  Gives the widget the keyboard focus.

• unsigned int **takesevents** () const
  Returns if the widget is able to take events.

• int **testShortcut** ()
  Returns true if the widget's label contains the entered 'x' shortcut.

• const char∗ **tooltip** () const
  Gets the current tooltip text.

• void **tooltip** (const char∗ text)
  Sets the current tooltip text.

• *Fl_Window* **top_window** () const
  Returns a pointer to the top-level window for the widget.

• *Fl_Window* **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar **type** () const
  Gets the widget type.

• void **type** (uchar t)
  Sets the widget type.

• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void **user_data** () const
  Gets the user data for this widget.

• void **user_data** (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

• void **user_data** (void ∗v)
  Sets the user data for this widget.

• unsigned int **visible** () const
  Returns whether a widget is visible.

• unsigned int **visible_focus** () const
  Checks whether this widget has a visible focus.

• void **visible_focus** (int v)
Modifies keyboard focus navigation.
- \textbf{int visible\_r () const}
  Returns whether a widget and all its parents are visible.
- \textbf{int w () const}
  Gets the widget width.
- \textbf{FL\_When when () const}
  Returns the conditions under which the callback is called.
- \textbf{void when (uchar i)}
  Sets the flags used to decide when a callback is called.
- \textbf{Fl\_Window * window () const}
  Returns a pointer to the nearest parent window up the widget hierarchy.
- \textbf{int x () const}
  Gets the widget position in its window.
- \textbf{int y () const}
  Gets the widget position in its window.
- \textbf{virtual \textasciitilde Fl\_Widget ()}
  Destroys the widget.

\textbf{Protected Member Functions}
- \textbf{void draw () FL\_OVERRIDE}
  Draws the widget.

\textbf{Protected Member Functions inherited from Fl\_Menu\_}
- \textbf{int item\_pathname\_ (char *name, int namelen, const Fl\_Menu\_Item *finditem, const Fl\_Menu\_Item *menu=0) const}

\textbf{Protected Member Functions inherited from Fl\_Widget}
- \textbf{void clear\_flag (unsigned int c)}
  Clears a flag in the flags mask.
- \textbf{void draw\_backdrop () const}
  \textit{If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.}
- \textbf{void draw\_box () const}
  Draws the widget box according its box style.
- \textbf{void draw\_box (Fl\_Boxtype t, Fl\_Color c) const}
  Draws a box of type \textit{t}, of color \textit{c} at the widget's position and size.
- \textbf{void draw\_box (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color c) const}
  Draws a box of type \textit{t}, of color \textit{c} at the position \textit{X,Y} and size \textit{W,H}.
- \textbf{void draw\_focus () const}
  Draws a focus rectangle around the widget.
- \textbf{void draw\_focus (Fl\_Boxtype t, int X, int Y, int W, int H) const}
  Draws a focus rectangle around the widget.
- \textbf{void draw\_focus (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color bg) const}
  Draws a focus box for the widget at the given position and size.
- \textbf{void draw\_label () const}
  Draws the widget's label at the defined label position.
- \textbf{void draw\_label (int, int, int) const}
  Draws the label in an arbitrary bounding box.
- \textbf{Fl\_Widget (int x, int y, int w, int h, const char *label=0L)}
  Creates a widget at the given position and size.
• unsigned int flags() const
  
  Gets the widget flags mask.

• void h(int v)
  
  Internal use only.

• void set_flag(unsigned int c)
  
  Sets a flag in the flags mask.

• void w(int v)
  
  Internal use only.

• void x(int v)
  
  Internal use only.

• void y(int v)
  
  Internal use only.

Friends

• class Fl_Sys_Menu_Bar_Driver

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback(Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don’t set a callback.

• static unsigned int label_shortcut(const char *t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int test_shortcut(const char *, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

11.84 Fl_Menu_Bar Class Reference

11.84.1 Detailed Description

This widget provides a standard menubar interface. Usually you will put this widget along the top edge of your window. The height of the widget should be 30 for the menu titles to draw correctly with the default font. The items on the bar and the menus they bring up are defined by a single Fl_Menu_Item array. Because a Fl_Menu_Item array defines a hierarchy, the top level menu defines the items in the menubar, while the submenus define the pull-down menus. Sub-sub menus and lower pop up to the right of the submenus.

```
| ico | File | Edit | Checkbx | Radio | Font | Empty | Inactive | Huge | button |
```

Figure 11.27 menubar

If there is an item in the top menu that is not a title of a submenu, then it acts like a "button" in the menubar. Clicking on it will pick it.

When the user clicks a menu item, value() is set to that item and then:

- The item's callback is done if one has been set; the Fl_Menu_Bar is passed as the Fl_Widget* argument, along with any userdata configured for the callback.
- If the item does not have a callback, the Fl_Menu_Bar's callback is done instead, along with any userdata configured for the callback. The callback can determine which item was picked using value(), mvalue(), item_pathname(), etc.

Submenus will also pop up in response to shortcuts indicated by putting a '&' character in the name field of the menu item. If you put a '&' character in a top-level "button" then the shortcut picks it. The '&' character in submenus is ignored until the menu is popped up. Typing the shortcut() of any of the menu items will cause callbacks exactly the same as when you pick the item with the mouse.

11.84.2 Constructor & Destructor Documentation

11.84.2.1 Fl_Menu_Bar()

```
Fl_Menu_Bar::Fl_Menu_Bar ( int X, int Y, int W, int H, const char * l = 0 )
```

Creates a new Fl_Menu_Bar widget using the given position, size, and label string. The default boxtype is FL_UP_BOX.
The constructor sets menu() to NULL. See Fl_Menu_ for the methods to set or change the menu.
labelsize(), labelfont(), and labelcolor() are used to control how the menubar items are drawn. They are initialized from the Fl_Menu static variables, but you can change them if desired.
label() is ignored unless you change align() to put it outside the menubar.
The destructor removes the Fl_Menu_Bar widget and all of its menu items.

11.84.3 Member Function Documentation

11.84.3.1 draw()

```
void Fl_Menu_Bar::draw ( ) [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
11.84.3.2 handle()

int Fl_Menu_Bar::handle (int event) [virtual]

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may “ring the bell” or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in | event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Widget.

11.84.3.3 update()

virtual void Fl_Menu_Bar::update () [inline], [virtual]

Updates the menu bar after any change to its items. This is useful when the menu bar can be an Fl_Sys_Menu_Bar object. Reimplemented in Fl_Sys_Menu_Bar.

The documentation for this class was generated from the following files:

- Fl_Menu_Bar.H
- Fl_Menu_Bar.cxx

11.85 Fl_Menu_Button Class Reference

This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of Fl_Menu_Item objects.

#include <Fl_Menu_Button.H>

Inheritance diagram for Fl_Menu_Button:
Fl_Menu_Button Class Reference

Public Types

- enum popup_buttons {
  POPUP1, POPUP2, POPUP12, POPUP3, POPUP13, POPUP23, POPUP123
}

  indicate what mouse buttons pop up the menu.

Public Member Functions

- Fl_Menu_Button(int x, int y, int w, int h, const char *label=0)
  Creates a new Fl_Menu_Button widget using the given position, size, and label string.

- int handle(int e) FL_OVERRIDE
  Handles the specified event.

- const Fl_Menu_Item *popup()
  Act exactly as though the user clicked the button or typed the shortcut key.

Public Member Functions inherited from Fl_Menu_

- int add(const char *label)
  This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.

- int add(const char *label, int shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)
  Adds a new menu item.

- int add(const char *a, const char *b, Fl_Callback *c, void *d=0, int e=0)
  See int Fl_Menu_::add(const char* label, int shortcut, Fl_Callback*, void* user_data=0, int flags=0)

- void clear()
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

- int clear_submenu(int index)
  Clears the specified submenu pointed to by index of all menu items.

- void copy(const Fl_Menu_Item *m, void *user_data=0)
  Sets the menu array pointer with a copy of m that will be automatically deleted.

- Fl_Boxtype down_box() const
  This box type is used to surround the currently-selected items in the menus.

- void down_box(Fl_Boxtype b)
  Sets the box type used to surround the currently-selected items in the menus.

- Fl_Color down_color() const
  For back compatibility, same as selection_color()

- void down_color(unsigned c)
  For back compatibility, same as selection_color()

- int find_index(const char *name) const
  Find the menu item index for a given menu pathname, such as "Edit/Copy".

- int find_index(const Fl_Menu_Item *item) const
  Find the index into the menu array for a given item.

- int find_index(Fl_Callback *cb) const
  Find the index into the menu array for a given callback cb.
• const Fl_Menu_Item * find_item (const char *name)
  
  Find the menu item for a given menu pathname, such as "Edit/Copy".

• const Fl_Menu_Item * find_item (Fl_Callback *)
  
  Find the menu item for the given callback cb.

• const Fl_Menu_Item * find_item_with_argument (long)
  
  Find the menu item for the given user argument v.

• const Fl_Menu_Item * find_item_with_user_data (void *)
  
  Find the menu item for the given user data v.

• Fl_Menu_ (int, int, int, int, const char * = 0)
  
  Creates a new Fl_Menu_ widget using the given position, size, and label string.

• void global ()
  
  Make the shortcuts for this menu work no matter what window has the focus when you type it.

• int insert (int index, const char *, int shortcut, Fl_Callback *, void *, int = 0)
  
  Inserts a new menu item at the specified index position.

• int insert (int index, const char *a, const char *b, Fl_Callback *c, void *d = 0, int e = 0)
  
  See int Fl_Menu_::insert(const char* label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)

• int item_pathname (char *, name, int namelen, const Fl_Menu_Item *finditem=0) const
  
  Get the menu ‘pathname’ for the specified menuitem.

• const Fl_Menu_Item * menu () const
  
  Returns a pointer to the array of Fl_Menu_Items.

• void menu (const Fl_Menu_Item *)
  
  Sets the menu array pointer directly.

• Fl_Boxtype menu_box () const
  
  Get the box type for the menu popup windows.

• void menu_box (Fl_Boxtype b)
  
  Set the box type for the menu popup windows.

• const Fl_Menu_Item * menu_end ()
  
  Finishes menu modifications and returns menu().

• int mode (int i) const
  
  Gets the flags of item i.

• void mode (int i, int fl)
  
  Sets the flags of item i.

• const Fl_Menu_Item * mvalue () const
  
  Returns a pointer to the last menu item that was picked.

• const Fl_Menu_Item * picked (const Fl_Menu_Item *)
  
  When user picks a menu item, call this.

• const Fl_Menu_Item * prev_mvalue () const
  
  Returns a pointer to the menu item that was picked before the current one was picked.

• void remove (int)
  
  Deletes item i from the menu.

• void replace (int, const char *)
  
  Changes the text of item i.

• void setonly (Fl_Menu_Item *item)
  
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

• void shortcut (int i, int s)
  
  Changes the shortcut of item i to s.

• int size () const
  
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.

• void size (int W, int H)
  
  const Fl_Menu_Item * testShortcut ()
  
  Returns the menu item with the entered shortcut (key value).
• const char * text () const
  Returns the title of the last item chosen.
• const char * text (int i) const
  Returns the title of item i.
• Fl_Color textcolor () const
  Get the current color of menu item labels.
• void textcolor (Fl_Color c)
  Sets the current color of menu item labels.
• Fl_Font textfont () const
  Gets the current font of menu item labels.
• void textfont (Fl_Font c)
  Sets the current font of menu item labels.
• Fl_Fontsize textsize () const
  Gets the font size of menu item labels.
• void textsize (Fl_Fontsize c)
  Sets the font size of menu item labels.
• int value () const
  Returns the index into menu() of the last item chosen by the user.
• int value (const Fl_Menu_Item *)
  The value is the index into menu() of the last item chosen by the user.
• int value (int i)
  The value is the index into menu() of the last item chosen by the user.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image *img)
Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  Gets the current callback function for the widget.

- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.
- **void** `copy_tooltip (const char *text)`
  
  Sets the current tooltip text.

- **uchar** `damage () const`
  
  Returns non-zero if `draw()` needs to be called.

- **void** `damage (uchar c)`
  
  Sets the damage bits for the widget.

- **void** `damage (uchar c, int x, int y, int w, int h)`
  
  Sets the damage bits for an area inside the widget.

- **int** `damage_resize (int, int, int)`
  
  Internal use only.

- **void** `deactivate ()`
  
  Deactivates the widget.

- **FL_Image * deimage ()**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **const FL_Image * deimage () const**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **void** `deimage (FL_Image &img)`
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void** `deimage (FL_Image *img)`
  
  Sets the image to use as part of the widget label when in the inactive state.

- **int** `deimage_bound () const`
  
  Returns whether the inactive image is managed by the widget.

- **void** `do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with default arguments.

- **void** `do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with arbitrary arguments.

- **void** `do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with arbitrary arguments.

- **void** `draw_label (int, int, int, int, FL_Align) const`
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int** `h () const`
  
  Gets the widget height.

- **virtual void** `hide ()`
  
  Makes a widget invisible.

- **FL_Image * image ()**
  
  Gets the image that is used as part of the widget label when in the active state.

- **const FL_Image * image () const**
  
  Gets the image that is used as part of the widget label when in the active state.

- **void** `image (FL_Image &img)`
  
  Sets the image to use as part of the widget label when in the active state.

- **void** `image (FL_Image *img)`
  
  Sets the image to use as part of the widget label when in the active state.

- **int** `image_bound () const`
  
  Returns whether the image is managed by the widget.

- **int** `inside (const FL_Widget *wgt) const`
  
  Checks if this widget is a child of `wgt`.

- **int** `is_label_copied () const`
  
  Returns whether the current label was assigned with `copy_label()`.

- **const char * label () const**
  
  Gets the current label text.

- **void** `label (const char *text)`
Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group ∗parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group ∗p)
  Internal use only - “for hacks only”.
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void ∗ user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void ∗ user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window ∗ window () const
Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.
- `int y () const`
  Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
  Destroys the widget.

Protected Member Functions

- `void draw () FL_OVERRIDE`
  Draws the widget.

Protected Member Functions inherited from Fl_Menu_

- `int item_pathname_ (char *name, int namelen, const Fl_Menu_Item *finditem, const Fl_Menu_Item *menu=0) const`

Protected Member Functions inherited from Fl_Widget

- `void clear_flag (unsigned int c)`
  Clears a flag in the flags mask.
- `void draw_backdrop () const`
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
  Draws the widget box according its box style.
- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget's position and size.
- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.
- `void draw_focus () const`
  Draws a focus rectangle around the widget.
- `void draw_focus (Fl_Boxtype t, int X, int Y , int W, int H) const`
  Draws a focus rectangle around the widget.
- `void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  Draws a focus box for the widget at the given position and size.
- `void draw_label () const`
  Draws the widget's label at the defined label position.
- `void draw_label (int, int, int, int) const`
  Draws the label in an arbitrary bounding box.
- `Fl_Widget (int x, int y, int w, int h, const char *label=0L)`
  Creates a widget at the given position and size.
- `unsigned int flags () const`
  Gets the widget flags mask.
- `void h (int v)`
  Internal use only.
- `void set_flag (unsigned int c)`
  Sets a flag in the flags mask.
- `void w (int v)`
  Internal use only.
- `void x (int v)`
  Internal use only.
- `void y (int v)`
  Internal use only.
Static Protected Attributes

- static Fl_Menu_Button* pressed_menu_button_ = NULL

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback(Fl_Widget* widget, void* data)
  
  The default callback for all widgets that don’t set a callback.

- static unsigned int label_shortcut(const char* t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int test_shortcut(const char* t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3, 
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, 
  AUTO_DELETE_USER_DATA = 1<<23, 
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }

  flags possible values enumeration.

Protected Attributes inherited from Fl_Menu_

- uchar alloc
- uchar down_box_
- Fl_Boxtype menu_box_
- Fl_Color textcolor_
- Fl_Font textfont_
- Fl_Fontsize textsize_

11.85.1 Detailed Description

This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of Fl_Menu_Item objects.
Normally any mouse button will pop up a menu and it is lined up below the button as shown in the picture. However an Fl_Menu_Button may also control a pop-up menu. This is done by setting the type(). If type() is zero a normal menu button is produced. If it is nonzero then this is a pop-up menu. The bits in type() indicate what mouse buttons pop up the menu (see Fl_Menu_Button::popup_buttons).

The menu will also pop up in response to shortcuts indicated by putting a ‘&’ character in the label(). Typing the shortcut() of any of the menu items will cause callbacks exactly the same as when you pick the item with the mouse. The ‘&’ character in menu item names are only looked at when the menu is popped up, however. When the user clicks a menu item, value() is set to that item and then:

- The item's callback is done if one has been set; the Fl_Menu_Button is passed as the Fl_Widget* argument, along with any userdata configured for the callback.
- If the item does not have a callback, the Fl_Menu_Button’s callback is done instead, along with any userdata configured for it. The callback can determine which item was picked using value(), mvalue(), item_pathname(), etc.

### 11.85.2 Member Enumeration Documentation

#### 11.85.2.1 popup_buttons

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>POPUP1</td>
<td>pops up with the mouse 1st button.</td>
</tr>
<tr>
<td>POPUP2</td>
<td>pops up with the mouse 2nd button.</td>
</tr>
<tr>
<td>POPUP12</td>
<td>pops up with the mouse 1st or 2nd buttons.</td>
</tr>
<tr>
<td>POPUP3</td>
<td>pops up with the mouse 3rd button.</td>
</tr>
<tr>
<td>POPUP13</td>
<td>pops up with the mouse 1st or 3rd buttons.</td>
</tr>
<tr>
<td>POPUP23</td>
<td>pops up with the mouse 2nd or 3rd buttons.</td>
</tr>
<tr>
<td>POPUP123</td>
<td>pops up with any mouse button.</td>
</tr>
</tbody>
</table>

Values for type() used to indicate what mouse buttons pop up the menu. Fl_Menu_Button::POPUP3 is usually what you want.
11.85.3 Constructor & Destructor Documentation

11.85.3.1 Fl_Menu_Button()

Fl_Menu_Button::Fl_Menu_Button ( int X, int Y, int W, int H, const char ∗ l = 0 )

Creates a new Fl_Menu_Button widget using the given position, size, and label string.
The default boxtype is FL_UP_BOX.
The constructor sets menu() to NULL. See Fl_Menu_ for the methods to set or change the menu.

11.85.4 Member Function Documentation

11.85.4.1 draw()

void Fl_Menu_Button::draw ( ) [protected], [virtual]

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.
Overide this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget ∗s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
Implements Fl_Widget.

11.85.4.2 handle()

int Fl_Menu_Button::handle ( int event ) [virtual]

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-
circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The
effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses)
in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In
such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by
returning 1 even if you didn't do anything with it.

Parameters

| in | event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Widget.
### 11.85.4.3 popup()

```
const Fl_Menu_Item * Fl_Menu_Button::popup ( )
```

Act exactly as though the user clicked the button or typed the shortcut key. The menu appears, it waits for the user to pick an item, and if they pick one it sets `value()` and does the callback or sets `changed()` as described above. The menu item is returned or NULL if the user dismisses the menu.

**Note**

Since FLTK 1.4.0 `Fl_Menu::menu_end()` is called before the menu pops up to make sure the menu array is located in private storage.

See also

- `Fl_Menu::menu_end()`

The documentation for this class was generated from the following files:

- Fl_Menu_Button.H
- Fl_Menu_Button.hxx

### 11.86 Fl_Menu_Item Struct Reference

The `Fl_Menu_Item` structure defines a single menu item that is used by the `Fl_Menu_` class.

```
#include <Fl_Menu_Item.H>
```

**Public Member Functions**

- `void activate ()`
  
  Allows a menu item to be picked.

- `int active () const`
  
  Gets whether or not the item can be picked.

- `int activevisible () const`
  
  Returns non 0 if FL_INACTIVE and FL_INVISIBLE are cleared, 0 otherwise.

- `int add (const char *, int shortcut, Fl_Callback *, void *, int=0)`
  
  Adds a menu item.

- `int add (const char *a, const char *b, Fl_Callback *c, void *d=0, int e=0)`
  
  See int add(const char *, int shortcut, Fl_Callback*, void*, int)

- `long argument () const`
  
  Gets the `user_data()` argument that is sent to the callback function.

- `void argument (long v)`
  
  Sets the `user_data()` argument that is sent to the callback function.

- `Fl_Callback_p callback () const`
  
  Returns the callback function that is set for the menu item.

- `void callback (Fl_Callback *c)`
  
  Sets the menu item's callback function.

- `void callback (Fl_Callback *c, void *p)`
  
  Sets the menu item's callback function and `userdata()` argument.

- `void callback (Fl_Callback0 *c)`
  
  Sets the menu item's callback function.

- `void callback (Fl_Callback1 *c, long p=0)`
  
  Sets the menu item's callback function and `userdata()` argument.

- `void check ()`
  
  Back compatibility only.

- `int checkbox () const`
  
  Returns true if a checkbox will be drawn next to this item.
• int **checked** () const
  
  Back compatibility only.

• void **clear** ()
  
  Turns the check or radio item "off" for the menu item.

• void **deactivate** ()
  
  Prevents a menu item from being picked.

• void **do_callback** (Fl_Widget ∗o) const
  
  Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.

• void **do_callback** (Fl_Widget ∗o, long arg) const
  
  Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.

• void **do_callback** (Fl_Widget ∗o, void ∗arg) const
  
  Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.

• void **draw** (int x, int y, int w, int h, const Fl_Menu_∗, int t=0) const
  
  Draws the menu item in bounding box x,y,w,h, optionally selects the item.

• const Fl_Menu_Item ∗**find_shortcut** (int ∗ip=0, const bool require_alt=false) const
  
  Search only the top level menu for a shortcut.

• Fl_Menu_Item ∗**first** ()
  
  Returns the first menu item, same as next(0).

• const Fl_Menu_Item ∗**first** () const
  
  Returns the first menu item, same as next(0).

• void **hide** ()
  
  Hides an item in the menu.

• void **image** (Fl_Image &image)
  
  Compatibility API for FLUID, same as image.label(this).

• void **image** (Fl_Image ∗image)
  
  Compatibility API for FLUID, same as image->label(this).

• int **insert** (int, const char ∗, int, Fl_Callback ∗, void ∗=0, int=0)
  
  Inserts an item at position index.

• const char ∗**label** () const
  
  Returns the title of the item.

• void **label** (const char ∗a)
  
  See const char ∗ Fl_Menu_Item::label() const

• void **label** (Fl_Labeltype a, const char ∗b)
  
  See const char ∗ Fl_Menu_Item::label() const

• Fl_Color **labelcolor** () const
  
  Gets the menu item's label color.

• void **labelcolor** (Fl_Color a)
  
  Sets the menu item's label color.

• Fl_Font **labelfont** () const
  
  Gets the menu item's label font.

• void **labelfont** (Fl_Font a)
  
  Sets the menu item's label font.

• Fl_Fontsize **labelsiz**e () const
  
  Gets the label font pixel size/height.

• void **labelsiz**e (Fl_Fontsize a)
  
  Sets the label font pixel size/height.

• Fl_Labeltype **labeltype** () const
  
  Returns the menu item's labeltype.

• void **labeltype** (Fl_Labeltype a)
  
  See Fl_Menu_Item::labeltype() const

Generated by Doxygen
Sets the menu item's labeltype.

- **int measure (int *h, const Fl_Menu_Item *) const**
  Measures width of label, including effect of & characters.

- **Fl_Menu_Item * next (int i=1) const**
  Advances a pointer by n items through a menu array, skipping the contents of submenus and invisible items.

- **const Fl_Menu_Item * next (int=1) const**
  Advance a pointer by n items through a menu array, skipping the contents of submenus and invisible items.

- **const Fl_Menu_Item * popup (int X, int Y, const char *title=0, const Fl_Menu_Item *picked=0, const Fl_Menu_Item *=0) const**
  This method is called by widgets that want to display menus.

- **const Fl_Menu_Item * pulldown (int X, int Y, int W, int H, const Fl_Menu_Item *picked=0, const Fl_Menu_Item *title=0, int menubar=0) const**
  Pulldown() is similar to popup(), but a rectangle is provided to position the menu.

- **int radio () const**
  Returns true if this item is a radio item.

- **void set ()**
  Turns the check or radio item "on" for the menu item.

- **void setonly (Fl_Menu_Item const *first=NULL)**
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items set.

- **int shortcut () const**
  Gets what key combination shortcut will trigger the menu item.

- **void shortcut (int s)**
  Sets exactly what key combination will trigger the menu item.

- **void show ()**
  Makes an item visible in the menu.

- **int size () const**
  Size of the menu starting from this menu item.

- **int submenu () const**
  Returns true if either FL_SUBMENU or FL_SUBMENU_POINTER is on in the flags.

- **const Fl_Menu_Item * testShortcut () const**
  This is designed to be called by a widgets handle() method in response to a FL_SHORTCUT event.

- **void uncheck ()**
  Back compatibility only.

- **void * user_data () const**
  Gets the user_data() argument that is sent to the callback function.

- **void user_data (void *v)**
  Sets the user_data() argument that is sent to the callback function.

- **int value () const**
  Returns the current value of the check or radio item.

- **void value (int v)**
  Sets the current value of the check or radio item.

- **int visible () const**
  Gets the visibility of an item.

Public Attributes

- **Fl_Callback * callback_**
  menu item callback

- **int flags**
  menu item flags like FL_MENU_TOGGLE, FL_MENU_RADIO

- **Fl_Color labelcolor_**
menu item text color
- **Fl_Font** `labelfont_`
  - which font for this menu item text
- **Fl_Fontsize** `labelsize_`
  - size of menu item text
- **uchar** `labelfont_`
  - how the menu item text looks like
- **int** `shortcut_`
  - menu item shortcut
- **const char** ∗`text`
  - menu item text, returned by `label()`
- **void** ∗`user_data_`
  - menu item user_data for the menu’s callback

### 11.86.1 Detailed Description

The **Fl_Menu_Item** structure defines a single menu item that is used by the **Fl_Menu_** class.

```c
struct Fl_Menu_Item {
  const char* text; // label()
  int shortcut_;    
  Fl_Callback* callback_; 
  void* user_data_; 
  uchar labeltype_;  
  uchar labelfont_; 
  uchar labelsize_;  
  uchar labelcolor_; 
};
```

```
enum { // values for flags:
  FL_MENU_INACTIVE = 1, // Deactivate menu item (gray out)
  FL_MENU_TOGGLE = 2, // Item is a checkbox toggle (shows checkbox for on/off state)
  FL_MENU_VALUE = 4, // The on/off state for checkbox/radio buttons (if set, state is ‘on’)
  FL_MENU_RADIO = 8, // Item is a radio button (one checkbox of many can be on)
  FL_MENU_INVISIBLE = 0x10, // Item will not show up (shortcut will work)
  FL_SUBMENU_POINTER = 0x20, // Indicates user_data() is a pointer to another menu array
  FL_SUBMENU = 0x40, // This item is a submenu to other items
  FL_MENU_DIVIDER = 0x80, // Creates divider line below this item. Also ends a group of radio buttons.
  FL_MENU_HORIZONITAL = 0x100, // ??? -- reserved, internal (do not use)
  FL_MENU_RESERVED = 0xffffffff // These bits are reserved for internal or future usage (do not use)
};
```

Typically menu items are statically defined; for example:

```c
Fl_Menu_Item popup[] = { 
  /*alpha*/, FL_ALT+'a', the_cb, (void*)1},
  /*beta*/ ,  FL_ALT+'b', the_cb, (void*)2),
  /*gamma*/, FL_ALT+'c', the_cb, (void*)3, FL_MENU_DIVIDER),
  /*strange*/, 0, strange_cb),
  /*charm*/, 0, charm_cb),
  /*truth*/, 0, truth_cb),
  /*beauty*/, 0, beauty_cb),
  /*submenu*/, 0, 0, 0, FL_SUBMENU),
  /*one*/),
  /*two*/,
  /*three*/),
  [0],
  /*inactive*/, FL_ALT+'i', 0, 0, FL_MENU_INACTIVE|FL_MENU_DIVIDER),
  /*invisible*/FL_ALT+'i', 0, 0, FL_MENU_INVISIBLE),
  /*check*/ ,  FL_ALT+'c', 0, 0, FL_MENU_TOGGLE|FL_MENU_VALUE),
  /*box*/ ,  FL_ALT+'b', 0, 0, FL_MENU_TOGGLE),
  [0]};
```

produces:
A submenu title is identified by the bit FL_SUBMENU in the flags field, and ends with a label() that is NULL. You can nest menus to any depth. A pointer to the first item in the submenu can be treated as an Fl_Menu array itself. It is also possible to make separate submenu arrays with FL_SUBMENU_POINTER flags.

You should use the method functions to access structure members and not access them directly to avoid compatibility problems with future releases of FLTK.

Note

Adding menu items with insert(), add(), or any of its overloaded variants copies the entire menu to internal storage. Using the memory of a static menu array after that would access unused (but not released) memory and thus have no effect.

11.86.2 Member Function Documentation

11.86.2.1 add()

int Fl_Menu_Item::add (const char * mytext, int sc, Fl_Callback * cb, void * data = 0, int myflags = 0)

Adds a menu item.

The text is split at '/' characters to automatically produce submenus (actually a totally unnecessary feature as you can now add submenu titles directly by setting FL_SUBMENU in the flags).

Returns

the index into the menu() array, where the entry was added
See also

Fl_Menu_Item::insert(int, const char*, int, Fl_Callback*, void*, int)

11.86.2.2 argument() [1/2]

long Fl_Menu_Item::argument ( ) const [inline]
Gets the user_data() argument that is sent to the callback function.
For convenience you can also define the callback as taking a long argument. This method casts the stored user-data() argument to long and returns it as a long value.

11.86.2.3 argument() [2/2]

void Fl_Menu_Item::argument (long v) [inline]
Sets the user_data() argument that is sent to the callback function.
For convenience you can also define the callback as taking a long argument. This method casts the given argument v to void* and stores it in the menu item's userdata() member. This may not be portable to some machines.

11.86.2.4 callback() [1/5]

Fl_Callback_p Fl_Menu_Item::callback ( ) const [inline]
Returns the callback function that is set for the menu item.
Each item has space for a callback function and an argument for that function. Due to back compatibility, the Fl_Menu_Item itself is not passed to the callback, instead you have to get it by calling ((Fl_Menu_*)w)->mvalue() where w is the widget argument.

11.86.2.5 callback() [2/5]

void Fl_Menu_Item::callback (Fl_Callback * c) [inline]
Sets the menu item's callback function.
This method does not set the userdata() argument.
See also

Fl_Callback_p Fl_MenuItem::callback() const

11.86.2.6 callback() [3/5]

void Fl_Menu_Item::callback (Fl_Callback * c, void * p) [inline]
Sets the menu item's callback function and userdata() argument.
See also

Fl_Callback_p Fl_MenuItem::callback() const

11.86.2.7 callback() [4/5]

void Fl_Menu_Item::callback (Fl_Callback0 * c) [inline]
Sets the menu item's callback function.
This method does not set the userdata() argument.
See also

Fl_Callback_p Fl_MenuItem::callback() const
11.86.2.8 callback() [5/5]

void Fl_Menu_Item::callback (  
    Fl_Callback1 * c,  
    long p = 0 ) [inline]

Sets the menu item's callback function and userdata() argument.  
The argument is cast to void* and stored as the userdata() for the menu item's callback function.

See also

    Fl_Callback_p Fl_MenuItem::callback() const

11.86.2.9 check()

void Fl_Menu_Item::check ( ) [inline]

Back compatibility only.

**Deprecated** Please use Fl_Menu_Item::set() instead. This method will be removed in FLTK 1.5.0 or later.

See also

    set()

11.86.2.10 checkbox()

int Fl_Menu_Item::checkbox ( ) const [inline]

Returns true if a checkbox will be drawn next to this item.

This is true if FL_MENU_TOGGLE or FL_MENU_RADIO is set in the flags.

11.86.2.11 checked()

int Fl_Menu_Item::checked ( ) const [inline]

Back compatibility only.

**Deprecated** Please use Fl_Menu_Item::value() instead. This method will be removed in FLTK 1.5.0 or later.

See also

    value()

11.86.2.12 deactivate()

void Fl_Menu_Item::deactivate ( ) [inline]

Prevents a menu item from being picked.

Note that this will also cause the menu item to appear grayed-out.

11.86.2.13 do_callback() [1/3]

void Fl_Menu_Item::do_callback (  
    Fl_Widget * o ) const [inline]

Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.  
The callback is called with the stored user_data() as its second argument.  
You must first check that callback() is non-zero before calling this.

11.86.2.14 do_callback() [2/3]

void Fl_Menu_Item::do_callback (  
    Fl_Widget * o,  
    long arg ) const [inline]

Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.  
This call overrides the callback's second argument with the given value arg.  
long arg is cast to void* when calling the callback. You must first check that callback() is non-zero before calling this.
11.86.2.15 do_callback() [3/3]

void Fl_Menu_Item::do_callback (  
    Fl_Widget * o,  
    void * arg ) const [inline]

Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.  
This call overrides the callback's second argument with the given value arg. You must first check that callback() is  
non-zero before calling this.

11.86.2.16 find_shortcut()

const Fl_Menu_Item * Fl_Menu_Item::find_shortcut (  
    int * ip = 0,  
    const bool require_alt = false ) const

Search only the top level menu for a shortcut.  
Either &x in the label or the shortcut fields are used.  
This tests the current event, which must be an FL_KEYBOARD or FL_SHORTCUT, against a shortcut value.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>returns the index of the item, if ip is not NULL.</td>
</tr>
<tr>
<td>require_alt</td>
<td>if true: match only if Alt key is pressed.</td>
</tr>
</tbody>
</table>

Returns

found Fl_Menu_Item or NULL

11.86.2.17 image() [1/2]

void Fl_Menu_Item::image (  
    Fl_Image & iimage ) [inline]

Compatibility API for FLUID, same as image.label(this).

Note

This method is intended for internal use by fluid and may not do what you expect.

11.86.2.18 image() [2/2]

void Fl_Menu_Item::image (  
    Fl_Image * iimage ) [inline]

Compatibility API for FLUID, same as image->label(this).

Note

This method is intended for internal use by fluid and may not do what you expect.

11.86.2.19 insert()

int Fl_Menu_Item::insert (  
    int index,  
    const char * mytext,  
    int sc,  
    Fl_Callback * cb,  
    void * data = 0,  
    int myflags = 0 )

Inserts an item at position index.  
If index is -1, the item is added the same way as Fl_Menu_Item::add().
If 'mytext' contains any un-escaped front slashes (/), it's assumed a menu pathname is being specified, and the value of \texttt{index} will be ignored.
In all other aspects, the behavior of \texttt{insert()} is the same as \texttt{add()}. 

Parameters

<table>
<thead>
<tr>
<th></th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>index</td>
<td>insert new items here</td>
</tr>
<tr>
<td>in</td>
<td>mytext</td>
<td>new label string, details see above</td>
</tr>
<tr>
<td>in</td>
<td>sc</td>
<td>keyboard shortcut for new item</td>
</tr>
<tr>
<td>in</td>
<td>cb</td>
<td>callback function for new item</td>
</tr>
<tr>
<td>in</td>
<td>data</td>
<td>user data for new item</td>
</tr>
<tr>
<td>in</td>
<td>myflags</td>
<td>menu flags as described in Fl_Menu_Item</td>
</tr>
</tbody>
</table>

Returns

the index into the menu() array, where the entry was added

### 11.86.2.20 label()

```cpp
class Fl_Menu_Item
{
public:
    const char * label() const [inline];
}
```

Returns the title of the item.

A NULL here indicates the end of the menu (or of a submenu). A '&' in the item will print an underscore under the next letter, and if the menu is popped up that letter will be a "shortcut" to pick that item. To get a real '& put two in a row.

### 11.86.2.21 labelcolor() [1/2]

```cpp
class Fl_Menu_Item
{
public:
    Fl_Color labelcolor() const [inline];
}
```

Gets the menu item's label color.

This color is passed to the labeltype routine, and is typically the color of the label text. This defaults to FL_BLACK. If this color is not black fltk will not use overlay bitplanes to draw the menu - this is so that images put in the menu draw correctly.

### 11.86.2.22 labelcolor() [2/2]

```cpp
void Fl_Menu_Item::labelcolor ( Fl_Color a ) [inline];
```

Sets the menu item's label color.

See also

```cpp
Fl_Color Fl_Menu_Item::labelcolor() const
```

### 11.86.2.23 labelfont() [1/2]

```cpp
class Fl_Menu_Item
{
public:
    Fl_Font labelfont() const [inline];
}
```

Gets the menu item's label font.

Fonts are identified by small 8-bit indexes into a table. See the enumeration list for predefined fonts. The default value is a Helvetica font. The function Fl::set_font() can define new fonts.

### 11.86.2.24 labelfont() [2/2]

```cpp
void Fl_Menu_Item::labelfont ( Fl_Font a ) [inline];
```

Sets the menu item's label font.

Fonts are identified by small 8-bit indexes into a table. See the enumeration list for predefined fonts. The default value is a Helvetica font. The function Fl::set_font() can define new fonts.
11.86.2.25  labeltype() [1/2]

Fl_Labeltype Fl_Menu_Item::labeltype ( ) const [inline]
Returns the menu item's labeltype.
A labeltype identifies a routine that draws the label of the widget. This can be used for special effects such as
emboss, or to use the label() pointer as another form of data such as a bitmap. The value FL_NORMAL_LABEL
prints the label as text.

11.86.2.26  labeltype() [2/2]

void Fl_Menu_Item::labeltype ( Fl_Labeltype a ) [inline]
Sets the menu item's labeltype.
A labeltype identifies a routine that draws the label of the widget. This can be used for special effects such as
emboss, or to use the label() pointer as another form of data such as a bitmap. The value FL_NORMAL_LABEL
prints the label as text.

11.86.2.27  measure()

int Fl_Menu_Item::measure ( int * hp, const Fl_Menu_Item * m ) const
Measures width of label, including effect of & characters.
Optionally, can get height if hp is not NULL.

11.86.2.28  next() [1/2]

Fl_Menu_Item * Fl_Menu_Item::next ( int i = 1 ) [inline]
Advances a pointer by n items through a menu array, skipping the contents of submenus and invisible items.
There are two calls so that you can advance through const and non-const data.

11.86.2.29  next() [2/2]

const Fl_Menu_Item * Fl_Menu_Item::next ( int n = 1 ) const
Advance a pointer by n items through a menu array, skipping the contents of submenus and invisible items.
There are two calls so that you can advance through const and non-const data.

11.86.2.30  popup()

const Fl_Menu_Item * Fl_Menu_Item::popup ( int X, int Y, const char * title = 0, const Fl_Menu_Item * picked = 0, const Fl_Menu_Item * menu_button = 0 ) const
This method is called by widgets that want to display menus.
The menu stays up until the user picks an item or dismisses it. The selected item (or NULL if none) is returned. This
does not do the callbacks or change the state of check or radio items.
The menu is positioned so the cursor is centered over the item picked. This will work even if picked is in a
submenu. If picked is zero or not in the menu item table the menu is positioned with the cursor in the top-left
corner.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in X,Y</td>
<td>the position of the mouse cursor, relative to the window that got the most recent event (usually you can pass Fl::event_x() and Fl::event_y() unchanged here).</td>
</tr>
<tr>
<td>in title</td>
<td>a character string title for the menu. If non-zero a small box appears above the menu with the title in it.</td>
</tr>
</tbody>
</table>
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>picked</th>
<th>if this pointer is not NULL, the popup menu will appear so that the picked menu is under the mouse pointer.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>menu_button</td>
<td>is a pointer to an Fl_Menu_Item from which the color and boxtypes for the menu are pulled. If NULL then defaults are used.</td>
</tr>
</tbody>
</table>

Returns

a pointer to the menu item selected by the user, or NULL

11.86.2.31 pulldown()

```
const Fl_Menu_Item * Fl_Menu_Item::pulldown (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const Fl_Menu_Item * initial_item = 0,  
  const Fl_Menu_ * pbutton = 0,  
  const Fl_Menu_Item * title = 0,  
  int menubar = 0 ) const
```

Pulldown() is similar to popup(), but a rectangle is provided to position the menu. The menu is made at least W wide, and the picked item initial_item is centered over the rectangle (like Fl_Choice uses). If initial_item is NULL or not found, the menu is aligned just below the rectangle (like a pulldown menu). The title and menubar arguments are used internally by the Fl_Menu_Bar widget.

11.86.2.32 radio()

```
int Fl_Menu_Item::radio ( ) const [inline]
```

Returns true if this item is a radio item. When a radio button is selected all "adjacent" radio buttons are turned off. A set of radio items is delimited by an item that has radio() false, or by an item with FL_MENU_DIVIDER turned on.

11.86.2.33 set()

```
void Fl_Menu_Item::set ( ) [inline]
```

Turns the check or radio item "on" for the menu item. Note that this does not turn off any adjacent radio items like setonly() does.

11.86.2.34 setonly()

```
void Fl_Menu_Item::setonly (  
  Fl_Menu_Item const * first = NULL )
```

Turns the radio item "on" for the menu item and turns "off" adjacent radio items set.

Note

This method is dangerous if radio items are first in the menu. Make sure that first is set correctly or use Fl_Menu_Item::setonly(Fl_Menu_Item+) instead.

Parameters

| in  | first       | start of menu array or NULL (default) if the radio group is not the first item |
11.86.2.35 shortcut()

```cpp
void Fl_Menu_Item::shortcut (int s) [inline]
```

Sets exactly what key combination will trigger the menu item. The value is a logical ‘or’ of a key and a set of shift flags, for instance FL_ALT+’a’ or FL_ALT+FL_F+10 or just ‘a’. A value of zero disables the shortcut. The key can be any value returned by Fl::event_key(), but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down. The shift flags can be any set of values accepted by Fl::event_state(). If the bit is on that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don’t care" setting).

11.86.2.36 size()

```cpp
int Fl_Menu_Item::size () const
```

Size of the menu starting from this menu item. This method counts all menu items starting with this menu item, including all menu items in the same (sub)menu level, all nested submenus, and the terminating empty (0) menu item. It does not count menu items referred to by FL_SUBMENU_POINTER menu items (except the single menu item with FL_SUBMENU_POINTER). All menu items counted are consecutive in memory (one array). Example:

```cpp
schemechoice = new Fl_Choice(X+125,Y,140,25,"FLTK Scheme");
schemechoice->add("none");
schemechoice->add("plastic");
schemechoice->add("gtk+");
schemechoice->add("gleam");
printf("schemechoice->menu()->size() = %d\n", schemechoice->menu()->size());
```

Output:
```
schemechoice->menu()->size() = 5
```

11.86.2.37 submenu()

```cpp
int Fl_Menu_Item::submenu ( ) const [inline]
```

Returns true if either FL_SUBMENU or FL_SUBMENU_POINTER is on in the flags. FL_SUBMENU indicates an embedded submenu that goes from the next item through the next one with a NULL label(). FL_SUBMENU_POINTER indicates that user_data() is a pointer to another menu array.

11.86.2.38 testShortcut()

```cpp
const Fl_Menu_Item * Fl_Menu_Item::test Shortcut ( ) const
```

This is designed to be called by a widgets handle() method in response to a FL_SHORTCUT event. If the current event matches one of the items shortcut, that item is returned. If the keystroke does not match any shortcuts then NULL is returned. This only matches the shortcut() fields, not the letters in the title preceeded by ‘

11.86.2.39 uncheck()

```cpp
void Fl_Menu_Item::uncheck ( ) [inline]
```

Back compatibility only.

**Deprecated** Please use Fl_Menu_Item::clear() instead. This method will be removed in FLTK 1.5.0 or later.

See also

- clear()

11.86.2.40 value()

```cpp
int Fl_Menu_Item::value ( ) const [inline]
```

Returns the current value of the check or radio item. This is zero (0) if the menu item is not checked and non-zero otherwise.
Since 1.4.0 this method returns 1 if the item is checked but you should not rely on a particular value, only zero or
non-zero.

Note
The returned value for a checked menu item was FL_MENU_VALUE (4) before FLTK 1.4.0.

The documentation for this struct was generated from the following files:
- Fl_Menu_Item.H
- Fl_Menu.cxx
- Fl_Menu_.cxx
- Fl_Menu_add.cxx

### 11.87 Fl_Menu_Window Class Reference

The `Fl_Menu_Window` widget is a window type used for menus.

```
#include <Fl_Menu_Window.H>
```

Inheritance diagram for Fl_Menu_Window:

```
Fl_Widget
    ↓
Fl_Group
    ↓
Fl_Window
    ↓
Fl_Single_Window
    ↓
Fl_Menu_Window
```

#### Public Member Functions

- **`Fl_Menu_Window`** (int W, int H, const char ∗l=0)
  
  Creates a new `Fl_Menu_Window` widget using the given size, and label string.

- **`Fl_Menu_Window`** (int X, int Y, int W, int H, const char ∗l=0)
  
  Creates a new `Fl_Menu_Window` widget using the given position, size, and label string.

- **`~Fl_Menu_Window`** ()
  
  Destroys the window and all of its children.

#### Public Member Functions inherited from Fl_Single_Window

- **`Fl_Single_Window`** (int W, int H, const char ∗l=0)
  
  Creates a new `Fl_Single_Window` widget using the given size, and label (title) string.

- **`Fl_Single_Window`** (int X, int Y, int W, int H, const char ∗l=0)
  
  Creates a new `Fl_Single_Window` widget using the given position, size, and label (title) string.

- **void** show () FL_OVERRIDE
  
  Makes a widget visible.

- **void** show (int a, char ∗∗b)
  
  Same as `Fl_Window::show(int a, char ∗∗b)`
Public Member Functions inherited from Fl_Window

• virtual class Fl_Double_Window ∗ as_double_window ()
  Return non-null if this is an Fl_Double_Window object.

• virtual class Fl_Overlay_Window ∗ as_overlay_window ()
  Return non-null if this is an Fl_Overlay_Window object.

• Fl_Window const ∗ as_window () const FL_OVERRIDE
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• unsigned int border () const
  Returns whether the window possesses a border.

• void border (int b)
  Sets whether or not the window manager border is around the window.

• void clear_border ()
  Fast inline function to turn the window manager border off.

• void clear_modal_states ()
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

• void copy_label (const char ∗a)
  Sets the window titlebar label to a copy of a character string.

• void cursor (const Fl_RGB_Image ∗, int, int)
  Changes the cursor for this window using the provided image as cursor's shape.

• void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  For back compatibility only.

• void cursor (Fl_Cursor)
  Changes the cursor for this window.

• int decorated_h () const
  Returns the window height including any window title bar and any frame added by the window manager.

• int decorated_w () const
  Returns the window width including any frame added by the window manager.

• void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  For back compatibility only.

• void default_cursor (Fl_Cursor)
  Sets the default window cursor.

• void draw_backdrop ()
  Draw the background image if one is set and is aligned inside.

• Fl_Window (int w, int h, const char ∗title=0)
  Creates a window from the given width w, height h, and title.

• Fl_Window (int x, int y, int w, int h, const char ∗title=0)
  Creates a window from the given position (x, y), size (w, h) and title.

• void free_position ()
  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.

• void fullscreen ()
  Makes the window completely fill one or more screens, without any window manager border visible.

• unsigned int fullscreen_active () const
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.

• void fullscreen_off ()
  Turns off any side effects of fullscreen()

• void fullscreen_off (int X, int Y, int W, int H)
  Turns off any side effects of fullscreen() and does resize(x,y,w,h).

• void fullscreen_screens (int top, int bottom, int left, int right)
Sets which screens should be used when this window is in fullscreen mode.

- **int handle (int) FL_OVERRIDE**
  Handles the specified event.

- **void hide () FL_OVERRIDE**
  Removes the window from the screen.

- **void hotspot (const Fl_Widget &p, int offscreen=0)**
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot (const Fl_Widget *, int offscreen=0)**
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot (int x, int y, int offscreen=0)**
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- **const void * icon () const**
  Gets the current icon window target dependent data.

- **void icon (const Fl_RGB_Image *)**
  Sets or resets a single window icon.

- **void icon (const void * ic)**
  Platform-specific method to set the window icon usable on Windows and X11 only.

- **void iconize ()**
  Iconifies the window.

- **const char * iconlabel () const**
  See void Fl_Window::iconlabel(const char *)

- **void iconlabel (const char *)**
  Sets the icon label.

- **void icons (const Fl_RGB_Image *[ ], int)**
  Sets the window icons.

- **void icons (HICON big_icon, HICON small_icon)**
  Sets the window icons using HICON handles (Windows platform only).

- **const char * label () const**
  See void Fl_Window::label(const char *)

- **void label (const char *)**
  Sets the window title bar label.

- **void label (const char * label, const char * iconlabel)**
  Sets the icon label.

- **void make_current ()**
  Sets things up so that the drawing functions in `<FL/fl_draw.H>` will go into this window.

- **void maximize ()**
  Maximizes a top-level window to its current screen.

- **unsigned int maximize_active () const**
  Returns whether the window is currently maximized.

- **unsigned int menu_window () const**
  Returns true if this window is a menu window.

- **unsigned int modal () const**
  Returns true if this window is modal or non-modal.

- **unsigned int non_modal () const**
  Returns true if this window is modal or non-modal.

- **fl_uintptr_t os_id ()**
  Returns a platform-specific identification of a shown window, or 0 if not shown.

- **unsigned int override () const**
Returns non-zero if OVERRIDE flag is set, 0 otherwise.

- **void resize** (int X, int Y, int W, int H) **FL_OVERRIDE**
  Changes the size and position of the window.

- **int screen_num ()**
  The number of the screen containing the mapped window.

- **void screen_num (int screen_num)**
  Set the number of the screen where to map the window.

- **void set_menu_window ()**
  Marks the window as a menu window.

- **void set_modal ()**
  A "modal" window, when shown(), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

- **void set_non_modal ()**
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a modal() one in that it remains on top, but it has no effect on event delivery.

- **void set_override ()**
  Activates the flags NOBORDER/OVERRIDE.

- **void set_tooltip_window ()**
  Marks the window as a tooltip window.

- **const Fl_Image ∗ shape ()**
  Returns the image controlling the window shape or NULL.

- **void shape (const Fl_Image &b)**
  Set the window’s shape with an Fl_Image.

- **void shape (const Fl_Image ∗img)**
  Assigns a non-rectangular shape to the window.

- **void show () FL_OVERRIDE**
  Puts the window on the screen.

- **void show (int argc, char ∗∗argv)**
  Puts the window on the screen with show() and parses command-line arguments.

- **int shown ()**
  Returns non-zero if show() has been called (but not hide()).

- **void size_range (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)**
  Sets the allowable range the user can resize this window to.

- **unsigned int tooltip_window () const**
  Returns true if this window is a tooltip window.

- **void un_maximize ()**
  Returns a previously maximized top-level window to its previous size.

- **void wait_for_expose ()**
  Waits for the window to be displayed after calling show().

- **int x_root () const**
  Gets the x position of the window on the screen.

- **const char ∗ xclass () const**
  Returns the xclass for this window, or a default.

- **void xclass (const char ∗c)**
  Sets the xclass for this window.

- **int y_root () const**
  Gets the y position of the window on the screen.

- **virtual ~FL_Window ()**
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Group

- Fl_Widget * & _ddfdesign_kludge ()
  This is for forms compatibility only.

- void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

- void add (Fl_Widget & w)
  See void Fl_Group::add(Fl_Widget &w)

- void add_resizable (Fl_Widget & o)
  Adds a widget to the group and makes it the resizable widget.

- Fl_Widget * const * array () const
  Returns a pointer to the array of children.

- Fl_Group const * as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

- Fl_Widget * child (int n) const
  Returns array()[n].

- int children () const
  Returns how many child widgets the group has.

- void clear ()
  Deletes all child widgets from memory recursively.

- unsigned int clip_children ()
  Returns the current clipping mode.

- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

- void end ()
  Exactly the same as current(this->parent()).

- int find (const Fl_Widget & o) const
  See int Fl_Group::find(const Fl_Widget *w) const.

- int find (const Fl_Widget * w) const
  Searches the child array for the widget and returns the index.

- Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.

- void focus (Fl_Widget * W)

- void forms_end ()
  This is for forms compatibility only.

- void init_sizes ()
  Resets the internal array of widget sizes and positions.

- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

- void insert (Fl_Widget & w, Fl_Widget * before)
  This does insert(w, find(before)).

- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

- void remove (Fl_Widget & o)
  Removes the widget o from the group.

- void remove (int index)
Removes the widget at index from the group but does not delete it.

- **Fl_Widget** ∗ resizable () const
  Returns the group's resizable widget.

- **void** resizable (Fl_Widget &o)
  Sets the group's resizable widget.

- **void** resizable (Fl_Widget ∗o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual** ∼Fl_Group ()
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- **void** _clear_fullscreen ()
- **void** _set_fullscreen ()
- **void** activate ()
  Activates the widget.

- **unsigned int** active () const
  Returns whether the widget is active.

- **int** active_r () const
  Returns whether the widget and all of its parents are active.

- **Fl_Align** align () const
  Gets the label alignment.

- **void** align (Fl_Align alignment)
  Sets the label alignment.

- **long** argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- **void** argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window** ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window** const ∗ as_gl_window () const
- **void** bind_deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

- **void** bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void** bind_image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.

- **void** bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype** box () const
  Gets the box type of the widget.

- **void** box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- **Fl_Callback_p** callback () const
  Gets the current callback function for the widget.

- **void** callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.

- **void** callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- **void** callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗ w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗ new_label)
  Sets the current label.
• void copy_tooltip (const char ∗ text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image ∗ deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound () const`
  Returns whether the inactive image is managed by the widget.

- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.

- `void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- `void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- `void draw_label (int, int, int, int, Fl_Align) const`
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h () const`
  Gets the widget height.

- `Fl_Image ∗image ()`
  Gets the image that is used as part of the widget label when in the active state.

- `const Fl_Image ∗image () const`
  Gets the image that is used as part of the widget label when in the active state.

- `void image (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the active state.

- `void image (Fl_Image ∗img)`
  Sets the image to use as part of the widget label when in the active state.

- `int image_bound () const`
  Returns whether the image is managed by the widget.

- `int inside (const Fl_Widget ∗wgt) const`
  Checks if this widget is a child of wgt.

- `int is_label_copied () const`
  Returns whether the current label was assigned with copy_label().

- `const char ∗label () const`
  Gets the current label text.

- `void label (const char ∗text)`
  Sets the current label pointer.

- `void label (Fl_Labeltype a, const char ∗b)`
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  Gets the label color.

- `void labelcolor (Fl_Color c)`
  Sets the label color.

- `Fl_Font labelfont () const`
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

- `void labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width ww and height hh accordingly with the label size.
- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
- unsigned int output () const
  Returns if a widget is used for output only.
- Fl_Group ∗ parent () const
  Returns a pointer to the parent widget.
- void parent (Fl_Group ∗ p)
  Internal use only - "for hacks only".
- void position (int X, int Y)
  Repositions the window or widget.
- void redraw ()
  Schedules the drawing of the widget.
- void redraw_label ()
  Schedules the drawing of the label.
- Fl_Color selection_color () const
  Gets the selection color.
- void selection_color (Fl_Color a)
  Sets the selection color.
- void set_active ()
  Marks the widget as active without sending events or changing focus.
- void set_changed ()
  Marks the value of the widget as changed.
- void set_output ()
  Sets a widget to output only.
- void set_visible ()
  Makes the widget visible.
- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
- int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
- void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
- void size (int W, int H)
  Changes the size of the widget.
- int take_focus ()
  Gives the widget the keyboard focus.
- unsigned int takesevents () const
  Returns if the widget is able to take events.
- int testshortcut ()
  Returns true if the widget's label contains the entered ' &x ' shortcut.
- const char ∗ tooltip () const
  Gets the current tooltip text.
- void tooltip (const char ∗text)
  Sets the current tooltip text.
- Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
- Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
- uchar type () const
Gets the widget type.

- void **type**(uchar t)
  
  Sets the widget type.

- int **use_accents_menu**()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void **user_data**(const)
  
  Gets the user data for this widget.

- void **user_data**(Fl_Callback_User_Data∗ v, bool auto_free)
  
  Sets the user data for this widget.

- void **user_data**(void∗ v)
  
  Sets the user data for this widget.

- unsigned int **visible**(()) const
  
  Checks whether a widget has a visible focus.

- unsigned int **visible_focus**(()) const
  
  Checks whether this widget is visible.

- void **visible_focus**(int v)
  
  Modifies keyboard focus navigation.

- int **visible_r**(()) const
  
  Returns whether a widget and all its parents are visible.

- int **w**(()) const
  
  Gets the widget width.

- Fl_When **when**(()) const
  
  Returns the conditions under which the callback is called.

- void **when**(uchar i)
  
  Sets the flags used to decide when a callback is called.

- Fl_Window∗ **window**(()) const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int **x**(()) const
  
  Gets the widget position in its window.

- int **y**(()) const
  
  Gets the widget position in its window.

- virtual **~Fl_Widget**(())
  
  Destroys the widget.

### Additional Inherited Members

#### Public Types inherited from Fl_Window

- typedef struct HICON__∗ HICON

#### Static Public Member Functions inherited from Fl_Window

- static Fl_Window∗ **current**()
  
  Returns the last window that was made current.

- static void **default_callback**(Fl_Window∗, void∗ v)
  
  Back compatibility: Sets the default callback v for win to call on close event.

- static void **default_icon**(const Fl_RGB_Image∗)
  
  Sets a single default window icon.

- static void **default_icons**(const Fl_RGB_Image∗[, ] int)
  
  Sets the default window icons.

- static void **default_icons**(HICON big_icon, HICON small_icon)
  
  Sets the default window icons (Windows platform only).
• static const char ∗ default_xclass ()
  Returns the default xclass.
• static void default_xclass (const char ∗)
  Sets the default window xclass.
• static bool is_a_rescale ()
  Returns true when a window is being rescaled.
• static char show_next_window_iconic ()
  Returns the static flag whether the next window should be opened iconified.
• static void show_next_window_iconic (char stat)
  Sets a static flag whether the next window should be opened iconified.

**Static Public Member Functions inherited from Fl_Group**

• static Fl_Group ∗ current ()
  Returns the currently active group.
• static void current (Fl_Group ∗g)
  Sets the current group.

**Static Public Member Functions inherited from Fl_Widget**

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

**Protected Types inherited from Fl_Widget**

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }
flags possible values enumeration.

**Protected Member Functions inherited from Fl_Window**

• void default_size_range ()
  Protected method to calculate the default size range of a window.
• void draw () FL_OVERRIDE
  Draws the widget.
• virtual void flush ()
  Forces the window to be drawn, this window is also made current and calls draw().
• int force_position () const
  Returns the internal state of the window’s FORCE_POSITION flag.
• void **force_position** (int force)
  
  Sets an internal flag that tells FLTK and the window manager to honor position requests.

• void **free_icons** ()
  
  Deletes all icons previously attached to the window.

• int **is_resizable** ()
  
  Protected method to determine whether a window is resizable.

### Protected Member Functions inherited from Fl_Group

• Fl_Rect * *bounds** ()
  
  Returns the internal array of widget sizes and positions.

• void **draw_child** (Fl_Widget &widget) const
  
  Forces a child to redraw.

• void **draw_children** ()
  
  Draws all children of the group.

• void **draw_outside_label** (const Fl_Widget &widget) const
  
  Parents normally call this to draw outside labels of child widgets.

• virtual int **on_insert** (Fl_Widget *, int)
  
  Allow derived groups to act when a widget is added as a child.

• virtual int **on_move** (int, int)
  
  Allow derived groups to act when a widget is moved within the group.

• virtual void **on_remove** (int)
  
  Allow derived groups to act when a child widget is removed from the group.

• int * *sizes** ()
  
  Returns the internal array of widget sizes and positions.

• void **update_child** (Fl_Widget &widget) const
  
  Draws a child only if it needs it.

### Protected Member Functions inherited from Fl_Widget

• void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

• void **draw_backdrop** () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void **draw_box** () const
  
  Draws the widget box according its box style.

• void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const
  
  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
Fl_Multi_Browser Class Reference

Creates a widget at the given position and size.

- unsigned int flags () const
  
  Gets the widget flags mask.

- void h (int v)
  
  Internal use only.

- void set_flag (unsigned int c)
  
  Sets a flag in the flags mask.

- void w (int v)
  
  Internal use only.

- void x (int v)
  
  Internal use only.

- void y (int v)
  
  Internal use only.

Static Protected Attributes inherited from Fl_Window

- static Fl_Window * current_
  
  Stores the last window that was made current.

11.87.1 Detailed Description

The Fl_Menu_Window widget is a window type used for menus. By default the window is drawn in the hardware overlay planes if they are available so that the menu don't force the rest of the window to redraw.

The documentation for this class was generated from the following files:

- Fl_Menu_Window.H
- Fl_Menu_Window.cxx

11.88 Fl_Multi_Browser Class Reference

The Fl_Multi_Browser class is a subclass of Fl_Browser which lets the user select any set of the lines.

#include <Fl_Multi_Browser.H>

Inheritance diagram for Fl_Multi_Browser:

```
Fl_Widget

Fl_Group

Fl_Browser_

Fl_Browser

Fl_Multi_Browser
```

Public Member Functions

- Fl_Multi_Browser (int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Multi_Browser widget using the given position, size, and label string.
Public Member Functions inherited from Fl_Browser

- `void add (const char *newtext, void *d=0)`
  Adds a new line to the end of the browser.

- `void bottomline (int line)`
  Scrolls the browser so the bottom item in the browser is showing the specified line.

- `void clear ()`
  Removes all the lines in the browser.

- `char column_char () const`
  Gets the current column separator character.

- `void column_char (char c)`
  Sets the column separator to c.

- `const int * column_widths () const`
  Gets the current column width array.

- `void column_widths (const int *arr)`
  Sets the current array to arr.

- `void * data (int line) const`
  Returns the user data() for specified line.

- `void data (int line, void *d)`
  Sets the user data for specified line to d.

- `void display (int line, int val=1)`
  For back compatibility.

- `int displayed (int line) const`
  Returns non-zero if line has been scrolled to a position where it is being displayed.

- `Fl_Browser (int X, int Y, int W, int H, const char *L=0)`
  The constructor makes an empty browser.

- `char format_char () const`
  Gets the current format code prefix character, which by default is '@'.

- `void format_char (char c)`
  Sets the current format code prefix character to c.

- `void hide () FL_OVERRIDE`
  Hides the entire Fl_Browser widget – opposite of show().

- `void hide (int line)`
  Makes line invisible, preventing selection by the user.

- `Fl_Image * icon (int line) const`
  Returns the icon currently defined for line.

- `void icon (int line, Fl_Image *icon)`
  Set the image icon for line to the value icon.

- `void insert (int line, const char *newtext, void *d=0)`
  Inserts a new entry whose label is newtext above given line, optional data d.

- `void lineposition (int line, Fl_Line_Position pos)`
  Updates the browser so that line is shown at position pos.

- `int load (const char *filename)`
  Clears the browser and reads the file, adding each line from the file to the browser.

- `void make_visible (int line)`
  Scrolls the item at the specified line visible().

- `void middleline (int line)`
  Scrolls the browser so the middle item in the browser is showing the specified line.

- `void move (int to, int from)`
  Line from is removed and reinserted at to.

- `void remove (int line)`
  Removes the user data() for specified line.
Remove entry for given line number, making the browser one line shorter.

- void remove_icon (int line)
  Removes the icon for line.

- void replace (int a, const char ∗b)
  For back compatibility only.

- int select (int line, int val=1)
  Sets the selection state of the item at line to the value val.

- int selected (int line) const
  Returns 1 if specified line is selected, 0 if not.

- void show () FL_OVERRIDE
  Shows the entire Fl_Browser widget – opposite of hide().

- void show (int line)
  Makes line visible, and available for selection by user.

- int size () const
  Returns how many lines are in the browser.

- void size (int W, int H)

- void swap (int a, int b)
  Swaps two browser lines a and b.

- const char ∗text (int line) const
  Returns the label text for the specified line.

- void text (int line, const char ∗newtext)
  Sets the text for the specified line to newtext.

- Fl_Fontsize textsize () const
  Gets the default text size (in pixels) for the lines in the browser.

- void textsize (Fl_Fontsize newSize)
  Sets the default text size (in pixels) for the lines in the browser to newSize.

- int topline () const
  Returns the line that is currently visible at the top of the browser.

- void topline (int line)
  Scrolls the browser so the top item in the browser is showing the specified line.

- int value () const
  Returns the line number of the currently selected line, or 0 if none selected.

- void value (int line)
  Sets the browser's value(), which selects the specified line.

- int visible (int line) const
  Returns non-zero if the specified line is visible, 0 if hidden.

- ~Fl_Browser ()
  The destructor deletes all list items and destroys the browser.

Public Member Functions inherited from Fl_Browser_

- int deselect (int docallbacks=0)
  Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

- void display (void ∗item)
  Displays the item, scrolling the list as necessary.

- int handle (int event) FL_OVERRIDE
  Handles the event within the normal widget bounding box.

- uchar has_scrollbar () const
  Returns the current scrollbar mode, see Fl_Browser:::has_scrollbar(uchar)

- void has_scrollbar (uchar mode)
  Sets whether the widget should have scrollbars or not (default Fl_Browser:::BOTH).
- **int hposition () const**
  Gets the horizontal scroll position of the list as a pixel position \( \text{pos} \).

- **void hposition (int)**
  Sets the horizontal scroll position of the list to pixel position \( \text{pos} \).

- **int linespacing () const**
  Return the height of additional spacing between browser lines.

- **void linespacing (int pixels)**
  Add some space between browser lines.

- **int position () const**
  **void position (int pos)**
  **void position (int x, int y)**
  **void resize (int X, int Y, int W, int H) FL_OVERRIDE**
  Repositions and/or resizes the browser.

- **void scrollbar_left ()**
  Moves the vertical scrollbar to the lefthand side of the list.

- **void scrollbar_right ()**
  Moves the vertical scrollbar to the righthand side of the list.

- **int scrollbar_size () const**
  Gets the current size of the scrollbars' troughs, in pixels.

- **void scrollbar_size (int newSize)**
  Sets the pixel size of the scrollbars' troughs to \( \text{newSize} \), in pixels.

- **int scrollbar_width () const**
  Returns the global value \( \text{Fl::scrollbar_size()} \).

- **void scrollbar_width (int width)**
  Sets the global \( \text{Fl::scrollbar_size()} \), and forces this instance of the widget to use it.

- **int select (void *, int val=1, int docallbacks=0)**
  Sets the selection state of \( \text{item} \) to \( \text{val} \), and returns 1 if the state changed or 0 if it did not.

- **void select_only (void *, int docallbacks=0)**
  Selects \( \text{item} \) and returns 1 if the state changed or 0 if it did not.

- **void sort (int flags=0)**
  Sort the items in the browser based on \( \text{flags} \).

- **FL_Color textcolor () const**
  Gets the default text color for the lines in the browser.

- **void textcolor (FL_Color col)**
  Sets the default text color for the lines in the browser to color \( \text{col} \).

- **FL_Font textfont () const**
  Gets the default text font for the lines in the browser.

- **void textfont (FL_Font font)**
  Sets the default text font for the lines in the browser to \( \text{font} \).

- **FL_Fontsize textsize () const**
  Gets the default text size (in pixels) for the lines in the browser.

- **void textsize (FL_Fontsize newSize)**
  Sets the default text size (in pixels) for the lines in the browser to \( \text{size} \).

- **int vposition () const**
  Gets the vertical scroll position of the list as a pixel position \( \text{pos} \).

- **void vposition (int pos)**
  Sets the vertical scroll position of the list to pixel position \( \text{pos} \).
Public Member Functions inherited from Fl_Group

- Fl_Widget * & _ddfdesign_kludge ()
  
  This is for forms compatibility only.

- void add (Fl_Widget &)
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- void add (Fl_Widget *o)
  
  See void Fl_Group::add(Fl_Widget &w)

- void add_resizable (Fl_Widget &o)
  
  Adds a widget to the group and makes it the resizable widget.

- Fl_Widget * const * array () const
  
  Returns a pointer to the array of children.

- Fl_Group const * as_group () const FL_OVERRIDE
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- void begin ()
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- Fl_Widget * child (int n) const
  
  Returns array()[n].

- int children () const
  
  Returns how many child widgets the group has.

- void clear ()
  
  Deletes all child widgets from memory recursively.

- unsigned int clip_children ()
  
  Returns the current clipping mode.

- void clip_children (int c)
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- virtual int delete_child (int n)
  
  Removes the widget at index from the group and deletes it.

- void end ()
  
  Exactly the same as current(this->parent()).

- int find (const Fl_Widget &o) const
  
  See int Fl_Group::find(const Fl_Widget &w) const.

- int find (const Fl_Widget *) const
  
  Searches the child array for the widget and returns the index.

- Fl_Group (int, int, int, int, const char * = 0)
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- void focus (Fl_Widget *)

- void forms_end ()
  
  This is for forms compatibility only.

- int handle (int) FL_OVERRIDE
  
  Handles the specified event.

- void init_sizes ()
  
  Resets the internal array of widget sizes and positions.

- void insert (Fl_Widget &, int i)
  
  The widget is removed from its current group (if any) and then inserted into this group.

- void insert (Fl_Widget &o, Fl_Widget *before)
  
  This does insert(w, find(before)).

- void remove (Fl_Widget &)
  
  Removes a widget from the group but does not delete it.

- void remove (Fl_Widget *)
Removes the widget o from the group.

- void **remove** (int index)
  
  Removes the widget at index from the group but does not delete it.

- FL_Widget ∗ **resizable** () const
  
  Returns the group's resizable widget.

- void **resizable** (FL_Widget ∗o)
  
  Sets the group's resizable widget.

- void **resizable** (FL_Widget &o)
  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- void **resize** (int, int, int, int) FL_OVERRIDE
  
  Resizes the Fl_Group widget and all of its children.

- virtual ~Fl_Group ()
  
  The destructor also deletes all the children.

**Public Member Functions inherited from Fl_Widget**

- void **_clear_fullscreen** ()
  
- void **_set_fullscreen** ()
  
- void **activate** ()
  
  Activates the widget.

- unsigned int **active** () const
  
  Returns whether the widget is active.

- int **active_r** () const
  
  Returns whether the widget and all of its parents are active.

- Fl_Align **align** () const
  
  Gets the label alignment.

- void **align** (Fl_Align alignment)
  
  Sets the label alignment.

- long **argument** () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- void **argument** (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window ∗ **as_gl_window** ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const ∗ **as_gl_window** () const
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual Fl_Window ∗ **as_window** ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const ∗ **as_window** () const
  
- void **bind_deimage** (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- void **bind_deimage** (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void **bind_image** (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the active state.

- void **bind_image** (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype **box** () const
  
  Gets the box type of the widget.

- void **box** (Fl_Boxtype new_box)
  
  Sets the box type for the widget.

- Fl_Callback_p **callback** () const
  
  Generated by Doxygen
11.88 Fl_Multi_Browser Class Reference

- void **callback** (Fl_Callback *cb)
  Gets the current callback function for the widget.

- void **callback** (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void **callback** (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.

- void **callback** (Fl_Callback0 *cb)
  Sets the current callback function for the widget.

- void **callback** (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int **changed** () const
  Checks if the widget value changed since the last callback.

- void **clear_active** ()
  Marks the widget as inactive without sending events or changing focus.

- void **clear_changed** ()
  Marks the value of the widget as unchanged.

- void **clear_damage** (uchar c=0)
  Clears or sets the damage flags.

- void **clear_output** ()
  Sets a widget to accept input.

- void **clear_visible** ()
  Hides the widget.

- void **clear_visible_focus** ()
  Disables keyboard focus navigation with this widget.

- Fl_Color **color** () const
  Gets the background color of the widget.

- void **color** (Fl_Color bg)
  Sets the background color of the widget.

- void **color** (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color **color2** () const
  For back compatibility only.

- void **color2** (unsigned a)
  For back compatibility only.

- int **contains** (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void **copy_label** (const char *new_label)
  Sets the current label.

- void **copy_tooltip** (const char *text)
  Sets the current tooltip text.

- uchar **damage** () const
  Returns non-zero if draw() needs to be called.

- void **damage** (uchar c)
  Sets the damage bits for the widget.

- void **damage** (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int **damage_resize** (int, int, int, int)
  Internal use only.

- void **deactivate** ()
  Deactivates the widget.
• **FL_Image** ∗ deimage ()
  
  Gets the image that is used as part of the widget label when in the inactive state.

• **const FL_Image** ∗ deimage () const
  
  Gets the image that is used as part of the widget label when in the inactive state.

• **void deimage (FL_Image &img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

• **void deimage (FL_Image ∗img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

• **int deimage_bound () const**
  
  Returns whether the inactive image is managed by the widget.

• **void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with default arguments.

• **void do_callback (FL_Widget ∗widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

• **void do_callback (FL_Widget ∗widget, void ∗arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

• **void draw_label (int, int, int, int, Fl_Align) const**
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• **int h () const**
  
  Gets the widget height.

• **FL_Image ∗ image ()**
  
  Gets the image that is used as part of the widget label when in the active state.

• **const FL_Image ∗ image () const**
  
  Gets the image that is used as part of the widget label when in the active state.

• **void image (FL_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

• **void image (FL_Image ∗img)**
  
  Sets the image to use as part of the widget label when in the active state.

• **int image_bound () const**
  
  Returns whether the image is managed by the widget.

• **int inside (const FL_Widget ∗wgt) const**
  
  Checks if this widget is a child of wgt.

• **int is_label_copied () const**
  
  Returns whether the current label was assigned with copy_label().

• **const char ∗ label () const**
  
  Gets the current label text.

• **void label (const char ∗text)**
  
  Sets the current label pointer.

• **void label (FL_Labeltype a, const char ∗b)**
  
  Shortcut to set the label text and type in one call.

• **FL_Color labelcolor () const**
  
  Gets the label color.

• **void labelcolor (FL_Color c)**
  
  Sets the label color.

• **FL_Font labelfont () const**
  
  Gets the font to use.

• **void labelfont (FL_Font f)**
  
  Sets the font to use.

• **FL_Fontsize labelsize () const**
  
  Gets the font size in pixels.

• **void labelsize (FL_Fontsize pix)**
Sets the font size in pixels.

- **`Fl_Labeltype labeltype () const`**
  Gets the label type.

- **`void labeltype (Fl_Labeltype a)`**
  Sets the label type.

- **`void measure_label (int &ww, int &hh) const`**
  Sets width ww and height hh accordingly with the label size.

- **`bool needs_keyboard () const`**
  Returns whether this widget needs a keyboard.

- **`void needs_keyboard (bool needs)`**
  Sets whether this widget needs a keyboard.

- **`unsigned int output () const`**
  Returns if a widget is used for output only.

- **`Fl_Group * parent () const`**
  Returns a pointer to the parent widget.

- **`void parent (Fl_Group * p)`**
  Internal use only - "for hacks only".

- **`void position (int X, int Y)`**
  Repositions the window or widget.

- **`void redraw ()`**
  Schedules the drawing of the widget.

- **`void redraw_label ()`**
  Schedules the drawing of the label.

- **`Fl_Color selection_color () const`**
  Gets the selection color.

- **`void selection_color (Fl_Color a)`**
  Sets the selection color.

- **`void set_active ()`**
  Marks the widget as active without sending events or changing focus.

- **`void set_changed ()`**
  Marks the value of the widget as changed.

- **`void set_output ()`**
  Sets a widget to output only.

- **`void set_visible ()`**
  Makes the widget visible.

- **`void set_visible_focus ()`**
  Enables keyboard focus navigation with this widget.

- **`int shortcut_label () const`**
  Returns whether the widget's label uses ' & ' to indicate shortcuts.

- **`void shortcut_label (int value)`**
  Sets whether the widget's label uses ' & ' to indicate shortcuts.

- **`void size (int W, int H)`**
  Changes the size of the widget.

- **`int take_focus ()`**
  Gives the widget the keyboard focus.

- **`unsigned int takesevents () const`**
  Returns if the widget is able to take events.

- **`int testShortcut ()`**
  Returns true if the widget's label contains the entered ' & x ' shortcut.

- **`const char * tooltip () const`**
  Gets the current tooltip text.
• **void tooltip (const char *text)**
  Sets the current tooltip text.

• **Fl_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

• **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

• **uchar type () const**
  Gets the widget type.

• **void type (uchar t)**
  Sets the widget type.

• **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void * user_data () const**
  Gets the user data for this widget.

• **void user_data (Fl_Callback_User_Data *v, bool auto_free)**
  Sets the user data for this widget.

• **void user_data (void *v)**
  Sets the user data for this widget.

• **unsigned int visible () const**
  Returns whether a widget is visible.

• **unsigned int visible_focus () const**
  Checks whether this widget has a visible focus.

• **void visible_focus (int v)**
  Modifies keyboard focus navigation.

• **int visible_r () const**
  Returns whether a widget and all its parents are visible.

• **int w () const**
  Gets the widget width.

• **Fl_When when () const**
  Returns the conditions under which the callback is called.

• **void when (uchar i)**
  Sets the flags used to decide when a callback is called.

• **Fl_Window * window () const**
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int x () const**
  Gets the widget position in its window.

• **int y () const**
  Gets the widget position in its window.

• **virtual ~Fl_Widget ()**
  Destroys the widget.

Additional Inherited Members

Public Types inherited from **Fl_Browser**

• **enum Fl_Line_Position { TOP, BOTTOM, MIDDLE }**
  For internal use only?

Public Types inherited from **Fl_Browser_**

• **enum {**
  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7 **}**
  Values for has_scrollbar().
Static Public Member Functions inherited from **Fl_Group**

- static **Fl_Group** ∗ current ()
  
  Returns the currently active group.

- static void current (Fl_Group ∗g)
  
  Sets the current group.

Static Public Member Functions inherited from **Fl_Widget**

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don’t set a callback.

- static unsigned int label_shortcut (const char ∗t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int test_shortcut (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Public Attributes inherited from **Fl_Browser**

- **Fl_Scrollbar** hscrollbar
  
  Horizontal scrollbar.

- **Fl_Scrollbar** scrollbar
  
  Vertical scrollbar.

Protected Types inherited from **Fl_Widget**

```cpp
enum {
    INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
    FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
    OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, Copied_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
    Menu_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
    GROUP_RELATIVE = 1<<16, Copied_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
    NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
    AUTO_DELETE_USER_DATA = 1<<23,
    MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
```

flags possible values enumeration.

Protected Member Functions inherited from **Fl_Browser**

- **FL_BLINE** ∗ _remove (int line)
  
  Removes the item at the specified line.

- **FL_BLINE** ∗ find_line (int line) const
  
  Returns the item for specified line.

- int full_height () const **FL_OVERRIDE**
  
  The height of the entire list of all visible() items in pixels.

- int incr_height () const **FL_OVERRIDE**
  
  The default 'average' item height (including inter-item spacing) in pixels.

- void insert (int line, **FL_BLINE** ∗item)
  
  Insert specified item above line.

- void ∗ item_at (int line) const **FL_OVERRIDE**
  
  Return the item at specified line.

- void item_draw (void ∗item, int X, int Y, int W, int H) const **FL_OVERRIDE**
Draws item at the position specified by XYWH.

- void *item_first () const FL_OVERRIDE
  Returns the very first item in the list.
- int item_height (void *item) const FL_OVERRIDE
  Returns height of item in pixels.
- void *item_last () const FL_OVERRIDE
  Returns the very last item in the list.
- void *item_next (void *item) const FL_OVERRIDE
  Returns the next item after item.
- void *item_prev (void *item) const FL_OVERRIDE
  Returns the previous item before item.
- void item_select (void *item, int val) FL_OVERRIDE
  Change the selection state of item to the value val.
- int item_selected (void *item) const FL_OVERRIDE
  See if item is selected.
- void item_swap (void *a, void *b) FL_OVERRIDE
  Swap the items a and b.
- const char *item_text (void *item) const FL_OVERRIDE
  Returns the label text for item.
- int item_width (void *item) const FL_OVERRIDE
  Returns width of item in pixels.
- int lineno (void *item) const
  Returns line number corresponding to item, or zero if not found.
- void swap (FL_BLINE *a, FL_BLINE *b)
  Swap the two items a and b.

Protected Member Functions inherited from Fl_Browser_

- void bbox (int &X, int &Y, int &W, int &H) const
  Returns the bounding box for the interior of the list's display window, inside the scrollbars.
- void deleting (void *item)
  This method should be used when item is being deleted from the list.
- int displayed (void *item) const
  Returns non-zero if item has been scrolled to a position where it is being displayed.
- void draw () FL_OVERRIDE
  Draws the list within the normal widget bounding box.
- void *find_item (int ypos)
  This method returns the item under mouse y position ypos.
- Fl_Browser_ (int X, int Y, int W, int H, const char *L=0)
  The constructor makes an empty browser.
- virtual int full_width () const
  This method may be provided by the subclass to indicate the full width of the item list, in pixels.
- void inserting (void *a, void *b)
  This method should be used when an item is in the process of being inserted into the list.
- virtual int item_quick_height (void *item) const
  This method may be provided by the subclass to return the height of the item, in pixels.
- int leftedge () const
  This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.
- void new_list ()
  This method should be called when the list data is completely replaced or cleared.
- void redraw_line (void *item)
This method should be called when the contents of item has changed, but not its height.

- void **redraw_lines ()**
  
  This method will cause the entire list to be redrawn.

- void **replacing (void ∗a, void ∗b)**
  
  This method should be used when item a is being replaced by item b.

- void **selection () const**
  
  Returns the item currently selected, or NULL if there is no selection.

- void **swapping (void ∗a, void ∗b)**
  
  This method should be used when two items a and b are being swapped.

- void **top () const**
  
  Returns the item that appears at the top of the list.

Protected Member Functions inherited from Fl_Group

- Fl_Rect ∗ **bounds ()**
  
  Returns the internal array of widget sizes and positions.

- void **draw () FL_OVERRIDE**
  
  Draws the widget.

- void **draw_child (Fl_Widget &widget) const**
  
  Forces a child to redraw.

- void **draw_children ()**
  
  Draws all children of the group.

- void **draw_outside_label (const Fl_Widget &widget) const**
  
  Parents normally call this to draw outside labels of child widgets.

- virtual int **on_insert (Fl_Widget ∗, int)**
  
  Allow derived groups to act when a widget is added as a child.

- virtual int **on_move (int, int)**
  
  Allow derived groups to act when a widget is moved within the group.

- virtual void **on_remove (int)**
  
  Allow derived groups to act when a child widget is removed from the group.

- int ∗ **sizes ()**
  
  Returns the internal array of widget sizes and positions.

- void **update_child (Fl_Widget &widget) const**
  
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void **clear_flag (unsigned int c)**
  
  Clears a flag in the flags mask.

- void **draw_backdrop () const**
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box () const**
  
  Draws the widget box according its box style.

- void **draw_box (Fl_Boxtype t, Fl_Color c) const**
  
  Draws a box of type t, of color c at the widget's position and size.

- void **draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus () const**
  
  Draws a focus rectangle around the widget.

- void **draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const**
  
  Draws a focus rectangle around the widget.

- void **draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  
  Draws a focus rectangle around the widget.
11.88.1 Detailed Description

The Fl_Multi_Browser class is a subclass of Fl_Browser which lets the user select any set of the lines.

The user interface is Macintosh style: clicking an item turns off all the others and selects that one, dragging selects all the items the mouse moves over, and ctrl + click (Cmd+click on the Mac OS platform) toggles the items. Shift + click extends the selection until the clicked item. This is different from how forms did it. Normally the callback is done when the user releases the mouse, but you can change this with when(). See Fl_Browser for methods to add and remove lines from the browser.

11.88.2 Constructor & Destructor Documentation

11.88.2.1 Fl_Multi_Browser()

Fl_Multi_Browser::Fl_Multi_Browser()
{
    int X,
    int Y,
    int W,
    int H,
    const char *L = 0
}

Creates a new Fl_Multi_Browser widget using the given position, size, and label string.

The default boxtype is FL_DOWN_BOX. The constructor specializes Fl_Browser() by setting the type to FL_←MULTI_BROWSER. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- Fl_Multi_Browser.H
- Fl_Browser.cxx
11.89 Fl_Multi_Label Struct Reference

Allows a mixed text and/or graphics label to be applied to an Fl_Menu_Item or Fl_Widget.

#include <Fl_Multi_Label.H>

Public Member Functions

• void label (Fl_Menu_Item *)
  This method is used to associate a Fl_Multi_Label with a Fl_Menu_Item.

• void label (Fl_Widget *)
  This method is used to associate a Fl_Multi_Label with a Fl_Widget.

Public Attributes

• const char * labela
  Holds the “leftmost” of the two elements in the composite label.

• const char * labelb
  Holds the “rightmost” of the two elements in the composite label.

• uchar typea
  Holds the “type” of labela.

• uchar typeb
  Holds the “type” of labelb.

11.89.1 Detailed Description

Allows a mixed text and/or graphics label to be applied to an Fl_Menu_Item or Fl_Widget.

Most regular FLTK widgets now support the ability to associate both images and text with a label but some special
cases, notably the non-widget Fl_Menu_Item objects, do not. Fl_Multi_Label may be used to create menu items
that have an icon and text, which would not normally be possible for an Fl_Menu_Item. For example, Fl_Multi_Label
is used in the New-Code submenu in fluid, and others.

Each Fl_Multi_Label holds two elements, labela and labelb; each may hold either a text label (const char*) or an
image (Fl_Image*). When displayed, labela is drawn first and labelb is drawn immediately to its right.

More complex labels might be constructed by setting labelb as another Fl_Multi_Label and thus chaining up a series
of label elements.

When assigning a label element to one of labela or labelb, they should be explicitly cast to (const char*) if they are
not of that type already.

Example Use: Fl_Menu_Bar

```c++
FL_Pixmap *image = new Fl_Pixmap(..); // image for menu item; any Fl_Image based widget
Fl_Menu_Bar *menu = new Fl_Menu_Bar(..); // can be any Fl_Menu_ oriented widget (Fl_Choice, Fl_Menu_Button..)

// Create a menu item
int i = menu->add("File/New", ..);
Fl_Menu_Item *item = (Fl_Menu_Item*)&(menu->menu()[i]);

// Create a multi label, assign it an image + text
Fl_Multi_Label *ml = new Fl_Multi_Label;
ml->typea = FL_IMAGE_LABEL;
```

Figure 11.31 Menu items with icons using Fl_Multi_Label
ml->labela = (const char*)image; // any Fl_Image widget: Fl_Fixmap, Fl_PNG_Image, etc..
// Right side of label is label text
ml->typea = FL_NORMAL_LABEL;
ml->labela = item->label();
// Assign the multilabel to the menu item
ml->label(item);

See also
Fl_Label and Fl_Labeltype and examples/howto-menu-with-images.cxx

11.89.2 Member Data Documentation

11.89.2.1 labela

const char* Fl_Multi_Label::labela
Holds the "leftmost" of the two elements in the composite label.
Typically this would be assigned either a text string (const char*), a Fl_Image or a Fl_Multi_Label.

11.89.2.2 labelb

const char* Fl_Multi_Label::labelb
Holds the "rightmost" of the two elements in the composite label.
Typically this would be assigned either a text string (const char*), a Fl_Image or a Fl_Multi_Label.

11.89.2.3 typea

uchar Fl_Multi_Label::typea
Holds the "type" of labela.
Typically this is set to FL_NORMAL_LABEL for a text label, FL_IMAGE_LABEL for an image (based on Fl_image)
or FL_MULTI_LABEL if "chaining" multiple Fl_Multi_Label elements together.

11.89.2.4 typeb

uchar Fl_Multi_Label::typeb
Holds the "type" of labelb.
Typically this is set to FL_NORMAL_LABEL for a text label, FL_IMAGE_LABEL for an image (based on Fl_image)
or FL_MULTI_LABEL if "chaining" multiple Fl_Multi_Label elements together.
The documentation for this struct was generated from the following files:

- Fl_Multi_Label.H
- Fl_Multi_Label.cxx

11.90 Fl_Multiline_Input Class Reference

This input field displays 'n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down
arrow keys.
#include <Fl_Multiline_Input.H>
Inheritance diagram for Fl_Multiline_Input:
Public Member Functions

- **Fl_Multiline_Input (int X, int Y, int W, int H, const char ∗l=0)**
  Creates a new Fl_Multiline_Input widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Input

- **Fl_Input (int, int, int, int, const char ∗=0)**
  Creates a new Fl_Input widget using the given position, size, and label string.
- **int handle (int) FL_OVERRIDE**
  Handles the specified event.

Public Member Functions inherited from Fl_Input_

- **int append (const char ∗t, int l=0, char keep_selection=0)**
  Append text at the end.
- **bool can_redo () const**
  Check if there is a redo action available.
- **bool can_undo () const**
  Check if the last operation can be undone.
- **int copy (int clipboard)**
  Put the current selection into the clipboard.
- **int copy_cuts ()**
  Copies the yank buffer to the clipboard.
- **Fl_Color cursor_color () const**
  Gets the color of the cursor.
- **void cursor_color (Fl_Color n)**
  Sets the color of the cursor.
- **int cut ()**
  Deletes the current selection.
- **int cut (int a, int b)**
  Deletes all characters between index \texttt{a} and \texttt{b}.
- **int cut (int n)**
  Deletes the next \texttt{n} bytes rounded to characters before or after the cursor.
- **double dvalue () const**
  Returns the widget text interpreted as a floating point number.
- **Fl_Input_ (int, int, int, int, const char ∗=0)**
  Creates a new Fl_Input_ widget.
- **unsigned int index (int i) const**
  Returns the character at index \texttt{i}.
- **int input_type () const**
  Gets the input field type.
- **void input_type (int t)**
  Sets the input field type.
- **int insert (const char ∗t, int l=0)**
  Inserts text at the cursor position.
- **int insert_position () const**
  Gets the position of the text cursor.
- **int insert_position (int p)**
  Sets the cursor position and mark.
- **int insert_position (int p, int m)**
  Sets the index for the cursor and mark.
• int ivalue () const
  Returns the widget text interpreted as a signed integer.
• int mark () const
  Gets the current selection mark.
• int mark (int m)
  Sets the current selection mark.
• int maximum_size () const
  Gets the maximum length of the input field in characters.
• void maximum_size (int m)
  Sets the maximum length of the input field in characters.
• int position () const
• int position (int p)
• int position (int p, int m)
• int readonly () const
  Gets the read-only state of the input field.
• void readonly (int b)
  Sets the read-only state of the input field.
• int redo ()
  Redo previous undo operation.
• int replace (int b, int e, const char ∗text, int ilen=0)
  Deletes text from b to e and inserts the new string text.
• void resize (int, int, int, int) FL_OVERRIDE
  Changes the size of the widget.
• int shortcut () const
  Return the shortcut key associated with this widget.
• void shortcut (int s)
  Sets the shortcut key associated with this widget.
• int size () const
  Returns the number of bytes in value().
• void size (int W, int H)
  Sets the width and height of this widget.
• int static_value (const char ∗)
  Changes the widget text.
• int static_value (const char ∗, int)
  Changes the widget text.
• int tab_nav () const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.
• void tab_nav (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.
• FL_Color textcolor () const
  Gets the color of the text in the input field.
• void textcolor (FL_Color n)
  Sets the color of the text in the input field.
• FL_Font textfont () const
  Gets the font of the text in the input field.
• void textfont (FL_FONT s)
  Sets the font of the text in the input field.
• FL_Fontsize textsize () const
  Gets the size of the text in the input field.
• void textsize (FL_Fontsize s)
  Sets the size of the text in the input field.
• int undo ()
  Undoes previous changes to the text buffer.
• const char * value () const
  Returns the text displayed in the widget.
• int value (const char *)
  Changes the widget text.
• int value (const char *, int)
  Changes the widget text.
• int value (double value)
  Changes the widget text to a floating point number ("%g").
• int value (int value)
  Changes the widget text to a signed integer number.
• int wrap () const
  Gets the word wrapping state of the input field.
• void wrap (int b)
  Sets the word wrapping state of the input field.
• ~Fl_Input_ ()
  Destroys the widget.

Public Member Functions inherited from Fi_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image * img)
Sets the image to use as part of the widget label when in the active state.

- **void** `bind_image(int f)`
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype** `box()` const
  Gets the box type of the widget.

- **void** `box(Fl_Boxtype new_box)`
  Sets the box type for the widget.

- **Fl_Callback_p** `callback()` const
  Gets the current callback function for the widget.

- **void** `callback(Fl_Callback *cb)`
  Sets the current callback function for the widget.

- **void** `callback(Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)`
  Sets the current callback function and managed user data for the widget.

- **void** `callback(Fl_Callback *cb, void *p)`
  Sets the current callback function and data for the widget.

- **void** `callback(Fl_Callback0 *cb)`
  Sets the current callback function for the widget.

- **void** `callback(Fl_Callback1 *cb, long p=0)`
  Sets the current callback function for the widget.

- **unsigned int** `changed()` const
  Checks if the widget value changed since the last callback.

- **void** `clear_active()`
  Marks the widget as inactive without sending events or changing focus.

- **void** `clear_changed()`
  Marks the value of the widget as unchanged.

- **void** `clear_damage(uchar c=0)`
  Clears or sets the damage flags.

- **void** `clear_output()`
  Sets a widget to accept input.

- **void** `clear_visible()`
  Hides the widget.

- **void** `clear_visible_focus()`
  Disables keyboard focus navigation with this widget.

- **Fl_Color** `color()` const
  Gets the background color of the widget.

- **void** `color(Fl_Color bg)`
  Sets the background color of the widget.

- **void** `color(Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- **Fl_Color** `color2()` const
  For back compatibility only.

- **void** `color2(unsigned a)`
  For back compatibility only.

- **int** `contains(const Fl_Widget *w)` const
  Checks if w is a child of this widget.

- **void** `copy_label(const char *new_label)`
  Sets the current label.

- **void** `copy_tooltip(const char *text)`
  Sets the current tooltip text.

- **uchar** `damage()` const
  Returns non-zero if `draw()` needs to be called.
• void `damage (uchar c)`
  Sets the damage bits for the widget.
• void `damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.
• int `damage_resize` (int, int, int, int)
  Internal use only.
• void `deactivate()`
  Deactivates the widget.
• `Fl_Image * deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.
• const `Fl_Image * deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.
• void `deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.
• void `deimage (Fl_Image * img)`
  Sets the image to use as part of the widget label when in the inactive state.
• int `deimage_bound () const`
  Returns whether the inactive image is managed by the widget.
• void `do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.
• void `do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
• void `do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
• void `draw_label (int, int, int, int, Fl_Align)` const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int `h () const`
  Gets the widget height.
• virtual void `hide ()`
  Makes a widget invisible.
• `Fl_Image * image ()`
  Gets the image that is used as part of the widget label when in the active state.
• const `Fl_Image * image () const`
  Gets the image that is used as part of the widget label when in the active state.
• void `image (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the active state.
• void `image (Fl_Image * img)`
  Sets the image to use as part of the widget label when in the active state.
• int `image_bound () const`
  Returns whether the image is managed by the widget.
• int `inside (const Fl_Widget *wgt)` const
  Checks if this widget is a child of `wgt`.
• int `is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.
• const char * `label () const`
  Gets the current label text.
• void `label (const char *text)`
  Sets the current label pointer.
• void `label (Fl_Labeltype a, const char *b)`
  Shortcut to set the label text and type in one call.
• `Fl_Color labelcolor () const`
- **void** labelcolor (Fl_Color c)
  
  Sets the label color.

- **void** labelfont (Fl_Font f)
  
  Sets the font to use.

- **void** labelfont () const
  
  Gets the font to use.

- **void** labelsize (Fl_Fontsize pix)
  
  Sets the font size in pixels.

- **void** labelsize () const
  
  Gets the font size in pixels.

- **void** labeltype (Fl_Labeltype a)
  
  Sets the label type.

- **void** labeltype () const
  
  Gets the label type.

- **void** measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

- **bool** needs_keyboard () const
  
  Returns whether this widget needs a keyboard.

- **void** needs_keyboard (bool needs)
  
  Sets whether this widget needs a keyboard.

- **unsigned int** output () const
  
  Returns if a widget is used for output only.

- **Fl_Group** ∗ parent () const
  
  Returns a pointer to the parent widget.

- **void** parent (Fl_Group ∗ p)
  
  Internal use only - "for hacks only".

- **void** position (int X, int Y)
  
  Repositions the window or widget.

- **void** redraw ()
  
  Schedules the drawing of the widget.

- **void** redraw_label ()
  
  Schedules the drawing of the label.

- **Fl_Color** selection_color () const
  
  Gets the selection color.

- **void** selection_color (Fl_Color a)
  
  Sets the selection color.

- **void** set_active ()
  
  Marks the widget as active without sending events or changing focus.

- **void** set_changed ()
  
  Marks the value of the widget as changed.

- **void** set_output ()
  
  Sets a widget to output only.

- **void** set_visible ()
  
  Makes the widget visible.

- **void** set_visible_focus ()
  
  Enables keyboard focus navigation with this widget.

- **int** shortcut_label () const
  
  Returns whether the widget's label uses `&` to indicate shortcuts.

- **void** shortcut_label (int value)
  
  Sets whether the widget's label uses `&` to indicate shortcuts.
virtual void show ()

Makes a widget visible.

void size (int W, int H)

Changes the size of the widget.

int take_focus ()

Gives the widget the keyboard focus.

unsigned int takesevents () const

Returns if the widget is able to take events.

int test_shortcut ()

Returns true if the widget's label contains the entered 'x' shortcut.

const char * tooltip () const

Gets the current tooltip text.

void tooltip (const char * text)

Sets the current tooltip text.

FL_Window * top_window () const

Returns a pointer to the top-level window for the widget.

FL_Window * top_window_offset (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.

uchar type () const

Gets the widget type.

void type (uchar t)

Sets the widget type.

int use_accents_menu ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

void * user_data () const

Gets the user data for this widget.

void user_data (FL_Callback_User_Data *v, bool auto_free)

Sets the user data for this widget.

void user_data (void *v)

Sets the user data for this widget.

unsigned int visible () const

Returns whether a widget is visible.

unsigned int visible_focus () const

Checks whether this widget has a visible focus.

void visible_focus (int v)

Modifies keyboard focus navigation.

int visible_r () const

Returns whether a widget and all its parents are visible.

int w () const

Gets the widget width.

FI_When when () const

Returns the conditions under which the callback is called.

void when (uchar i)

Sets the flags used to decide when a callback is called.

FL_Window * window () const

Returns a pointer to the nearest parent window up the widget hierarchy.

int x () const

Gets the widget position in its window.

int y () const

Gets the widget position in its window.

virtual ~FI_Widget ()

Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from Fl_Input

- static const char *copy_menu_text = "Copy"
  
  [this text may be customized at run-time]
- static const char *cut_menu_text = "Cut"
  
  [this text may be customized at run-time]
- static const char *paste_menu_text = "Paste"
  
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3, 
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7, 
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11, 
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15, 
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19, 
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, 
  AUTO_DELETE_USER_DATA = 1<<23, 
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }

  flags possible values enumeration.

Protected Member Functions inherited from Fl_Input

- void draw () FL_OVERRIDE
  
  Draws the widget.
- int handle_key ()
  
  Handles a keystroke.
- int handle_rmb ()
  
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

- int apply_undo ()
  
  Apply the current undo/redo operation.
- void drawtext (int, int, int, int)
  
  Draws the text in the passed bounding box.
- void drawtext (int, int, int, int, bool draw_active)
  
  Draws the text in the passed bounding box.
- void handle_mouse (int, int, int, int keepmark=0)
Handles mouse clicks and mouse moves.

- **int handleText (int e, int, int, int, int)**
  Handles all kinds of text field related events.

- **int lineEnd (int i) const**
  Finds the end of a line.

- **int lineStart (int i) const**
  Finds the start of a line.

- **int linesPerPage ()**

- **void maybe_do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Moves the cursor to the column given by up_down_pos.

- **int wordEnd (int i) const**
  Finds the end of a word.

- **int wordStart (int i) const**
  Finds the start of a word.

- **int xscroll () const**

- **int yscroll () const**

- **void yscroll (int yOffset)**

Protected Member Functions inherited from Fl_Widget

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

- **void drawBackdrop () const**
  Draws the widget backdrop.

- **void drawBox (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.

- **void drawBox (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void drawFocus () const**
  Draws a focus rectangle around the widget.

- **void drawFocus (Fl_Boxtype t, int X, int Y, int W, int H) const**
  Draws a focus rectangle around the widget.

- **void drawFocus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  Draws a focus box for the widget at the given position and size.

- **void drawLabel () const**
  Draws the widget's label at the defined label position.

- **void drawLabel (int, int, int, int) const**
  Draws the label in an arbitrary bounding box.

- **Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)**
  Creates a widget at the given position and size.

- **unsigned int flags () const**
  Gets the widget flags mask.

- **void h (int v)**
  Internal use only.

- **void set_flag (unsigned int c)**
  Sets a flag in the flags mask.

- **void w (int v)**
  Internal use only.
11.90.1 Detailed Description

This input field displays 'n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down arrow keys.

This is for editing multiline text.

This is far from the nirvana of text editors, and is probably only good for small bits of text, 10 lines at most. Note that this widget does not support scrollbars or per-character color control.

If you are presenting large amounts of text and need scrollbars or full color control of characters, you probably want Fl_Text_Editor instead.

In FLTK 1.3.x, the default behavior of the 'Tab' key was changed to support consistent focus navigation. To get the older FLTK 1.1.x behavior, set Fl_Input::::tab_nav() to 0. Newer programs should consider using Fl_Text_Editor.

11.90.2 Constructor & Destructor Documentation

11.90.2.1 Fl_Multiline_Input()

Fl_Multiline_Input::Fl_Multiline_Input (int X, int Y, int W, int H, const char *l=0)

Creates a new Fl_Multiline_Input widget using the given position, size, and label string.

The default boxtype is FL_DOWN_BOX.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- Fl_Multiline_Input.H
- Fl_Input.cxx

11.91 Fl_Multiline_Output Class Reference

This widget is a subclass of Fl_Output that displays multiple lines of text.

#include <Fl_Multiline_Output.H>

```

Public Member Functions

- Fl_Multiline_Output (int X, int Y, int W, int H, const char *l=0)

  Creates a new Fl_Multiline_Output widget using the given position, size, and label string.
Public Member Functions inherited from Fl_Output

• Fl_Output (int X, int Y, int W, int H, const char *l=0)
  Creates a new Fl_Output widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Input

• Fl_Input (int, int, int, int, const char *l=0)
  Creates a new Fl_Input widget using the given position, size, and label string.
• int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Input_

• int append (const char *t, int l=0, char keep_selection=0)
  Append text at the end.
• bool can_redo () const
  Check if there is a redo action available.
• bool can_undo () const
  Check if the last operation can be undone.
• int copy (int clipboard)
  Put the current selection into the clipboard.
• int copy_cuts ()
  Copies the yank buffer to the clipboard.
• Fl_Color cursor_color () const
  Gets the color of the cursor.
• void cursor_color (Fl_Color n)
  Sets the color of the cursor.
• int cut ()
  Deletes the current selection.
• int cut (int a, int b)
  Deletes all characters between index \(a\) and \(b\).
• int cut (int n)
  Deletes the next \(n\) bytes rounded to characters before or after the cursor.
• double dvalue () const
  Returns the widget text interpreted as a floating point number.
• Fl_Input_ (int, int, int, int, const char *l=0)
  Creates a new Fl_Input_ widget.
• unsigned int index (int i) const
  Returns the character at index \(i\).
• int input_type () const
  Gets the input field type.
• void input_type (int t)
  Sets the input field type.
• int insert (const char *t, int l=0)
  Inserts text at the cursor position.
• int insert_position () const
  Gets the position of the text cursor.
• int insert_position (int p)
  Sets the cursor position and mark.
• int insert_position (int p, int m)
  Sets the index for the cursor and mark.
• int ivalue () const
  Returns the widget text interpreted as a signed integer.
• int mark () const
  Gets the current selection mark.
• int mark (int m)
  Sets the current selection mark.
• int maximum_size () const
  Gets the maximum length of the input field in characters.
• void maximum_size (int m)
  Sets the maximum length of the input field in characters.
• int position () const
• int position (int p)
• int position (int p, int m)
• int readonly () const
  Gets the read-only state of the input field.
• void readonly (int b)
  Sets the read-only state of the input field.
• int redo ()
  Redo previous undo operation.
• int replace (int b, int e, const char ∗text, int ilen=0)
  Deletes text from b to e and inserts the new string text.
• void resize (int, int, int, int) FL_OVERRIDE
  Changes the size of the widget.
• int shortcut () const
  Return the shortcut key associated with this widget.
• void shortcut (int s)
  Sets the shortcut key associated with this widget.
• int size () const
  Returns the number of bytes in value().
• void size (int W, int H)
  Sets the width and height of this widget.
• int static_value (const char ∗)
  Changes the widget text.
• int static_value (const char ∗, int)
  Changes the widget text.
• int tab_nav () const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.
• void tab_nav (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.
• FL_Color textcolor () const
  Gets the color of the text in the input field.
• void textcolor (FL_Color n)
  Sets the color of the text in the input field.
• FL_Font textfont () const
  Gets the font of the text in the input field.
• void textfont (FL_Font s)
  Sets the font of the text in the input field.
• FL_Fontsize textsize () const
  Gets the size of the text in the input field.
• void textsize (FL_Fontsize s)
  Sets the size of the text in the input field.
• int undo ()
  Undoes previous changes to the text buffer.
• const char * value () const
  Returns the text displayed in the widget.
• int value (const char *)
  Changes the widget text.
• int value (const char *, int)
  Changes the widget text.
• int value (double value)
  Changes the widget text to a floating point number ("%g").
• int value (int value)
  Changes the widget text to a signed integer number.
• int wrap () const
  Gets the word wrapping state of the input field.
• void wrap (int b)
  Sets the word wrapping state of the input field.
• ~Fl_Input_ ()
  Destroys the widget.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image * img)
Sets the image to use as part of the widget label when in the active state.

- **void** `bind_image` (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **FL_Boxtype** `box` () const
  
  Gets the box type of the widget.

- **void** `box` (FL_Boxtype new_box)
  
  Sets the box type for the widget.

- **FL_Callback_p** `callback` () const
  
  Gets the current callback function for the widget.

- **void** `callback` (FL_Callback_p cb)
  
  Sets the current callback function for the widget.

- **void** `callback` (FL_Callback_p cb, FL_Callback_User_Data *p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.

- **void** `callback` (FL_Callback_p cb, void *p)
  
  Sets the current callback function and data for the widget.

- **void** `callback` (FL_Callback0_p cb)
  
  Sets the current callback function for the widget.

- **void** `callback` (FL_Callback1_p cb, long p=0)
  
  Sets the current callback function for the widget.

- **unsigned int** `changed` () const
  
  Checks if the widget value changed since the last callback.

- **void** `clear_active` ()
  
  Marks the widget as inactive without sending events or changing focus.

- **void** `clear_changed` ()
  
  Marks the value of the widget as unchanged.

- **void** `clear_damage` (uchar c=0)
  
  Clears or sets the damage flags.

- **void** `clear_output` ()
  
  Sets a widget to accept input.

- **void** `clear_visible` ()
  
  Hides the widget.

- **void** `clear_visible_focus` ()
  
  Disables keyboard focus navigation with this widget.

- **FL_Color** `color` () const
  
  Gets the background color of the widget.

- **void** `color` (FL_Color bg)
  
  Sets the background color of the widget.

- **void** `color` (FL_Color bg, FL_Color sel)
  
  Sets the background and selection color of the widget.

- **FL_Color** `color2` () const
  
  For back compatibility only.

- **void** `color2` (unsigned a)
  
  For back compatibility only.

- **int** `contains` (const FL_Widget *w) const
  
  Checks if w is a child of this widget.

- **void** `copy_label` (const char *new_label)
  
  Sets the current label.

- **void** `copy_tooltip` (const char *text)
  
  Sets the current tooltip text.

- **uchar** `damage` () const
  
  Returns non-zero if `draw()` needs to be called.
• void damage (uchar c)

  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)

  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)

  Internal use only.

• void deactivate ()

  Deactivates the widget.

• Fl_Image ∗ deimage ()

  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image ∗ deimage () const

  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)

  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image *img)

  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const

  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reas one=FL_REASON_UNKNOWN)

  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reas one=FL_REASON_UNKNOWN)

  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reas one=FL_REASON_UNKNOWN)

  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const

  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const

  Gets the widget height.

• virtual void hide ()

  Makes a widget invisible.

• Fl_Image ∗ image ()

  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image ∗ image () const

  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)

  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)

  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const

  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const

  Checks if this widget is a child of wgt.

• int is_label_copied () const

  Returns whether the current label was assigned with copy_label().

• const char ∗ label () const

  Gets the current label text.

• void label (const char ∗text)

  Sets the current label text.

• void label (Fl_Labeltype a, const char ∗b)

  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const

  Returns the label color.
Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group * p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.

• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
virtual void show ()
Makes a widget visible.

void size (int W, int H)
Changes the size of the widget.

int take_focus ()
Gives the widget the keyboard focus.

unsigned int takefocus () const
Returns if the widget is able to take events.

int test_shortcut ()
Returns true if the widget's label contains the entered 'x' shortcut.

const char * tooltip () const
Gets the current tooltip text.

void tooltip (const char *text)
Sets the current tooltip text.

Fl_Window * top_window () const
Returns a pointer to the top-level window for the widget.

Fl_Window * top_window_offset (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.

uchar type () const
Gets the widget type.

void type (uchar t)
Sets the widget type.

int use_accents_menu ()
Returns non zero if MAC_USE.AccENTS_Menu flag is set, 0 otherwise.

void * user_data () const
Gets the user data for this widget.

void user_data (Fl_Callback_User_Data +v, bool auto_free)
Sets the user data for this widget.

void user_data (void +v)
Sets the user data for this widget.

unsigned int visible () const
Returns whether a widget is visible.

unsigned int visible_focus () const
Checks whether this widget has a visible focus.

void visible_focus (int v)
Modifies keyboard focus navigation.

int visible_r () const
Returns whether a widget and all its parents are visible.

int w () const
Gets the widget width.

Fl_When when () const
Returns the conditions under which the callback is called.

void when (uchar i)
Sets the flags used to decide when a callback is called.

Fl_Window * window () const
Returns a pointer to the nearest parent window up the widget hierarchy.

int x () const
Gets the widget position in its window.

int y () const
Gets the widget position in its window.

virtual ~Fl_Widget ()
Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from Fl_Input

• static const char ∗copy_menu_text = "Copy"
  [this text may be customized at run-time]
• static const char ∗cut_menu_text = "Cut"
  [this text may be customized at run-time]
• static const char ∗paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

  enum {
    INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
    FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
    OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
    MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
    GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
    NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
    AUTO_DELETE_USER_DATA = 1<<23,
    MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
  }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Input

• void draw () FL_OVERRIDE
  Draws the widget.
• int handle_key ()
  Handles a keystroke.
  int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

• int apply_undo ()
  Apply the current undo/redo operation.
• void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
• void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
• void handle_mouse (int, int, int, int keepmark=0)
Handles mouse clicks and mouse moves.

- int handletext (int e, int, int, int, int)
  Handles all kinds of text field related events.
- int line_end (int i) const
  Finds the end of a line.
- int line_start (int i) const
  Finds the start of a line.
- int linesPerPage ()
- void maybe_do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Moves the cursor to the column given by up_down_pos.
- int word_end (int i) const
  Finds the end of a word.
- int word_start (int i) const
  Finds the start of a word.
- int xscroll () const
- int yscroll () const
- void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
11.91.1 Detailed Description

This widget is a subclass of Fl_Output that displays multiple lines of text. It also displays tab characters as whitespace to the next column. Note that this widget does not support scrollbars, or per-character color control.
If you are presenting large amounts of read-only text and need scrollbars, or full color control of characters, then use Fl_Text_Display. If you want to display HTML text, use Fl_Help_View.
A caret cursor (\^) shows the keyboard navigation mark for keyboard selection of the output text, e.g. Arrow Keys to move the cursor, Shift + Arrow Keys to create a text selection, and \'^C\' to copy the selected text to the paste buffer. The caret cursor can be disabled by disabling the widget's "visible focus" using clear_visible_focus(), inherited from the Fl_Widget base class. Doing this also disables the widget's keyboard navigation.

11.91.2 Constructor & Destructor Documentation

11.91.2.1 Fl_Multiline_Output()

Fl_Multiline_Output::Fl_Multiline_Output (  
   int X,  
   int Y,  
   int W,  
   int H,  
   const char ∗ l = 0 )  

Creates a new Fl_Multiline_Output widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX. Inherited destructor destroys the widget and any value associated with it. The documentation for this class was generated from the following files:

• Fl_Multiline_Output.H  
• Fl_Input.cxx

11.92 Fl_Native_File_Chooser Class Reference

This class lets an FLTK application easily and consistently access the operating system's native file chooser. #include <Fl_Native_File_Chooser.H>

Public Types

• enum Option {  
   NO_OPTIONS = 0x0000 ,  
   SAVEAS_CONFIRM = 0x0001 ,  
   NEW_FOLDER = 0x0002 ,  
   PREVIEW = 0x0004 ,  
   USE_FILTER_EXT = 0x0008 }  
• enum Type {  
   BROWSE_FILE = 0 ,  
   BROWSE_DIRECTORY ,  
   BROWSE_MULTI_FILE ,  
   BROWSE_MULTI_DIRECTORY ,  
   BROWSE_SAVE_FILE ,  
   BROWSE_SAVE_DIRECTORY }  

Public Member Functions

• int count () const  
   Returns the number of filenames (or directory names) the user selected.  
• const char ∗ directory () const  
   Returns the current preset directory() value.  
• void directory (const char ∗val)  
   Preset the directory the browser will show when opened.
• const char * `errmsg()` const
  Returns a system dependent error message for the last method that failed.

• const char * `filename()` const
  Return the filename the user chose.

• const char * `filename(int i)` const
  Return one of the filenames the user selected.

• const char * `filter()` const
  Returns the filter string last set.

• void `filter(const char * f)`
  Sets the filename filters used for browsing.

• int `filter_value()` const
  Returns which filter value was last selected by the user.

• void `filter_value(int i)`
  Sets which filter will be initially selected.

• int `filters()` const
  Gets how many filters were available, not including "All Files".

• `Fl_Native_File_Chooser(int val=BROWSE_FILE)`
  The constructor.

• int `options()` const
  Gets the platform specific `Fl_Native_File_Chooser::Option` flags.

• void `options(int o)`
  Sets the platform specific chooser options to `val`.

• const char * `preset_file()` const
  Get the preset filename.

• void `preset_file(const char * f)`
  Sets the default filename for the chooser.

• int `show()`
  Post the chooser's dialog.

• const char * `title()` const
  Get the title of the file chooser's dialog window.

• void `title(const char * t)`
  Set the title of the file chooser's dialog window.

• int `type()` const
  Gets the current `Fl_Native_File_Chooser::Type` of browser.

• void `type(int t)`
  Sets the current `Fl_Native_File_Chooser::Type` of browser.

• `~Fl_Native_File_Chooser()`
  Destructor.

**Static Public Attributes**

• static const char * `file_exists_message` = "File exists. Are you sure you want to overwrite?"
  Localizable message.
11.92.1 Detailed Description

This class lets an FLTK application easily and consistently access the operating system's native file chooser. Some operating systems have very complex and specific file choosers that many users want access to specifically, instead of FLTK's default file chooser(s).

In cases where there is no native file browser, FLTK's own file browser is used instead.

To use this widget, use the following include in your code:

```cpp
#include <FL/Fl_Native_File_Chooser.H>
```

The following example shows how to pick a single file:

```cpp
// Create and post the local native file chooser
#include <FL/Fl_Native_File_Chooser.H>
[
...
Fl_Native_File_Chooser fnfc;
fnfc.title("Pick a file");
fnfc.type(Fl_Native_File_Chooser::BROWSE_FILE);
fnfc.filter("Text*\.txt\n" "C Files*\.cxx,\.h,\.c");
fnfc.directory("/var/tmp"); // default directory to use
// Show native chooser
switch ( fnfc.show() ) {
  case -1: printf("ERROR: %s\n", fnfc.errmsg()); break; // ERROR
  case 1: printf("CANCEL\n"); break; // CANCEL
  default: printf("PICKED: %s\n", fnfc.filename()); break; // FILE CHOSEN
}
```

The `Fl_Native_File_Chooser` widget transmits UTF-8 encoded filenames to its user. It is recommended to open files that may have non-ASCII names with the `fl_fopen()` or `fl_open()` utility functions that handle these names in a cross-platform way (whereas the standard `fopen()`/`open()` functions fail on the Windows platform to open files with a non-ASCII name).

Platform Specific Caveats

- Under X11/Wayland, what dialog opens is determined as follows:
  
  1. If command `zenity` is available at run-time and if `Fl::option(OPTION_FNFC_USES_ZENITY)` is not turned off, the `zenity`-based dialog opens. This is expected to be more appropriate than other dialog forms for sandboxed apps.
  
  2. Else if the app runs under the KDE desktop and if command `kdialog` is available at run-time and if the library was not built with `cmake -DOPTION_USE_KDIALOG=Off`, the `kdialog`-based dialog opens.
  
  3. Else if the GTK library is available at run-time on the computer and if `Fl::option(OPTION_FNFC_USES_GTK)` is not turned off, the GTK-styled dialog opens. Call `fl_register_images()` to add a "Preview" button to this dialog. Use the static public attributes of class `Fl_File_Chooser` to localize the browser.
  
  4. Otherwise, FLTK's own dialog produced by the `Fl_File_Chooser` class opens. Call `fl_register_images()` to add a "Preview" button to it. It's best if you also call `Fl_File_Icon::load_system_icons()` at the start of `main()`, to enable the nicer looking file browser widgets. Use the static public attributes of class `Fl_File_Chooser` to localize the browser.

- Some operating systems support certain OS specific options; see `Fl_Native_File_Chooser::options()` for a list.
11.92.2 Member Enumeration Documentation

11.92.2.1 Option

```cpp
enum Fl_Native_File_Chooser::Option
```

**Enumerator**

- **NO_OPTIONS**: no options enabled
- **SAVEAS_CONFIRM**: Show native ‘Save As’ overwrite confirm dialog.
- **NEW_FOLDER**: Show ‘New Folder’ icon (if supported)
- **PREVIEW**: enable preview mode (if supported)
- **USE_FILTER_EXT**: Chooser filter presets the output file extension (if supported)

11.92.2.2 Type

```cpp
enum Fl_Native_File_Chooser::Type
```

**Enumerator**

- **BROWSE_FILE**: browse files (lets user choose one file)
- **BROWSE_DIRECTORY**: browse directories (lets user choose one directory)
- **BROWSE_MULTI_FILE**: browse files (lets user choose multiple files)
- **BROWSE_MULTI_DIRECTORY**: browse directories (lets user choose multiple directories)
- **BROWSE_SAVE_FILE**: browse to save a file
- **BROWSE_SAVE_DIRECTORY**: browse to save a directory
11.92.3 Constructor & Destructor Documentation

11.92.3.1 Fl_Native_File_Chooser()

Fl_Native_File_Chooser::Fl_Native_File_Chooser ( 
    int val = BROWSE_FILE)

The constructor.
Internally allocates the native widgets. Optional \texttt{val} presets the type of browser this will be, which can also be changed with \texttt{type()}.

11.92.3.2 \texttt{\neg\neg} Fl_Native_File_Chooser()

Fl_Native_File_Chooser::\texttt{\neg\neg}Fl_Native_File_Chooser ( )
Destructor.
Deallocates any resources allocated to this widget.

11.92.4 Member Function Documentation

11.92.4.1 \texttt{\neg\neg}count()

int Fl_Native_File_Chooser::\texttt{\neg\neg}count ( ) const

Returns the number of filenames (or directory names) the user selected.
\textbf{Example:}
\begin{verbatim}
if ( fnfc->show() == 0 ) {
    // Print all filenames user selected
    for (int n=0; n<fnfc->count(); n++) {
        printf("%d) '%s'\n", n, fnfc->filename(n));
    }
}
\end{verbatim}

11.92.4.2 \texttt{\neg\neg}directory()

void Fl_Native_File_Chooser::\texttt{\neg\neg}directory ( const char * val )

Preset the directory the browser will show when opened.
If \texttt{val} is NULL, or no directory is specified, the chooser will attempt to use the last non-cancelled folder.

11.92.4.3 \texttt{\neg\neg}errmsg()

const char * Fl_Native_File_Chooser::\texttt{\neg\neg}errmsg ( ) const

Returns a system dependent error message for the last method that failed.
This message should at least be flagged to the user in a dialog box, or to some kind of error log. Contents will be valid only for methods that document \texttt{errmsg()} will have info on failures.

11.92.4.4 \texttt{\neg\neg}filename() [1/2]

const char * Fl_Native_File_Chooser::\texttt{\neg\neg}filename ( ) const

Return the filename the user chose.
Use this if only expecting a single filename. If more than one filename is expected, use \texttt{filename(int)} instead. Return value may be "" if no filename was chosen (eg. user cancelled).

11.92.4.5 \texttt{\neg\neg}filename() [2/2]

const char * Fl_Native_File_Chooser::\texttt{\neg\neg}filename ( int i ) const

Return one of the filenames the user selected.
Use \texttt{count()} to determine how many filenames the user selected.
\textbf{Example:}
\begin{verbatim}
if ( fnfc->show() == 0 ) {
    // Print all filenames user selected
    for (int n=0; n<fnfc->count(); n++) {
        printf("%d) '%s'\n", n, fnfc->filename(n));
    }
}
\end{verbatim}
11.92.4.6 filter() [1/2]

const char * Fl_Native_File_Chooser::filter ( ) const
Returns the filter string last set.
Can be NULL if no filter was set.

11.92.4.7 filter() [2/2]

void Fl_Native_File_Chooser::filter ( const char * f )
Sets the filename filters used for browsing.
The default is NULL, which browses all files.
The filter string can be any of:

- A single wildcard (eg. "*.txt")
- Multiple wildcards (eg. "*.{cxx,h,H}"")
- A descriptive name followed by a "\t" and a wildcard (eg. "Text Files\t*.txt")
- A list of separate wildcards with a "\n" between each (eg. "*.{cxx,H}\n*.txt")
- A list of descriptive names and wildcards (eg. "C++ Files\t*.{cxx,H}\nTxt Files\t*.txt")

The format of each filter is a wildcard, or an optional user description followed by 't' and the wildcard.
On most platforms, each filter is available to the user via a pulldown menu in the file chooser. The 'All Files' option
is always available to the user.

11.92.4.8 filter_value() [1/2]

int Fl_Native_File_Chooser::filter_value ( ) const
Returns which filter value was last selected by the user.
This is only valid if the chooser returns success.

11.92.4.9 filter_value() [2/2]

void Fl_Native_File_Chooser::filter_value ( int i )
Sets which filter will be initially selected.
The first filter is indexed as 0. If filter_value()==filters(), then "All Files" was chosen. If filter_value() > filters(), then
a custom filter was set.

11.92.4.10 options()

void Fl_Native_File_Chooser::options ( int o )
Sets the platform specific chooser options to val.
val is expected to be one or more Fl_Native_File_Chooser::Option flags ORed together. Some platforms have
OS-specific functions that can be enabled/disabled via this method.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
<th>Min</th>
<th>Mac</th>
<th>Other</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW_FOLDER</td>
<td>Shows the 'New Folder' button.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PREVIEW</td>
<td>Enables the 'Preview' mode by default.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>SAVEAS_CONFIRM</td>
<td>Confirm dialog if BROWSE_SAVE_FILE file exists.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>USE_FILTER_EXT</td>
<td>Chooser filter presets the output file extension.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

11.92.4.11 preset_file()

void Fl_Native_File_Chooser::preset_file ( const char * f )
Sets the default filename for the chooser.
Use directory() to set the default directory. Mainly used to preset the filename for save dialogs, and on most
platforms can be used for opening files as well.
11.92.12  show()

```cpp
int Fl_Native_File_Chooser::show()
```

Post the chooser's dialog.
Blocks until dialog has been completed or cancelled.
Returns

- 0 – user picked a file
- 1 – user cancelled
- -1 – failed; errmsg() has reason

11.92.13  title() [1/2]

```cpp
const char * Fl_Native_File_Chooser::title() const
```

Get the title of the file chooser's dialog window.
Return value may be NULL if no title was set.

11.92.14  title() [2/2]

```cpp
void Fl_Native_File_Chooser::title(const char * t)
```

Set the title of the file chooser's dialog window.
Can be NULL if no title desired. The default title varies according to the platform, so you are advised to set the title explicitly.

The documentation for this class was generated from the following files:

- Fl_Native_File_Chooser.H
- Fl_Native_File_Chooser.cxx
- Fl_Native_File_Chooser_GTK.cxx

11.93  Fl_Nice_Slider Class Reference

Inheritance diagram for Fl_Nice_Slider:

```
```

Public Member Functions

- Fl_Nice_Slider(int X, int Y, int W, int H, const char *L=0)

Public Member Functions inherited from Fl_Slider

- void bounds(double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- Fl_Slider(int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Slider widget using the given position, size, and label string.
- Fl_Slider(uchar t, int X, int Y, int W, int H, const char *L)
Creates a new Fl_Slider widget using the given type, position, size, and label string.

- **int handle (int) FL_OVERRIDE**
  Handles the specified event.

- **int scrollvalue (int pos, int size, int first, int total)**
  Sets the size and position of the sliding knob in the box.

- **Fl_Boxtype slider () const**
  Gets the slider box type.

- **void slider (Fl_Boxtype c)**
  Sets the slider box type.

- **float slider_size () const**
  Get the dimensions of the moving piece of slider.

- **void slider_size (double v)**
  Set the dimensions of the moving piece of slider.

### Public Member Functions inherited from Fl_Valuator

- **void bounds (double a, double b)**
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp (double)**
  Clamps the passed value to the valuator range.

- **virtual int format (char ∗)**
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment (double, int)**
  Adds n times the step value to the passed value.

- **double maximum () const**
  Gets the maximum value for the valuator.

- **void maximum (double a)**
  Sets the maximum value for the valuator.

- **double minimum () const**
  Gets the minimum value for the valuator.

- **void minimum (double a)**
  Sets the minimum value for the valuator.

- **void precision (int digits)**
  Sets the step value to $1.0 / 10^{\text{digits}}$.

- **void range (double a, double b)**
  Sets the minimum and maximum values for the valuator.

- **double round (double)**
  Round the passed value to the nearest step increment.

- **double step () const**
  Gets or sets the step value.

- **void step (double a, int b)**
  See double Fl_Valuator::step() const

- **void step (double s)**
  See double Fl_Valuator::step() const.

- **void step (int a)**
  See double Fl_Valuator::step() const.

- **double value () const**
  Gets the floating point(double) value.

- **int value (double)**
  Sets the current value.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  
  Activates the widget.
- unsigned int active () const
  
  Returns whether the widget is active.
- int active_r () const
  
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  
  Gets the label alignment.
- void align (Fl_Align alignment)
  
  Sets the label alignment.
- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const ∗ as_group () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  
  Sets the current callback function for the widget.
- unsigned int changed () const
Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)
  Sets the current label.

- void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image ∗&img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**
  Changes the size or position of the widget.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char * tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.
• **uchar type () const**
  
  Gets the widget type.

• **void type (uchar t)**
  
  Sets the widget type.

• **int use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void * user_data () const**
  
  Gets the user data for this widget.

• **void user_data (Fl_Callback_User_Data *v, bool auto_free)**
  
  Sets the user data for this widget.

• **void user_data (void *v)**
  
  Sets the user data for this widget.

• **unsigned int visible () const**
  
  Returns whether a widget is visible.

• **unsigned int visible_focus () const**
  
  Checks whether this widget has a visible focus.

• **void visible_focus (int v)**
  
  Modifies keyboard focus navigation.

• **int visible_r () const**
  
  Returns whether a widget and all its parents are visible.

• **int w () const**
  
  Gets the widget width.

• **FL_When when () const**
  
  Returns the conditions under which the callback is called.

• **void when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

• **FL_Window * window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int x () const**
  
  Gets the widget position in its window.

• **int y () const**
  
  Gets the widget position in its window.

• **virtual ~Fl_Widget ()**
  
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• **static void default_callback (Fl_Widget *widget, void *data)**
  
  The default callback for all widgets that don’t set a callback.

• **static unsigned int label_shortcut (const char *t)**
  
  Returns the Unicode value of the ’&x’ shortcut in a given text.

• **static int test_shortcut (const char *t, const bool require_alt=false)**
  
  Returns true if the given text t contains the entered ’&x’ shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
    = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.

Protected Member Functions inherited from Fl_Slider

- void draw () FL_OVERRIDE
  Draws the widget.
- void draw (int, int, int, int)
- int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y, int W, int H, const char ∗L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void handle_push ()
  Stores the current value in the previous value.
- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
- double previous_value () const
  Gets the previous floating point value before an event changed it.
- void set_value (double v)
  Sets the current floating point value.
- double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void value_damage ()
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const

Generated by Doxygen
Draws a box of type t, of color c at the widget's position and size.

- **void** draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void** draw_focus () const
  
  Draws a focus rectangle around the widget.

- **void** draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

- **void** draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

- **void** draw_label () const
  
  Draws the widget's label at the defined label position.

- **void** draw_label (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- **Fl_Widget** (int x, int y, int w, int h, const char *label=0L)
  
  Creates a widget at the given position and size.

- **unsigned int** flags () const
  
  Gets the widget flags mask.

- **void** h (int v)
  
  Internal use only.

- **void** set_flag (unsigned int c)
  
  Sets a flag in the flags mask.

- **void** w (int v)
  
  Internal use only.

- **void** x (int v)
  
  Internal use only.

- **void** y (int v)
  
  Internal use only.

The documentation for this class was generated from the following files:

- Fl_Nice_Slider.H
- Fl_Slider.cxx

### 11.94 Fl_Output Class Reference

This widget displays a piece of text.

```cpp
#include <Fl_Output.H>
```

Inheritance diagram for Fl_Output:

```

Generated by Doxygen
Public Member Functions

- **Fl_Output** (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new Fl_Output widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Input

- **Fl_Input** (int, int, int, int, const char *l=0)
  
  Creates a new Fl_Input widget using the given position, size, and label string.

- int handle (int) FL_OVERRIDE
  
  Handles the specified event.

Public Member Functions inherited from Fl_Input_

- int append (const char *t, int l=0, char keep_selection=0)
  
  Append text at the end.

- bool can_redo () const
  
  Check if there is a redo action available.

- bool can_undo () const
  
  Check if the last operation can be undone.

- int copy (int clipboard)
  
  Put the current selection into the clipboard.

- int copy_cuts ()
  
  Copies the yank buffer to the clipboard.

- **Fl_Color cursor_color () const**
  
  Gets the color of the cursor.

- void cursor_color (Fl_Color n)
  
  Sets the color of the cursor.

- int cut ()
  
  Deletes the current selection.

- int cut (int a, int b)
  
  Deletes all characters between index a and b.

- int cut (int n)
  
  Deletes the next n bytes rounded to characters before or after the cursor.

- double dvalue () const
  
  Returns the widget text interpreted as a floating point number.

- **Fl_Input_** (int, int, int, int, const char *l=0)
  
  Creates a new Fl_Input_ widget.

- unsigned int index (int i) const
  
  Returns the character at index i.

- int input_type () const
  
  Gets the input field type.

- void input_type (int t)
  
  Sets the input field type.

- int insert (const char *t, int l=0)
  
  Inserts text at the cursor position.

- int insert_position () const
  
  Gets the position of the text cursor.

- int insert_position (int p)
  
  Sets the cursor position and mark.

- int insert_position (int p, int m)
  
  Sets the index for the cursor and mark.
• int `ivalue ()` const
  Returns the widget text interpreted as a signed integer.
• int `mark ()` const
  Gets the current selection mark.
• int `mark (int m)`
  Sets the current selection mark.
• int `maximum_size ()` const
  Gets the maximum length of the input field in characters.
• void `maximum_size (int m)`
  Sets the maximum length of the input field in characters.
• int `position ()` const
• int `position (int p)`
• int `position (int p, int m)`
  Gets the read-only state of the input field.
• void `readonly (int b)`
  Sets the read-only state of the input field.
• int `redo ()`
  Redo previous undo operation.
• int `replace (int b, int e, const char ∗text, int ilen=0)`
  Deletes text from b to e and inserts the new string ∗text.
• void `resize (int, int, int, int) FL_OVERRIDE`
  Changes the size of the widget.
• int `shortcut ()` const
  Return the shortcut key associated with this widget.
• void `shortcut (int s)`
  Sets the shortcut key associated with this widget.
• int `size ()` const
  Returns the number of bytes in `value()`.
• void `size (int W, int H)`
  Sets the width and height of this widget.
• int `static_value (const char ∗)`
  Changes the widget text.
• int `static_value (const char ∗, int)`
  Changes the widget text.
• int `tab_nav ()` const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.
• void `tab_nav (int val)`
  Sets whether the Tab key does focus navigation, or inserts tab characters into `Fl_Multiline_Input`.
• FL_Color `textcolor ()` const
  Gets the color of the text in the input field.
• void `textcolor (FL_Color n)`
  Sets the color of the text in the input field.
• FL_Font `textfont ()` const
  Gets the font of the text in the input field.
• void `textfont (FL_Font s)`
  Sets the font of the text in the input field.
• FL_Fontsize `textsize ()` const
  Gets the size of the text in the input field.
• void `textsize (FL_Fontsize s)`
  Sets the size of the text in the input field.
• int undo ()
  Undoes previous changes to the text buffer.
• const char * value () const
  Returns the text displayed in the widget.
• int value (const char *)
  Changes the widget text.
• int value (const char *, int)
  Changes the widget text.
• int value (double value)
  Changes the widget text to a floating point number ("%g").
• int value (int value)
  Changes the widget text to a signed integer number.
• int wrap () const
  Gets the word wrapping state of the input field.
• void wrap (int b)
  Sets the word wrapping state of the input field.
• ~Fl_Input_ ()
  Destroys the widget.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image * img)
Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  
  Gets the current callback function for the widget.

- **void callback (Fl_Callback +cb)**
  
  Sets the current callback function for the widget.

- **void callback (Fl_Callback +cb, Fl_Callback_User_Data +p, bool auto_free)**
  
  Sets the current callback function and managed user data for the widget.

- **void callback (Fl_Callback +cb, void +p)**
  
  Sets the current callback function and data for the widget.

- **void callback (Fl_Callback0 +cb)**
  
  Sets the current callback function for the widget.

- **void callback (Fl_Callback1 +cb, long p=0)**
  
  Sets the current callback function for the widget.

- **unsigned int changed () const**
  
  Checks if the widget value changed since the last callback.

- **void clear_active ()**
  
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  
  Clears or sets the damage flags.

- **void clear_output ()**
  
  Sets a widget to accept input.

- **void clear_visible ()**
  
  Hides the widget.

- **void clear_visible_focus ()**
  
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  
  For back compatibility only.

- **void color2 (unsigned a)**
  
  For back compatibility only.

- **int contains (const Fl_Widget +w) const**
  
  Checks if w is a child of this widget.

- **void copy_label (const char +new_label)**
  
  Sets the current label.

- **void copy_tooltip (const char +text)**
  
  Sets the current tooltip text.

- **uchar damage () const**
  
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Re reasonably unknown)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Re reasonably unknown)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Re reasonably unknown)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label text.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
Gets the label color.

- **void labelcolor (Fl_Color c)**
  - Sets the label color.

- **Fl_Font labelfont () const**
  - Gets the font to use.

- **void labelfont (Fl_Font f)**
  - Sets the font to use.

- **Fl_Fontsize labelsize () const**
  - Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  - Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  - Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  - Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  - Sets width ww and height hh accordingly with the label size.

- **bool needs_keyboard () const**
  - Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  - Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  - Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  - Returns a pointer to the parent widget.

- **void parent (Fl_Group * p)**
  - Internal use only - "for hacks only".

- **void position (int X, int Y)**
  - Repositions the window or widget.

- **void redraw ()**
  - Schedules the drawing of the widget.

- **void redraw_label ()**
  - Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  - Gets the selection color.

- **void selection_color (Fl_Color a)**
  - Sets the selection color.

- **void set_active ()**
  - Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  - Marks the value of the widget as changed.

- **void set_output ()**
  - Sets a widget to output only.

- **void set_visible ()**
  - Makes the widget visible.

- **void set_visible_focus ()**
  - Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  - Returns whether the widget's label uses ' & ' to indicate shortcuts.

- **void shortcut_label (int value)**
  - Sets whether the widget's label uses ' & ' to indicate shortcuts.
• virtual void show ()
  **Makes a widget visible.**
• void size (int W, int H)
  **Changes the size of the widget.**
• int take_focus ()
  **Gives the widget the keyboard focus.**
• unsigned int takesevents () const
  **Returns if the widget is able to take events.**
• int test_shortcut ()
  **Returns true if the widget’s label contains the entered ‘&x’ shortcut.**
• const char * tooltip () const
  **Gets the current tooltip text.**
• void tooltip (const char *text)
  **Sets the current tooltip text.**
• Fl_Window * top_window () const
  **Returns a pointer to the top-level window for the widget.**
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  **Finds the x/y offset of the current widget relative to the top-level window.**
• uchar type () const
  **Gets the widget type.**
• void type (uchar t)
  **Sets the widget type.**
• int use_accents_menu ()
  **Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.**
• void * user_data () const
  **Gets the user data for this widget.**
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  **Sets the user data for this widget.**
• void user_data (void *v)
  **Sets the user data for this widget.**
• unsigned int visible () const
  **Returns whether a widget is visible.**
• unsigned int visible_focus () const
  **Checks whether this widget has a visible focus.**
• void visible_focus (int v)
  **Modifies keyboard focus navigation.**
• int visible_r () const
  **Returns whether a widget and all its parents are visible.**
• int w () const
  **Gets the widget width.**
• Fl_When when () const
  **Returns the conditions under which the callback is called.**
• void when (uchar i)
  **Sets the flags used to decide when a callback is called.**
• Fl_Window * window () const
  **Returns a pointer to the nearest parent window up the widget hierarchy.**
• int x () const
  **Gets the widget position in its window.**
• int y () const
  **Gets the widget position in its window.**
• virtual ~Fl_Widget ()
  **Destroys the widget.**
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int testShortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Static Public Attributes inherited from Fl_Input

• static const char ∗copy_menu_text = “Copy”
  [this text may be customized at run-time]
• static const char ∗cut_menu_text = “Cut”
  [this text may be customized at run-time]
• static const char ∗paste_menu_text = ”Paste”
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6,
  CHANGED = 1<<7, OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9,
  COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11, MENU_WINDOW = 1<<12,
  TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPYED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18,
  MAC_USE_ACCEPTS_MENU = 1<<19, NEEDS_KEYBOARD = 1<<20,
  IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<25, USERFLAG2 = 1<<26, USERFLAG1 = 1<<27
}
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Input

• void draw () FL_OVERRIDE
  Draws the widget.
• int handle_key ()
  Handles a keystroke.
• int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

• int apply_undo ()
  Apply the current undo/redo operation.
• void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
• void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
• void handle_mouse (int, int, int, int keepmark=0)
Handles mouse clicks and mouse moves.

- `int handletext (int e, int, int, int, int)`
  Handles all kinds of text field related events.

- `int line_end (int i) const`
  Finds the end of a line.

- `int line_start (int i) const`
  Finds the start of a line.

- `int linesPerPage ()` (Protect)

- `void maybe_do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)` (Protect)

- `int up_down_position (int, int keepmark=0)` (Protect)
  Moves the cursor to the column given by `up_down_pos`.

- `int word_end (int i) const`
  Finds the end of a word.

- `int word_start (int i) const`
  Finds the start of a word.

- `int xscroll () const`
- `int yscroll () const`
- `void yscroll (int yOffset)` (Protect)

Protected Member Functions inherited from Fl_Widget

- `void clear_flag (unsigned int c)` (Protect)
  Clears a flag in the flags mask.

- `void draw_backdrop () const`
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- `void draw_box () const`
  Draws the widget box according its box style.

- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget's position and size.

- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.

- `void draw_focus () const`
  Draws a focus rectangle around the widget.

- `void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const`
  Draws a focus rectangle around the widget.

- `void draw-focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  Draws a focus box for the widget at the given position and size.

- `void draw_label () const`
  Draws the widget's label at the defined label position.

- `void draw_label (int, int, int, int) const`
  Draws the label in an arbitrary bounding box.

- `Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)`
  Creates a widget at the given position and size.

- `unsigned int flags () const`
  Gets the widget flags mask.

- `void h (int v)`
  Internal use only.

- `void set_flag (unsigned int c)`
  Sets a flag in the flags mask.

- `void w (int v)`
  Internal use only.
11.94.1 Detailed Description

This widget displays a piece of text.
When you set the `value()` , `Fl_Output` does a `strcpy()` to its own storage, which is useful for program-generated values. The user may select portions of the text using the mouse and paste the contents into other fields or programs.

![Figure 11.33 Fl_Output](image)

There is a single subclass, `Fl_Multiline_Output`, which allows you to display multiple lines of text. `Fl_Multiline_Output` does not provide scroll bars. If a more complete text editing widget is needed, use `Fl_Text_Display` instead.
The text may contain any characters except `\0`, and will correctly display anything, using `\X` notation for unprintable control characters and `\nnn` notation for unprintable characters with the high bit set. It assumes the font can draw any characters in the ISO-Latin1 character set.

11.94.2 Constructor & Destructor Documentation

11.94.2.1 Fl_Output()

```cpp
Fl_Output::Fl_Output (int X, int Y, int W, int H, const char * l = 0)
```

Creates a new `Fl_Output` widget using the given position, size, and label string.
The default boxtype is `FL_DOWN_BOX`.
Inherited destructor destroys the widget and any value associated with it.
The documentation for this class was generated from the following files:

- Fl_Output.H
- Fl_Multiline_Output
- Fl_Input.cxx
- Fl_Output.cxx
11.95 Fl_Overlay_Window Class Reference

This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image.

#include <Fl_Overlay_Window.H>

Inheritance diagram for Fl_Overlay_Window:

```
Fl_Widget
   |      |
   |      Fl_Group
   |      |
   |      Fl_Window
   |      |
   |      Fl_Double_Window
   |      |
Fl_Overlay_Window
```

Public Member Functions

- Fl_Overlay_Window * as_overlay_window () FL_OVERRIDE
  Return non-null if this is an Fl_Overlay_Window object.
- int can_do_overlay ()
  Returns non-zero if there's hardware overlay support.
- virtual void draw_overlay ()=0
  You must subclass Fl_Overlay_Window and provide this method.
- void flush () FL_OVERRIDE
  Forces the window to be drawn, this window is also made current and calls draw().
- void hide () FL_OVERRIDE
  Makes a widget invisible.
- void redraw_overlay ()
  Call this to indicate that the overlay data has changed and needs to be redrawn.
- void resize (int, int, int, int) FL_OVERRIDE
  Changes the size or position of the widget.
- void show () FL_OVERRIDE
  Makes a widget visible.
- void show (int a, char **b)
  Same as Fl_Window::show(int a, char **b)
- ~Fl_Overlay_Window ()
  Destroys the window and all child widgets.

Public Member Functions inherited from Fl_Double_Window

- Fl_Double_Window * as_double_window () FL_OVERRIDE
  Return non-null if this is an Fl_Overlay_Window object.
- Fl_Double_Window (int W, int H, const char *l=0)
  Creates a new Fl_Double_Window widget using the given position, size, and label (title) string.
- Fl_Double_Window (int X, int Y, int W, int H, const char *l=0)
  See Fl_Double_Window::Fl_Double_Window(int w, int h, const char *label = 0)
- void show (int a, char **b)
  Same as Fl_Window::show(int a, char **b)
- ~Fl_Double_Window ()
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Window

• Fl_Window const * as_window () const FL_OVERRIDE
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• unsigned int border () const
  
  Returns whether the window possesses a border.

• void border (int b)
  
  Sets whether or not the window manager border is around the window.

• void clear_border ()
  
  Fast inline function to turn the window manager border off.

• void clear_modal_states ()
  
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

• void copy_label (const char * a)
  
  Sets the window titlebar label to a copy of a character string.

• void cursor (const Fl_RGB_Image *, int, int)
  
  Changes the cursor for this window using the provided image as cursor's shape.

• void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.

• void cursor (Fl_Cursor)
  
  Changes the cursor for this window.

• int decorated_h () const
  
  Returns the window height including any window title bar and any frame added by the window manager.

• int decorated_w () const
  
  Returns the window width including any frame added by the window manager.

• void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.

• void default_cursor (Fl_Cursor)
  
  Sets the default window cursor.

• void draw_backdrop ()
  
  Draw the background image if one is set and is aligned inside.

• Fl_Window (int w, int h, const char * title=0)
  
  Creates a window from the given width \texttt{w}, height \texttt{h}, and \texttt{title}.

• Fl_Window (int x, int y, int w, int h, const char * title=0)
  
  Creates a window from the given position \texttt{(x, y)}, size \texttt{(w, h)} and \texttt{title}.

• void free_position ()
  
  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.

• void fullscreen ()
  
  Makes the window completely fill one or more screens, without any window manager border visible.

• unsigned int fullscreen_active () const
  
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.

• void fullscreen_off ()
  
  Turns off any side effects of fullscreen()

• void fullscreen_off (int X, int Y, int W, int H)
  
  Turns off any side effects of fullscreen() and does resize(x,y,w,h).

• void fullscreen_screens (int top, int bottom, int left, int right)
  
  Sets which screens should be used when this window is in fullscreen mode.

• int handle (int) FL_OVERRIDE
  
  Handles the specified event.

• void hide () FL_OVERRIDE

Generated by Doxygen
Removes the window from the screen.

- void **hotspot** (const **Fl_Widget** &p, int offscreen=0)
  - See void **Fl_Window::hotspot**(int x, int y, int offscreen = 0)
- void **hotspot** (const **Fl_Widget** *, int offscreen=0)
  - See void **Fl_Window::hotspot**(int x, int y, int offscreen = 0)
- void **hotspot** (int x, int y, int offscreen=0)
  - Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- const void * **icon** () const
  - Gets the current icon window target dependent data.
- void **icon** (const **Fl_RGB_Image** *)
  - Sets or resets a single window icon.
- void **icon** (const void *ic)
  - Platform-specific method to set the window icon usable on Windows and X11 only.
- void **iconize** ()
  - Iconifies the window.
- const char * **iconlabel** () const
  - See void **Fl_Window::iconlabel**(const char *)
- void **iconlabel** (const char *)
  - Sets the icon label.
- void **icons** (const **Fl_RGB_Image** *[], int)
  - Sets the window icons.
- void **icons** (HICON big_icon, HICON small_icon)
  - Sets the window icons using HICON handles (Windows platform only).
- const char * **label** () const
  - See void **Fl_Window::label**(const char *)
- void **label** (const char * label)
  - Sets the window title bar label.
- void **label** (const char * label, const char * iconlabel)
  - Sets the icon label.
- void **make_current** ()
  - Sets things up so that the drawing functions in `<FL/fl_draw.H>` will go into this window.
- void **maximize** ()
  - Maximizes a top-level window to its current screen.
- unsigned int **maximize_active** () const
  - Returns whether the window is currently maximized.
- unsigned int **menu_window** () const
  - Returns true if this window is a menu window.
- unsigned int **modal** () const
  - Returns true if this window is modal.
- unsigned int **non_modal** () const
  - Returns true if this window is modal or non-modal.
- **fl.UIntptr_t** **os_id** ()
  - Returns a platform-specific identification of a shown window, or 0 if not shown.
- unsigned int **override** () const
  - Returns non zero if OVERRIDE flag is set, 0 otherwise.
- void **resize** (int X, int Y, int W, int H) **FL_OVERRIDE**
  - Changes the size and position of the window.
- int **screen_num** ()
The number of the screen containing the mapped window.

- void **screen_num** (int screen_num)
  Set the number of the screen where to map the window.

- void **set_menu_window** ()
  Marks the window as a menu window.

- void **set_modal** ()
  A "modal" window, when **shown**(), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

- void **set_non_modal** ()
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a **modal**() one in that it remains on top, but it has no effect on event delivery.

- void **set_override** ()
  Activates the flags NOBORDER|OVERRIDE.

- void **set_tooltip_window** ()
  Marks the window as a tooltip window.

- const Fl_Image ∗ **shape** ()
  Returns the image controlling the window shape or NULL.

- void **shape** (const Fl_Image &b)
  Set the window's shape with an Fl_Image.

- void **shape** (const Fl_Image ∗img)
  Assigns a non-rectangular shape to the window.

- void **show** () FL_OVERRIDE
  Puts the window on the screen.

- void **show** (int argc, char ∗∗argv)
  Puts the window on the screen with show() and parses command-line arguments.

- int **shown** ()
  Returns non-zero if show() has been called (but not hide()).

- void **size_range** (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
  Sets the allowable range the user can resize this window to.

- unsigned int **tooltip_window** () const
  Returns true if this window is a tooltip window.

- void **un_maximize** ()
  Returns a previously maximized top-level window to its previous size.

- void **wait_for_expose** ()
  Waits for the window to be displayed after calling show().

- int **x_root** () const
  Gets the x position of the window on the screen.

- const char ∗ **xclass** () const
  Returns the xclass for this window, or a default.

- void **xclass** (const char ∗c)
  Sets the xclass for this window.

- int **y_root** () const
  Gets the y position of the window on the screen.

- virtual ~Fl_Window ()
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Group

- Fl_Widget * _ddfdesign_kludge ()
  
  This is for forms compatibility only.
- void add (Fl_Widget &)
  
  The widget is removed from its current group (if any) and then added to the end of this group.
- void add (Fl_Widget &o)
  
  See void Fl_Group::add(Fl_Widget &w)
- void add_resizable (Fl_Widget &o)
  
  Adds a widget to the group and makes it the resizable widget.
- Fl_Widget *const * array () const
  
  Returns a pointer to the array of children.
- Fl_Group const * as_group () const FL_OVERRIDE
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- void begin ()
  
  Sets the current group so you can build the widget tree by just constructing the widgets.
- Fl_Widget * child (int n) const
  
  Returns array()[n].
- int children () const
  
  Returns how many child widgets the group has.
- void clear ()
  
  Deletes all child widgets from memory recursively.
- unsigned int clip_children ()
  
  Returns the current clipping mode.
- void clip_children (int c)
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int delete_child (int n)
  
  Removes the widget at index from the group and deletes it.
- void end ()
  
  Exactly the same as current(this->parent()).
- int find (const Fl_Widget &o) const
  
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *) const
  
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char *=0)
  
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget *W)
- void forms_end ()
  
  This is for forms compatibility only.
- void init_sizes ()
  
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *=o)
  
  Removes the widget o from the group.
- void remove (int index)
Removes the widget at index from the group but does not delete it.

- **Fl_Widget *resizable () const**
  Returns the group's resizable widget.

- **void resizable (Fl_Widget &o)**
  Sets the group's resizable widget.

- **void resizable (Fl_Widget *o)**
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual ~Fl_Group ()**
  The destructor also deletes all the children.

## Public Member Functions inherited from Fl_Widget

- **void _clear_fullscreen ()**
- **void _set_fullscreen ()**
- **void activate ()**
  Activates the widget.

- **unsigned int active () const**
  Returns whether the widget is active.

- **int active_r () const**
  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**
  Gets the label alignment.

- **void align (Fl_Align alignment)**
  Sets the label alignment.

- **long argument () const**
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window *as_gl_window ()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const *as_gl_window () const**

- **void bind_deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void bind_deimage (int f)**
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  Gets the current callback function for the widget.

- **void callback (Fl_Callback *cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**
  Sets the current callback function and managed user data for the widget.

- **void callback (Fl_Callback *cb, void *p)**
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
  Sets the current label.
• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image ∗img)
Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **Fl_Img = image ()**
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Img = image () const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Img &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Img *img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

- **const char * label () const**
  Gets the current label text.

- **void label (const char *text)**
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  Sets the label color.

- **Fl_Font labelfont () const**
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  Sets width ww and height hh accordingly with the label size.
- **bool needs_keyboard ()** const
  Returns whether this widget needs a keyboard.
- **void needs_keyboard (bool needs)**
  Sets whether this widget needs a keyboard.
- **unsigned int output ()** const
  Returns if a widget is used for output only.
- **FL_Group * parent ()** const
  Returns a pointer to the parent widget.
- **void parent (FL_Group *p)**
  Internal use only - "for hacks only".
- **void position (int X, int Y)**
  Repositions the window or widget.
- **void redraw ()**
  Schedules the drawing of the widget.
- **void redraw_label ()**
  Schedules the drawing of the label.
- **FL_Color selection_color ()** const
  Gets the selection color.
- **void selection_color (FL_Color a)**
  Sets the selection color.
- **void set_active ()**
  Marks the widget as active without sending events or changing focus.
- **void set_changed ()**
  Marks the value of the widget as changed.
- **void set_output ()**
  Sets a widget to output only.
- **void set_visible ()**
  Makes the widget visible.
- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.
- **int shortcut_label ()** const
  Returns whether the widget's label uses '&' to indicate shortcuts.
- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.
- **void size (int W, int H)**
  Changes the size of the widget.
- **int take_focus ()**
  Gives the widget the keyboard focus.
- **unsigned int takesevents ()** const
  Returns if the widget is able to take events.
- **int testShortcut ()**
  Returns true if the widget's label contains the entered '&x' shortcut.
- **const char * tooltip ()** const
  Gets the current tooltip text.
- **void tooltip (const char *text)**
  Sets the current tooltip text.
- **FL_Window * top_window ()** const
  Returns a pointer to the top-level window for the widget.
- **FL_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.
- **uchar type ()** const
Gets the widget type.
• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
  
  void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• Fl_Overlay_Window (int W, int H, const char *l=0)
  See Fl_Overlay_Window::Fl_Overlay_Window(int X, int Y, int W, int H, const char *l=0)

• Fl_Overlay_Window (int X, int Y, int W, int H, const char *l=0)
  Creates a new Fl_Overlay_Window widget using the given position, size, and label (title) string.

Protected Member Functions inherited from Fl_Window

• void default_size_range ()
  Protected method to calculate the default size range of a window.

• void draw () FL_OVERRIDE
  Draws the widget.

• int force_position () const
  Returns the internal state of the window's FORCE_POSITION flag.

• void force_position (int force)
  Sets an internal flag that tells FLTK and the window manager to honor position requests.

• void free_icons ()
Deletes all icons previously attached to the window.

- `int is_resizable ()`
  Protected method to determine whether a window is resizable.

### Protected Member Functions inherited from Fl_Group

- `Fl_Rect * bounds ()`
  Returns the internal array of widget sizes and positions.
- `void draw_child (Fl_Widget &widget) const`
  Forces a child to redraw.
- `void draw_children ()`
  Draws all children of the group.
- `void draw_outside_label (const Fl_Widget &widget) const`
  Parents normally call this to draw outside labels of child widgets.
- `virtual int on_insert (Fl_Widget *, int)`
  Allow derived groups to act when a widget is added as a child.
- `virtual int on_move (int, int)`
  Allow derived groups to act when a widget is moved within the group.
- `virtual void on_remove (int)`
  Allow derived groups to act when a child widget is removed from the group.
- `int * sizes ()`
  Returns the internal array of widget sizes and positions.
- `void update_child (Fl_Widget &widget) const`
  Draws a child only if it needs it.

### Protected Member Functions inherited from Fl_Widget

- `void clear_flag (unsigned int c)`
  Clears a flag in the flags mask.
- `void draw_backdrop () const`
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
  Draws the widget box according its box style.
- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget's position and size.
- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.
- `void draw_focus () const`
  Draws a focus rectangle around the widget.
- `void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const`
  Draws a focus rectangle around the widget.
- `void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  Draws a focus box for the widget at the given position and size.
- `void draw_label () const`
  Draws the widget's label at the defined label position.
- `void draw_label (int, int, int, int) const`
  Draws the label in an arbitrary bounding box.
- `Fl_Widget (int x, int y, int w, int h, const char *label=0L)`
  Creates a widget at the given position and size.
- `unsigned int flags () const`
  Gets the widget flags mask.
- `void h (int v)`
• void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

• void **w** (int v)
  
  Internal use only.

• void **x** (int v)
  
  Internal use only.

• void **y** (int v)
  
  Internal use only.

**Additional Inherited Members**

**Public Types inherited from Fl_Window**

• typedef struct HICON__ * HICON

**Static Public Member Functions inherited from Fl_Window**

• static Fl_Window * **current** ()
  
  Returns the last window that was made current.

• static void **default_callback** (Fl_Window *, void *)
  
  Back compatibility: Sets the default callback v for win to call on close event.

• static void **default_icon** (const Fl_RGB_Image *)
  
  Sets a single default window icon.

• static void **default_icons** (const Fl_RGB_Image [*] *, int)
  
  Sets the default window icons.

• static void **default_icons** (HICON big_icon, HICON small_icon)
  
  Sets the default window icons (Windows platform only).

• static const char **default_xclass** ()
  
  Returns the default xclass.

• static void **default_xclass** (const char *)
  
  Sets the default window xclass.

• static bool **is_a_rescale** ()
  
  Returns true when a window is being rescaled.

• static char **show_next_window_iconic** ()
  
  Returns the static flag whether the next window should be opened iconified.

• static void **show_next_window_iconic** (char)
  
  Sets a static flag whether the next window should be opened iconified.

**Static Public Member Functions inherited from Fl_Group**

• static Fl_Group * **current** ()
  
  Returns the currently active group.

• static void **current** (Fl_Group *)
  
  Sets the current group.

**Static Public Member Functions inherited from Fl_Widget**

• static void **default_callback** (Fl_Widget *, void *)
  
  The default callback for all widgets that don’t set a callback.

• static unsigned int **label_shortcut** (const char *)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int **test_shortcut** (const char *, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.
Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,

flags possible values enumeration.

Static Protected Attributes inherited from Fl_Window

• static Fl_Window * current_
  Stores the last window that was made current.

11.95.1 Detailed Description

This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image.
The overlay is designed to be a rapidly-changing but simple graphic such as a mouse selection box. Fl_Overlay_Window uses the overlay planes provided by your graphics hardware if they are available.
If no hardware support is found the overlay is simulated by drawing directly into the on-screen copy of the double-buffered window, and "erased" by copying the backbuffer over it again. This means the overlay will blink if you change the image in the window.

11.95.2 Constructor & Destructor Documentation

11.95.2.1 Fl_Overlay_Window()

Fl_Overlay_Window::Fl_Overlay_Window ( int X , int Y , int W , int H , const char * l = 0 ) [protected]

Creates a new Fl_Overlay_Window widget using the given position, size, and label (title) string.
If the positions (x,y) are not given, then the window manager will choose them.

11.95.3 Member Function Documentation

11.95.3.1 as_overlay_window()

Fl_Overlay_Window * Fl_Overlay_Window::as_overlay_window ( ) [inline], [virtual]

Return non-null if this is an Fl_Overlay_Window object.
Reimplemented from Fl_Window.

11.95.3.2 draw_overlay()

virtual void Fl_Overlay_Window::draw_overlay ( ) [pure virtual]

You must subclass Fl_Overlay_Window and provide this method.
It is just like a draw() method, except it draws the overlay. The overlay will have already been "cleared" when this is called. You can use any of the routines described in <FL/fl_draw.H>.
11.95.3.3  flush()

void Fl_Overlay_Window::flush ( ) [virtual]
Forces the window to be drawn, this window is also made current and calls draw().
Reimplemented from Fl_Double_Window.

11.95.3.4  hide()

void Fl_Overlay_Window::hide ( ) [virtual]
Makes a widget invisible.
See also
    show(), visible(), visible_r()
Reimplemented from Fl_Double_Window.

11.95.3.5  redraw_overlay()

void Fl_Overlay_Window::redraw_overlay ( )
Call this to indicate that the overlay data has changed and needs to be redrawn.
The overlay will be clear until the first time this is called, so if you want an initial display you must call this after calling show().

11.95.3.6  resize()

void Fl_Overlay_Window::resize ( int x, int y, int w, int h ) [virtual]
Changes the size or position of the widget.
This is a virtual function so that the widget may implement its own handling of resizing. The default version does not call the redraw() method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.
Some window managers under X11 call resize() a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.
position(X, Y) is a shortcut for resize(X, Y, w(), h()), and size(W, H) is a shortcut for resize(x(), y(), W, H).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x, y</th>
<th>new position relative to the parent window</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>w, h</td>
<td>new size</td>
</tr>
</tbody>
</table>

See also
    position(int,int), size(int,int)
Reimplemented from Fl_Double_Window.

11.95.3.7  show()

void Fl_Overlay_Window::show ( ) [virtual]
Makes a widget visible.
An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL_SHOW.
The visible() method returns true if the widget is set to be visible. The visible_r() method returns true if the widget and all of its parents are visible. A widget is only visible if visible() is true on it and all of its parents.
Changing it will send FL_SHOW or FL_HIDE events to the widget. Do not change it if the parent is not visible, as this will send false FL_SHOW or FL_HIDE events to the widget. redraw() is called if necessary on this or the parent.
See also

hide(), visible(), visible_r()

Reimplemented from Fl_Double_Window.
The documentation for this class was generated from the following files:

• Fl_Overlay_Window.H
• Fl_Overlay_Window.cxx

11.96 Fl_Pack Class Reference

This widget was designed to add the functionality of compressing and aligning widgets.

#include <Fl_Pack.H>

Inheritance diagram for Fl_Pack:

```
Fl_Widget
  ↓
Fl_Group
  ↓
Fl_Pack
```

Public Types

• enum { VERTICAL = 0, HORIZONTAL = 1 }

Public Member Functions

• Fl_Pack (int X, int Y, int W, int H, const char *L=0)
  Creates a new Fl_Pack widget using the given position, size, and label string.
• uchar horizontal () const
  Returns non-zero if Fl_Pack alignment is horizontal.
• void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Override Fl_Group resize behavior.
• int spacing () const
  Gets the number of extra pixels of blank space that are added between the children.
• void spacing (int i)
  Sets the number of extra pixels of blank space that are added between the children.

Public Member Functions inherited from Fl_Group

• Fl_Widget * & _ddfdesign_kludge ()
  This is for forms compatibility only.
• void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
• void add (Fl_Widget *o)
  See void Fl_Group::add(Fl_Widget &w)
• void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
• Fl_Widget * const + array () const
  Returns a pointer to the array of children.
• Fl_Group const * as_group () const FL_OVERRIDE
• Fl_Group * as_group () FL_OVERRIDE

Generated by Doxygen
Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin ()**
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget * child (int n) const**
  
  Returns array()[n].

- **int children () const**
  
  Returns how many child widgets the group has.

- **void clear ()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()**
  
  Returns the current clipping mode.

- **void clip_children (int c)**
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child (int n)**
  
  Removes the widget at index from the group and deletes it.

- **void end ()**
  
  Exactly the same as current(this->parent()).

- **int find (const Fl_Widget &o) const**
  
  See int Fl_Group::find(const Fl_Widget *w) const.

- **int find (const Fl_Widget *) const**
  
  Searches the child array for the widget and returns the index.

- **Fl_Group (int, int, int, int, const char *)=0**
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus (Fl_Widget *)**

- **void forms_end ()**
  
  This is for forms compatibility only.

- **int handle (int) FL_OVERRIDE**
  
  Handles the specified event.

- **void init_sizes ()**
  
  Resets the internal array of widget sizes and positions.

- **void insert (Fl_Widget &, int i)**
  
  The widget is removed from its current group (if any) and then inserted into this group.

- **void insert (Fl_Widget &, Fl_Widget *) before)**
  
  This does insert(w, find(before)).

- **void remove (Fl_Widget &)**
  
  Removes a widget from the group but does not delete it.

- **void remove (Fl_Widget *)**
  
  Removes the widget o from the group.

- **void remove (int index)**
  
  Removes the widget at index from the group but does not delete it.

- **Fl_Widget * resizable () const**
  
  Returns the group’s resizable widget.

- **void resizable (Fl_Widget &o)**
  
  Sets the group’s resizable widget.

- **void resizable (Fl_Widget *)**
  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual ~Fl_Group ()**
  
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
Marks the widget as inactive without sending events or changing focus.

- `void clear_changed()`
  Marks the value of the widget as unchanged.

- `void clear_damage(uchar c=0)`
  Clears or sets the damage flags.

- `void clear_output()`
  Sets a widget to accept input.

- `void clear_visible()`
  Hides the widget.

- `void clear_visible_focus()`
  Disables keyboard focus navigation with this widget.

- `Fl_Color color() const`
  Gets the background color of the widget.

- `void color(Fl_Color bg)`
  Sets the background color of the widget.

- `void color(Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- `Fl_Color color2() const`
  For back compatibility only.

- `void color2(unsigned a)`
  For back compatibility only.

- `int contains(const Fl_Widget* w) const`
  Checks if w is a child of this widget.

- `void copy_label(const char* new_label)`
  Sets the current label.

- `void copy_tooltip(const char* text)`
  Sets the current tooltip text.

- `uchar damage() const`
  Returns non-zero if draw() needs to be called.

- `void damage(uchar c)`
  Sets the damage bits for the widget.

- `void damage(uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.

- `int damage_resize(int, int, int, int)`
  Internal use only.

- `void deactivate()`
  Deactivates the widget.

- `Fl_Image *deimage()`
  Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image *deimage()` const
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage(Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage(Fl_Image *img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound() const`
  Returns whether the inactive image is managed by the widget.

- `void do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.

- `void do_callback(Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗widget, void ∗arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
Returns if a widget is used for output only.

- \texttt{Fl\_Group * parent () const}
  Returns a pointer to the parent widget.

- \texttt{void parent (Fl\_Group *p)}
  Internal use only - "for hacks only".

- \texttt{void position (int X, int Y)}
  Repositions the window or widget.

- \texttt{void redraw ()}
  Schedules the drawing of the widget.

- \texttt{void redraw\_label ()}
  Schedules the drawing of the label.

- \texttt{Fl\_Color selection\_color () const}
  Gets the selection color.

- \texttt{void selection\_color (Fl\_Color a)}
  Sets the selection color.

- \texttt{void set\_active ()}
  Marks the widget as active without sending events or changing focus.

- \texttt{void set\_changed ()}
  Marks the value of the widget as changed.

- \texttt{void set\_output ()}
  Sets a widget to output only.

- \texttt{void set\_visible ()}
  Makes the widget visible.

- \texttt{void set\_visible\_focus ()}
  Enables keyboard focus navigation with this widget.

- \texttt{int shortcut\_label () const}
  Returns whether the widget's label uses '&' to indicate shortcuts.

- \texttt{void shortcut\_label (int value)}
  Sets whether the widget's label uses '&' to indicate shortcuts.

- \texttt{virtual void show ()}
  Makes a widget visible.

- \texttt{void size (int W, int H)}
  Changes the size of the widget.

- \texttt{int take\_focus ()}
  Gives the widget the keyboard focus.

- \texttt{unsigned int takesevents () const}
  Returns if the widget is able to take events.

- \texttt{int test\_shortcut ()}
  Returns true if the widget's label contains the entered 'x' shortcut.

- \texttt{const char * tooltip () const}
  Gets the current tooltip text.

- \texttt{void tooltip (const char *text)}
  Sets the current tooltip text.

- \texttt{Fl\_Window * top\_window () const}
  Returns a pointer to the top-level window for the widget.

- \texttt{Fl\_Window * top\_window\_offset (int xoff, int yoff) const}
  Finds the x/y offset of the current widget relative to the top-level window.

- \texttt{uchar type () const}
  Gets the widget type.

- \texttt{void type (uchar t)}
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (FL_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• FL_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• FL_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Group

• Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
• void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
• void draw_children ()
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
• virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
• virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
• virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

• static Fl_Group * current ()
  Returns the currently active group.
• static void current (Fl_Group *g)
  Sets the current group.
Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int labelShortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int testShortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

} flags possible values enumeration.

11.96.1 Detailed Description

This widget was designed to add the functionality of compressing and aligning widgets. If type() is Fl_Pack::HORIZONTAL all the children are resized to the height of the Fl_Pack, and are moved next to each other horizontally. If type() is not Fl_Pack::HORIZONTAL then the children are resized to the width and are stacked below each other. Then the Fl_Pack resizes itself to surround the child widgets.

You may want to put the Fl_Pack inside an Fl_Scroll.

The ’resizable()’ for Fl_Pack is set to NULL by default. Its behavior is slightly different than in a normal Fl_Group widget: only if the resizable() widget is the last widget in the group it is extended to take the full available width or height, respectively, of the Fl_Group.

Note

You can nest Fl_Pack widgets or put them inside Fl_Scroll widgets or inside other group widgets but their behavior can sometimes be "surprising". This is partly due to the fact that Fl_Pack widgets resize themselves during their draw() operation, trying to react on their child widgets resizing themselves during their draw() operations which can be confusing. If you want to achieve special resize behavior of nested group widgets it can sometimes be easier to derive your own specialized group widget than to try to make nested Fl_Pack widgets behave as expected.

See also

Fl_Group::resizable()

11.96.2 Constructor & Destructor Documentation

11.96.2.1 Fl_Pack()

Fl_Pack::Fl_Pack (}
  int X,
  int Y,
  int W,
```c
int H,
    const char * L = 0 );
```

Creates a new Fl_Pack widget using the given position, size, and label string. The default boxtype is FL_NO_BOX. The default type() is Fl_Pack::VERTICAL.

The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the Fl_Pack and all of its children can be automatic (local) variables, but you must declare the Fl_Pack first, so that it is destroyed last.

### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X, Y</th>
<th>X and Y coordinates (position)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>W, H</td>
<td>width and height, respectively</td>
</tr>
<tr>
<td>in</td>
<td>L</td>
<td>label (optional)</td>
</tr>
</tbody>
</table>

#### 11.96.3 Member Function Documentation

##### 11.96.3.1 draw()

```c
void Fl_Pack::draw ( ) [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget’s draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```c
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from Fl_Group.

##### 11.96.3.2 horizontal()

```c
uchar Fl_Pack::horizontal ( ) const [inline]
```

Returns non-zero if Fl_Pack alignment is horizontal.

Returns

non-zero if Fl_Pack alignment is horizontal (Fl_Pack::HORIZONTAL)

**Note**

Currently the return value is the same as Fl_Group::type(), but this may change in the future. Do not set any other values than the following with Fl_Pack::type():

- **FL_Pack::VERTICAL** (Default)
- **FL_Pack::HORIZONTAL**

See class Fl_Pack documentation for details.

##### 11.96.3.3 resize()

```c
void Fl_Pack::resize (  
    int X,
    int Y,
    int W,
    int H ) [virtual]
```

Override Fl_Group resize behavior.

Resizing an Fl_Pack will not resize any of its children, but trigger a redraw, which in turn recalculates the dimensions of all children.
Parameters

\begin{verbatim}
in | X,Y,W,H | new position and size of the Fl_Pack widget
\end{verbatim}

Reimplemented from Fl_Group.
The documentation for this class was generated from the following files:

- Fl_Pack.H
- Fl_Pack.cxx

### 11.97 Fl_Paged_Device Class Reference

Represents page-structured drawing surfaces.

```c
#include <Fl_Paged_Device.H>
```

Inheritance diagram for Fl_Paged_Device:

```
Fl_Surface_Device
     |________________|
     
Fl_Widget_Surface

Fl_Paged_Device
```

Classes

- struct page_format
  
  width, height and name of a page format

Public Types

- enum Page_Format {
  A0 = 0 , A1 , A2 , A3 ,
  A4 , A5 , A6 , A7 ,
  A8 , A9 , B0 , B1 ,
  B2 , B3 , B4 , B5 ,
  B6 , B7 , B8 , B9 ,
  B10 , C5E , DLE , EXECUTIVE ,
  FOLIO , LEDGER , LEGAL , LETTER ,
  TABLOID , ENVELOPE , MEDIA = 0x1000 }

  Possible page formats.

- enum Page_Layout { PORTRAIT = 0 , LANDSCAPE = 0x100 , REVERSED = 0x200 , ORIENTATION = 0x300 }

  Possible page layouts.

Public Member Functions

- virtual int begin_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL)
  
  Begins a print job.

- virtual int begin_page (void)
  
  Begins a new printed page.

- virtual void end_job (void)
To be called at the end of a print job.

- virtual int end_page (void)

To be called at the end of each page.

- virtual void margins (int *left, int *top, int *right, int *bottom)
  
  Computes the dimensions of margins that lie between the printable page area and the full page.

- void print_widget (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Synonym of draw(Fl_Widget*, int, int)

- void print_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Synonym of draw_decorated_window(Fl_Window*, int, int)

- virtual void rotate (float angle)
  
  Rotates the graphics operations relatively to paper.

- virtual void scale (float scale_x=0, float scale_y=0.)
  
  Changes the scaling of page coordinates.

- int start_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL)
  
  Synonym of begin_job(int pagecount, int *frompage, int *topage, char **perr_message).

- int start_page ()
  
  Synonym of begin_page().

- virtual ~Fl_Paged_Device ()
  
  The destructor.

Public Member Functions inherited from Fl_Widget_Surface

- void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Draws the widget on the drawing surface.

- void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Draws a window with its title bar and frame if any.

- virtual void origin (int *x, int *y)
  
  Computes the coordinates of the current origin of graphics functions.

- virtual void origin (int x, int y)
  
  Sets the position of the origin of graphics in the drawable part of the drawing surface.

- void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  
  Draws a rectangular part of an on-screen window.

- virtual int int printable_rect (int *w, int *h)
  
  Computes the width and height of the drawable area of the drawing surface.

- virtual void translate (int x, int y)
  
  Translates the current graphics origin accounting for the current rotation.

- virtual void untranslate ()
  
  Undoes the effect of a previous translate() call.

Public Member Functions inherited from Fl_Surface_Device

- Fl_Graphics_Driver * driver ()
  
  Returns the graphics driver of this drawing surface.

- virtual bool is_current ()
  
  Is this surface the current drawing surface?

- virtual void set_current (void)
  
  Make this surface the current drawing surface.

- virtual ~Fl_Surface_Device ()
  
  The destructor.
Static Public Attributes

- static const page_format page_formats [NO_PAGE_FORMATS]
  width, height and name of all elements of the enum Page_Format.

Protected Member Functions

- Fl_Paged_Device ()
  The constructor.

Protected Member Functions inherited from Fl_Widget_Surface

- Fl_Widget_Surface (Fl_Graphics_Driver *d)
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

- void driver (Fl_Graphics_Driver *graphics_driver)
  Sets the graphics driver of this drawing surface.
- virtual void end_current ()
  FLTK calls this each time a surface ceases to be the current drawing surface.
- Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)
  Constructor that sets the graphics driver to use for the created surface.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * pop_current ()
  Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void push_current (Fl_Surface_Device *new_current)
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static Fl_Surface_Device * surface ()
  The current drawing surface.

Protected Attributes inherited from Fl_Widget_Surface

- int x_offset
  horizontal offset to the origin of graphics coordinates
- int y_offset
  vertical offset to the origin of graphics coordinates

11.97.1 Detailed Description

Represents page-structured drawing surfaces.
This class has no public constructor: don't instantiate it; use Fl_Printer or Fl_PostScript_File_Device instead.

11.97.2 Member Enumeration Documentation

11.97.2.1 Page_Format

enum Fl_Paged_Device::Page_Format
Possible page formats.
All paper formats with pre-defined width and height. The Fl_Paged_Device::page_formats array gives these widths and heights.
### 11.97.2.2 Page_Layout

- **enumerator:** Fl_Paged_Device::Page_Layout

Possible page layouts.

</tbody>
</table>

### 11.97.3 Member Function Documentation

#### 11.97.3.1 begin_job()

```
int Fl_Paged_Device::begin_job ( 
    int pagecount = 0, 
    int * frompage = NULL, 
    int * topage = NULL, 
    char ** perr_message = NULL ) [virtual]
```

Begins a print job.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>pagecount</td>
</tr>
<tr>
<td>out</td>
<td>frompage</td>
</tr>
<tr>
<td>out</td>
<td>topage</td>
</tr>
<tr>
<td>out</td>
<td>perr_message</td>
</tr>
</tbody>
</table>

Returns

0 if OK, 1 if user cancelled the job, 2 if any error.

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.

11.97.3.2 begin_page()

int Fl_Paged_Device::begin_page (  
   void ) [virtual]  

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area.

This function also makes this surface the current drawing surface with Fl_Surface_Device::push_current().

Note

begin_page() calls Fl_Surface_Device::push_current() and leaves this device as the active surface. If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current(), or the content of the dialog box will be rendered to the printer instead of the screen.

Returns

0 if OK, non-zero if any error.

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.

11.97.3.3 end_job()

void Fl_Paged_Device::end_job (  
   void ) [virtual]  

To be called at the end of a print job.

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.

11.97.3.4 end_page()

int Fl_Paged_Device::end_page (  
   void ) [virtual]  

To be called at the end of each page.

This function also stops this surface from being the current drawing surface with Fl_Surface_Device::pop_current().

Note

end_page() calls Fl_Surface_Device::pop_current(). If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current().

Returns

0 if OK, non-zero if any error.

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.
### 11.97.3.5 margins()

```cpp
void Fl_Paged_Device::margins (  
    int * left,  
    int * top,  
    int * right,  
    int * bottom) [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page. Values are in the same unit as that used by FLTK drawing functions. They are changed by `scale()` calls.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>out left</code></td>
<td>If non-null, <code>*left</code> is set to the left margin size.</td>
</tr>
<tr>
<td><code>out top</code></td>
<td>If non-null, <code>*top</code> is set to the top margin size.</td>
</tr>
<tr>
<td><code>out right</code></td>
<td>If non-null, <code>*right</code> is set to the right margin size.</td>
</tr>
<tr>
<td><code>out bottom</code></td>
<td>If non-null, <code>*bottom</code> is set to the bottom margin size.</td>
</tr>
</tbody>
</table>

Reimplemented in `Fl_PostScript_File_Device`, and `Fl_Printer`.

### 11.97.3.6 rotate()

```cpp
void Fl_Paged_Device::rotate (  
    float angle) [virtual]
```

Rotates the graphics operations relatively to paper. The rotation is centered on the current graphics origin. Successive `rotate()` calls don't combine their effects.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>angle</code></td>
<td>Rotation angle in counter-clockwise degrees.</td>
</tr>
</tbody>
</table>

Reimplemented in `Fl_PostScript_File_Device`, and `Fl_Printer`.

### 11.97.3.7 scale()

```cpp
void Fl_Paged_Device::scale (  
    float scale_x,  
    float scale_y = 0.) [virtual]
```

Changes the scaling of page coordinates. This function also resets the origin of graphics functions at top left of printable page area. After a `scale()` call, do a `printable_rect()` call to get the new dimensions of the printable page area. Successive `scale()` calls don't combine their effects.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>scale_x</code></td>
<td>Horizontal dimensions of plot are multiplied by this quantity.</td>
</tr>
<tr>
<td><code>scale_y</code></td>
<td>Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code>. Thus, <code>scale(factor);</code> is equivalent to <code>scale(factor, factor);</code></td>
</tr>
</tbody>
</table>

Reimplemented in `Fl_PostScript_File_Device`, and `Fl_Printer`.

### 11.97.3.8 start_job()

```cpp
int Fl_Paged_Device::start_job (  
    int pagecount = 0,  
    int * frompage = NULL,  
    int * topage = NULL,  
    char ** perr_message = NULL) [inline]
```
11.98 Fl_Pixmap Class Reference

The Fl_Pixmap class supports caching and drawing of colormap (pixmap) images, including transparency.

```cpp
#include <Fl_Pixmap.H>
```

Inheritance diagram for Fl_Pixmap:

```
Fl_Image
   |
   | Fl_Pixmap
   |   |
   |   |
   |   | Fl_GIF_Image
   |   | Fl_XPM_Image
   |   | Fl_Anim_GIF_Image
```

Public Member Functions

- `int cache_h ()`
- `int cache_w ()`
- `void color_average (Fl_Color c, float i) FL_OVERRIDE`
  The `color_average()` method averages the colors in the image with the provided FLTK color value.
- `Fl_Image * copy () const`
- `Fl_Image * copy (int W, int H) const FL_OVERRIDE`
  Creates a resized copy of the image.
- `void desaturate () FL_OVERRIDE`
  The `desaturate()` method converts an image to grayscale.
- `void draw (int X, int Y)`
- `void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE`
  Draws the image to the current drawing surface with a bounding box.
- `Fl_Pixmap (char const * D)`
  The constructors create a new pixmap from the specified XPM data.
- `Fl_Pixmap (const char * const * D)`
  The constructors create a new pixmap from the specified XPM data.
- `Fl_Pixmap (const uchar * const * D)`
  The constructors create a new pixmap from the specified XPM data.
- `Fl_Pixmap (uchar * const * D)`
  The constructors create a new pixmap from the specified XPM data.
- `void label (Fl_Menu_Item * m) FL_OVERRIDE`
  This method is an obsolete way to set the image attribute of a menu item.
- `void label (Fl_Widget * w) FL_OVERRIDE`

Generated by Doxygen
This method is an obsolete way to set the image attribute of a widget or menu item.

- **void uncache ()** FL_OVERRIDE
  
  If the image has been cached for display, delete the cache data.

- **virtual ~Fl_Pixmap ()**
  
  The destructor frees all memory and server resources that are used by the pixmap.

### Public Member Functions inherited from Fl_Image

- **virtual class Fl_Shared_Image * as_shared_image ()**
  
  Returns whether an image is an Fl_Shared_Image or not.

- **Fl_Image * copy () const**
  
  Creates a copy of the image in the same size.

- **int count () const**
  
  Returns the number of data values associated with the image.

- **int d () const**
  
  Returns the image depth.

- **const char *const * data () const**
  
  Returns a pointer to the current image data array.

- **int data_h () const**
  
  Returns the height of the image data.

- **int data_w () const**
  
  Returns the width of the image data.

- **void draw (int X, int Y)**
  
  Draws the image to the current drawing surface.

- **int fail () const**
  
  Returns a value that is not 0 if there is currently no image available.

- **Fl_Image (int W, int H, int D)**
  
  The constructor creates an empty image with the specified width, height, and depth.

- **int h () const**
  
  Returns the current image drawing height in FLTK units.

- **void inactive ()**
  
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

- **int ld () const**
  
  Returns the current line data size in bytes.

- **virtual void release ()**
  
  Releases an Fl_Image - the same as 'delete this'.

- **virtual void scale (int width, int height, int proportional=1, int can_expand=0)**
  
  Sets the drawing size of the image.

- **int w () const**
  
  Returns the current image drawing width in FLTK units.

- **virtual ~Fl_Image ()**
  
  The destructor is a virtual method that frees all memory used by the image.

### Public Attributes

- **int alloc_data**

### Protected Member Functions

- **void measure ()**
Protected Member Functions inherited from Fl_Image

- void d (int D)
  Sets the current image depth.
- void data (const char * const * p, int c)
  Sets the current data pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h (int H)
  Sets the height of the image data.
- void ld (int LD)
  Sets the current line data size in bytes.
- void w (int W)
  Sets the width of the image data.

Friends

- class Fl_Graphics_Driver

Additional Inherited Members

Static Public Member Functions inherited from Fl_Image

- static Fl_Labeltype define_FL_IMAGE_LABEL ()
- static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
- static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
- static Fl_RGB_Scaling scaling_algorithm ()
  Gets what algorithm is used when resizing a source image to draw it.
- static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  True after fl_register_images() was called, false before.

- static void measure (const Fl_Label *lo, int &lw, int &lh)

11.98.1 Detailed Description

The Fl_Pixmap class supports caching and drawing of colormap ( pixmap) images, including transparency.
11.98.2 Constructor & Destructor Documentation

11.98.2.1 Fl_Pixmap () [1/4]

Fl_Pixmap::Fl_Pixmap (char *const D ) [inline], [explicit]
The constructors create a new pixmap from the specified XPM data.

11.98.2.2 Fl_Pixmap () [2/4]

Fl_Pixmap::Fl_Pixmap (uchar *const D ) [inline], [explicit]
The constructors create a new pixmap from the specified XPM data.

11.98.2.3 Fl_Pixmap () [3/4]

Fl_Pixmap::Fl_Pixmap (const char *const D ) [inline], [explicit]
The constructors create a new pixmap from the specified XPM data.

11.98.2.4 Fl_Pixmap () [4/4]

Fl_Pixmap::Fl_Pixmap (const uchar *const D ) [inline], [explicit]
The constructors create a new pixmap from the specified XPM data.

11.98.3 Member Function Documentation

11.98.3.1 color_average()

void Fl_Pixmap::color_average (Fl_Color c, float i) [virtual]
The color_average() method averages the colors in the image with the provided FLTK color value.
The first argument specifies the FLTK color to be used.
The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results
in no color blend, and a value of 0.0 results in a constant image of the specified color.
An internal copy is made of the original image data before changes are applied, to avoid modifying the original
image data in memory.
Reimplemented from Fl_Image.

11.98.3.2 copy()

Fl_Image * Fl_Pixmap::copy (int W, int H) const [virtual]
Creates a resized copy of the image.
The new image should be released when you are done with it.
Note: since FLTK 1.4.0 you can use Fl_Image::release() for all types of images (i.e. all subclasses of Fl_Image)
instead of operator delete for Fl_Image's and Fl_Image::release() for Fl_Shared_Image's.
The new image data will be converted to the requested size. RGB images are resized using the algorithm set by
Fl_Image::RGB_scaling().
For the new image the following equations are true:

- \( w() == \text{data}_w() == W \)
- \( h() == \text{data}_h() == H \)

**Parameters**

| in | \( W, H \) | Requested width and height of the new image |

**Note**

The returned image can be safely cast to the same image type as that of the source image provided this type is one of `Fl_RGB(Image`, `Fl_SVG(Image`, `Fl_Pixmap`, `Fl_Bitmap`, `Fl_Tiled_Image`, `Fl_Anim_GIF_Image` and `Fl_Shared_Image`. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an `Fl_GIF(Image` is an object of class `Fl_Pixmap`.

Since FLTK 1.4.0 this method is ‘const’. If you derive your own class from `Fl_Image` or any subclass your overridden methods of `‘Fl_Image::copy(const)` and `‘Fl_Image::copy(int, int) const` must also be ‘const’ for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been ‘const’.

Reimplemented from `Fl_Image`.

### 11.98.3.3 desaturate()

```cpp
void Fl_Pixmap::desaturate () [virtual]
```

The `desaturate()` method converts an image to grayscale. If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from `Fl_Image`.

### 11.98.3.4 draw()

```cpp
void Fl_Pixmap::draw (
    int X,
    int Y,
    int W,
    int H,
    int cx = 0,
    int cy = 0 ) [virtual]
```

Draws the image to the current drawing surface with a bounding box. Arguments \( X, Y, W, H \) specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the \( cx \) and \( cy \) arguments.

In other words: `fl_push_clip(X,Y,W,H)` is applied, the image is drawn with its upper-left corner at \( X-cx, Y-cy \) and its own width and height, `fl_pop_clip()` is applied.

Reimplemented from `Fl_Image`.

### 11.98.3.5 label() [1/2]

```cpp
void Fl_Pixmap::label (Fl_Menu_Item * m) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

**Deprecated**  Please use `Fl_Menu_Item::image()` instead.

Reimplemented from `Fl_Image`.

---

Generated by Doxygen
11.98.3.6 label() [2/2]

void Fl_Pixmap::label (  
    Fl_Widget * widget ) [virtual]

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use Fl_Widget::image() or Fl_Widget::deimage() instead.

Reimplemented from Fl_Image.

11.98.3.7 uncache()

void Fl_Pixmap::uncache ( ) [virtual]

If the image has been cached for display, delete the cache data.
This allows you to change the data used for the image and then redraw it without recreating an image object.
Reimplemented from Fl_Image.

The documentation for this class was generated from the following files:

- Fl_Pixmap.H
- Fl_Pixmap.cxx

11.99 Fl_Plugin Class Reference

**Fl_Plugin** allows link-time and run-time integration of binary modules.

```cpp
#include <Fl_Plugin.H>
```

Inheritance diagram for Fl_Plugin:

```
Fl_Device_Plugin
    Fl_Plugin
```

**Public Member Functions**

- `Fl_Plugin (const char *klass, const char *name)`
  
  *Create a plugin.*

- `virtual ~Fl_Plugin ()`
  
  *Clear the plugin and remove it from the database.*

11.99.1 Detailed Description

**Fl_Plugin** allows link-time and run-time integration of binary modules.
**Fl_Plugin** and **Fl_Plugin_Manager** provide a small and simple solution for linking C++ classes at run-time, or optionally linking modules at compile time without the need to change the main application.

**Fl_Plugin_Manager** uses static initialization to create the plugin interface early during startup. Plugins are stored in a temporary database, organized in classes.

Plugins should derive a new class from **Fl_Plugin** as a base:

```cpp
class My_Plugin : public Fl_Plugin {
  public:
    My_Plugin() : Fl_Plugin("effects", "blur") { }
    void do_something(...);
  
  My_Plugin blur_plugin();
```

Plugins can be put into modules and either linked before distribution, or loaded from dynamically linkable files. An **Fl_Plugin_Manager** is used to list and access all currently loaded plugins.

```cpp
Fl_Plugin_Manager mgr("effects");
int i, n = mgr.plugins();
for (i=0; i<n; i++) {
    My_Plugin *pin = (My_Plugin*)mgr.plugin(i);
    pin->do_something();
}
```
11.99.2 Constructor & Destructor Documentation

11.99.2.1 Fl_Plugin()

Fl_Plugin::Fl_Plugin (const char ∗klass, const char ∗name)
Create a plugin.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>klass</th>
<th>plugins are grouped in classes</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>name</td>
<td>every plugin should have a unique name</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Plugin.H
- Fl_Preferences.cxx

11.100 Fl_Plugin_Manager Class Reference

Fl_Plugin_Manager manages link-time and run-time plugin binaries.

```
#include <Fl_Plugin.H>
```

Inheritance diagram for Fl_Plugin_Manager:

```
Fl_Preferences

Fl_Plugin_Manager
```

Public Member Functions

- `Fl_Preferences::ID addPlugin (const char ∗name, Fl_Plugin ∗plugin)`
  
  This function adds a new plugin to the database.
- `Fl_Plugin_Manager (const char ∗klass)`
  
  Manage all plugins belonging to one class.
- `Fl_Plugin ∗plugin (const char ∗name)`
  
  Return the address of a plugin by name.
- `Fl_Plugin ∗plugin (int index)`
  
  Return the address of a plugin by index.
- `int plugins ()`
  
  Return the number of plugins in the klass.
- `~Fl_Plugin_Manager ()`
  
  Remove the plugin manager.

Public Member Functions inherited from Fl_Preferences

- `char clear ()`
  
  Delete all groups and all entries.
- `char delete_all_entries ()`
  
  Delete all entries.
- `char delete_all_groups ()`
  
  Delete all groups.
- `char delete_entry (const char ∗entry)`
Deletes a single name/value pair.

- **char delete_group (const char *group)**

  Deletes a group.

- **int dirty ()**

  Check if there were changes to the database that need to be written to disk.

- **int entries ()**

  Returns the number of entries (name/value pairs) in a group.

- **const char * entry (int index)**

  Returns the name of an entry.

- **char entry_exists (const char *key)**

  Returns non-zero if an entry with this name exists.

- **Root filename (char *buffer, size_t buffer_size)**

  Return the file name and path to the preference file.

- **Fl_Preferences (const char *path, const char *vendor, const char *application)**

  Deprecated: Use this constructor to create or read a preference file at an arbitrary position in the file system.

- **Fl_Preferences (const char *path, const char *vendor, const char *application, Root flags)**

  Use this constructor to create or read a preference file at an arbitrary position in the file system.

- **Fl_Preferences (const Fl_Preferences &)**

  Create another reference to a Preferences group.

- **Fl_Preferences (Fl_Preferences &parent, const char *group)**

  Generate or read a new group of entries within another group.

- **Fl_Preferences (Fl_Preferences &parent, int groupIndex)**

  Open a child group using a given index.

- **Fl_Preferences (Fl_Preferences *parent, const char *group)**

  Create or access a group of preferences using a name.

- **Fl_Preferences (ID id)**

  The constructor creates a group that manages key/value pairs and child groups.

- **int flush ()**

  Writes preferences to disk if they were modified.

- **char get (const char *entry, char *&value, const char *defaultValue)**

  Reads an entry from the group.

- **char get (const char *entry, char *&value, const char *defaultValue, int maxSize)**

  Reads an entry from the group.

- **char get (const char *entry, double &value, double defaultValue)**

  Reads an entry from the group.

- **char get (const char *entry, float &value, float defaultValue)**

  Reads an entry from the group.

- **char get (const char *entry, int &value, int defaultValue)**

  Reads an entry from the group.

- **char get (const char *entry, void *&value, const void *defaultValue, int defaultSize)**

  Reads an entry from the group.

- **char get (const char *entry, void *&value, const void *defaultValue, int defaultSize, int *size)**

  Reads a binary entry from the group, encoded in hexadecimal blocks.

- **char get_userdata_path (char *path, int pathlen)**

  Creates a path that is related to the preference file and that is usable for additional application data.

- **const char * group (int num_group)**

  Generated by Doxygen
Returns the name of the Nth \((\text{num\_group})\) group.

- \textbf{char group\_exists (const char \*key)}
  
  Returns non-zero if a group with this name exists.

- \textbf{int groups ()}
  
  Returns the number of groups that are contained within a group.

- \textbf{ID id ()}
  
  Return an ID that can later be reused to open more references to this dataset.

- \textbf{const char \* name ()}
  
  Return the name of this entry.

- \textbf{const char \* path ()}
  
  Return the full path to this entry.

- \textbf{char set (const char \*entry, const char \*value)}
  
  Sets an entry (name/value pair).

- \textbf{char set (const char \*entry, const void \*value, int size)}
  
  Sets an entry (name/value pair).

- \textbf{char set (const char \*entry, double value)}
  
  Sets an entry (name/value pair).

- \textbf{char set (const char \*entry, double value, int precision)}
  
  Sets an entry (name/value pair).

- \textbf{char set (const char \*entry, float value)}
  
  Sets an entry (name/value pair).

- \textbf{char set (const char \*entry, float value, int precision)}
  
  Sets an entry (name/value pair).

- \textbf{char set (const char \*entry, int value)}
  
  Sets an entry (name/value pair).

- \textbf{int size (const char \*entry)}
  
  Returns the size of the value part of an entry.

- \textbf{virtual \~Fl\_Preferences ()}
  
  The destructor removes allocated resources.

**Static Public Member Functions**

- \textbf{static int load (const char \*filename)}
  
  Load a module from disk.

- \textbf{static int loadAll (const char \*filepath, const char \*pattern=0)}
  
  Use this function to load a whole directory full of modules.

- \textbf{static void removePlugin (Fl\_Preferences::ID id)}
  
  Remove any plugin.

**Static Public Member Functions inherited from Fl\_Preferences**

- \textbf{static unsigned int file\_access ()}
  
  Return the current file access permissions for the FLTK preferences system.

- \textbf{static void file\_access (unsigned int flags)}
  
  Tell the FLTK preferences system which files in the file system it may read, create, or write.

- \textbf{static Root filename (char \*buffer, size\_t buffer\_size, Root root, const char \*vendor, const char \*application)}
  
  Determine the file name and path to preferences that would be opened with these parameters.

- \textbf{static const char \* new\_UUID ()}
  
  Returns a UUID as generated by the system.

- \textbf{static char remove (ID id\_)}
  
  Remove the group with this ID from a database.
Additional Inherited Members

Public Types inherited from Fl_Preferences

- typedef void * ID
  Every Fl_Preferences-Group has a unique ID.
- enum Root {
    UNKNOWN_ROOT_TYPE = -1, SYSTEM = 0, USER, MEMORY,
    ROOT_MASK = 0x00FF, CORE = 0x0100, C_LOCALE = 0x1000, CLEAR = 0x2000,
    SYSTEM_L = SYSTEM | C_LOCALE, USER_L = USER | C_LOCALE, CORE_SYSTEM_L = CORE |
    SYSTEM_L, CORE_USER_L = CORE | USER_L, CORE_SYSTEM = CORE | SYSTEM, CORE_USER = CORE | USER
}
  Define the scope of the preferences.

Static Public Attributes inherited from Fl_Preferences

- static const unsigned int ALL = ALL_READ_OK | ALL_WRITE_OK
  Set this to give FLTK and applications permission to read, write, and create preference files.
- static const unsigned int ALL_READ_OK = USER_READ_OK | SYSTEM_READ_OK | CORE_READ_OK
  Set this to allow FLTK and applications to read preference files.
- static const unsigned int ALL_WRITE_OK = USER_WRITE_OK | SYSTEM_WRITE_OK | CORE_WRITE_OK
  Set this to allow FLTK and applications to create and write preference files.
- static const unsigned int APP_OK = SYSTEM_OK | USER_OK
  Set this if it is OK for applications to read, create, and write any kind of preference files.
- static const unsigned int CORE_OK = CORE_READ_OK | CORE_WRITE_OK
  Set this if it is OK for FLTK to read, create, or write preference files.
- static const unsigned int CORE_READ_OK = 0x0010
  Set this if it is OK for FLTK to read preference files.
- static const unsigned int CORE_WRITE_OK = 0x0020
  Set this if it is OK for FLTK to create or write preference files.
- static const unsigned int NONE = 0x0000
  Set this if no call to Fl_Preferences shall access the file system.
- static const unsigned int SYSTEM_OK = SYSTEM_READ_OK | SYSTEM_WRITE_OK
  Set this if it is OK for applications to read, create, and write system wide preference files.
- static const unsigned int SYSTEM_READ_OK = 0x0004
  Set this if it is OK for FLTK to read preference files.
- static const unsigned int SYSTEM_WRITE_OK = 0x0008
  Set this if it is OK for applications to create or write system wide preference files.
- static const unsigned int SYSTEM_WRITE_OK = 0x0004
  Set this if it is OK for FLTK to create or write system wide preference files.
- static const unsigned int USER_OK = USER_READ_OK | USER_WRITE_OK
  Set this if it is OK for applications to create and write user preference files.
- static const unsigned int USER_READ_OK = 0x0001
  Set this if it is OK for applications to read user preference files.
- static const unsigned int USER_WRITE_OK = 0x0002
  Set this if it is OK for applications to create and write user preference files.

Protected Attributes inherited from Fl_Preferences

- RootNode * rootNode
11.100.1 Detailed Description

*Fl_Plugin_Manager* manages link-time and run-time plugin binaries.

See also

*Fl_Plugin*

11.100.2 Constructor & Destructor Documentation

11.100.2.1 \~*Fl_Plugin_Manager()*

*Fl_Plugin_Manager::\~Fl_Plugin_Manager*()

Remove the plugin manager.

Calling this does not remove the database itself or any plugins. It just removes the reference to the database.

11.100.3 Member Function Documentation

11.100.3.1 addPlugin()

*Fl_Preferences::ID Fl_Plugin_Manager::addPlugin* (const char ∗name, Fl_Plugin ∗plugin)

This function adds a new plugin to the database.

There is no need to call this function explicitly. Every *Fl_Plugin* constructor will call this function at initialization time.

11.100.3.2 load()

*int Fl_Plugin_Manager::load* (const char ∗filename) [static]

Load a module from disk.

A module must be a dynamically linkable file for the given operating system. When loading a module, its +init function will be called which in turn calls the constructor of all statically initialized *Fl_Plugin* classes and adds them to the database.

11.100.3.3 removePlugin()

*void Fl_Plugin_Manager::removePlugin* (Fl_Preferences::ID id) [static]

Remove any plugin.

There is no need to call this function explicitly. Every *Fl_Plugin* destructor will call this function at destruction time.

The documentation for this class was generated from the following files:

- Fl_Plugin.H
- Fl_Preferences.cxx

11.101 Fl_PNG_Image Class Reference

The *Fl_PNG_Image* class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files.

#include <Fl_PNG_Image.H>

Inheritance diagram for *Fl_PNG_Image*:

- **static void measure (const Fl_Label *lo, int &lw, int &lh)**

11.101.1 Detailed Description

The Fl_PNG_Image class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files. The class loads color-mapped and full-color images and handles color- and alpha-based transparency.

11.101.2 Constructor & Destructor Documentation

11.101.2.1 Fl_PNG_Image() [1/2]

Fl_PNG_Image::Fl_PNG_Image (const char * filename )

The constructor loads the named PNG image from the given png filename. The constructor frees all memory and server resources that are used by the image. Use Fl_Image::fail() to check if Fl_PNG_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the PNG format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason.
11.102 Fl_PNM_Image Class Reference

Parameters

| in | filename | Name of PNG file to read |

11.101.2.2 Fl_PNG_Image() [2/2]

Fl_PNG_Image::Fl_PNG_Image (  
const char ∗ name_png,  
const unsigned char ∗ buffer,  
int maxsize )

Constructor that reads a PNG image from memory.  
Construct an image from a block of memory inside the application. Fluid offers "binary Data" chunks as a great way  
to add image data into the C++ source code. name_png can be NULL. If a name is given, the image is added to the  
list of shared images (see: Fl_Shared_Image) and will be available by that name.

Parameters

| name_png | A name given to this image or NULL  
buffer | Pointer to the start of the PNG image in memory  
maxsize | Size in bytes of the memory buffer containing the PNG image |

The documentation for this class was generated from the following files:

- Fl_PNG_Image.H
- Fl_PNG_Image.cxx

11.102 Fl_PNM_Image Class Reference

The Fl_PNM_Image class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM)  
image files.

#include <Fl_PNM_Image.H>

Inheritance diagram for Fl_PNM_Image:

- Fl_PNM_Image
  - Fl_RGB_Image
    - Fl_Image

Public Member Functions

- Fl_PNM_Image (const char ∗ filename)  
  The constructor loads the named PNM image.

Public Member Functions inherited from Fl_RGB_Image

- virtual Fl_SVG_Image ∗ as-svg_image ()  
  Returns whether an image is an Fl_SVG_Image or not.
- int cache_h ()
- int cache_w ()
- void color_average (Fl_Color c, float i) FL_OVERRIDE  
  The color_average() method averages the colors in the image with the provided FLTK color value.
• **Fl_Image** ∗ **copy () const**
  Creates a resized copy of the image.

• **void desaturate () FL_OVERRIDE**
  The desaturate() method converts an image to grayscale.

• **void draw (int X, int Y)**
  Draws the image to the current drawing surface with a bounding box.

• **Fl_RGB_Image (const Fl_Pixmap ∗ pxm, Fl_Color bg=FL_GRAY)**
  The constructor creates a new RGBA image from the specified Fl_Pixmap.

• **Fl_RGB_Image (const uchar ∗ bits, int bits_length, int W, int H, int D, int LD)**
  The constructor creates a new image from the specified data.

• **Fl_RGB_Image (const uchar ∗ bits, int W, int H, int D=3, int LD=0)**
  The constructor creates a new image from the specified data.

• **void label (Fl_Menu_Item ∗ m) FL_OVERRIDE**
  This method is an obsolete way to set the image attribute of a menu item.

• **void label (Fl_Widget ∗ w) FL_OVERRIDE**
  This method is an obsolete way to set the image attribute of a widget or menu item.

• **virtual void normalize ()**
  Makes sure the object is fully initialized.

• **void uncache () FL_OVERRIDE**
  If the image has been cached for display, delete the cache data.

• **~Fl_RGB_Image () FL_OVERRIDE**
  The destructor frees all memory and server resources that are used by the image.

Public Member Functions inherited from Fl_Image

• **virtual class Fl_Shared_Image ∗ as_shared_image ()**
  Returns whether an image is an Fl_Shared_Image or not.

• **Fl_Image ∗ copy () const**
  Creates a copy of the image in the same size.

• **int count () const**
  Returns the number of data values associated with the image.

• **int d () const**
  Returns the image depth.

• **const char ∗ const ∗ data () const**
  Returns a pointer to the current image data array.

• **int data_h () const**
  Returns the height of the image data.

• **int data_w () const**
  Returns the width of the image data.

• **void draw (int X, int Y)**
  Draws the image to the current drawing surface.

• **int fail () const**
  Returns a value that is not 0 if there is currently no image available.

• **Fl_Image (int W, int H, int D)**
  The constructor creates an empty image with the specified width, height, and depth.

• **int h () const**
  Returns the current image drawing height in FLTK units.

• **void inactive ()**
The `inactive()` method calls `color_average(FL_BACKGROUND_COLOR, 0.33f)` to produce an image that appears grayed out.

- `int ld() const`
  Returns the current line data size in bytes.
- `virtual void release()`
  Releases an `Fl_Image` - the same as `delete this`.
- `virtual void scale(int width, int height, int proportional=1, int can_expand=0)`
  Sets the drawing size of the image.
- `int w() const`
  Returns the current image drawing width in FLTK units.
- `virtual ~Fl_Image()`
  The destructor is a virtual method that frees all memory used by the image.

### Additional Inherited Members

**Static Public Member Functions inherited from Fl_RGB_Image**

- `static size_t max_size()`
  Returns the maximum allowed image size in bytes when creating an `Fl_RGB_Image` object.
- `static void max_size(size_t size)`
  Sets the maximum allowed image size in bytes when creating an `Fl_RGB_Image` object.

**Static Public Member Functions inherited from Fl_Image**

- `static Fl_Labeltype define_FL_IMAGE_LABEL()`
- `static Fl_RGB_Scaling RGB_scaling()`
  Returns the currently used RGB image scaling method.
- `static void RGB_scaling(Fl_RGB_Scaling)`
  Sets the RGB image scaling method used for `copy(int, int)`.
- `static Fl_RGB_Scaling scaling_algorithm()`
  Gets what algorithm is used when resizing a source image to draw it.
- `static void scaling_algorithm(Fl_RGB_Scaling algorithm)`
  Sets what algorithm is used when resizing a source image to draw it.

**Public Attributes inherited from Fl_RGB_Image**

- `int alloc_array`
  If non-zero, the object's data array is `delete[]`ed when deleting the object.
- `const uchar *array`
  Points to the start of the object's data array.

**Static Public Attributes inherited from Fl_Image**

- `static const int ERR_FILE_ACCESS = -2`
- `static const int ERR_FORMAT = -3`
- `static const int ERR_MEMORY_ACCESS = -4`
- `static const int ERR_NO_IMAGE = -1`
- `static bool register_images_done = false`
  True after `fl_register_images()` was called, false before.
Protected Member Functions inherited from Fl_Image

- void \(d\) (int \(D\))
  
  Sets the current image depth.

- void data (const char *const *p, int c)
  
  Sets the current data pointer and count of pointers in the array.

- void draw_empty (int \(X\), int \(Y\))
  
  The protected method draw_empty() draws a box with an \(X\) in it.

- int draw_scaled (int \(X\), int \(Y\), int \(W\), int \(H\))
  
  Draw the image to the current drawing surface rescaled to a given width and height.

- void \(h\) (int \(H\))
  
  Sets the height of the image data.

- void \(l\) (int \(LD\))
  
  Sets the current line data size in bytes.

- void \(w\) (int \(W\))
  
  Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)

- static void measure (const Fl_Label *lo, int &lw, int &lh)

11.102.1 Detailed Description

The Fl_PNM_Image class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files.

The class loads bitmap, grayscale, and full-color images in both ASCII and binary formats.

11.102.2 Constructor & Destructor Documentation

11.102.2.1 Fl_PNM_Image()

Fl_PNM_Image::Fl_PNM_Image (const char *filename)

The constructor loads the named PNM image.

The destructor frees all memory and server resources that are used by the image. Use Fl_Image::fail() to check if Fl_PNM_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the PNM format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason.

Parameters

\begin{itemize}
\item \texttt{filename} a full path and name pointing to a valid jpeg file.
\end{itemize}

The documentation for this class was generated from the following files:

- Fl_PNM_Image.H
- Fl_PNM_Image.cxx

11.103 Fl_Positioner Class Reference

This class is provided for Forms compatibility.

#include <Fl_Positioner.H>

Inheritance diagram for Fl_Positioner:
Public Member Functions

- **Fl_Positioner** (int x, int y, int w, int h, const char *l=0)
  
  Creates a new Fl_Positioner widget using the given position, size, and label string.

- int handle (int) FL_OVERRIDE
  
  Handles the specified event.

- int value (double, double)
  
  Returns the current position in x and y.

- void xbounds (double, double)
  
  Sets the X axis bounds.

- double xmaximum () const
  
  Gets the X axis maximum.

- void xmaximum (double a)
  
  Same as xbounds(xminimum(), a)

- double xminimum () const
  
  Gets the X axis minimum.

- void xminimum (double a)
  
  Same as xbounds(a, xmaximum())

- void xstep (double a)
  
  Sets the stepping value for the X axis.

- double xvalue () const
  
  Gets the X axis coordinate.

- int xvalue (double)
  
  Sets the X axis coordinate.

- void ybounds (double, double)
  
  Sets the Y axis bounds.

- double ymaximum () const
  
  Gets the Y axis maximum.

- void ymaximum (double a)
  
  Same as ybounds(yminimum(), a)

- double yminimum () const
  
  Gets the Y axis minimum.

- void yminimum (double a)
  
  Same as ybounds(a, ymaximum())

- void ystep (double a)
  
  Sets the stepping value for the Y axis.

- double yvalue () const
  
  Gets the Y axis coordinate.

- int yvalue (double)
  
  Sets the Y axis coordinate.
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
Checks if the widget value changed since the last callback.

- void \texttt{clear\_active} ()
  
  Marks the widget as inactive without sending events or changing focus.

- void \texttt{clear\_changed} ()
  
  Marks the value of the widget as unchanged.

- void \texttt{clear\_damage} (uchar c=0)
  
  Clears or sets the damage flags.

- void \texttt{clear\_output} ()
  
  Sets a widget to accept input.

- void \texttt{clear\_visible} ()
  
  Hides the widget.

- void \texttt{clear\_visible\_focus} ()
  
  Disables keyboard focus navigation with this widget.

- \texttt{Fl\_Color color} () const
  
  Gets the background color of the widget.

- void \texttt{color} (Fl\_Color bg)
  
  Sets the background color of the widget.

- void \texttt{color} (Fl\_Color bg, Fl\_Color sel)
  
  Sets the background and selection color of the widget.

- \texttt{Fl\_Color color2} () const
  
  For back compatibility only.

- void \texttt{color2} (unsigned a)
  
  For back compatibility only.

- int \texttt{contains} (const Fl\_Widget *w) const
  
  Checks if w is a child of this widget.

- void \texttt{copy\_label} (const char *new\_label)
  
  Sets the current label.

- void \texttt{copy\_tooltip} (const char *text)
  
  Sets the current tooltip text.

- uchar \texttt{damage} () const
  
  Returns non-zero if \texttt{draw()} needs to be called.

- void \texttt{damage} (uchar c)
  
  Sets the damage bits for the widget.

- void \texttt{damage} (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.

- int \texttt{damage\_resize} (int, int, int, int)
  
  Internal use only.

- void \texttt{deactivate} ()
  
  Deactivates the widget.

- Fl\_Image * \texttt{deimage} ()
  
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl\_Image * \texttt{deimage} () const
  
  Gets the image that is used as part of the widget label when in the inactive state.

- void \texttt{deimage} (Fl\_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- void \texttt{deimage} (Fl\_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- int \texttt{deimage\_bound} () const
  
  Returns whether the inactive image is managed by the widget.

- void \texttt{do\_callback} (Fl\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)
  
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- `unsigned int output() const`
  Returns if a widget is used for output only.

- `Fi_Group * parent() const`
  Returns a pointer to the parent widget.

- `void parent(Fi_Group * p)`
  Internal use only - “for hacks only”.

- `void position(int X, int Y)`
  Repositions the window or widget.

- `void redraw()`
  Schedules the drawing of the widget.

- `void redraw_label()`
  Schedules the drawing of the label.

- `virtual void resize(int x, int y, int w, int h)`
  Changes the size or position of the widget.

- `Fi_Color selection_color() const`
  Gets the selection color.

- `void selection_color(Fi_Color a)`
  Sets the selection color.

- `void set_active()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed()`
  Marks the value of the widget as changed.

- `void set_output()`
  Sets a widget to output only.

- `void set_visible()`
  Makes the widget visible.

- `void set_visible_focus()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label() const`
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- `void shortcut_label(int value)`
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- `virtual void show()`
  Makes a widget visible.

- `void size(int W, int H)`
  Changes the size of the widget.

- `int take_focus()`
  Gives the widget the keyboard focus.

- `unsigned int takeevents() const`
  Returns if the widget is able to take events.

- `int testShortcut()`
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- `const char * tooltip() const`
  Gets the current tooltip text.

- `void tooltip(const char *text)`
  Sets the current tooltip text.

- `Fi_Window * top_window()`
  Returns a pointer to the top-level window for the widget.

- `Fi_Window * top_window_offset(int &xoff, int &yoff)`
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void *user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• int visible_r () const
  Modifies keyboard focus navigation.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window *window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.

• void draw (int, int, int, int)

• int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget's label at the defined label position.

• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

• unsigned int flags () const
  Gets the widget flags mask.

• void h (int v)
  Internal use only.

• void set_flag (unsigned int c)
  Sets a flag in the flags mask.

• void w (int v)
  Internal use only.

• void x (int v)
  Internal use only.

• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.

• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
   INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
   FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
   OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
   MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
   GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
   NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
   AUTO_DELETE_USER_DATA = 1<<23 ,
   MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
   flags possible values enumeration.
11.103.1 Detailed Description

This class is provided for Forms compatibility. It provides 2D input. It would be useful if this could be put atop another widget so that the crosshairs are on top, but this is not implemented. The color of the crosshairs is selection_color().

![Figure 11.34 Fl_Positioner](image)

**Figure 11.34 Fl_Positioner**

11.103.2 Constructor & Destructor Documentation

11.103.2.1 `Fl_Positioner()`

```cpp
Fl_Positioner::Fl_Positioner ( 
    int X, 
    int Y, 
    int W, 
    int H, 
    const char ∗ l = 0 )
```

Creates a new Fl_Positioner widget using the given position, size, and label string. The default boxtype is FL_NO_BOX.

11.103.3 Member Function Documentation

11.103.3.1 `draw()`

```cpp
void Fl_Positioner::draw ( ) [protected], [virtual]
```

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead. Override this function to draw your own widgets. If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget ∗s = ∗scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.

11.103.3.2 `handle()`

```cpp
int Fl_Positioner::handle ( 
    int event ) [virtual]
```

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.
Parameters

- **event**: the kind of event received

Return values

- **0**: if the event was not used or understood
- **1**: if the event was used and can be deleted

See also

- Fl_Event

Reimplemented from Fl_Widget.

The documentation for this class was generated from the following files:

- Fl_Positioner.H
- Fl_Positioner.cxx

### 11.104 Fl_PostScript_File_Device Class Reference

To send graphical output to a PostScript file.

```c
#include <Fl_PostScript.H>
```

Inheritance diagram for Fl_PostScript_File_Device:

```
Fl_Surface_Device
   
Fl_Widget_Surface
   
Fl_Paged_Device
   
Fl_PostScript_File_Device
```

**Public Member Functions**

- **int begin_job (FILE *ps_output, int pagecount=0, enum Fl_Paged_Device::Page_Format format=Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout=Fl_Paged_Device::PORTRAIT)**
  
  Begins the session where all graphics requests will go to FILE pointer.

- **int begin_job (int pagecount, int *from, int *to, char **perr_message) FL_OVERRIDE**
  
  Don't use with this class.

- **int begin_job (int pagecount=0, enum Fl_Paged_Device::Page_Format format=Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout=Fl_Paged_Device::PORTRAIT)**
  
  Begins the session where all graphics requests will go to a local PostScript file.

- **int begin_page (void) FL_OVERRIDE**
  
  Begins a new printed page.

- **void close_command (Fl_PostScript_Close_Command cmd)**
  
  Sets the function `end_job()` calls to close the file()

- **void end_current () FL_OVERRIDE**
  
  FLTKit calls this each time a surface ceases to be the current drawing surface.

- **void end_job (void) FL_OVERRIDE**
  
  Completes all PostScript output.

Generated by Doxygen
• int end_page (void) FL_OVERRIDE
  
  To be called at the end of each page.

• FILE * file ()
  Returns the underlying FILE* receiving all PostScript data.

• Fl_PostScript_File_Device ()
  The constructor.

• void margins (int *left, int *top, int *right, int *bottom) FL_OVERRIDE
  Computes the dimensions of margins that lie between the printable page area and the full page.

• void origin (int *x, int *y) FL_OVERRIDE
  Computes the coordinates of the current origin of graphics functions.

• void origin (int x, int y) FL_OVERRIDE
  Sets the position of the origin of graphics in the drawable part of the drawing surface.

• int printable_rect (int *w, int *h) FL_OVERRIDE
  Computes the width and height of the drawable area of the drawing surface.

• void rotate (float angle) FL_OVERRIDE
  Rotates the graphics operations relatively to paper.

• void scale (float scale_x, float scale_y=0.) FL_OVERRIDE
  Changes the scaling of page coordinates.

• void set_current () FL_OVERRIDE
  Makes this surface the current drawing surface.

• int start_job (FILE *ps_output, int pagecount=0, enum Fl_Paged_Device::Page_Format format=Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout=Fl_Paged_Device::PORTRAIT)
  Synonym of begin_job().

• int start_job (int pagecount=0, enum Fl_Paged_Device::Page_Format format=Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout=Fl_Paged_Device::PORTRAIT)
  Synonym of begin_job().

• void translate (int x, int y) FL_OVERRIDE
  Translates the current graphics origin accounting for the current rotation.

• void untranslate (void) FL_OVERRIDE
  Undoes the effect of a previous translate() call.

• ~Fl_PostScript_File_Device ()
  The destructor.

Public Member Functions inherited from Fl_Paged_Device

• void print_widget (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  Synonym of draw(Fl_Widget*, int, int)

• void print_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  Synonym of draw_decorated_window(Fl_Window*, int, int)

• int start_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL)
  Synonym of begin_job(int pagecount, int *frompage, int *topage, char **perr_message).  

• int start_page ()
  Synonym of begin_page().

• virtual ~Fl_Paged_Device ()
  The destructor.

Public Member Functions inherited from Fl_Widget_Surface

• void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  Draws the widget on the drawing surface.

• void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  Draws a window with its title bar and frame if any.

• void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  Draws a rectangular part of an on-screen window.
Public Member Functions inherited from \texttt{Fl\_Surface\_Device}

- \texttt{FI\_Graphics\_Driver} \* \texttt{driver} ()
  
  Returns the graphics driver of this drawing surface.

- virtual bool \texttt{is\_current} ()
  
  Is this surface the current drawing surface?

- virtual \texttt{\~Fl\_Surface\_Device} ()
  
  The destructor.

Static Public Attributes

- static const char \* \texttt{file\_chooser\_title}
  
  Label of the PostScript file chooser window.

Static Public Attributes inherited from \texttt{Fl\_Paged\_Device}

- static const page\_format page\_formats [NO\_PAGE\_FORMATS]
  
  width, height and name of all elements of the enum Page\_Format.

Protected Member Functions

- \texttt{FI\_PostScript\_Graphics\_Driver} \* \texttt{driver} ()
  
  Returns the PostScript driver of this drawing surface.

Protected Member Functions inherited from \texttt{Fl\_Paged\_Device}

- \texttt{FI\_Paged\_Device} ()
  
  The constructor.

Protected Member Functions inherited from \texttt{Fl\_Widget\_Surface}

- \texttt{FI\_Widget\_Surface} (FI\_Graphics\_Driver \*d)
  
  The constructor.

Protected Member Functions inherited from \texttt{Fl\_Surface\_Device}

- void \texttt{driver} (FI\_Graphics\_Driver \*graphics\_driver)
  
  Sets the graphics driver of this drawing surface.

- \texttt{FI\_Surface\_Device} (FI\_Graphics\_Driver \*graphics\_driver)
  
  Constructor that sets the graphics driver to use for the created surface.

Additional Inherited Members

Public Types inherited from \texttt{Fl\_Paged\_Device}

- enum Page\_Format {
    A0 = 0 , A1 , A2 , A3 ,
    A4 , A5 , A6 , A7 ,
    A8 , A9 , B0 , B1 ,
    B2 , B3 , B4 , B5 ,
    B6 , B7 , B8 , B9 ,
    B10 , C5E , DLE , EXECUTIVE ,
    FOLIO , LEDGER , LEGAL , LETTER ,
    TABLOID , ENVELOPE , MEDIA = 0x1000 }

  Possible page formats.

- enum Page\_Layout { PORTRAIT = 0 , LANDSCAPE = 0x100 , REVERSED = 0x200 , ORIENTATION = 0x300 }

  Possible page layouts.
Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * pop_current ()
  Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void push_current (Fl_Surface_Device *new_current)
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static Fl_Surface_Device * surface ()
  The current drawing surface.

Protected Attributes inherited from Fl_Widget_Surface

- int x_offset
  horizontal offset to the origin of graphics coordinates
- int y_offset
  vertical offset to the origin of graphics coordinates

11.104.1 Detailed Description

To send graphical output to a PostScript file.

This class is used exactly as the Fl_Printer class except for the begin_job() call, two variants of which are usable
and allow to specify what page format and layout are desired.

Processing of text: Text uses vectorial fonts under the X11 + Pango and the Wayland platforms. With other
platforms, only text restricted to the Latin alphabet (and a few other characters listed in the table below) and to FLTK
standard fonts is vectorized. All other unicode characters or all other fonts (FL_FREE_FONT and above) are output
as a bitmap. FLTK standard fonts are output using the corresponding PostScript standard fonts. The latin alphabet
means all unicode characters between U+0020 and U+017F, or, in other words, the ASCII, Latin-1 Supplement and
Latin Extended-A charts.

Figure 11.35 Extra characters supported by standard PostScript fonts

Processing of transparent Fl_RGB_Imag objects: Under the X11 + Pango and the Wayland platforms, these
objects are output with their exact transparency. With other platforms, these objects are drawn blended to white
color. Class Fl_EPS_File_Surface’s constructor allows to set another background color for blending.
11.104.2 Member Function Documentation

11.104.2.1 begin_job() [1/3]

int Fl_PostScript_File_Device::begin_job (  
  FILE * ps_output,  
  int pagecount = 0,  
  enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,  
  enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT )

Begins the session where all graphics requests will go to FILE pointer.  
This member function prevents end_job() from closing ps_output, so the user can check with ferror(ps_output) for output errors.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ps_output</td>
<td>A writable FILE pointer that will receive PostScript output and that should not be closed until after end_job() has been called.</td>
</tr>
<tr>
<td>pagecount</td>
<td>The total number of pages to be created. Use 0 if this number is unknown when this function is called.</td>
</tr>
<tr>
<td>format</td>
<td>Desired page format.</td>
</tr>
<tr>
<td>layout</td>
<td>Desired page layout.</td>
</tr>
</tbody>
</table>

Returns

always 0.

11.104.2.2 begin_job() [2/3]

int Fl_PostScript_File_Device::begin_job (  
  int pagecount,  
  int * from,  
  int * to,  
  char ** perr_message ) [virtual]

Don't use with this class.  
Reimplemented from Fl_Paged_Device.

11.104.2.3 begin_job() [3/3]

int Fl_PostScript_File_Device::begin_job (  
  int pagecount = 0,  
  enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,  
  enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT )

Begins the session where all graphics requests will go to a local PostScript file.  
Opens a file dialog to select an output PostScript file. This member function makes end_job() close the resulting PostScript file and display an alert message with fl_alert() in case of any output error.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pagecount</td>
<td>The total number of pages to be created. Use 0 if this number is unknown when this function is called.</td>
</tr>
<tr>
<td>format</td>
<td>Desired page format.</td>
</tr>
<tr>
<td>layout</td>
<td>Desired page layout.</td>
</tr>
</tbody>
</table>

Returns

0 if OK, 1 if user cancelled the file dialog, 2 if fopen failed on user-selected output file.
11.104.2.4 begin_page()

int Fl_PostScript_File_Device::begin_page ( 
    void ) [virtual]

Begins a new printed page.
The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area.
This function also makes this surface the current drawing surface with Fl_Surface_Device::push_current().

Note
begin_page() calls Fl_Surface_Device::push_current() and leaves this device as the active surface. If
any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK
windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to
Fl_Surface_Device::push_current(), or the content of the dialog box will be rendered to the printer instead of
the screen.

Returns
0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

11.104.2.5 end_current()

void Fl_PostScript_File_Device::end_current ( ) [virtual]

FLTK calls this each time a surface ceases to be the current drawing surface.
This member function is mostly of interest to developers of new Fl_Surface_Device derived classes. It allows to
perform surface-specific operations necessary when this surface ceases to be current. Each implementation should
end with a call to Fl_Surface_Device::end_current().
Reimplemented from Fl_Surface_Device.

11.104.2.6 end_job()

void Fl_PostScript_File_Device::end_job ( 
    void ) [virtual]

Completes all PostScript output.
This also closes with fclose() the underlying file() unless close_command() was used to set another function.
Reimplemented from Fl_Paged_Device.

11.104.2.7 end_page()

int Fl_PostScript_File_Device::end_page ( 
    void ) [virtual]

To be called at the end of each page.
This function also stops this surface from being the current drawing surface with Fl_Surface_Device::pop_current().

Note
end_page() calls Fl_Surface_Device::pop_current(). If any calls between begin_page() and end_page()
open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to
Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current().

Returns
0 if OK, non-zero if any error.

Reimplemented from Fl_Paged_Device.
11.104.2.8 margins()

```cpp
t void Fl_PostScript_File_Device::margins {
    int * left,
    int * top,
    int * right,
    int * bottom ) [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page. Values are in the same unit as that used by FLTK drawing functions. They are changed by scale() calls.

**Parameters**

<table>
<thead>
<tr>
<th>out</th>
<th>left</th>
<th>If non-null, *left is set to the left margin size.</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>top</td>
<td>If non-null, *top is set to the top margin size.</td>
</tr>
<tr>
<td>out</td>
<td>right</td>
<td>If non-null, *right is set to the right margin size.</td>
</tr>
<tr>
<td>out</td>
<td>bottom</td>
<td>If non-null, *bottom is set to the bottom margin size.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

11.104.2.9 origin() [1/2]

```cpp
t void Fl_PostScript_File_Device::origin {
    int * x,
    int * y ) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**

| out | x, y     | If non-null, +x and +y are set to the horizontal and vertical coordinates of the graphics origin. |

Reimplemented from Fl_Widget_Surface.

11.104.2.10 origin() [2/2]

```cpp
t void Fl_PostScript_File_Device::origin {
    int x,
    int y ) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface. Arguments should be expressed relatively to the result of a previous printable_rect() call. That is, printable_rect(&w, &h); origin(w/2, 0); sets the graphics origin at the top center of the drawable area. Successive origin() calls don’t combine their effects. Origin() calls are not affected by rotate() calls (for classes derived from Fl_Paged_Device).

**Parameters**

| in  | x, y     | Horizontal and vertical positions in the drawing surface of the desired origin of graphics. |

Reimplemented from Fl_Widget_Surface.

11.104.2.11 printable_rect()

```cpp
t int Fl_PostScript_File_Device::printable_rect {
    int * w,
    int * h ) [virtual]
```

Computes the width and height of the drawable area of the drawing surface. Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to origin(). If the object is derived from class Fl_Paged_Device, values account for the user-selected paper type and print orientation and are changed by scale() calls.
Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Widget_Surface.

11.104.2.12 rotate()

void Fl_PostScript_File_Device::rotate (  
  float angle  )  [virtual]

Rotates the graphics operations relatively to paper.
The rotation is centered on the current graphics origin. Successive rotate() calls don’t combine their effects.

Parameters

| angle | Rotation angle in counter-clockwise degrees. |

Reimplemented from Fl_Paged_Device.

11.104.2.13 scale()

void Fl_PostScript_File_Device::scale (  
  float scale_x,  
  float scale_y = 0.  )  [virtual]

Changes the scaling of page coordinates.
This function also resets the origin of graphics functions at top left of printable page area. After a scale() call, do a printable_rect() call to get the new dimensions of the printable page area. Successive scale() calls don’t combine their effects.

Parameters

| scale←-_x | Horizontal dimensions of plot are multiplied by this quantity. |
| scale←-_y | Same as above, vertically. The value 0. is equivalent to setting scale_y = scale_x. Thus, scale(factor); is equivalent to scale(factor, factor); |

Reimplemented from Fl_Paged_Device.

11.104.2.14 set_current()

void Fl_PostScript_File_Device::set_current (  
  void  )  [virtual]

Make this surface the current drawing surface.
This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().

Note

It’s recommended to use this function only as follows:

- The current drawing surface is the display;
- make current another surface, e.g., an Fl_Printer or an Fl_Image_Surface object, calling set_current() on this object;
- draw to that surface;
- make the display current again with Fl_Display_Device::display_device() -> set_current();. Don’t do any other call to set_current() before this one.

Other scenarios of drawing surface changes should be performed via Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().

Reimplemented from Fl_Surface_Device.
11.104.2.15  **start_job()** [1/2]

```c
int Fl_PostScript_File_Device::start_job (  
    FILE ∗ ps_output,  
    int pagecount = 0,  
    enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,  
    enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT ) [inline]
```

Synonym of `begin_job()`.  
For API compatibility with FLTK 1.3.x

11.104.2.16  **start_job()** [2/2]

```c
int Fl_PostScript_File_Device::start_job (  
    int pagecount = 0,  
    enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,  
    enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT ) [inline]
```

Synonym of `begin_job()`.  
For API compatibility with FLTK 1.3.x

11.104.2.17  **translate()**

```c
void Fl_PostScript_File_Device::translate (  
    int x,  
    int y ) [virtual]
```

Translates the current graphics origin accounting for the current rotation.  
Each `translate()` call must be matched by an `untranslate()` call.  
Successive `translate()` calls add up their effects.  
Reimplemented from `Fl_Widget_Surface`.

11.104.2.18  **untranslate()**

```c
void Fl_PostScript_File_Device::untranslate (  
    void ) [virtual]
```

Undoes the effect of a previous `translate()` call.  
Reimplemented from `Fl_Widget_Surface`.  
The documentation for this class was generated from the following file:

- Fl_PostScript.H

### 11.105  **Fl_Preferences Class Reference**

`Fl_Preferences` store user settings between application starts.  
```c
#include <Fl_Preferences.H>
```

Inheritance diagram for `Fl_Preferences`:

```
Fl_Preferences
   `- Fl_Plugin_Manager
```

**Classes**

- struct `Entry`
- class `Name`
  
  "Name" provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.
- class `Node`
- class `RootNode`

Generated by Doxygen
Public Types

- typedef void *ID

  * Every Fl_Preferences-Group has a unique ID.

- enum Root {
  UNKNOWN_ROOT_TYPE = -1,
  SYSTEM = 0,
  USER,
  MEMORY,
  ROOT_MASK = 0x00FF,
  CORE = 0x0100,
  C_LOCALE = 0x1000,
  CLEAR = 0x2000,
  SYSTEM_L = SYSTEM | C_LOCALE,
  USER_L = USER | C_LOCALE,
  CORE_SYSTEM_L = CORE | SYSTEM_L,
  CORE_USER_L = CORE | USER_L,
  CORE_SYSTEM = CORE | SYSTEM,
  CORE_USER = CORE | USER
}

  Define the scope of the preferences.

Public Member Functions

- char clear ()

  Delete all groups and all entries.

- char delete_all_entries ()

  Delete all entries.

- char delete_all_groups ()

  Delete all groups.

- char delete_entry (const char *entry)

  Deletes a single name/value pair.

- char delete_group (const char *group)

  Deletes a group.

- int dirty ()

  Check if there were changes to the database that need to be written to disk.

- int entries ()

  Returns the number of entries (name/value pairs) in a group.

- const char * entry (int index)

  Returns the name of an entry.

- char entry_exists (const char *key)

  Returns non-zero if an entry with this name exists.

- Root filename (char *buffer, size_t buffer_size)

  Return the file name and path to the preference file.

- Fl_Preferences (const char *path, const char *vendor, const char *application)

  The constructor creates a group that manages key/value pairs and child groups.

- Fl_Preferences (const char *path, const char *vendor, const char *application, Root flags)

  Use this constructor to create or read a preference file at an arbitrary position in the file system.

- Fl_Preferences (const Fl_Preferences &)

  Create another reference to a Preferences group.

- Fl_Preferences (Fl_Preferences &parent, const char *group)

  Generate or read a new group of entries within another group.

- Fl_Preferences (Fl_Preferences &parent, int groupIndex)

  Open a child group using a given index.

- Fl_Preferences (Fl_Preferences &parent, const char *group)

  Create or access a group of preferences using a name.

- Fl_Preferences (Fl_Preferences &parent, int groupIndex)

- Fl_Preferences (ID id)

  Create a new dataset access point using a dataset ID.

- Fl_Preferences (Root root, const char *vendor, const char *application)

  The constructor creates a group that manages key/value pairs and child groups.

- int flush ()
11.105 Fl_Preferences Class Reference

Writes preferences to disk if they were modified.

- **char get (const char *entry, char *)&value, const char *defaultValue)**
  
  Reads an entry from the group.

- **char get (const char *entry, char *value, const char *defaultValue, int maxSize)**
  
  Reads an entry from the group.

- **char get (const char *entry, double &value, double defaultValue)**
  
  Reads an entry from the group.

- **char get (const char *entry, float &value, float defaultValue)**
  
  Reads an entry from the group.

- **char get (const char *entry, int &value, int defaultValue)**
  
  Reads an entry from the group.

- **char get (const char *entry, void *&value, const void *defaultValue, int defaultSize)**
  
  Reads an entry from the group.

- **char get (const char *entry, void *value, const void *defaultValue, int defaultSize, int maxSize)**
  
  Reads a binary entry from the group, encoded in hexadecimal blocks.

- **char get_userdata_path (char *path, int pathlen)**
  
  Creates a path that is related to the preference file and that is usable for additional application data.

- **const char *group (int num_group)**
  
  Returns the name of the Nth (num_group) group.

- **char group_exists (const char *key)**
  
  Returns non-zero if a group with this name exists.

- **int groups ()**
  
  Returns the number of groups that are contained within a group.

- **ID id ()**
  
  Return an ID that can later be reused to open more references to this dataset.

- **const char *name ()**
  
  Return the name of this entry.

- **const char *path ()**
  
  Return the full path to this entry.

- **char set (const char *entry, const char *value)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, const void *value, int size)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, double value)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, double value, int precision)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, float value)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, float value, int precision)**
  
  Sets an entry (name/value pair).

- **char set (const char *entry, int value)**
  
  Sets an entry (name/value pair).

- **int size (const char *entry)**
  
  Returns the size of the value part of an entry.

- **virtual ~Fl_Preferences ()**
  
  The destructor removes allocated resources.
Static Public Member Functions

- static unsigned int file_access ()
  
  Return the current file access permissions for the FLTK preferences system.

- static void file_access (unsigned int flags)
  
  Tell the FLTK preferences system which files in the file system it may read, create, or write.

- static Root filename (char ∗buffer, size_t buffer_size, Root root, const char ∗vendor, const char ∗application)
  
  Determine the file name and path to preferences that would be opened with these parameters.

- static const char ∗ new_UUID ()
  
  Returns a UUID as generated by the system.

- static char remove (ID id_)
  
  Remove the group with this ID from a database.

Static Public Attributes

- static const unsigned int ALL = ALL_READ_OK | ALL_WRITE_OK
  
  Set this to give FLTK and applications permission to read, write, and create preference files.

- static const unsigned int ALL_READ_OK = USER_READ_OK | SYSTEM_READ_OK | CORE_READ_OK
  
  Set this to allow FLTK and applications to read preference files.

- static const unsigned int ALL_WRITE_OK = USER_WRITE_OK | SYSTEM_WRITE_OK | CORE_WRITE_OK
  
  Set this to allow FLTK and applications to create and write preference files.

- static const unsigned int APP_OK = SYSTEM_OK | USER_OK
  
  Set this if it is OK for applications to read, create, and write any kind of preference files.

- static const unsigned int CORE_OK = CORE_READ_OK | CORE_WRITE_OK
  
  Set this if it is OK for FLTK to read, create, or write preference files.

- static const unsigned int CORE_READ_OK = 0x0010
  
  Set this if it is OK for FLTK to read preference files.

- static const unsigned int CORE_WRITE_OK = 0x0020
  
  Set this if it is OK for FLTK to create or write preference files.

- static const unsigned int NONE = 0x0000
  
  Set this if no call to Fl_Preferences shall access the file system.

- static const unsigned int SYSTEM_OK = SYSTEM_READ_OK | SYSTEM_WRITE_OK
  
  Set this if it is OK for applications to read, create, and write system wide preference files.

- static const unsigned int SYSTEM_READ_OK = 0x0004
  
  Set this if it is OK for applications to read system wide preference files.

- static const unsigned int SYSTEM_WRITE_OK = 0x0008
  
  Set this if it is OK for applications to create and write system wide preference files.

- static const unsigned int USER_OK = USER_READ_OK | USER_WRITE_OK
  
  Set this if it is OK for applications to read, create, and write user preference files.

- static const unsigned int USER_READ_OK = 0x0001
  
  Set this if it is OK for applications to read user preference files.

- static const unsigned int USER_WRITE_OK = 0x0002
  
  Set this if it is OK for applications to create and write user preference files.

Protected Attributes

- RootNode * rootNode

Friends

- class Node
- class RootNode
11.105.1 Detailed Description

FL_Preferences store user settings between application starts. FL_Preferences are similar to the Registry on Windows and Preferences on MacOS, providing a simple method to store customizable user settings between app launches, for instance the previous window position or a history of previously used documents.

Preferences are organized in a hierarchy of groups. Every group can contain more groups and any number of key/value pairs. Keys can be text strings containing ASCII letters, digits, periods, and underscores. Forward slashes in a key name are treated as subgroups, i.e. the key 'window/width' would actually refer to the key 'width' inside the group 'window'.

Keys usually have a unique name within their group. Duplicate keys are possible though and can be accessed using the index based functions.

A value can be an UTF-8 string. Control characters and UTF-8 sequences are stored as octal values. Long strings are wrapped at the line ending and will be reassembled when reading the file back.

Several methods allow setting and getting numerical values and binary data.

Preferences are stored in text files that can be edited manually if needed. The file format is easy to read and relatively forgiving. Preference files are the same on all platforms. User comments in preference files are preserved. Filenames are unique for each application by using a vendor/application naming scheme. The user must provide default values for all entries to ensure proper operation should preferences be corrupted or not yet exist.

FLTK preferences are not meant to replace a fully features database. No merging of data takes place. If several instances of an app access the same database at the same time, only the most recent changes will persist.

Preferences should no be used to store document data. The .prefs file should be kept small for performance reasons. One application can have multiple preference files. Extensive binary data however should be stored in separate files: see Fl_Preferences::get_userdata_path() .

FL_Preferences are not thread-safe. They can temporarily change the locale on some platforms during read and write access, which also changes it temporarily in other threads of the same app.

Typically a preferences database is read at startup, and then reopened and written at app shutdown:

```c
int appWindowWidth, appWindowHeight;

void launch() {
    Fl_Preferences app(Fl_Preferences::USER_L, "matthiasm.com", "hello");
    // 'app' constructor will be called, reading data from .prefs file
    Fl_Preferences window(app, "window");
    window.get("width", appWindowWidth, 800);
    window.get("height", appWindowHeight, 600);
    // 'app' destructor will be called. This will write data to the
    // .prefs file if any preferences were changed or added
}

void quit() {
    Fl_Preferences app(Fl_Preferences::USER_L, "matthiasm.com", "hello");
    Fl_Preferences window(app, "window");
    window.set("width", appWindowWidth);
    window.set("height", appWindowHeight);
}
```

See also

FL_Preferences::Fl_Preferences(Root root, const char ∗vendor, const char ∗application)

As a special case, FL_Preferences can be memory mapped and not be associated with a file on disk.

See also

FL_Preferences::Fl_Preferences(Fl_Preferences ∗parent, const char ∗group) for more details on memory mapped preferences.

Note

Starting with FLTK 1.3, preference databases are expected to be in UTF-8 encoding. Previous databases were stored in the current character set or code page which renders them incompatible for text entries using international characters.

Starting with FLTK 1.4, searching a valid path to store the preference files has changed slightly. Please see Fl_Preferences::Fl_Preferences(Root, const char*, const char*) for details.

Starting with FLTK 1.4, preference files should be created with SYSTEM_L or USER_L to be interchangeable between computers with differing locale settings. The legacy modes, LOCAL and SYSTEM, will read and write floating point values using the decimal point of the current locale. As a result, a fp-value would be written
'3.1415' on a German machine, and would be read back as '3.0' on a US machine because the comma would not be recognized as an alternative decimal point.

11.105.2 Member Typedef Documentation

11.105.2.1 ID

typedef void* Fl_Preferences::ID

Every Fl_Preferences-Group has a unique ID. ID's can be retrieved from an Fl_Preferences-Group and can then be used to create more Fl_Preference references to the same data set, as long as the database remains open.

11.105.3 Member Enumeration Documentation

11.105.3.1 Root

enum Fl_Preferences::Root

Define the scope of the preferences.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNKNOWN_ROOT_TYPE</td>
<td>Returned if storage could not be determined.</td>

11.105.4 Constructor & Destructor Documentation

11.105.4.1 Fl_Preferences() [1/8]

Fl_Preferences::Fl_Preferences ( 
    Root root,
    const char * vendor,
    const char * application )

The constructor creates a group that manages key/value pairs and child groups. Preferences can be stored per user using the root type Fl_Preferences::USER_L, or stored system-wide using Fl_Preferences::SYSTEM_L.

Groups and key/value pairs can be read and written randomly. Reading undefined values will return the default value. Writing undefined values will create all required groups and key/value pairs.

This constructor creates the base instance for all following entries and reads the database from disk into memory if it exists. The vendor argument is a unique text string identifying the development team or vendor of an application. A domain name or an EMail address (replacing the '@' with a '.') are great unique names, e.g. "research.matthiasm.com" or "fluid.fltk.org". The application argument can be the working title or final name of your application. Both vendor and application must be valid UNIX path segments as they become parts of the preference file path and may

Generated by Doxygen
contain forward slashes to create deeper file structures.

Note

On *Windows*, the directory is constructed by querying the *Common AppData* or *AppData* key of the `Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders` registry entry. The filename and path is then constructed as `$(query)/$(vendor)/$(application).prefs`. If the query call fails, data will be stored in RAM only. It will be lost when the app exits.

In FLTK versions before 1.4.0, if querying the registry failed, preferences would be written to `C:\FLTK\$(vendor)\$(application).prefs`.

Note

On *Linux*, the *USER* directory is constructed by reading `$HOME`. If `$HOME` is not set or not pointing to an existing directory, FLTK will check the path member of the passwd struct returned by `getpwuid(getuid())` . If all attempts fail, data will be stored in RAM only and be lost when the app exits.

The system preference filename is hardcoded as `/etc/fltk/$(vendor)/$(application).prefs`. For backward compatibility, the old *USER*.prefs file naming scheme `$(directory)/.fltk/$(vendor)/$(application).prefs` is checked first. If that file does not exist, the environment variable `$XDG_CONFIG_HOME` is read as a base directory. If `$XDG_CONFIG_HOME` not set, the base directory defaults to `$HOME/.config/`. The user preferences will be stored in `$(directory)/$(vendor)/$(application).prefs`. The user data path will be `$(directory)/$(vendor)/$(application)/`. In FLTK versions before 1.4.0, if `$HOME` was not set, the *USER* path would be empty, generating `$(vendor)/$(application).prefs`, which was used relative to the current working directory.

Note

On *macOS*, the *USER* directory is constructed by reading `$HOME`. If `$HOME` is not set or not pointing to an existing directory, we check the path returned by `NSHomeDirectory()`, and finally checking the path member of the passwd struct returned by `getpwuid(getuid())` . If all attempts fail, data will be stored in RAM only and be lost when the app exits. The filename and path is then constructed as `$(directory)/←Library/Preferences/$(vendor)/$(application).prefs`. The *SYSTEM* directory is hardcoded as `/Library/Preferences/$(vendor)/$(application).prefs`.

In FLTK versions before 1.4.0, if `$HOME` was not set, the *USER* path would be `NULL`, generating `<null>/Library/Preferences/$(vendor)/$(application).prefs`, which would silently fail to create a preference file.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>root</td>
<td>can be USER_L or SYSTEM_L for user specific or system wide preferences, add the CLEAR flag to start with a clean set of preferences instead of reading them from a preexisting database</td>
</tr>
<tr>
<td>in</td>
<td>vendor</td>
<td>unique text describing the company or author of this file, must be a valid filepath segment</td>
</tr>
<tr>
<td>in</td>
<td>application</td>
<td>unique text describing the application, must be a valid filepath segment</td>
</tr>
</tbody>
</table>

See also

`Fl_Preferences(Fl_Preferences ∗parent, const char ∗group)` with parent set to NULL

11.105.4.2 Fl_Preferences() [2/8]

```cpp
Fl_Preferences::Fl_Preferences (const char ∗ path,
```
Use this constructor to create or read a preference file at an arbitrary position in the file system. The file name is generated in the form $(path)/$(application).prefs. If application is NULL, path is taken literally as the file path and name.

Example: read from an existing database and write modifications when flushed

```cpp
Fl_Preferences database("/user/matt/test.prefs", "org.fltk.test", NULL,
                        Fl_Preferences::C_LOCALE);
```

// Example: create a new preferences file with an empty data set

```cpp
Fl_Preferences database("/user/matt/test.prefs", "org.fltk.test", NULL,
                        (Fl_Preferences::Root)(Fl_Preferences::C_LOCALE|Fl_Preferences::CLEAR));
```

Note

the C_LOCALE flag is is not set by default for backward compatibility, but it is highly recommended to set it when opening a database.

### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>path</th>
<th>path to the directory that contains the preference file</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>vendor</td>
<td>unique text describing the company or author of this file, must be a valid file path segment</td>
</tr>
<tr>
<td>in</td>
<td>application</td>
<td>unique text describing the application, must be a valid filename or NULL</td>
</tr>
<tr>
<td>in</td>
<td>flags</td>
<td>C_LOCALE to make the preferences file independent of the current locale, add the CLEAR flag to start with a clean set of preferences instead of reading from the database</td>
</tr>
</tbody>
</table>

### 11.105.4.3 Fl_Preferences() [3/8]

Fl_Preferences::Fl_Preferences ( Fl_Preferences & parent,
                               const char * group )

Generate or read a new group of entries within another group.
Use the group argument to name the group that you would like to access. Group can also contain a path to a group further down the hierarchy by separating group names with a forward slash '/'.

### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>parent</th>
<th>reference object for the new group</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>group</td>
<td>name of the group to access (may contain '/')</td>
</tr>
</tbody>
</table>

### 11.105.4.4 Fl_Preferences() [4/8]

Fl_Preferences::Fl_Preferences ( Fl_Preferences * parent,
                               const char * group )

Create or access a group of preferences using a name.
Parent should point to a previously created parent preferences group to create a preferences hierarchy. If parent is set to NULL, an unnamed database will be accessed that exists only in local memory and is not associated with a file on disk. The root type of this database is set to Fl_Preferences::MEMORY.

- the memory database is not shared among multiple instances of the same app
- memory databases are not thread safe
- all data will be lost when the app quits

```cpp
void some_function() {
    Fl_Preferences guide( NULL, "Guide" );
}
```
guide.set("answer", 42);
}
void other_function() {
  int x;
  Fl_Preferences guide( NULL, "Guide");
guide.get("answer", x, -1);
}

FTLK uses the memory database to manage plugins. See Fl_Preferences.

### Parameters

| in | parent | the parameter parent is a pointer to the parent group. If parent is NULL, the new preferences item refers to an application internal database ("runtime prefs") which exists only once, and remains in RAM only until the application quits. This database is used to manage plugins and other data indexes by strings. Runtime prefs are not thread-safe. |
| in | group  | a group name that is used as a key into the database |

See also

Fl_Preferences( Fl_Preferences&, const char *group )

#### Fl_Preferences() [5/8]

Fl_Preferences::Fl_Preferences (  
        Fl_Preferences & parent,  
        int groupIndex )

Open a child group using a given index.
Use the groupIndex argument to find the group that you would like to access. If the given index is invalid (negative or too high), a new group is created with a UUID as a name.
The index needs to be fixed. It is currently backward. Index 0 points to the last member in the 'list' of preferences.

### Parameters

| in | parent | reference object for the new group |
| in | groupIndex | zero based index into child groups |

#### Fl_Preferences() [6/8]

Fl_Preferences::Fl_Preferences (  
        Fl_Preferences * parent,  
        int groupIndex )

See also

Fl_Preferences( Fl_Preferences&, int groupIndex )

#### Fl_Preferences() [7/8]

Fl_Preferences::Fl_Preferences (  
        Fl_Preferences::ID id )

Create a new dataset access point using a dataset ID.
ID's are a great way to remember shortcuts to database entries that are deeply nested in a preferences database, as long as the database root is not deleted. An ID can be retrieved from any Fl_Preferences dataset, and can then be used to create multiple new references to the same dataset.
ID's can be very helpful when put into the user_data() field of widget callbacks.

#### Fl_Preferences() [virtual]

Fl_Preferences::~Fl_Preferences ( )
The destructor removes allocated resources. When used on the base preferences group, the destructor flushes all changes to the preference file and deletes all internal databases. The destructor does not remove any data from the database. It merely deletes your reference to the database.

**11.105.4.9 Fl_Preferences() [8/8]**

`Fl_Preferences::Fl_Preferences (const char ∗ path, const char ∗ vendor, const char ∗ application)`

Deprecated: Use this constructor to create or read a preference file at an arbitrary position in the file system.

* Deprecated "in 1.4.0 - use Fl_Preferences(path, vendor, application, flags) instead"

This constructor should no longer be used because the generated database uses the current locale, making it impossible to exchange floating point settings between machines with different language settings. Use `Fl_Preferences(path, vendor, application, Fl_Preferences::C_LOCALE)` in new projects and `Fl_Preferences(path, vendor, application, 0)` if you must keep backward compatibility.

See also

`Fl_Preferences( const char ∗ path, const char ∗ vendor, const char ∗ application, Root flags )`

**11.105.5 Member Function Documentation**

**11.105.5.1 delete_entry()**

`char Fl_Preferences::delete_entry (const char ∗ key)`

Deletes a single name/value pair. This function removes the entry `key` from the database.

Parameters

- **key** name of entry to delete

Returns

- 0 if deleting the entry failed

**11.105.5.2 delete_group()**

`char Fl_Preferences::delete_group (const char ∗ group)`

Deletes a group. Removes a group and all keys and groups within that group from the database.

Parameters

- **group** name of the group to delete

Returns

- 0 if call failed
11.105.3 dirty()

int Fl_Preferences::dirty ( )
Check if there were changes to the database that need to be written to disk.

Returns
- 1 if the database will be written to disk by flush or destructor.
- 0 if the database is unchanged since the last write operation.
- -1 if there is an internal database error.

11.105.4 entries()

int Fl_Preferences::entries ( )
Returns the number of entries (name/value pairs) in a group.

Returns
number of entries

11.105.5 entry()

const char * Fl_Preferences::entry ( int index )
Returns the name of an entry.
There is no guaranteed order of entry names. The index must be within the range given by entries().

Parameters

| in   | index | number indexing the requested entry |

Returns
pointer to value cstring

11.105.6 entry_exists()

char Fl_Preferences::entry_exists ( const char * key )
Returns non-zero if an entry with this name exists.

Parameters

| in   | key   | name of entry that is searched for |

Returns
0 if entry was not found

11.105.7 file_access() [1/2]

unsigned int Fl_Preferences::file_access ( ) [static]
Return the current file access permissions for the FLTK preferences system.
See also
Fl_Preferences::file_access(unsigned int)
11.105.5.8 file_access() [2/2]

```cpp
void Fl_PREFERENCES::file_access ( unsigned int flags ) [static]
```

Tell the FLTK preferences system which files in the file system it may read, create, or write.

The FLTK core library will try to read or even create or write preference files when calling `Fl::option()`, `Fl_File_Chooser`, the printing panel, and possibly some other internal functions. If your application wants to keep FLTK from touching the file system, call this function before making any other FLTK calls:

```cpp
// neither FLTK nor the app may read, create, or write preference files
Fl_PREFERENCES::file_access( Fl_PREFERENCES::NONE );
```

or

```cpp
// FLTK may not read, create, or write preference files, but the application may
Fl_PREFERENCES::file_access( Fl_PREFERENCES::APP_OK );
```

All flags can be combined using an OR operator. If flags are not set, that specific access to the file system will not be allowed. By default, all access is granted. To clear one or more flags from the default setting, use:

```cpp
Fl_PREFERENCES::file_access( Fl_PREFERENCES::file_access() &~ Fl_PREFERENCES::SYSTEM_WRITE );
```

If preferences are created using a filename (instead of `Fl_PREFERENCES::USER` or `Fl_PREFERENCES::SYSTEM`), file access is handled as if the `Fl_PREFERENCES::USER` flag was set.

See also

- `Fl_PREFERENCES::NONE` and others for a list of flags.
- `Fl_PREFERENCES::file_access()`

11.105.5.9 filename() [1/2]

```cpp
Fl_PREFERENCES::Root Fl_PREFERENCES::filename ( char * buffer, size_t buffer_size )
```

Return the file name and path to the preference file.

If the preferences have not changed or have not been flushed, the file or directory may not have been created yet.

**Parameters**

<table>
<thead>
<tr>
<th>out buffer</th>
<th>write the resulting path into this buffer</th>
</tr>
</thead>
<tbody>
<tr>
<td>in buffer_size</td>
<td>size of the buffer in bytes</td>
</tr>
</tbody>
</table>

**Returns**

the root type at creation type, or MEMORY for runtime prefs, it does not return CORE or LOCALE flags.

11.105.5.10 filename() [2/2]

```cpp
Fl_PREFERENCES::Root Fl_PREFERENCES::filename ( char * buffer, size_t buffer_size, Root root, const char * vendor, const char * application ) [static]
```

Determine the file name and path to preferences that would be openend with these parameters.

Find the possible location of a preference file on disk without touching any of the pathname components. This can be used to check if a preference file already exists.

**Parameters**

<table>
<thead>
<tr>
<th>out buffer</th>
<th>write the resulting path into this buffer</th>
</tr>
</thead>
<tbody>
<tr>
<td>in buffer_size</td>
<td>size of the buffer in bytes</td>
</tr>
<tr>
<td>in root</td>
<td>can be USER_L or SYSTEM_L for user specific or system wide preferences</td>
</tr>
</tbody>
</table>
Parameters

| in  | vendor | unique text describing the company or author of this file, must be a valid filepath segment |
| in  | application | unique text describing the application, must be a valid filepath segment |

Returns

the input root value, or `FL_PREFERENCES::UNKNOWN_ROOT_TYPE` if the path could not be determined.

See also

`FL_PREFERENCES( Root root, const char *vendor, const char *application )`

### 11.105.5.11 flush()

```
int Fl_Preferences::flush ( )
```

Writes preferences to disk if they were modified.
This method can be used to verify that writing a preference file went well. Deleting the base preferences object will also write the contents of the database to disk.

Returns

-1 if anything went wrong, i.e. file could not be opened, permissions blocked writing, etc.
0 if the file was written to disk. This does not check if the disk ran out of space and the file is truncated.
1 if no data was written to the database and no write attempt to disk was made.

### 11.105.5.12 get() [1/8]

```
char Fl_Preferences::get ( const char * key, char ** text, const char * defaultValue )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). `get()` allocates memory of sufficient size to hold the value. The buffer must be free’d by the developer using `free(value)`.

Parameters

| in  | key | name of entry |
| out | text | returned from preferences or default value if none was set |
| in  | defaultValue | default value to be used if no preference was set |

Returns

0 if the default value was used

### 11.105.5.13 get() [2/8]

```
char Fl_Preferences::get ( const char * key, char * text, const char * defaultValue, int maxSize )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). 'maxSize' is the maximum length of text that will be read. The text buffer must allow for one additional byte for a trailing zero.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>text</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
<tr>
<td>in</td>
<td>maxSize</td>
<td>maximum length of value plus one byte for a trailing zero</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

11.105.5.14 get() [3/8]

```cpp
char Fl_Preferences::get ( 
    const char * key, 
    double & value, 
    double defaultValue )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>value</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

11.105.5.15 get() [4/8]

```cpp
char Fl_Preferences::get ( 
    const char * key, 
    float & value, 
    float defaultValue )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>value</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used
11.105.16 get() [5/8]

```c
char Fl_Preferences::get (  
    const char * key,  
    int & value,  
    int defaultValue )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>value</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

### Returns

0 if the default value was used

---

11.105.17 get() [6/8]

```c
char Fl_Preferences::get (  
    const char * key,  
    void * & data,  
    const void * defaultValue,  
    int defaultSize )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). get() allocates memory of sufficient size to hold the value. The buffer must be free’d by the developer using 'free(value)'.

### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>data</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultSize</td>
<td>size of default value array</td>
</tr>
</tbody>
</table>

### Returns

0 if the default value was used

---

11.105.18 get() [7/8]

```c
char Fl_Preferences::get (  
    const char * key,  
    void * data,  
    const void * defaultValue,  
    int defaultSize,  
    int * maxSize )
```

Reads a binary entry from the group, encoded in hexadecimal blocks.
A binary (not hex) default value can be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). MaxSize is the maximum length of text that will be read and returns the actual number of bytes read.
11.105.19  **get() [8/8]**

```c
char Fl_Preferences::get ( const char * key, void * data, const void * defaultValue, int defaultSize, int maxSize )
```

Reads a binary entry from the group, encoded in hexadecimal blocks.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>data</td>
<td>value returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultSize</td>
<td>size of default value array</td>
</tr>
<tr>
<td>in, out</td>
<td>maxSize</td>
<td>maximum length of value and actual number of bytes set</td>
</tr>
</tbody>
</table>

**Returns**

0 if the default value was used

See also

```c
Fl_Preferences::get( const char *key, void *data, const void *defaultValue, int defaultSize, int *maxSize )
```

11.105.5.20  **get_userdata_path()**

```c
char Fl_Preferences::get_userdata_path ( char * path, int pathlen )
```

Creates a path that is related to the preference file and that is usable for additional application data.

This function creates a directory that is named after the preferences database without the .prefs extension and located in the same directory. It then fills the given buffer with the complete path name. There is no way to verify that the path name fit into the buffer. If the name is too long, it will be clipped. This function can be used with direct paths that don't end in .prefs. `getUserDataPath()` will remove any extension and end the path with a / . If the file name has no extension, `getUserDataPath()` will append .data/ to the path name.

**Example:**

```c
Fl_Preferences prefs( USER, "matthiasm.com", "test" );
char path[FL_PATH_MAX];
prefs.getUserDataPath( path, FL_PATH_MAX );
creates the preferences database in the directory (User 'matt' on Linux):
/Users/matt/.fltkmattiasm.com/test.prefs
..and returns the userdata path:
/Users/matt/.fltk/matthiasm.com/test/
### Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>path</th>
<th>buffer for user data path</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>pathlen</td>
<td>size of path buffer (should be at least FL_PATH_MAX)</td>
</tr>
</tbody>
</table>

### Returns

- 1 if there is no filename (`path` will be unmodified)
- 1 if `pathlen` is 0 (`path` will be unmodified)
- 1 if a path was created successfully, `path` will contain the path name ending in a `'/`
- 0 if path was not created for some reason; `path` will contain the pathname that could not be created

### See also

- `Fl_Preferences::Fl_Preferences(Root, const char*, const char*)`

#### 11.105.5.21 group()

```cpp
class Fl_Preferences {
    const char * group(int num_group);
}
```

Returns the name of the Nth (`num_group`) group.

There is no guaranteed order of group names. The index must be within the range given by `groups()`.

### Parameters

| in | num_group | number indexing the requested group |

### Returns

'C' string pointer to the group name

#### 11.105.5.22 group_exists()

```cpp
class Fl_Preferences {
    char group_exists(const char * key);
}
```

Returns non-zero if a group with this name exists.

Group names are relative to the `Fl_Preferences` node and can contain a path. `"."` describes the current node, `"./"` describes the topmost node. By preceding a groupname with a `"./"` its path becomes relative to the topmost node.

### Parameters

| in | key | name of group that is searched for |

### Returns

0 if no group by that name was found

#### 11.105.5.23 groups()

```cpp
class Fl_PREFERENCES {
    int groups();
}
```

Returns the number of groups that are contained within a group.

### Returns

0 for no groups at all
11.105.5.24 new_UUID()

const char * Fl_Preferences::new_UUID ( ) [static]
Returns a UUID as generated by the system.
A UUID is a "universally unique identifier" which is commonly used in configuration files to create identities. A UUID in ASCII looks like this: 937C4900-51AA-4C11-8DD3-7AB59944F03E. It has always 36 bytes plus a trailing zero.

Returns

a pointer to a static buffer containing the new UUID in ASCII format. The buffer is overwritten during every call to this function!

11.105.5.25 set() [1/7]

char Fl_Preferences::set ( const char * key, const char * text )
Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>text</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

11.105.5.26 set() [2/7]

char Fl_Preferences::set ( const char * key, const void * data, int dsize )
Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>data</td>
<td>set this entry to value</td>
</tr>
<tr>
<td>in</td>
<td>dsize</td>
<td>size of data array</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

11.105.5.27 set() [3/7]

char Fl_Preferences::set ( const char * key, double value )
Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

**Returns**

0 if setting the value failed

### 11.105.5.28 set() [4/7]

```c
char Fl_Preferences::set (const char * key, double value, int precision )
```

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
<tr>
<td>in</td>
<td>precision</td>
<td>number of decimal digits to represent value</td>
</tr>
</tbody>
</table>

**Returns**

0 if setting the value failed

### 11.105.5.29 set() [5/7]

```c
char Fl_Preferences::set (const char * key, float value )
```

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

**Returns**

0 if setting the value failed

### 11.105.30 set() [6/7]

```c
char Fl_Preferences::set (const char * key, 
```
Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

Parameters

<table>
<thead>
<tr>
<th>in key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in value</td>
<td>set this entry to value</td>
</tr>
<tr>
<td>in precision</td>
<td>number of decimal digits to represent value</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

11.105.31 set() [7/7]

cchar Fl_Preferences::set ( const char * key, int value )

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

Parameters

<table>
<thead>
<tr>
<th>in key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in value</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

11.105.32 size()

int Fl_Preferences::size ( const char * key )

Returns the size of the value part of an entry.

Parameters

| in key | name of entry |

Returns

size of value

11.105.6 Member Data Documentation

11.105.6.1 CORE_READ_OK

const unsigned int Fl_Preferences::CORE_READ_OK = 0x0010 [static]

Set this if it is OK for FLTK to read preference files.
USER_READ_OK and/or SYSTEM_READ_OK must also be set.
11.105.6.2 CORE_WRITE_OK

const unsigned int Fl_Preferences::CORE_WRITE_OK = 0x0020 [static]
Set this if it is OK for FLTK to create or write preference files.
USER_WRITE_OK and/or SYSTEM_WRITE_OK must also be set.

11.105.6.3 NONE

const unsigned int Fl_Preferences::NONE = 0x0000 [static]
Set this if no call to Fl_Preferences shall access the file system.
See also
Fl_Preferences::file_access(unsigned int)
Fl_Preferences::file_access()

11.106 Fl_Printer Class Reference

OS-independent print support.
#include <Fl_Printer.H>
Inheritance diagram for Fl_Printer:

```
Fl_Surface_Device
  Fl_Widget_Surface
    Fl_Paged_Device
      Fl_Printer
```

Public Member Functions

- int begin_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL) FL_OVERRIDE
  Begins a print job.
- int begin_page (void) FL_OVERRIDE
  Begins a new printed page.
- void end_job (void) FL_OVERRIDE
  To be called at the end of a print job.
- int end_page (void) FL_OVERRIDE
  To be called at the end of each page.
- Fl_Printer (void)
  The constructor.
- bool is_current () FL_OVERRIDE
  Is this surface the current drawing surface?
- void margins (int *left, int *top, int *right, int *bottom) FL_OVERRIDE
  Computes the dimensions of margins that lie between the printable page area and the full page.
- void origin (int *x, int *y) FL_OVERRIDE
Computes the coordinates of the current origin of graphics functions.

- **void** origin (int x, int y) FL OVERRIDE
  
  Sets the position of the origin of graphics in the drawable part of the drawing surface.

- **int** printable_rect (int *w, int *h) FL OVERRIDE
  
  Computes the width and height of the drawable area of the drawing surface.

- **void** rotate (float angle) FL OVERRIDE
  
  Rotates the graphics operations relatively to paper.

- **void** scale (float scale_x, float scale_y=0.) FL OVERRIDE
  
  Changes the scaling of page coordinates.

- **void** set_current (void) FL_OVERRIDE
  
  Make this surface the current drawing surface.

- **void** translate (int x, int y) FL_OVERRIDE
  
  Translates the current graphics origin accounting for the current rotation.

- **void** untranslate (void) FL_OVERRIDE
  
  Undoes the effect of a previous translate() call.

- **~Fl_Printer** (void)

  The destructor.

**Public Member Functions inherited from Fl_Paged_Device**

- **void** print_widget (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Synonym of draw(Fl_Widget+, int, int)

- **void** print_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Synonym of draw_decorated_window(Fl_Window+, int, int)

- **int** start_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL)
  
  Synonym of begin_job(int pagecount, int *frompage, int *topage, char **perr_message).

- **int** start_page ()

  Synonym of begin_page().

- **virtual** ~Fl_Paged_Device ()

  The destructor.

**Public Member Functions inherited from Fl_Widget_Surface**

- **void** draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Draws the widget on the drawing surface.

- **void** draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Draws a window with its title bar and frame if any.

- **void** print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)

  Draws a rectangular part of an on-screen window.

**Public Member Functions inherited from Fl_Surface_Device**

- **Fl_Graphics_Driver *driver ()**

  Returns the graphics driver of this drawing surface.

- **virtual** ~Fl_Surface_Device ()

  The destructor.
**Static Public Attributes**

These attributes are useful for the Linux/Unix platform only.

- static const char * `dialog_title` = "Print"
  [this text may be customized at run-time]
- static const char * `dialog_printer` = "Printer:"
  [this text may be customized at run-time]

- static const char * `property_cancel` = "Cancel"
  [this text may be customized at run-time]

**Static Public Attributes inherited from Fl_Paged_Device**

- static const `page_format` page_formats [NO_PAGE_FORMATS]

  width, height and name of all elements of the enum `Page_Format`.

**Additional Inherited Members**

**Public Types inherited from Fl_Paged_Device**

- enum `Page_Format`
  
  A0 = 0 , A1 , A2 , A3 ,
  A4 , A5 , A6 , A7 ,
  A8 , A9 , B0 , B1 ,
  B2 , B3 , B4 , B5 ,
  B6 , B7 , B8 , B9 ,
  B10 , C5E , DLE , EXECUTIVE ,
  FOLIO , LEDGER , LEGAL , LETTER ,
  TABLOID , ENVELOPE , MEDIA = 0x1000 }

Generated by Doxygen
Possible page formats.
- enum Page/Layout { PORTRAIT = 0, LANDSCAPE = 0x100, REVERSED = 0x200, ORIENTATION = 0x300 }

Possible page layouts.

Static Public Member Functions inherited from Fl_Surface_Device
- static Fl_Surface_Device * pop_current ()
  Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void push_current (Fl_Surface_Device *new_current)
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static Fl_Surface_Device * surface ()
  The current drawing surface.

Protected Member Functions inherited from Fl_Paged_Device
- Fl_Paged_Device ()
  The constructor.

Protected Member Functions inherited from Fl_Widget_Surface
- Fl_Widget_Surface (Fl_Graphics_Driver *d)
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device
- void driver (Fl_Graphics_Driver *graphics_driver)
  Sets the graphics driver of this drawing surface.
- virtual void end_current ()
  FLTK calls this each time a surface ceases to be the current drawing surface.
- Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)
  Constructor that sets the graphics driver to use for the created surface.

Protected Attributes inherited from Fl_Widget_Surface
- int x_offset
  horizontal offset to the origin of graphics coordinates
- int y_offset
  vertical offset to the origin of graphics coordinates

11.106.1 Detailed Description
OS-independent print support.
Fl_Printer allows to use all drawing, color, text, image, and clip FLTK functions, and to have them operate on printed page(s). There are two main, non exclusive, ways to use it.

- Print any widget (standard, custom, Fl_Window, Fl_Gl_Window) as it appears on screen, with optional translation, scaling and rotation. This is done by calling print_widget(), print_window() or print_window_part().

- Use a series of FLTK graphics commands (e.g., font, text, lines, colors, clip, image) to compose a page appropriately shaped for printing.

In both cases, begin by begin_job(), begin_page(), printable_rect() and origin() calls and finish by end_page() and end_job() calls.

Example of use: print a widget centered in a page
#include <FL/Fl_Printer.H>
#include <FL/Fl_Draw.H>
int width, height;
Fl_Widget *widget = ...  // a widget we want printed
Fl_Printer *printer = new Fl_Printer();
if (printer->begin_job(1) == 0) {
    printer->begin_page();
    printer->printable_rect(&width, &height);
    fl_color(FL_BLACK);
    fl_line_style(FL_SOLID, 2);
    fl_rect(0, 0, width, height);
    fl_font(FL_COURIER, 12);
    time_t now; time(&now); fl_draw(ctime(&now), 0, fl_height());
    printer->origin(width/2, height/2);
    printer->print_widget(widget, -widget->w()/2, -widget->h()/2);
    printer->end_page();
    printer->end_job();
}
delete printer;

Recommended method to refresh GUI while printing :
printer->begin_job(0);
    ...

    Fl_Surface_Device::push_current(Fl_Display_Device::display_device());
    Fl::check(); // or any operation that draws to display
    Fl_Surface_Device::pop_current();
    ...

printer->end_job();

Platform specifics

- X11 and Wayland platforms:
  - FLTK expresses all graphics data using (Level 2) PostScript and sends that to the selected printer. See class Fl_PostScript_File_Device for a description of how text and transparent images appear in print.
  - If the GTK library is available at run-time, class Fl_Printer runs GTK’s printer dialog which allows to set printer, paper size and orientation.
  - Under the KDE desktop, Fl_Printer runs the kdialog command to create KDE-styled file dialogs if that command is available at run-time, unless FLTK was built with CMake and option OPTION_USE_KDIALOG turned off. In that case, Fl_Printer attempts to run the GTK dialog.
  - If the GTK library is not available, or if Fl::option(Fl::OPTION_PRINTER_USES_GTK) has been turned off, class Fl_Printer runs FLTK’s print dialog.

    • Unless it has been previously changed, the default paper size is A4. To change that, press the “Properties” button of the "Print" dialog window opened by an Fl_Printer::begin_job() call. This opens a "Printer Properties" window where it’s possible to select the adequate paper size. Finally press the "Save" button therein to assign the chosen paper size to the chosen printer for this and all further print operations.

    • Use the static public attributes of this class to set the print dialog to other languages than English. For example, the "Printer:" dialog item Fl_Printer::dialog_printer can be set to French with:

        Fl_Printer::dialog_printer = "Imprimante:";

    before creation of the Fl_Printer object.

    • Use Fl_PostScript_File_Device::file_chooser_title to customize the title of the file chooser dialog that opens when using the "Print To File" option of the print dialog.

- Windows platform: Transparent Fl_RGB_Image’s don’t print with exact transparency on most printers (a workaround is to use print_window_part() ). Fl_RGB_Image’s don’t rotate() well.

- Mac OS X platform: all graphics requests print as on display and accept rotation and scaling.

11.106.2 Member Function Documentation

11.106.2.1 begin_job()

int Fl_Printer::begin_job (  
    int pagecount = 0,
    int * frompage = NULL,
    int * topage = NULL,
    char ** perr_message = NULL ) [virtual]

Begins a print job.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>pagecount</th>
<th>the total number of pages of the job (or 0 if you don’t know the number of pages)</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>frompage</td>
<td>if non-null, +frompage is set to the first page the user wants printed</td>
</tr>
<tr>
<td>out</td>
<td>topage</td>
<td>if non-null, +topage is set to the last page the user wants printed</td>
</tr>
<tr>
<td>out</td>
<td>perr_message</td>
<td>if non-null and if the returned value is 2, +perr_message is set to a string describing the error. That string can be delete[]'d after use.</td>
</tr>
</tbody>
</table>

Returns

0 if OK, 1 if user cancelled the job, 2 if any error.

Reimplemented from Fl_Paged_Device.

11.106.2.2 begin_page()

```cpp
int Fl_Printer::begin_page (  
    void     )  [virtual]  
```

Begins a new printed page.
The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area.
This function also makes this surface the current drawing surface with Fl_Surface_Device::push_current().

Note

begin_page() calls Fl_Surface_Device::push_current() and leaves this device as the active surface. If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current(), or the content of the dialog box will be rendered to the printer instead of the screen.

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

11.106.2.3 end_job()

```cpp
void Fl_Printer::end_job (  
    void     )  [virtual]  
```

To be called at the end of a print job.
Reimplemented from Fl_Paged_Device.

11.106.2.4 end_page()

```cpp
int Fl_Printer::end_page (  
    void     )  [virtual]  
```

To be called at the end of each page.
This function also stops this surface from being the current drawing surface with Fl_Surface_Device::pop_current().

Note

end_page() calls Fl_Surface_Device::pop_current(). If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current().

Returns

0 if OK, non-zero if any error.

Reimplemented from Fl_Paged_Device.
11.106.2.5  is_current()

bool Fl_Printer::is_current ( ) [virtual]
Is this surface the current drawing surface?
Reimplemented from Fl_Surface_Device.

11.106.2.6  margins()

void Fl_Printer::margins (  
    int * left,  
    int * top,  
    int * right,  
    int * bottom ) [virtual]
Computes the dimensions of margins that lie between the printable page area and the full page. 
Values are in the same unit as that used by FLTK drawing functions. They are changed by scale() calls.

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>left</th>
<th>If non-null, +left is set to the left margin size.</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>top</td>
<td>If non-null, +top is set to the top margin size.</td>
</tr>
<tr>
<td>out</td>
<td>right</td>
<td>If non-null, +right is set to the right margin size.</td>
</tr>
<tr>
<td>out</td>
<td>bottom</td>
<td>If non-null, +bottom is set to the bottom margin size.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

11.106.2.7  origin() [1/2]

void Fl_Printer::origin (  
    int * x,  
    int * y ) [virtual]
Computes the coordinates of the current origin of graphics functions.

Parameters

| out | x,y | If non-null, +x and +y are set to the horizontal and vertical coordinates of the graphics origin. |

Reimplemented from Fl_Widget_Surface.

11.106.2.8  origin() [2/2]

void Fl_Printer::origin (  
    int x,  
    int y ) [virtual]
Sets the position of the origin of graphics in the drawable part of the drawing surface. 
Arguments should be expressed relatively to the result of a previous printable_rect() call. That is, printable_rect(&w, &h); origin(w/2, 0); sets the graphics origin at the top center of the drawable area. Successive origin() calls don't combine their effects. Origin() calls are not affected by rotate() calls (for classes derived from Fl_Paged_Device).

Parameters

| in  | x,y | Horizontal and vertical positions in the drawing surface of the desired origin of graphics. |

Reimplemented from Fl_Widget_Surface.

11.106.2.9  printable_rect()

int Fl_Printer::printable_rect (  

11.106 Fl_Printer Class Reference

```c
int * w,
int * h;  // [virtual]
```

Computes the width and height of the drawable area of the drawing surface.
Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to `origin()`. If the object is derived from class `Fl_Paged_Device`, values account for the user-selected paper type and print orientation and are changed by `scale()` calls.

Returns

0 if OK, non-zero if any error

Reimplemented from `Fl_Widget_Surface`.

### 11.106.2.10 rotate()

```c
void Fl_Printer::rotate (  
    float angle  )  // [virtual]
```

Rotates the graphics operations relatively to paper.
The rotation is centered on the current graphics origin. Successive `rotate()` calls don't combine their effects.

Parameters

| `angle` | Rotation angle in counter-clockwise degrees. |

Reimplemented from `Fl_Paged_Device`.

### 11.106.2.11 scale()

```c
void Fl_Printer::scale (  
    float scale_x,  
    float scale_y = 0.  )  // [virtual]
```

Changes the scaling of page coordinates.
This function also resets the origin of graphics functions at top left of printable page area. After a `scale()` call, do a `printable_rect()` call to get the new dimensions of the printable page area. Successive `scale()` calls don't combine their effects.

Parameters

| `scale_x` | Horizontal dimensions of plot are multiplied by this quantity. |
| `scale_y` | Same as above, vertically. The value 0. is equivalent to setting `scale_y = scale_x`. Thus, `scale(factor);` is equivalent to `scale(factor, factor);` |

Reimplemented from `Fl_Paged_Device`.

### 11.106.2.12 set_current()

```c
void Fl_Printer::set_current (  
    void  )  // [virtual]
```

Make this surface the current drawing surface.
This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is `Fl_Surface_Device::push_current()` / `Fl_Surface_Device::pop_current()`.

Note

It's recommended to use this function only as follows:

- The current drawing surface is the display;
- make current another surface, e.g., an `Fl_Printer` or an `Fl_Image_Surface` object, calling `set_current()` on this object;

Generated by Doxygen
• draw to that surface;
• make the display current again with Fl_Display_Device::display_device()->set_current();. Don’t do any other call to set_current() before this one.

Other scenarios of drawing surface changes should be performed via Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().

Reimplemented from Fl_Surface_Device.

11.106.2.13 translate()

void Fl_Printer::translate (int x, int y) [virtual]

Translates the current graphics origin accounting for the current rotation.
Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects.
Reimplemented from Fl_Widget_Surface.

11.106.2.14 untranslate()

void Fl_Printer::untranslate (void) [virtual]

Undoes the effect of a previous translate() call.
Reimplemented from Fl_Widget_Surface.

The documentation for this class was generated from the following files:
• Fl_Printer.H
• Fl_Printer.cxx

11.107 Fl_Progress Class Reference

Displays a progress bar for the user.
#include <Fl_Progress.H>

Inheritance diagram for Fl_Progress:

```
Fl_Widget
    Fl_Progress
```

Public Member Functions

• Fl_Progress (int x, int y, int w, int h, const char *l=0)
  The constructor creates the progress bar using the position, size, and label.
• float maximum () const
  Gets the maximum value in the progress widget.
• void maximum (float v)
  Sets the maximum value in the progress widget.
• float minimum () const
  Gets the minimum value in the progress widget.
• void minimum (float v)
  Sets the minimum value in the progress widget.
• float value () const
  Gets the current value in the progress widget.
• void value (float v)
  Sets the current value in the progress widget.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
  Activates the widget.
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group () const
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Returns whether the widget has changed.
Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void **do_callback**( Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void **do_callback**( Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void **draw_label**( int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int **h** () const
  Gets the widget height.
• virtual int **handle**( int event)
  Handles the specified event.
• virtual void **hide** ()
  Makes a widget invisible.
• Fl_Image ∗**image** ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗**image** () const
  Gets the image that is used as part of the widget label when in the active state.
• void **image**( Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void **image**( Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int **image_bound** () const
  Returns whether the image is managed by the widget.
• int **inside**( const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int **is_label_copied** () const
  Returns whether the current label was assigned with copy_label().
• const char ∗**label** () const
  Gets the current label text.
• void **label**( const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color **labelcolor** () const
  Gets the label color.
• void **labelcolor**( Fl_Color c)
  Sets the label color.
• Fl_Font **labelfont** () const
  Gets the font to use.
• void **labelfont**( Fl_Font f)
  Sets the font to use.
• Fl_Fontsize **labelsize** () const
  Gets the font size in pixels.
• void **labelsize**( Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype **labeltype** () const
  Gets the label type.
• void **labeltype**( Fl_Labeltype a)
  Sets the label type.
• void **measure_label**( int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool **needs_keyboard** () const
Returns whether this widget needs a keyboard.

- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

- unsigned int output () const
  Returns if a widget is used for output only.

- FL_Group ∗ parent () const
  Returns a pointer to the parent widget.

- void parent (FL_Group ∗p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- FL_Color selection_color () const
  Gets the selection color.

- void selection_color (FL_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.

- const char ∗ tooltip () const
  Gets the current tooltip text.

- void tooltip (const char ∗text)
  Sets the current tooltip text.

- FL_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• **Fl_Window** * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• **uchar type** () const
  Gets the widget type.

• **void type (uchar t)**
  Sets the widget type.

• **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void * user_data () const**
  Gets the user data for this widget.

• **void user_data (Fl_Callback_User_Data *v, bool auto_free)**
  Sets the user data for this widget.

• **void user_data (void *v)**
  Sets the user data for this widget.

• **unsigned int visible () const**
  Returns whether a widget is visible.

• **unsigned int visible_focus () const**
  Checks whether this widget has a visible focus.

• **void visible_focus (int v)**
  Modifies keyboard focus navigation.

• **int visible_r () const**
  Returns whether a widget and all its parents are visible.

• **int w () const**
  Gets the widget width.

• **Fl_When when () const**
  Returns the conditions under which the callback is called.

• **void when (uchar i)**
  Sets the flags used to decide when a callback is called.

• **Fl_Window * window () const**
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int x () const**
  Gets the widget position in its window.

• **int y () const**
  Gets the widget position in its window.

• **virtual ~Fl_Widget ()**
  Destroys the widget.

### Protected Member Functions

• **void draw () FL_OVERRIDE**
  Draws the progress bar.

### Protected Member Functions inherited from **Fl_Widget**

• **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

• **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• **void draw_box () const**
  Draws the widget box according its box style.

• **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.
• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const
  
  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)

  Creates a widget at the given position and size.

• unsigned int **flags** () const
  
  Gets the widget flags mask.

• void **h** (int v)
  
  Internal use only.

• void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

• void **w** (int v)
  
  Internal use only.

• void **x** (int v)
  
  Internal use only.

• void **y** (int v)
  
  Internal use only.

### Additional Inherited Members

### Static Public Member Functions inherited from Fl_Widget

• static void **default_callback** (Fl_Widget ∗ widget, void ∗ data)
  
  The default callback for all widgets that don't set a callback.

• static unsigned int **label_shortcut** (const char ∗ t)
  
  Returns the Unicode value of the 'x' shortcut in a given text.

• static int **test_shortcut** (const char ∗ t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered 'x' shortcut.

### Protected Types inherited from Fl_Widget

• enum {
  
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }

  flags possible values enumeration.
11.107 Detailed Description
Displays a progress bar for the user.

11.107.2 Constructor & Destructor Documentation

11.107.2.1 Fl_Progress()

```cpp
Fl_Progress::Fl_Progress (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ L = 0 )
```

The constructor creates the progress bar using the position, size, and label. You can set the background color with color() and the progress bar color with selection_color(), or you can set both colors together with color(unsigned bg, unsigned sel). The default colors are FL_BACKGROUND2_COLOR and FL_YELLOW, resp.

11.107.3 Member Function Documentation

11.107.3.1 draw()

```cpp
void Fl_Progress::draw (  
    void ) [protected], [virtual]
```

Draws the progress bar. Implements Fl_Widget.

11.107.3.2 maximum() [1/2]

```cpp
float Fl_Progress::maximum ( ) const [inline]
```

Gets the maximum value in the progress widget.

11.107.3.3 maximum() [2/2]

```cpp
void Fl_Progress::maximum (  
    float v ) [inline]
```

Sets the maximum value in the progress widget.

11.107.3.4 minimum() [1/2]

```cpp
float Fl_Progress::minimum ( ) const [inline]
```

Gets the minimum value in the progress widget.

11.107.3.5 minimum() [2/2]

```cpp
void Fl_Progress::minimum (  
    float v ) [inline]
```

Sets the minimum value in the progress widget.
11.107.3.6 value() [1/2]

float Fl_Progress::value() const [inline]
Gets the current value in the progress widget.

11.107.3.7 value() [2/2]

void Fl_Progress::value(float v) [inline]
Sets the current value in the progress widget.

The documentation for this class was generated from the following files:

• Fl_Progress.H
• Fl_Progress.hxx

```

Public Member Functions

• **Fl_Radio_Button** (int X, int Y, int W, int H, const char *L=0)
  
  The constructor creates the button using the given position, size, and label.

Public Member Functions inherited from Fl_Button

• int **clear()**
  
  Same as value(0).

• uchar **compact()**
  
  Return true if buttons are rendered as compact buttons.

• void **compact(uchar v)**
  
  Decide if buttons should be rendered in compact mode.

• Fl_Boxtype **down_box()** const
  
  Returns the current down box type, which is drawn when value() is non-zero.

• void **down_box(Fl_Boxtype b)**
  
  Sets the down box type.

• Fl_Color **down_color()** const
  
  (for backwards compatibility)

• void **down_color(unsigned c)**
  
  (for backwards compatibility)

• **Fl_Button** (int X, int Y, int W, int H, const char *L=0)
  
  The constructor creates the button using the given position, size, and label.

• int **handle(int)** FL_OVERRIDE

Generated by Doxygen
Handles the specified event.

- **int set ()**
  
  *Same as value(1).*

- **void setonly ()**
  
  *Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).*

- **int shortcut () const**

  *Returns the current shortcut key for the button.*

- **void shortcut (const char ∗s)**

  *(for backwards compatibility)*

- **void shortcut (int s)**

  *Sets the shortcut key to s.*

- **char value () const**

  *Returns the current value of the button (0 or 1).*

- **int value (int v)**

  *Sets the current value of the button.*

### Public Member Functions inherited from **Fl_Widget**

- **void _clear_fullscreen ()**

- **void _set_fullscreen ()**

- **void activate ()**

  *Activates the widget.*

- **unsigned int active () const**

  *Returns whether the widget is active.*

- **int active_r () const**

  *Returns whether the widget and all of its parents are active.*

- **Fl_Align align () const**

  *Gets the label alignment.*

- **void align (Fl_Align alignment)**

  *Sets the label alignment.*

- **long argument () const**

  *Gets the current user data (long) argument that is passed to the callback function.*

- **void argument (long v)**

  *Sets the current user data (long) argument that is passed to the callback function.*

- **virtual class Fl_Gl_Window ∗ as_gl_window ()**

  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

- **virtual class Fl_Gl_Window const ∗ as_gl_window () const**

- **virtual Fl_Group ∗ as_group ()**

  *Returns an Fl_Group pointer if this widget is an Fl_Group.*

- **virtual Fl_Group const ∗ as_group () const**

- **virtual Fl_Window ∗ as_window ()**

  *Returns an Fl_Window pointer if this widget is an Fl_Window.*

- **virtual Fl_Window ∗ as_window () const**

- **void bind_deimage (Fl_Image ∗img)**

  *Sets the image to use as part of the widget label when in the inactive state.*

- **void bind_deimage (int f)**

  *Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

- **void bind_image (Fl_Image ∗img)**

  *Sets the image to use as part of the widget label when in the active state.*

- **void bind_image (int f)**

  *Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
• **Fl_Boxtype box () const**
  Gets the box type of the widget.

• **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.

• **Fl_Callback_p callback () const**
  Gets the current callback function for the widget.

• **void callback (Fl_Callback +cb)**
  Sets the current callback function for the widget.

• **void callback (Fl_Callback +cb, Fl_Callback_User_Data +p, bool auto_free)**
  Sets the current callback function and managed user data for the widget.

• **void callback (Fl_Callback +cb, void +p)**
  Sets the current callback function and data for the widget.

• **void callback (Fl_Callback0 +cb)**
  Sets the current callback function for the widget.

• **void callback (Fl_Callback1 +cb, long p=0)**
  Sets the current callback function for the widget.

• **unsigned int changed () const**
  Checks if the widget value changed since the last callback.

• **void clear_active ()**
  Marks the widget as inactive without sending events or changing focus.

• **void clear_changed ()**
  Marks the value of the widget as unchanged.

• **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

• **void clear_output ()**
  Sets a widget to accept input.

• **void clear_visible ()**
  Hides the widget.

• **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

• **Fl_Color color () const**
  Gets the background color of the widget.

• **void color (Fl_Color bg)**
  Sets the background color of the widget.

• **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

• **Fl_Color color2 () const**
  For back compatibility only.

• **void color2 (unsigned a)**
  For back compatibility only.

• **int contains (const Fl_Widget +w) const**
  Checks if w is a child of this widget.

• **void copy_label (const char +new_label)**
  Sets the current label.

• **void copy_tooltip (const char +text)**
  Sets the current tooltip text.

• **uchar damage () const**
  Returns non-zero if draw() needs to be called.

• **void damage (uchar c)**
  Sets the damage bits for the widget.

• **void damage (uchar c, int x, int y, int w, int h)**
Sets the damage bits for an area inside the widget.

- `int damage_resize(int, int, int, int)`
  
  Internal use only.

- `void deactivate()`
  
  Deactivates the widget.

- `Fl_Image * deimage()`
  
  Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image * deimage() const`
  
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage(Fl_Image &img)`
  
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage(Fl_Image *img)`
  
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound() const`
  
  Returns whether the inactive image is managed by the widget.

- `void do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with default arguments.

- `void do_callback(Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with arbitrary arguments.

- `void do_callback(Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with arbitrary arguments.

- `void draw_label(int, int, int, int, Fl_Align) const`
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h() const`
  
  Gets the widget height.

- `virtual void hide()`
  
  Makes a widget invisible.

- `Fl_Image * image()`
  
  Gets the image that is used as part of the widget label when in the active state.

- `const Fl_Image * image() const`
  
  Gets the image that is used as part of the widget label when in the active state.

- `void image(Fl_Image &img)`
  
  Sets the image to use as part of the widget label when in the active state.

- `void image(Fl_Image *img)`
  
  Sets the image to use as part of the widget label when in the active state.

- `int image_bound() const`
  
  Returns whether the image is managed by the widget.

- `int inside(const Fl_Widget *wgt) const`
  
  Checks if this widget is a child of `wgt`.

- `int is_label_copied() const`
  
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label() const`
  
  Gets the current label text.

- `void label()`
  
  Sets the current label pointer.

- `void label(Fl_Labeltype a, const char *b)`
  
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor() const`
  
  Gets the label color.

- `void labelcolor(Fl_Color c)`
  
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.

• Fl_Group ∗parent () const
  Returns a pointer to the parent widget.

• void parent (Fl_Group ∗p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  Gets the selection color.

• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses '\' to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget's label uses '\' to indicate shortcuts.

• virtual void show ()
Makes a widget visible.

- `void size (int W, int H)`
  Changes the size of the widget.

- `int take_focus ()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.

- `int testShortcut ()`
  Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.

- `void tooltip (const char * text)`
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.

- `int use_accents_menu ()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void * user_data () const`
  Gets the user data for this widget.

- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
  Sets the user data for this widget.

- `void user_data (void *v)`
  Sets the user data for this widget.

- `unsigned int visible () const`
  Returns whether a widget is visible.

- `unsigned int visible_focus () const`
  Checks whether this widget has a visible focus.

- `void visible_focus (int v)`
  Modifies keyboard focus navigation.

- `int visible_r () const`
  Returns whether a widget and all its parents are visible.

- `int w () const`
  Gets the widget width.

- `Fl_When when () const`
  Returns the conditions under which the callback is called.

- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- `virtual ~Fl_Widget ()`
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.

• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7
  ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , Copied_LABEL = 1<<10 , Clip_CHILDREN = 1<<11
  ,
  Menu_WINDOW = 1<<12 , ToolTip_WINDOW = 1<<13 , Modal = 1<<14 , No_OVERLAY = 1<<15
  ,
  Group_RELATIVE = 1<<16 , Copied_ToolTip = 1<<17 , FullSCREEN = 1<<18 , Mac_USE_ACCEPTS_MENU
  = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  Auto_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Button

• void draw () FL_OVERRIDE
  Draws the widget.

• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget’s position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget’s label at the defined label position.

• void draw_label (int, int, int, int) const
Draws the label in an arbitrary bounding box.

- `Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)`
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

Static Protected Member Functions inherited from `Fl_Button`

- static void key_release_timeout (void ∗)

Static Protected Attributes inherited from `Fl_Button`

- static Fl_Widget_Tracker ∗key_release_tracker = 0

11.108.1 Constructor & Destructor Documentation

11.108.1.1 Fl_Radio_Button()

Fl_Radio_Button::Fl_Radio_Button (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗L = 0 )

The constructor creates the button using the given position, size, and label. The Button type() is set to FL_RADIO_BUTTON.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X, Y, W, H</td>
</tr>
<tr>
<td>in</td>
<td>L</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Radio_Button.H
- Fl_Button.cxx

11.109 Fl_Radio_Light_Button Class Reference

Inheritance diagram for Fl_Radio_Light_Button:
Public Member Functions

• **Fl_Radio_Light_Button** (int X, int Y, int W, int H, const char ∗l=0)

Public Member Functions inherited from **Fl_Light_Button**

• **Fl_Light_Button** (int x, int y, int w, int h, const char ∗l=0)
  
  Creates a new Fl_Light_Button widget using the given position, size, and label string.

• int **handle** (int) FL_OVERRIDE
  
  Handles the specified event.

Public Member Functions inherited from **Fl_Button**

• int **clear** ()
  
  *Same as value(0).*

• uchar **compact** ()
  
  Return true if buttons are rendered as compact buttons.

• void **compact** (uchar v)
  
  Decide if buttons should be rendered in compact mode.

• Fl_Boxtype **down_box** () const
  
  Returns the current down box type, which is drawn when value() is non-zero.

• void **down_box** (Fl_Boxtype b)
  
  Sets the down box type.

• **Fl_Color** **down_color** () const
  
  *(for backwards compatibility)*

• void **down_color** (unsigned c)
  
  *(for backwards compatibility)*

• **Fl_Button** (int X, int Y, int W, int H, const char ∗L=0)
  
  The constructor creates the button using the given position, size, and label.

• int **set** ()
  
  *Same as value(1).*

• void **setonly** ()
  
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).

• int **shortcut** () const
  
  Returns the current shortcut key for the button.

• void **shortcut** (const char ∗s)
  
  *(for backwards compatibility)*

• void **shortcut** (int s)
  
  Sets the shortcut key to s.

• char **value** () const
  
  Returns the current value of the button (0 or 1).

• int **value** (int v)
  
  Sets the current value of the button.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const ∗ as_group () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Gets the current user data (long) argument that is passed to the callback function.
Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)
  Sets the current label.

- void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Ima_ge *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char *label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  Internal use only - “for hacks only”.

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.

- `void set_visible ()`
  Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- `void shortcut_label (int value)`
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- `virtual void show ()`
  Makes a widget visible.

- `void size (int W, int H)`
  Changes the size of the widget.

- `int take_focus ()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.

- `int test_shortcut ()`
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.

- `void tooltip (const char *text)`
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int useaccents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• FL_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• FL_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.

• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

```cpp
enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTip = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
};
```

flags possible values enumeration.

Protected Member Functions inherited from Fl_Light_Button

- void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Button

- void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const
  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Static Protected Member Functions inherited from Fl_Button

• static void key_release_timeout (void *)

Static Protected Attributes inherited from Fl_Button

• static Fl_Widget_Tracker * key_release_tracker = 0

The documentation for this class was generated from the following files:

• Fl_Radio_Light_Button.H
• Fl_Light_Buttoncxx

11.110  Fl_Radio_Round_Button Class Reference

Inheritance diagram for Fl_Radio_Round_Button:

```
Fl_Widget
  Fl_Button
    Fl_Light_Button
      Fl_Round_Button
        Fl_Radio_Round_Button
```

Public Member Functions

• Fl_Radio_Round_Button (int X, int Y, int W, int H, const char *L=0)
  Creates a new Fl_Radio_Button widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Round_Button

• Fl_Round_Button (int x, int y, int w, int h, const char *l=0)
  Creates a new Fl_Round_Button widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Light_Button

• Fl_Light_Button (int x, int y, int w, int h, const char *l=0)
  Creates a new Fl_Light_Button widget using the given position, size, and label string.

• int handle (int) FL_OVERRIDE
  Handles the specified event.
Public Member Functions inherited from Fl_Button

- int clear ()
  Same as value(0).

- uchar compact ()
  Return true if buttons are rendered as compact buttons.

- void compact (uchar v)
  Decide if buttons should be rendered in compact mode.

- Fl_Boxtype down_box () const
  Returns the current down box type, which is drawn when value() is non-zero.

- void down_box (Fl_Boxtype b)
  Sets the down box type.

- Fl_Color down_color () const
  (for backwards compatibility)

- void down_color (unsigned c)
  (for backwards compatibility)

- Fl_Button (int X, int Y, int W, int H, const char ∗L=0)
  The constructor creates the button using the given position, size, and label.

- int set ()
  Same as value(1).

- void setonly ()
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).

- int shortcut () const
  Returns the current shortcut key for the button.

- void shortcut (const char ∗s)
  (for backwards compatibility)

- void shortcut (int s)
  Sets the shortcut key to s.

- char value () const
  Returns the current value of the button (0 or 1).

- int value (int v)
  Sets the current value of the button.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()

- void _set_fullscreen ()

- void activate ()
  Activates the widget.

- unsigned int active () const
  Returns whether the widget is active.

- int active_r () const
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  Gets the label alignment.

- void align (Fl_Align alignment)
  Sets the label alignment.

- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window ∗as_gl_window ()
Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * as_gl_window () const

Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const * as_group () const

• virtual Fl_Window * as_window ()

Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * as_window () const

void bind_deimage (Fl_Image * img)
Sets the image to use as part of the widget label when in the inactive state.

void bind_deimage (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

void bind_image (Fl_Image * img)
Sets the image to use as part of the widget label when in the active state.

void bind_image (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
Sets the box type for the widget.

• Fl_Callback_p callback () const
Gets the current callback function for the widget.

• void callback (Fl_Callback * cb)
Sets the current callback function for the widget.

• void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback * cb, void * p)
Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 * cb)
Sets the current callback function for the widget.

• void callback (Fl_Callback1 * cb, long p=0)
Sets the current callback function for the widget.

• unsigned int changed () const
Checks if the widget value changed since the last callback.

• void clear_active ()
Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
Clears or sets the damage flags.

• void clear_output ()
Sets a widget to accept input.

• void clear_visible ()
Hides the widget.

• void clear_visible_focus ()
Disables keyboard focus navigation with this widget.

• Fl_Color color () const
Gets the background color of the widget.

• void color (Fl_Color bg)
Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  
  For back compatibility only.

- **void color2 (unsigned a)**
  
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  
  Sets the current label.

- **void copy_tooltip (const char *text)**
  
  Sets the current tooltip text.

- **uchar damage () const**
  
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  
  Internal use only.

- **void deactivate ()**
  
  Deactivates the widget.

- **Fl_Image *deimage ()**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image *deimage () const**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reas reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reas reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reas reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  
  Gets the widget height.

- **virtual void hide ()**
  
  Makes a widget invisible.

- **Fl_Image *image ()**
  
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image *image () const**
  
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`  
  *Returns whether the image is managed by the widget.*

- `int inside (const Fl_Widget *wgt) const`  
  *Checks if this widget is a child of wgt.*

- `int is_label_copied () const`  
  *Returns whether the current label was assigned with copy_label().*

- `const char * label () const`  
  *Gets the current label text.*

- `void label (const char *text)`  
  *Sets the current label pointer.*

- `void label (Fl_Labeltype a, const char *b)`  
  *Shortcut to set the label text and type in one call.*

- `Fl_Color labelcolor () const`  
  *Gets the label color.*

- `void labelcolor (Fl_Color c)`  
  *Sets the label color.*

- `Fl_Font labelfont () const`  
  *Gets the font to use.*

- `void labelfont (Fl_Font f)`  
  *Sets the font to use.*

- `Fl_Fontsize labelsize () const`  
  *Gets the font size in pixels.*

- `void labelsize (Fl_Fontsize pix)`  
  *Sets the font size in pixels.*

- `Fl_Labeltype labeltype () const`  
  *Gets the label type.*

- `void measure_label (int &ww, int &hh) const`  
  *Sets width ww and height hh accordingly with the label size.*

- `bool needs_keyboard () const`  
  *Returns whether this widget needs a keyboard.*

- `void needs_keyboard (bool needs)`  
  *Sets whether this widget needs a keyboard.*

- `unsigned int output () const`  
  *Returns if a widget is used for output only.*

- `Fl_Group * parent () const`  
  *Returns a pointer to the parent widget.*

- `void parent (Fl_GROUP *p)`  
  *Internal use only - “for hacks only”.*

- `void position (int X, int Y)`  
  *Repositions the window or widget.*

- `void redraw ()`  
  *Schedules the drawing of the widget.*

- `void redraw_label ()`  
  *Schedules the drawing of the label.*

- `virtual void resize (int x, int y, int w, int h)`  
  *Changes the size or position of the widget.*

- `Fl_Color selection_color () const`  
  *Gets the selection color.*

- `void selection_color (Fl_Color a)`
Sets the selection color.

- void set_active()
  Marks the widget as active without sending events or changing focus.

- void set_changed()
  Marks the value of the widget as changed.

- void set_output()
  Sets a widget to output only.

- void set_visible()
  Makes the widget visible.

- void set_visible_focus()
  Enables keyboard focus navigation with this widget.

- int shortcut_label() const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label(int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void show()
  Makes a widget visible.

- void size(int W, int H)
  Changes the size of the widget.

- int take_focus()
  Gives the widget the keyboard focus.

- unsigned int takesevents() const
  Returns if the widget is able to take events.

- int test_shortcut()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char* tooltip() const
  Gets the current tooltip text.

- void tooltip(const char* text)
  Sets the current tooltip text.

- Fl_Window* top_window()
  Returns a pointer to the top-level window for the widget.

- Fl_Window* top_window_offset(int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type() const
  Gets the widget type.

- void type(uchar t)
  Sets the widget type.

- int use_accents_menu()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void* user_data() const
  Gets the user data for this widget.

- void user_data(Fl_Callback_User_Data*v, bool auto_free)
  Sets the user data for this widget.

- void user_data(void*v)
  Sets the user data for this widget.

- unsigned int visible() const
  Returns whether a widget is visible.

- unsigned int visible_focus() const
  Checks whether this widget has a visible focus.

- void visible_focus(int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ∼Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.

• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1 << 0, INVISIBLE = 1 << 1, OUTPUT = 1 << 2, NOBORDER = 1 << 3,
  FORCE_POSITION = 1 << 4, NON_MODAL = 1 << 5, SHORTCUT_LABEL = 1 << 6, CHANGED = 1 << 7,
  OVERRIDE = 1 << 8, VISIBLE_FOCUS = 1 << 9, COPIED_LABEL = 1 << 10, CLIP_CHILDREN = 1 << 11,
  MENU_WINDOW = 1 << 12, TOOLTIP_WINDOW = 1 << 13, MODAL = 1 << 14, NO_OVERLAY = 1 << 15,
  GROUP_RELATIVE = 1 << 16, COPIED_TOOLTIP = 1 << 17, FULLSCREEN = 1 << 18, MAC_USE_ACCENTS_MENU
  = 1 << 19, NEEDS_KEYBOARD = 1 << 20, IMAGE_BOUND = 1 << 21, DEIMAGE_BOUND = 1 << 22,
  AUTO_DELETE_USER_DATA = 1 << 23, MAXIMIZED = 1 << 24, USERFLAG3 = 1 << 29, USERFLAG2 = 1 << 30, USERFLAG1 = 1 << 31
}
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Light_Button

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Button

• void simulate_key_action ()
Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a focus rectangle around the widget.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus box for the widget at the given position and size.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Static Protected Member Functions inherited from Fl_Button

- static void key_release_timeout (void ∗)

Static Protected Attributes inherited from Fl_Button

- static Fl_Widget_Tracker ∗ key_release_tracker = 0

11.110.1 Constructor & Destructor Documentation

11.110.1.1 Fl_Radio_Round_Button()

Fl_Radio_Round_Button::Fl_Radio_Round_Button { 
  int X,
  int Y,
  int W,
int H,
const char * L = 0 )

Creates a new Fl_Radio_Button widget using the given position, size, and label string. The button type() is set to FL_RADIO_BUTTON.

Parameters

| in | X,Y,W,H | position and size of the widget |
| in | L | widget label, default is no label |

The documentation for this class was generated from the following files:

- Fl_Round_Button.H
- Fl_Round_Button.cxx

11.111 Fl_Rect Class Reference

Rectangle with standard FLTK coordinates (X, Y, W, H).

#include <Fl_Rect.H>

Public Member Functions

- int b () const
  gets the bottom edge (y + h).
- void b (int B)
  sets the height based on B and y
- Fl_Rect ()
  The default constructor creates an empty rectangle (x = y = w = h = 0).
- Fl_Rect (const Fl_Widget & widget)
  This constructor creates a rectangle based on a widget's position and size.
- Fl_Rect (const Fl_Widget * const widget)
  This constructor creates a rectangle based on a widget's position and size.
- Fl_Rect (int W, int H)
  This constructor creates a rectangle with x = y = 0 and the given width and height.
- Fl_Rect (int X, int Y, int W, int H, Fl_Boxtype bt)
  This constructor creates a rectangle with the given x,y coordinates and the given width and height reduced by the box frame size.
- int h () const
  gets the height
- void h (int H)
  sets the height
- void inset (Fl_Boxtype bt)
  Move all edges in by the frame size of box type bt.
- void inset (int d)
  Move all edges in by d.
- void inset (int left, int top, int right, int bottom)
  Move all edges in by left, top, right, bottom.
- int r () const
  gets the right edge (x + w).
- void r (int R)
  sets the width based on R and x
• int w () const
  gets the width
• void w (int W)
  sets the width
• int x () const
  gets the x coordinate (left edge)
• void x (int X)
  sets the x coordinate (left edge)
• int y () const
  gets the y coordinate (top edge)
• void y (int Y)
  sets the y coordinate (top edge)

Friends
• bool operator!= (const Fl_Rect &lhs, const Fl_Rect &rhs)
• bool operator== (const Fl_Rect &lhs, const Fl_Rect &rhs)

11.111.1 Detailed Description
Rectangle with standard FLTK coordinates (X, Y, W, H).
This may be used internally, for overloaded widget constructors and other overloaded methods like fl_measure(),
fl_text_extents(), fl_rect(), fl_rectf(), and maybe more.

11.111.2 Constructor & Destructor Documentation
11.111.2.1 Fl_Rect()
Fl_Rect::Fl_Rect {
  int X,
  int Y,
  int W,
  int H,
  Fl_Boxtype bt ) [inline]
This constructor creates a rectangle with the given x,y coordinates and the given width and height reduced by the
box frame size.
This is the same as using the constructor w/o bt and subsequently calling inset(bt).

11.111.3 Member Function Documentation
11.111.3.1 b()
int Fl_Rect::b ( ) const [inline]
gets the bottom edge (y + h).

Note
r() and b() are coordinates outside the area of the rectangle.

11.111.3.2 inset() [1/3]
void Fl_Rect::inset {
  Fl_Boxtype bt ) [inline]
Move all edges in by the frame size of box type bt.
Shrinks the rectangle at all sides by the frame width or height of the given box type bt.
This method uses the frame sizes given by the box type bt using
• Fl::box_dx(bt)
11.112 Fl_Scroll::Fl_Region_LRTB Struct Reference

- Fl::box_dy(bt)
- Fl::box_dw(bt)
- Fl::box_dh(bt)

If the rectangle is smaller than the frame sizes the result is undefined, i.e. an invalid or empty rectangle.

11.111.3.3 inset() [2/3]

```cpp
void Fl_Rect::inset (int d) [inline]
```

Move all edges in by d.
Shrinks the rectangle by d at all sides keeping the center of the rectangle at the same spot.
If d is negative, the rectangle is enlarged.
If d >= w() or h() the result is undefined, i.e. an invalid or empty rectangle.

11.111.3.4 inset() [3/3]

```cpp
void Fl_Rect::inset (int left, int top, int right, int bottom) [inline]
```

Move all edges in by left, top, right, bottom.
Shrinks the rectangle on all sides keeping the center of the rectangle at the same spot.
If any value is negative, the rectangle is enlarged.
Values are not range checked; it is possible to create an invalid or empty rectangle.

11.111.3.5 r()

```cpp
int Fl_Rect::r ( ) const [inline]
```

gets the right edge (x + w).

Note

r() and b() are coordinates outside the area of the rectangle.

The documentation for this class was generated from the following file:

- Fl_Rect.H

11.112 Fl_Scroll::Fl_Region_LRTB Struct Reference

A local struct to manage a region defined by left/right/top/bottom.
```
#include <Fl_Scroll.H>
```

Public Attributes

- int b
  (b)ottom "y" position, aka y2
- int l
  (l)eft "x" position, aka x1
- int r
  (r)ight "x" position, aka x2
- int t
  (t)op "y" position, aka y1
11.112.1 Detailed Description

A local struct to manage a region defined by left/right/top/bottom.
The documentation for this struct was generated from the following file:

- Fl_Scroll.H

11.113 Fl_Scroll::Fl_Region_XYWH Struct Reference

A local struct to manage a region defined by xywh.
#include <Fl_Scroll.H>

Public Attributes

- int h
- int w
- int x
- int y

11.113.1 Detailed Description

A local struct to manage a region defined by xywh.
The documentation for this struct was generated from the following file:

- Fl_Scroll.H

11.114 Fl_Repeat_Button Class Reference

The Fl_Repeat_Button is a subclass of Fl_Button that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down.
#include <Fl_Repeat_Button.H>

Inheritance diagram for Fl_REPEAT_BUTTON:

```
Fl_Widget
    ↓
Fl_Button
    ↓
Fl_REPEAT_BUTTON
```

Public Member Functions

- void deactivate ()
- Fl_REPEAT_BUTTON (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new Fl_REPEAT_BUTTON widget using the given position, size, and label string.
- int handle (int) FL_OVERRIDE
  
  Handles the specified event.

Public Member Functions inherited from Fl_Button

- int clear ()
  
  Same as value(0).
- uchar compact ()
  
  Return true if buttons are rendered as compact buttons.
- void compact (uchar v)
Decide if buttons should be rendered in compact mode.

- **Fl_Boxtype** `down_box()` const
  
  Returns the current down box type, which is drawn when `value()` is non-zero.

- **void** `down_box(Fl_Boxtype b)`
  
  Sets the down box type.

- **Fl_Boxtype** `down_color()` const
  
  (for backwards compatibility)

- **void** `down_color(unsigned c)`
  
  (for backwards compatibility)

- **Fl_Button**(int X, int Y, int W, int H, const char *L=0)
  
  The constructor creates the button using the given position, size, and label.

- **int** `set()`
  
  *Same as value(1).*

- **void** `setonly()`
  
  *Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).*

- **int** `shortcut()` const
  
  Returns the current shortcut key for the button.

- **void** `shortcut(const char *s)`
  
  (for backwards compatibility)

- **void** `shortcut(int s)`
  
  Sets the shortcut key to `s`.

- **char** `value()` const
  
  Returns the current value of the button (0 or 1).

- **int** `value(int v)`
  
  *Sets the current value of the button.*

---

**Public Member Functions inherited from Fl_Widget**

- **void** `_clear_fullscreen()`

- **void** `_set_fullscreen()`

- **void** `activate()`
  
  Activates the widget.

- **unsigned int** `active()` const
  
  Returns whether the widget is active.

- **int** `active_r()` const
  
  Returns whether the widget and all of its parents are active.

- **Fl_Align** `align()` const
  
  Gets the label alignment.

- **void** `align(Fl_Align alignment)`
  
  Sets the label alignment.

- **long** `argument()` const
  
  Gets the current user data (long) argument that is passed to the callback function.

- **void** `argument(long v)`
  
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class** `Fl_Gl_Window * as_gl_window()`
  
  Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.

- **virtual class** `Fl_Gl_Window const * as_gl_window()` const

- **virtual Fl_Group * as_group()**
  
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

- **virtual Fl_Group const * as_group()** const

- **virtual Fl_Window * as_window()**

---

Generated by Doxygen
Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * as_window () const
  
Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (Fl_Image *img)
  
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (int f)
  
Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  
Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  
Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  
Sets the box type for the widget.

• Fl_Callback_p callback () const
  
Gets the current callback function for the widget.

• void callback (Fl_Callback *cb)
  
Sets the current callback function for the widget.

• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  
Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback *cb, void *p)
  
Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 *cb)
  
Sets the current callback function for the widget.

• void callback (Fl_Callback1 *cb, long p=0)
  
Sets the current callback function for the widget.

• unsigned int changed () const
  
Checks if the widget value changed since the last callback.

• void clear_active ()
  
Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  
Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  
Clears or sets the damage flags.

• void clear_output ()
  
Sets a widget to accept input.

• void clear_visible ()
  
Hides the widget.

• void clear_visible_focus ()
  
Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  
Gets the background color of the widget.

• void color (Fl_Color bg)
  
Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  
Sets the background and selection color of the widget.

• Fl_Color color2 () const
  
For back compatibility only.

• void color2 (unsigned a)
  
For back compatibility only.

• int contains (const Fl_Widget +w) const
Checks if \texttt{w} is a child of this widget.

- \texttt{void copy_label (const char \* new_label)}
  Sets the current label.
- \texttt{void copy_tooltip (const char \* text)}
  Sets the current tooltip text.
- \texttt{uchar damage () const}
  Returns non-zero if \texttt{draw()} needs to be called.
- \texttt{void damage (uchar c)}
  Sets the damage bits for the widget.
- \texttt{void damage (uchar c, int x, int y, int w, int h)}
  Sets the damage bits for an area inside the widget.
- \texttt{int damage_resize (int, int, int, int)}
  Internal use only.
- \texttt{void deactivate ()}
  Deactivates the widget.
- \texttt{Fl\_Image \* deimage ()}
  Gets the image that is used as part of the widget label when in the inactive state.
- \texttt{const Fl\_Image \* deimage () const}
  Gets the image that is used as part of the widget label when in the inactive state.
- \texttt{void deimage (Fl\_Image \&img)}
  Sets the image to use as part of the widget label when in the inactive state.
- \texttt{void deimage (Fl\_Image \* img)}
  Sets the image to use as part of the widget label when in the inactive state.
- \texttt{int deimage_bound () const}
  Returns whether the inactive image is managed by the widget.
- \texttt{void do_callback (Fl\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)}
  Calls the widget callback function with default arguments.
- \texttt{void do_callback (Fl\_Widget \* widget, long arg, Fl\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)}
  Calls the widget callback function with arbitrary arguments.
- \texttt{void do_callback (Fl\_Widget \* widget, void \* arg=0, Fl\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)}
  Calls the widget callback function with arbitrary arguments.
- \texttt{void draw_label (int, int, int, int, Fl\_Align) const}
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- \texttt{int h () const}
  Gets the widget height.
- \texttt{virtual void hide ()}
  Makes a widget invisible.
- \texttt{Fl\_Image \* image ()}
  Gets the image that is used as part of the widget label when in the active state.
- \texttt{const Fl\_Image \* image () const}
  Gets the image that is used as part of the widget label when in the active state.
- \texttt{void image (Fl\_Image \&img)}
  Sets the image to use as part of the widget label when in the active state.
- \texttt{void image (Fl\_Image \* img)}
  Sets the image to use as part of the widget label when in the active state.
- \texttt{int image_bound () const}
  Returns whether the image is managed by the widget.
- \texttt{int inside (const Fl\_Widget \* wgt) const}
  Checks if this widget is a child of \texttt{wgt}.
- \texttt{int is_label_copied () const}
  Returns whether the current label was assigned with \texttt{copy_label()}.
• const char * label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.

• Fl_Group * parent () const
  Returns a pointer to the parent widget.

• void parent (Fl_Group *p)
  Internal use only - “for hacks only”.

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  Gets the selection color.

• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
Sets a widget to output only.

• void \texttt{set_visible ()}
  Makes the widget visible.

• void \texttt{set_visible_focus ()}
  Enables keyboard focus navigation with this widget.

• int \texttt{shortcut_label()} \texttt{const}
  Returns whether the widget's label uses '\&' to indicate shortcuts.

• void \texttt{shortcut_label(int value)}
  Sets whether the widget's label uses '\&' to indicate shortcuts.

• virtual void \texttt{show ()}
  Makes a widget visible.

• void \texttt{size(int W, int H)}
  Changes the size of the widget.

• int \texttt{take_focus ()}
  Gives the widget the keyboard focus.

• unsigned int \texttt{takesevents()} \texttt{const}
  Returns if the widget is able to take events.

• int \texttt{test_shortcut ()}
  Returns true if the widget's label contains the entered '\&x' shortcut.

• const char* \texttt{tooltip()} \texttt{const}
  Gets the current tooltip text.

• void \texttt{tooltip(const char* text)}
  Sets the current tooltip text.

• Fl\_Window* \texttt{top_window()} \texttt{const}
  Returns a pointer to the top-level window for the widget.

• Fl\_Window* \texttt{top_window_offset(int \&xoff, int \&yoff)} \texttt{const}
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar \texttt{type()} \texttt{const}
  Gets the widget type.

• void \texttt{type(uchar t)}
  Sets the widget type.

• int \texttt{use_accents_menu()}
  Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.

• void* \texttt{user_data()} \texttt{const}
  Gets the user data for this widget.

• void \texttt{user_data(Fl\_Callback\_User\_Data *v, bool auto\_free)}
  Sets the user data for this widget.

• void \texttt{user_data(void *v)}
  Sets the user data for this widget.

• unsigned int \texttt{visible()} \texttt{const}
  Returns whether a widget is visible.

• unsigned int \texttt{visible\_focus()} \texttt{const}
  Checks whether this widget has a visible focus.

• void \texttt{visible\_focus(int v)}
  Modifies keyboard focus navigation.

• int \texttt{visible\_r()} \texttt{const}
  Returns whether a widget and all its parents are visible.

• int \texttt{w()} \texttt{const}
  Gets the widget width.

• Fl\_When \texttt{when()} \texttt{const}
  Returns the conditions under which the callback is called.
• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  
  Gets the widget position in its window.
• int y () const
  
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char *, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,

  flags possible values enumeration.

Protected Member Functions inherited from Fl_Button

• void draw () FL_OVERRIDE
  
  Draws the widget.
• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.
• void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.
- **void** `draw_box` *(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const*
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void** `draw_focus()` const
  Draws a focus rectangle around the widget.

- **void** `draw_focus` *(Fl_Boxtype t, int X, int Y, int W, int H) const*
  Draws a focus rectangle around the widget.

- **void** `draw_focus` *(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const*
  Draws a focus box for the widget at the given position and size.

- **void** `draw_label()` const
  Draws the widget's label at the defined label position.

- **void** `draw_label` *(int, int, int, int) const*
  Draws the label in an arbitrary bounding box.

- **Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)***
  Creates a widget at the given position and size.

- **unsigned int** `flags()` const
  Gets the widget flags mask.

- **void** `h (int v)`
  Internal use only.

- **void** `set_flag` *(unsigned int c)*
  Sets a flag in the flags mask.

- **void** `w (int v)`
  Internal use only.

- **void** `x (int v)`
  Internal use only.

- **void** `y (int v)`
  Internal use only.

**11.114 Detailed Description**

The Fl_Repeat_Button is a subclass of Fl_Button that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down. The speed of the repeat is fixed and depends on the implementation.

**11.114.2 Constructor & Destructor Documentation**

**11.114.2.1 Fl_Repeat_Button()**

Fl_Repeat_Button::Fl_Repeat_Button {
  int X,
  int Y,
  int W,
  int H,
  const char ∗l = 0
}

Creates a new Fl_Repeat_Button widget using the given position, size, and label string. The default boxtype is FL_UP_BOX. Deletes the button.
11.114.3 Member Function Documentation

11.114.3.1 handle()

```cpp
int Fl_Repeat_Button::handle (int event) { [virtual]
Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

- `in event` the kind of event received

Return values

- 0 if the event was not used or understood
- 1 if the event was used and can be deleted

See also

- Fl_Event

Reimplemented from Fl_Button.
The documentation for this class was generated from the following files:

- Fl_Repeat_Button.H
- Fl_Repeat_Button.cxx

11.115 Fl_Return_Button Class Reference

The Fl_Return_Button is a subclass of Fl_Button that generates a callback when it is pressed or when the user presses the Enter key.

```cpp
#include <Fl_Return_Button.H>
```

Inheritance diagram for Fl_Return_Button:

```
```

Public Member Functions

- Fl_Return_Button (int X, int Y, int W, int H, const char *l=0)
Creates a new `Fl_Return_Button` widget using the given position, size, and label string.

- **int handle (int)** FL_OVERRIDE
  
  Handles the specified event.

### Public Member Functions inherited from `Fl_Button`

- **int clear ()**
  
  *Same as value(0).*

- **uchar compact ()**
  
  *Return true if buttons are rendered as compact buttons.*

- **void compact (uchar v)**
  
  *Decide if buttons should be rendered in compact mode.*

- **Fl_Boxtype down_box () const**
  
  *Returns the current down box type, which is drawn when value() is non-zero.*

- **void down_box (Fl_Boxtype b)**
  
  *Sets the down box type.*

- **Fl_Color down_color () const**
  
  *(for backwards compatibility)*

- **void down_color (unsigned c)**
  
  *(for backwards compatibility)*

- **Fl_Button (int X, int Y, int W, int H, const char ∗L=0)**
  
  *The constructor creates the button using the given position, size, and label.*

- **int set ()**
  
  *Same as value(1).*

- **void setonly ()**
  
  *Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).*

- **int shortcut () const**
  
  *Returns the current shortcut key for the button.*

- **void shortcut (const char ∗s)**
  
  *(for backwards compatibility)*

- **void shortcut (int s)**
  
  *Sets the shortcut key to s.*

- **char value () const**
  
  *Returns the current value of the button (0 or 1).*

- **int value (int v)**
  
  *Sets the current value of the button.*

### Public Member Functions inherited from `Fl_Widget`

- **void _clear_fullscreen ()**

- **void _set_fullscreen ()**

- **void activate ()**
  
  *Activates the widget.*

- **unsigned int active () const**
  
  *Returns whether the widget is active.*

- **int active_r () const**
  
  *Returns whether the widget and all of its parents are active.*

- **Fl_Align align () const**
  
  *Gets the label alignment.*

- **void align (Fl_Align alignment)**
  
  *Sets the label alignment.*

- **long argument () const**

*Generated by Doxygen*
Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)

Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * as_gl_window ()

Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * as_gl_window () const

• virtual Fl_Group * as_group ()

Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const * as_group () const

• virtual Fl_Window * as_window ()

Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * as_window () const

• void bind_deimage (Fl_Image * img)

Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image * img)

Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const

Gets the box type of the widget.

• void box (Fl_Boxtype new_box)

Sets the box type for the widget.

• Fl_Callback_p callback () const

Gets the current callback function for the widget.

• void callback (Fl_Callback * cb)

Sets the current callback function for the widget.

• void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)

Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback * cb, void * p)

Sets the current callback function and data for the widget.

• void callback (Fl_Callback * cb)

Sets the current callback function for the widget.

• void callback (Fl_Callback1 * cb, long p=0)

Sets the current callback function for the widget.

• unsigned int changed () const

Checks if the widget value changed since the last callback.

• void clear_active ()

Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()

Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)

Clears or sets the damage flags.

• void clear_output ()

Sets a widget to accept input.

• void clear_visible ()

Hides the widget.

• void clear_visible_focus ()

Disables keyboard focus navigation with this widget.

• Fl_Color color () const
Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
- void copy_label (const char *new_label)
  Sets the current label.
- void copy_tooltip (const char *text)
  Sets the current tooltip text.
- uchar damage () const
  Returns non-zero if draw() needs to be called.
- void damage (uchar c)
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
- int damage_resize (int, int, int, int)
  Internal use only.
- void deactivate ()
  Deactivates the widget.
- Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
- const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
- void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
- void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
- void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
- void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int h () const
  Gets the widget height.
- virtual void hide ()
  Makes a widget invisible.
- Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
- const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

• **void image (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the active state.

• **int image_bound () const**
  
  Returns whether the image is managed by the widget.

• **int inside (const Fl_Widget *wgt) const**
  
  Checks if this widget is a child of \texttt{wgt}.

• **int is_label_copied () const**
  
  Returns whether the current label was assigned with \texttt{copy_label()}.

• **const char * label () const**
  
  Gets the current label text.

• **void label (const char *text)**
  
  Sets the current label pointer.

• **void label (Fl_Labeltype a, const char *b)**
  
  Shortcut to set the label text and type in one call.

• **Fl_Color labelcolor () const**
  
  Gets the label color.

• **void labelcolor (Fl_Color c)**
  
  Sets the label color.

• **Fl_Font labelfont () const**
  
  Gets the font to use.

• **void labelfont (Fl_Font f)**
  
  Sets the font to use.

• **Fl_Fontsize labelsize () const**
  
  Gets the font size in pixels.

• **void labelsize (Fl_Fontsize pix)**
  
  Sets the font size in pixels.

• **Fl_Labeltype labeltype () const**
  
  Gets the label type.

• **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

• **void measure_label (int &ww, int &hh) const**
  
  Sets width \texttt{ww} and height \texttt{hh} accordingly with the label size.

• **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

• **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

• **unsigned int output () const**
  
  Returns if a widget is used for output only.

• **Fl_Group * parent () const**
  
  Returns a pointer to the parent widget.

• **void parent (Fl_Group *=p)**
  
  Internal use only - “for hacks only”.

• **void position (int X, int Y)**
  
  Repositions the window or widget.

• **void redraw ()**
  
  Schedules the drawing of the widget.

• **void redraw_label ()**
  
  Schedules the drawing of the label.

• **virtual void resize (int x, int y, int w, int h)**
Changes the size or position of the widget.

- **FL_Color selection_color()** const
  
  Gets the selection color.

- **void selection_color(FL_Color a)**
  
  Sets the selection color.

- **void set_active()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed()**
  
  Marks the value of the widget as changed.

- **void set_output()**
  
  Sets a widget to output only.

- **void set_visible()**
  
  Makes the widget visible.

- **void set_visible_focus()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label()** const
  
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- **void shortcut_label(int value)**
  
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- **virtual void show()**
  
  Makes a widget visible.

- **void size(int W, int H)**
  
  Changes the size of the widget.

- **int take_focus()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents()** const
  
  Returns if the widget is able to take events.

- **int testShortcut()**
  
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- **const char * tooltip()** const
  
  Gets the current tooltip text.

- **void tooltip(const char *text)**
  
  Sets the current tooltip text.

- **FL_Window *top_window()** const
  
  Returns a pointer to the top-level window for the widget.

- **FL_Window *top_window_offset(int &xoff, int &yoff)** const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type()** const
  
  Gets the widget type.

- **void type(uchar t)**
  
  Sets the widget type.

- **int use_accents_menu()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void *user_data()** const
  
  Gets the user data for this widget.

- **void user_data(Fl_Callback_User_Data *v, bool auto_free)**
  
  Sets the user data for this widget.

- **void user_data(void *v)**
  
  Sets the user data for this widget.

- **unsigned int visible()** const
  
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Button

• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,

Generated by Doxygen
11.115.1 Detailed Description

The Fl_Return_Button is a subclass of Fl_Button that generates a callback when it is pressed or when the user presses the Enter key. A carriage-return symbol is drawn next to the button label.

![Fl_Return_Button](image)

Figure 11.36 Fl_Return_Button

11.115.2 Constructor & Destructor Documentation

11.115.2.1 Fl_Return_Button()

```cpp
Fl_Return_Button::Fl_Return_Button (int X, int Y, int W, int H, const char * l = 0)
```

Creates a new Fl_Return_Button widget using the given position, size, and label string. The default boxtype is FL_UP_BOX. The inherited destructor deletes the button.

11.115.3 Member Function Documentation

11.115.3.1 draw()

```cpp
void Fl_Return_Button::draw () [protected], [virtual]
```

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead. Override this function to draw your own widgets.

If you ever need to call another widget's `draw` method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from Fl_Button.

11.115.3.2 handle()

```cpp
int Fl_Return_Button::handle (int event) [virtual]
```

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

- `event` the kind of event received
Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the event was not used or understood</td>
</tr>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

## 11.116 Fl_RGB_Image Class Reference

The Fl_RGB_Image class supports caching and drawing of full-color images with 1 to 4 channels of color information.

```cpp
#include <Fl_Image.H>
```

Inheritance diagram for Fl_RGB_Image:

```

### Public Member Functions

- **virtual Fl_SVG_Image * as_svg_image ()**
  Returns whether an image is an Fl_SVG_Image or not.
- **int cache_h ()**
- **int cache_w ()**
- **void color_average (Fl_Color c, float i) FL_OVERRIDE**
  The color_average() method averages the colors in the image with the provided FLTK color value.
- **Fl_Image * copy () const**
- **Fl_Image * copy (int W, int H) const FL_OVERRIDE**
  Creates a resized copy of the image.
- **void desaturate () FL_OVERRIDE**
  The desaturate() method converts an image to grayscale.
- **void draw (int X, int Y)**
- **void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDES**
  Draws the image to the current drawing surface with a bounding box.
- **Fl_RGB_Image (const Fl_Pixmap *pxm, Fl_Color bg=FL_GRAY)**
  The constructor creates a new RGBA image from the specified Fl_Pixmap.
- **Fl_RGB_Image (const uchar *bits, int bits_length, int W, int H, int D, int LD)**
  The constructor creates a new image from the specified data.
- **Fl_RGB_Image (const uchar *bits, int W, int H, int D=3, int LD=0)**
  The constructor creates a new image from the specified data.
- void label (Fl_Menu_Item *m) FL_OVERRIDE
  
  This method is an obsolete way to set the image attribute of a menu item.
- void label (Fl_Widget *w) FL_OVERRIDE
  
  This method is an obsolete way to set the image attribute of a widget or menu item.
- virtual void normalize ()
  
  Makes sure the object is fully initialized.
- void uncache () FL_OVERRIDE
  
  If the image has been cached for display, delete the cache data.
- ~Fl_RGB_IMAGE () FL_OVERRIDE
  
  The destructor frees all memory and server resources that are used by the image.

**Public Member Functions inherited from Fl_image**

- virtual class Fl_Shared_image * as_shared_image ()
  
  Returns whether an image is an Fl_Shared_image or not.
- Fl_image * copy () const
  
  Creates a copy of the image in the same size.
- int count () const
  
  Returns the number of data values associated with the image.
- int d () const
  
  Returns the image depth.
- const char *const * data () const
  
  Returns a pointer to the current image data array.
- int data_h () const
  
  Returns the height of the image data.
- int data_w () const
  
  Returns the width of the image data.
- void draw (int X, int Y)
  
  Draws the image to the current drawing surface.
- int fail () const
  
  Returns a value that is not 0 if there is currently no image available.
- Fl_image (int W, int H, int D)
  
  The constructor creates an empty image with the specified width, height, and depth.
- int h () const
  
  Returns the current image drawing height in FLTK units.
- void inactive ()
  
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.
- int ld () const
  
  Returns the current line data size in bytes.
- virtual void release ()
  
  Releases an Fl_image - the same as 'delete this'.
- virtual void scale (int width, int height, int proportional=1, int can_expand=0)
  
  Sets the drawing size of the image.
- int w () const
  
  Returns the current image drawing width in FLTK units.
- virtual ~Fl_image ()
  
  The destructor is a virtual method that frees all memory used by the image.
Static Public Member Functions

- static size_t max_size()
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
- static void max_size (size_t size)
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

Static Public Member Functions inherited from Fl_Image

- static Fl_Labeltype define_FL_IMAGE_LABEL ()
- static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
- static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
- static Fl_RGB_Scaling scaling_algorithm ()
  Gets what algorithm is used when resizing a source image to draw it.
- static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.

Public Attributes

- int alloc_array
  If non-zero, the object's data array is delete[]d when deleting the object.
- const uchar ∗ array
  Points to the start of the object's data array.

Friends

- class Fl_Graphics_Driver

Additional Inherited Members

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  True after fl_register_images() was called, false before.

Protected Member Functions inherited from Fl_Image

- void d (int D)
  Sets the current image depth.
- void data (const char ∗ const ∗ p, int c)
  Sets the current data pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h (int H)
  Sets the height of the image data.
- void ld (int LD)
  Sets the current line data size in bytes.
- void w (int W)
  Sets the width of the image data.
Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

11.116.1 Detailed Description

The Fl_RGB_Image class supports caching and drawing of full-color images with 1 to 4 channels of color information. Images with an even number of channels are assumed to contain alpha information, which is used to blend the image with the contents of the screen.

Fl_RGB_Image is defined in <FL/Fl_Image.H>, however for compatibility reasons <FL/Fl_RGB_Image.H> should be included.

11.116.2 Constructor & Destructor Documentation

11.116.2.1 Fl_RGB_Image() [1/3]

Fl_RGB_Image::Fl_RGB_Image (const uchar *bits, int W, int H, int D = 3, int LD = 0)

The constructor creates a new image from the specified data. The data array bits must contain sufficient data to provide \(W \times H \times D\) image bytes and optional line padding, see LD.

\(W\) and \(H\) are the width and height of the image in pixels, resp. D is the image depth and can be:

- D=1: each uchar in bits[] is a grayscale pixel value
- D=2: each uchar pair in bits[] is a grayscale + alpha pixel value
- D=3: each uchar triplet in bits[] is an R/G/B pixel value
- D=4: each uchar quad in bits[] is an R/G/B/A pixel value

LD specifies the line data size of the array, see Fl_Image::ld(int). If LD is zero, then \(W \times D\) is assumed, otherwise LD must be greater than or equal to \(W \times D\) to account for (unused) extra data per line (padding).

The caller is responsible that the image data array bits persists as long as the image is used.

This constructor sets Fl_RGB_Image::alloc_array to 0. To have the image object control the deallocation of the data array bits, set alloc_array to non-zero after construction.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>bits</th>
<th>The image data array.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>(W)</td>
<td>The width of the image in pixels.</td>
</tr>
<tr>
<td>in</td>
<td>(H)</td>
<td>The height of the image in pixels.</td>
</tr>
<tr>
<td>in</td>
<td>(D)</td>
<td>The image depth, or 'number of channels' (default=3).</td>
</tr>
<tr>
<td>in</td>
<td>LD</td>
<td>Line data size (default=0).</td>
</tr>
</tbody>
</table>

See also

Fl_Image::data(), Fl_Image::w(), Fl_Image::h(), Fl_Image::d(), Fl_Image::ld(int)

11.116.2.2 Fl_RGB_Image() [2/3]

Fl_RGB_Image::Fl_RGB_Image (const uchar *bits,
The constructor creates a new image from the specified data. If the provided array is too small to contain all the image data, the constructor will not generate the image to avoid illegal memory read access and instead set `data` to NULL and `ld` to `ERR_MEMORY_ACCESS`.

### Parameters

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bits</code></td>
<td>image data</td>
</tr>
<tr>
<td><code>bits_length</code></td>
<td>length of the <code>bits</code> array in bytes</td>
</tr>
<tr>
<td><code>W</code></td>
<td>image width in pixels</td>
</tr>
<tr>
<td><code>H</code></td>
<td>image height in pixels</td>
</tr>
<tr>
<td><code>D</code></td>
<td>image depth in bytes, 1 for gray scale, 2 for gray with alpha, 3 for RGB, and 4 for RGB plus alpha</td>
</tr>
<tr>
<td><code>LD</code></td>
<td>line length in bytes, or 0 to use W*D.</td>
</tr>
</tbody>
</table>

### Member Function Documentation

#### 11.116.3.1 as_svg_image()

```cpp
def as_svg_image() -> Fl_SVG_Image *
```

Virtual method that returns whether an image is an `Fl_SVG_Image` or not. This method returns a pointer to the `Fl_SVG_Image` if this object is an instance of `Fl_SVG_Image` or NULL if not. Reimplemented in `Fl_SVG_Image`.

#### 11.116.3.2 color_average()

```cpp
def color_average(Fl_Color c, float i)
```

The `color_average()` method averages the colors in the image with the provided FLTK color value. The first argument specifies the FLTK color to be used. The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory. Reimplemented from `Fl_Image`. Reimplemented in `Fl_SVG_Image`.

Generated by Doxygen
11.116.3.3 copy()

```cpp
Fl_Image * Fl_RGB_Image::copy (  
    int W,  
    int H ) const [virtual]
```

Creates a resized copy of the image. The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use `Fl_Image::release()` for all types of images (i.e. all subclasses of `Fl_Image`) instead of `operator delete` for `Fl_Image`'s and `Fl_Image::release()` for `Fl_Shared_Image`'s. The new image data will be converted to the requested size. RGB images are resized using the algorithm set by `Fl_Image::RGB_scaling()`.

For the new image the following equations are true:

- \( w() == data_w() == W \)
- \( h() == data_h() == H \)

**Parameters**

\[ \text{in} \quad W/H \quad \text{Requested width and height of the new image} \]

**Note**

The returned image can be safely cast to the same image type as that of the source image provided this type is one of `Fl_RGB_Image`, `Fl_SVG_Image`, `Fl_Pixmap`, `Fl_Bitmap`, `Fl_Tiled_Image`, `Fl_Anim_GIF_Image` and `Fl_Shared_Image`. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an `Fl_GIF_Image` is an object of class `Fl_Pixmap`.

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from `Fl_Image` or any subclass your overridden methods of `Fl_Image::copy() const` and `Fl_Image::copy(int, int) const` must also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from `Fl_Image`.
Reimplemented in `Fl_SVG_Image`.

11.116.3.4 desaturate()

```cpp
void Fl_RGB_Image::desaturate ( ) [virtual]
```

The `desaturate()` method converts an image to grayscale. If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from `Fl_Image`.
Reimplemented in `Fl_SVG_Image`.

11.116.3.5 draw()

```cpp
void Fl_RGB_Image::draw (  
    int X,  
    int Y,  
    int W,  
    int H,  
    int cx = 0,  
    int cy = 0 ) [virtual]
```

Draws the image to the current drawing surface with a bounding box. Arguments \( X, Y, W, H \) specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the \( cx \) and \( cy \) arguments.

In other words: `fl_push_clip(X,Y,W,H)` is applied, the image is drawn with its upper-left corner at \( X-cx, Y-cy \) and its own width and height, `fl_pop_clip()` is applied.
Reimplemented from Fl_Image.
Reimplemented in Fl_SVG_Image.

11.116.3.6 label() [1/2]

void Fl_RGB_Image::label (Fl_Menu_Item * m) [virtual]

This method is an obsolete way to set the image attribute of a menu item.

Deprecated Please use Fl_Menu_Item::image() instead.

Reimplemented from Fl_Image.

11.116.3.7 label() [2/2]

void Fl_RGB_Image::label (Fl_Widget * widget) [virtual]

This method is an obsolete way to set the image attribute of a widget or menu item.

Deprecated Please use Fl_Widget::image() or Fl_Widget::deimage() instead.

Reimplemented from Fl_Image.

11.116.3.8 max_size() [1/2]

static size_t Fl_RGB_Image::max_size () [inline], [static]

Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

See also

void Fl_RGB_Image::max_size(size_t)

11.116.3.9 max_size() [2/2]

static void Fl_RGB_Image::max_size (size_t size) [inline], [static]

Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object. The image size in bytes of an Fl_RGB_Image object is the value of the product w() * h() * d(). If this product exceeds size, the created object of a derived class of Fl_RGB_Image won’t be loaded with the image data. This does not apply to direct RGB image creation with Fl_RGB_Image(const uchar *bits, int W, int H, int D, int LD). The default max_size() value is essentially infinite.

11.116.3.10 normalize()

virtual void Fl_RGB_Image::normalize ( ) [inline], [virtual]

Makes sure the object is fully initialized.
In particular, makes sure member variable array is non-null.
Reimplemented in Fl_SVG_Image.

11.116.3.11 uncache()

void Fl_RGB_Image::uncache ( ) [virtual]

If the image has been cached for display, delete the cache data.
This allows you to change the data used for the image and then redraw it without recreating an image object.
Reimplemented from Fl_Image.
11.116.4 Member Data Documentation

11.116.4.1 array

```cpp
class Fl_RGB_Image::array
const uchar* Fl_RGB_Image::array
```
Points to the start of the object’s data array.

See also

class Fl_SVG_Image which delays initialization of this member variable.

The documentation for this class was generated from the following files:

- Fl_Image.H
- Fl_Image.cxx

11.117 Fl_Roller Class Reference

The Fl_Roller widget is a “dolly” control commonly used to move 3D objects.

```cpp
#include <Fl_Roller.H>
```

Inheritance diagram for Fl_Roller:

```
Fl_Widget
   |
   v
Fl_Valuator
   |
   v
Fl_Roller
```

Public Member Functions

- **Fl_Roller** (int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Roller widget using the given position, size, and label string.

- **int handle** (int) FL_OVERRIDE
  
  Handles the specified event.

Public Member Functions inherited from Fl_Valuator

- **void bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp** (double)
  
  Clamps the passed value to the valuator range.

- **virtual int format** (char *)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment** (double, int)
  
  Adds n times the step value to the passed value.

- **double maximum** () const
  
  Gets the maximum value for the valuator.

- **void maximum** (double a)
  
  Sets the maximum value for the valuator.

- **double minimum** () const
  
  Gets the minimum value for the valuator.

- **void minimum** (double a)
  
  Sets the minimum value for the valuator.

- **void precision** (int digits)
Sets the step value to $1.0 / 10^9$.

- **void range** (double a, double b)
  Sets the minimum and maximum values for the valuator.

- **double round** (double)
  Round the passed value to the nearest step increment.

- **double step** () const
  Gets or sets the step value.

- **void step** (double a, int b)
  See double Fl_Valuator::step() const

- **void step** (double s)
  See double Fl_Valuator::step() const.

- **void step** (int a)
  See double Fl_Valuator::step() const

- **double value** () const
  Gets the floating point(double) value.

- **int value** (double)
  Sets the current value.

### Public Member Functions inherited from Fl_Widget

- **void _clear_fullscreen** ()
- **void _set_fullscreen** ()
- **void activate** ()
  Activates the widget.
- **unsigned int active** () const
  Returns whether the widget is active.
- **int active_r** () const
  Returns whether the widget and all of its parents are active.
- **Fl_Align align** () const
  Gets the label alignment.
- **void align** (Fl_Align alignment)
  Sets the label alignment.
- **long argument** () const
  Gets the current user data (long) argument that is passed to the callback function.
- **void argument** (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- **virtual class Fl_Gl_Window** ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- **virtual class Fl_Gl_Window** const ∗ as_gl_window () const
- **virtual Fl_Group** ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- **virtual Fl_Group** const ∗ as_group () const
- **virtual Fl_Window** ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- **virtual Fl_Window** const ∗ as_window () const
- **void bind_deimage** (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.
- **void bind_deimage** (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- **void bind_image** (Fl_Image ∗img)
Sets the image to use as part of the widget label when in the active state.

- **void bind_image** (int f)

  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box** () const

  Gets the box type of the widget.

- **void box** (Fl_Boxtype new_box)

  Sets the box type for the widget.

- **Fl_Callback_p callback** () const

  Gets the current callback function for the widget.

- **void callback** (Fl_Callback +cb)

  Sets the current callback function for the widget.

- **void callback** (Fl_Callback +cb, Fl_Callback_User_Data +p, bool auto_free)

  Sets the current callback function and managed user data for the widget.

- **void callback** (Fl_Callback +cb, void +p)

  Sets the current callback function and data for the widget.

- **void callback** (Fl_Callback0 +cb)

  Sets the current callback function for the widget.

- **void callback** (Fl_Callback1 +cb, long p=0)

  Sets the current callback function for the widget.

- **unsigned int changed** () const

  Checks if the widget value changed since the last callback.

- **void clear_active** ()

  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed** ()

  Marks the value of the widget as unchanged.

- **void clear_damage** (uchar c=0)

  Clears or sets the damage flags.

- **void clear_output** ()

  Sets a widget to accept input.

- **void clear_visible** ()

  Hides the widget.

- **void clear_visible_focus** ()

  Disables keyboard focus navigation with this widget.

- **Fl_Color color** () const

  Gets the background color of the widget.

- **void color** (Fl_Color bg)

  Sets the background color of the widget.

- **void color** (Fl_Color bg, Fl_Color sel)

  Sets the background and selection color of the widget.

- **Fl_Color color2** () const

  For back compatibility only.

- **void color2** (unsigned a)

  For back compatibility only.

- **int contains** (const Fl_Widget +w) const

  Checks if w is a child of this widget.

- **void copy_label** (const char +new_label)

  Sets the current label.

- **void copy_tooltip** (const char +text)

  Sets the current tooltip text.

- **uchar damage** () const

  Returns non-zero if draw() needs to be called.
• void **damage** (uchar c)
  
  Sets the damage bits for the widget.

• void **damage** (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.

• int **damage_resize** (int, int, int, int)
  
  Internal use only.

• void **deactivate** ()
  
  Deactivates the widget.

• Fl_Image ∗ **deimage** ()
  
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image ∗ **deimage** () const
  
  Gets the image that is used as part of the widget label when in the inactive state.

• void **deimage**(Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• void **deimage**(Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• int **deimage_bound** () const
  
  Returns whether the inactive image is managed by the widget.

• void **do_callback** (Fl_CallbackReason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.

• void **do_callback** (Fl_Widget ∗ widget, long arg, Fl_CallbackReason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **do_callback** (Fl_Widget ∗ widget, void ∗ arg=0, Fl_CallbackReason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **draw_label** (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int **h** () const
  
  Gets the widget height.

• virtual void **hide** ()
  
  Makes a widget invisible.

• Fl_Image ∗ **image** ()
  
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image ∗ **image** () const
  
  Gets the image that is used as part of the widget label when in the active state.

• void **image**(Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

• void **image**(Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the active state.

• int **image_bound** () const
  
  Returns whether the image is managed by the widget.

• int **inside** (const Fl_Widget ∗ wgt) const
  
  Checks if this widget is a child of wgt.

• int **is_label_copied** () const
  
  Returns whether the current label was assigned with copy_label().

• const char ∗ **label** () const
  
  Gets the current label text.

• void **label** (const char ∗ text)
  
  Sets the current label text.

• void **label**(Fl_Labeltype a, const char ∗ b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color **labelcolor** () const
Gets the label color.

- void labelcolor (Fl_Color c)
  Sets the label color.

- Fl_Font labelfont () const
  Gets the font to use.

- void labelfont (Fl_Font f)
  Sets the font to use.

- Fl_Fontsize labelsize () const
  Gets the font size in pixels.

- void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

- Fl_Labeltype labeltype () const
  Gets the label type.

- void labeltype (Fl_Labeltype a)
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '& to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• virtual ∼Fl_Widget ()
  Destroys the widget.
Protected Member Functions

- void \texttt{draw()} \texttt{FL\_OVERRIDE}
  
  Draws the widget.

Protected Member Functions inherited from \texttt{Fl\_Valuator}

- \texttt{Fl\_Valuator} (int X, int Y, int W, int H, const char *L)
  
  Creates a new \texttt{Fl\_Valuator} widget using the given position, size, and label string.

- void \texttt{handle\_drag} (double newvalue)
  
  Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.

- void \texttt{handle\_push}()
  
  Stores the current value in the previous value.

- void \texttt{handle\_release}()
  
  Called after an FL\_WHEN\_RELEASE event is received and before the callback.

- int \texttt{horizontal}() const
  
  Tells if the valuator is an FL\_HORIZONTAL one.

- double \texttt{previous\_value}() const
  
  Gets the previous floating point value before an event changed it.

- void \texttt{set\_value} (double v)
  
  Sets the current floating point value.

- double \texttt{softclamp} (double)
  
  Clamps the value, but accepts \texttt{v} if the previous value is not already out of range.

- virtual void \texttt{value\_damage} ()
  
  Asks for partial redraw.

Protected Member Functions inherited from \texttt{Fl\_Widget}

- void \texttt{clear\_flag} (unsigned int c)
  
  Clears a flag in the flags mask.

- void \texttt{draw\_backdrop} () const
  
  If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.

- void \texttt{draw\_box} () const
  
  Draws the widget box according its box style.

- void \texttt{draw\_box} (Fl\_Boxtype t, Fl\_Color c) const
  
  Draws a box of type \texttt{t}, of color \texttt{c} at the widget's position and size.

- void \texttt{draw\_box} (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color c) const
  
  Draws a box of type \texttt{t}, of color \texttt{c} at the position \texttt{X,Y} and size \texttt{W,H}.

- void \texttt{draw\_focus} () const
  
  Draws a focus rectangle around the widget.

- void \texttt{draw\_focus} (Fl\_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

- void \texttt{draw\_focus} (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

- void \texttt{draw\_label} () const
  
  Draws the widget's label at the defined label position.

- void \texttt{draw\_label} (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- \texttt{Fl\_Widget} (int x, int y, int w, int h, const char *\texttt{label}=0L)
  
  Creates a widget at the given position and size.

- unsigned int \texttt{flags} () const
  
  Gets the widget flags mask.
• void h (int v)
  *Internal use only.*
• void set_flag (unsigned int c)
  *Sets a flag in the flags mask.*
• void w (int v)
  *Internal use only.*
• void x (int v)
  *Internal use only.*
• void y (int v)
  *Internal use only.*

Additional Inherited Members

Static Public Member Functions inherited from **Fl_Widget**

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  *The default callback for all widgets that don’t set a callback.*
• static unsigned int label_shortcut (const char ∗t)
  *Returns the Unicode value of the ‘&x’ shortcut in a given text.*
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  *Returns true if the given text t contains the entered ‘&x’ shortcut.*

Protected Types inherited from **Fl_Widget**

11.117.1 Detailed Description

The **Fl_Roller** widget is a "dolly" control commonly used to move 3D objects.
The roller can be controlled by clicking and dragging the mouse, by the corresponding arrow keys when the roller
has the keyboard focus, or by the mouse wheels when the mouse pointer is positioned over the roller widget.
11.117.2 Constructor & Destructor Documentation

11.117.2.1 Fl_Roller()

   Fl_Roller::Fl_Roller (  
      int X,  
      int Y,  
      int W,  
      int H,  
      const char ∗ L = 0 )

Creates a new Fl_Roller widget using the given position, size, and label string. The default boxtype is FL_NO_BOX. Inherited destructor destroys the valuator.

11.117.3 Member Function Documentation

11.117.3.1 draw()

   void Fl_Roller::draw ( ) [protected], [virtual]

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget ∗ s = & scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
Implements Fl_Widget.

11.117.3.2 handle()

   int Fl_Roller::handle (  
      int event ) [virtual]

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>event</th>
<th>the kind of event received</th>
</tr>
</thead>
</table>

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

Fl_Event

Reimplemented from Fl_Widget.

The documentation for this class was generated from the following files:

- Fl_Roller.H
- Fl_Roller.cxx

### 11.118 Fl_Round_Button Class Reference

Buttons generate callbacks when they are clicked by the user.

```cpp
#include <Fl_Round_Button.H>
```

Inheritance diagram for Fl_Round_Button:

```
Fl_Widget
  ↓
Fl_Button
  ↓
Fl_Light_Button
  ↓
Fl_Round_Button
  ↓
Fl_Radio_Round_Button
```

**Public Member Functions**

- `Fl_Round_Button (int x, int y, int w, int h, const char *l=0)`
  
  Creates a new Fl_Round_Button widget using the given position, size, and label string.

**Public Member Functions inherited from Fl_Light_Button**

- `Fl_Light_Button (int x, int y, int w, int h, const char *l=0)`
  
  Creates a new Fl_Light_Button widget using the given position, size, and label string.

- `int handle (int) FL_OVERRIDE`
  
  Handles the specified event.

**Public Member Functions inherited from Fl_Button**

- `int clear ()`
  
  Same as `value(0)`.

- `uchar compact ()`
  
  Return true if buttons are rendered as compact buttons.

- `void compact (uchar v)`
  
  Decide if buttons should be rendered in compact mode.

- `Fl_Boxtype down_box () const`
  
  Returns the current down box type, which is drawn when `value()` is non-zero.

- `void down_box (Fl_Boxtype b)`
  
  Sets the down box type.

- `Fl_Color down_color () const`
  
  (for backwards compatibility)
• **void** `down_color` (unsigned c)
  *(for backwards compatibility)*

• **Fl_Button** (int X, int Y, int W, int H, const char ∗L=0)
  *The constructor creates the button using the given position, size, and label.*

• int `set` ()
  *Same as `value(1)`.*

• **void** `setonly` ()
  *Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).*

• int `shortcut` () const
  *Returns the current shortcut key for the button.*

• **void** `shortcut` (const char ∗s)
  *(for backwards compatibility)*

• **void** `shortcut` (int s)
  *Sets the shortcut key to s.*

• char `value` () const
  *Returns the current value of the button (0 or 1).*

• int `value` (int v)
  *Sets the current value of the button.*

### Public Member Functions inherited from Fl_Widget

• **void** `_clear_fullscreen` ()

• **void** `_set_fullscreen` ()

• **void** `activate` ()
  *Activates the widget.*

• unsigned int `active` () const
  *Returns whether the widget is active.*

• int `active_r` () const
  *Returns whether the widget and all of its parents are active.*

• **Fl_Align** `align` () const
  *Gets the label alignment.*

• **void** `align` (Fl_Align alignment)
  *Sets the label alignment.*

• long `argument` () const
  *Gets the current user data (long) argument that is passed to the callback function.*

• **void** `argument` (long v)
  *Sets the current user data (long) argument that is passed to the callback function.*

• virtual class `Fl_Gl_Window` ∗`as_gl_window` ()
  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

• virtual class `Fl_Gl_Window` const ∗`as_gl_window` () const
  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

• virtual `Fl_Group` ∗`as_group` ()
  *Returns an Fl_Group pointer if this widget is an Fl_Group.*

• virtual `Fl_Group` const ∗`as_group` () const
  *Returns an Fl_Group pointer if this widget is an Fl_Group.*

• virtual `Fl_Window` ∗`as_window` ()
  *Returns an Fl_Window pointer if this widget is an Fl_Window.*

• virtual `Fl_Window` const ∗`as_window` () const
  *Returns an Fl_Window pointer if this widget is an Fl_Window.*

• **void** `bind_deimage` (Fl_Image ∗img)
  *Sets the image to use as part of the widget label when in the inactive state.*

• **void** `bind_deimage` (int f)
  *Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

• **void** `bind_image` (Fl_Image ∗img)
Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  
  **Bind the image to the widget, so the widget will delete the image when it is no longer needed.**

- **FL_Boxtype box () const**
  
  **Gets the box type of the widget.**

- **void box (FL_Boxtype new_box)**
  
  **Sets the box type for the widget.**

- **FL_Callback_p callback () const**
  
  **Gets the current callback function for the widget.**

- **void callback (FL_Callback +cb)**
  
  **Sets the current callback function for the widget.**

- **void callback (FL_Callback +cb, FL_Callback_User_Data +p, bool auto_free)**
  
  **Sets the current callback function and managed user data for the widget.**

- **void callback (FL_Callback +cb, void +p)**
  
  **Sets the current callback function and data for the widget.**

- **void callback (FL_Callback0 +cb)**
  
  **Sets the current callback function for the widget.**

- **void callback (FL_Callback1 +cb, long p=0)**
  
  **Sets the current callback function for the widget.**

- **unsigned int changed () const**
  
  **Checks if the widget value changed since the last callback.**

- **void clear_active ()**
  
  **Marks the widget as inactive without sending events or changing focus.**

- **void clear_changed ()**
  
  **Marks the value of the widget as unchanged.**

- **void clear_damage (uchar c=0)**
  
  **Clears or sets the damage flags.**

- **void clear_output ()**
  
  **Sets a widget to accept input.**

- **void clear_visible ()**
  
  **Hides the widget.**

- **void clear_visible_focus ()**
  
  **Disables keyboard focus navigation with this widget.**

- **FL_Color color () const**
  
  **Gets the background color of the widget.**

- **void color (FL_Color bg)**
  
  **Sets the background color of the widget.**

- **void color (FL_Color bg, FL_Color sel)**
  
  **Sets the background and selection color of the widget.**

- **FL_Color color2 () const**
  
  **For back compatibility only.**

- **void color2 (unsigned a)**
  
  **For back compatibility only.**

- **int contains (const FL_Widget +w) const**
  
  **Checks if w is a child of this widget.**

- **void copy_label (const char +new_label)**
  
  **Sets the current label.**

- **void copy_tooltip (const char +text)**
  
  **Sets the current tooltip text.**

- **uchar damage () const**
  
  **Returns non-zero if draw() needs to be called.**
• void **damage** (uchar c)
  Sets the damage bits for the widget.

• void **damage** (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int **damage_resize** (int, int, int, int)
  Internal use only.

• void **deactivate** ()
  Deactivates the widget.

• Fl_Imga**ge** = **deimage** ()
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Imga**ge** = **deimage** () const
  Gets the image that is used as part of the widget label when in the inactive state.

• void **deimage**(Fl_Imga**ge** &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void **deimage**(Fl_Imga**ge** img)
  Sets the image to use as part of the widget label when in the inactive state.

• int **deimage_bound**(int const)
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Imga**ge** = **image** ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Imga**ge** = **image** () const
  Gets the image that is used as part of the widget label when in the active state.

• void **image**(Fl_Imga**ge** &img)
  Sets the image to use as part of the widget label when in the active state.

• void **image**(Fl_Imga**ge** img)
  Sets the image to use as part of the widget label when in the active state.

• int **image_bound**(int const)
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char *label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label text.

• Fl_Color labelcolor () const
  Shortcut to set the label text and type in one call.
Gets the label color.

- void *labelcolor* (*Fl_Color* c)
  
  Sets the label color.

- *Fl_Font labelfont* () const
  
  Gets the font to use.

- void *labelfont* (*Fl_Font* f)
  
  Sets the font to use.

- *Fl_Fontsize labelsizex* () const
  
  Gets the font size in pixels.

- void *labelsizex* (*Fl_Fontsize* pix)
  
  Sets the font size in pixels.

- *Fl_Labeltype labeltype* () const
  
  Gets the label type.

- void *labeltype* (*Fl_Labeltype* a)
  
  Sets the label type.

- void *measure_label* (int &ww, int &hh) const
  
  Sets width &ww and height &hh accordingly with the label size.

- bool *needs_keyboard* () const
  
  Returns whether this widget needs a keyboard.

- void *needs_keyboard* (bool needs)
  
  Sets whether this widget needs a keyboard.

- unsigned int *output* () const
  
  Returns if a widget is used for output only.

- *Fl_Group* *parent* () const
  
  Returns a pointer to the parent widget.

- void *parent* (*Fl_Group* *p)
  
  Internal use only - “for hacks only”.

- void *position* (int X, int Y)
  
  Repositions the window or widget.

- void *redraw* ()
  
  Schedules the drawing of the widget.

- void *redraw_label* ()
  
  Schedules the drawing of the label.

- virtual void *resize* (int x, int y, int w, int h)
  
  Changes the size or position of the widget.

- *Fl_Color selection_color* () const
  
  Gets the selection color.

- void *selection_color* (*Fl_Color* a)
  
  Sets the selection color.

- void *set_active* ()
  
  Marks the widget as active without sending events or changing focus.

- void *set_changed* ()
  
  Marks the value of the widget as changed.

- void *set_output* ()
  
  Sets a widget to output only.

- void *set_visible* ()
  
  Makes the widget visible.

- void *set_visible_focus* ()
  
  Enables keyboard focus navigation with this widget.

- int *shortcut_label* () const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  "The default callback for all widgets that don't set a callback."
- static unsigned int label_shortcut (const char ∗t)
  "Returns the Unicode value of the '&x' shortcut in a given text."
- static int test_shortcut (const char ∗t, const bool require_alt=false)
  "Returns true if the given text t contains the entered '&x' shortcut."

• static void key_release_timeout (void ∗)

Static Protected Attributes inherited from Fl_Button
• static Fl_Widget_Tracker ∗key_release_tracker = 0

11.118.1 Detailed Description
Buttons generate callbacks when they are clicked by the user.
You control exactly when and how by changing the values for type() and when().

The Fl_Round_Button subclass displays the “on” state by turning on a light, rather than drawing pushed in. The shape of the “light” is initially set to FL_ROUND_DOWN_BOX. The color of the light when on is controlled with selection_color(), which defaults to FL_FOREGROUND_COLOR.

11.118.2 Constructor & Destructor Documentation
11.118.2.1 Fl_Round_Button()
Fl_Round_Button::Fl_Round_Button (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char ∗L = 0 )
Creates a new Fl_Round_Button widget using the given position, size, and label string.
The `Fl_Round_Button` subclass displays the "ON" state by turning on a light, rather than drawing pushed in. The default box type is `FL_NO_BOX`, which draws the label w/o a box right of the checkmark. The shape of the "light" is set with `down_box()` and its default value is `FL_ROUND_DOWN_BOX`. The color of the light when on is controlled with `selection_color()`, which defaults to `FL_FOREGROUND_COLOR` (usually black).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X,Y,W,H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- `Fl_Round_Button.H`
- `Fl_Round_Button.cxx`

### 11.119 Fl_Round_Clock Class Reference

A clock widget of type `FL_ROUND_CLOCK`.

```
#include <Fl_Round_Clock.H>
```

Fl_Round_Clock
```

**Public Member Functions**

- `Fl_Round_Clock (int X, int Y, int W, int H, const char *L=0)`  
  Creates the clock widget, setting his type and box.

**Public Member Functions inherited from `Fl_Clock`**

- `Fl_Clock (int X, int Y, int W, int H, const char *L=0)`  
  Create an `Fl_Clock` widget using the given position, size, and label string.
- `Fl_Clock (uchar t, int X, int Y, int W, int H, const char *L)`  
  Create an `Fl_Clock` widget using the given clock type `t`, position, size, and label string.
- `int handle (int) FL_OVERRIDE`  
  Handles the specified event.
- `~Fl_Clock ()`  
  The destructor removes the clock.

**Public Member Functions inherited from `Fl_Clock_Output`**

- `Fl_Clock_Output (int X, int Y, int W, int H, const char *L=0)`  
  Create a new `Fl_Clock_Output` widget with the given position, size and label.
- `int hour () const`  
  Returns the displayed hour (0 to 23).
• int minute () const  
  Returns the displayed minute (0 to 59).
• int second () const  
  Returns the displayed second (0 to 60, 60=leap second).
• int shadow () const  
  Returns the shadow drawing mode of the hands.
• void shadow (int mode)  
  Sets the shadow drawing mode of the hands.
• ulong value () const  
  Returns the displayed time.
• void value (int H, int m, int s)  
  Set the displayed time.
• void value (ulong v)  
  Set the displayed time.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()  
  Activates the widget.
• unsigned int active () const  
  Returns whether the widget is active.
• int active_r () const  
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const  
  Gets the label alignment.
• void align (Fl_Align alignment)  
  Sets the label alignment.
• long argument () const  
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)  
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual Fl_Group ∗ as_group ()  
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const  
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Window ∗ as_window ()  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• void bind_deimage (Fl_Image ∗img)  
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗img)  
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  Gets the current callback function for the widget.

- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int **damage_resize**(int, int, int, int)
  
  Internal use only.

• void **deactivate**()
  
  Deactivates the widget.

• Fl_Image * **deimage**()
  
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image * **deimage**() const
  
  Gets the image that is used as part of the widget label when in the inactive state.

• void **deimage**(Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• void **deimage**(Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• int **deimage_bound**() const
  
  Returns whether the inactive image is managed by the widget.

• void **do_callback**(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.

• void **do_callback**(Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **do_callback**(Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **draw_label**(int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int **h**() const
  
  Gets the widget height.

• virtual void **hide**()
  
  Makes a widget invisible.

• Fl_Image * **image**()
  
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * **image**() const
  
  Gets the image that is used as part of the widget label when in the active state.

• void **image**(Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

• void **image**(Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.

• int **image_bound**() const
  
  Returns whether the image is managed by the widget.

• int **inside**(const Fl_Widget *wgt) const
  
  Checks if this widget is a child of wgt.

• int **is_label_copied**() const
  
  Returns whether the current label was assigned with copy_label().

• const char * **label**() const
  
  Gets the current label text.

• void **label**(const char *text)
  
  Sets the current label pointer.

• void **label**(Fl_Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color **labelcolor**() const
  
  Gets the label color.

• void **labelcolor**(Fl_Color c)
  
  Sets the label color.

• Fl_Font **labelfont**() const
  
  Gets the label font.
• void labelfont (FL_Font f)
  Sets the font to use.

• FL_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (FL_Fontsize pix)
  Sets the font size in pixels.

• FL_Labeltype labeltype () const
  Gets the label type.

• void labeltype (FL_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.

• FL_Group * parent () const
  Returns a pointer to the parent widget.

• void parent (FL_Group * p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

• FL_Color selection_color () const
  Gets the selection color.

• void selection_color (FL_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.
  
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7
  , OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11
  , MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15
  , GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19, NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}  
flags possible values enumeration.

Protected Member Functions inherited from Fl_Clock_Output

• void draw () FL_OVERRIDE
  Draw clock with current position and size.

• void draw (int X, int Y, int W, int H)
  Draw clock with the given position and size.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget’s position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget’s label at the defined label position.
• void **draw_label** (int, int, int, int) const

    *Draws the label in an arbitrary bounding box.*

• **Fl_Widget** (int x, int y, int w, int h, const char ∗label=0L)

    *Creates a widget at the given position and size.*

• unsigned int **flags** () const

    *Gets the widget flags mask.*

• void **h** (int v)

    *Internal use only.*

• void **set_flag** (unsigned int c)

    *Sets a flag in the flags mask.*

• void **w** (int v)

    *Internal use only.*

• void **x** (int v)

    *Internal use only.*

• void **y** (int v)

    *Internal use only.*

### 11.119.1 Detailed Description

A clock widget of type FL_ROUND_CLOCK.

Has no box.

### 11.119.2 Constructor & Destructor Documentation

#### 11.119.2.1 Fl_Round_Clock()

```cpp
Fl_Round_Clock::Fl_Round_Clock (int X, int Y, int W, int H, const char ∗L = 0L)
```

Creates the clock widget, setting his type and box.

Create an Fl_Round_Clock widget using the given position, size, and label string.

The clock type is FL_ROUND_CLOCK and the boxtype is FL_NO_BOX.

This constructor is the same as Fl_Clock(FL_ROUND_CLOCK, X, Y, W, H, L).

See also

Fl_Clock(uchar, int, int, int, const char ∗)

#### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X,Y,W,H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

• Fl_Round_Clock.H
• Fl_Clock.cxx

### 11.120 Fl_Scheme Class Reference

#### Static Public Member Functions

• static int **add_scheme_name** (const char ∗name)
Add a scheme name to the list of known schemes.

• static const char ** names ()
  Return a list of all known scheme names.

• static int num_schemes ()
  Return the number of currently registered schemes.

11.120.1 Member Function Documentation

11.120.1.1 add_scheme_name()

int Fl_Scheme::add_scheme_name (  
  const char * name ) [static]

Add a scheme name to the list of known schemes.
This method is public in FLTK 1.4.0 because derived classes of Fl_Scheme are not yet implemented. Thus, users implementing their own schemes can use this method to add the scheme name to the list of known schemes which is for instance used in Fl_Scheme::names().

Note

Attention! In a future version, when subclasses of Fl_Scheme will be implemented, this method will either be replaced by another protected method or it will no longer do anything (kept only for ABI reasons).

The new scheme name must consist of valid ASCII characters as described below:

• lowercase letters 'a' - 'z'
• numbers '0' - '9'
• any character in "$+_." (w/o the quotes).

The name must not be longer than 12 ASCII characters (bytes). The new scheme name is added to the end of the unordered list.

Note

Call this method only once for each scheme name. If the returned value is <= 0 you should check the scheme name.

The given scheme name is copied and may be freed directly after the call to add_scheme_name().

Parameters

| in | name | New scheme name |

Returns

The new number of schemes if the name was successfully added. This is the same as the index of the scheme + 1.

Return values

| 0  | Scheme name already exists          |
| -1 | Invalid character(s) in name       |
| -2 | The name is too long               |
Since 1.4.0

11.120.1.2 names()

const char ** Fl_Scheme::names() [static]

Return a list of all known scheme names.
This list is only valid until a new scheme is added or one is removed. It is possible that scheme names are appended to the list during the runtime of the program but schemes can't be removed.

Getting the list of known schemes can be useful to populate a menu of scheme choices to let the user select a scheme. You should process the names immediately and you should never store a pointer to the list or any individual name for later reference because the location of the list can be changed (reallocated) when schemes are added.

The list of scheme names is null-terminated.

Note

Currently (in FLTK 1.4.0) schemes can only be added to the list and not removed from the list. This may change in a later version.

Returns

List of currently known scheme names.

11.120.1.3 num_schemes()

static int Fl_Scheme::num_schemes() [inline], [static]

Return the number of currently registered schemes.

Returns

Number of registered schemes.

The documentation for this class was generated from the following files:

- Fl_Scheme.H
- Fl_Scheme.cxx

11.121 Fl_Scheme_Choice Class Reference

Inheritance diagram for Fl_Scheme_Choice:

```
Fl_Widget
    |
    v
Fl_Menu_
    |
    v
Fl_Choice
    |
    v
Fl_Scheme_Choice
```

Public Member Functions

- Fl_Scheme_Choice (int X, int Y, int W, int H, const char *L=0)
  The constructor initializes the Fl_Scheme_Choice object with all known schemes.

- int handle (int event) FL_OVERRIDE
  Handle FLTK events.

- virtual void init_value ()
  Public method to initialize the value of the Fl_Scheme_Choice widget.
Public Member Functions inherited from Fl_Choice

- **Fl_Choice** (int X, int Y, int W, int H, const char *L=0)
  
  Create a new Fl_Choice widget using the given position, size and label string.

- **int value () const**
  
  Gets the index of the last item chosen by the user.

- **int value (const Fl_Menu_Item *v)**
  
  Sets the currently selected value using a pointer to menu item.

- **int value (int v)**
  
  Sets the currently selected value using the index into the menu item array.

Public Member Functions inherited from Fl_Menu_

- **int add (const char *a)**
  
  This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.

- **int add (const char *, int shortcut, Fl_Callback *, void *, int=0)**
  
  Adds a new menu item.

- **int add (const char *, const char *, int shortcut, Fl_Callback *, void *, int=0)**
  
  See int Fl_Menu_::add(const char * label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)

- **void clear ()**
  
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

- **int clear_submenu (int index)**
  
  Clears the specified submenu pointed to by index of all menu items.

- **void copy (const Fl_Menu_Item *m, void *user_data=0)**
  
  Sets the menu array pointer with a copy of m that will be automatically deleted.

- **Fl_Boxtype down_box () const**
  
  This box type is used to surround the currently-selected items in the menus.

- **void down_box (Fl_Boxtype b)**
  
  Sets the box type used to surround the currently-selected items in the menus.

- **Fl_Color down_color () const**
  
  For back compatibility, same as selection_color()

- **void down_color (unsigned c)**
  
  For back compatibility, same as selection_color()

- **int find_index (const char *name) const**
  
  Find the menu item index for a given menu pathname, such as "Edit/Copy".

- **int find_index (const Fl_Menu_Item *item) const**
  
  Find the index into the menu array for a given item.

- **int find_index (Fl_Callback *cb) const**
  
  Find the index into the menu array for a given callback cb.

- **const Fl_Menu_Item * find_item (const char *name)**
  
  Find the menu item for a given menu pathname, such as "Edit/Copy".

- **const Fl_Menu_Item * find_item (Fl_Callback *)**
  
  Find the menu item for the given callback cb.

- **const Fl_Menu_Item * find_item_with_argument (long)**
  
  Find the menu item for the given user argument v.

- **const Fl_Menu_Item * find_item_with_user_data (void *)**
  
  Find the menu item for the given user data v.

- **Fl_Menu_ () (int, int, int, int, const char *L=0)**
  
  Creates a new Fl_Menu_ widget using the given position, size, and label string.

- **void global ()**
  
  Make the shortcuts for this menu work no matter what window has the focus when you type it.
• int insert (int index, const char *, int shortcut, Fl_Callback *, void *=0, int e=0)
  
  Inserts a new menu item at the specified index position.

• int insert (int index, const char *a, const char *b, Fl_Callback *c, void *d=0, int e=0)
  See int Fl_Menu_::insert(const char* label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)

• int item_pathname (char *name, int namelen, const Fl_Menu_Item *find_item=0) const
  
  Get the menu 'pathname' for the specified menu item.

• const Fl_Menu_Item * menu () const
  
  Returns a pointer to the array of Fl_Menu_Items.

• void menu (const Fl_Menu_Item *m)
  
  Sets the menu array pointer directly.

• Fl_Boxtype menu_box () const
  
  Get the box type for the menu popup windows.

• void menu_box (Fl_Boxtype b)
  
  Set the box type for the menu popup windows.

• const Fl_Menu_Item * menu_end ()
  
  Finishes menu modifications and returns menu().

• int mode (int i) const
  
  Gets the flags of item i.

• void mode (int i, int fl)
  
  Sets the flags of item i.

• const Fl_Menu_Item * mvalue () const
  
  Returns a pointer to the last menu item that was picked.

• const Fl_Menu_Item * prev_mvalue () const
  
  Returns a pointer to the menu item that was picked before the current one was picked.

• void remove (int)
  
  Deletes item i from the menu.

• void replace (int, const char *)
  
  Changes the text of item i.

• void setonly (Fl_Menu_Item *item)
  
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

• void shortcut (int i, int s)
  
  Changes the shortcut of item i to s.

• int size () const
  
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.

• void size (int W, int H)
  
• const Fl_Menu_Item * testShortcut ()
  
  Returns the menu item with the entered shortcut (key value).

• const char * text () const
  
  Returns the title of the last item chosen.

• const char * text (int i) const
  
  Returns the title of item i.

• Fl_Color textcolor () const
  
  Get the current color of menu item labels.

• void textcolor (Fl_Color c)
  
  Sets the current color of menu item labels.

• Fl_Font textfont () const
  
  Gets the current font of menu item labels.

• void textfont (Fl_Font c)
  
  Sets the current font of menu item labels.
• **Fl_Fontsize** `textsize()` const
  
  Gets the font size of menu item labels.

• void `textsize(Fl_Fontsize c)`
  
  Sets the font size of menu item labels.

• int `value()` const
  
  Returns the index into `menu()` of the last item chosen by the user.

• int `value(const Fl_Menu_Item *)`  
  
  The value is the index into `menu()` of the last item chosen by the user.

• int `value(int i)`  
  
  The value is the index into `menu()` of the last item chosen by the user.

### Public Member Functions inherited from Fl_Widget

• void `_clear_fullscreen()`  
  
  Activates the widget.

• void `_set_fullscreen()`  
  
  Activates the widget.

• unsigned int `active()` const
  
  Returns whether the widget is active.

• int `active_r()` const
  
  Returns whether the widget and all of its parents are active.

• **Fl_Align** `align()` const
  
  Gets the label alignment.

• void `align(Fl_Align alignment)`  
  
  Sets the label alignment.

• long `argument()` const
  
  Gets the current user data (long) argument that is passed to the callback function.

• void `argument(long v)`  
  
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class **Fl_Gl_Window** * as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class **Fl_Gl_Window** const & as_gl_window () const
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual **Fl_Group** * as_group ()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual **Fl_Group** const & as_group () const
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual **Fl_Window** * as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual **Fl_Window** const & as_window () const
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• void `bind_deimage(Fl_Image * img)`  
  
  Sets the image to use as part of the widget label when in the inactive state.

• void `bind_deimage(int f)`  
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void `bind_image(Fl_Image * img)`  
  
  Sets the image to use as part of the widget label when in the active state.

• void `bind_image(int f)`  
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• **Fl_Boxtype** `box()` const
  
  Gets the box type of the widget.

• void `box(Fl_Boxtype new_box)`  
  
  Sets the box type for the widget.

• **Fl_Callback** _p `callback()` const

Generated by Doxygen
Gets the current callback function for the widget.

- void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)
  Sets the current label.

- void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
Gets the font size in pixels.

- void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

- Fl_Labeltype labeltype () const
  Gets the label type.

- void labeltype (Fl_Labeltype a)
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int take_events () const
  Returns if the widget is able to take events.

• int testShortcut ()
  Returns true if the widget's label contains the entered ‘&x’ shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Static Protected Member Functions

• static void scheme_cb_ (Fl_Widget *w, void *)
  Internal Fl_Scheme_Choice callback function (protected).
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don't set a callback.

• static unsigned int labelShortcut (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int testShortcut (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
    INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
    FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7

    OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 ,Copied_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11

    , MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15

    , MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31
}

flags possible values enumeration.

Protected Member Functions inherited from Fl_Choice

• void draw () FL_OVERRIDE
  
  Draws the widget.

Protected Member Functions inherited from Fl_Menu_

• int itemPathname_ (char ∗name, int namelen, const Fl_Menu_Item ∗finditem, const Fl_Menu_Item ∗menu=0) const

Protected Member Functions inherited from Fl_Widget

• void clearFlag (unsigned int c)
  
  Clears a flag in the flags mask.

• void drawBackdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void drawBox () const
  
  Draws the widget box according its box style.

• void drawBox (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

• void drawBox (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void drawFocus () const
  
  Draws a focus rectangle around the widget.

• void drawFocus (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

• void drawFocus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const

Generated by Doxygen
Draws a focus box for the widget at the given position and size.

- **void draw_label () const**
  Draws the widget's label at the defined label position.

- **void draw_label (int, int, int, int) const**
  Draws the label in an arbitrary bounding box.

- **FL_Widget (int x, int y, int w, int h, const char ∗label=0L)**
  Creates a widget at the given position and size.

- **unsigned int flags () const**
  Gets the widget flags mask.

- **void h (int v)**
  Internal use only.

- **void set_flag (unsigned int c)**
  Sets a flag in the flags mask.

- **void w (int v)**
  Internal use only.

- **void x (int v)**
  Internal use only.

- **void y (int v)**
  Internal use only.

Protected Attributes inherited from **FL_Menu_**

- **uchar alloc**
- **uchar down_box_**
- **Fl_Boxtype menu_box_**
- **Fl_Color textcolor_**
- **Fl_Font textfont_**
- **Fl_Fontsize textsize_**

### 11.121.1 Constructor & Destructor Documentation

#### 11.121.1.1 Fl_Scheme_Choice()

**Fl_Scheme_Choice::Fl_Scheme_Choice (**

  int X,
  int Y,
  int W,
  int H,
  const char ∗L = 0 )

The constructor initializes the **Fl_Scheme_Choice** object with all known schemes.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>X, Y</th>
<th>Widget coordinates</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>W, H</td>
<td>Widget size (width, height)</td>
</tr>
<tr>
<td>in</td>
<td>L</td>
<td>Widget label (default: NULL, no label)</td>
</tr>
</tbody>
</table>

### 11.121.2 Member Function Documentation

#### 11.121.2.1 handle()

**int Fl_Scheme_Choice::handle (**

  int event ) [virtual]

Handle FLTK events.
This widget uses FL_SHOW and some other events to initialize its \texttt{value()} according to the current scheme. All events are also handled by the base class \texttt{Fl\_Choice}.

**Parameters**

\texttt{in} \hspace{1em} \texttt{event}

**Returns**

1 if the event was used, 0 otherwise

Reimplemented from \texttt{Fl\_Choice}.

### 11.121.2.2 init_value()

\begin{verbatim}
void Fl_Scheme_Choice::init_value ( ) [virtual]
\end{verbatim}

Public method to initialize the value of the \texttt{Fl\_Scheme\_Choice} widget. Normally you don't need to call this unless you change the current scheme by calling \texttt{Fl::scheme(const char *)}. The \texttt{Fl\_Scheme\_Choice} widget does this automatically when the widget is shown (when receiving the FL\_SHOW event) which should always be after \texttt{Fl\_Window::show(argc, argv)} which may set the current scheme by interpreting the commandline.

**Since**

1.4.0

### 11.121.2.3 scheme_cb()

\begin{verbatim}
void Fl_Scheme_Choice::scheme_cb_ (Fl_Widget * w, void *)
\end{verbatim}

Internal \texttt{Fl\_Scheme\_Choice} callback function (protected). You don't need to set a callback for this widget. The default callback changes the scheme (\texttt{Fl::scheme()}) and redraws all open windows. You may override the callback if changing the scheme shall redraw other windows or don't redraw the window at all.

**Parameters**

\texttt{in} \hspace{1em} \texttt{w} \hspace{1em} The \texttt{Fl\_Scheme\_Choice} widget

The documentation for this class was generated from the following files:

- \texttt{Fl\_Scheme\_Choice.H}
- \texttt{Fl\_Scheme\_Choice.cxx}

### 11.122 Fl\_Scroll Class Reference

This container widget lets you maneuver around a set of widgets much larger than your window.

\texttt{#include <Fl\_Scroll.H>}

Inheritance diagram for Fl\_Scroll:

```
Fl_Widget
    ↓
Fl_Group
    ↓
Fl_Scroll
```
Classes

• struct Fl_Region_LRTB
    A local struct to manage a region defined by left/right/top/bottom.
• struct Fl_Region_XYWH
    A local struct to manage a region defined by xywh.
• struct Fl_Scrollbar_Data
    A local struct to manage a scrollbar's xywh region and tab values.
• struct ScrollInfo
    Structure to manage scrollbar and widget interior sizes.

Public Types

• enum {
    HORIZONTAL = 1 , VERTICAL = 2 , BOTH = 3 , ALWAYS_ON = 4 ,
    HORIZONTAL_ALWAYS = 5 , VERTICAL_ALWAYS = 6 , BOTH_ALWAYS = 7 }

Public Member Functions

• void clear ()
    Clear all but the scrollbars...
• int delete_child (int n) FL_OVERRIDE
    Removes the widget at index from the group and deletes it.
• Fl_Scroll (int X, int Y, int W, int H, const char ∗L=0)
    Creates a new Fl_Scroll widget using the given position, size, and label string.
• int handle (int) FL_OVERRIDE
    Handles the specified event.
• void resize (int X, int Y, int W, int H) FL_OVERRIDE
    Resizes the Fl_Scroll widget and moves its children if necessary.
• void scroll_to (int, int)
    Moves the contents of the scroll group to a new position.
• int scrollbar_size () const
    Gets the current size of the scrollbars' troughs, in pixels.
• void scrollbar_size (int newSize)
    Sets the pixel size of the scrollbars' troughs to newSize, in pixels.
• int xposition () const
    Gets the current horizontal scrolling position.
• int yposition () const
    Gets the current vertical scrolling position.
• virtual ~Fl_Scroll ()
    The destructor also deletes all the children.

Public Member Functions inherited from Fl_Group

• Fl_Widget ∗& _ddfdesign_kludge ()
    This is for forms compatibility only.
• void add (Fl_Widget &)
    The widget is removed from its current group (if any) and then added to the end of this group.
• void add (Fl_Widget ∗o)
    See void Fl_Group::add(Fl_Widget ∗w)
• void add_resizable (Fl_Widget &o)
    Adds a widget to the group and makes it the resizable widget.
• Fl_Widget ∗const ∗array () const
Returns a pointer to the array of children.

- Fl_Group const * as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

- Fl_Widget * child (int n) const
  Returns array()[n].

- int children () const
  Returns how many child widgets the group has.

- void clear ()
  Deletes all child widgets from memory recursively.

- unsigned int clip_children ()
  Returns the current clipping mode.

- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- void end ()
  Exactly the same as current(this-&gt;parent()).

- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.

- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.

- Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.

- void focus (Fl_Widget *)
- void forms_end ()
  This is for forms compatibility only.

- void init_sizes ()
  Resets the internal array of widget sizes and positions.

- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).

- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

- void remove (Fl_Widget *o)
  Removes the widget o from the group.

- void remove (int index)
  Removes the widget at index from the group but does not delete it.

- Fl_Widget * resizable () const
  Returns the group's resizable widget.

- void resizable (Fl_Widget &o)
  Sets the group's resizable widget.

- void resizable (Fl_Widget *)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- virtual ~Fl_Group ()
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
Returns if a widget is used for output only.

- **Fl_Group** *parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int testShortcut ()**
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char * tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **Fl_Window *top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window *top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.
• int **use_accents_menu** ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void *user_data () const
  
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  
  Sets the user data for this widget.

• void user_data (void *v)
  
  Sets the user data for this widget.

• unsigned int visible () const
  
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  
  Modifies keyboard focus navigation.

• int visible_r () const
  
  Returns whether a widget and all its parents are visible.

• int w () const
  
  Gets the widget width.

• Fl_When when () const
  
  Returns the conditions under which the callback is called.

• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Window *window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

**Public Attributes**

• Fl_Scrollbar hscrollbar
• Fl_Scrollbar scrollbar

**Protected Member Functions**

• void bbox (int &, int &, int &, int &)
  
  Returns the bounding box for the interior of the scrolling area, inside the scrollbars.

• void draw () FL_OVERRIDE
  
  Draws the widget.

• void fix_scrollbar_order ()
  
  Ensure the scrollbars are the last children.

• int on_insert (Fl_Widget *, int) FL_OVERRIDE
  
  Change insert position of a child before it is added.

• int on_move (int, int) FL_OVERRIDE
  
  Change new position of a child before it is moved.

• void recalc_scrollbars (ScrollInfo &si) const
  
  Calculate visibility/size/position of scrollbars, find children's bounding box.
Protected Member Functions inherited from Fl_Group

- **Fl_Rect * bounds ()**
  Returns the internal array of widget sizes and positions.
- **void draw_child (Fl_Widget &widget) const**
  Forces a child to redraw.
- **void draw_children ()**
  Draws all children of the group.
- **void draw_outside_label (const Fl_Widget &widget) const**
  Parents normally call this to draw outside labels of child widgets.
- **virtual void on_remove (int)**
  Allow derived groups to act when a child widget is removed from the group.
- **int * sizes ()**
  Returns the internal array of widget sizes and positions.
- **void update_child (Fl_Widget &widget) const**
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.
- **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- **void draw_box () const**
  Draws the widget box according its box style.
- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.
- **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  Draws a box of type t, of color c at the position X,Y and size W,H.
- **void draw_focus () const**
  Draws a focus rectangle around the widget.
- **void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const**
  Draws a focus rectangle around the widget.
- **void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  Draws a focus box for the widget at the given position and size.
- **void draw_label () const**
  Draws the widget's label at the defined label position.
- **void draw_label (int, int, int, int) const**
  Draws the label in an arbitrary bounding box.
- **void (int x, int y, int w, int h, const char *label=0L)**
  Creates a widget at the given position and size.
- **unsigned int flags () const**
  Gets the widget flags mask.
- **void h (int v)**
  Internal use only.
- **void set_flag (unsigned int c)**
  Sets a flag in the flags mask.
- **void w (int v)**
  Internal use only.
- **void x (int v)**
  Internal use only.
- **void y (int v)**
  Internal use only.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

• static Fl_Group * current ()

  Returns the currently active group.

• static void current (Fl_Group *g)

  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)

  The default callback for all widgets that don’t set a callback.

• static unsigned int label_shortcut (const char *t)

  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int test_shortcut (const char *t, const bool require_alt=false)

  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,

  flags possible values enumeration.

11.122.1 Detailed Description

This container widget lets you maneuver around a set of widgets much larger than your window.
If the child widgets are larger than the size of this object then scrollbars will appear so that you can scroll over to
them:

![Figure 11.40 Fl_Scroll](image)

If all of the child widgets are packed together into a solid rectangle then you want to set box() to FL_NO_BOX or one
of the _FRAME types. This will result in the best output. However, if the child widgets are a sparse arrangement
you must set box() to a real _BOX type. This can result in some blinking during redrawing, but that can be solved
by using a Fl_Double_Window.
The Fl_Scroll widget calculates the bounding box of all its children by using their widget positions and sizes (x, y, w, h). Outside labels are not considered. If you need outside labels of any widgets or free space outside of this
bounding box you can add a tiny invisible Fl_Box at the relevant corner(s) of the Fl_Scroll widget, for instance:
By default you can scroll in both directions, and the scrollbars disappear if the data will fit in the area of the scroll. Use `Fl_Scroll::type()` to change this as follows:

- 0 - No scrollbars
- `Fl_Scroll::HORIZONTAL` - Only a horizontal scrollbar.
- `Fl_Scroll::VERTICAL` - Only a vertical scrollbar.
- `Fl_Scroll::BOTH` - The default is both scrollbars.
- `Fl_Scroll::HORIZONTAL_ALWAYS` - Horizontal scrollbar always on, vertical always off.
- `Fl_Scroll::VERTICAL_ALWAYS` - Vertical scrollbar always on, horizontal always off.
- `Fl_Scroll::BOTH_ALWAYS` - Both always on.

Use `scrollbar.align(int)` (see `void Fl_Widget::align(Fl_Align)`): to change what side the scrollbars are drawn on.

If the `FL_ALIGN_LEFT` bit is on, the vertical scrollbar is on the left. If the `FL_ALIGN_TOP` bit is on, the horizontal scrollbar is on the top. Note that only the alignment flags in scrollbar are considered. The flags in hscrollbar however are ignored.

This widget can also be used to pan around a single child widget "canvas". This child widget should be of your own class, with a `draw()` method that draws the contents. The scrolling is done by changing the `x()` and `y()` of the widget, so this child must use the `x()` and `y()` to position its drawing. To speed up drawing it should test `fl_not_clipped(int x, int y, int w, int h)` to find out if a particular area of the widget must be drawn.

Another very useful child is a single `Fl_Pack`, which is itself a group that packs its children together and changes size to surround them. Filling the `Fl_Pack` with `Fl_Tabs` groups (and then putting normal widgets inside those) gives you a very powerful scrolling list of individually-openable panels.

Fluid lets you create these, but you can only lay out objects that fit inside the `Fl_Scroll` without scrolling. Be sure to leave space for the scrollbars, as Fluid won't show these either. **You cannot use `Fl_Window` as a child of this since the clipping is not conveyed to it when drawn, and it will draw over the scrollbars and neighboring objects.**

### 11.122.2 Constructor & Destructor Documentation

#### 11.122.2.1 Fl_Scroll()

`Fl_Scroll::Fl_Scroll ( int X, int Y, int W, int H, const char * L = 0 )`

Creates a new `Fl_Scroll` widget using the given position, size, and label string. The default boxtype is `FL_NO_BOX`.

The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the `Fl_Scroll` and all of its children can be automatic (local) variables, but you must declare the `Fl_Scroll` first, so that it is destroyed last.

#### 11.122.2.2 ~Fl_Scroll()

`Fl_Scroll::~Fl_Scroll ( ) [virtual]`

The destructor also deletes all the children.

`Fl_Group::~Fl_Group()`
11.122 Fl_Scroll Class Reference

11.122.3 Member Function Documentation

11.122.3.1 bbox()

```cpp
void Fl_Scroll::bbox (  
    int & X,
    int & Y,
    int & W,
    int & H ) const [protected]
```

Returns the bounding box for the interior of the scrolling area, inside the scrollbars. This method does not change the scrollbars or their visibility. First the scrollbar positions and visibility are calculated as they should be, according to the positions and sizes of the children. Then the bounding box is calculated. You may need to call `redraw()` to make sure the widget gets updated.

See also

- `recalc_scrollbars()`

11.122.3.2 delete_child()

```cpp
int Fl_Scroll::delete_child (  
    int index ) [virtual]
```

Removes the widget at `index` from the group and deletes it. This method does nothing if `index` is out of bounds or if `Fl_Group::child(index)` is one of the scrollbars.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>index</th>
</tr>
</thead>
<tbody>
<tr>
<td>index of child to be removed</td>
<td></td>
</tr>
</tbody>
</table>

Returns

success (0) or error code

Return values

| 0 | success |
| 1 | index out of range |
| 2 | widget not allowed to be removed (see note) |

See also

- `Fl_Group::delete_child(int index)`

Since

FLTK 1.4.0

Reimplemented from `Fl_Group`.

11.122.3.3 draw()

```cpp
void Fl_Scroll::draw ( ) [protected], [virtual]
```

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead. Override this function to draw your own widgets. If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget *s = scrollbar; // scrollbar is an embedded Fl_Scrollbar  
   s->draw();  // calls Fl_Scrollbar::draw()
```

Reimplemented from `Fl_Group`.

Generated by Doxygen
11.122.3.4 fix_scrollbar_order()

```c
void Fl_Scroll::fix_scrollbar_order () [protected]
```
Ensure the scrollbars are the last children.

When `Fl_Scroll` is instantiated the first child of the `Fl_Group` is the vertical scrollbar `scrollbar` and the second child is the horizontal scrollbar `hscrollbar`.

These two widgets must always be the last two widgets and in this order to guarantee the correct drawing order and event delivery.

Since FLTK 1.4.0 the new method `on_insert()` modifies the insert position of other children if it would be after the scrollbars.

11.122.3.5 handle()

```c
int Fl_Scroll::handle ( int event ) [virtual]
```
Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.

This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

- **in event** the kind of event received

Return values

- 0 if the event was not used or understood
- 1 if the event was used and can be deleted

See also

- `Fl_Event`

Reimplemented from `Fl_Group`.

11.122.3.6 on_insert()

```c
int Fl_Scroll::on_insert ( Fl_Widget * candidate, int index ) [protected], [virtual]
```
Change insert position of a child before it is added.

Fix insert position if the new child is planned to be inserted after the scrollbars. We can assume that the scrollbars are always the last two children!

`Fl_Group` calls this when a new widget is added. We return the new index if the new widget would be added after the scrollbars.

Parameters

- **in candidate** the candidate will be added to the child array after this method returns.
- **in index** add the child at this position in the array.
Returns

- index to position the child as planned
- a new index to force the child to a different position
-1 to keep the group from adding the candidate

Version

1.4.0

See also

`Fl_Group::on_insert(Fl_Widget *candidate, int index)`

Reimplemented from `Fl_Group`.

### on_move()

```cpp
int Fl_Scroll::on_move (int old_index, int new_index) [protected], [virtual]
```

Change new position of a child before it is moved.
Fix new position if the new child is planned to be moved after the scrollbars. We can assume that the scrollbars are always the last two children!
`Fl_Group` calls this when a widget is moved within the list of children. We return a new index if the widget would be moved after the scrollbars.

**Parameters**

| old_index | the current index of the child that will be moved |
| new_index | the new index of the child |

Returns

new index, possibly corrected to avoid last two scrollbar entries

Reimplemented from `Fl_Group`.

### recalc_scrollbars()

```cpp
void Fl_Scroll::recalc_scrollbars (ScrollInfo & si) const [protected]
```

Calculate visibility/size/position of scrollbars, find children's bounding box.
The `si` parameter will be filled with data from the calculations. Derived classes can make use of this call to figure out the scrolling area eg. during `resize()` handling.
This method does not change the scrollbars or their visibility. It calculates the scrollbar positions and visibility as they should be, according to the positions and sizes of the children.
You may need to call `redraw()` to make sure the widget gets updated.

**Parameters**

| in, out si | – ScrollInfo structure, filled with data |
void Fl_Scroll::resize (int X, int Y, int W, int H) [virtual]

Resizes the Fl_Scroll widget and moves its children if necessary.
The Fl_Scroll widget first resizes itself, and then it moves all its children if (and only if) the Fl_Scroll widget has been moved. The children are moved by the same amount as the Fl_Scroll widget has been moved, hence all children keep their relative positions.

Note

Fl_Scroll::resize() does not call Fl_Group::resize(), and child widgets are not resized.

Since children of an Fl_Scroll are not resized, the resizable() widget is ignored (if it is set).
The scrollbars are moved to their proper positions, as given by Fl_Scroll::scrollbar.align(), and switched on or off as necessary.

Note

Due to current (FLTK 1.3.x) implementation constraints some of this may effectively be postponed until the Fl_Scroll is drawn the next time. This may change in a future release.

See also

Fl_Group::resizable()
Fl_Widget::resize(int,int,int,int)

Reimplemented from Fl_Group.

void Fl_Scroll::scroll_to (int X, int Y)

Moves the contents of the scroll group to a new position.
This is like moving the scrollbars of the Fl_Scroll around. For instance:

```
Fl_Scroll scroll (10,10,200,200);
Fl_Box b1 (10,10,50,50,"b1"); // relative (x,y) = (0,0)
Fl_Box b2 (60,60,50,50,"b2"); // relative (x,y) = (50,50)
Fl_Box b3 (60,110,50,50,"b3"); // relative (x,y) = (50,100)
// populate scroll with more children ...
scroll.end();
scroll.scroll_to(50,100);
```

will move the logical origin of the internal scroll area to (-50,-100) relative to the origin of the Fl_Scroll (10,10), i.e. Fl_Box b3 will be visible in the top left corner of the scroll area.

int Fl_Scroll::scrollbar_size ( ) const [inline]

Gets the current size of the scrollbars' troughs, in pixels.
If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also

Fl::scrollbar_size(int)
11.122.3.12 `scrollbar_size()` [2/2]

```cpp
void Fl_Scroll::scrollbar_size (  
    int newSize ) [inline]
```

Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels. Normally you should not need this method, and should use `Fl::scrollbar_size(int)` instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want. Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare. Setting `newSize` to the special value of 0 causes the widget to track the global `Fl::scrollbar_size()`, which is the default.

Parameters

| in | `newSize` | Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global `Fl::scrollbar_size()` |

See also

- `Fl::scrollbar_size()`

11.122.3.13 `xposition()`

```cpp
int Fl_Scroll::xposition ( ) const [inline]
```

Gets the current horizontal scrolling position.

11.122.3.14 `yposition()`

```cpp
int Fl_Scroll::yposition ( ) const [inline]
```

Gets the current vertical scrolling position.

The documentation for this class was generated from the following files:

- `Fl_Scroll.H`
- `Fl_Scroll.cxx`

11.123 `Fl_Scrollbar Class Reference`

The `Fl_Scrollbar` widget displays a slider with arrow buttons at the ends of the scrollbar.

```cpp
#include <Fl_Scrollbar.H>
```

Public Member Functions

- **Fl_Scrollbar (int X, int Y, int W, int H, const char *L=0)**
  
  Creates a new Fl_Scrollbar widget with given position, size, and label.

- **int handle (int) FL_OVERRIDE**
  
  Handles the specified event.

- **int linesize () const**
  
  Get the size of step, in lines, that the arrow keys move.

- **void linesize (int i)**
  
  This number controls how big the steps are that the arrow keys do.

- **int value () const**
  
  Gets the integer value (position) of the slider in the scrollbar.

- **int value (int p)**
  
  Sets the value (position) of the slider in the scrollbar.

- **int value (int pos, int windowSize, int first_line, int total_lines)**
  
  Sets the position, size and range of the slider in the scrollbar.

- **~Fl_Scrollbar ()**
  
  Destroys the Scrollbar.

Public Member Functions inherited from Fl_Slider

- **void bounds (double a, double b)**
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **Fl_Slider (int X, int Y, int W, int H, const char *L=0)**
  
  Creates a new Fl_Slider widget using the given position, size, and label string.

- **Fl_Slider (uchar t, int X, int Y, int W, int H, const char *L)**
  
  Creates a new Fl_Slider widget using the given type, position, size, and label string.

- **int handle (int) FL_OVERRIDE**
  
  Handles the specified event.

- **int scrollvalue (int pos, int size, int first, int total)**
  
  Sets the size and position of the sliding knob in the box.

- **Fl_Boxtype slider () const**
  
  Gets the slider box type.

- **void slider (Fl_Boxtype c)**
  
  Sets the slider box type.

- **float slider_size () const**
  
  Get the dimensions of the moving piece of slider.

- **void slider_size (double v)**
  
  Set the dimensions of the moving piece of slider.

Public Member Functions inherited from Fl_Valuator

- **void bounds (double a, double b)**
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp (double)**
  
  Clamps the passed value to the valuator range.

- **virtual int format (char *)**
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment (double, int)**
  
  Adds n times the step value to the passed value.

- **double maximum () const**
  
  Gets the maximum value for the valuator.
• void maximum (double a)
  *Sets the maximum value for the valuator.*

• double minimum () const
  *Gets the minimum value for the valuator.*

• void minimum (double a)
  *Sets the minimum value for the valuator.*

• void precision (int digits)
  *Sets the step value to $1.0 / 10^\text{digits}$. *

• void range (double a, double b)
  *Sets the minimum and maximum values for the valuator.*

• double round (double)
  *Round the passed value to the nearest step increment.*

• double step () const
  *Gets or sets the step value.*

• void step (double a, int b)
  *See double Fl_Valuator::step() const*

• void step (double s)
  *See double Fl_Valuator::step() const.*

• void step (int a)
  *See double Fl_Valuator::step() const*

• double value () const
  *Gets the floating point(double) value.*

• int value (double)
  *Sets the current value.*

**Public Member Functions inherited from Fl_Widget**

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  *Activates the widget.*

• unsigned int active () const
  *Returns whether the widget is active.*

• int active_r () const
  *Returns whether the widget and all of its parents are active.*

• Fl_Align align () const
  *Gets the label alignment.*

• void align (Fl_Align alignment)
  *Sets the label alignment.*

• long argument () const
  *Gets the current user data (long) argument that is passed to the callback function.*

• void argument (long v)
  *Sets the current user data (long) argument that is passed to the callback function.*

• virtual class Fl_Gl_Window ∗ as_gl_window ()
  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

• virtual class Fl_Gl_Window const ∗ as_gl_window () const
  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

• virtual Fl_Group ∗ as_group ()
  *Returns an Fl_Group pointer if this widget is an Fl_Group.*

• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const & as_window () const
- void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- int contains (const Fl_Widget *w) const
Checks if \( w \) is a child of this widget.

- **void** `copy_label` (const char *new_label)
  
  Sets the current label.

- **void** `copy_tooltip` (const char *text)
  
  Sets the current tooltip text.

- **uchar** `damage` () const
  
  Returns non-zero if `draw()` needs to be called.

- **void** `damage` (uchar c)
  
  Sets the damage bits for the widget.

- **void** `damage` (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.

- **int** `damage_resize` (int, int, int, int)
  
  Internal use only.

- **void** `deactivate` ()
  
  Deactivates the widget.

- **FL_Image** * `deimage` ()
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **const** `FL_Image` * `deimage` () const
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **void** `deimage` (FL_image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void** `deimage` (FL_image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- **int** `deimage_bound` () const
  
  Returns whether the inactive image is managed by the widget.

- **void** `do_callback` (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.

- **void** `do_callback` (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

- **void** `do_callback` (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

- **void** `draw_label` (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int** `h` () const
  
  Gets the widget height.

- **virtual** **void** `hide` ()
  
  Makes a widget invisible.

- **FL_Image** * `image` ()
  
  Gets the image that is used as part of the widget label when in the active state.

- **const** `FL_Image` * `image` () const
  
  Gets the image that is used as part of the widget label when in the active state.

- **void** `image` (FL_image &img)
  
  Sets the image to use as part of the widget label when in the active state.

- **void** `image` (FL_image *img)
  
  Sets the image to use as part of the widget label when in the active state.

- **int** `image_bound` () const
  
  Returns whether the image is managed by the widget.

- **int** `inside` (const Fl_Widget *wgt) const
  
  Checks if this widget is a child of \( wgt \).

- **int** `is_label_copied` () const
  
  Returns whether the current label was assigned with `copy_label()`.
• **const char ∗ label () const**
  
  Gets the current label text.

• **void label (const char ∗text)**
  
  Sets the current label pointer.

• **void label (FL_Labeltype a, const char ∗b)**
  
  Shortcut to set the label text and type in one call.

• **FL_Color labelcolor () const**
  
  Gets the label color.

• **void labelcolor (FL_Color c)**
  
  Sets the label color.

• **FL_Font labelfont () const**
  
  Gets the font to use.

• **void labelfont (FL_Font f)**
  
  Sets the font to use.

• **FL_Fontsize labelsize () const**
  
  Gets the font size in pixels.

• **void labelsize (FL_Fontsize pix)**
  
  Sets the font size in pixels.

• **FL_Labeltype labeltype () const**
  
  Gets the label type.

• **void labeltype (FL_Labeltype a)**
  
  Sets the label type.

• **void measure_label (int &ww, int &hh) const**
  
  Sets width ww and height hh accordingly with the label size.

• **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

• **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

• **unsigned int output () const**
  
  Returns if a widget is used for output only.

• **FL_Group ∗ parent () const**
  
  Returns a pointer to the parent widget.

• **void parent (FL_Group ∗p)**
  
  Internal use only - "for hacks only".

• **void position (int X, int Y)**
  
  Repositions the window or widget.

• **void redraw ()**
  
  Schedules the drawing of the widget.

• **void redraw_label ()**
  
  Schedules the drawing of the label.

• **virtual void resize (int x, int y, int w, int h)**
  
  Changes the size or position of the widget.

• **FL_Color selection_color () const**
  
  Gets the selection color.

• **void selection_color (FL_Color a)**
  
  Sets the selection color.

• **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

• **void set_changed ()**
  
  Marks the value of the widget as changed.

• **void set_output ()**
Sets a widget to output only.

- **void** `set_visible()`
  
  Makes the widget visible.

- **void** `set_visible_focus()`
  
  Enables keyboard focus navigation with this widget.

- **int** `shortcut_label()` const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void** `shortcut_label(int value)`
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void** `show()`
  
  Makes a widget visible.

- **void** `size(int W, int H)`
  
  Changes the size of the widget.

- **int** `take_focus()`
  
  Gives the widget the keyboard focus.

- **unsigned int** `takesevents()` const
  
  Returns if the widget is able to take events.

- **int** `test_shortcut()`
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char** ∗ `tooltip()` const
  
  Gets the current tooltip text.

- **void** `tooltip(const char ∗text)`
  
  Sets the current tooltip text.

- **FL_Window** ∗ `top_window()` const
  
  Returns a pointer to the top-level window for the widget.

- **FL_Window** ∗ `top_window_offset(int &xoff, int &yoff)` const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar** `type()` const
  
  Gets the widget type.

- **void** `type(uchar t)`
  
  Sets the widget type.

- **int** `use_accents_menu()`
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void** ∗ `user_data()` const
  
  Gets the user data for this widget.

- **void** `user_data(Fl_Callback_User_Data ∗v, bool auto_free)`
  
  Sets the user data for this widget.

- **void** `user_data(void ∗v)`
  
  Sets the user data for this widget.

- **unsigned int** `visible()` const
  
  Returns whether a widget is visible.

- **unsigned int** `visible_focus()` const
  
  Checks whether this widget has a visible focus.

- **void** `visible_focus(int v)`
  
  Modifies keyboard focus navigation.

- **int** `visible_r()` const
  
  Returns whether a widget and all its parents are visible.

- **int** `w()` const
  
  Gets the widget width.

- **FL_When** `when()` const
  
  Returns the conditions under which the callback is called.
- **void when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

- **FL_Window * window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  
  Gets the widget position in its window.

- **int y () const**
  
  Gets the widget position in its window.

- **virtual ~FL_Widget ()**
  
  Destroys the widget.

### Protected Member Functions

- **void draw () FL_OVERRIDE**
  
  Draws the widget.

### Protected Member Functions inherited from Fl_Slider

- **void draw () FL_OVERRIDE**
  
  Draws the widget.

- **void draw (int, int, int, int)**

- **int handle (int, int, int, int)**

### Protected Member Functions inherited from Fl_Valuator

- **Fl_Valuator (int X, int Y, int W, int H, const char ∗L)**
  
  Creates a new Fl_Valuator widget using the given position, size, and label string.

- **void handle_drag (double newvalue)**
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- **void handle_push ()**
  
  Stores the current value in the previous value.

- **void handle_release ()**
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.

- **int horizontal () const**
  
  Tells if the valuator is an FL_HORIZONTAL one.

- **double previous_value () const**
  
  Gets the previous floating point value before an event changed it.

- **void set_value (double v)**
  
  Sets the current floating point value.

- **double softclamp (double)**
  
  Clamps the value, but accepts v if the previous value is not already out of range.

- **virtual void value_damage ()**
  
  Asks for partial redraw.

### Protected Member Functions inherited from Fl_Widget

- **void clear_flag (unsigned int c)**
  
  Clears a flag in the flags mask.

- **void draw_backdrop () const**
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box () const**
  
  Draws the widget box according its box style.

- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
Draws a box of type t, of color c at the widget’s position and size.

- void `draw_box` (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void `draw_focus` () const
  
  Draws a focus rectangle around the widget.

- void `draw_focus` (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

- void `draw_focus` (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

- void `draw_label` () const
  
  Draws the widget’s label at the defined label position.

- void `draw_label` (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- `Fl_Widget` (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

- unsigned int `flags` () const
  
  Gets the widget flags mask.

- void `h` (int v)
  
  Internal use only.

- void `set_flag` (unsigned int c)
  
  Sets a flag in the flags mask.

- void `w` (int v)
  
  Internal use only.

- void `x` (int v)
  
  Internal use only.

- void `y` (int v)
  
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don’t set a callback.

- static unsigned int `label_shortcut` (const char ∗t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int `test_shortcut` (const char ∗, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from `Fl_Widget`

- enum {
  
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31}

  flags possible values enumeration.

Generated by Doxygen
11.123.1 Detailed Description

The Fl_Scrollbar widget displays a slider with arrow buttons at the ends of the scrollbar. Clicking on the arrows move up/left and down/right by linesize(). Scrollbars also accept FL_SHORTCUT events: the arrows move by linesize(), and vertical scrollbars take Page Up/Down (they move by the page size minus linesize()) and Home/End (they jump to the top or bottom). Scrollbars have step(1) preset (they always return integers). If desired you can set the step() to non-integer values. You will then have to use casts to get at the floating-point versions of value() from Fl_Slider.

![Fl_Scrollbar](image)

Figure 11.41 Fl_Scrollbar

11.123.2 Constructor & Destructor Documentation

11.123.2.1 Fl_Scrollbar()

```cpp
Fl_Scrollbar::Fl_Scrollbar (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ L = 0 )
```

Creates a new Fl_Scrollbar widget with given position, size, and label. You need to do type(FL_HORIZONTAL) if you want a horizontal scrollbar.

11.123.3 Member Function Documentation

11.123.3.1 draw()

```cpp
void Fl_Scrollbar::draw ( ) [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```cpp
Fl_Widget ∗s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.

11.123.3.2 handle()

```cpp
int Fl_Scrollbar::handle (  
    int event ) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in  | event | the kind of event received |

Return values

| 0   | if the event was not used or understood |
| 1   | if the event was used and can be deleted |

See also

*Fl_Event*

Reimplemented from *Fl_Widget*.

11.123.3.3 *linesize()*

```cpp
void Fl_Scrollbar::linesize (int i) [inline]
```

This number controls how big the steps are that the arrow keys do. In addition page up/down move by the size last sent to value() minus one linesize(). The default is 16.

11.123.3.4 *value()* [1/3]

```cpp
int Fl_Scrollbar::value () const [inline]
```

Gets the integer value (position) of the slider in the scrollbar. You can get the floating point value with *Fl_Slider::value()*.

See also

*Fl_Scrollbar::value(int p)*  
*Fl_Scrollbar::value(int pos, int size, int first, int total)*

11.123.3.5 *value()* [2/3]

```cpp
int Fl_Scrollbar::value (int p) [inline]
```

Sets the value (position) of the slider in the scrollbar.

See also

*Fl_Scrollbar::value()*  
*Fl_Scrollbar::value(int pos, int size, int first, int total)*

11.123.3.6 *value()* [3/3]

```cpp
int Fl_Scrollbar::value (int pos, int windowSize, int first_line, int total_lines ) [inline]
```

Sets the position, size and range of the slider in the scrollbar.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>pos</th>
<th>position, first line displayed</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>windowSize</td>
<td>number of lines displayed</td>
</tr>
<tr>
<td>in</td>
<td>first_line</td>
<td>number of first line</td>
</tr>
<tr>
<td>in</td>
<td>total_lines</td>
<td>total number of lines</td>
</tr>
</tbody>
</table>

You should call this every time your window changes size, your data changes size, or your scroll position changes (even if in response to a callback from this scrollbar). All necessary calls to `redraw()` are done. Calls `Fl_Slider::scrollvalue(int pos, int size, int first, int total)`. The documentation for this class was generated from the following files:

- `Fl_Scrollbar.H`
- `Fl_Scrollbar.cxx`

### 11.124 Fl_Scroll::Fl_Scrollbar_Data Struct Reference

A local struct to manage a scrollbar's xywh region and tab values.

`#include <Fl_Scroll.H>`

**Public Attributes**

- int `first`
  
  scrollbar tab's "number of first line"

- int `h`

- int `pos`
  
  scrollbar tab's "position of first line displayed"

- int `size`
  
  scrollbar tab's "size of window in lines"

- int `total`
  
  scrollbar tab's "total number of lines"

- int `w`

- int `x`

- int `y`

### 11.124.1 Detailed Description

A local struct to manage a scrollbar's xywh region and tab values.

The documentation for this struct was generated from the following file:

- `Fl_Scroll.H`

### 11.125 Fl_Secret_Input Class Reference

The `Fl_Secret_Input` class is a subclass of `Fl_Input` that displays its input as a string of placeholders.

`#include <Fl_Secret_Input.H>`

Inheritance diagram for `Fl_Secret_Input`:
Public Member Functions

- **Fl_Secret_Input** (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new Fl_Secret_Input widget using the given position, size, and label string.

- int handle (int) FL_OVERRIDE
  
  Handles the specified event.

Public Member Functions inherited from Fl_Input

- **Fl_Input** (int, int, int, int, const char *l=0)
  
  Creates a new Fl_Input widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Input_

- int append (const char *t, int l=0, char keep_selection=0)
  
  Append text at the end.

- bool can_redo () const
  
  Check if there is a redo action available.

- bool can_undo () const
  
  Check if the last operation can be undone.

- int copy (int clipboard)
  
  Put the current selection into the clipboard.

- int copy_cuts ()
  
  Copies the yank buffer to the clipboard.

- Fl_Color cursor_color () const
  
  Gets the color of the cursor.

- void cursor_color (Fl_Color n)
  
  Sets the color of the cursor.

- int cut ()
  
  Deletes the current selection.

- int cut (int a, int b)
  
  Deletes all characters between index a and b.

- int cut (int n)
  
  Deletes the next n bytes rounded to characters before or after the cursor.

- double dvalue () const
  
  Returns the widget text interpreted as a floating point number.

- **Fl_Input_** (int, int, int, int, const char *l=0)
  
  Creates a new Fl_Input_ widget.

- unsigned int index (int i) const
  
  Returns the character at index i.

- int input_type () const
  
  Gets the input field type.
• void input_type (int t)
  Sets the input field type.

• int insert (const char *t, int l=0)
  Inserts text at the cursor position.

• int insert_position () const
  Gets the position of the text cursor.

• int insert_position (int p)
  Sets the cursor position and mark.

• int insert_position (int p, int m)
  Sets the index for the cursor and mark.

• int ivalue () const
  Returns the widget text interpreted as a signed integer.

• int mark () const
  Gets the current selection mark.

• int mark (int m)
  Sets the current selection mark.

• int maximum_size () const
  Gets the maximum length of the input field in characters.

• void maximum_size (int m)
  Sets the maximum length of the input field in characters.

• int position () const
• int position (int p)
• int position (int p, int m)
  Gets the read-only state of the input field.

• int readonly () const
  Gets the read-only state of the input field.

• void readonly (int b)
  Sets the read-only state of the input field.

• int redo ()
  Redo previous undo operation.

• int replace (int b, int e, const char *text, int ilen=0)
  Deletes text from b to e and inserts the new string text.

• void resize (int, int, int, int) FL_OVERRIDE
  Changes the size of the widget.

• int shortcut () const
  Return the shortcut key associated with this widget.

• void shortcut (int s)
  Sets the shortcut key associated with this widget.

• int size () const
  Returns the number of bytes in value().

• void size (int W, int H)
  Sets the width and height of this widget.

• int static_value (const char *)
  Changes the widget text.

• int static_value (const char *, int)
  Changes the widget text.

• int tab_nav () const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

• void tab_nav (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

• Fl_Color textcolor () const
  Gets the color of the text in the input field.
• void textcolor (Fl_Color n)
  
  Sets the color of the text in the input field.

• Fl_Font textfont () const
  
  Gets the font of the text in the input field.

• void textfont (Fl_Font s)
  
  Sets the font of the text in the input field.

• Fl_Fontsize textsize () const
  
  Gets the size of the text in the input field.

• void textsize (Fl_Fontsize s)
  
  Sets the size of the text in the input field.

• int undo ()
  
  Undoes previous changes to the text buffer.

• const char ∗ value () const
  
  Returns the text displayed in the widget.

• int value (const char ∗)
  
  Changes the widget text.

• int value (const char ∗, int)
  
  Changes the widget text.

• int value (double value)
  
  Changes the widget text to a floating point number ("%g").

• int value (int value)
  
  Changes the widget text to a signed integer number.

• int wrap () const
  
  Gets the word wrapping state of the input field.

• void wrap (int b)
  
  Sets the word wrapping state of the input field.

• ~Fl_Input_ ()
  
  Destroys the widget.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()

• void _set_fullscreen ()

• void activate ()
  
  Activates the widget.

• unsigned int active () const
  
  Returns whether the widget is active.

• int active_r () const
  
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  
  Gets the label alignment.

• void align (Fl_Align alignment)
  
  Sets the label alignment.

• long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const ∗ as_gl_window () const

• virtual Fl_Group ∗ as_group ()

Generated by Doxygen
Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const & as_group () const

Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const & as_window ()

Sets the image to use as part of the widget label when in the inactive state.

- virtual Fl_Image * bind_deimage (Fl_Image *img)

- void bind_deimage (int f)

Sets the image to use as part of the widget label when in the active state.

- void bind_image (Fl_Image *img)

- void bind_image (int f)

Gets the box type of the widget.

- Fl_Boxtype box () const

Sets the box type for the widget.

- void box (Fl_Boxtype new_box)

Gets the current callback function for the widget.

- Fl_Callback_p callback () const

Sets the current callback function for the widget.

- void callback (Fl_Callback *cb)

Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)

Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 *cb)

Calls the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)

Checks if the widget value changed since the last callback.

- void clear_active ()

Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()

Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)

Clears or sets the damage flags.

- void clear_output ()

Sets a widget to accept input.

- void clear_visible ()

Hides the widget.

- void clear_visible_focus ()

Disables keyboard focus navigation with this widget.

- Fl_Color color () const

Gets the background color of the widget.

- void color (Fl_Color bg)

Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.

- Fl_Color color2 () const

For back compatibility only.
• void color2 (unsigned a)
  
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  
  Sets the current label.
• void copy_tooltip (const char *text)
  
  Sets the current tooltip text.
• uchar damage () const
  
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  
  Internal use only.
• void deactivate ()
  
  Deactivates the widget.
• Fl_Image *deimage ()
  
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image *deimage () const
  
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  
  Gets the widget height.
• virtual void hide ()
  
  Makes a widget invisible.
• Fl_Image *image ()
  
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
Checks if this widget is a child of \texttt{wgt}.

- **int is_label_copied () const**
  
  Returns whether the current label was assigned with \texttt{copy_label()}.

- **const char * label () const**
  
  Gets the current label text.

- **void label (const char *text)**
  
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  
  Sets the label color.

- **Fl_Font labelfont () const**
  
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width \texttt{ww} and height \texttt{hh} accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  \textit{Internal use only - "for hacks only".}

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.
- void set_output ()
  
  Sets a widget to output only.
- void set_visible ()
  
  Makes the widget visible.
- void set_visible_focus ()
  
  Enables keyboard focus navigation with this widget.
- int shortcut_label () const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.
- void shortcut_label (int value)
  
  Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void show ()
  
  Makes a widget visible.
- void size (int W, int H)
  
  Changes the size of the widget.
- int take_focus ()
  
  Gives the widget the keyboard focus.
- unsigned int takesevents () const
  
  Returns if the widget is able to take events.
- int test_shortcut ()
  
  Returns true if the widget's label contains the entered '&x' shortcut.
- const char * tooltip () const
  
  Gets the current tooltip text.
- void tooltip (const char *text)
  
  Sets the current tooltip text.
- Fl_Window * top_window () const
  
  Returns a pointer to the top-level window for the widget.
- Fl_Window * top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.
- uchar type () const
  
  Gets the widget type.
- void type (uchar t)
  
  Sets the widget type.
- int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * user_data () const
  
  Gets the user data for this widget.
- void user_data (Fl_Callback_User_Data *v, bool auto_free)
  
  Sets the user data for this widget.
- void user_data (void *v)
  
  Sets the user data for this widget.
- unsigned int visible () const
  
  Returns whether a widget is visible.
- unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.
- void visible_focus (int v)
  
  Modifies keyboard focus navigation.
- int visible_r () const
  
  Returns whether a widget and all its parents are visible.
- int w () const
  
  Gets the widget width.
Returns the conditions under which the callback is called.

- **void when (uchar i)**
  Sets the flags used to decide when a callback is called.
- **Fl_Window * window () const**
  Returns a pointer to the nearest parent window up the widget hierarchy.
- **int x () const**
  Gets the widget position in its window.
- **int y () const**
  Gets the widget position in its window.
- virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

**Static Public Member Functions inherited from Fl_Widget**

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

**Static Public Attributes inherited from Fl_Input**

- static const char *copy_menu_text = "Copy"
  [this text may be customized at run-time]
- static const char *cut_menu_text = "Cut"
  [this text may be customized at run-time]
- static const char *paste_menu_text = "Paste"
  [this text may be customized at run-time]

**Protected Types inherited from Fl_Widget**

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

**Protected Member Functions inherited from Fl_Input**

- void draw () FL_OVERRIDE
  Draws the widget.
- int handle_key ()
  Handles a keystroke.
• int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

• int apply_undo ()
  Apply the current undo/redo operation.
• void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
• void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
• void handle_mouse (int, int, int, int, int keepmark=0)
  Handles mouse clicks and mouse moves.
• int handletext (int e, int, int, int, int)
  Handles all kinds of text field related events.
• int line_end (int i) const
  Finds the end of a line.
• int line_start (int i) const
  Finds the start of a line.
• int linesPerPage ()
• void maybe_do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
• int up_down_position (int, int, int keepmark=0)
  Moves the cursor to the column given by up_down_pos.
• int word_end (int i) const
  Finds the end of a word.
• int word_start (int i) const
  Finds the start of a word.
• int xscroll () const
• int yscroll () const
• void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the given label position.
• void draw_label (int, int, int, int) const
Sets the label in an arbitrary bounding box.

- **Fl_Widget** (int x, int y, int w, int h, const char *label=0L)
  
  Creates a widget at the given position and size.

- unsigned int **flags** () const
  
  Gets the widget flags mask.

- void **h** (int v)
  
  Internal use only.

- void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

- void **w** (int v)
  
  Internal use only.

- void **x** (int v)
  
  Internal use only.

- void **y** (int v)
  
  Internal use only.

### 11.125.1 Detailed Description

The **Fl_Secret_Input** class is a subclass of **Fl_Input** that displays its input as a string of placeholders. Depending on the platform this placeholder is either the asterisk (‘*’) or the Unicode bullet character (U+2022). This subclass is usually used to receive passwords and other “secret” information.

### 11.125.2 Constructor & Destructor Documentation

#### 11.125.2.1 Fl_Secret_Input()

**Fl_Secret_Input::Fl_Secret_Input** (  
   int X,  
   int Y,  
   int W,  
   int H,  
   const char * l = 0 )

Creates a new Fl_Secret_Input widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX. Inherited destructor destroys the widget and any value associated with it.

### 11.125.3 Member Function Documentation

#### 11.125.3.1 handle()

**int Fl_Secret_Input::handle** (  
   int event ) [virtual]

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

**Parameters**

- **int event** the kind of event received
Return values

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the event was not used or understood</td>
</tr>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

Fl_Event

Reimplemented from Fl_Input.

The documentation for this class was generated from the following files:

- Fl_Secret_Input.H
- Fl_Input.cxx

11.126 Fl_Select_Browser Class Reference

The class is a subclass of Fl_Browser which lets the user select a single item, or no items by clicking on the empty space.

#include <Fl_Select_Browser.H>

```

Public Member Functions

- Fl_Select_Browser (int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Select_Browser widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Browser

- void add (const char *newtext, void *d=0)
  
  Adds a new line to the end of the browser.
- void bottomline (int line)
  
  Scrolls the browser so the bottom item in the browser is showing the specified line.
- void clear ()
  
  Removes all the lines in the browser.
- char column_char () const
  
  Gets the current column separator character.
- void column_char (char c)
  
  Sets the column separator to c.
- const int * column_widths () const
  
  Gets the current column width array.
- void column_widths (const int *arr)
Sets the current array to \texttt{arr}.

- \texttt{void \* data (int line) const}
  
  Returns the user data() for specified \texttt{line}.

- \texttt{void data (int line, void \*d)}
  
  Sets the user data for specified \texttt{line} to \texttt{d}.

- \texttt{void display (int line, int val=1)}
  
  For back compatibility.

- \texttt{int displayed (int line) const}
  
  Returns non-zero if \texttt{line} has been scrolled to a position where it is being displayed.

- \texttt{Fl_Browser (int X, int Y, int W, int H, const char \*L=0)}
  
  The constructor makes an empty browser.

- \texttt{char format_char () const}
  
  Gets the current format code prefix character, which by default is \texttt{@}\texttt{.}

- \texttt{void format_char (char c)}
  
  Sets the current format code prefix character to \texttt{c}.

- \texttt{void hide () FL_OVERRIDE}
  
  Hides the entire \texttt{Fl_Browser} widget – opposite of \texttt{show()}.

- \texttt{void hide (int line)}
  
  Makes \texttt{line} invisible, preventing selection by the user.

- \texttt{Fl_Image \* icon (int line) const}
  
  Returns the icon currently defined for \texttt{line}.

- \texttt{void icon (int line, Fl_Image \*icon)}
  
  Set the image icon for \texttt{line} to the value \texttt{icon}.

- \texttt{void insert (int line, const char \*newtext, void \*d=0)}
  
  Insert a new entry whose label is \texttt{newtext} above given \texttt{line}, optional data \texttt{d}.

- \texttt{void lineposition (int line, Fl_Line_Position pos)}
  
  Updates the browser so that \texttt{line} is shown at position \texttt{pos}.

- \texttt{int load (const char \*filename)}
  
  Clears the browser and reads the file, adding each line from the file to the browser.

- \texttt{void make_visible (int line)}
  
  Make the item at the specified \texttt{line} visible().

- \texttt{void middleline (int line)}
  
  Scrolls the browser so the middle item in the browser is showing the specified \texttt{line}.

- \texttt{void move (int to, int from)}
  
  \texttt{Line from} is removed and reinserted at \texttt{to}.

- \texttt{void remove (int line)}
  
  Remove entry for given \texttt{line} number, making the browser one line shorter.

- \texttt{void remove_icon (int line)}
  
  Removes the icon for \texttt{line}.

- \texttt{void replace (int a, const char \*b)}
  
  For back compatibility only.

- \texttt{int select (int line, int val=1)}
  
  Sets the selection state of the item at \texttt{line} to the value \texttt{val}.

- \texttt{int selected (int line) const}
  
  Returns 1 if specified \texttt{line} is selected, 0 if not.

- \texttt{void show () FL_OVERRIDE}
  
  Shows the entire \texttt{Fl_Browser} widget – opposite of \texttt{hide()}.

- \texttt{void show (int line)}
  
  Makes \texttt{line} visible, and available for selection by user.

- \texttt{int size () const}
  
  Returns how many lines are in the browser.
• void size (int W, int H)
• void swap (int a, int b)

Swaps two browser lines a and b.
• const char ∗ text (int line) const

Returns the label text for the specified line.
• void text (int line, const char ∗newtext)

Sets the text for the specified line to newtext.

Fl_Fontsize fontsize () const

Gets the default text size (in pixels) for the lines in the browser.
• void fontsize (Fl_Fontsize newSize)

Sets the default text size (in pixels) for the lines in the browser to newSize.
• int topline () const

Returns the line that is currently visible at the top of the browser.
• void topline (int line)

Scrolls the browser so the top item in the browser is showing the specified line.
• int value () const

Returns the line number of the currently selected line, or 0 if none selected.
• void value (int line)

Sets the browser’s value(), which selects the specified line.
• int visible (int line) const

Returns non-zero if the specified line is visible, 0 if hidden.

• ~Fl_Browser ()

The destructor deletes all list items and destroys the browser.

Public Member Functions inherited from Fl_Browser_

• int deselect (int docallbacks=0)

Deselects all items in the list and returns 1 if the state changed or 0 if it did not.
• void display (void ∗item)

Displays the item, scrolling the list as necessary.
• int handle (int event) FL_OVERRIDE

Handles the event within the normal widget bounding box.
• uchar has_scrollbar () const

Returns the current scrollbar mode, see Fl_Browser_::has_scrollbar(uchar)
• void has_scrollbar (uchar mode)

Sets whether the widget should have scrollbars or not (default Fl_Browser_::BOTH).
• int hposition () const

Gets the horizontal scroll position of the list as a pixel position pos.
• void hposition (int)

Sets the horizontal scroll position of the list to pixel position pos.
• int linespacing () const

Return the height of additional spacing between browser lines.
• void linespacing (int pixels)

Add some space between browser lines.
• int position () const

• void position (int pos)
• void position (int x, int y)
• void resize (int X, int Y, int W, int H) FL_OVERRIDE

Repositions and/or resizes the browser.
• void scrollbar_left ()

Moves the vertical scrollbar to the lefthand side of the list.
• void scrollbar_right ()
  Moves the vertical scrollbar to the righthand side of the list.
• int scrollbar_size () const
  Gets the current size of the scrollbars' troughs, in pixels.
• void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.
• int scrollbar_width () const
  Returns the global value Fl::scrollbar_size().
• void scrollbar_width (int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.
• int select (void ∗ item, int val=1, int docallbacks=0)
  Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.
• int select_only (void ∗ item, int docallbacks=0)
  Selects item and returns 1 if the state changed or 0 if it did not.
• void sort (int flags=0)
  Sort the items in the browser based on flags.
• Fl_Color textcolor () const
  Gets the default text color for the lines in the browser.
• void textcolor (Fl_Color col)
  Sets the default text color for the lines in the browser to color col.
• Fl_Font textfont () const
  Gets the default text font for the lines in the browser.
• void textfont (Fl_Font font)
  Sets the default text font for the lines in the browser to font.
• Fl_Fontsize textsize () const
  Gets the default text size (in pixels) for the lines in the browser.
• void textsize (Fl_Fontsize newSize)
  Sets the default text size (in pixels) for the lines in the browser to size.
• int vposition () const
  Gets the vertical scroll position of the list as a pixel position pos.
• void vposition (int pos)
  Sets the vertical scroll position of the list to pixel position pos.

Public Member Functions inherited from Fl_Group

• Fl_Widget ∗& _ddfdesign_kludge ()
  This is for forms compatibility only.
• void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
• void add (Fl_Widget &o)
  See void Fl_Group::add(Fl_Widget &w)
• void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
• FL_Widget ∗const + array () const
  Returns a pointer to the array of children.
• FL_Group const ∗ as_group () const FL_OVERRIDE
• FL_Group ∗ as_group () FL_OVERRIDE
  Returns an FL_Group pointer if this widget is an FL_Group.
• void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
• FL_Widget ∗ child (int n) const
Returns array()[n].

- **int children() const**
  - Returns how many child widgets the group has.

- **void clear()**
  - Deletes all child widgets from memory recursively.

- **unsigned int clip_children()**
  - Returns the current clipping mode.

- **void clip_children(int c)**
  - Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child(int n)**
  - Removes the widget at index from the group and deletes it.

- **void end()**
  - Exactly the same as current(this->parent()).

- **int find(const Fl_Widget &o) const**
  - See int Fl_Group::find(const Fl_Widget *w) const.

- **int find(const Fl_Widget *) const**
  - Searches the child array for the widget and returns the index.

- **Fl_Group(int, int, int, int, const char * = 0)**
  - Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus(Fl_Widget *)**

- **void forms_end()**
  - This is for forms compatibility only.

- **int handle(int) FL_OVERRIDE**
  - Handles the specified event.

- **void init_sizes()**
  - Resets the internal array of widget sizes and positions.

- **void insert(Fl_Widget &, int i)**
  - The widget is removed from its current group (if any) and then inserted into this group.

- **void insert(Fl_Widget &, Fl_Widget *) before**
  - This does insert(w, find(before)).

- **void remove(Fl_Widget &)**
  - Removes a widget from the group but does not delete it.

- **void remove(Fl_Widget *) o**
  - Removes the widget o from the group.

- **void remove(int index)**
  - Removes the widget at index from the group but does not delete it.

- **Fl_Widget * resizable() const**
  - Returns the group's resizable widget.

- **void resizable(Fl_Widget &o)**
  - Sets the group's resizable widget.

- **void resizable(Fl_Widget *o)**
  - The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **void resize(int, int, int, int) FL_OVERRIDE**
  - Resizes the Fl_Group widget and all of its children.

- **virtual ~Fl_Group()**
  - The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output ()**
  Sets a widget to accept input.

- **void clear_visible ()**
  Hides the widget.

- **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image * deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image * deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.
• void **do_callback** (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **draw_label** (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int **h** () const
  
  Gets the widget height.

• Fl_Image ∗**image** ()
  
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image ∗**image** () const
  
  Gets the image that is used as part of the widget label when in the active state.

• void **image** (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

• void **image** (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the active state.

• int **image_bound** () const
  
  Returns whether the image is managed by the widget.

• int **inside** (const Fl_Widget ∗wgt) const
  
  Checks if this widget is a child of wgt.

• int **is_label_copied** () const
  
  Returns whether the current label was assigned with copy_label().

• const char ∗**label** () const
  
  Gets the current label text.

• void **label** (const char ∗text)
  
  Sets the current label pointer.

• void **label** (Fl_Labeltype a, const char ∗b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color **labelcolor** () const
  
  Gets the label color.

• void **labelcolor** (Fl_Color c)
  
  Sets the label color.

• Fl_Font **labelfont** () const
  
  Gets the font to use.

• void **labelfont** (Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize **labelsiz**e () const
  
  Gets the font size in pixels.

• void **labelsiz**e (Fl_Fontsize pix)
  
  Sets the font size in pixels.

• Fl_Labeltype **labeltype** () const
  
  Gets the label type.

• void **labeltype** (Fl_Labeltype a)
  
  Sets the label type.

• void **measure_label** (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• bool **needs_keyboard** () const
  
  Returns whether this widget needs a keyboard.

• void **needs_keyboard** (bool needs)
  
  Sets whether this widget needs a keyboard.

• unsigned int **output** () const
  
  Returns if a widget is used for output only.

• Fl_Group ∗**parent** () const
Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.

- **void set_visible ()**
  
  Makes the widget visible.

- **void set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- **void shortcut_label (int value)**
  
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- **void size (int W, int H)**
  
  Changes the size of the widget.

- **int take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- **const char * tooltip () const**
  
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  
  Gets the widget type.

- **void type (uchar t)**
  
  Sets the widget type.

- **int use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void * user_data () const**
  
  Gets the user data for this widget.
• void **user_data**(Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void **user_data**(void ∗v)
  Sets the user data for this widget.
• unsigned int **visible**(const)
  Returns whether a widget is visible.
• unsigned int **visible_focus**(const)
  Checks whether this widget has a visible focus.
• void **visible_focus**(int v)
  Modifies keyboard focus navigation.
• int **visible_r**(const)
  Returns whether a widget and all its parents are visible.
• int **w**(const)
  Gets the widget width.
• Fl_When **when**(const)
  Returns the conditions under which the callback is called.
• void **when**(uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window ∗**window**(const)
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int **x**(const)
  Gets the widget position in its window.
• int **y**(const)
  Gets the widget position in its window.
• virtual ~Fl_Widget()
  Destroys the widget.

Additional Inherited Members

Public Types inherited from Fl_Browser

• enum Fl_Line_Position { TOP, BOTTOM, MIDDLE }
  For internal use only?

Public Types inherited from Fl_Browser_

• enum {
  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7 }
  Values for has_scrollbar().

Static Public Member Functions inherited from Fl_Group

• static Fl_Group ∗**current**( )
  Returns the currently active group.
• static void **current**(Fl_Group ∗g)
  Sets the current group.
Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Public Attributes inherited from Fl_Browser

- Fl_Scrollbar hscrollbar
  Horizontal scrollbar.
- Fl_Scrollbar scrollbar
  Vertical scrollbar.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1 << 0, INVISIBLE = 1 << 1, OUTPUT = 1 << 2, NOBORDER = 1 << 3,
  FORCE_POSITION = 1 << 4, NON_MODAL = 1 << 5, SHORTCUT_LABEL = 1 << 6, CHANGED = 1 << 7,
  OVERRIDE = 1 << 8,VISIBLE_FOCUS = 1 << 9, COPIED_LABEL = 1 << 10, CLIP_CHILDREN = 1 << 11,
  MENU_WINDOW = 1 << 12, TOOLTIP_WINDOW = 1 << 13, MODAL = 1 << 14, NO_OVERLAY = 1 << 15,
  GROUP_RELATIVE = 1 << 16, COPIED_TOOLTIP = 1 << 17, FULLSCREEN = 1 << 18, MAC_USE_ACCENTS_MENU = 1 << 19,
  NEEDS_KEYBOARD = 1 << 20, IMAGE_BOUND = 1 << 21, DEIMAGE_BOUND = 1 << 22,
  AUTO_DELETE_USER_DATA = 1 << 23,
  MAXIMIZED = 1 << 24, USERFLAG3 = 1 << 29, USERFLAG2 = 1 << 30, USERFLAG1 = 1 << 31
}
flags possible values enumeration.

Protected Member Functions inherited from Fl_Browser

- FL_BLINE ∗_remove (int line)
  Removes the item at the specified line.
- FL_BLINE ∗find_line (int line) const
  Returns the item for specified line.
- int full_height () const FL_OVERRIDE
  The height of the entire list of all visible() items in pixels.
- int incr_height () const FL_OVERRIDE
  The default 'average' item height (including inter-item spacing) in pixels.
- void insert (int line, FL_BLINE ∗item)
  Insert specified item above line.
- void ∗item_at (int line) const FL_OVERRIDE
  Return the item at specified line.
- void item_draw (void ∗item, int X, int Y , int W, int H) const FL_OVERRIDE
  Draws item at the position specified by XYWH.
- void ∗item_first () const FL_OVERRIDE
  Returns the very first item in the list.
- int item_height (void ∗item) const FL_OVERRIDE
  Returns height of item in pixels.
- void ∗item_last () const FL_OVERRIDE
Returns the very last item in the list.

- **void** *item_next (void *item) const FL_OVERRIDE*
  
  Returns the next item after *item*.

- **void** *item_prev (void *item) const FL_OVERRIDE*
  
  Returns the previous item before *item*.

- **void** *item_select (void *item, int val) FL_OVERRIDE*
  
  Change the selection state of *item* to the value *val*.

- **int** *item_selected (void *item) const FL_OVERRIDE*
  
  See if *item* is selected.

- **void** *item_swap (void *a, void *b) FL_OVERRIDE*
  
  Swap the items *a* and *b*.

- **const char** *item_text (void *item) const FL_OVERRIDE*
  
  Returns the label text for *item*.

- **int** *item_width (void *item) const FL_OVERRIDE*
  
  Returns width of *item* in pixels.

- **int** *lineno (void *item) const*
  
  Returns line number corresponding to *item*, or zero if not found.

- **void** *swap (FL_BLINE *a, FL_BLINE *b) FL_OVERRIDE*
  
  Swap the two items *a* and *b*.

### Protected Member Functions inherited from Fl_Browser_

- **void** *bbox (int &X, int &Y, int &W, int &H) const*
  
  Returns the bounding box for the interior of the list’s display window, inside the scrollbars.

- **void** *deleting (void *item)*
  
  This method should be used when *item* is being deleted from the list.

- **int** *displayed (void *item) const*
  
  Returns non-zero if *item* has been scrolled to a position where it is being displayed.

- **void** *draw () FL_OVERRIDE*
  
  Draws the list within the normal widget bounding box.

- **void** *find_item (int ypos)*
  
  This method returns the item under mouse y position *ypos*.

- **Fl_Browser_ (int X, int Y, int W, int H, const char *L=0)*
  
  The constructor makes an empty browser.

- **virtual int** *full_width () const*
  
  This method may be provided by the subclass to indicate the full width of the item list, in pixels.

- **void** *inserting (void *a, void *b)*
  
  This method should be used when an item is in the process of being inserted into the list.

- **virtual int** *item_quick_height (void *item) const*
  
  This method may be provided by the subclass to return the height of the *item*, in pixels.

- **int** *leftedge () const*
  
  This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

- **void** *new_list () *
  
  This method should be called when the list data is completely replaced or cleared.

- **void** *redraw_line (void *item)*
  
  This method should be called when the contents of *item* has changed, but not its height.

- **void** *redraw_lines ()*
  
  This method will cause the entire list to be redrawn.

- **void** *replacing (void *a, void *b)*
  
  This method should be used when *item a* is being replaced by *item b*.

- **void** *selection () const*
Returns the item currently selected, or NULL if there is no selection.

- void **swapping** (void *a, void *b)
  
  This method should be used when two items a and b are being swapped.

- void **top** () const
  
  Returns the item that appears at the top of the list.

**Protected Member Functions inherited from Fl_Group**

- FL_Rect * **bounds** ()
  
  Returns the internal array of widget sizes and positions.

- void **draw** () **FL_OVERRIDE**
  
  Draws the widget.

- void **draw_child** (Fl_Widget &widget) const
  
  Forces a child to redraw.

- void **draw_children** ()
  
  Draws all children of the group.

- void **draw_outside_label** (const Fl_Widget &widget) const
  
  Parents normally call this to draw outside labels of child widgets.

- virtual int **on_insert** (Fl_Widget *, int)
  
  Allow derived groups to act when a widget is added as a child.

- virtual int **on_move** (int, int)
  
  Allow derived groups to act when a widget is moved within the group.

- virtual void **on_remove** (int)
  
  Allow derived groups to act when a child widget is removed from the group.

- int * **sizes** ()
  
  Returns the internal array of widget sizes and positions.

- void **update_child** (Fl_Widget &widget) const
  
  Draws a child only if it needs it.

**Protected Member Functions inherited from Fl_Widget**

- void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

- void **draw_backdrop** () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box** () const
  
  Draws the widget box according its box style.

- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  
  Draws the widget's label at the defined label position.

- void **draw_label** (int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- void **draw_label** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.

• unsigned int flags () const
  Gets the widget flags mask.

• void h (int v)
  Internal use only.

• void set_flag (unsigned int c)
  Sets a flag in the flags mask.

• void w (int v)
  Internal use only.

• void x (int v)
  Internal use only.

• void y (int v)
  Internal use only.

11.126.1 Detailed Description

The class is a subclass of Fl_Browser which lets the user select a single item, or no items by clicking on the empty space.
As long as the mouse button is held down on an unselected item it is highlighted. Normally the callback is done when the user presses the mouse, but you can change this with when().
See Fl_Browser for methods to add and remove lines from the browser.

11.126.2 Constructor & Destructor Documentation

11.126.2.1 Fl_Select_Browser()

Fl_Select_Browser::Fl_Select_Browser (  
   int X,  
   int Y,  
   int W,  
   int H,  
   const char * L = 0 )

Creates a new Fl_Select_Browser widget using the given position, size, and label string.
The default boxtype is FL_DOWN_BOX. The constructor specializes Fl_Browser() by setting the type to FL_SELECT_BROWSER. The destructor destroys the widget and frees all memory that has been allocated.
The documentation for this class was generated from the following files:

• Fl_Select_Browser.H  
• Fl_Browser.cxx

11.127 Fl_Shared_Image Class Reference

This class supports caching, loading, and drawing of image files.
#include <Fl_Shared_Image.H>
Inheritance diagram for Fl_Shared_Image:

```
Fl_Image
  
Fl_Shared_Image
```
Public Member Functions

- `Fl_Shared_Image ∗ as_shared_image () FL_OVERRIDE`
  Returns whether an image is an `Fl_Shared_Image` or not.

- `void color_average (FL_Color c, float i) FL_OVERRIDE`
  The `color_average()` method averages the colors in the image with the provided FLTK color value.

- `Fl_Image ∗ copy () const`
  `Fl_Image ∗ copy (int W, int H) const FL_OVERRIDE`
  Creates a resized copy of the image.

- `void desaturate () FL_OVERRIDE`
  The `desaturate()` method converts an image to grayscale.

- `void draw (int X, int Y)`
  `void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE`
  Draws the image to the current drawing surface with a bounding box.

- `const Fl_Image ∗ image () const`
  Returns a pointer to the internal `Fl_Image` object.

- `const char ∗ name ()`
  Returns the filename of the shared image.

- `int original ()`
  Returns whether this is an original image.

- `int refcount ()`
  Returns the number of references of this shared image.

- `void release () FL_OVERRIDE`
  Releases and possibly destroys (if refcount <= 0) a shared image.

- `virtual void reload () FL_OVERRIDE`
  Reloads the shared image from disk.

- `void uncache () FL_OVERRIDE`
  If the image has been cached for display, delete the cache data.

Public Member Functions inherited from `Fl_Image`

- `Fl_Image ∗ copy () const`
  Creates a copy of the image in the same size.

- `int count () const`
  Returns the number of data values associated with the image.

- `int d () const`
  Returns the image depth.

- `const char ∗ const ∗ data () const`
  Returns a pointer to the current image data array.

- `int data_h () const`
  Returns the height of the image data.

- `int data_w () const`
  Returns the width of the image data.

- `void draw (int X, int Y)`
  Draws the image to the current drawing surface.

- `int fail () const`
  Returns a value that is not 0 if there is currently no image available.

- `Fl_Image (int W, int H, int D)`
  The constructor creates an empty image with the specified width, height, and depth.

- `int h () const`
  Returns the current image drawing height in FLTK units.

- `void inactive ()`

Generated by Doxygen
The \texttt{inactive()} method calls \texttt{color\_average(FL\_BACKGROUND\_COLOR, 0.33f)} to produce an image that appears grayed out.

- \texttt{virtual void label (Fl\_Menu\_Item \ast m)}
  This method is an obsolete way to set the image attribute of a menu item.

- \texttt{virtual void label (Fl\_Widget \ast w)}
  This method is an obsolete way to set the image attribute of a widget or menu item.

- \texttt{int ld () const}
  Returns the current line data size in bytes.

- \texttt{virtual void scale (int width, int height, int proportional=1, int can\_expand=0)}
  Sets the drawing size of the image.

- \texttt{int w () const}
  Returns the current image drawing width in FLTK units.

- \texttt{virtual \sim\texttt{Fl\_Image} ()}
  The destructor is a virtual method that frees all memory used by the image.

**Static Public Member Functions**

- \texttt{static void add\_handler (Fl\_Shared\_Handler f)}
  Adds a shared image handler, which is basically a test function for adding new image formats.

- \texttt{static Fl\_Shared\_Image \ast find (const char \ast name, int W=0, int H=0)}
  Finds a shared image from its name and size specifications.

- \texttt{static Fl\_Shared\_Image \ast get (const char \ast name, int W=0, int H=0)}
  Find or load an image that can be shared by multiple widgets.

- \texttt{static Fl\_Shared\_Image \ast get (Fl\_RGB\_Image \ast rgb, int own\_it=1)}
  Builds a shared image from a pre-existing \texttt{Fl\_RGB\_Image}.

- \texttt{static Fl\_Shared\_Image \ast\ast images ()}
  Returns the \texttt{Fl\_Shared\_Image \ast} array.

- \texttt{static int num\_images ()}
  Returns the total number of shared images in the array.

- \texttt{static void remove\_handler (Fl\_Shared\_Handler f)}
  Removes a shared image handler.

**Static Public Member Functions inherited from \texttt{Fl\_Image}**

- \texttt{static Fl\_Labeltype define\_FL\_IMAGE\_LABEL ()}

- \texttt{static Fl\_RGB\_Scaling RGB\_scaling ()}
  Returns the currently used RGB image scaling method.

- \texttt{static void RGB\_scaling (Fl\_RGB\_Scaling)}
  Sets the RGB image scaling method used for copy(int, int).

- \texttt{static Fl\_RGB\_Scaling scaling\_algorithm ()}
  Gets what algorithm is used when resizing a source image to draw it.

- \texttt{static void scaling\_algorithm (Fl\_RGB\_Scaling algorithm)}
  Sets what algorithm is used when resizing a source image to draw it.

**Protected Member Functions**

- \texttt{void add ()}
  Adds a shared image to the image cache.

- \texttt{Fl\_Shared\_Image ()}
  Creates an empty shared image.

- \texttt{Fl\_Shared\_Image (const char \ast n, Fl\_Image \ast img=0)}
  Creates a shared image from its filename and its corresponding \texttt{Fl\_Image\ast} \texttt{img}.

- \texttt{void update ()}
  \texttt{virtual \sim\texttt{Fl\_Shared\_Image} ()}
  The destructor frees all memory and server resources that are used by the image.
Protected Member Functions inherited from Fl_Image

- void d (int D)
  
  Sets the current image depth.

- void data (const char *const *p, int c)
  
  Sets the current data pointer and count of pointers in the array.

- void draw_empty (int X, int Y)
  
  The protected method draw_empty() draws a box with an X in it.

- int draw_scaled (int X, int Y, int W, int H)
  
  Draw the image to the current drawing surface rescaled to a given width and height.

- void h (int H)
  
  Sets the height of the image data.

- void Id (int LD)
  
  Sets the current line data size in bytes.

- void w (int W)
  
  Sets the width of the image data.

Static Protected Member Functions

- static int compare (Fl_Shared_Image **i0, Fl_Shared_Image **i1)
  
  Compares two shared images.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)

- static void measure (const Fl_LABEL *lo, int &lw, int &lh)

Protected Attributes

- int alloc_image_

- Fl_IMAGE * image_

- const char * name_

- int original_

- int refcount_

Static Protected Attributes

- static int allocHandlers_ = 0

- static int allocImages_ = 0

- static Fl_Shared_Handler * handlers_ = 0

- static Fl_Shared_IMAGE ** images_ = 0

- static int numHandlers_ = 0

- static int numImages_ = 0

Friends

- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false

  True after fl_register_images() was called, false before.

11.127.1 Detailed Description

This class supports caching, loading, and drawing of image files. Most applications will also want to link against the fltk_images library and call the fl_register_images() function to support standard image formats such as BMP, GIF, JPEG, PNG, and SVG (unless the library was built with the option removing SVG support).

Images can be requested (loaded) with Fl_Shared_Image::get(), find(), and some other methods. All images are cached in an internal list of shared images and should be released when they are no longer needed. A refcount is used to determine if a released image is to be destroyed with delete.

11.127.2 Constructor & Destructor Documentation

11.127.2.1 Fl_Shared_Image() [1/2]

Fl_Shared_Image::Fl_Shared_Image ( ) [protected]

Creates an empty shared image.

The constructors create a new shared image record in the image cache.

The constructors are protected and cannot be used directly from a program. Use the get() method instead.

11.127.2.2 Fl_Shared_Image() [2/2]

Fl_Shared_Image::Fl_Shared_Image (const char ∗ n, Fl_Image ∗ img = 0) [protected]

Creates a shared image from its filename and its corresponding Fl_Image* img.

The constructors create a new shared image record in the image cache.

The constructors are protected and cannot be used directly from a program. Use the get() method instead.

11.127.2.3 ~Fl_Shared_Image()

Fl_Shared_Image::~Fl_Shared_Image ( ) [protected], [virtual]

The destructor frees all memory and server resources that are used by the image.

The destructor is protected and cannot be used directly from a program. Use the Fl_Shared_Image::release() method instead.

11.127.3 Member Function Documentation

11.127.3.1 add()

void Fl_Shared_Image::add ( ) [protected]

Adds a shared image to the image cache.
This **protected** method adds an image to the cache, an ordered list of shared images. The cache is searched for a matching image whenever one is requested, for instance with `Fl_Shared_Image::get()` or `Fl_Shared_Image::find()`.

### 11.127.3.2 add_handler()

```cpp
void Fl_Shared_Image::add_handler (Fl_Shared_Handler f) [static]
```

Adds a shared image handler, which is basically a test function for adding new image formats. This function will be called when an `Fl_Shared_Image` is to be loaded (for instance with `Fl_Shared_Image::get()`) and the image type is not known to FLTK.

All registered image handlers will be called in the order of registration. You should always call `fl_register_images()` before adding your own handlers - unless you need to override a known image file type which should be rare.

See also

- Fl_Shared_Handler for more information of the function you need to define.

### 11.127.3.3 as_shared_image()

```cpp
Fl_Shared_Image * Fl_Shared_Image::as_shared_image () [inline], [virtual]
```

Returns whether an image is an `Fl_Shared_Image` or not. This virtual method returns a pointer to an `Fl_Shared_Image` if this object is an instance of `Fl_Shared_Image` or NULL if not. This can be used to detect if a given `Fl_Image` object is a shared image, i.e. derived from `Fl_Shared_Image`.

Since

- 1.4.0

Reimplemented from `Fl_Image`.

### 11.127.3.4 color_average()

```cpp
void Fl_Shared_Image::color_average (Fl_Color c, float i) [virtual]
```

The `color_average()` method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from `Fl_Image`.

### 11.127.3.5 compare()

```cpp
int Fl_Shared_Image::compare (Fl_Shared_Image ** i0, Fl_Shared_Image ** i1) [static], [protected]
```

Compares two shared images.

The order of comparison is:

1. Image name, usually the filename used to load it
2. Image width
3. Image height

A special case is considered if the width of one of the images is zero and the other image is marked `original`. In this case the images match, i.e. the comparison returns success (0).
An image is marked \textit{original} if it was directly loaded from a file or from memory as opposed to copied and resized images.

This comparison is used in \texttt{Fl\_Shared\_Image::find()} to find an image that matches the requested one or to find the position where a new image should be entered into the sorted list of shared images.

It is usually used in two steps:

1. search with exact width and height
2. if not found, search again with width = 0 (and height = 0)

The first step will only return a match if the image exists with the same width and height. The second step will match if there is an image marked \textit{original} with the same name, regardless of width and height.

\textbf{Returns}

Whether the images match or their relative sort order (see text).

\textbf{Return values}

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>the images match</td>
</tr>
<tr>
<td>&lt; 0</td>
<td>Image \textit{i0} is less than image \textit{i1}</td>
</tr>
<tr>
<td>&gt; 0</td>
<td>Image \textit{i0} is greater than image \textit{i1}</td>
</tr>
</tbody>
</table>

\subsubsection{11.127.3.6 \texttt{copy()}}

\texttt{Fl\_Image} \texttt{* Fl\_Shared\_Image::copy ( int \ W, int \ H ) const [virtual]}

Creates a resized copy of the image.

The new image should be released when you are done with it.

\textbf{Note}:

Since FLTK 1.4.0 you can use \texttt{Fl\_Image::release()} for all types of images (i.e. all subclasses of \texttt{Fl\_Image}) instead of operator \texttt{delete} for \texttt{Fl\_Image}’s and \texttt{Fl\_Image::release()} for \texttt{Fl\_Shared\_Image}’s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by \texttt{Fl\_Image::RGB\_scaling()}.

For the new image the following equations are true:

- \( w() = data\_w() = W \)
- \( h() = data\_h() = H \)

\textbf{Parameters}

\begin{tabular}{|l|}
\hline
\texttt{W,H} \quad Requested width and height of the new image \\
\hline
\end{tabular}

\textbf{Note}

The returned image can be safely cast to the same image type as that of the source image provided this type is one of \texttt{Fl\_RGB\_Image}, \texttt{Fl\_SVG\_Image}, \texttt{Fl\_Pixmap}, \texttt{Fl\_Bitmap}, \texttt{Fl\_Tiled\_Image}, \texttt{Fl\_Anim\_GIF\_Image} and \texttt{Fl\_Shared\_Image}. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an \texttt{Fl\_GIF\_Image} is an object of class \texttt{Fl\_Pixmap}.

Since FLTK 1.4.0 this method is ‘const’. If you derive your own class from \texttt{Fl\_Image} or any subclass your overridden methods of \texttt{Fl\_Image::copy()} const’ and \texttt{Fl\_Image::copy(int, int) const} must also be ‘const’ for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been ‘const’.

Reimplemented from \texttt{Fl\_Image}.
11.127.3.7 desaturate()

```cpp
void Fl_Shared_Image::desaturate ( ) [virtual]
```

The `desaturate()` method converts an image to grayscale. If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory. Reimplemented from `Fl_Image`.

11.127.3.8 draw()

```cpp
void Fl_Shared_Image::draw ( int X, int Y, int W, int H, int cx = 0, int cy = 0 ) [virtual]
```

Draws the image to the current drawing surface with a bounding box. Arguments `X, Y, W, H` specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the `cx` and `cy` arguments. In other words: `fl_push_clip(X,Y,W,H)` is applied, the image is drawn with its upper-left corner at `X-cx,Y-cy` and its own width and height, `fl_pop_clip()` is applied. Reimplemented from `Fl_Image`.

11.127.3.9 find()

```cpp
Fl_Shared_Image * Fl_Shared_Image::find ( const char * name, int W = 0, int H = 0 ) [static]
```

Finds a shared image from its name and size specifications. This uses a binary search in the image cache. If the image `name` exists with the exact width `W` and height `H`, then it is returned. If `W == 0` and the image `name` exists with another size, then the original image with that `name` is returned. In either case the refcount of the returned image is increased. The found image should be released with `Fl_Shared_Image::release()` when no longer needed.

11.127.3.10 get() [1/2]

```cpp
Fl_Shared_Image * Fl_Shared_Image::get ( const char * name, int W = 0, int H = 0 ) [static]
```

Find or load an image that can be shared by multiple widgets. If the image exists with the requested size, this image will be returned. If the image exists, but only with another size, then a new copy with the requested size (width `W` and height `H`) will be created as a resized copy of the original image. The new image is added to the internal list of shared images. If the image does not yet exist, then a new image of the proper dimension is created from the filename `name`. The original image from filename `name` is always added to the list of shared images in its original size. If the requested size differs, then the resized copy with width `W` and height `H` is also added to the list of shared images.

Note

If the sizes differ, then two images are created as mentioned above. This is intentional so the original image is cached and preserved. If you request the same image with another size later, then the original image will be found, copied, resized, and returned.

Shared JPEG and PNG images can also be created from memory by using their named memory access constructor. You should `release()` the image when you’re done with it.
11.127.3.11 get() [2/2]

```
Fl_Shared_Image* Fl_Shared_Image::get (      
    Fl_RGB_Image* rgb,                         
    int own_it = 1                       )       
```

Builds a shared image from a pre-existing `Fl_RGB_Image`.

### Parameters

<table>
<thead>
<tr>
<th>name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rgb</td>
<td>an <code>Fl_RGB_Image</code> used to build a new shared image.</td>
</tr>
<tr>
<td>own_it</td>
<td>1 if the shared image should delete rgb when it is itself deleted, 0 otherwise</td>
</tr>
</tbody>
</table>

### Version

1.3.4

11.127.3.12 image()

```
const Fl_Image* Fl_Shared_Image::image ( ) const [inline]
```

Returns a pointer to the internal `Fl_Image` object.

The output is a pointer to the internal image (`Fl_Image` or subclass) which can be used to inspect or copy the image.

**Do not try to modify the image!** You can copy the image though if you want or need to change any attributes, size etc. If all you need to do is to resize the image you should use `Fl_Shared_Image::copy(int, int)` instead.

### Note

The internal image (pointer) is protected for good reasons, e.g. to prevent access to the image so it can't be modified by user code. **DO NOT** cast away the `const` attribute to modify the image.

User code should rarely need this method. Use with caution.

### Returns

- `const Fl_Image* image`, the internal `Fl_Image`

### Since

1.4.0

11.127.3.13 original()

```
int Fl_Shared_Image::original ( ) [inline]
```

Returns whether this is an original image.

Images loaded from a file or from memory are marked `original` as opposed to images created as a copy of another image with different size (width or height).
Note

This is useful for debugging (rarely used in user code).

Since

FLTK 1.4.0

11.127.3.14 refcount()

int Fl_Shared_Image::refcount ( ) [inline]
Returns the number of references of this shared image.
When reference is below 1, the image is deleted.

11.127.3.15 release()

void Fl_Shared_Image::release ( ) [virtual]
Releases and possibly destroys (if refcount \leq 0) a shared image.
In the latter case, it will reorganize the shared image array so that no hole will occur.
Reimplemented from Fl_Image.

11.127.3.16 uncache()

void Fl_Shared_Image::uncache ( ) [virtual]
If the image has been cached for display, delete the cache data.
This allows you to change the data used for the image and then redraw it without recreating an image object.
Reimplemented from Fl_Image.
The documentation for this class was generated from the following files:

• Fl_Shared_Image.H
• Fl_Shared_Image.cxx

11.128 Fl_Shortcut_Button Class Reference

A button that allows the user to type a key combination to create shortcuts.
Inheritance diagram for Fl_Shortcut_Button:

```
                Fl_Widget
                 |
                Fl_Button
                 |
Fl_Shortcut_Button
```

Public Member Functions

• void default_clear ( )
  No longer show the button to reverse to a default shortcut.
• Fl_Shortcut default_value ( )
  Return the default shortcut.
• void default_value (Fl_Shortcut shortcut)
  Set the default shortcut.
• Fl_Shortcut_Button (int X, int Y, int W, int H, const char *l=0)
  Construct a shortcut button.
• Fl_Shortcut value ( )
Return the user selected shortcut.

- void value (Fl_Shortcut shortcut)
  Set the displayed shortcut.

Public Member Functions inherited from **Fl_Button**

- int clear ()
  Same as value(0).

- uchar compact ()
  Return true if buttons are rendered as compact buttons.

- void compact (uchar v)
  Decide if buttons should be rendered in compact mode.

- Fl_Boxtype down_box () const
  Returns the current down box type, which is drawn when value() is non-zero.

- void down_box (Fl_Boxtype b)
  Sets the down box type.

- Fl_Color down_color () const
  (for backwards compatibility)

- void down_color (unsigned c)
  (for backwards compatibility)

- Fl_Button (int X, int Y, int W, int H, const char ∗L=0)
  The constructor creates the button using the given position, size, and label.

- int set ()
  Same as value(1).

- void setonly ()
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).

- int shortcut () const
  Returns the current shortcut key for the button.

- void shortcut (const char ∗s)
  (for backwards compatibility)

- void shortcut (int s)
  Sets the shortcut key to s.

- char value () const
  Returns the current value of the button (0 or 1).

- int value (int v)
  Sets the current value of the button.

Public Member Functions inherited from **Fl_Widget**

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.

- unsigned int active () const
  Returns whether the widget is active.

- int active_r () const
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  Gets the label alignment.

- void align (Fl_Align alignment)
- long argument () const
Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)

Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const * as_gl_window () const

- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const * as_group () const

- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const * as_window () const

- void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  Gets the current callback function for the widget.

- void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
void color (Fl_Color bg)
      
Sets the background color of the widget.

void color (Fl_Color bg, Fl_Color sel)
        
Sets the background and selection color of the widget.

Fl_Color color2 () const
        
For back compatibility only.

void color2 (unsigned a)
        
For back compatibility only.

int contains (const Fl_Widget *w) const
        
Checks if w is a child of this widget.

void copy_label (const char *new_label)
        
Sets the current label.

void copy_tooltip (const char *text)
        
Sets the current tooltip text.

uchar damage () const
        
Returns non-zero if draw() needs to be called.

damage (uchar c)
        
Sets the damage bits for the widget.

damage (uchar c, int x, int y, int w, int h)
        
Sets the damage bits for an area inside the widget.

damage_resize (int, int, int, int)
        
Internal use only.

deactivate ()
        
Deactivates the widget.

Fl_Image *deimage ()
        
Gets the image that is used as part of the widget label when in the inactive state.

codeimage () const
        
Gets the image that is used as part of the widget label when in the inactive state.

deimage (Fl_Image &img)
        
Sets the image to use as part of the widget label when in the inactive state.

deimage (Fl_Image *img)
        
Sets the image to use as part of the widget label when in the inactive state.

deimage_bound () const
        
Returns whether the inactive image is managed by the widget.

do_callback (Fl_Callback *reason=FL_REASON_UNKNOWN)
        
Calls the widget callback function with default arguments.

do_callback (Fl_Widget *widget, long arg, Fl_Callback *reason=FL_REASON_UNKNOWN)
        
Calls the widget callback function with arbitrary arguments.

do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback *reason=FL_REASON_UNKNOWN)
        
Calls the widget callback function with arbitrary arguments.

draw_label (int, int, int, Fl_Align) const
        
Draws the label in an arbitrary bounding box with an arbitrary alignment.

eh () const
        
Gets the widget height.

virtual void hide ()
        
Makes a widget invisible.

Fl_Image *image ()
        
Gets the image that is used as part of the widget label when in the active state.

const Fl_Image *image () const
        
Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
Changes the size or position of the widget.

- **FL_Color selection_color () const**
  Gets the selection color.

- **void selection_color (FL_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int testShortcut ()**
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char *tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **FL_Window *top_window () const**
  Returns a pointer to the top-level window for the widget.

- **FL_Window *top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.

- **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void *user_data () const**
  Gets the user data for this widget.

- **void user_data (FL_Callback_User_Data *v, bool auto_free)**
  Sets the user data for this widget.

- **void user_data (void *v)**
  Sets the user data for this widget.

- **unsigned int visible () const**
  Returns whether a widget is visible.
• unsigned int **visible_focus () const
  Checks whether this widget has a visible focus.
• void **visible_focus (int v)
  Modifies keyboard focus navigation.
• int **visible_r () const
  Returns whether a widget and all its parents are visible.
• int **w () const
  Gets the widget width.
• Fl_When **when () const
  Returns the conditions under which the callback is called.
• void **when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * **window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int **x () const
  Gets the widget position in its window.
• int **y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void do_end_hot_callback ()
  Call the callback if the user is interested.
• void draw () FL_OVERRIDE
  Draw the textual representation of the shortcut button.
• int handle (int) FL_OVERRIDE
  Handle keystrokes to catch the user's shortcut.

Protected Member Functions inherited from Fl_Button

• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Protected Attributes
- Fl_Shortcut shortcut_value

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget
- static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget
- enum { INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3, FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7, OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11, MENU_WINDOW = 1<<12, TOOLIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15, GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19, NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 } flags possible values enumeration.

- static void key_release_timeout (void ∗)
Static Protected Attributes inherited from Fl_Button

- static Fl_Widget_Tracker * key_release_tracker = 0

11.128.1 Detailed Description

A button that allows the user to type a key combination to create shortcuts. After clicked once, the button catches the following keyboard events and records the pressed keys and all modifiers. It draws a text representation of the shortcut. The backspace key deletes the current shortcut. A second click on the button or moving focus makes the last shortcut permanent.

The Shortcut button calls the user callback after every change if FL_WHEN_CHANGED is set, and when the button is no longer recording shortcuts if FL_WHEN_RELEASE is set.

11.128.2 Constructor & Destructor Documentation

11.128.2.1 Fl_Shortcut_Button()

Fl_Shortcut_Button::Fl_Shortcut_Button (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char * l = 0 )  

Construct a shortcut button.

Parameters

<table>
<thead>
<tr>
<th>X, Y, W, H</th>
<th>position and size of the button</th>
</tr>
</thead>
<tbody>
<tr>
<td>l</td>
<td>label text when no shortcut is set</td>
</tr>
</tbody>
</table>

11.128.3 Member Function Documentation

11.128.3.1 default_value() [1/2]

Fl_Shortcut Fl_Shortcut_Button::default_value ( )  

Return the default shortcut.

Returns

- shortcut encoded as key and modifier

11.128.3.2 default_value() [2/2]

void Fl_Shortcut_Button::default_value (  
    Fl_Shortcut shortcut )  

Set the default shortcut.

If set, and additional 'reverse' button appears that the user can click to reset the shortcut to some default value (including 0).

Parameters

| shortcut | encoded as key and modifier |

11.128.3.3 draw()

void Fl_Shortcut_Button::draw (  
    void ) [protected], [virtual]
Draw the textual representation of the shortcut button. When the button can receive shortcut key events, it’s "hot". A hot button is drawn in selection color. A cold button is drawn as a regular text box containing a human readable version of the shortcut key. Reimplemented from Fl_Button.

11.128.3.4 handle()

int Fl_Shortcut_Button::handle (  
  int e ) [protected], [virtual]

Handle keystrokes to catch the user’s shortcut. Reimplemented from Fl_Button.

11.128.3.5 value() [1/2]

Fl_Shortcut Fl_Shortcut_Button::value ( )

Return the user selected shortcut.

Returns

shortcut encoded as key and modifier

11.128.3.6 value() [2/2]

void Fl_Shortcut_Button::value (  
  Fl_Shortcut shortcut )

Set the displayed shortcut.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shortcut</td>
<td>Fl_Shortcut</td>
<td>encoded as key and modifier</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Shortcut_Button.H
- Fl_Shortcut_Button.cxx

11.129 Fl_Simple_Counter Class Reference

This widget creates a counter with only 2 arrow buttons.

#include <Fl_Simple_Counter.H>

Inheritance diagram for Fl_Simple_Counter:

```

Public Member Functions

- Fl_Simple_Counter (int X, int Y, int W, int H, const char *L=0)
Public Member Functions inherited from Fl_Counter

- **Fl_Counter**(int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Counter widget using the given position, size, and label string.

- **int handle**(int) FL_OVERRIDE
  
  Handles the specified event.

- **void lstep**(double a)
  
  Sets the increment for the large step buttons.

- **double step**(double a) const
  
  Returns the increment for normal step buttons.

- **void step**(double a)
  
  Sets the increment for the normal step buttons.

- **void step**(double a, double b)
  
  Sets the increments for the normal and large step buttons.

- **Fl_Color textcolor**(const)
  
  Gets the font color.

- **void textcolor**(Fl_Color s)
  
  Sets the font color to s.

- **Fl_Font textfont**(const)
  
  Gets the text font.

- **void textfont**(Fl_Font s)
  
  Sets the text font to s.

- **Fl_Fontsize textsize**(const)
  
  Gets the font size.

- **void textsize**(Fl_Fontsize s)
  
  Sets the font size to s.

- **~Fl_Counter**()
  
  Destroys the valuator.

Public Member Functions inherited from Fl_Valuator

- **void bounds**(double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp**(double)
  
  Clamps the passed value to the valuator range.

- **virtual int format**(char *)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment**(double, int)
  
  Adds n times the step value to the passed value.

- **double maximum**(const)
  
  Gets the maximum value for the valuator.

- **void maximum**(double a)
  
  Sets the maximum value for the valuator.

- **double minimum**(const)
  
  Gets the minimum value for the valuator.

- **void minimum**(double a)
  
  Sets the minimum value for the valuator.

- **void precision**(int digits)
  
  Sets the step value to 1.0 / 10^digits.

- **void range**(double a, double b)
  
  Sets the minimum and maximum values for the valuator.

- **double round**(double)
Round the passed value to the nearest step increment.

- double step () const
  
  Gets or sets the step value.

- void step (double a, int b)
  
  See double Fl_Valuator::step() const

- void step (double s)
  
  See double Fl_Valuator::step() const.

- void step (int a)
  
  See double Fl_Valuator::step() const

- double value () const
  
  Gets the floating point(double) value.

- int value (double)
  
  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  
  Activates the widget.

- unsigned int active () const
  
  Returns whether the widget is active.

- int active_r () const
  
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  
  Gets the label alignment.

- void align (Fl_Align alignment)
  
  Sets the label alignment.

- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window * as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const * as_gl_window () const
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual Fl_Group * as_group ()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const * as_group () const
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Window * as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const * as_window () const
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- void bind_deimage (Fl_Image * img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image * img)
  
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
Gets the box type of the widget.

- void *box (Fl_Boxtype new_box)

Sets the box type for the widget.

- Fl_Callback_p callback () const

Gets the current callback function for the widget.

- void *callback (Fl_Callback cb)

Sets the current callback function for the widget.

- void *callback (Fl_Callback cb, Fl_Callback_User_Data p, bool auto_free)

Sets the current callback function and managed user data for the widget.

- void *callback (Fl_Callback cb, void p)

Sets the current callback function and data for the widget.

- void *callback (Fl_Callback0 cb)

Sets the current callback function for the widget.

- void *callback (Fl_Callback1 cb, long p=0)

Sets the current callback function for the widget.

- unsigned int changed () const

Checks if the widget value changed since the last callback.

- void clear_active ()

Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()

Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)

Clears or sets the damage flags.

- void clear_output ()

Sets a widget to accept input.

- void clear_visible ()

Hides the widget.

- void clear_visible_focus ()

Disables keyboard focus navigation with this widget.

- Fl_Color color () const

Gets the background color of the widget.

- void color (Fl_Color bg)

Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.

- Fl_Color color2 () const

For back compatibility only.

- void color2 (unsigned a)

For back compatibility only.

- int contains (const Fl_Widget w) const

Checks if w is a child of this widget.

- void copy_label (const char *new_label)

Sets the current label.

- void copy_tooltip (const char *text)

Sets the current tooltip text.

- uchar damage () const

Returns non-zero if draw() needs to be called.

- void damage (uchar c)

Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.
• **int** `damage_resize` (int, int, int, int)
  Internal use only.
• **void** `deactivate` ()
  Deactivates the widget.
• **FL_Image** * `deimage` ()
  Gets the image that is used as part of the widget label when in the inactive state.
• **const FL_Image** * `deimage` () const
  Gets the image that is used as part of the widget label when in the inactive state.
• **void** `deimage` (**FL_Image** &img)
  Sets the image to use as part of the widget label when in the inactive state.
• **void** `deimage` (**FL_Image** *img)
  Sets the image to use as part of the widget label when in the inactive state.
• **int** `deimage_bound` () const
  Returns whether the inactive image is managed by the widget.
• **void** `do_callback` (**FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  Calls the widget callback function with default arguments.
• **void** `do_callback` (**FL_Widget** *widget, long arg, **FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  Calls the widget callback function with arbitrary arguments.
• **void** `do_callback` (**FL_Widget** *widget, void *arg=0, **FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  Calls the widget callback function with arbitrary arguments.
• **void** `draw_label` (int, int, int, int, **Fl_Align**) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• **int** `h` () const
  Gets the widget height.
• virtual **void** `hide` ()
  Makes a widget invisible.
• **FL_Image** * `image` ()
  Gets the image that is used as part of the widget label when in the active state.
• **const FL_Image** * `image` () const
  Gets the image that is used as part of the widget label when in the active state.
• **void** `image` (**FL_Image** &img)
  Sets the image to use as part of the widget label when in the active state.
• **void** `image` (**FL_Image** *img)
  Sets the image to use as part of the widget label when in the active state.
• **int** `image_bound` () const
  Returns whether the image is managed by the widget.
• **int** `inside` (**const FL_Widget** *wgt*) const
  Checks if this widget is a child of *wgt*.
• **int** `is_label_copied` () const
  Returns whether the current label was assigned with `copy_label()`.
• **const char** * `label` () const
  Gets the current label text.
• **void** `label` (const char *text)
  Sets the current label pointer.
• **void** `label` (**FL_Labeltype** a, const char *b)
  Shortcut to set the label text and type in one call.
• **FL_Color** `labelcolor` () const
  Gets the label color.
• **void** `labelcolor` (**FL_Color** c)
  Sets the label color.
• **FL_Font** `labelfont` () const
  Gets the label font.
Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group * p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , Copied_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLKIT_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , Copied_TOOLKIT = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCEPtS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Counter

- void arrow_widths (int &w1, int &w2)
  Compute sizes (widths) of arrow boxes.
- void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y , int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void handle_push ()
  Stores the current value in the previous value.
- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
- double previous_value () const
  Gets the previous floating point value before an event changed it.
- void set_value (double v)
  Sets the current floating point value.
- double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void value_damage ()
  Asks for partial redraw.
Protected Member Functions inherited from Fl_Widget

- void clear_flag(unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop() const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box() const
  Draws the widget box according its box style.
- void draw_box(Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus() const
  Draws a focus rectangle around the widget.
- void draw_focus(Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label() const
  Draws the widget's label at the defined label position.
- void draw_label(int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget(int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags() const
  Gets the widget flags mask.
- void h(int v)
  Internal use only.
- void set_flag(unsigned int c)
  Sets a flag in the flags mask.
- void w(int v)
  Internal use only.
- void x(int v)
  Internal use only.
- void y(int v)
  Internal use only.

11.129.1 Detailed Description

This widget creates a counter with only 2 arrow buttons.

![Figure 11.42 Fl_Simple_Counter](image)

The documentation for this class was generated from the following files:

- Fl_Simple_Counter.H
- Fl_Counter.cxx
# Fl_Simple_Terminal Class Reference

This is a continuous text scroll widget for logging and debugging output, much like a terminal.

```c
#include <Fl_Simple_Terminal.H>
```

Inheritance diagram for Fl_Simple_Terminal:

```
Fl_Widget
  └── Fl_Group
        ├── Fl_Text_Display
        |    └── Fl_Simple_Terminal
```

**Public Member Functions**

- `bool ansi () const`
  
  Get the state of the ANSI flag which enables/disables the handling of ANSI sequences in text.

- `void ansi (bool val)`
  
  Enable/disable support of ANSI sequences like "\033[31m", which sets the color/font/weight/size of any text that follows.

- `bool ansi_show_unknown () const`
  
  See if we should show unknown ANSI sequences with '¿' or not.

- `void ansi_show_unknown (bool val)`
  
  Enable showing unknown ESC sequences with the '¿' character.

- `void append (const char ∗s, int len=-1)`
  
  Appends new string 's' to terminal.

- `void clear ()`
  
  Clears the terminal's screen and history.

- `int current_style () const`
  
  Get the current style char used for style buffer.

- `int current_style_index () const`
  
  Get the style table index used as the current drawing color/font/weight/size for new text.

- `void current_style_index (int)`
  
  Set the style table index used as the current drawing color/font/weight/size for new text.

- `Fl_Simple_Terminal (int X, int Y, int W, int H, const char ∗l=0)`
  
  Creates a new Fl_Simple_Terminal widget that can be a child of other FLTK widgets.

- `int history_lines () const`
  
  Get the maximum number of terminal history lines last set by history_lines(int).

- `void history_lines (int)`
  
  Sets the maximum number of lines for the terminal history.

- `int normal_style_index () const`
  
  Gets the style table index used by the ANSI terminal reset sequence "\033[0m".

- `void normal_style_index (int)`
  
  Sets the style table index used by the ANSI terminal reset sequence "\033[0m", which resets the current drawing color/font/weight/size to "normal".

- `void printf (const char ∗fmt,...)`
  
  Appends printf formatted messages to the terminal.

- `void remove_lines (int start, int count)`
  
  Remove the specified range of lines from the terminal, starting with line 'start' and removing 'count' lines.
• bool stay_at_bottom () const
  Gets the current value of the stay_at_bottom(bool) flag.

• void stay_at_bottom (bool)
  Configure the terminal to remain scrolled to the bottom when possible, chasing the end of the buffer whenever new
text is added.

• const Fl_Text_Display::Style_Table_Entry ∗ style_table () const
  Return the current style table being used.

• void style_table (Fl_Text_Display::Style_Table_Entry ∗stable, int stable_size, int normal_style_index=0)
  Set a user defined style table, which controls the font colors, faces, weights and sizes available for the terminal's text
content.

• int style_table_size () const
  Return the current style table's size (in bytes).

• const char ∗ text () const
  Returns entire text content of the terminal as a single string.

• const char ∗ text () const
  Replaces the terminal with new text content in string 's'.

• void vprintf (const char ∗ fmt, va_list ap)
  Appends printf formatted messages to the terminal.

• ~Fl_Simple_Terminal ()
  Destructor for this widget; removes any internal allocations for the terminal, including text buffer, style buffer, etc.

Public Member Functions inherited from Fl_Text_Display

• Fl_Text_Buffer ∗ buffer () const
  Gets the current text buffer associated with the text widget.

• void buffer (Fl_Text_Buffer &buf)
  Sets the current text buffer associated with the text widget.

• void buffer (Fl_Text_Buffer ∗ buf)
  Attach a text buffer to display, replacing the current buffer (if any).

• double col_to_x (double col) const
  Convert a column number into an x pixel position.

• int count_lines (int start, int end, bool start_pos_is_line_start) const
  Count the number of lines between two positions.

• Fl_Color cursor_color () const
  Gets the text cursor color.

• void cursor_color (Fl_Color n)
  Sets the text cursor color.

• int cursor_style () const
  Sets the text cursor style.

• Fl_Text_Display (int X, int Y , int W, int H, const char ∗ l=0)
  Creates a new text display widget.

• Fl_Color grammar_underline_color () const
  Gets the underline color for style attribute ATTR_GRAMMAR.

• void grammar_underline_color (Fl_Color color)
  Sets the underline color for style attribute ATTR_GRAMMAR.

• int handle (int e) FL_OVERRIDE
  Event handling.

• void hide_cursor ()
  Hides the text cursor.

• void highlight_data (Fl_Text_Buffer ∗styleBuffer, const Style_Table_Entry ∗styleTable, int nStyles, char unfinishedStyle, Unfinished_Style_Cb unfinishedHighlightCB, void ∗cbArg)
  Generates by Doxygen
Attach (or remove) highlight information in text display and redisplay.

- int in_selection (int x, int y) const
  Check if a pixel position is within the primary selection.

- void insert (const char *text)
  Inserts "text" at the current cursor location.

- int insert_position () const
  Gets the position of the text insertion cursor for text display.

- void insert_position (int newPos)
  Sets the position of the text insertion cursor for text display.

- int line_end (int startPos, bool startPosIsLineStart) const
  Returns the end of a line.

- int line_start (int pos) const
  Return the beginning of a line.

- Fl_Align linenumber_align () const
  Returns the alignment used for line numbers (if enabled).

- void linenumber_align (Fl_Align val)
  Set alignment for line numbers (if enabled).

- Fl_Color linenumberbgcolor () const
  Returns the background color used for line numbers (if enabled).

- void linenumberbgcolor (Fl_Color val)
  Set the background color used for line numbers (if enabled).

- Fl_Color linenumberfgcolor () const
  Return the foreground color used for line numbers (if enabled).

- void linenumberfgcolor (Fl_Color val)
  Set the foreground color used for line numbers (if enabled).

- Fl_Font linenumberfont () const
  Return the font used for line numbers (if enabled).

- void linenumberfont (Fl_Font val)
  Set the font used for line numbers (if enabled).

- const char *linenumber_format () const
  Returns the line number printf() format string.

- void linenumber_format (const char *val)
  Sets the printf() style format string used for line numbers.

- Fl_Fontsize linenumber_size () const
  Return the font size used for line numbers (if enabled).

- void linenumber_size (Fl_Fontsize val)
  Set the font size used for line numbers (if enabled).

- int linenumber_width () const
  Return the screen area width provided for line numbers.

- void linenumber_width (int width)
  Set width of screen area for line numbers.

- int move_down ()
  Moves the current insert position down one line.

- int move_left ()
  Moves the current insert position left one character.

- int move_right ()
  Moves the current insert position right one character.

- int move_up ()
  Moves the current insert position up one line.

- void next_word (void)
  Moves the current insert position right one word.
• void overstrike (const char *text)
  Replaces text at the current insert position.

• int position_style (int lineStartPos, int lineLen, int lineIndex) const
  Find the correct style for a character.

• int position_to_xy (int pos, int *x, int *y) const
  Convert a character index into a pixel position.

• void previous_word (void)
  Moves the current insert position left one word.

• virtual void recalc_display ()
  Recalculate the display’s visible lines and scrollbar sizes.

• void redisplay_range (int start, int end)
  Marks text from start to end as needing a redraw.

• void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Change the size of the displayed text area.

• int rewind_lines (int startPos, int nLines)
  Skip a number of lines back.

• void scroll (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

• Fl_Align scrollbar_align () const
  Gets the scrollbar alignment type.

• void scrollbar_align (Fl_Align a)
  Sets the scrollbar alignment type.

• int scrollbar_size () const
  Gets the current size of the scrollbars’ troughs, in pixels.

• void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars’ troughs to newSize, in pixels.

• int scrollbar_width () const
  Returns the global value Fl::scrollbar_size() unless a specific scrollbar_width_ has been set.

• void scrollbar_width (int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

• Fl_Color secondary_selection_color () const
  Gets the background color for the secondary selection block.

• void secondary_selection_color (Fl_Color color)
  Sets the background color for the secondary selection block.

• int shortcut () const
• void shortcut (int s)

• void show_cursor (int b=1)
  Shows the text cursor.

• void show_insert_position ()
  Scrolls the text buffer to show the current insert position.

• int skip_lines (int startPos, int nLines, bool startPosIsLineStart)
  Skip a number of lines forward.

• Fl_Color spelling_underline_color () const
  Gets the underline color for style attribute ATTR_SPELLING.

• void spelling_underline_color (Fl_Color color)
  Sets the underline color for style attribute ATTR_SPELLING.

• Fl_Text_Buffer * style_buffer () const
  Gets the current style buffer associated with the text widget.

• Fl_Color textcolor () const
  Gets the default color of text in the widget.

• void textcolor (Fl_Color n)
Sets the default color of text in the widget.

- `Fl_Font textfont () const`
  
  Gets the default font used when drawing text in the widget.

- `void textfont (Fl_Font s)`
  
  Sets the default font used when drawing text in the widget.

- `Fl_Fontsize textsize () const`
  
  Gets the default size of text in the widget.

- `void textsize (Fl_Fontsize s)`
  
  Sets the default size of text in the widget.

- `int word_end (int pos) const`
  
  Moves the insert position to the end of the current word.

- `int word_start (int pos) const`
  
  Moves the insert position to the beginning of the current word.

- `void wrap_mode (int wrap, int wrap_margin)`
  
  Set the new text wrap mode.

- `int wrapped_column (int row, int column) const`
  
  Nobody knows what this function does.

- `int wrapped_row (int row) const`
  
  Nobody knows what this function does.

- `double x_to_col (double x) const`
  
  Convert an x pixel position into a column number.

- `~Fl_Text_Display ()`
  
  Free a text display and release its associated memory.

Public Member Functions inherited from `Fl_Group`

- `Fl_Widget *& _ddfdesign_kludge ()`
  
  This is for forms compatibility only.

- `void add (Fl_Widget &)`
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- `void add (Fl_Widget *o)`
  
  See void `Fl_Group::add(Fl_Widget &w)`

- `void add_resizable (Fl_Widget &o)`
  
  Adds a widget to the group and makes it the resizable widget.

- `Fl_Widget *const * array () const`
  
  Returns a pointer to the array of children.

- `Fl_Group const * as_group () const FL_OVERRIDE`
  
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

- `void begin ()`
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- `Fl_Widget * child (int n) const`
  
  Returns `array()[n].`

- `int children () const`
  
  Returns how many child widgets the group has.

- `void clear ()`
  
  Deletes all child widgets from memory recursively.

- `unsigned int clip_children ()`
  
  Returns the current clipping mode.

- `void clip_children (int c)`
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
• virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

• void end ()
  Exactly the same as current(this->parent()).

• int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget ∗w) const.

• int find (const Fl_Widget ∗) const
  Searches the child array for the widget and returns the index.

• Fl_Group (int, int, int, int, const char ∗=0)
  Creates a new Fl_Group widget using the given position, size, and label string.

• void focus (Fl_Widget ∗W)

• void forms_end ()
  This is for forms compatibility only.

• void init_sizes ()
  Resets the internal array of widget sizes and positions.

• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

• void insert (Fl_Widget &o, Fl_Widget ∗before)
  This does insert(w, find(before)).

• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

• void remove (Fl_Widget ∗o)
  Removes the widget o from the group.

• void remove (int index)
  Removes the widget at index from the group but does not delete it.

• Fl_Widget ∗resizable () const
  Returns the group's resizable widget.

• void resizable (Fl_Widget &o)
  Sets the group's resizable widget.

• void resizable (Fl_Widget ∗o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.

• unsigned int active () const
  Returns whether the widget is active.

• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• **Fl_Color color2 () const**
  For back compatibility only.
• **void color2 (unsigned a)**
  For back compatibility only.
• **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.
• **void copy_label (const char *new_label)**
  Sets the current label.
• **void copy_tooltip (const char *text)**
  Sets the current tooltip text.
• **uchar damage () const**
  Returns non-zero if `draw()` needs to be called.
• **void damage (uchar c)**
  Sets the damage bits for the widget.
• **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.
• **int damage_resize (int, int, int, int)**
  Internal use only.
• **void deactivate ()**
  Deactivates the widget.
• **Fl_Image * deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.
• **const Fl_Image * deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.
• **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.
• **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.
• **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.
• **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.
• **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.
• **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.
• **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• **int h () const**
  Gets the widget height.
• **virtual void hide ()**
  Makes a widget invisible.
• **Fl_Image * image ()**
  Gets the image that is used as part of the widget label when in the active state.
• **const Fl_Image * image () const**
  Gets the image that is used as part of the widget label when in the active state.
• **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.
• **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.
• **int image_bound () const**
Returns whether the image is managed by the widget.

- int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

- int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

- const char * label () const
  Gets the current label text.

- void label (const char *text)
  Sets the current label pointer.

- void label (FL_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

- FL_Color labelcolor () const
  Gets the label color.

- void labelcolor (FL_Color c)
  Sets the label color.

- FL_Font labelfont () const
  Gets the font to use.

- void labelfont (FL_Font f)
  Sets the font to use.

- FL_Fontsize labelsize () const
  Gets the font size in pixels.

- void labelsize (FL_Fontsize pix)
  Sets the font size in pixels.

- FL_Labeltype labeltype () const
  Gets the label type.

- void labeltype (FL_Labeltype a)
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

- unsigned int output () const
  Returns if a widget is used for output only.

- FL_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (FL_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- FL_Color selection_color () const
  Gets the selection color.

- void selection_color (FL_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
11.130 Fl_Simple_Terminal Class Reference

Gets the widget width.

• Fl_When when () const

  Returns the conditions under which the callback is called.

• void when (uchar i)

  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const

  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const

  Gets the widget position in its window.

• int y () const

  Gets the widget position in its window.

• virtual ~Fl_Widget ()

  Destroys the widget.

Protected Member Functions

• void append_ansi (const char * s, int len)

  Handle appending string with ANSI escape sequences, and other 'special' character processing (such as
  backspaces).

• void backspace_buffer (unsigned int count)

  Destructive backspace from end of existing buffer() for specified count characters.

• void draw () FL_OVERRIDE

  Draws the widget, including a cursor at the end of the buffer.

• void enforce_history_lines ()

  Enforce 'history_lines' limit on the history buffer by trimming off lines from the top of the buffer.

• void enforce_stay_at_bottom ()

  Scroll to last line unless someone has manually scrolled the vertical scrollbar away from the bottom.

• void handle_backspace ()

  Handle a Unicode aware backspace.

• void unknown_escape ()

• void vscroll_cb2 (Fl_Widget *, void *)

Protected Member Functions inherited from Fl_Text_Display

• void absolute_top_line_number (int oldFirstChar)

  Re-calculate absolute top line number for a change in scroll position.

• void calc_last_char ()

  Update last display character index.

• void calc_line_starts (int startLine, int endLine)

  Update the line starts array.

• void clear_rect (int style, int x, int y, int width, int height) const

  Clear a rectangle with the appropriate background color for style.

• void display_insert ()

  Scroll the display to bring insertion cursor into view.

• void draw () FL_OVERRIDE

  Draw the widget.

• void draw_cursor (int, int)

  Draw a cursor with top center at X, Y.

• void draw_line_numbers (bool clearAll)

  Refresh the line number area.

• void draw_range (int start, int end)

  Draw a range of text.
• void draw_string (int style, int x, int y, int toX, const char *string, int nChars) const
  Draw a text segment in a single style.

• void draw_text (int X, int Y, int W, int H)
  Refresh a rectangle of the text display.

• void draw_vline (int visLineNum, int leftClip, int rightClip, int leftCharIndex, int rightCharIndex)
  Draw a single line of text.

• int empty_vlines () const
  Return true if there are lines visible with no corresponding buffer text.

• void extend_range_for_styles (int *start, int *end)
  I don’t know what this does!

• void find_line_end (int pos, bool start_pos_is_line_start, int *lineEnd, int *nextLineStart) const
  Finds both the end of the current line and the start of the next line.

• void find_wrap_range (const char *deletedText, int pos, int nInserted, int nDeleted, int *modRangeStart, int *modRangeEnd, int *linesInserted, int *linesDeleted)
  Wrapping calculations.

• int find_x (const char *s, int len, int style, int x) const
  Find the index of the character that lies at the given x position / closest cursor position.

• int get_absolute_top_line_number () const
  Returns the absolute (non-wrapped) line number of the first line displayed.

• int handle_rmb (int readonly)
  Handle right mouse button down events.

• int handle_vline (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const
  Universal pixel machine.

• int longest_vline () const
  Find the longest line of all visible lines.

• void maintain_absolute_top_line_number (int state)
  Line numbering stuff, currently unused.

• int maintaining_absolute_top_line_number () const
  Returns true if a separate absolute top line number is being maintained.

• void measure_deleted_lines (int pos, int nDeleted)
  Wrapping calculations.

• double measure_proportional_character (const char *s, int colNum, int pos) const
  Wrapping calculations.

• int measure_vline (int visLineNum) const
  Returns the width in pixels of the displayed line pointed to by "visLineNum".

• void offset_line_starts (int newTopLineNum)
  Offset line start counters for a new vertical scroll position.

• int position_to_line (int pos, int *lineNum) const
  Convert a position index into a line number offset.

• int position_to_linecol (int pos, int *lineNum, int *column) const
  Find the line and column number of position pos.

• void reset_absolute_top_line_number ()
  Reestablish the absolute (non-wrapped) top line number.

• void scroll_ (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

• double string_width (const char *string, int length, int style) const
  Find the width of a string in the font of a particular style.

• void update_h_scrollbar ()
  Update horizontal scrollbar.
• void update_line_starts (int pos, int charsInserted, int charsDeleted, int linesInserted, int linesDeleted, int *scrolled)

Update line start arrays and variables.

• void update_v_scrollbar ()

Update vertical scrollbar.

• int vline_length (int visLineNum) const

Count number of bytes in a visible line.

• int wrap_uses_character (int lineEndPos) const

Check if the line break is caused by a newline or by line wrapping.

• void wrapped_line_counter (Fl_Text_Buffer *buf, int startPos, int maxPos, int maxLines, bool startPosLineStart, int styleBufOffset, int *retPos, int *retLines, int *retLineStart, int *retLineEnd, bool countLastLineMissingNewLine=true) const

Wrapping calculations.

• int xy_to_position (int x, int y, int PosType=CHARACTER_POS) const

Translate a pixel position into a character index.

• void xy_to_rowcol (int x, int y, int *row, int *column, int PosType=CHARACTER_POS) const

Translate pixel coordinates into row and column.

Protected Member Functions inherited from Fl_Group

• Fl_Rect * bounds ()

Returns the internal array of widget sizes and positions.

• void draw_child (Fl_Widget &widget) const

Forces a child to redraw.

• void draw_children ()

Draws all children of the group.

• void draw_outside_label (const Fl_Widget &widget) const

Parents normally call this to draw outside labels of child widgets.

• virtual int on_insert (Fl_Widget *, int)

Allow derived groups to act when a widget is added as a child.

• virtual int on_move (int, int)

Allow derived groups to act when a widget is moved within the group.

• virtual void on_remove (int)

Allow derived groups to act when a child widget is removed from the group.

• int * sizes ()

Returns the internal array of widget sizes and positions.

• void update_child (Fl_Widget &widget) const

Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)

Clears a flag in the flags mask.

• void draw_backdrop () const

If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const

Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const

Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const

Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

Static Protected Member Functions

- static void vscroll_cb (Fl_Widget *, void *)

Static Protected Member Functions inherited from Fl_Text_Display

- static void buffer_modified_cb (int pos, int nInserted, int nDeleted, int nRestyled, const char ∗deletedText, void ∗cbArg)
  This is called whenever the buffer is modified.

- static void buffer_predelete_cb (int pos, int nDeleted, void ∗cbArg)
  This is called before any characters are deleted.

- static void h_scrollbar_cb (Fl_Scrollbar ∗w, Fl_Text_Display ∗d)
  Callback for drag or valueChanged on horizontal scrollbar.

- static void scroll_timer_cb (void ∗)
  Timer callback for scroll events.

- static void v_scrollbar_cb (Fl_Scrollbar ∗w, Fl_Text_Display ∗d)
  Callback for drag or valueChanged on vertical scrollbar.

Protected Attributes

11.130.1 Detailed Description

This is a continuous text scroll widget for logging and debugging output, much like a terminal. Includes printf() for appending messages, a line limit for the screen history size, ANSI sequences to control text color, font face, font weight and font size. This is useful in place of using stdout/stderr for logging messages when no terminal is available, such as when an application is invoked from a desktop shortcut, dock, or file browser. Like a regular console terminal, the vertical scrollbar 'tracks' the bottom of the buffer as new output is added. When the user scrolls away from the bottom, this 'tracking' feature is temporarily suspended, so the user can browse the terminal history without fighting the scrollbar when new text is added asynchronously. When the user returns the scrollbar to the bottom of the display, the scrollbar's tracking resumes.

Features include:

- history_lines(int) can define a maximum size for the terminal screen history
- stay_at_bottom(bool) can be used to cause the terminal to keep scrolled to the bottom
- ansi(bool) enables ANSI sequences within the text to control text colors
- style_table() can be used to define custom color/font/weight/size combinations

What this widget is NOT is a full terminal emulator; it does NOT handle stdio redirection, pipes, pseudo ttys, termio character cooking, keyboard input processing, screen addressing, random cursor positioning, curses(3) compatibility, or VT100/term emulation.

It is a simple text display widget that leverages the features of the Fl_Text_Display base class to handle terminal-like behavior, such as logging events or debug information.

Example use:
```c
#include <FL/Fl_Simple_Terminal.H>

tty = new Fl_Simple_Terminal(...);
tty->ansi(true); // enable use of "\033[\m"

tty->printf("The time is now: \033[32m%s\033[0m", date_time_str);
```

Example application:

Style Tables For Color/Font/Fontsise Control

Internally this widget derives from Fl_Text_Display, and therefore inherits some of its idiosyncrasies. In particular, when colors are used, the base class's concept of a 'style table' is used.
The 'style table' is similar to a color mapped image; where each pixel is a single value that is an index into a table of colors to minimize per-pixel memory use.

The style table has a similar goal; since every character in the terminal can potentially be a different color, instead of managing several integer attribute values per-character, a single character for each character is used as an index into the style table, choosing one of the available color/font/weight/size values available. This saves on as much as 3 to 4 times the memory use, useful when there's a large amount of text.

When `ansi()` is set to 'true', ANSI sequences of the form "\033[#m" can be used to select different colors, font faces, font weights (bold,italic..), and font sizes, where '#' is the index number into the style table. Example:

```
\033[0mThis text uses the 1st entry in the style table\n```
```
\033[1mThis text uses the 2nd entry in the style table\n```
```
\033[2mThis text uses the 3rd entry in the style table\n```

etc..

There is a built-in style table that provides some commonly used ANSI colors for "\033[30m" through "\033[37m" (blk,red,grn,yel,blu,mag,cyn,wht), and a brighter version of those colors for "\033[40" through "\033[47m". See `ansi(bool)` for more info.

You can also supply a custom style table using `style_table(Style_Table_Entry *,int,int)`, allowing you to define your own color/font/weight/size combinations. See that method's docs for more info.

All style index numbers are rounded to the size of the style table (via modulus) to protect the style array from overruns.

### 11.130.2 Member Function Documentation

#### 11.130.2.1 ansi() [1/2]

```cpp
bool Fl_Simple_Terminal::ansi ( ) const
```

Get the state of the ANSI flag which enables/disables the handling of ANSI sequences in text.

When true, ANSI sequences in the text stream control color, font and font sizes of text (e.g. "\033[41mThis is Red\033[0m"). For more info, see `ansi(bool)`.

See also

```cpp
ansi(bool)
```

#### 11.130.2.2 ansi() [2/2]

```cpp
void Fl_Simple_Terminal::ansi ( bool val )
```

Enable/disable support of ANSI sequences like "\033[31m", which sets the color/font/weight/size of any text that follows.

If enabled, ANSI sequences of the form "\033[#m" can be used to change font color, face, and size, where '#' is an index number into the current style table. These "escape sequences" are hidden from view. If disabled, the `textcolor()` / `textfont()` / `textsize()` methods define the color and font for all text in the terminal. ANSI sequences are not handled specially, and rendered as raw text.

A built-in style table is provided, but you can configure a custom style table using `style_table(Style_Table_Entry*,int,int)` for your own colors and fonts.

The built-in style table supports these ANSI sequences:

<table>
<thead>
<tr>
<th>ANSI Sequence</th>
<th>Color Name</th>
<th>Font Face + Size</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;\033[0m&quot;</td>
<td>&quot;Normal&quot;</td>
<td>FL_COURIER, 14</td>
<td>Resets to default color/font/weight/size</td>
</tr>
<tr>
<td>&quot;\033[30m&quot;</td>
<td>Medium Black</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[31m&quot;</td>
<td>Medium Red</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[32m&quot;</td>
<td>Medium Green</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[33m&quot;</td>
<td>Medium Yellow</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[34m&quot;</td>
<td>Medium Blue</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[35m&quot;</td>
<td>Medium Magenta</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[36m&quot;</td>
<td>Medium Cyan</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[37m&quot;</td>
<td>Medium White</td>
<td>FL_COURIER, 14</td>
<td>The color when &quot;\033[0m&quot; reset is used</td>
</tr>
<tr>
<td>&quot;\033[40m&quot;</td>
<td>Bright Black</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[41m&quot;</td>
<td>Bright Red</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[42m&quot;</td>
<td>Bright Green</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[43m&quot;</td>
<td>Bright Yellow</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[44m&quot;</td>
<td>Bright Blue</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
<tr>
<td>&quot;\033[45m&quot;</td>
<td>Bright Magenta</td>
<td>FL_COURIER, 14</td>
<td></td>
</tr>
</tbody>
</table>

Generated by Doxygen
11.130 Fl_Simple_Terminal Class Reference

Here's example code demonstrating the use of ANSI codes to select the built-in colors, and how it looks in the terminal:

![Figure 11.43 Fl_Simple_Terminal built-in ANSI sequences](image)

**Note**

Changing the `ansi(bool)` value clears the buffer and forces a `redraw()`.

Enabling ANSI mode overrides `textfont()`, `textsize()`, `textcolor()` completely, which are controlled instead by `current_style_index()` and the current `style_table()`.

See also

`style_table(Style_Table_Entry*,int,int), current_style_index(), normal_style_index()`

---

### 11.130.2.3 ansi_show_unknown() [1/2]

```cpp
bool Fl_Simple_Terminal::ansi_show_unknown ( void ) const
```

See if we should show unknown ANSI sequences with ‘¿’ or not.

See also

`ansi_show_unknown(bool)`

### 11.130.2.4 ansi_show_unknown() [2/2]

```cpp
void Fl_Simple_Terminal::ansi_show_unknown ( bool val )
```

Enable showing unknown ESC sequences with the ‘¿’ character.

By default this is off, and unknown escape sequences are silently ignored.

See also

`ansi_show_unknown()`

### 11.130.2.5 append()

```cpp
void Fl_Simple_Terminal::append ( const char * s, int len = -1 )
```

Appends new string ‘s’ to terminal.

The string can contain UTF-8, crlf’s. And if `ansi(bool)` is set to ‘true’, ANSI 'ESC' sequences (such as ESC[1m) and other control characters (such as backspace) are handled.

**Parameters**

<table>
<thead>
<tr>
<th>s</th>
<th>string to append.</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>optional length of string can be specified if known to save the internals from having to call <code>strlen()</code></td>
</tr>
</tbody>
</table>
11.130.2.6 backspace_buffer()

void Fl_Simple_Terminal::backspace_buffer (unsigned int count) [protected]

Destructive backspace from end of existing buffer() for specified count characters. Takes into account multi-byte (Unicode) chars. So if count is 3, last 3 chars are deleted from end of buffer.

11.130.2.7 clear()

void Fl_Simple_Terminal::clear ()

Clears the terminal's screen and history. Cursor moves to top of window.

11.130.2.8 current_style()

int Fl_Simple_Terminal::current_style ( ) const

Get the current style char used for style buffer. This character appends in parallel with any text in the text buffer to specify the per-character styling. This is typically 'A' for the first entry, 'B' for the second entry, etc. This value is changed by current_style_index(int).

See also

current_style_index(int)

11.130.2.9 current_style_index() [1/2]

int Fl_Simple_Terminal::current_style_index ( ) const

Get the style table index used as the current drawing color/font/weight/size for new text. This value is also controlled by the ANSI sequence "\033[m", where # would be a new style index value. So if the application executes: term->append("\033[4mTesting"), then current_style_index() returns 4.

See also

current_style_index(int)

11.130.2.10 current_style_index() [2/2]

void Fl_Simple_Terminal::current_style_index (int val)

Set the style table index used as the current drawing color/font/weight/size for new text. For example:

: tty->ansi(true);
yy->append("Some normal text.
\n");
tty->current_style_index(2); // same as \033[2m

tty->append("This text will be green.\n");
tty->current_style_index(tty->normal_style_index()); // same as \033[0m

tty->append("Back to normal text.\n");
:

This value can also be changed by an ANSI sequence like "\033[#m", where # would be a new style index value. So if the application executes: term->append("\033[4mTesting"), then current_style_index() will be left set to 4.

The index number specified should be within the number of items in the current style table. Values larger than the table will be clamped to the size of the table with a modulus operation. Effective only when ansi(bool) is true.
11.130.2.11 draw()

```cpp
void Fl_Simple_Terminal::draw ( )
    [protected], [virtual]
```

Draws the widget, including a cursor at the end of the buffer.
This is needed since currently Fl_Text_Display doesn't provide a reliable way to always do this.
Reimplemented from Fl_Group.

11.130.2.12 enforce_history_lines()

```cpp
void Fl_Simple_Terminal::enforce_history_lines ( )
    [protected]
```

Enforce 'history_lines' limit on the history buffer by trimming off lines from the top of the buffer.
This is a protected member called automatically by the public API functions. Only internal methods or subclasses
adjusting the internal buffer directly should need to call this.

11.130.2.13 enforce_stay_at_bottom()

```cpp
void Fl_Simple_Terminal::enforce_stay_at_bottom ( )
    [protected]
```

Scroll to last line unless someone has manually scrolled the vertical scrollbar away from the bottom.
This is a protected member called automatically by the public API functions. Only internal methods or subclasses
adjusting the internal buffer directly should need to call this.

11.130.2.14 handle_backspace()

```cpp
void Fl_Simple_Terminal::handle_backspace ( )
    [protected]
```

Handle a Unicode aware backspace.
This flushes the string parsed so far to Fl_Text_Display, then lets Fl_Text_Display handle the unicode aware
backspace.

11.130.2.15 history_lines() [1/2]

```cpp
int Fl_Simple_Terminal::history_lines ( ) const
```

Get the maximum number of terminal history lines last set by history_lines(int).
-1 indicates an unlimited scroll history.

See also

- history_lines(int)

11.130.2.16 history_lines() [2/2]

```cpp
void Fl_Simple_Terminal::history_lines ( int maxlines )
```

Sets the maximum number of lines for the terminal history.
The new limit value is automatically enforced on the current screen history, truncating off any lines that exceed the
new limit.
When a limit is set, the buffer is trimmed as new text is appended, ensuring the buffer never displays more than the
specified number of lines.
The default maximum is 500 lines.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>maxlines</strong></td>
</tr>
</tbody>
</table>

11.130.2.17 normal_style_index() [1/2]

```cpp
int Fl_Simple_Terminal::normal_style_index ( ) const
```

Gets the style table index used by the ANSI terminal reset sequence "\033[0m".
This is the value last set by `normal_style_index(int)`, or as set by the 3rd argument to `style_table(Style_Table_Entry*,int,int)`.

See also

`normal_style_index(int), ansi(bool), style_table(Style_Table_Entry*,int,int)`

### 11.130.2.18 normal_style_index() [2/2]

```cpp
void Fl_Simple_Terminal::normal_style_index (int val)
```

Sets the style table index used by the ANSI terminal reset sequence "\033[0m", which resets the current drawing color/font/weight/size to “normal”.

Effective only when `ansi(bool)` is ‘true’.

See also

`ansi(bool), style_table(Style_Table_Entry*,int,int)`

Note

Changing this value does not change the current drawing color. To change that, use `current_style_index(int)`.

### 11.130.2.19 printf()

```cpp
void Fl_Simple_Terminal::printf (const char * fmt, ... )
```

Appends printf formatted messages to the terminal.

The string can contain UTF-8, crlf's, and ANSI sequences are also supported when `ansi(bool)` is set to ‘true’.

Example:

```cpp
#include <FL/Fl_Simple_Terminal.H>
int main(..) {
    // Create a simple terminal, and append some messages to it
    Fl_Simple_Terminal *tty = new Fl_Simple_Terminal(..);
    // Append three lines of formatted text to the buffer
    tty->printf("The current date is: %s.\n\nThe time is: %s\n", date_str, time_str);
    tty->printf("The current PID is %ld.\n", (long)getpid());
    // ...

    Note

See Fl_Text_Buffer::vprintf() for limitations.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>fmt</th>
</tr>
</thead>
</table>
|    | is a printf format string for the message text.

### 11.130.2.20 remove_lines()

```cpp
void Fl_Simple_Terminal::remove_lines (int start, int count)
```

Remove the specified range of lines from the terminal, starting with line 'start' and removing 'count' lines.

This method is used to enforce the history limit.

Parameters

<table>
<thead>
<tr>
<th>start</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>starting line to remove</td>
<td>number of lines to remove</td>
</tr>
</tbody>
</table>
11.130.2.21 stay_at_bottom() [1/2]

    bool Fl_Simple_Terminal::stay_at_bottom() const

 Gets the current value of the stay_at_bottom(bool) flag.
When true, the terminal tries to keep the scrollbar scrolled to the bottom when new text is added.

See also
    stay_at_bottom(bool)

11.130.2.22 stay_at_bottom() [2/2]

    void Fl_Simple_Terminal::stay_at_bottom(bool val)

 Configure the terminal to remain scrolled to the bottom when possible, chasing the end of the buffer whenever new
text is added.
If disabled, the terminal behaves more like a text display widget; the scrollbar does not chase the bottom of the
buffer.
If the user scrolls away from the bottom, this ‘chasing’ feature is temporarily disabled. This prevents the user
from having to fight the scrollbar chasing the end of the buffer while browsing when new text is also being added
asynchronously. When the user returns the scroller to the bottom of the display, the chasing behavior resumes.
The default is ‘true’.

11.130.2.23 style_table() [1/2]

    const Fl_Text_Display::Style_Table_Entry * Fl_Simple_Terminal::style_table() const

 Return the current style table being used.
This is the value last passed as the 1st argument to style_table(Style_Table_Entry*,int,int). If no style table was
defined, the built-in style table is returned.
ansi(bool) must be set to ‘true’ for the style table to be used at all.

See also
    style_table(Style_Table_Entry*,int,int)

11.130.2.24 style_table() [2/2]

    void Fl_Simple_Terminal::style_table(Fl_Text_Display::Style_Table_Entry * stable,
                                          int stable_size,
                                          int normal_style_index = 0)

 Set a user defined style table, which controls the font colors, faces, weights and sizes available for the terminal's
text content.
ansi(bool) must be set to ‘true’ for the defined style table to be used at all.
If ‘stable’ is NULL, then the “built in” style table is used. For info about the built-in colors, see ansi(bool).
Which style table entry used for drawing depends on the value last set by current_style_index(), or by the ANSI
sequence “\033[#m”, where ‘#’ is the index into the style table array, the index limited to the size of the array via
modulus.
If the index# passed via “\033[#m” is larger than the number of elements in the table, the value is clamped via
modulus. So for a 10 element table, the following ANSI codes would all be equivalent, selecting the 5th element in
the table: “\033[5m”, “\033[15m”, “\033[25m”, etc. This is because 5==(15%10)==(25%10), etc.
A special exception is made for “\033[0m”, which is supposed to “reset” the current style table to default
color/font/weight/size, as last set by normal_style_index, or by the API method normal_style_index(int).
In cases like the built-in style table, where the 17th item is the “normal” color, the ‘normal_style_index’ is set to 17
so that “\033[0m” resets to that color, instead of the first element in the table.
If you want “\033[0m” to simply pick the first element in the table, then set ‘normal_style_index’ to 0.
An example of defining a custom style table (white courier 14, red courier 14, and white helvetica 14):
    int main() {
        // Our custom style table
        Fl_Text_Display::Style_Table_Entry mystyle[] = {
            (const Fl_Text_Display::Style_Table_Entry*).....
        }
    }
// Font Color Font Face Font Size Index ANSI Sequence
// ----------------- ----------------- -------- ------- ------------
{ FL_WHITE, FL_COURIER_BOLD, 14 }, // 0 "33[0m" (*default*)
{ FL_RED, FL_COURIER_BOLD, 14 }, // 1 "33[1m"
{ FL_WHITE, FL_HELVETICA, 14 } // 2 "33[2m";

// Create terminal, enable ANSI and our style table
tty = new Fl_Simple_Terminal(...); // enable ANSI codes
tty->style_table(mystyle[0], sizeof(mystyle), 0); // use our custom style table

// Now write to terminal, with ANSI that uses our style table
tty->printf("033[0mNormal Text\n");
tty->append("033[2mWhite Helvetica\n033[0mBack to normal.\n");

Note

Changing the style table clear()s the terminal.
You currently can't control /background/ color of text, a limitation of Fl_Text_Display's current implementation.
The caller is responsible for managing the memory of the style table.
Until STR#3412 is repaired, Fl_Text_Display has scrolling bug if the style table's font size != textsize()

Parameters

<table>
<thead>
<tr>
<th>stable</th>
<th>- the style table, an array of structs of the type Fl_Text_Display::Style_Table_Entry. Can be NULL to use the default style table (see ansi(bool)).</th>
</tr>
</thead>
<tbody>
<tr>
<td>stable_size</td>
<td>- the sizeof() the style table (in bytes). Set this to 0 if 'stable' is NULL.</td>
</tr>
<tr>
<td>normal_style_index</td>
<td>- the style table index# used when the special ANSI sequence &quot;033[0m&quot; is encountered. Normally use 0 so that sequence selects the first item in the table. Only use different values if a different entry in the table should be the default. This value should not be larger than the number of items in the table, or it will be clamped with a modulus operation. This value is ignored if stable is NULL.</td>
</tr>
</tbody>
</table>

11.130.225 style_table_size()

int Fl_Simple_Terminal::style_table_size ( ) const
Return the current style table's size (in bytes).
This is the value last passed as the 2nd argument to style_table(Style_Table_Entry*,int,int).

11.130.226 text() [1/2]

const char * Fl_Simple_Terminal::text ( ) const
Returns entire text content of the terminal as a single string.
This includes the screen history, as well as the visible onscreen content.

11.130.227 text() [2/2]

void Fl_Simple_Terminal::text ( const char * s,
int len = -1 )
Replaces the terminal with new text content in string 's'.
The string can contain UTF-8, crlf's, and ANSI sequences are also supported when ansi(bool) is set to 'true'.
Old terminal content is completely cleared.

Parameters

<table>
<thead>
<tr>
<th>s</th>
<th>string to append.</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>optional length of string can be specified if known to save the internals from having to call strlen()</td>
</tr>
</tbody>
</table>
See also
append(), printf(), vprintf(), clear()

11.130.2.28 vprintf()

void Fl_Simple_Terminal::vprintf (const char ∗ fmt, va_list ap)

Appends printf formatted messages to the terminal. Subclasses can use this to implement their own printf() functionality. The string can contain UTF-8, crlf’s, and ANSI sequences are also supported when ansi(bool) is set to ‘true’.

Note
The expanded string is currently limited to 1024 characters.

Parameters

<table>
<thead>
<tr>
<th>fmt</th>
<th>is a printf format string for the message text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>is a va_list created by va_start() and closed with va_end(), which the caller is responsible for handling.</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Simple_Terminal.H
- Fl_Simple_Terminal.cxx

11.131 Fl_Single_Window Class Reference

This is the same as Fl_Window.

```cpp
#include <Fl_Single_Window.H>
```

Inheritance diagram for Fl_Single_Window:

```
Fl_Widget
   |
   v
Fl_Group
   |
   v
Fl_Window
   |
   v
Fl_Single_Window
   |
   v
Fl_Menu_Window
```

Public Member Functions

- **Fl_Single_Window** (int W, int H, const char ∗l=0)
  Creates a new Fl_Single_Window widget using the given size, and label (title) string.

- **Fl_Single_Window** (int X, int Y, int W, int H, const char ∗l=0)
  Creates a new Fl_Single_Window widget using the given position, size, and label (title) string.

- **void show ()** FL_OVERRIDE
  Makes a widget visible.

- **void show (int a, char **b)**
  Same as Fl_Window::show(int a, char **b)
Public Member Functions inherited from Fl_Window

- virtual class Fl_Double_Window * as_double_window ()
  
  Return non-null if this is an Fl_Double_Window object.

- virtual class Fl_Overlay_Window * as_overlay_window ()

  Return non-null if this is an Fl_Overlay_Window object.

- Fl_Window const * as_window () const FL_OVERRIDE

  Returns an Fl_Window pointer if this widget is an Fl_Window.

- unsigned int border () const

  Returns whether the window possesses a border.

- void border (int b)

  Sets whether or not the window manager border is around the window.

- void clear_border ()

  Fast inline function to turn the window manager border off.

- void clear_modal_states ()

  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

- void copy_label (const char *a)

  Sets the window titlebar label to a copy of a character string.

- void cursor (const Fl_RGB_Image *, int, int)

  Changes the cursor for this window using the provided image as cursor's shape.

- void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)

  For back compatibility only.

- void cursor (Fl_Cursor)

  Changes the cursor for this window.

- int decorated_h () const

  Returns the window height including any window title bar and any frame added by the window manager.

- int decorated_w () const

  Returns the window width including any frame added by the window manager.

- void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)

  For back compatibility only.

- void default_cursor (Fl_Cursor)

  Sets the default window cursor.

- void draw_backdrop ()

  Draw the background image if one is set and is aligned inside.

- Fl_Window (int w, int h, const char *title=0)

  Creates a window from the given width w, height h, and title.

- Fl_Window (int x, int y, int w, int h, const char *title=0)

  Creates a window from the given position (x, y), size (w, h) and title.

- void free_position ()

  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.

- void fullscreen ()

  Makes the window completely fill one or more screens, without any window manager border visible.

- unsigned int fullscreen_active () const

  Returns non zero if FULLSCREEN flag is set, 0 otherwise.

- void fullscreen_off ()

  Turns off any side effects of fullscreen()

- void fullscreen_off (int X, int Y, int W, int H)

  Turns off any side effects of fullscreen() and does resize(x,y,w,h).

- void fullscreen_screens (int top, int bottom, int left, int right)
Sets which screens should be used when this window is in fullscreen mode.

- **int handle (int) FL_OVERRIDE**
  Handles the specified event.

- **void hide () FL_OVERRIDE**
  Removes the window from the screen.

- **void hotspot (const Fl_Widget &p, int offscreen=0)**
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot (const Fl_Widget *, int offscreen=0)**
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot (int x, int y, int offscreen=0)**
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- **const void * icon () const**
  Gets the current icon window target dependent data.

- **void icon (const Fl_RGB_Image *)**
  Sets or resets a single window icon.

- **void icon (const void *ic)**
  Platform-specific method to set the window icon usable on Windows and X11 only.

- **void iconize ()**
  Iconifies the window.

- **const char * iconlabel () const**
  See void Fl_Window::iconlabel(const char *)

- **void iconlabel (const char *)**
  Sets the icon label.

- **void icons (const Fl_RGB_Image *[ ], int)**
  Sets the window icons.

- **void icons (HICON big_icon, HICON small_icon)**
  Sets the window icons using HICON handles (Windows platform only).

- **const char * label () const**
  See void Fl_Window::label(const char *)

- **void label (const char *)**
  Sets the window title bar label.

- **void label (const char *label, const char *iconlabel)**
  Sets the icon label.

- **void make_current ()**
  Sets things up so that the drawing functions in `<FL/fl_draw.H>` will go into this window.

- **void maximize ()**
  Maximizes a top-level window to its current screen.

- **unsigned int maximize_active () const**
  Returns whether the window is currently maximized.

- **unsigned int menu_window () const**
  Returns true if this window is a menu window.

- **unsigned int modal () const**
  Returns true if this window is modal.

- **unsigned int non_modal () const**
  Returns true if this window is modal or non-modal.

- **fl_uintptr_t os_id ()**
  Returns a platform-specific identification of a shown window, or 0 if not shown.

- **unsigned int override () const**
Returns non zero if OVERRIDE flag is set, 0 otherwise.

- `void resize (int X, int Y, int W, int H) FL_OVERRIDE`
  Changes the size and position of the window.

- `int screen_num ()`
  The number of the screen containing the mapped window.

- `void screen_num (int screen_num)`
  Set the number of the screen where to map the window.

- `void set_menu_window ()`
  Marks the window as a menu window.

- `void set_modal ()`
  A "modal" window, when `shown()`, will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

- `void set_non_modal ()`
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a `modal()` one in that it remains on top, but it has no effect on event delivery.

- `void set_override ()`
  Activates the flags NOBORDER|OVERRIDE.

- `void set_tooltip_window ()`
  Marks the window as a tooltip window.

- `const Fl_Image * shape ()`
  Returns the image controlling the window shape or NULL.

- `void shape (const Fl_Image &b)`
  Set the window’s shape with an `Fl_Image`.

- `void shape (const Fl_Image *img)`
  Assigns a non-rectangular shape to the window.

- `void show () FL_OVERRIDE`
  Puts the window on the screen.

- `void show (int argc, char **argv)`
  Puts the window on the screen with `show()` and parses command-line arguments.

- `int shown ()`
  Returns non-zero if `show()` has been called (but not `hide()`).

- `void size_range (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)`
  Sets the allowable range the user can resize this window to.

- `unsigned int tooltip_window () const`
  Returns true if this window is a tooltip window.

- `void un_maximize ()`
  Returns a previously maximized top-level window to its previous size.

- `void wait_for_expose ()`
  Waits for the window to be displayed after calling `show()`.

- `int x_root () const`
  Gets the x position of the window on the screen.

- `const char * xclass () const`
  Returns the xclass for this window, or a default.

- `void xclass (const char *c)`
  Sets the xclass for this window.

- `int y_root () const`
  Gets the y position of the window on the screen.

- `virtual ~FL_Window ()`
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Group

- Fl_Widget * &_ddfdesign_kludge ()
  This is for forms compatibility only.
- void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
- void add (Fl_Widget *o)
  See void Fl_Group::add(Fl_Widget &w)
- void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
- Fl_Widget * const * array () const
  Returns a pointer to the array of children.
- Fl_Group const * as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
- Fl_Widget * child (int n) const
  Returns array()[n].
- int children () const
  Returns how many child widgets the group has.
- void clear ()
  Deletes all child widgets from memory recursively.
- unsigned int clip_children ()
  Returns the current clipping mode.
- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
- void end ()
  Exactly the same as current(this->parent()).
- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget *W)
- void forms_end ()
  This is for forms compatibility only.
- void init_sizes ()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
Removes the widget at index from the group but does not delete it.

- **Fl_Widget** ∗ resizable () const
  Returns the group's resizable widget.

- **void** resizable (Fl_Widget &o)
  Sets the group's resizable widget.

- **void** resizable (Fl_Widget ∗o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual** ∼Fl_Group ()
  The destructor also deletes all the children.

### Public Member Functions inherited from **Fl_Widget**

- **void** _clear_fullscreen ()
- **void** _set_fullscreen ()
- **void** activate ()
  Activates the widget.

- **unsigned int** active () const
  Returns whether the widget is active.

- **int** active_r () const
  Returns whether the widget and all of its parents are active.

- **Fl_Align** align () const
  Gets the label alignment.

- **void** align (Fl_Align alignment)
  Sets the label alignment.

- **long** argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- **void** argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual** class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual** class Fl_Gl_Window const ∗ as_gl_window () const

- **void** bind_deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

- **void** bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void** bind_image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.

- **void** bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype** box () const
  Gets the box type of the widget.

- **void** box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- **Fl_Callback_p** callback () const
  Gets the current callback function for the widget.

- **void** callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.

- **void** callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- **void** callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (FL_Widget *wgt, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (FL_Widget *wgt, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, FL_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• FL_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const FL_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (FL_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (FL_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const FL_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char *label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (FL_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• FL_Color labelcolor () const
  Gets the label color.
• void labelcolor (FL_Color c)
  Sets the label color.
• FL_Font labelfont () const
  Gets the font to use.
• void labelfont (FL_Font f)
  Sets the font to use.
• FL_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (FL_Fontsize pix)
  Sets the font size in pixels.
• FL_Labeltype labeltype () const
  Gets the label type.
• void labeltype (FL_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
- **bool needs_keyboard ()** const
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output ()** const
  
  Returns if a widget is used for output only.

- **Fl_Group * parent ()** const
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **Fl_Color selection_color ()** const
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.

- **void set_visible ()**
  
  Makes the widget visible.

- **void set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label ()** const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **void size (int W, int H)**
  
  Changes the size of the widget.

- **int take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents ()** const
  
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char * tooltip ()** const
  
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  
  Sets the current tooltip text.

- **Fl_Window * top_window ()** const
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type ()** const
Gets the widget type.

- void **type**(uchar t)
  Sets the widget type.
- int **use_accents_menu**()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void *user_data() const
  Gets the user data for this widget.
- void user_data(Fl_Callback_User_Data*v, bool auto_free)
  Sets the user data for this widget.
- void user_data(void*v)
  Sets the user data for this widget.
- unsigned int visible() const
  Returns whether a widget is visible.
- unsigned int visible_focus() const
  Checks whether this widget has a visible focus.
- void visible_focus(int v)
  Modifies keyboard focus navigation.
- int visible_r() const
  Returns whether a widget and all its parents are visible.
- int **w**() const
  Gets the widget width.
- Fl_When when() const
  Returns the conditions under which the callback is called.
- void when(uchar i)
  Sets the flags used to decide when a callback is called.
- Fl_Window* window() const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- int **x**() const
  Gets the widget position in its window.
- int **y**() const
  Gets the widget position in its window.
- virtual ~Fl_Widget()
  Destroys the widget.

Additional Inherited Members

**Public Types inherited from Fl_Window**

- typedef struct HICON__ » HICON

**Static Public Member Functions inherited from Fl_Window**

- static Fl_Window* current() 
  Returns the last window that was made current.
- static void default_callback(Fl_Window*, void*v)
  Back compatibility: Sets the default callback v for win to call on close event.
- static void default_icon(const Fl_RGB_Image*)
  Sets a single default window icon.
- static void default_icons(const Fl_RGB_Image*, int)
  Sets the default window icons.
- static void default_icons(HICON big_icon, HICON small_icon)
  Sets the default window icons (Windows platform only).
• static const char * _default_xclass ()
  Returns the default xclass.
• static void _default_xclass (const char *)
  Sets the default window xclass.
• static bool _is_a_rescale ()
  Returns true when a window is being rescaled.
• static char _show_next_window_iconic ()
  Returns the static flag whether the next window should be opened iconified.
• static void _show_next_window_iconic (char stat)
  Sets a static flag whether the next window should be opened iconified.

Static Public Member Functions inherited from Fl_Group
• static Fl_Group * _current ()
  Returns the currently active group.
• static void _current (Fl_Group * g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget
• static void _default_callback (Fl_Widget * widget, void * data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int _label_shortcut (const char * t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int _test_shortcut (const char * t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget
• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7 ,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPYED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPYED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19, ,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  maximized = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Window
• void _default_size_range ()
  Protected method to calculate the default size range of a window.
• void _draw () FL_OVERRIDE
  Draws the widget.
• virtual void _flush ()
  Forces the window to be drawn, this window is also made current and calls draw().
• int _force_position () const
  Returns the internal state of the window’s FORCE_POSITION flag.
• void **force_position** (int force)
  
  Sets an internal flag that tells FLTK and the window manager to honor position requests.

• void **free_icons** ()
  
  Deletes all icons previously attached to the window.

• int **is_resizable** ()
  
  Protected method to determine whether a window is resizable.

### Protected Member Functions inherited from **Fl_Group**

• **Fl_Rect** ∗ **bounds** ()
  
  Returns the internal array of widget sizes and positions.

• void **draw_child** (**Fl_Widget** &widget) const
  
  Forces a child to redraw.

• void **draw_children** ()
  
  Draws all children of the group.

• void **draw_outside_label** (**const Fl_Widget** &widget) const
  
  Parents normally call this to draw outside labels of child widgets.

• virtual int **on_insert** (**Fl_Widget** ∗, int)
  
  Allow derived groups to act when a widget is added as a child.

• virtual int **on_move** (int, int)
  
  Allow derived groups to act when a widget is moved within the group.

• virtual void **on_remove** (int)
  
  Allow derived groups to act when a child widget is removed from the group.

• int ∗ **sizes** ()
  
  Returns the internal array of widget sizes and positions.

• void **update_child** (**Fl_Widget** &widget) const
  
  Draws a child only if it needs it.

### Protected Member Functions inherited from **Fl_Widget**

• void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

• void **draw_backdrop** () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void **draw_box** () const
  
  Draws the widget box according its box style.

• void **draw_box** (**Fl_Boxtype** t, **Fl_Color** c) const
  
  Draws a box of type t, of color c at the widget's position and size.

• void **draw_box** (**Fl_Boxtype** t, int x, int y, int w, int h, **Fl_Color** c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (**Fl_Boxtype** t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (**Fl_Boxtype** t, int x, int y, int w, int h, **Fl_Color** bg) const
  
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const
  
  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• **Fl_Widget** (int x, int y, int w, int h, **const char** ∗label=0L)
Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Static Protected Attributes inherited from Fl_Window

- static Fl_Window * current_
  Stores the last window that was made current.

11.131 Detailed Description

This is the same as Fl_Window. However, it is possible that some implementations will provide double-buffered windows by default. This subclass can be used to force single-buffering. This may be useful for modifying existing programs that use incremental update, or for some types of image data, such as a movie flipbook.

11.131.2 Member Function Documentation

11.131.2.1 show()

void Fl_Single_Window::show ( ) [virtual]
Makes a widget visible.
An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL_SHOW.
The visible() method returns true if the widget is set to be visible. The visible_r() method returns true if the widget and all of its parents are visible. A widget is only visible if visible() is true on it and all of its parents.
Changing it will send FL_SHOW or FL_HIDE events to the widget. Do not change it if the parent is not visible, as this will send false FL_SHOW or FL_HIDE events to the widget. redraw() is called if necessary on this or the parent.
See also
  hide(), visible(), visible_r()

Reimplemented from Fl_Widget.
The documentation for this class was generated from the following files:

- Fl_Single_Window.H
- Fl_Single_Window.cxx

11.132 Fl_Slider Class Reference

The Fl_Slider widget contains a sliding knob inside a box.
#include <Fl_Slider.H>

Inheritance diagram for Fl_Slider:
Public Member Functions

- void `bounds` (double a, double b)
  
  *Sets the minimum (a) and maximum (b) values for the valuator widget.*

- Fl_Slider (int X, int Y, int W, int H, const char *L=0)
  
  *Creates a new Fl_Slider widget using the given position, size, and label string.*

- Fl_Slider (uchar t, int X, int Y, int W, int H, const char *L)
  
  *Creates a new Fl_Slider widget using the given type, position, size, and label string.*

- int `handle` (int) FL_OVERRIDE
  
  *Handles the specified event.*

- int `scrollvalue` (int pos, int size, int first, int total)
  
  *Sets the size and position of the sliding knob in the box.*

- Fl_Boxtype `slider` () const
  
  *Gets the slider box type.*

- void `slider` (Fl_Boxtype c)
  
  *Sets the slider box type.*

- float `slider_size` () const
  
  *Get the dimensions of the moving piece of slider.*

- void `slider_size` (double v)
  
  *Set the dimensions of the moving piece of slider.*

Public Member Functions inherited from Fl_Valuator

- void `bounds` (double a, double b)
  
  *Sets the minimum (a) and maximum (b) values for the valuator widget.*

- double `clamp` (double)
  
  *Clamps the passed value to the valuator range.*

- virtual int `format` (char *)
  
  *Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*

- double `increment` (double, int)
  
  *Adds n times the step value to the passed value.*

- double `maximum` () const
  
  *Gets the maximum value for the valuator.*

- void `maximum` (double a)
  
  *Sets the maximum value for the valuator.*

- double `minimum` () const
  
  *Gets the minimum value for the valuator.*

- void `minimum` (double a)
  
  *Sets the minimum value for the valuator.*

- void `precision` (int digits)
  
  *Sets the step value to 1.0 / 10^digits.*

- void `range` (double a, double b)
  
  *Sets the minimum and maximum values for the valuator.*

- double `round` (double)
Round the passed value to the nearest step increment.

- double step () const
  
  Gets or sets the step value.

- void step (double a, int b)
  
  See double Fl_Valuator::step() const

- void step (double s)
  
  See double Fl_Valuator::step() const.

- void step (int a)
  
  See double Fl_Valuator::step() const

- double value () const
  
  Gets the floating point(double) value.

- int value (double)
  
  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  
  Activates the widget.

- unsigned int active () const
  
  Returns whether the widget is active.

- int active_r () const
  
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  
  Gets the label alignment.

- void align (Fl_Align alignment)
  
  Sets the label alignment.

- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const ∗ as_gl_window () const

- virtual Fl_Group ∗ as_group ()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const ∗ as_group () const

- virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const ∗ as_window () const

- void bind_deimage (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.

- void callback (Fl_Callback ∗cb)
  
  Sets the current callback function for the widget.

- void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback ∗cb, void ∗p)
  
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 ∗cb)
  
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 ∗cb, long p=0)
  
  Sets the current callback function for the widget.

- unsigned int changed () const
  
  Checks if the widget value changed since the last callback.

- void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.

- void clear_output ()
  
  Sets a widget to accept input.

- void clear_visible ()
  
  Hides the widget.

- void clear_visible_focus ()
  
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  
  Gets the background color of the widget.

- void color (Fl_Color bg)
  
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  
  For back compatibility only.

- void color2 (unsigned a)
  
  For back compatibility only.

- int contains (const Fl_Widget ∗w) const
  
  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)
  
  Sets the current label.

- void copy_tooltip (const char ∗text)
  
  Sets the current tooltip text.

- uchar damage () const
  
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.
• int **damage_resize** (int, int, int, int)
  
  *Internal use only.*

• void **deactivate** ()
  
  Deactivates the widget.

• **Fl_Image** ∗ (**deimage** ()
  
  *Gets the image that is used as part of the widget label when in the inactive state.*

• const **Fl_Image** ∗ (**deimage** () const
  
  *Gets the image that is used as part of the widget label when in the inactive state.*

• void **deimage** (**Fl_Image** &img)
  
  *Sets the image to use as part of the widget label when in the inactive state.*

• void **deimage** (**Fl_Image** ∗ img)
  
  *Sets the image to use as part of the widget label when in the inactive state.*

• int **deimage_bound** () const
  
  *Returns whether the inactive image is managed by the widget.*

• void **do_callback** (**Fl_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  
  *Calls the widget callback function with default arguments.*

• void **do_callback** (**Fl_Widget** ∗ wgt, long arg, **Fl_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  
  *Calls the widget callback function with arbitrary arguments.*

• void **do_callback** (**Fl_Widget** ∗ wgt, void ∗ arg=0, **Fl_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  
  *Calls the widget callback function with arbitrary arguments.*

• void **draw_label** (int, int, int, int, **Fl_Align**) const
  
  *Draws the label in an arbitrary bounding box with an arbitrary alignment.*

• int **h** () const
  
  *Gets the widget height.*

• virtual void **hide** ()
  
  *Makes a widget invisible.*

• **Fl_Image** ∗ (**image** ()
  
  *Gets the image that is used as part of the widget label when in the active state.*

• const **Fl_Image** ∗ (**image** () const
  
  *Gets the image that is used as part of the widget label when in the active state.*

• void **image** (**Fl_Image** &img)
  
  *Sets the image to use as part of the widget label when in the active state.*

• void **image** (**Fl_Image** ∗ img)
  
  *Sets the image to use as part of the widget label when in the active state.*

• int **image_bound** () const
  
  *Returns whether the image is managed by the widget.*

• int **inside** (**const Fl_Widget** ∗ wgt) const
  
  *Checks if this widget is a child of wgt.*

• int **is_label_copied** () const
  
  *Returns whether the current label was assigned with copy_label().*

• const **char** ∗ (**label** () const
  
  *Gets the current label text.*

• void **label** (**const char** ∗ text)
  
  *Sets the current label pointer.*

• void **label** (**Fl_Labeltype** a, **const char** ∗ b)
  
  *Shortcut to set the label text and type in one call.*

• **Fl_Color** **labelcolor** () const
  
  *Gets the label color.*

• void **labelcolor** (**Fl_Color** c)
  
  *Sets the label color.*

• **Fl_Font labelfont** () const
Gets the font to use.
• void *labelfont* (*Fl_Font* f)
  
  Sets the font to use.

• *Fl_Fontsize* *labelsiz*e () const
  
  Gets the font size in pixels.

• void *labelsiz*e (*Fl_Fontsize* pix)
  
  Sets the font size in pixels.

• *Fl_Labelltype* *l*abel*type* () const
  
  Gets the label type.

• void *l*abel*type* (*Fl_Labelltype* a)
  
  Sets the label type.

• void *measure_label* (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• bool *needs_keyboard* () const
  
  Returns whether this widget needs a keyboard.

• void *needs_keyboard* (bool needs)
  
  Sets whether this widget needs a keyboard.

• unsigned int *output* () const
  
  Returns if a widget is used for output only.

• *Fl_Group* *parent* () const
  
  Returns a pointer to the parent widget.

• void *parent* (*Fl_Group* *p)
  
  Internal use only - "for hacks only".

• void *position* (int X, int Y)
  
  Repositions the window or widget.

• void *redraw* ()
  
  Schedules the drawing of the widget.

• void *redraw_label* ()
  
  Schedules the drawing of the label.

• virtual void *resize* (int x, int y, int w, int h)

  Changes the size or position of the widget.

• *Fl_Color* *selection_color* () const
  
  Gets the selection color.

• void *selection_color* (*Fl_Color* a)
  
  Sets the selection color.

• void *set_active* ()
  
  Marks the widget as active without sending events or changing focus.

• void *set_changed* ()
  
  Marks the value of the widget as changed.

• void *set_output* ()
  
  Sets a widget to output only.

• void *set_visible* ()
  
  Makes the widget visible.

• void *set_visible_focus* ()
  
  Enables keyboard focus navigation with this widget.

• int *shortcut_label* () const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void *shortcut_label* (int value)
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void *show* ()

  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takeevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Protected Member Functions

- void `draw()` FL_OVERRIDE
  Draws the widget.
- void `draw(int, int, int, int)`
- int `handle(int, int, int, int)`

Protected Member Functions inherited from `Fl_Valuator`

- `Fl_Valuator(int X, int Y, int W, int H, const char *)` L
  Creates a new `Fl_Valuator` widget using the given position, size, and label string.
- void `handle_drag(double newvalue)`
  Called during a drag operation, after an `FL_WHEN_CHANGED` event is received and before the callback.
- void `handle_push()`
  Stores the current value in the previous value.
- void `handle_release()`
  Called after an `FL_WHEN_RELEASE` event is received and before the callback.
- int `horizontal()` const
  Tells if the valuator is an `FL_HORIZONTAL` one.
- double `previous_value()` const
  Gets the previous floating point value before an event changed it.
- void `set_value(double v)`
  Sets the current floating point value.
- double `softclamp(double)`
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void `value_damage()`
  Asks for partial redraw.

Protected Member Functions inherited from `Fl_Widget`

- void `clear_flag(unsigned int c)`
  Clears a flag in the flags mask.
- void `draw_backdrop()` const
  If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.
- void `draw_box()` const
  Draws the widget box according its box style.
- void `draw_box(Fl_Boxtype t, Fl_Color c)` const
  Draws a box of type `t`, of color `c` at the widget's position and size.
- void `draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c)` const
  Draws a box of type `t`, of color `c` at the position `X,Y` and size `W,H`.
- void `draw_focus()` const
  Draws a focus rectangle around the widget.
- void `draw_focus(Fl_Boxtype t, int X, int Y, int W, int H)` const
  Draws a focus rectangle around the widget.
- void `draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg)` const
  Draws a focus box for the widget at the given position and size.
- void `draw_label()` const
  Draws the widget's label at the defined label position.
- void `draw_label(int, int, int)` const
  Draws the label in an arbitrary bounding box.
- `Fl_Widget(int x, int y, int w, int h, const char *label="0L")`
  Creates a widget at the given position and size.
• unsigned int **flags** () const  
  *Gets the widget flags mask.*
• void **h** (int v)  
  *Internal use only.*
• void **set_flag** (unsigned int c)  
  *Sets a flag in the flags mask.*
• void **w** (int v)  
  *Internal use only.*
• void **x** (int v)  
  *Internal use only.*
• void **y** (int v)  
  *Internal use only.*

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void **default_callback** (Fl_Widget ∗widget, void ∗data)  
  *The default callback for all widgets that don’t set a callback.*
• static unsigned int **label_shortcut** (const char ∗t)  
  *Returns the Unicode value of the ‘&x’ shortcut in a given text.*
• static int **test_shortcut** (const char ∗t, const bool require_alt=false)  
  *Returns true if the given text t contains the entered ‘&x’ shortcut.*

  *flags possible values enumeration.*

11.132.1 Detailed Description

The Fl_Slider widget contains a sliding knob inside a box. It is often used as a scrollbar. Moving the box all the way to the top/left sets it to the minimum(), and to the bottom/right to the maximum(). The minimum() may be greater than the maximum() to reverse the slider direction. Use void Fl_Widget::type(int) to set how the slider is drawn, which can be one of the following:

• FL_VERTICAL - Draws a vertical slider (this is the default).
• FL_HORIZONTAL - Draws a horizontal slider.
• FL_VERT_FILL_SLIDER - Draws a filled vertical slider, useful as a progress or value meter.
• FL_HOR_FILL_SLIDER - Draws a filled horizontal slider, useful as a progress or value meter.
• FL_VERT_NICE_SLIDER - Draws a vertical slider with a nice looking control knob.
• FL_HOR_NICE_SLIDER - Draws a horizontal slider with a nice looking control knob.

Figure 11.44 Fl_Slider

11.132.2 Constructor & Destructor Documentation

11.132.2.1 Fl_Slider()

Fl_Slider::Fl_Slider ( )
  
  int X,
  int Y,
  int W,
  int H,
  const char * L = 0 )

Creates a new Fl_Slider widget using the given position, size, and label string.
The default boxtype is FL_DOWN_BOX.

11.132.3 Member Function Documentation

11.132.3.1 bounds()

void Fl_Slider::bounds ( )
  
  double a,
  double b )

Sets the minimum (a) and maximum (b) values for thevaluator widget.
if at least one of the values is changed, a partial redraw is asked.

11.132.3.2 draw()

void Fl_Slider::draw ( )

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Implements Fl_Widget.
Reimplemented in Fl_Value_Slider.

11.132.3.3 handle()

int Fl_Slider::handle ( )

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-
circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

**Parameters**

| in  | event | the kind of event received |

**Return values**

| 0   | if the event was not used or understood |
| 1   | if the event was used and can be deleted |

**See also**

Fl_Event

Reimplemented from Fl_Widget.
Reimplemented in Fl_Value_Slider.

### 11.132.3.4 scrollvalue()

```cpp
int Fl_Slider::scrollvalue (int pos, int size, int first, int total)
```

Sets the size and position of the sliding knob in the box.

**Parameters**

| in  | pos | position of first line displayed |
| in  | size | size of window in lines |
| in  | first | number of first line |
| in  | total | total number of lines |

Returns Fl_Valuator::value(p)

### 11.132.3.5 slider_size()

```cpp
void Fl_Slider::slider_size (double v)
```

Set the dimensions of the moving piece of slider.

This is the fraction of the size of the entire widget. If you set this to 1 then the slider cannot move. The default value is .08.

For the "fill" sliders this is the size of the area around the end that causes a drag effect rather than causing the slider to jump to the mouse.

The documentation for this class was generated from the following files:

- Fl_Slider.H
- Fl_Slider.cxx

### 11.133 Fl_Spinner Class Reference

This widget is a combination of a numerical input widget and repeat buttons.
#include <Fl_Spinner.H>

   v
Fl_Spinner

Classes

• class Fl_Spinner_Input

Public Member Functions

• Fl_Color color () const
   Returns the background color of the spinner widget's input field.

• void color (Fl_Color v)
   Sets the background color of the spinner widget's input field.

• Fl_Spinner (int X, int Y, int W, int H, const char ∗L=0)
   Creates a new Fl_Spinner widget using the given position, size, and label string.

• const char ∗ format () const
   Returns the format string for the value.

• void format (const char ∗f)
   Sets the format string for the value.

• int handle (int event) FL_OVERRIDE
   Handles the specified event.

• double maximum () const
   Gets the maximum value of the widget.

• void maximum (double m)
   Sets the maximum value of the widget.

• int maximum_size () const
   Returns the maximum width of the input field.

• void maximum_size (int m)
   Sets the maximum width of the input field.

• double minimum () const
   Gets the minimum value of the widget.

• void minimum (double m)
   Sets the minimum value of the widget.

• void range (double a, double b)
   Sets the minimum and maximum values for the widget.

• void resize (int X, int Y, int W, int H) FL_OVERRIDE
   Resizes the Fl_Group widget and all of its children.

• Fl_Color selection_color () const
   Returns the selection color of the spinner widget's input field.

• void selection_color (Fl_Color val)
   Sets the selection color of the spinner widget's input field.

• double step () const
   Gets the amount to change the value when the user clicks a button.

• void step (double s)
Sets or returns the amount to change the value when the user clicks a button.

- **Fl_Color textcolor() const**
  
  Gets the color of the text in the input field.

- **void textcolor(Fl_Color c)**
  
  Sets the color of the text in the input field.

- **Fl_Font textfont() const**
  
  Gets the font of the text in the input field.

- **void textfont(Fl_Font f)**
  
  Sets the font of the text in the input field.

- **Fl_Fontsize textsize() const**
  
  Gets the size of the text in the input field.

- **void textsize(Fl_Fontsize s)**
  
  Sets the size of the text in the input field.

- **uchar type() const**
  
  Gets the numeric representation in the input field.

- **void type(uchar v)**
  
  Sets the numeric representation in the input field.

- **double value() const**
  
  Gets the current value of the widget.

- **void value(double v)**
  
  Sets the current value of the input widget.

- **int wrap() const**
  
  Gets the wrap mode of the Fl_Spinner widget.

- **void wrap(int set)**
  
  Sets whether the spinner wraps around at upper and lower bounds.

### Public Member Functions inherited from Fl_Group

- **Fl_Widget **& _ddfdesign_kludge()**
  
  This is for forms compatibility only.

- **void add(Fl_Widget &)**
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void add(Fl_Widget &o)**
  
  See void Fl_Group::add(Fl_Widget &w)

- **void add_resizable(Fl_Widget &o)**
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget **& const **+ array() const**
  
  Returns a pointer to the array of children.

- **Fl_Group const **& as_group() const FL_OVERRIDE**
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin()**
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget **& child(int n) const**
  
  Returns array[/n].

- **int children() const**
  
  Returns how many child widgets the group has.

- **void clear()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children()**
  
  Returns the current clipping mode.
• void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

• void end ()
  Exactly the same as current(this->parent()).

• int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.

• int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.

• Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.

• void focus (Fl_Widget *W)
• void forms_end ()
  This is for forms compatibility only.

• void init_sizes ()
  Resets the internal array of widget sizes and positions.

• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

• void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).

• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

• void remove (Fl_Widget *o)
  Removes the widget o from the group.

• void remove (int index)
  Removes the widget at index from the group but does not delete it.

• Fl_Widget *resizable () const
  Returns the group's resizable widget.

• void resizable (Fl_Widget &o)
  Sets the group's resizable widget.

• void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clearfullscreen ()
• void _setfullscreen ()
• void activate ()
  Activates the widget.

• unsigned int active () const
  Returns whether the widget is active.

• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
Gets the current user data (long) argument that is passed to the callback function.

- **void argument** (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window + as_gl_window ()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const + as_gl_window () const**
  **virtual Fl_Window + as_window ()**
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **void bind_deimage (Fl_Image +img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void bind_deimage** (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image (Fl_Image +img)**
  Sets the image to use as part of the widget label when in the active state.

- **void bind_image** (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  Gets the current callback function for the widget.

- **void callback (Fl_Callback +cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback +cb, Fl_Callback_User_Data +p, bool auto_free)**
  Sets the current callback function and managed user data for the widget.

- **void callback (Fl_Callback +cb, void +p)**
  Sets the current callback function and data for the widget.

- **void callback (Fl_Callback0 +cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback1 +cb, long p=0)**
  Sets the current callback function for the widget.

- **unsigned int changed () const**
  Checks if the widget value changed since the last callback.

- **void clear_active ()**
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output ()**
  Sets a widget to accept input.

- **void clear_visible ()**
  Hides the widget.

- **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

• void copy_label (const char ∗new_label)
  Sets the current label.

• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.

• Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image ∗img)
Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of `wgt`.

- **int is_label_copied () const**
  Returns whether the current label was assigned with `copy_label()`.

- **const char * label () const**
  Gets the current label text.

- **void label (const char *text)**
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  Sets the label color.

- **Fl_Font labelfont () const**
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  Sets width `ww` and height `hh` accordingly with the label size.

- **bool needs_keyboard () const**
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗ text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
Returns whether a widget and all its parents are visible.

- int w() const
  Gets the widget width.
- Fl_When when() const
  Returns the conditions under which the callback is called.
- void when(uchar i)
  Sets the flags used to decide when a callback is called.
- Fl_Window *window() const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- int x() const
  Gets the widget position in its window.
- int y() const
  Gets the widget position in its window.
- virtual ~Fl_Widget()
  Destroys the widget.

Protected Member Functions

- void draw() FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Group

- Fl_Rect *bounds()
  Returns the internal array of widget sizes and positions.
- void draw_child(Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children()
  Draws all children of the group.
- void draw_outside_label(const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert(Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move(int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove(int)
  Allow derived groups to act when a child widget is removed from the group.
- int *sizes()
  Returns the internal array of widget sizes and positions.
- void update_child(Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag(unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop()
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box()
  Draws the widget box according its box style.
- void draw_box(Fl_Boxtype t, Fl_Color c)
  Draws a box of type t, of color c at the widget's position and size.
• void **draw_box** (**Fl_Boxtype** t, int x, int y, int w, int h, **Fl_Color** c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (**Fl_Boxtype** t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (**Fl_Boxtype** t, int x, int y, int w, int h, **Fl_Color** bg) const
  
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const
  
  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• **Fl_Widget** (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

• unsigned int **flags** () const
  
  Gets the widget flags mask.

• void **h** (int v)
  
  Internal use only.

• void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

• void **w** (int v)
  
  Internal use only.

• void **x** (int v)
  
  Internal use only.

• void **y** (int v)
  
  Internal use only.

Protected Attributes

• **Fl_Repeat_Button** down_button_

• **Fl_Spinner_Input** input_

• **Fl_Repeat_Button** up_button_

Additional Inherited Members

Static Public Member Functions inherited from **Fl_Group**

• static **Fl_Group** ∗current ()
  
  Returns the currently active group.

• static void **current** (**Fl_Group** ∗g)
  
  Sets the current group.

Static Public Member Functions inherited from **Fl_Widget**

• static void **default_callback** (**Fl_Widget** ∗widget, void ∗data)
  
  The default callback for all widgets that don't set a callback.

• static unsigned int **labelShortcut** (const char ∗t)
  
  Returns the Unicode value of the '\&x' shortcut in a given text.

• static int **testShortcut** (const char ∗, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '\&x' shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTip = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.

11.133.1 Detailed Description

This widget is a combination of a numerical input widget and repeat buttons. The user can either type into the input area or use the buttons to change the value.

![Figure 11.45 Fl_Spinner widget](image)

### 11.133.2 Constructor & Destructor Documentation

#### 11.133.2.1 Fl_Spinner()

Fl_Spinner::Fl_Spinner (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char * L = 0  )

Creates a new Fl_Spinner widget using the given position, size, and label string. The inherited destructor destroys the widget and any value associated with it.

11.133.3 Member Function Documentation

#### 11.133.3.1 draw()

void Fl_Spinner::draw ( ) [protected], [virtual]

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead. Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from Fl_Group.
11.133.3.2 handle()

```cpp
int Fl_Spinner::handle ( int event ) [virtual]
```

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (key presses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

**Parameters**

| in | event | the kind of event received |

**Return values**

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

**See also**

Fl_Event

Reimplemented from Fl_Group.

11.133.3.3 resize()

```cpp
void Fl_Spinner::resize ( int X, int Y, int W, int H ) [virtual]
```

Resizes the Fl_Group widget and all of its children.
The Fl_Group widget first resizes itself, and then it moves and resizes all its children according to the rules documented for Fl_Group::resizable(Fl_Widget*)

**See also**

Fl_Group::resizable(Fl_Widget*)

Fl_Group::resizable()

Fl_Widget::resize(int,int,int,int)

Reimplemented from Fl_Group.

11.133.3.4 step() [1/2]

```cpp
double Fl_Spinner::step ( ) const [inline]
```

Gets the amount to change the value when the user clicks a button.

**See also**

Fl_Spinner::step(double)
11.133.3.5 Step() [2/2]

```cpp
void Fl_Spinner::step (double s)
```

Sets or returns the amount to change the value when the user clicks a button. Before setting step to a non-integer value, the spinner type() should be changed to floating point.

See also:
```
double Fl_Spinner::step() const
```

11.133.3.6 Type() [1/2]

```cpp
uchar Fl_Spinner::type () const [inline]
```

Gets the numeric representation in the input field.

See also:
```
Fl_Spinner::type(uchar)
```

11.133.3.7 Type() [2/2]

```cpp
void Fl_Spinner::type (uchar v)
```

Sets the numeric representation in the input field. Valid values are FL_INT_INPUT and FL_FLOAT_INPUT. Also changes the format() template. Setting a new spinner type via a superclass pointer will not work.

Note:
```
type() is not a virtual function.
```

11.133.3.8 Value()

```cpp
void Fl_Spinner::value (double v) [inline]
```

Sets the current value of the input widget. Before setting value to a non-integer value, the spinner type() should be changed to floating point.

11.133.3.9 Wrap() [1/2]

```cpp
int Fl_Spinner::wrap ( ) const [inline]
```

Gets the wrap mode of the Fl_Spinner widget.

See also:
```
void wrap(int)
```

Since
```
1.4.0
```

11.133.3.10 Wrap() [2/2]

```cpp
void Fl_Spinner::wrap (int set) [inline]
```

Sets whether the spinner wraps around at upper and lower bounds. If wrap mode is on the spinner value is set to the minimum() or maximum() if the value exceeds the upper or lower bounds, resp., if it was changed by one of the buttons or the FL_Up or FL_Down keys. The spinner stops at the upper and lower bounds if wrap mode is off. The default wrap mode is on for backwards compatibility with FLTK 1.3.x and older versions.
Wrap mode does not apply to the input field if the input value is edited directly as a number. The input value is always clipped to the allowed range as if wrap mode was off when the input field is left (i.e. loses focus).

See also
minimum(), maximum()

Parameters

- **in set** non-zero sets wrap mode, zero resets wrap mode

Since 1.4.0

The documentation for this class was generated from the following files:

- Fl_Spinner.H
- Fl_Spinner.cxx

### 11.134 Fl_Spinner::Fl_Spinner_Input Class Reference

Inheritance diagram for Fl_Spinner::Fl_Spinner_Input:

```
  Fl_Widget
  |     |
  |     |
  Fl_Input_
  |     |
  |     |
  Fl_Input
  |     |
Fl_Spinner::Fl_Spinner_Input
```

**Public Member Functions**

- **Fl_Spinner_Input** (int X, int Y, int W, int H)
- **int handle** (int event) FL_OVERRIDE

  Handles events of Fl_Spinner’s embedded input widget.

**Public Member Functions inherited from Fl_Input**

- **Fl_Input** (int, int, int, int, const char ∗=0)

  Creates a new Fl_Input widget using the given position, size, and label string.

**Public Member Functions inherited from Fl_Input_**

- **int append** (const char ∗t, int l=0, char keep_selection=0)

  Append text at the end.

- **bool can_redo** () const

  Check if there is a redo action available.

- **bool can_undo** () const

  Check if the last operation can be undone.
• int copy (int clipboard)
  
  Put the current selection into the clipboard.
• int copy_cuts ()
  
  Copies the yank buffer to the clipboard.
• Fl_Color cursor_color () const
  
  Gets the color of the cursor.
• void cursor_color (Fl_Color n)
  
  Sets the color of the cursor.
• int cut ()
  
  Deletes the current selection.
• int cut (int a, int b)
  
  Deletes all characters between index a and b.
• int cut (int n)
  
  Deletes the next n bytes rounded to characters before or after the cursor.
• double dvalue () const
  
  Returns the widget text interpreted as a floating point number.
• Fl_Input_ (int, int, int, int, const char ∗=0)
  
  Creates a new Fl_Input_ widget.
• unsigned int index (int i) const
  
  Returns the character at index i.
• int input_type () const
  
  Gets the input field type.
• void input_type (int t)
  
  Sets the input field type.
• int insert (const char ∗t, int l=0)
  
  Inserts text at the cursor position.
• int insert_position () const
  
  Gets the position of the text cursor.
• int insert_position (int p)
  
  Sets the cursor position and mark.
• int insert_position (int p, int m)
  
  Sets the index for the cursor and mark.
• int ivalue () const
  
  Returns the widget text interpreted as a signed integer.
• int mark () const
  
  Gets the current selection mark.
• int mark (int m)
  
  Sets the current selection mark.
• int maximum_size () const
  
  Gets the maximum length of the input field in characters.
• void maximum_size (int m)
  
  Sets the maximum length of the input field in characters.
• int position () const
• int position (int p)
• int position (int p, int m)
• int readonly () const
  
  Gets the read-only state of the input field.
• void readonly (int b)
  
  Sets the read-only state of the input field.
• int redo ()
  
  Redo previous undo operation.
• **int replace** (int b, int e, const char ∗text, int ilen=0)
  
  Deletes text from b to e and inserts the new string text.

• **void resize** (int, int, int, int) FL_OVERRID
  
  Changes the size of the widget.

• **int shortcut** () const
  
  Returns the shortcut key associated with this widget.

• **void shortcut** (int s)
  
  Sets the shortcut key associated with this widget.

• **int size** () const
  
  Returns the number of bytes in value().

• **void size** (int W, int H)
  
  Sets the width and height of this widget.

• **int static_value** (const char ∗)
  
  Changes the widget text.

• **int static_value** (const char ∗, int)
  
  Changes the widget text.

• **int tab_nav** () const
  
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

• **void tab_nav** (int val)
  
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

• **Fl_Color textcolor** () const
  
  Gets the color of the text in the input field.

• **void textcolor** (Fl_Color n)
  
  Sets the color of the text in the input field.

• **Fl_Font textfont** () const
  
  Gets the font of the text in the input field.

• **void textfont** (Fl_Font s)
  
  Sets the font of the text in the input field.

• **Fl_Fontsize textsize** () const
  
  Gets the size of the text in the input field.

• **void textsize** (Fl_Fontsize s)
  
  Sets the size of the text in the input field.

• **int undo** ()
  
  Undoes previous changes to the text buffer.

• const char ∗ **value** () const
  
  Returns the text displayed in the widget.

• **int value** (const char ∗)
  
  Changes the widget text.

• **int value** (const char ∗, int)
  
  Changes the widget text.

• **int value** (double value)
  
  Changes the widget text to a floating point number ("%g").

• **int value** (int value)
  
  Changes the widget text to a signed integer number.

• **int wrap** () const
  
  Gets the word wrapping state of the input field.

• **void wrap** (int b)
  
  Sets the word wrapping state of the input field.

• **Fl_Input_** ()
  
  Destroys the widget.
Public Member Functions inherited from Fl_Widget

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
  Activates the widget.
- `unsigned int active () const`
  Returns whether the widget is active.
- `int active_r () const`
  Returns whether the widget and all of its parents are active.
- `Fl_Align align () const`
  Gets the label alignment.
- `void align (Fl_Align alignment)`
  Sets the label alignment.
- `long argument () const`
  Gets the current user data (long) argument that is passed to the callback function.
- `void argument (long v)`
  Sets the current user data (long) argument that is passed to the callback function.
- `virtual class Fl_Gl_Window * as_gl_window ()`
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- `virtual class Fl_Gl_Window const * as_gl_window () const`
- `virtual Fl_Group * as_group ()`
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- `virtual Fl_Group const * as_group () const`
- `virtual Fl_Window * as_window ()`
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- `virtual Fl_Window const * as_window () const`
- `void bind_deimage (Fl_Image * img)`
  Sets the image to use as part of the widget label when in the inactive state.
- `void bind_deimage (int f)`
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- `void bind_image (Fl_Image * img)`
  Sets the image to use as part of the widget label when in the active state.
- `void bind_image (int f)`
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- `Fl_Boxtype box () const`
  Gets the box type of the widget.
- `void box (Fl_Boxtype new_box)`
  Sets the box type for the widget.
- `Fl_Callback_p callback () const`
  Gets the current callback function for the widget.
- `void callback (Fl_Callback * cb)`
  Sets the current callback function for the widget.
- `void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)`
  Sets the current callback function and managed user data for the widget.
- `void callback (Fl_Callback * cb, void * p)`
  Sets the current callback function and data for the widget.
- `void callback (Fl_Callback0 * cb)`
  Sets the current callback function for the widget.
- `void callback (Fl_Callback1 * cb, long p=0)`
  Sets the current callback function for the widget.
- `unsigned int changed () const`
Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)
  Sets the current label.

- void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labelfont () const
  Gets the label type.
• void labelfont (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- **unsigned int output() const**
  Returns if a widget is used for output only.

- **Fl_Group* parent() const**
  Returns a pointer to the parent widget.

- **void parent(Fl_Group*p)**
  Internal use only - "for hacks only".

- **void position(int X, int Y)**
  Repositions the window or widget.

- **void redraw()**
  Schedules the drawing of the widget.

- **void redraw_label()**
  Schedules the drawing of the label.

- **Fl_Color selection_color() const**
  Gets the selection color.

- **void selection_color(Fl_Color a)**
  Sets the selection color.

- **void set_active()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed()**
  Marks the value of the widget as changed.

- **void set_output()**
  Sets a widget to output only.

- **void set_visible()**
  Makes the widget visible.

- **void set_visible_focus()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label() const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label(int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show()**
  Makes a widget visible.

- **void size(int W, int H)**
  Changes the size of the widget.

- **int take_focus()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents() const**
  Returns if the widget is able to take events.

- **int testShortcut()**
  Returns true if the widget's label contains the entered '\&x' shortcut.

- **const char* tooltip() const**
  Gets the current tooltip text.

- **void tooltip(const char* text)**
  Sets the current tooltip text.

- **Fl_Window* top_window() const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window* top_window_offset(int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type() const**
  Gets the widget type.
• void **type** (uchar t)
  
  Sets the widget type.

• int **use_accents_menu** ()

  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * **user_data** () const

  Gets the user data for this widget.

• void **user_data** (Fl_Callback_User_Data *v, bool auto_free)

  Sets the user data for this widget.

• void **user_data** (void *v)

  Sets the user data for this widget.

• unsigned int **visible** () const

  Returns whether a widget is visible.

• unsigned int **visible_focus** () const

  Checks whether this widget has a visible focus.

• void **visible_focus** (int v)

  Modifies keyboard focus navigation.

• int **visible_r** () const

  Returns whether a widget and all its parents are visible.

• int **w** () const

  Gets the widget width.

• Fl_When **when** () const

  Returns the conditions under which the callback is called.

• void **when** (uchar i)

  Sets the flags used to decide when a callback is called.

• Fl_Window * **window** () const

  Returns a pointer to the nearest parent window up the widget hierarchy.

• int **x** () const

  Gets the widget position in its window.

• int **y** () const

  Gets the widget position in its window.

• virtual ~**Fl_Widget** ()

  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void **default_callback** (Fl_Widget *widget, void *data)

  The default callback for all widgets that don’t set a callback.

• static unsigned int **label_shortcut** (const char *t)

  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int **test_shortcut** (const char *t, const bool require_alt=false)

  Returns true if the given text t contains the entered ‘&x’ shortcut.

Static Public Attributes inherited from Fl_Input

• static const char * **copy_menu_text** = "Copy"

  [this text may be customized at run-time]

• static const char * **cut_menu_text** = "Cut"

  [this text may be customized at run-time]

• static const char * **paste_menu_text** = "Paste"

  [this text may be customized at run-time]

Protected Member Functions inherited from Fl_Input

```plaintext
• void draw () FL OVERRIDE
  Draws the widget.
  • int handle_key ()
    Handles a keystroke.
  • int handle_rmb ()
    Handle right mouse button down events.
```

Protected Member Functions inherited from Fl_Input_

```plaintext
• int apply_undo ()
  Apply the current undo/redo operation.
  • void drawtext (int, int, int, int)
    Draws the text in the passed bounding box.
  • void drawtext (int, int, int, int, bool draw_active)
    Draws the text in the passed bounding box.
  • void handle_mouse (int, int, int, int, int keepmark=0)
    Handles mouse clicks and mouse moves.
  • int handletext (int e, int, int, int, int)
    Handles all kinds of text field related events.
  • int line_end (int i) const
    Finds the end of a line.
  • int line_start (int i) const
    Finds the start of a line.
  • int linesPerPage ()
  • void maybe_do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  • int up_down_position (int, int keepmark=0)
    Moves the cursor to the column given by up_down_pos.

    Finds the end of a word.
  • int word_start (int i) const
    Finds the start of a word.
  • int xscroll () const
  • int yscroll () const
  • void yscroll (int yOffset)
```

Generated by Doxygen
Protected Member Functions inherited from Fl_Widget

- **clear_flag**(unsigned int c)
  Clears a flag in the flags mask.
- **draw_backdrop()** const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- **draw_box()** const
  Draws the widget box according its box style.
- **draw_box(Fl_Boxtype t, Fl_Color c)** const
  Draws a box of type t, of color c at the widget's position and size.
- **draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c)** const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- **draw_focus()** const
  Draws a focus rectangle around the widget.
- **draw_focus(Fl_Boxtype t, int X, int Y, int W, int H)** const
  Draws a focus rectangle around the widget.
- **draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg)** const
  Draws a focus box for the widget at the given position and size.
- **draw_label()** const
  Draws the widget's label at the defined label position.
- **draw_label(int, int, int, int)** const
  Draws the label in an arbitrary bounding box.
- **Fl_Widget(int x, int y, int w, int h, const char *label=0L)**
  Creates a widget at the given position and size.
- **flags()** const
  Gets the widget flags mask.
- **h(int v)**
  Internal use only.
- **set_flag(unsigned int c)**
  Sets a flag in the flags mask.
- **w(int v)**
  Internal use only.
- **x(int v)**
  Internal use only.
- **y(int v)**
  Internal use only.

### 11.134.1 Member Function Documentation

#### 11.134.1.1 handle()

```cpp
text
int Fl_Spinner::Fl_Spinner_Input::handle ( 
    int event ) [virtual]
```

Handles events of Fl_Spinner's embedded input widget. Works like Fl_Input::handle() but ignores FL_Up and FL_Down keys so they can be handled by the parent widget (Fl_Spinner). Reimplemented from Fl_Input.
The documentation for this class was generated from the following files:

- Fl_Spinner.H
- Fl_Spinner.cxx
11.135 FL_Surface_Device Class Reference

A drawing surface that's susceptible to receive graphical output.

```cpp
#include <Fl_Device.H>
```

Inheritance diagram for Fl_Surface_Device:

```
Fl_Surface_Device
    Fl_Display_Device Fl_Widget_Surface

    Fl_PostScript_File_Device Fl_Printer
```

**Public Member Functions**

- `Fl_Graphics_Driver * driver()`
  - Returns the graphics driver of this drawing surface.
- `virtual bool is_current()`
  - Is this surface the current drawing surface?
- `virtual void set_current(void)`
  - Make this surface the current drawing surface.
- `virtual ~Fl_Surface_Device()`
  - The destructor.

**Static Public Member Functions**

- `static Fl_Surface_Device * pop_current()`
  - Removes the top element from the current drawing surface stack, and makes the new top element current.
- `static void push_current(Fl_Surface_Device *new_current)`
  - Pushes `new_current` on top of the stack of current drawing surfaces, and makes it current.
- `static Fl_Surface_Device * surface()`
  - The current drawing surface.

**Protected Member Functions**

- `void driver(Fl_Graphics_Driver *graphics_driver)`
  - Sets the graphics driver of this drawing surface.
- `virtual void end_current()`
  - FLTK calls this each time a surface ceases to be the current drawing surface.
- `Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)`
  - Constructor that sets the graphics driver to use for the created surface.

### 11.135.1 Detailed Description

A drawing surface that's susceptible to receive graphical output.

Any FLTK application has at any time a current drawing surface to which all drawing requests are directed. The current surface is given by `Fl_Surface_Device::surface()`. When `main()` begins running, the current drawing surface has been set to the computer's display, an instance of the `Fl_Display_Device` class.

A drawing surface other than the computer's display, is typically used as follows:

1. Create `surface`, an object from a particular `Fl_Surface_Device` derived class (e.g., `Fl_Copy_Surface`, `Fl_Printer`).
2. Call `Fl_Surface_Device::push_current(surface)`; to redirect all graphics requests to `surface` which becomes the new current drawing surface (not necessary with classes `Fl_Printer` / `Fl_PostScript_File_Device` because it is done by `Fl_Paged_Device::begin_page()`).
3. At this point all of the Drawing functions (e.g., `fl_rect()`) or the Color & Font functions or Drawing Images functions (e.g., `fl_draw_image()`, `Fl_Image::draw()`) operate on the new current drawing surface. Drawing surfaces from `Fl_Widget_Surface` derived classes allow additional ways to draw to them (e.g., `Fl_Printer::print_widget()`, `Fl_Image_Surface::draw()`).

4. After all drawing requests have been performed, redirect graphics requests back to their previous destination with `Fl_Surface_Device::pop_current()`; (not necessary with classes `Fl_Printer` / `Fl_PostScript_File_Device`).

5. Delete `surface`.

For back-compatibility, it is also possible to use the `Fl_Surface_Device::set_current()` member function to change the current drawing surface, once to the new surface, once to the previous one.

Class `Fl_Surface_Device` can also be derived to define new kinds of graphical output usable with FLTK drawing functions. An example would be to draw to a PDF file. This would require to create a new class, say `PDF_File_Surface`, derived from class `Fl_Surface_Device`, and another new class, say `PDF_Graphics_Driver`, derived from class `Fl_Graphics_Driver`. Class `PDF_Graphics_Driver` should implement all virtual methods of the `Fl_Graphics_Driver` class to support all FLTK drawing functions and have them draw into PDF files. Alternatively, class `PDF_Graphics_Driver` could implement only some virtual methods, and only part of the FLTK drawing API would be usable when drawing to PDF files.

### 11.135.2 Member Function Documentation

#### 11.135.2.1 `end_current()`

```cpp
template void Fl_Surface_Device::end_current ( ) [inline], [protected], [virtual]
```

FLTKit calls this each time a surface ceases to be the current drawing surface. This member function is mostly of interest to developers of new `Fl_Surface_Device` derived classes. It allows to perform surface-specific operations necessary when this surface ceases to be current. Each implementation should end with a call to `Fl_Surface_Device::end_current()`.

Reimplemented in `Fl_PostScript_File_Device`.

#### 11.135.2.2 `is_current()`

```cpp
template bool Fl_Surface_Device::is_current ( ) [virtual]
```

Is this surface the current drawing surface?

Reimplemented in `Fl_Copy_Surface`, `Fl_Image_Surface`, and `Fl_Printer`.

#### 11.135.2.3 `pop_current()`

```cpp
Fl_Surface_Device * Fl_Surface_Device::pop_current ( ) [static]
```

Removes the top element from the current drawing surface stack, and makes the new top element current. Returns

A pointer to the new current drawing surface.

See also

`Fl_Surface_Device::push_current(Fl_Surface_Device *)`

Version

1.4.0

#### 11.135.2.4 `push_current()`

```cpp
void Fl_Surface_Device::push_current ( Fl_Surface_Device * new_current ) [static]
```

Pushes `new_current` on top of the stack of current drawing surfaces, and makes it current. `new_current` will receive all future graphics requests.

Any call to `push_current()` must be matched by a subsequent call to `Fl_Surface_Device::pop_current()`. The max height of this stack is 16.
11.135.2.5 set_current()

void Fl_Surface_Device::set_current ( void ) [virtual]

Make this surface the current drawing surface.
This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the
current drawing surface is Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().

Note
It's recommended to use this function only as follows:

• The current drawing surface is the display;
• make current another surface, e.g., an Fl_Printer or an Fl_Image_Surface object, calling set_current() on this object;
• draw to that surface;
• make the display current again with Fl_Display_Device::display_device()->set_current();. Don't do any other call to set_current() before this one.

Other scenarios of drawing surface changes should be performed via Fl_Surface_Device::push_current() /
Fl_Surface_Device::pop_current().

Reimplemented in Fl_Copy_Surface, Fl_Image_Surface, Fl_PostScript_File_Device, and Fl_Printer.

11.135.2.6 surface()

static Fl_Surface_Device * Fl_Surface_Device::surface ( ) [inline], [static]
The current drawing surface.
In other words, the Fl_Surface_Device object that currently receives all graphics requests.

Note
It's possible to transiently remove the GUI scaling factor in place in the current drawing surface with
fl_override_scale().

The documentation for this class was generated from the following files:

• Fl_Device.H
• Fl_Device.cxx

11.136 Fl_SVG_File_Surface Class Reference

A drawing surface producing a Scalable Vector Graphics (SVG) file.
#include <Fl_SVG_File_Surface.H>

Inheritance diagram for Fl_SVG_File_Surface:

```
Fl_Surface_Device
  └── Fl_Widget_Surface
      └── Fl_SVG_File_Surface
```
Public Member Functions

- int close ()
  Closes the FILE pointer where SVG data is output.

- FILE * file ()
  Returns the underlying FILE pointer.

- Fl_SVG_File_Surface (int width, int height, FILE *svg, int(*closef)(FILE *))=NULL)
  Constructor of the SVG drawing surface.

- void origin (int *x, int *y) FL_OVERRIDE
  Computes the coordinates of the current origin of graphics functions.

- void origin (int x, int y) FL_OVERRIDE
  Sets the position of the origin of graphics in the drawable part of the drawing surface.

- int printable_rect (int *w, int *h) FL_OVERRIDE
  Computes the width and height of the drawable area of the drawing surface.

- void translate (int x, int y) FL_OVERRIDE
  Translates the current graphics origin accounting for the current rotation.

- void untranslate () FL_OVERRIDE
  Undoes the effect of a previous translate() call.

- ~Fl_SVG_File_Surface ()
  Destructor.

Public Member Functions inherited from Fl_Widget_Surface

- void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  Draws the widget on the drawing surface.

- void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  Draws a window with its title bar and frame if any.

- void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  Draws a rectangular part of an on-screen window.

Public Member Functions inherited from Fl_Surface_Device

- Fl_Graphics_Driver * driver ()
  Returns the graphics driver of this drawing surface.

- bool is_current ()
  Is this surface the current drawing surface?

- void set_current (void)
  Make this surface the current drawing surface.

- ~Fl_Surface_Device ()
  The destructor.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * pop_current ()
  Removes the top element from the current drawing surface stack, and makes the new top element current.

- static void push_current (Fl_Surface_Device *new_current)
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.

- static Fl_Surface_Device * surface ()
  The current drawing surface.
Protected Member Functions inherited from Fl_Widget_Surface

- **Fl_Widget_Surface (Fl_Graphics_Driver *d)**
  
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

- **void driver (Fl_Graphics_Driver *graphics_driver)**
  
  Sets the graphics driver of this drawing surface.

- **virtual void end_current ()**
  
  FLTK calls this each time a surface ceases to be the current drawing surface.

- **Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)**
  
  Constructor that sets the graphics driver to use for the created surface.

Protected Attributes inherited from Fl_Widget_Surface

- **int x_offset**
  
  horizontal offset to the origin of graphics coordinates

- **int y_offset**
  
  vertical offset to the origin of graphics coordinates

### 11.136.1 Detailed Description

A drawing surface producing a Scalable Vector Graphics (SVG) file.

This drawing surface allows to store any FLTK graphics in vectorial form in a “Scalable Vector Graphics” file.

Usage example:

```cpp
Fl_Window *win = ... // Window to draw to a .svg file
int ww = win->decorated_w();
int wh = win->decorated_h();
FILE *svg = fl_fopen("/path/to/mywindow.svg", "w");
if (!svg) {
    Fl_SVG_File_Surface *surface = new Fl_SVG_File_Surface(ww, wh, svg);
    Fl_Surface_Device::push_current(surface);
    fl_color(FL_WHITE);
    fl_rectf(0, 0, ww, wh);
    surface->draw_decorated_window(win);
    Fl_Surface_Device::pop_current();
    delete surface; // the .svg file is not complete until the destructor was run
    fclose(svg);
}
```

**Note**

FLTK uses the PNG and JPEG libraries to encode images to the SVG format. For this reason, class Fl_SVG_File_Surface is placed in the fltk_images library. If JPEG is not available at application build time, PNG is enough (but produces a quite larger output). If PNG isn't available either, images don't appear in the SVG output.

### 11.136.2 Constructor & Destructor Documentation

#### 11.136.2.1 Fl_SVG_File_Surface()

```cpp
Fl_SVG_File_Surface::Fl_SVG_File_Surface (int width, int height, FILE * svg, int(*)(FILE *) closef = NULL)
```

Constructor of the SVG drawing surface.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>width,height</code></td>
<td>Width and height of the graphics area in FLTK drawing units</td>
</tr>
</tbody>
</table>
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `svg`     | A writable FILE pointer where the SVG data are to be sent. The resulting SVG data are not complete until after destruction of the `Fl_SVG_File_Surface` object or after calling `close()`.
| `closef`  | If not NULL, the destructor and `close()` will call `closef(svg)` after all SVG data has been sent. If NULL, `fclose(svg)` is called instead. This allows to close the FILE pointer by, e.g., `pclose`, or, using a function such as "int keep_open(FILE*){return 0;}", to keep it open after completion of all output to `svg`. Function `closef` should return non-zero to indicate an error. |

11.136.2.2 `~Fl_SVG_File_Surface()`

`Fl_SVG_File_Surface::~Fl_SVG_File_Surface ( )`  
Destructor.  
The underlying FILE pointer is processed as by `close()`.

11.136.3 Member Function Documentation

11.136.3.1 close()

```c
int Fl_SVG_File_Surface::close ( )
```

Closes the FILE pointer where SVG data is output.
The underlying FILE is closed by function `fclose()` unless another function was set at object’s construction time. The only operation possible after this on the `Fl_SVG_File_Surface` object is its destruction.

Returns

The value returned by the closing function call.

11.136.3.2 origin() [1/2]

```c
void Fl_SVG_File_Surface::origin (  
    int * x,  
    int * y ) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>out x,y</code></td>
<td>If non-null, <code>*x</code> and <code>*y</code> are set to the horizontal and vertical coordinates of the graphics origin.</td>
</tr>
</tbody>
</table>

Reimplemented from `Fl_Widget_Surface`.

11.136.3.3 origin() [2/2]

```c
void Fl_SVG_File_Surface::origin (  
    int x,  
    int y ) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.  
Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive `origin()` calls don’t combine their effects. `Origin()` calls are not affected by `rotate()` calls (for classes derived from `Fl_Paged_Device`).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>in x,y</code></td>
<td>Horizontal and vertical positions in the drawing surface of the desired origin of graphics.</td>
</tr>
</tbody>
</table>
Reimplemented from `Fl_Widget_Surface`.

### 11.136.3.4 printable_rect()

```c
int Fl_SVG_File_Surface::printable_rect ( int * w, int * h ) [virtual]
```

Computes the width and height of the drawable area of the drawing surface. Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to `origin()`. If the object is derived from class `Fl_Paged_Device`, values account for the user-selected paper type and print orientation and are changed by `scale()` calls. Returns

0 if OK, non-zero if any error

Reimplemented from `Fl_Widget_Surface`.

### 11.136.3.5 translate()

```c
void Fl_SVG_File_Surface::translate ( int x, int y ) [virtual]
```

Translates the current graphics origin accounting for the current rotation. Each `translate()` call must be matched by an `untranslate()` call. Successive `translate()` calls add up their effects. Reimplemented from `Fl_Widget_Surface`.

### 11.136.3.6 untranslate()

```c
void Fl_SVG_File_Surface::untranslate ( void ) [virtual]
```

Undoes the effect of a previous `translate()` call. Reimplemented from `Fl_Widget_Surface`.

The documentation for this class was generated from the following file:

- `Fl_SVG_File_Surface.H`

---

### 11.137 Fl_SVG_Image Class Reference

The **Fl_SVG_Image** class supports loading, caching and drawing of scalable vector graphics (SVG) images.

```c
#include <Fl_SVG_Image.H>
```

Inheritance diagram for `Fl_SVG_Image`:

```

Fl_RGB_Image
    |   |
    v   v
Fl_SVG_Image
```

Public Member Functions

- **`Fl_SVG_Image * as_svg_image () FL_OVERRIDE`**
  
  Returns whether an image is an `Fl_SVG_Image` or not.
- **`void color_average (Fl_Color c, float i) FL_OVERRIDE`**
  
  The `color_average()` method averages the colors in the image with the provided FLTK color value.
- **`Fl_SVG_Image * copy () const`**
• **Fl_image** * copy (int W, int H) const FL_OVERRIDE
  Creates a resized copy of the image.
• void desaturate () FL_OVERRIDE
  The desaturate() method converts an image to grayscale.
• void draw (int X, int Y)
• void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  Draws the image to the current drawing surface with a bounding box.
• **Fl_SVG_Imag e** (const char ∗ filename)
  Load an SVG image from a file.
• **Fl_SVG_Imag e** (const char ∗ sharedname, const char ∗ svg_data)
  Load an SVG image from memory.
• **Fl_SVG_Imag e** (const char ∗ sharedname, const unsigned char ∗ svg_data, size_t length)
  Load an SVG image from memory.
• void normalize () FL_OVERRIDE
  Makes sure the object is fully initialized.
• void resize (int width, int height)
  Have the svg data (re)-rasterized using the given width and height values.
• virtual ∼**Fl_SVG_Imag e** ()
  The destructor frees all memory and server resources that are used by the SVG image.

Public Member Functions inherited from Fl_RGB_Imag e

• int cache_h ()
• int cache_w ()
• **Fl_image** * copy () const
• void draw (int X, int Y)
• **Fl_RGB_Imag e** (const Fl_Pixmap ∗ pxm, Fl_Color bg=FL_GRAY)
  The constructor creates a new RGBA image from the specified Fl_Pixmap.
• **Fl_RGB_Imag e** (const uchar ∗ bits, int bits_length, int W, int H, int D, int LD)
  The constructor creates a new image from the specified data.
• **Fl_RGB_Imag e** (const uchar ∗ bits, int W, int H, int D=3, int LD=0)
  The constructor creates a new image from the specified data.
• void label (Fl_Menu_Item ∗ m) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a menu item.
• void label (Fl_Widget ∗ w) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a widget or menu item.
• void uncache () FL_OVERRIDE
  If the image has been cached for display, delete the cache data.
• ∼**Fl_RGB_Imag e** () FL_OVERRIDE
  The destructor frees all memory and server resources that are used by the image.

Public Member Functions inherited from Fl_Imag e

• virtual class Fl_Shared_Imag e ∗ as_shared_image ()
  Returns whether an image is an Fl_Shared_Imag e or not.
• **Fl_image** * copy () const
  Creates a copy of the image in the same size.
• int count () const
  Returns the number of data values associated with the image.
• int d () const
  Returns the image depth.
• const char ∗ const ∗ data () const
Returns a pointer to the current image data array.

- **int data_h() const**
  Returns the height of the image data.
- **int data_w() const**
  Returns the width of the image data.
- **void draw(int X, int Y)**
  Draws the image to the current drawing surface.
- **int fail() const**
  Returns a value that is not 0 if there is currently no image available.
- **Fl_Image(int W, int H, int D)**
  The constructor creates an empty image with the specified width, height, and depth.
- **int h() const**
  Returns the current image drawing height in FLTK units.
- **void inactive()**
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.
- **int ld() const**
  Returns the current line data size in bytes.
- **virtual void release()**
  Releases an Fl_image - the same as 'delete this'.
- **virtual void scale(int width, int height, int proportional=1, int can_expand=0)**
  Sets the drawing size of the image.
- **int w() const**
  Returns the current image drawing width in FLTK units.
- **virtual ~Fl_Image()**
  The destructor is a virtual method that frees all memory used by the image.

**Public Attributes**

- **bool proportional**
  Set this to false to allow image re-scaling that alters the image aspect ratio.

**Public Attributes inherited from Fl_RGB_Image**

- **int alloc_array**
  If non-zero, the object's data array is delete[]d when deleting the object.
- **const uchar *array**
  Points to the start of the object's data array.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_RGB_Image**

- **static size_t max_size()**
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
- **static void max_size(size_t size)**
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
Static Public Member Functions inherited from Fl_Image

- static Fl_Labeltype define_FL_IMAGE_LABEL ()
- static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
- static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
- static Fl_RGB_Scaling scaling_algorithm ()
  Gets what algorithm is used when resizing a source image to draw it.
- static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  True after fl_register_images() was called, false before.

Protected Member Functions inherited from Fl_Image

- void d (int D)
  Sets the current image depth.
- void data (const char ∗const ∗p, int c)
  Sets the current data pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h (int H)
  Sets the height of the image data.
- void ld (int LD)
  Sets the current line data size in bytes.
- void w (int W)
  Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label ∗lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label ∗lo, int &lw, int &lh)

11.137.1 Detailed Description

The Fl_SVG_Image class supports loading, caching and drawing of scalable vector graphics (SVG) images.
The FLTK library performs parsing and rasterization of SVG data using a modified version of the nanosvg software (https://github.com/memononen/nanosvg). The software modification allows the option to change the image ratio while performing rasterization.

Use Fl_Image::fail() to check if the Fl_SVG_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, and ERR_FORMAT if the SVG format could not be decoded. If the image has loaded correctly, w(), h(), and d() should return values greater than zero.

Rasterization is not done until the image is first drawn or resize() or normalize() is called. Therefore, array is NULL until then. The delayed rasterization ensures an Fl_SVG_Image is always rasterized to the exact screen resolution at which it is drawn.

The Fl_SVG_Image class draws images computed by nanosvg with the following known limitations.
The FLTK library can optionally be built without SVG support; in that case, class Fl_SVG_Image is unavailable.

Example of displaying a hard-coded svg file:

```cpp
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_SVG_Image.H>

const char *svg_data = "<svg viewBox="0 0 200 200" version="1.1">
  <rect x="25" y="50" width="150" height="150" fill="black" transform="rotate(45 100 100)"/>
</svg>";

int main(int argc, char **argv) {
  Fl_SVG_Image *svg = new Fl_SVG_Image(0, svg_data); // create SVG object
  Fl_Window *win = new Fl_Window(720, 486, "svg test");
  Fl_Box *box = new Fl_Box(0, 0, win->w(), win->h());
  box->image(svg); // assign svg object to Fl_Box
  win->end();
  win->show(argc, argv);
  return(Fl::run());
}
```

Example of displaying an svg image from a file:

```cpp
#include <errno.h> // errno
#include <string.h> // strerror
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_SVG_Image.H>
#include <FL/fl_message.H>

int main(int argc, char **argv) {
  Fl_Window *win = new Fl_Window(720, 486, "svg test");
  Fl_Box *box = new Fl_Box(0, 0, win->w(), win->h());
  // Load svg image from disk, assign to a box
  const char *svgpath = "/var/tmp/simple.svg";
  Fl_SVG_Image *svg = new Fl_SVG_Image(svgpath); // load SVG object from disk
  switch (svg->fail()) {
    case Fl_Image::ERR_FILE_ACCESS:
      // File couldn’t load? show path + os error to user
      fl_alert("%s: %s", svgpath, strerror(errno));
      return 1;
    case Fl_Image::ERR_FORMAT:
      // Parsing error
      fl_alert("%s: couldn’t decode image", svgpath);
      return 1;
  }
  box->image(svg); // assign svg object to box
  win->end();
  win->show(argc, argv);
  return(Fl::run());
}
```

Example of fitting an svg image to a resizable Fl_Box:

```cpp
#include <FL/Fl_Window.H>
#include <FL/Fl_SVG_Image.H>
#include <FL/Fl_Box.H>

class resizable_box : public Fl_Box {
  public:
    resizable_box(int w, int h) : Fl_Box(0, 0, w, h, NULL) {}
    virtual void resize(int x, int y, int w, int h) {
      Fl_Box::resize(x, y, w, h);
    }
  }

int main(int argc, char **argv) {
  Fl_Window *win = new Fl_Window(130, 130);
  resizable_box *box = new resizable_box(win->w(), win->h());
  Fl_SVG_Image *svg = new Fl_SVG_Image("/path/to/image.svg");
  box->image(svg);
  svg->scale(box->w(), box->h());
  win->end();
  win->resizeable(win);
  win->show(argc, argv);
  return Fl::run();
}
```
11.137.2 Constructor & Destructor Documentation

11.137.2.1 Fl_SVG_Image() [1/3]

Fl_SVG_Image::Fl_SVG_Image ( const char * filename )

Load an SVG image from a file.
This constructor loads the SVG image from a .svg or .svgz file. The reader recognizes if the data is compressed, and decompresses it if zlib is available (HAVE_LIBZ).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>the filename for a .svg or .svgz file</td>
</tr>
</tbody>
</table>

11.137.2.2 Fl_SVG_Image() [2/3]

Fl_SVG_Image::Fl_SVG_Image ( const char * sharedname, const char * svg_data )

Load an SVG image from memory.
This constructor loads the SVG image from a block of memory. This version is commonly used for uncompressed text data, but the reader recognizes if the data is compressed, and decompresses it if zlib is available (HAVE_LIBZ).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sharedname</td>
<td>if not NULL, a shared image will be generated with this name</td>
</tr>
<tr>
<td>svg_data</td>
<td>a pointer to the memory location of the SVG image data</td>
</tr>
</tbody>
</table>

Note

In-memory SVG data is parsed by the object constructor and is no longer needed after construction.

11.137.2.3 Fl_SVG_Image() [3/3]

Fl_SVG_Image::Fl_SVG_Image ( const char * name, const unsigned char * svg_data, size_t length )

Load an SVG image from memory.
This constructor loads the SVG image from a block of memory. This version is commonly used for compressed binary data, but the reader recognizes if the data is uncompressed, and reads it as a text block.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>if not NULL, a shared image will be generated with this name</td>
</tr>
<tr>
<td>svg_data</td>
<td>a pointer to the memory location of the SVG image data</td>
</tr>
<tr>
<td>length</td>
<td>of svg_data or 0 if the length is unknown. This will protect memory outside of the svg_data array from illegal read operations for compressed SVG data</td>
</tr>
</tbody>
</table>
In-memory SVG data is parsed by the object constructor and is no longer needed after construction.

### 11.137.3 Member Function Documentation

#### 11.137.3.1 as_svg_image()

```cpp
Fl_SVG_Image ∗ Fl_SVG_Image::as_svg_image ( ) [inline], [virtual]
```

Returns whether an image is an `Fl_SVG_Image` or not.
This virtual method returns a pointer to the `Fl_SVG_Image` if this object is an instance of `Fl_SVG_Image` or NULL if not.
Reimplemented from `Fl_RGB_Image`.

#### 11.137.3.2 color_average()

```cpp
void Fl_SVG_Image::color_average ( Fl_Color c, float i ) [virtual]
```

The `color_average()` method averages the colors in the image with the provided FLTK color value.
The first argument specifies the FLTK color to be used.
The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results
in no color blend, and a value of 0.0 results in a constant image of the specified color.
An internal copy is made of the original image data before changes are applied, to avoid modifying the original
image data in memory.
Reimplemented from `Fl_RGB_Image`.

#### 11.137.3.3 copy()

```cpp
Fl_Image ∗ Fl_SVG_Image::copy ( int W, int H ) const [virtual]
```

Creates a resized copy of the image.
The new image should be released when you are done with it.
Note: since FLTK 1.4.0 you can use `Fl_Image::release()` for all types of images (i.e. all subclasses of `Fl_Image`)
instead of operator `delete` for `Fl_Image`'s and `Fl_Image::release()` for `Fl_Shared_Image`'s.
The new image data will be converted to the requested size. RGB images are resized using the algorithm set by
`Fl_Image::RGB_scaling()`.
For the new image the following equations are true:

- w() == data_w() == W
- h() == data_h() == H

**Parameters**

| in | W, H | Requested width and height of the new image |

**Note**

The returned image can be safely cast to the same image type as that of the source image provided this type
is one of `Fl_RGB_Image`, `Fl_SVG_Image`, `Fl_Pixmap`, `Fl_Bitmap`, `Fl_Tiled_Image`, `Fl_Anim_GIF_Image` and
`Fl_Shared_Image`. Returned objects copied from images of other, derived, image classes belong to the parent
class appearing in this list. For example, the copy of an `Fl_GIF_Image` is an object of class `Fl_Pixmap`.
Since FLTK 1.4.0 this method is 'const'. If you derive your own class from `Fl_Image` or any subclass your
overridden methods of 'Fl_Image::copy(const)' and 'Fl_Image::copy(int, int) const' must also be 'const' for
inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from `Fl_RGB_Image`. **Generated by Doxygen**
11.137.3.4 desaturate()

void Fl_SVG_Image::desaturate () [virtual]

The desaturate() method converts an image to grayscale.
If the image contains an alpha channel (depth = 4), the alpha channel is preserved.
An internal copy is made of the original image data before changes are applied, to avoid modifying the original
image data in memory.
Reimplemented from Fl_RGB_Image.

11.137.3.5 draw()

void Fl_SVG_Image::draw ( int X, int Y, int W, int H, int cx = 0, int cy = 0 ) [virtual]

Draws the image to the current drawing surface with a bounding box.
Arguments X,Y,W,H specify a bounding box for the image, with the origin (upper-left corner) of the image offset
by the cx and cy arguments.
In other words: fl_push_clip(X,Y,W,H) is applied, the image is drawn with its upper-left corner at
X-cx,Y-cy and its own width and height, fl_pop_clip() is applied.
Reimplemented from Fl_RGB_Image.

11.137.3.6 normalize()

void Fl_SVG_Image::normalize ( ) [virtual]

Makes sure the object is fully initialized.
This function rasterizes the SVG image, and consequently initializes its array member, if that was not done before.
Reimplemented from Fl_RGB_Image.

11.137.3.7 resize()

void Fl_SVG_Image::resize ( int width, int height )

Have the svg data (re-)rasterized using the given width and height values.
By default, the resulting image w() and h() will be close to width and height while preserving the width/height
ratio of the SVG data. If proportional was set to false, the image is rasterized to the exact width and height
values. In both cases, data_w() and data_h() values are set to w() and h(), respectively.

11.137.4 Member Data Documentation
11.137.4.1 proportional

bool Fl_SVG_Image::proportional

Set this to false to allow image re-scaling that alters the image aspect ratio.
Upon object creation, proportional is set to true, and the aspect ratio is kept constant.
The documentation for this class was generated from the following files:

• Fl_SVG_Image.H
• Fl_SVG_Image.cxx

11.138 Fl_Sys_Menu_Bar Class Reference

A class to create and modify menus that appear on macOS in the menu bar at the top of the screen.
#include <Fl_Sys_Menu_Bar.H>
Inheritance diagram for Fl_Sys_Menu_Bar:
Public Types

- `enum window_menu_style_enum { no_window_menu = 0, tabbing_mode_none, tabbing_mode_automatic, tabbing_mode_preferred }`
  
  Possible styles of the Window menu in the system menu bar.

Public Member Functions

- `int add (const char *label, const char *shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)`
  Adds a new menu item.
- `int add (const char *label, int shortcut, Fl_Callback *, void *user_data=0, int flags=0)`
  Add a new menu item to the system menu bar.
- `int add (const char *str)`
  Forms-compatible procedure to add items to the system menu bar.
- `void clear ()`
  Set the Fl_Menu_Item array pointer to null, indicating a zero-length menu.
- `int clear_submenu (int index)`
  Clears the specified submenu pointed to by index of all menu items.
- `Fl_Sys_Menu_Bar (int x, int y, int w, int h, const char *l=0)`
  The constructor.
- `int insert (int index, const char *label, const char *shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)`
  Insert a new menu item.
- `int insert (int index, const char *label, int shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)`
  insert in the system menu bar a new menu item
- `const Fl_Menu_Item *menu () const`
  Return the system menu's array of Fl_Menu_Item's.
- `void menu (const Fl_Menu_Item *m)`
  create a system menu bar using the given list of menu structs
- `int mode (int i) const`
  Gets the flags of item i.
- `void mode (int i, int fl)`
  Sets the flags of item i.
- `void remove (int n)`
  remove an item from the system menu bar
- `void replace (int index, const char *name)`
  rename an item from the system menu bar
- `void setonly (Fl_Menu_Item *item)`
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.
- `void shortcut (int i, int s)`
  Changes the shortcut of item i to n.
- `void update () FL_OVERRIDE`
  Updates the menu bar after any change to its items.
- `virtual ~Fl_Sys_Menu_Bar ()`
  The destructor.
Public Member Functions inherited from Fl_Menu_Bar

- Fl_Menu_Bar (int X, int Y, int W, int H, const char *l=0)
  Creates a new Fl_Menu_Bar widget using the given position, size, and label string.

- int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Menu_

- int add (const char *)
  This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with ' | ' separating the menu items, and tab separating the menu item names from an optional shortcut string.

- int add (const char *, int shortcut, Fl_Callback *, void *=0, int=0)
  Adds a new menu item.

- int add (const char *, const char *, Fl_Callback *, void *, int=0)
  See int Fl_Menu_::add(const char * label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)

- void clear ()
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

- int clear_submenu (int index)
  Clears the specified submenu pointed to by index of all menu items.

- void copy (const Fl_Menu_Item *, void *user_data=0)
  Sets the menu array pointer with a copy of m that will be automatically deleted.

- Fl_Boxtype down_box () const
  This box type is used to surround the currently-selected items in the menus.

- void down_box (Fl_Boxtype b)
  Sets the box type used to surround the currently-selected items in the menus.

- Fl_Color down_color () const
  For back compatibility, same as selection_color()

- void down_color (unsigned c)
  For back compatibility, same as selection_color()

- int find_index (const char *) const
  Find the menu item index for a given menu pathname, such as "Edit/Copy".

- int find_index (const Fl_Menu_Item *item) const
  Find the index into the menu array for a given item.

- int find_index (Fl_Callback *cb) const
  Find the index into the menu array for a given callback cb.

- const Fl_Menu_Item * find_item (const char *)
  Find the menu item for a given menu pathname, such as "Edit/Copy".

- const Fl_Menu_Item * find_item (const Fl_Callback *)
  Find the menu item for the given callback cb.

- const Fl_Menu_Item * find_item_with_argument (long)
  Find the menu item for the given user argument v.

- const Fl_Menu_Item * find_item_with_user_data (void *)
  Find the menu item for the given user data v.

- Fl_Menu_ (int, int, int, int, const char *l=0)
  Creates a new Fl_Menu_ widget using the given position, size, and label string.

- void global ()
  Make the shortcuts for this menu work no matter what window has the focus when you type it.

- int insert (int index, const char *, int shortcut, Fl_Callback *, void *=0, int=0)
  Inserts a new menu item at the specified index position.

- int insert (int index, const char *, const char *, Fl_Callback *, void *, int e=0)
  See int Fl_Menu_::insert(const char * label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)
- int item_pathname (char ∗ name, int namelen, const Fl_Menu_Item ∗ finditem=0) const
  Get the menu 'pathname' for the specified menuItem.
- const Fl_Menu_Item ∗ menu () const
  Returns a pointer to the array of Fl_Menu_Items.
- void menu (const Fl_Menu_Item ∗ m)
  Sets the menu array pointer directly.
- FL_Boxtype menu_box () const
  Get the box type for the menu popup windows.
- void menu_box (FL_Boxtype b)
  Set the box type for the menu popup windows.
- const Fl_Menu_Item ∗ menu_end ()
  Finishes menu modifications and returns menu().
- int mode (int i) const
  Gets the flags of item i.
- void mode (int i, int fl)
  Sets the flags of item i.
- const Fl_Menu_Item ∗ mvalue () const
  Returns a pointer to the last menu item that was picked.
- const Fl_Menu_Item ∗ picked (const Fl_Menu_Item ∗)
  When user picks a menu item, call this.
- const Fl_Menu_Item ∗ prev_mvalue () const
  Returns a pointer to the menu item that was picked before the current one was picked.
- void remove (int)
  Deletes item i from the menu.
- void replace (int, const char ∗)
  Changes the text of item i.
- void setonly (Fl_Menu_Item ∗ item)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.
- void shortcut (int i, int s)
  Changes the shortcut of item i to s.
- int size () const
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.
- void size (int W, int H)
- const Fl_Menu_Item ∗ test_shortcut ()
  Returns the menu item with the entered shortcut (key value).
- const char ∗ text () const
  Returns the title of the last item chosen.
- const char ∗ text (int i) const
  Returns the title of item i.
- FL_Color textcolor () const
  Get the current color of menu item labels.
- void textcolor (FL_Color c)
  Sets the current color of menu item labels.
- FL_Font textfont () const
  Gets the current font of menu item labels.
- void textfont (FL_Font c)
  Sets the current font of menu item labels.
- FL_Fontsize textsize () const
  Gets the font size of menu item labels.
- void textsize (FL_Fontsize c)
  Sets the font size of menu item labels.
• int value () const
  Returns the index into menu() of the last item chosen by the user.
• int value (const Fl_Menu_Item *)
  The value is the index into menu() of the last item chosen by the user.
• int value (int i)
  The value is the index into menu() of the last item chosen by the user.

Public Member Functions inherited from Fl_Widget
• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
Sets the current callback function and managed user data for the widget.

- `void callback (Fl_Callback ∗cb, void ∗p)`
  Sets the current callback function and data for the widget.
- `void callback (Fl_Callback0 ∗cb)`
  Sets the current callback function for the widget.
- `void callback (Fl_Callback1 ∗cb, long p=0)`
  Sets the current callback function for the widget.
- `unsigned int changed () const`
  Checks if the widget value changed since the last callback.
- `void clear_active ()`
  Marks the widget as inactive without sending events or changing focus.
- `void clear_changed ()`
  Marks the value of the widget as unchanged.
- `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.
- `void clear_output ()`
  Sets a widget to accept input.
- `void clear_visible ()`
  Hides the widget.
- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.
- `Fl_Color color () const`
  Gets the background color of the widget.
- `void color (Fl_Color bg)`
  Sets the background color of the widget.
- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.
- `Fl_Color color2 () const`
  For back compatibility only.
- `void color2 (unsigned a)`
  For back compatibility only.
- `int contains (const Fl_Widget ∗w) const`
  Checks if w is a child of this widget.
- `void copy_label (const char ∗new_label)`
  Sets the current label.
- `void copy_tooltip (const char ∗text)`
  Sets the current tooltip text.
- `uchar damage () const`
  Returns non-zero if draw() needs to be called.
- `void damage (uchar c)`
  Sets the damage bits for the widget.
- `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.
- `int damage_resize (int, int, int, int)`
  Internal use only.
- `void deactivate ()`
  Deactivates the widget.
- `Fl_Image ∗deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.
- `const Fl_Image ∗deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.
- `void deimage (Fl_Image &img)`
  
  Sets the image to use as part of the widget label when in the inactive state.
- `void deimage (Fl_Image *img)`
  
  Sets the image to use as part of the widget label when in the inactive state.
- `int deimage_bound () const`
  
  Returns whether the inactive image is managed by the widget.
- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with default arguments.
- `void do_callback (Fl_Widget *wgt, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with arbitrary arguments.
- `void do_callback (Fl_Widget *wgt, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with arbitrary arguments.
- `void draw_label (int, int, int, int, Fl_Align) const`
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`
  
  Gets the widget height.
- `virtual void hide ()`
  
  Makes a widget invisible.
- `Fl_Image * image ()`
  
  Gets the image that is used as part of the widget label when in the active state.
- `const Fl_Image * image () const`
  
  Gets the image that is used as part of the widget label when in the active state.
- `void image (Fl_Image &img)`
  
  Sets the image to use as part of the widget label when in the active state.
- `void image (Fl_Image *img)`
  
  Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`
  
  Returns whether the image is managed by the widget.
- `int inside (const Fl_Widget *wgt) const`
  
  Checks if this widget is a child of `wgt`.
- `int is_label_copied () const`
  
  Returns whether the current label was assigned with `copy_label()`.
- `const char * label () const`
  
  Gets the current label text.
- `void label (const char *text)`
  
  Sets the current label pointer.
- `void label (Fl_Labeltype a, const char *b)`
  
  Shortcut to set the label text and type in one call.
- `Fl_Color labelcolor () const`
  
  Gets the label color.
- `void labelcolor (Fl_Color c)`
  
  Sets the label color.
- `Fl_Font labelfont () const`
  
  Gets the font to use.
- `void labelfont (Fl_Font f)`
  
  Sets the font to use.
- `Fl_Fontsize labelsize () const`
  
  Gets the font size in pixels.
- `void labelsize (Fl_Fontsize pix)`
  
  Sets the font size in pixels.
Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  
  Repositions the window or widget.

- `void redraw ()`
  
  Schedules the drawing of the widget.

- `void redraw_label ()`
  
  Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  
  Sets the selection color.

- `void set_active ()`
  
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  
  Marks the value of the widget as changed.

- `void set_output ()`
  
  Sets a widget to output only.

- `void set_visible ()`
  
  Makes the widget visible.

- `void set_visible_focus ()`
  
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- `void shortcut_label (int value)`
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- `virtual void show ()`
  
  Makes a widget visible.

- `void size (int W, int H)`
  
  Changes the size of the widget.

- `int take_focus ()`
  
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  
  Returns if the widget is able to take events.

- `int test_shortcut ()`
  
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  
  Gets the current tooltip text.

• void tooltip (const char *text)
  
  Sets the current tooltip text.

• Fl_Window * top_window () const
  
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  
  Gets the widget type.

• void type (uchar t)
  
  Sets the widget type.

• int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  
  Sets the user data for this widget.

• void user_data (void *v)
  
  Sets the user data for this widget.

• unsigned int visible () const
  
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  
  Modifies keyboard focus navigation.

• int visible_r () const
  
  Returns whether a widget and all its parents are visible.

• int w () const
  
  Gets the widget width.

• Fl_When when () const
  
  Returns the conditions under which the callback is called.

• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Static Public Member Functions

• static void about (Fl_Callback *cb, void *data)
  
  Attaches a callback to the “About myprog” item of the system application menu.

• static void create_window_menu ()
  
  Adds a Window menu, to the end of the system menu bar.

• static window_menu_style_enum window_menu_style ()
  
  Get the style of the Window menu in the system menu bar.

• static void window_menu_style (window_menu_style_enum style)
  
  Set the desired style of the Window menu in the system menu bar.
Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int labelShortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int testShortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Member Functions

- void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Menu_

- int itemPathname_ (char *name, int namelen, const Fl_Menu_Item *findItem, const Fl_Menu_Item *menu=0) const

Protected Member Functions inherited from Fl_Widget

- void clearFlag (unsigned int c)
  Clears a flag in the flags mask.
- void drawBackdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void drawBox () const
  Draws the widget box according its box style.
- void drawBox (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void drawBox (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void drawFocus () const
  Draws a focus rectangle around the widget.
- void drawFocus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void drawFocus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void drawLabel () const
  Draws the widget's label at the defined label position.
- void drawLabel (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void setFlag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

11.138.1 Detailed Description

A class to create and modify menus that appear on macOS in the menu bar at the top of the screen.

On other than macOS platforms, Fl_Sys_Menu_Bar is a synonym of class Fl_Menu_Bar.

On the macOS platform, replace Fl_Menu_Bar with Fl_Sys_Menu_Bar, and a system menu at the top of the screen will be available. This menu will match an array of Fl_Menu_Item's exactly as in all other FLTK menus (except for the submenu with the application's own name and the 'Window' menu; see below). There is, though, an important difference between an Fl_Sys_Menu_Bar object under macOS and under other platforms: only a single object from this class can be created, because macOS uses a single system menu bar. Therefore, porting to macOS an app that creates, on other platforms, several Fl_Menu_Bar objects, one for each of several windows, is more complex that just replacing Fl_Menu_Bar by Fl_Sys_Menu_Bar.

On the macOS platform, the system menu bar of any FLTK app begins with the Application menu which the FLTK library automatically constructs. Functions Fl_Mac_App_Menu::custom_application_menu_items() and Fl_Sys_Menu_Bar::about() can be used to further customize the Application menu. The FLTK library also automatically constructs and handles a Window menu which can be further customized (or even removed) calling Fl_Sys_Menu_Bar::window_menu_style(window_menu_style_enum style). Other member functions of this class allow the app to generate the rest of the system menu bar. It is recommended to localize the system menu bar using the standard Mac OS X localization procedure (see Internationalization).

Changes to the menu state are immediately visible in the menubar when they are made using member functions of the Fl_Sys_Menu_Bar class. Other changes (e.g., by a call to Fl_Menu_Item::set()) should be followed by a call to update() to be visible in the menubar across all platforms. macOS global variable fl_sys_menu_bar points to the unique, current system menu bar.

A few FLTK menu features are not supported by the Mac System menu:

- no symbolic labels
- no embossed labels
- no font sizes

As described above, the submenu with the application's own name (usually the second submenu from the left, immediately following the "Apple" submenu) is a special case, and can be managed with
For example, to make your own "Appname -> Preferences" dialog, you might use:

```c
#include <FL/platform.H> // for Fl_Mac_App_Menu class
#include <FL/Fl_Sys_Menu_Bar.H> // for Fl_Menu_Item

void prefs_cb(Fl_Widget *w, void *data) {
    // ..Open your preferences dialog here..
}

int main(..) {
    // Items to add to the application menu
    static Fl_Menu_Item appitems[] = {
        { "Preferences", 0, prefs_cb, 0, 0 },
        { 0 }, { 0 }
    };
    Fl_Mac_App_Menu::custom_application_menu_items(appitems); // adds it
}
```

..the result being:

![Figure 11.46 Mac Application submenu](image)

11.138.2 Member Enumeration Documentation

11.138.2.1 window_menu_style_enum

enum Fl_Sys_Menu_Bar::window_menu_style_enum
Possible styles of the Window menu in the system menu bar.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_window_menu</td>
<td>No Window menu in the system menu bar.</td>
</tr>
<tr>
<td>tabbing_mode_none</td>
<td>No tabbed windows, but the system menu bar contains a Window menu.</td>
</tr>
<tr>
<td>tabbing_mode_automatic</td>
<td>Windows are created by themselves but can be tabbed later.</td>
</tr>
<tr>
<td>tabbing_mode_preferred</td>
<td>Windows are tabbed when created.</td>
</tr>
</tbody>
</table>

11.138.3 Constructor & Destructor Documentation

11.138.3.1 Fl_Sys_Menu_Bar()

Fl_Sys_Menu_Bar::Fl_Sys_Menu_Bar (  
    int x,
    int y,
    int w,
    int h,
    const char * l = 0  )

The constructor.
On Mac OS X, all arguments are unused. On other platforms they are used as by Fl_Menu_Bar::Fl_Menu_Bar().

11.138.4 Member Function Documentation

11.138.4.1 about()

void Fl_Sys_Menu_Bar::about (  
    Fl_Callback * cb,
void * data ) [static]

Attaches a callback to the "About myprog" item of the system application menu.
This cross-platform function is effective only under the MacOS platform.

Parameters

| cb | a callback that will be called by "About myprog" menu item with NULL 1st argument. |
| data | a pointer transmitted as 2nd argument to the callback. |

11.138.4.2  add() [1/3]

```c
int Fl_Sys_Menu_Bar::add (  
    const char * label,  
    const char * shortcut,  
    Fl_Callback * cb,  
    void * user_data = 0,  
    int flags = 0 ) [inline]
```

Adds a new menu item.

See also

```c
Fl_Menu_::add(const char* label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)
```

11.138.4.3  add() [2/3]

```c
int Fl_Sys_Menu_Bar::add (  
    const char * label,  
    int shortcut,  
    Fl_Callback * cb,  
    void * user_data = 0,  
    int flags = 0 )
```

Add a new menu item to the system menu bar.
Add to the system menu bar a new menu item, with a title string, shortcut int, callback, argument to the callback, and flags.

Parameters

| label | - new menu item's label |
| shortcut | - new menu item's integer shortcut (can be 0 for none, or e.g. FL_ALT+'x') |
| cb | - callback to be invoked when item selected (can be 0 for none, in which case the menubar's callback() can be used instead) |
| user_data | - argument to the callback |
| flags | - item's flags, e.g. FL_MENU_TOGGLE, etc. |

Returns

the index into the menu() array, where the entry was added

See also

```c
Fl_Menu_::add(const char* label, int shortcut, Fl_Callback *cb, void *user_data, int flags)
```

11.138.4.4  add() [3/3]

```c
int Fl_Sys_Menu_Bar::add (  
    const char * str )
```

Forms-compatible procedure to add items to the system menu bar.
Returns

the index into the menu() array, where the entry was added

See also

Fl_Menu_::add(const char* str)

11.138.4.5 clear()

void Fl_Sys_Menu_Bar::clear ( )

Set the Fl_Menu_Item array pointer to null, indicating a zero-length menu.

See also

Fl_Menu_::clear()

11.138.4.6 clear_submenu()

int Fl_Sys_Menu_Bar::clear_submenu ( int index )

Clears the specified submenu pointed to by index of all menu items.

See also

Fl_Menu_::clear_submenu(int index)

11.138.4.7 create_window_menu()

void Fl_Sys_Menu_Bar::create_window_menu ( ) [static]

Adds a Window menu, to the end of the system menu bar. FLTK apps typically don't need to call this function which is automatically called by the library the first time a window is shown. The default system menu bar contains a Window menu with a "Merge All Windows" item. Other Window menu styles can be obtained calling Fl_Sys_Menu_Bar::window_menu_style(window_menu_style_enum) before the first Fl_Window::show(). Alternatively, an app can call create_window_menu() after having populated the system menu bar, for example with menu(const Fl_Menu_Item *), and before the first Fl_Window::show(). This function does nothing on non MacOS platforms.

Version

1.4

11.138.4.8 draw()

void Fl_Sys_Menu_Bar::draw ( ) [protected], [virtual]

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Reimplemented from Fl_Menu_Bar.

11.138.4.9 insert() [1/2]

int Fl_Sys_Menu_Bar::insert ( int index,

const char * label,
const char * shortcut,
    Fl_Callback * cb,
    void * user_data = 0,
    int flags = 0) [inline]

Insert a new menu item.

See also

    Fl_Menu_::insert(int index, const char* label, const char* shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)

11.138.4.10  insert() [2/2]

int Fl_Sys_Menu_Bar::insert (   int index,
    const char * label,
    int shortcut,
    Fl_Callback * cb,
    void * user_data = 0,
    int flags = 0 )

insert in the system menu bar a new menu item
Insert in the system menu bar a new menu item, with a title string, shortcut int, callback, argument to the callback, and flags.

Returns

    the index into the menu() array, where the entry was inserted

See also

    Fl_Menu_::insert(int index, const char* label, int shortcut, Fl_Callback *cb, void *user_data, int flags)

11.138.4.11  menu()

void Fl_Sys_Menu_Bar::menu (   const Fl_Menu_Item * m )

create a system menu bar using the given list of menu structs

Author

    Matthias Melcher

Parameters

    m  Zero-ending list of Fl_Menu_Item's

11.138.4.12  mode()

void Fl_Sys_Menu_Bar::mode (   int i,
    int fl )

Sets the flags of item i.
See also

`Fl_Menu_::mode(int i, int fl)`

11.138.4.13 remove()

```cpp
void Fl_Sys_Menu_Bar::remove ( int index )
```
remove an item from the system menu bar

Parameters

- `index` the index of the item to remove

11.138.4.14 replace()

```cpp
void Fl_Sys_Menu_Bar::replace ( int index,
                              const char * name )
```
rename an item from the system menu bar

Parameters

- `index` the index of the item to rename
- `name` the new item name as a UTF8 string

11.138.4.15 update()

```cpp
void Fl_Sys_Menu_Bar::update ( ) [virtual]
```
Updates the menu bar after any change to its items.
This is useful when the menu bar can be an `Fl_Sys_Menu_Bar` object.
Reimplemented from `Fl_Menu_Bar`.

11.138.4.16 window_menu_style()

```cpp
void Fl_Sys_Menu_Bar::window_menu_style ( Fl_Sys_Menu_Bar::window_menu_style_enum style ) [static]
```
Set the desired style of the Window menu in the system menu bar.
This function, to be called before the first call to `Fl_Window::show()`,
allows to control whether the system menu bar should contain a Window menu,
and if yes, whether new windows should be displayed in tabbed form.
These are the effects of various values for `style`:

- `no_window_menu`: don't add a Window menu to the system menu bar
- `tabbing_mode_none`: add a simple Window menu to the system menu bar
- `tabbing_mode_automatic`: the window menu also contains "Merge All Windows" to group all windows in a single tabbed display mode. This is the default Window menu style for FLTK apps.
- `tabbing_mode_preferred`: new windows are displayed in tabbed mode when first created

The Window menu, if present, is entirely created and controlled by the FLTK library.
Mac OS version 10.12 or later must be running for windows to be displayed in tabbed form.
Under non MacOS platforms, this function does nothing.
11.139 Fl_Table Class Reference

A table of widgets or other content.

```c
#include <Fl_Table.H>
```

Inheritance diagram for Fl_Table:

```
Fl_Widget
   ↓
Fl_Group
   ↓
Fl_Table
   ↓
Fl_Table_Row
```

Public Types

- enum TableContext {
  CONTEXT_NONE = 0 , CONTEXT_STARTPAGE = 0x01 , CONTEXT_ENDPAGE = 0x02 , CONTEXT_ROW_HEADER = 0x04 , CONTEXT_COL_HEADER = 0x08 , CONTEXT_CELL = 0x10 , CONTEXT_TABLE = 0x20 , CONTEXT_RC_RESIZE = 0x40 }

The context bit flags for Fl_Table related callbacks.

Public Member Functions

- void add (Fl_Widget &wgt)
  The specified widget is removed from its current group (if any) and added to the end of Fl_Table's group.
- void add (Fl_Widget *wgt)
  The specified widget is removed from its current group (if any) and added to the end of Fl_Table's group.
- Fl_Widget *const * array ()
  Returns a pointer to the array of children.
- void begin ()
- void callback (Fl_Widget *, void *)
  Callbacks will be called depending on the setting of Fl_Widget::when().
- int callback_col ()
  Returns the current column the event occurred on.
- TableContext callback_context ()
  Returns the current 'table context'.
- int callback_row ()
  Returns the current row the event occurred on.
- Fl_Widget * child (int n) const
  Returns the child widget by an index.
- int children () const
  Returns the number of children in the table.
• virtual void clear ()
  Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.

• int col_header ()
  Returns if column headers are enabled or not.

• void col_header (int flag)
  Enable or disable column headers.

• Fl_Color col_header_color ()
  Gets the color for column headers.

• void col_header_color (Fl_Color val)
  Sets the color for column headers and redraws the table.

• int col_header_height ()
  Gets the column header height.

• void col_header_height (int height)
  Sets the height in pixels for column headers and redraws the table.

• int col_position ()
  Returns the current column scroll position as a column number.

• void col_position (int col)
  Sets the horizontal scroll position so 'col' is at the left, and causes the screen to redraw.

• int col_resize ()
  Returns if column resizing by the user is allowed.

• void col_resize (int flag)
  Allows/disallows column resizing by the user.

• int col_resize_min ()
  Returns the current column minimum resize value.

• void col_resize_min (int val)
  Sets the current column minimum resize value.

• int col_width (int col)
  Returns the current width of the specified column in pixels.

• void col_width (int col, int width)
  Sets the width of the specified column in pixels, and the table is redrawn.

• void col_width_all (int width)
  Convenience method to set the width of all columns to the same value, in pixels.

• int cols ()
  Get the number of columns in the table.

• virtual void cols (int val)
  Set the number of columns in the table and redraw.

• void do_callback (TableContext context, int row, int col)
  Calls the widget callback.

• void end ()

• int find (const Fl_Widget &wgt) const

• int find (const Fl_Widget *wgt) const

• Fl_Table (int X, int Y, int W, int H, const char *l=0)
  The constructor for Fl_Table.

• void get_selection (int &row_top, int &col_left, int &row_bot, int &col_right)
  Gets the region of cells selected (highlighted).

• void init_sizes ()
  Resets the internal array of widget sizes and positions.

• void insert (Fl_Widget &wgt, Fl_Widget *w2)
  The specified widget is removed from its current group (if any) and inserted into Fl_Table's group before widget 'w2'.
The specified widget is removed from its current group (if any) and inserted into the Fl_Table's group at position 'n'.

- **int is_interactive_resize ()**
  Returns 1 if someone is interactively resizing a row or column.

- **int is_selected (int r, int c)**
  See if the cell at row r and column c is selected.

- **int move_cursor (int R, int C)**
  Same as move_cursor(R,C,1);

- **int move_cursor (int R, int C, int shiftselect)**
  Moves the selection cursor a relative number of rows/columns specified by R/C.

- **void remove (Fl_Widget &wgt)**
  The specified widget is removed from Fl_Table's group.

- **void resize (int X, int Y, int W, int H) FL_OVERRIDE**
  Handle resize events if user resizes parent window.

- **int row_header ()**
  Returns if row headers are enabled or not.

- **void row_header (int flag)**
  Enables/disables showing the row headers.

- **Fl_Color row_header_color ()**
  Returns the current row header color.

- **void row_header_color (Fl_Color val)**
  Sets the row header color and causes the screen to redraw.

- **int row_header_width ()**
  Returns the current row header width (in pixels).

- **void row_header_width (int width)**
  Sets the row header width to n and causes the screen to redraw.

- **int row_height (int row)**
  Returns the current height of the specified row as a value in pixels.

- **void row_height (int row, int height)**
  Sets the height of the specified row in pixels, and the table is redrawn.

- **void row_height_all (int height)**
  Convenience method to set the height of all rows to the same value, in pixels.

- **int row_position ()**
  Returns the current row scroll position as a row number.

- **void row_position (int row)**
  Sets the vertical scroll position so 'row' is at the top, and causes the screen to redraw.

- **int row_resize ()**
  Returns if row resizing by the user is allowed.

- **void row_resize (int flag)**
  Allows/disallows row resizing by the user.

- **int row_resize_min ()**
  Returns the current row minimum resize value.

- **void row_resize_min (int val)**
  Sets the current row minimum resize value.

- **int rows ()**
  Returns the number of rows in the table.

- **virtual void rows (int val)**
  Sets the number of rows in the table, and the table is redrawn.

- **int scrollbar_size () const**
  Gets the current size of the scrollbars' troughs, in pixels.

- **void scrollbar_size (int newSize)**
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.
• void **set_selection** (int row_top, int col_left, int row_bot, int col_right)
  Sets the region of cells to be selected (highlighted).

• int **tab_cell_nav** () const
  Get state of table's 'Tab' key cell navigation flag.

• void **tab_cell_nav** (int val)
  Flag to control if Tab navigates table cells or not.

• void **table_box** (Fl_Boxtype val)
  Sets the kind of box drawn around the data table, the default being FL_NO_BOX.

• Fl_Boxtype **table_box** (void)
  Returns the current box type used for the data table.

• int **top_row** ()
  Returns the current top row shown in the table.

• void **top_row** (int row)
  Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.

• void **visible_cells** (int &r1, int &r2, int &c1, int &c2)
  Returns the range of row and column numbers for all visible and partially visible cells in the table.

• void **when** (Fl_When flags)
  The Fl_Widget::when() function is used to set a group of flags, determining when the widget callback is called:

• ~Fl_Table ()
  The destructor for Fl_Table.

Public Member Functions inherited from Fl_Group

• Fl_Widget * & _ddfdesign_kludge ()
  This is for forms compatibility only.

• void **add** (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

• void **add** (Fl_Widget *o)
  See void Fl_Group::add(Fl_Widget &w)

• void **add_resizable** (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget * const *array () const
  Returns a pointer to the array of children.

• int **children** () const
  Returns how many child widgets the group has.

• void **clear** ()
  Deletes all child widgets from memory recursively.

• unsigned int **clip_children** ()
  Returns the current clipping mode.

• void **clip_children** (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• virtual int **delete_child** (int n)
  Removes the widget at index from the group and deletes it.

• void **end** ()
  Generated by Doxygen
Exactly the same as current(this->parent()).

- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget *W)
- void forms_end ()
  This is for forms compatibility only.
- void init_sizes ()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
  Removes the widget at index from the group but does not delete it.
- Fl_Widget * resizable () const
  Returns the group's resizable widget.
- void resizable (Fl_Widget &o)
  Sets the group's resizable widget.
- void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Window ∗ as_window ()

Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)

Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)

Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const

Gets the box type of the widget.
• void box (Fl_Boxtype new_box)

Sets the box type for the widget.
• Fl_Callback_p callback () const

Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)

Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)

Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)

Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗ cb)

Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)

Sets the current callback function for the widget.
• unsigned int changed () const

Checks if the widget value changed since the last callback.
• void clear_active ()

Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()

Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)

Clears or sets the damage flags.
• void clear_output ()

Sets a widget to accept input.
• void clear_visible ()

Hides the widget.
• void clear_visible_focus ()

Disables keyboard focus navigation with this widget.
• Fl_Color color () const

Gets the background color of the widget.
• void color (Fl_Color bg)

Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.
• Fl_Color color2 () const

For back compatibility only.
• void color2 (unsigned a)
For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image * deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image * deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **Fl_Image * image ()**
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image * image () const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.

• Fl_Grup * parent () const
  Returns a pointer to the parent widget.

• void parent (Fl_Grup *p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• Fl_Color selection_color () const
  Gets the selection color.

• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
Sets a widget to output only.

- void `set_visible()`
  
  Makes the widget visible.

- void `set_visible_focus()`
  
  Enables keyboard focus navigation with this widget.

- int `shortcut_label()` const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void `shortcut_label(int value)`
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void `show()`
  
  Makes a widget visible.

- void `size(int W, int H)`
  
  Changes the size of the widget.

- int `take_focus()`
  
  Gives the widget the keyboard focus.

- unsigned int `takeevents()` const
  
  Returns if the widget is able to take events.

- int `test_shortcut()`
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- const char* `tooltip()` const
  
  Gets the current tooltip text.

- void `tooltip(const char* text)`
  
  Sets the current tooltip text.

- `Fl_Window* top_window()` const
  
  Returns a pointer to the top-level window for the widget.

- `Fl_Window* top_window_offset(int &xoff, int &yoff)` const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar `type()` const
  
  Gets the widget type.

- void `type(uchar t)`
  
  Sets the widget type.

- int `use_accents_menu()`
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void* `user_data()` const
  
  Gets the user data for this widget.

- void `user_data(Fl_Callback_User_Data*v, bool auto_free)`
  
  Sets the user data for this widget.

- void `user_data(void*v)`
  
  Sets the user data for this widget.

- unsigned int `visible()` const
  
  Returns whether a widget is visible.

- unsigned int `visible_focus()` const
  
  Checks whether this widget has a visible focus.

- void `visible_focus(int v)`
  
  Modifies keyboard focus navigation.

- int `visible_r()` const
  
  Returns whether a widget and all its parents are visible.

- int `w()` const
  
  Gets the widget width.

- `Fl_When when()` const
  
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Types

• enum ResizeFlag {
  RESIZE_NONE = 0, RESIZE_COL_LEFT = 1, RESIZE_COL_RIGHT = 2, RESIZE_ROW ABOVE = 3,
  RESIZE_ROW_BELOW = 4 }

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30,
  USERFLAG1 = 1<<31 }

  flags possible values enumeration.

Protected Member Functions

• void change_cursor (Fl_Cursor newcursor)
  Change mouse cursor to different type.
• long col_scroll_position (int col)
  Returns the scroll position (in pixels) of the specified column 'col'.
• TableContext cursor2rowcol (int &R, int &C, ResizeFlag &resizeflag)
  Find row/col for the recent mouse event.
• void damage_zone (int r1, int c1, int r2, int c2, int r3=0, int c3=0)
  Sets the damage zone to the specified row/col values.
• void draw () FL_OVERRIDE
  Draws the entire Fl_Table.
• virtual void draw_cell (TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0)
  Subclass should override this method to handle drawing the cells.
• int find_cell (TableContext context, int R, int C, int &X, int &Y, int &W, int &H)
  Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.
• void get_bounds (TableContext context, int &X, int &Y, int &W, int &H)
  Returns the (X,Y,W,H) bounding region for the specified 'context'.
• int handle (int e) FL_OVERRIDE
  Handle FLTK events.
• int is_fltk_container ()
  
  Does the table contain any child fltk widgets?
• void recalc_dimensions ()
  
  Recalculate the dimensions of the table, and affect any children.
• void redraw_range (int topRow, int botRow, int leftCol, int rightCol)
  
  Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(DAMAGE_CHILD).
• int row_col_clamp (TableContext context, int &R, int &C)
  
  Return specified row/col values R and C to within the table’s current row/col limits.
• long row_scroll_position (int row)
  
  Returns the scroll position (in pixels) of the specified ‘row’.
• void table_resized ()
  
  Call this if table was resized, to recalculate internal data.
• void table_scrolled ()
  
  Recalculate internals after a scroll.

Protected Member Functions inherited from Fl_Group

• Fl_Rect * bounds ()
  
  Returns the internal array of widget sizes and positions.
• void draw_child (Fl_Widget &widget) const
  
  Forces a child to redraw.
• void draw_children ()
  
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  
  Parents normally call this to draw outside labels of child widgets.
• virtual int on_insert (Fl_Widget *, int)
  
  Allow derived groups to act when a widget is added as a child.
• virtual int on_move (int, int)
  
  Allow derived groups to act when a widget is moved within the group.
• virtual void on_remove (int)
  
  Allow derived groups to act when a child widget is removed from the group.
• int * sizes ()
  
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.
• void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget’s position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

Static Protected Member Functions

- static void scroll_cb (Fl_Widget *, void *)
  Callback for when someone moves a scrollbar.

Protected Attributes

- int botrow
  bottom row# of currently visible table on screen

- int current_col
  selection cursor's current column (-1 if none)

- int current_row
  selection cursor's current row (-1 if none)

- Fl_Scrollbar * hscrollbar
  child horizontal scrollbar widget

- int leftcol
  left column# of currently visible table on screen

- int leftcol_scpos
  precomputed scroll position for left column

- int rightcol
  right column# of currently visible table on screen

- int select_col
  extended selection column (-1 if none)

- int select_row
  extended selection row (-1 if none)

- Fl_Scroll * table
  child Fl_Scroll widget container for child fltk widgets (if any)

- int table_h
  table's virtual height (in pixels)

- int table_w
  table's virtual width (in pixels)
table’s virtual width (in pixels)

- **int** `tih`
  Data table’s inner h dimension, inside bounding box. See Table Dimension Diagram.

- **int** `tiw`
  Data table’s inner w dimension, inside bounding box. See Table Dimension Diagram.

- **int** `tix`
  Data table’s inner x dimension, inside bounding box. See Table Dimension Diagram.

- **int** `tly`
  Data table’s inner y dimension, inside bounding box. See Table Dimension Diagram.

- **int** `toh`
  Data table’s outer h dimension, outside bounding box. See Table Dimension Diagram.

- **int** `toprow`
  Top row# of currently visible table on screen

- **int** `toprow_scrollpos`
  Precomputed scroll position for top row

- **int** `tow`
  Data table’s outer w dimension, outside bounding box. See Table Dimension Diagram.

- **int** `tox`
  Data table’s outer x dimension, outside bounding box. See Table Dimension Diagram.

- **int** `toy`
  Data table’s outer y dimension, outside bounding box. See Table Dimension Diagram.

- **Fl_Scrollbar** `vscrollbar`
  Child vertical scrollbar widget

- **int** `wih`
  Table widget’s inner h dimension, inside bounding box. See Table Dimension Diagram.

- **int** `wiw`
  Table widget’s inner w dimension, inside bounding box. See Table Dimension Diagram.

- **int** `wxw`
  Table widget’s inner x dimension, inside bounding box. See Table Dimension Diagram.

- **int** `wiy`
  Table widget’s inner y dimension, inside bounding box. See Table Dimension Diagram.

### Additional Inherited Members

#### Static Public Member Functions inherited from Fl_Group

- static **Fl_Group** `current ()`
  Returns the currently active group.

- static void `current(Fl_Group *g)`
  Sets the current group.

#### Static Public Member Functions inherited from Fl_Widget

- static void `default_callback(Fl_Widget *widget, void *data)`
  The default callback for all widgets that don’t set a callback.

- static unsigned int `label_shortcut(const char *t)`
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int `test_shortcut(const char *t, const bool require_alt=false)`
  Returns true if the given text `t` contains the entered ‘&x’ shortcut.
11.139.1 Detailed Description

A table of widgets or other content. This is the base class for table widgets.

To be useful it must be subclassed and several virtual functions defined. Normally applications use widgets derived from this widget, and do not use this widget directly; this widget is usually too low level to be used directly by applications.

This widget does not handle the data in the table. The `draw_cell()` method must be overridden by a subclass to manage drawing the contents of the cells.

This widget can be used in several ways:

- As a custom widget; see examples/table-simple.cxx and test/table.cxx. Very optimal for even extremely large tables.
- As a table made up of a single FLTK widget instanced all over the table, simulating a numeric spreadsheet. See examples/table-spreadsheet.cxx and examples/table-spreadsheet-with-keyboard-nav.cxx. Optimal for large tables.
- As a regular container of FLTK widgets, one widget per cell. See examples/table-as-container.cxx. Not recommended for large tables.

![Figure 11.47 table-simple example](image1)

When acting as part of a custom widget, events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events are generated based on the setting for `Fl_Table::when()`.

When acting as a container for FLTK widgets, the FLTK widgets maintain themselves. Although the `draw_cell()` method must be overridden, its contents can be very simple. See the `draw_cell()` code in examples/table-simple.cxx.
The following variables are available to classes deriving from Fl_Table:

![Figure 11.49 Fl_Table Dimensions](image)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x/y/w/h()</td>
<td>Fl_Table widget's outer dimension. The outer edge of the border of the Fl_Table. (Red in the diagram above)</td>
</tr>
<tr>
<td>wix/wiy/wiw/wih</td>
<td>Fl_Table widget's inner dimension. The inner edge of the border of the Fl_Table. eg. if the Fl_Table's box() is FL_NO_BOX, these values are the same as x/y/w/h(). (Yellow in the diagram above)</td>
</tr>
<tr>
<td>tox/toy/tow/toh</td>
<td>The table's outer dimension. The outer edge of the border around the cells, but inside the row/col headings and scrollbars. (Green in the diagram above)</td>
</tr>
<tr>
<td>tix/tiy/tiw/th</td>
<td>The table's inner dimension. The inner edge of the border around the cells, but inside the row/col headings and scrollbars. AKA the table's clip region. eg. if the table_box() is FL_NO_BOX, these values are the same as tox/toy/tow/toh. (Blue in the diagram above)</td>
</tr>
</tbody>
</table>

CORE DEVELOPERS

- Greg Ercolano : 12/16/2002 - initial implementation 12/16/02. Fl_Table, Fl_Table_Row, docs.
- Jean-Marc Lienher : 02/22/2004 - added keyboard nav + mouse selection, and ported Fl_Table into fltk-utf8-1.1.4

OTHER CONTRIBUTORS

- Inspired by the Feb 2000 version of FLVW's Flvw_Table widget. Mucho thanks to those folks.
- Mister Satan : 04/07/2003 - MinGW porting mods, and singleinput.cxx; a cool FL_Input oriented spreadsheet example
- Marek Paliwoda : 01/08/2003 - Porting mods for Borland
- Ori Berger : 03/16/2006 - Optimizations for >500k rows/cols

LICENSE

Greg kindly gave his permission to integrate Fl_Table and Fl_Table_Row into FLTK, allowing FLTK license to apply while his widgets are part of the library. [updated by Greg, 04/26/17]

11.139.2 Member Enumeration Documentation

11.139.2.1 TableContext

enum Fl_Table::TableContext
The context bit flags for \texttt{Fl\_Table} related callbacks.
Should be used in \texttt{draw\_cell()} to determine what's being drawn, or in a \texttt{callback()} to determine where a recent event occurred.

<table>
<thead>
<tr>
<th>Enumerators</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTEXT_NONE</td>
<td>no known context</td>
</tr>
<tr>
<td>CONTEXT_STARTPAGE</td>
<td>before the table is redrawn</td>
</tr>
<tr>
<td>CONTEXT_ENDPAGE</td>
<td>after the table is redrawn</td>
</tr>
<tr>
<td>CONTEXT_ROW_HEADER</td>
<td>drawing or event occurred in the row header</td>
</tr>
<tr>
<td>CONTEXT_COL_HEADER</td>
<td>drawing or event occurred in the col header</td>
</tr>
<tr>
<td>CONTEXT_CELL</td>
<td>drawing or event occurred in a cell</td>
</tr>
<tr>
<td>CONTEXT_TABLE</td>
<td>drawing or event occurred in a dead zone of table</td>
</tr>
<tr>

<td>column or row is being resized</td>
</tr>
</tbody>
</table>

### 11.139.3 Constructor & Destructor Documentation

#### 11.139.3.1 \texttt{Fl\_Table()}

\texttt{Fl\_Table::Fl\_Table (}
\begin{verbatim}
  int X,
  int Y,
  int W,
  int H,
  const char * l = 0
\end{verbatim}
\texttt{)}

The constructor for \texttt{Fl\_Table}.
The constructor creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

#### 11.139.3.2 \texttt{~Fl\_Table()}

\texttt{Fl\_Table::\~Fl\_Table ( )}

The destructor for \texttt{Fl\_Table}.
The destructor destroys the table and its associated widgets.

### 11.139.4 Member Function Documentation

#### 11.139.4.1 \texttt{array()}

\texttt{Fl\_Widget *const * Fl\_Table::array ( ) [inline]}

Returns a pointer to the array of children.
\textit{This pointer is only valid until the next time a child is added or removed.}

#### 11.139.4.2 \texttt{callback()}

\texttt{void Fl\_Table::callback (}
\begin{verbatim}
  Fl\_Widget * ,
  void *  
\end{verbatim}
\texttt{)}

Callbacks will be called depending on the setting of \texttt{Fl\_Widget::when()}. Callback functions should use the following functions to determine the context/row/column:

- \texttt{Fl\_Table::callback\_row()} returns current row
- \texttt{Fl\_Table::callback\_col()} returns current column
- \texttt{Fl\_Table::callback\_context()} returns current table context

\texttt{callback\_row()} and \texttt{callback\_col()} will be set to the row and column number the event occurred on. If someone clicked on a row header, \texttt{col} will be 0. If someone clicked on a column header, \texttt{row} will be 0. \texttt{callback\_context()} will return one of the following:
11.139.4.3 callback_col()

int Fl_Table::callback_col ( ) [inline]
Returns the current column the event occurred on.
This function should only be used from within the user's callback function.

11.139.4.4 callback_context()

TableContext Fl_Table::callback_context ( ) [inline]
Returns the current 'table context'.
This function should only be used from within the user's callback function.

11.139.4.5 callback_row()

int Fl_Table::callback_row ( ) [inline]
Returns the current row the event occurred on.
This function should only be used from within the user's callback function.

11.139.4.6 child()

Fl_Widget * Fl_Table::child ( int n ) const [inline]
Returns the child widget by an index.
When using the Fl_Table as a container for FLTK widgets, this method returns the widget pointer from the internal array of widgets in the container.
Typically used in loops, eg:
for ( int i=0; i<children(); i++ ) {
    Fl_Widget *w = child(i);
    [..]
}

11.139.4.7 children()

int Fl_Table::children ( ) const [inline]
Returns the number of children in the table.
When using the Fl_Table as a container for FLTK widgets, this method returns how many child widgets the table
has.
See also
    child(int)

11.139.4.8 clear()

virtual void Fl_Table::clear ( ) [inline], [virtual]
Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were
added with begin()/end() or add()/insert()/etc.
See also
    rows(int), cols(int)
Reimplemented in Fl_Table_Row.

11.139.4.9 col_header()

void Fl_Table::col_header ( int flag ) [inline]
Enable or disable column headers.
If changed, the table is redrawn.

11.139.4.10 col_resize()

void Fl_Table::col_resize ( int flag ) [inline]
Allows/disallows column resizing by the user.
1=allow interactive resizing, 0=disallow interactive resizing. Since interactive resizing is done via the column head-
ers, col_header() must also be enabled to allow resizing.

11.139.4.11 col_resize_min()

void Fl_Table::col_resize_min ( int val ) [inline]
Sets the current column minimum resize value.
This is used to prevent the user from interactively resizing any column to be smaller than 'pixels'. Must be a value
>1.

11.139.4.12 col_width()

void Fl_Table::col_width ( int col, int width )
Sets the width of the specified column in pixels, and the table is redrawn.
callback() will be invoked with CONTEXT_RC_RESIZE if the column's width was actually changed, and when() is
FL_WHEN_CHANGED.
11.139.4.13  col_width_all()

void Fl_Table::col_width_all (  
    int width )  [inline]

Convenience method to set the width of all columns to the same value, in pixels.  
The screen is redrawn.

11.139.4.14  cursor2rowcol()

Fl_Table::TableContext Fl_Table::cursor2rowcol (  
    int & R,  
    int & C,  
    ResizeFlag & resizeflag )  [protected]

Find row/col for the recent mouse event.  
Returns the context, and the row/column values in R/C.  Also returns 'resizeflag' if mouse is hovered over a resize  
boundary.

11.139.4.15  damage_zone()

void Fl_Table::damage_zone (  
    int r1,  
    int c1,  
    int r2,  
    int c2,  
    int r3 = 0,  
    int c3 = 0 )  [protected]

Sets the damage zone to the specified row/col values.  
Calls redraw_range().

11.139.4.16  do_callback()

void Fl_Table::do_callback (  
    TableContext context,  
    int row,  
    int col )  [inline]

Calls the widget callback.  
Saves the specified 'context', 'row', and 'col' values, so that the user's callback can then access them with the  
member functions callback_context(), callback_row() and callback_col().

11.139.4.17  draw()

void Fl_Table::draw (  
    void )  [protected],  [virtual]

Draws the entire Fl_Table.  
Lets fltk widgets draw themselves first, followed by the cells via calls to draw_cell().  
Reimplemented from Fl_Group.

11.139.4.18  draw_cell()

virtual void Fl_Table::draw_cell (  
    TableContext context,  
    int R = 0,  
    int C = 0,  
    int X = 0,  
    int Y = 0,  
    int W = 0,  
    int H = 0 )  [inline],  [protected],  [virtual]

Subclass should override this method to handle drawing the cells.  
This method will be called whenever the table is redrawn, once per cell.
Only cells that are completely (or partially) visible will be told to draw.

`context` will be one of the following:

| Fl_Table::CONTEXT_STARTPAGE | When table, or parts of the table, are about to be redrawn. Use to initialize static data, such as font selections. R/C will be zero, X/Y/W/H will be the dimensions of the table's entire data area. (Useful for locking a database before accessing; see also `visible_cells()`) |
| Fl_Table::CONTEXT_ENDPAGE | When table has completed being redrawn. R/C will be zero, X/Y/W/H dimensions of table's data area. (Useful for unlocking a database after accessing) |
| Fl_Table::CONTEXT_ROW_HEADER | Whenever a row header cell needs to be drawn. R will be the row number of the header being redrawn, C will be zero, X/Y/W/H will be the fltk drawing area of the row header in the window |
| Fl_Table::CONTEXT_COL_HEADER | Whenever a column header cell needs to be drawn. R will be zero, C will be the column number of the header being redrawn, X/Y/W/H will be the fltk drawing area of the column header in the window |
| Fl_Table::CONTEXT_CELL | Whenever a data cell in the table needs to be drawn. R/C will be the row/column of the cell to be drawn, X/Y/W/H will be the fltk drawing area of the cell in the window |
| Fl_Table::CONTEXT_RC_RESIZE | Whenever table or row/column is resized or scrolled, either interactively or via `col_width()` or `row_height()`. R/C/X/Y/W/H will all be zero. Useful for fltk containers that need to resize or move the child fltk widgets. |

R and C will be set to the row and column number of the cell being drawn. In the case of row headers, C will be 0. In the case of column headers, R will be 0. X/Y/W/H will be the position and dimensions of where the cell should be drawn.

In the case of custom widgets, a minimal `draw_cell()` override might look like the following. With custom widgets it is up to the caller to handle drawing everything within the dimensions of the cell, including handling the selection color. Note all clipping must be handled as well; this allows drawing outside the dimensions of the cell if so desired for 'custom effects'.

```c
// This is called whenever Fl_Table wants you to draw a cell
void MyTable::draw_cell(Fl_Table* context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0) {
    static char s[40];
    sprintf(s, "%d/%d", R, C); // text for each cell
    switch ( context ) {
        case CONTEXT_STARTPAGE: // Fl_Table telling us it’s starting to draw page
            fl_font(FL_HELVETICA, 16);
            return;
        case CONTEXT_ROW_HEADER: // Fl_Table telling us to draw row/col headers
            fl_draw_box(FL_THIN_UP_BOX, X, Y, W, H, color());
            fl_color(FL_BLACK);
            fl_draw(s, X, Y, W, H, FL_ALIGN_CENTER);
            fl_pop_clip();
            return;
        case CONTEXT_COL_HEADER:
            fl_push_clip(X, Y, W, H);
            { fl_draw_box(FL_THIN_UP_BOX, X, Y, W, H, color());
              fl_color(FL_BLACK);
              fl_draw(s, X, Y, W, H, FL_ALIGN_CENTER);
            }
            fl_pop_clip();
            return;
        case CONTEXT_CELL: // Fl_Table telling us to draw cells
            fl_push_clip(X, Y, W, H);
            {
                // BG COLOR
                if (row_selected(R) ? selection_color() : FL_WHITE);
                fl_rectf(X, Y, W, H);
            }
            // TEXT
            fl_color(FL_BLACK);
```
11.139 Fl_Table Class Reference

```c
fl_draw(s, X, Y, W, H, FL_ALIGN_CENTER);

// BORDER
fl_color(FL_LIGHT2);
fl_rect(X, Y, W, H);
}
fl_pop_clip();
return;

default:
return;
}
//NOTREACHED
```

11.139.4.19 find_cell()

```c
int Fl_Table::find_cell {
    TableContext context,
    int R,
    int C,
    int & X,
    int & Y,
    int & W,
    int & H } [protected]
```

Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.

Returns

- 0 – on success, XYWH returns the region of the specified cell.
- -1 – if R or C are out of range, and X/Y/W/H will be set to zero.

11.139.4.20 get_selection()

```c
void Fl_Table::get_selection {
    int & row_top,
    int & col_left,
    int & row_bot,
    int & col_right }
```

Gets the region of cells selected (highlighted).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>row_top</th>
<th>Returns the top row of selection area</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>col_left</td>
<td>Returns the left column of selection area</td>
</tr>
<tr>
<td>in</td>
<td>row_bot</td>
<td>Returns the bottom row of selection area</td>
</tr>
<tr>
<td>in</td>
<td>col_right</td>
<td>Returns the right column of selection area</td>
</tr>
</tbody>
</table>

11.139.4.21 handle()

```c
int Fl_Table::handle ( int e ) [protected], [virtual]
```

Handle FLTK events.
Reimplemented from Fl_Group.
Reimplemented in Fl_Table_Row.

11.139.4.22 init_sizes()

```c
void Fl_Table::init_sizes ( ) [inline]
```

Resets the internal array of widget sizes and positions.

Generated by Doxygen
See also

Fl_Group::init_sizes()

11.139.4.23 insert()

void Fl_Table::insert (Fl_Widget & wgt,
                      Fl_Widget * w2)  [inline]
The specified widget is removed from its current group (if any) and inserted into Fl_Table's group before widget 'w2'. This will append if 'w2' is not in Fl_Table's group.

11.139.4.24 is_interactive_resize()

int Fl_Table::is_interactive_resize ( )  [inline]
Returns 1 if someone is interactively resizing a row or column.
You can currently call this only from within your callback().

11.139.4.25 is_selected()

int Fl_Table::is_selected (int r, int c)
See if the cell at row r and column c is selected.
Returns

1 if the cell is selected, 0 if not.

11.139.4.26 move_cursor()

int Fl_Table::move_cursor (int R, int C, int shiftselect)
Moves the selection cursor a relative number of rows/columns specified by R/C.
R/C can be positive or negative, depending on the direction to move. A value of 0 for R or C prevents cursor movement on that axis.
If shiftselect is set, the selection range is extended to the new cursor position. If clear, the cursor is simply moved, and any previous selection is cancelled.
Used mainly by keyboard events (e.g. Fl_Right, FL_Home, FL_End..) to let the user keyboard navigate the selection cursor around.
The scroll positions may be modified if the selection cursor traverses into cells off the screen's edge. Internal variables select_row/select_col and current_row/current_col are modified, among others.
Examples:
R=1, C=0 -- moves the selection cursor one row downward.
R=5, C=0 -- moves the selection cursor 5 rows downward.
R=-5, C=0 -- moves the cursor 5 rows upward.
R=2, C=2 -- moves the cursor 2 rows down and 2 columns to the right.

11.139.4.27 recalc_dimensions()

void Fl_Table::recalc_dimensions ()  [protected]
Recalculate the dimensions of the table, and affect any children.
Internally, Fl_Group::resize() and init_sizes() are called.

11.139.4.28 redraw_range()

void Fl_Table::redraw_range (int topRow, int botRow,
int leftCol,
int rightCol) [inline], [protected]

Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(DAMAGE_CHILD).
Extends any previously defined range to redraw.

11.139.4.29  resize()

void Fl_Table::resize (  
    int X,
    int Y,
    int W,
    int H ) [virtual]

Handle resize events if user resizes parent window.  
This changes the size of Fl_Table, causing it to redraw.  
Reimplemented from Fl_Group.

11.139.4.30  row_col_clamp()

int Fl_Table::row_col_clamp (  
    TableContext context,
    int & R,
    int & C ) [protected]

Return specified row/col values R and C to within the table's current row/col limits.
Returns
0 if no changes were made, or 1 if they were.

11.139.4.31  row_header()

void Fl_Table::row_header (  
    int flag ) [inline]

Enables/disables showing the row headers.  
1=enabled, 0=disabled. If changed, the table is redrawn.

11.139.4.32  row_height()

void Fl_Table::row_height (  
    int row,
    int height )

Sets the height of the specified row in pixels, and the table is redrawn.  
callback() will be invoked with CONTEXT_RC_RESIZE if the row's height was actually changed, and when() is 
FL_WHEN_CHANGED.

11.139.4.33  row_height_all()

void Fl_Table::row_height_all (  
    int height ) [inline]

Convenience method to set the height of all rows to the same value, in pixels.  
The screen is redrawn.

11.139.4.34  row_resize()

void Fl_Table::row_resize (  
    int flag ) [inline]

Allows/disallows row resizing by the user.  
1=allow interactive resizing, 0=disallow interactive resizing. Since interactive resizing is done via the row headers,  
row_header() must also be enabled to allow resizing.
11.139.4.35  row_resize_min()

void Fl_Table::row_resize_min (  
    int val ) [inline]

Sets the current row minimum resize value.  
This is used to prevent the user from interactively resizing any row to be smaller than ‘pixels’. Must be a value >=1.

11.139.4.36  rows()

void Fl_Table::rows (  
    int val ) [virtual]

Sets the number of rows in the table, and the table is redrawn.  
Reimplemented in Fl_Table_Row.

11.139.4.37  scrollbar_size() [1/2]

int Fl_Table::scrollbar_size ( ) const [inline]
gets the current size of the scrollbars' troughs, in pixels.  
if this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.

Returns

scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also

Fl::scrollbar_size(int)

11.139.4.38  scrollbar_size() [2/2]

void Fl_Table::scrollbar_size (  
    int newSize ) [inline]

Sets the pixel size of the scrollbars' troughs to newSize, in pixels.  
Normally you should not need this method, and should use Fl::scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.  
Setting newSize to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the default.

Parameters

| in  | newSize | Sets the scrollbar size in pixels.  
If 0 (default), scrollbar size tracks the global Fl::scrollbar_size() |

See also

Fl::scrollbar_size()

11.139.4.39  set_selection()

void Fl_Table::set_selection (  
    int row_top,  
    int col_left,  
    int row_bot,  
    int col_right )

Sets the region of cells to be selected (highlighted).
So for instance, set_selection(0,0,0,0) selects the top/left cell in the table. And set_selection(0,0,1,1) selects the four cells in rows 0 and 1, column 0 and 1.
To deselect all cells, use set_selection(-1,-1,-1,-1);

Parameters

| in | row_top | Top row of selection area |
| in | col_left | Left column of selection area |
| in | row_bot | Bottom row of selection area |
| in | col_right | Right column of selection area |

11.139.4.40 \textbf{tab\_cell\_nav()} [1/2]

\texttt{int Fl\_Table::tab\_cell\_nav () const [inline]}

Get state of table's 'Tab' key cell navigation flag.

Returns

1 if Tab configured to navigate cells in table
0 to navigate widget focus (default)

See also

\texttt{tab\_cell\_nav(int)}

11.139.4.41 \textbf{tab\_cell\_nav()} [2/2]

\texttt{void Fl\_Table::tab\_cell\_nav (int val) [inline]}

Flag to control if Tab navigates table cells or not.
If on, Tab key navigates table cells. If off, Tab key navigates fltk widget focus. (default)
As of fltk 1.3, the default behavior of the Tab key is to navigate focus off of the current widget, and on to the next one. But in some applications, it's useful for Tab to be used to navigate cells in the \texttt{Fl\_Table}.

Parameters

| in | val | If val is 1, Tab key navigates cells in table, not fltk widgets. If val is 0, Tab key will advance focus to the next fltk widget (default), and does not navigate cells in table. |

11.139.4.42 \textbf{table\_box()}

\texttt{void Fl\_Table::table\_box (Fl\_Boxtype val) [inline]}

Sets the kind of box drawn around the data table, the default being \texttt{FL\_NO\_BOX}.
Changing this value will cause the table to redraw.

11.139.4.43 \textbf{table\_resized()}

\texttt{void Fl\_Table::table\_resized ( ) [protected]}

Call this if table was resized, to recalculate internal data. Calls \texttt{recall\_dimensions()}, and recalculates scrollbar sizes.

11.139.4.44 \textbf{table\_scrolled()}

\texttt{void Fl\_Table::table\_scrolled ( ) [protected]}
Recalculate internals after a scroll. Call this if the table has been scrolled or resized. Does not handle \texttt{redraw()}. TODO: Assumes \texttt{t[xywh]} has already been recalculated.

\subsection{11.139.4.45 \texttt{top\_row() [1/2]}}

\begin{verbatim}
int Fl_Table::top_row ( ) [inline]
\end{verbatim}

Returns the current top row shown in the table. This row may be partially obscured.

\subsection{11.139.4.46 \texttt{top\_row() [2/2]}}

\begin{verbatim}
void Fl_Table::top_row ( int row ) [inline]
\end{verbatim}

Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn. If the table cannot be scrolled that far, it is scrolled as far as possible.

\subsection{11.139.4.47 \texttt{visible\_cells()}}

\begin{verbatim}
void Fl_Table::visible_cells ( int & r1, int & r2, int & c1, int & c2 ) [inline]
\end{verbatim}

Returns the range of row and column numbers for all visible and partially visible cells in the table. These values can be used e.g. by your \texttt{draw\_cell()} routine during \texttt{CONTEXT\_STARTPAGE} to figure out what cells are about to be redrawn for the purposes of locking the data from a database before it’s drawn.

\begin{verbatim}
leftcol rightcol
| toprow \ ---- \,
| | VISI T A B L E |
| | E R R O R |
| V I S I B L E |
| T A B L E |
| bottom \ ----
\end{verbatim}

e.g. in a table where the visible rows are 5-20, and the visible columns are 100-120, then those variables would be:

- \texttt{toprow} = 5
- \texttt{botrow} = 20
- \texttt{leftcol} = 100
- \texttt{rightcol} = 120

\subsection{11.139.4.48 \texttt{when()}}

\begin{verbatim}
void Fl_Table::when ( Fl_When flags )
\end{verbatim}

The \texttt{Fl\_Widget::when()} function is used to set a group of flags, determining when the widget callback is called:

\begin{verbatim}
<table>
<thead>
<tr>
<th>FL_WHEN_CHANGED</th>
<th>callback() will be called when rows or columns are resized (interactively or via \texttt{col_width() or row_height()}) passing \texttt{CONTEXT_RC_RESIZE} via \texttt{callback_context()}.</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_WHEN_RELEASE</td>
<td>callback() will be called during \texttt{FL_RELEASE} events, such as when someone releases a mouse button somewhere on the table.</td>
</tr>
</tbody>
</table>
\end{verbatim}

The \texttt{callback()} routine is sent a TableContext that indicates the context the event occurred in, such as in a cell, in a header, or elsewhere on the table. When an event occurs in a cell or header, \texttt{callback\_row()} and \texttt{callback\_col()} can be used to determine the row and column. The callback can also look at the regular \texttt{fltk} event values (i.e. \texttt{Fl::event()} and \texttt{Fl::event\_button()}) to determine what kind of event is occurring.

The documentation for this class was generated from the following files:
11.140 Fl_Table_Row Class Reference

A table with row selection capabilities.
#include <Fl_Table_Row.H>

Inheritance diagram for Fl_Table_Row:

   v
Fl_Table_Row
```

Public Types

- enum TableRowSelectMode { SELECT_NONE, SELECT_SINGLE, SELECT_MULTI }

Public Types inherited from Fl_Table

- enum TableContext {
  CONTEXT_NONE = 0, CONTEXT_STARTPAGE = 0x01, CONTEXT_ENDPAGE = 0x02, CONTEXT_ROW_HEADER = 0x04,
  CONTEXT_COL_HEADER = 0x08, CONTEXT_CELL = 0x10, CONTEXT_TABLE = 0x20, CONTEXT_RC_RESIZE = 0x40
}

The context bit flags for Fl_Table related callbacks.

Public Member Functions

- void clear () FL_OVERRIDE
  Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.

- Fl_Table_Row (int X, int Y, int W, int H, const char ∗l=0)
  The constructor for the Fl_Table_Row.

- int row_selected (int row)
  Checks to see if 'row' is selected.

- int rows ()
  void rows (int val) FL_OVERRIDE
  Sets the number of rows in the table, and the table is redrawn.

- void select_all_rows (int flag=1)
  This convenience function changes the selection state for all rows based on 'flag'.

- int select_row (int row, int flag=1)
  Changes the selection state for 'row', depending on the value of 'flag'.

- TableRowSelectMode type () const
  void type (TableRowSelectMode val)
  Sets the table selection mode.

- ~Fl_Table_Row ()
  The destructor for the Fl_Table_Row.
Public Member Functions inherited from Fl_Table

• void add (Fl_Widget &wgt)
  The specified widget is removed from its current group (if any) and added to the end of Fl_Table's group.

• void add (Fl_Widget *wgt)
  The specified widget is removed from its current group (if any) and added to the end of Fl_Table's group.

• Fl_Widget *const * array ()
  Returns a pointer to the array of children.

• void begin ()

• void callback (Fl_Widget *, void *)
  Callbacks will be called depending on the setting of Fl_Widget:when().

• int callback_col ()
  Returns the current column the event occurred on.

• TableContext callback_context ()
  Returns the current 'table context'.

• int callback_row ()
  Returns the current row the event occurred on.

• Fl_Widget * child (int n) const
  Returns the child widget by an index.

• int children () const
  Returns the number of children in the table.

• int col_header ()
  Returns if column headers are enabled or not.

• void col_header (int flag)
  Enable or disable column headers.

• Fl_Color col_header_color ()
  Gets the color for column headers.

• void col_header_color (Fl_Color val)
  Sets the color for column headers and redraws the table.

• int col_header_height ()
  Gets the column header height.

• void col_header_height (int height)
  Sets the height in pixels for column headers and redraws the table.

• int col_position ()
  Returns the current column scroll position as a column number.

• void col_position (int col)
  Sets the horizontal scroll position so 'col' is at the left, and causes the screen to redraw.

• int col_resize ()
  Returns if column resizing by the user is allowed.

• void col_resize (int flag)
  Allows/disallows column resizing by the user.

• int col_resize_min ()
  Returns the current column minimum resize value.

• void col_resize_min (int val)
  Sets the current column minimum resize value.

• int col_width (int col)
  Returns the current width of the specified column in pixels.

• void col_width (int col, int width)
  Sets the width of the specified column in pixels, and the table is redrawn.

• void col_width_all (int width)
  Convenience method to set the width of all columns to the same value, in pixels.
• int cols()
  Get the number of columns in the table.
• virtual void cols(int val)
  Set the number of columns in the table and redraw.
• void do_callback(TableContext context, int row, int col)
  Calls the widget callback.
• void end()
• int find(const Fl_Widget &wgt) const
• int find(const Fl_Widget *wgt) const
• Fl_Table(int X, int Y, int W, int H, const char *l=0)
  The constructor for Fl_Table.
• void get_selection(int &row_top, int &col_left, int &row_bot, int &col_right)
  Gets the region of cells selected (highlighted).
• void init_sizes()
  Resets the internal array of widget sizes and positions.
• void insert(Fl_Widget &wgt, Fl_Widget *w2)
  The specified widget is removed from its current group (if any) and inserted into Fl_Table's group before widget 'w2'.
• void insert(Fl_Widget &wgt, int n)
  The specified widget is removed from its current group (if any) and inserted into the Fl_Table's group at position 'n'.
• int is_interactive_resize()
  Returns 1 if someone is interactively resizing a row or column.
• int is_selected(int r, int c)
  See if the cell at row r and column c is selected.
• int move_cursor(int R, int C)
  Same as move_cursor(R,C,1);.
• int move_cursor(int R, int C, int shiftselect)
  Moves the selection cursor a relative number of rows/columns specified by R/C.
• void remove(Fl_Widget &wgt)
  The specified widget is removed from Fl_Table's group.
• void resize(int X, int Y, int W, int H) FL_OVERRIDE
  Handle resize events if user resizes parent window.
• int row_header()
  Returns if row headers are enabled or not.
• void row_header(int flag)
  Enables/disables showing the row headers.
• Fl_Color row_header_color()
  Returns the current row header color.
• void row_header_color(Fl_Color val)
  Sets the row header color and causes the screen to redraw.
• int row_header_width()
  Returns the current row header width (in pixels).
• void row_header_width(int width)
  Sets the row header width to n and causes the screen to redraw.
• int row_height(int row)
  Returns the current height of the specified row as a value in pixels.
• void row_height(int row, int height)
  Sets the height of the specified row in pixels, and the table is redrawn.
• void row_height_all(int height)
  Convenience method to set the height of all rows to the same value, in pixels.
• int row_position()
  Returns the current row scroll position as a row number.
• void **row_position** (int row)
  Sets the vertical scroll position so 'row' is at the top, and causes the screen to redraw.
• int **row_resize** ()
  Returns if row resizing by the user is allowed.
• void **row_resize** (int flag)
  Allows/disallows row resizing by the user.
• int **row_resize_min** ()
  Returns the current row minimum resize value.
• void **row_resize_min** (int val)
  Sets the current row minimum resize value.
• int **rows** ()
  Returns the number of rows in the table.
• int **scrollbar_size** () const
  Gets the current size of the scrollbars’ troughs, in pixels.
• void **scrollbar_size** (int newSize)
  Sets the pixel size of the scrollbars’ troughs to newSize, in pixels.
• void **set_selection** (int row_top, int col_left, int row_bot, int col_right)
  Sets the region of cells to be selected (highlighted).
• int **tab_cell_nav** () const
  Get state of table’s ‘Tab’ key cell navigation flag.
• void **tab_cell_nav** (int val)
  Flag to control if Tab navigates table cells or not.
• void **table_box** (Fl_Boxtype val)
  Sets the kind of box drawn around the data table, the default being FL_NO_BOX.
• Fl_Boxtype **table_box** (void)
  Returns the current box type used for the data table.
• int **top_row** ()
  Returns the current top row shown in the table.
• void **top_row** (int row)
  Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.
• void **visible_cells** (int &r1, int &r2, int &c1, int &c2)
  Returns the range of row and column numbers for all visible and partially visible cells in the table.
• void **when** (Fl_When flags)
   The Fl_Widget::when() function is used to set a group of flags, determining when the widget callback is called:
• ~Fl_Table ()
   The destructor for Fl_Table.

Public Member Functions inherited from Fl_Group

• Fl_Widget * & _ddfdesign_kludge ()
  This is for forms compatibility only.
• void **add** (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
• void **add** (Fl_Widget +o)
  See void Fl_Group::add(Fl_Widget *)&w
• void **add_resizable** (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
• Fl_Widget * const + array () const
  Returns a pointer to the array of children.
• Fl_Group * const + as_group () const FL_OVERRIDE
• Fl_Group + as_group () FL_OVERRIDE
Returns an Fl_Group pointer if this widget is an Fl_Group.

• void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

• Fl_Widget ∗ child (int n) const
  Returns array()[n].

• int children () const
  Returns how many child widgets the group has.

• void clear ()
  Deletes all child widgets from memory recursively.

• unsigned int clip_children ()
  Returns the current clipping mode.

• void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

• void end ()
  Exactly the same as current(this->parent()).

• int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget ∗w) const.

• int find (const Fl_Widget ∗) const
  Searches the child array for the widget and returns the index.

• Fl_Group (int, int, int, int, const char ∗=0)
  Creates a new Fl_Group widget using the given position, size, and label string.

• void focus (Fl_Widget ∗W)

• void forms_end ()
  This is for forms compatibility only.

• void init_sizes ()
  Resets the internal array of widget sizes and positions.

• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

• void insert (Fl_Widget &o, Fl_Widget ∗before)
  This does insert(w, find(before)).

• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

• void remove (Fl_Widget ∗o)
  Removes the widget o from the group.

• void remove (int index)
  Removes the widget at index from the group but does not delete it.

• Fl_Widget ∗ resizable () const
  Returns the group's resizable widget.

• void resizable (Fl_Widget &o)
  Sets the group's resizable widget.

• void resizable (Fl_Widget ∗o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• virtual ~Fl_Group ()
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- class Fl_Gl_Window const ∗ as_gl_window () const
- Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- void clear_changed()
  *Marks the value of the widget as unchanged.*

- void clear_damage(uchar c=0)
  *Clears or sets the damage flags.*

- void clear_output()
  *Sets a widget to accept input.*

- void clear_visible()
  *Hides the widget.*

- void clear_visible_focus()
  *Disables keyboard focus navigation with this widget.*

- Fl_Color color() const
  *Gets the background color of the widget.*

- void color(Fl_Color bg)
  *Sets the background color of the widget.*

- void color(Fl_Color bg, Fl_Color sel)
  *Sets the background and selection color of the widget.*

- Fl_Color color2() const
  *For back compatibility only.*

- void color2(unsigned a)
  *For back compatibility only.*

- int contains(const Fl_Widget *w) const
  *Checks if w is a child of this widget.*

- void copy_label(const char *new_label)
  *Sets the current label.*

- void copy_tooltip(const char *text)
  *Sets the current tooltip text.*

- uchar damage() const
  *Returns non-zero if draw() needs to be called.*

- void damage(uchar c)
  *Sets the damage bits for the widget.*

- void damage(uchar c, int x, int y, int w, int h)
  *Sets the damage bits for an area inside the widget.*

- int damage_resize(int, int, int, int)
  *Internal use only.*

- void deactivate()
  *Deactivates the widget.*

- Fl_Image *deimage()
  *Gets the image that is used as part of the widget label when in the inactive state.*

- const Fl_Image *deimage() const
  *Gets the image that is used as part of the widget label when in the inactive state.*

- void deimage(Fl_Image &img)
  *Sets the image to use as part of the widget label when in the inactive state.*

- void deimage(Fl_Image *img)
  *Sets the image to use as part of the widget label when in the inactive state.*

- int deimage_bound() const
  *Returns whether the inactive image is managed by the widget.*

- void do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  *Calls the widget callback function with default arguments.*

- void do_callback(Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  *Calls the widget callback function with arbitrary arguments.*
• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int testShortcut ()**
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char * tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• int find_cell (TableContext context, int R, int C, int &X, int &Y, int &W, int &H)
• int handle (int event) FL_OVERRIDe
  Handle FLTK events.

Protected Member Functions inherited from Fl_Table

• void change_cursor (Fl_Cursor newcursor)
  Change mouse cursor to different type.
• long col_scroll_position (int col)
  Returns the scroll position (in pixels) of the specified column 'col'.
• TableContext cursor2rowcol (int &R, int &C, ResizeFlag &resizeflag)
  Find row/col for the recent mouse event.
• void damage_zone (int r1, int c1, int r2, int c2, int r3=0, int c3=0)
  Sets the damage zone to the specified row/col values.
• void draw () FL_OVERRIDe
  Draws the entire Fl_Table.
• virtual void draw_cell (TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0)
  Subclass should override this method to handle drawing the cells.
• int find_cell (TableContext context, int R, int C, int &X, int &Y, int &W, int &H)
Find a cell’s X/Y/W/H region for the specified cell in row ‘R’, column ‘C’.

- **void get_bounds** (TableContext context, int &X, int &Y, int &W, int &H)
  Returns the (X,Y,W,H) bounding region for the specified 'context'.

- **int is_fltk_container** ()
  Does the table contain any child fltk widgets?

- **void recalc_dimensions** ()
  Recalculate the dimensions of the table, and affect any children.

- **void redraw_range** (int topRow, int botRow, int leftCol, int rightCol)
  Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(DAMAGE_CHILD).

- **int row_col_clamp** (TableContext context, int &R, int &C)
  Return specified row/col values R and C to within the table’s current row/col limits.

- **long row_scroll_position** (int row)
  Returns the scroll position (in pixels) of the specified 'row'.

- **void table_resized** ()
  Call this if table was resized, to recalculate internal data.

- **void table_scrolled** ()
  Recalculate internals after a scroll.

### Protected Member Functions inherited from Fl_Group

- **Fl_Rect * bounds** ()
  Returns the internal array of widget sizes and positions.

- **void draw_child** (Fl_Widget &widget) const
  Forces a child to redwarc.

- **void draw_children** ()
  Draws all children of the group.

- **void draw_outside_label** (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.

- **virtual int on_insert** (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.

- **virtual int on_move** (int, int)
  Allow derived groups to act when a widget is moved within the group.

- **virtual void on_remove** (int)
  Allow derived groups to act when a child widget is removed from the group.

- **int * sizes** ()
  Returns the internal array of widget sizes and positions.

- **void update_child** (Fl_Widget &widget) const
  Draws a child only if it needs it.

### Protected Member Functions inherited from Fl_Widget

- **void clear_flag** (unsigned int c)
  Clears a flag in the flags mask.

- **void draw_backdrop** () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box** () const
  Draws the widget box according its box style.

- **void draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus** () const
Draws a focus rectangle around the widget.

- `void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const`
  Draws a focus rectangle around the widget.

- `void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  Draws a focus box for the widget at the given position and size.

- `void draw_label () const`
  Draws the widget’s label at the defined label position.

- `void draw_label (int, int, int, int) const`
  Draws the label in an arbitrary bounding box.

- `Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)`
  Creates a widget at the given position and size.

- `unsigned int flags () const`
  Gets the widget flags mask.

- `void h (int v)`
  Internal use only.

- `void set_flag (unsigned int c)`
  Sets a flag in the flags mask.

- `void w (int v)`
  Internal use only.

- `void x (int v)`
  Internal use only.

- `void y (int v)`
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Group`

- `static Fl_Group ∗current ()`
  Returns the currently active group.

- `static void current (Fl_Group ∗g)`
  Sets the current group.

Static Public Member Functions inherited from `Fl_Widget`

- `static void default_callback (Fl_Widget ∗widget, void ∗data)`
  The default callback for all widgets that don’t set a callback.

- `static unsigned int label_shortcut (const char ∗t)`
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- `static int test_shortcut (const char ∗, const bool require_alt=false)`
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from `Fl_Table`

- `enum ResizeFlag {
  RESIZE_NONE = 0 , RESIZE_COL_LEFT = 1 , RESIZE_COL_RIGHT = 2 , RESIZE_ROW_ABOVE = 3 ,
  RESIZE_ROW_BELOW = 4 }

}
```
flags possible values enumeration.

Static Protected Member Functions inherited from Fl_Table

```c
static void scroll_cb (Fl_Widget *, void *)
```
Callback for when someone moves a scrollbar.

Protected Attributes inherited from Fl_Table

```c
int botrow
    bottom row# of currently visible table on screen
int current_col
    selection cursor's current column (-1 if none)
int current_row
    selection cursor's current row (-1 if none)
Fl_Scrollbar * hscrollbar
    child horizontal scrollbar widget
int leftcol
    left column# of currently visible table on screen
int leftcol_scrollpos
    precomputed scroll position for left column
int rightcol
    right column# of currently visible table on screen
int select_col
    extended selection column (-1 if none)
int select_row
    extended selection row (-1 if none)
Fl_Scroll * table
    child Fl_Scroll widget container for child fltk widgets (if any)
int table_h
    table's virtual height (in pixels)
int table_w
    table's virtual width (in pixels)
int tih
    Data table's inner h dimension, inside bounding box. See Table Dimension Diagram.
int tiw
    Data table's inner w dimension, inside bounding box. See Table Dimension Diagram.
int tix
    Data table's inner x dimension, inside bounding box. See Table Dimension Diagram.
```
• int tiy
  Data table’s inner y dimension, inside bounding box. See Table Dimension Diagram.
• int toh
  Data table’s outer h dimension, outside bounding box. See Table Dimension Diagram.
• int toprow
  top row# of currently visible table on screen
• int toprow_scrollpos
  precomputed scroll position for top row
• int tow
  Data table’s outer w dimension, outside bounding box. See Table Dimension Diagram.
• int tox
  Data table’s outer x dimension, outside bounding box. See Table Dimension Diagram.
• int toy
  Data table’s outer y dimension, outside bounding box. See Table Dimension Diagram.
• Fl_Scrollbar * vscrollbar
  child vertical scrollbar widget
• int wih
  Table widget’s inner h dimension, inside bounding box. See Table Dimension Diagram.
• int wiw
  Table widget’s inner w dimension, inside bounding box. See Table Dimension Diagram.
• int wix
  Table widget’s inner x dimension, inside bounding box. See Table Dimension Diagram.
• int wiy
  Table widget’s inner y dimension, inside bounding box. See Table Dimension Diagram.

11.140.1 Detailed Description

A table with row selection capabilities.
This class implements a simple table with the ability to select rows. This widget is similar to an Fl_Browser
with columns. Most methods of importance will be found in the Fl_Table widget, such as Fl_Table::rows() and
Fl_Table::cols().
To be useful it must be subclassed and at minimum the draw_cell() method must be overridden to provide
the content of the cells. This widget does not manage the cell's data content; it is up to the parent class's draw_cell() method
override to provide this.
Events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events
are generated based on the values you supply for Fl_Table::when().

11.140.2 Constructor & Destructor Documentation

11.140.2.1 Fl_Table_Row()

Fl_Table_Row::Fl_Table_Row ( int X,
  int Y,
  int W,
  int H,
  const char * l = 0 ) [inline]
The constructor for the Fl_Table_Row.
This creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

11.140.2.2 ~Fl_Table_Row()

Fl_Table_Row::~Fl_Table_Row ( ) [inline]
The destructor for the Fl_Table_Row.
Destroys the table and its associated widgets.
11.140.3 Member Function Documentation

11.140.3.1 clear()

```cpp
void Fl_Table_Row::clear ( ) [inline], [virtual]
```
Cleans the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.

See also

* rows(int), cols(int)

Reimplemented from Fl_Table.

11.140.3.2 handle()

```cpp
int Fl_Table_Row::handle (int e ) [protected], [virtual]
```
Handle FLTK events.
Reimplemented from Fl_Table.

11.140.3.3 row_selected()

```cpp
int Fl_Table_Row::row_selected (int row)
```
Checks to see if 'row' is selected.
Returns 1 if selected, 0 if not. You can change the selection of a row by clicking on it, or by using `select_row(row, flag)`.

11.140.3.4 rows()

```cpp
void Fl_Table_Row::rows (int val) [virtual]
```
Sets the number of rows in the table, and the table is redrawn.
Reimplemented from Fl_Table.

11.140.3.5 select_all_rows()

```cpp
void Fl_Table_Row::select_all_rows (int flag = 1)
```
This convenience function changes the selection state for all rows based on 'flag'.
0=deselect, 1=select, 2=toggle existing state.

11.140.3.6 select_row()

```cpp
int Fl_Table_Row::select_row (int row, int flag = 1)
```
Changes the selection state for 'row', depending on the value of 'flag'.
0=deselected, 1=select, 2=toggle existing state.

11.140.3.7 type()

```cpp
void Fl_Table_Row::type (TableRowSelectMode val)
```
Sets the table selection mode.

* Fl_Table_Row::SELECT_NONE - No selection allowed
* Fl_Table_Row::SELECT_SINGLE - Only single rows can be selected
* Fl_Table_Row::SELECT_MULTI - Multiple rows can be selected
The documentation for this class was generated from the following files:

- Fl_Table_Row.H
- Fl_Table_Row.cxx

11.141 Fl_Tabs Class Reference

The Fl_Tabs widget is a container widget that displays a set of tabs, with each tab representing a different child widget.

```
#include <Fl_Tabs.H>
```

Inheritance diagram for Fl_Tabs:

```
Fl_Widget
   |
   v

   v
Fl_Tabs
```

Public Types

- `enum { OVERFLOW_COMPRESS = 0, OVERFLOW_CLIP, OVERFLOW_PULLDOWN, OVERFLOW_DRAG }`

Public Member Functions

- `void client_area (int &rx, int &ry, int &rw, int &rh, int tabh=0)`
  - Returns the position and size available to be used by its children.

- `Fl_Tabs (int X, int Y, int W, int H, const char∗ L=0)`
  - Creates a new Fl_Tabs widget using the given position, size, and label string.

- `int handle (int) FL_OVERRIDE`
  - Handle all events in the tabs area and forward the rest to the selected child.

- `void handle_overflow (int ov)`
  - Set a method to handle an overflowing tab bar.

- `Fl_Widget∗ push () const`
  - Returns the tab group for the tab the user has currently down-clicked on and remains over until FL_RELEASE.

- `int push (Fl_Widget ∗)`
  - This is called by the tab widget's handle() method to set the tab group widget the user last FL_PUSH'ed on.

- `Fl_Align tab_align () const`
  - Gets the tab label alignment.

- `void tab_align (Fl_Align a)`
  - Sets the tab label alignment.

- `Fl_Widget∗ value ()`
  - Gets the currently visible widget/tab.

- `int value (Fl_Widget ∗)`
  - Sets the widget to become the current visible widget/tab.

- `virtual Fl_Widget∗ which (int event_x, int event_y)`
  - Return a pointer to the child widget with a tab at the given coordinates.

- `virtual ~Fl_Tabs ()`
  - Delete allocated resources and destroy all children.
Public Member Functions inherited from \texttt{Fl\_Group}

- \texttt{Fl\_Widget \& \_ddfdesign\_kludge ()}
  This is for forms compatibility only.
- \texttt{void add (Fl\_Widget \&)}
  The widget is removed from its current group (if any) and then added to the end of this group.
- \texttt{void add (Fl\_Widget \*o)}
  See void \texttt{Fl\_Group::add(Fl\_Widget \&w)}
- \texttt{void add\_resizable (Fl\_Widget \&o)}
  Adds a widget to the group and makes it the resizable widget.
- \texttt{Fl\_Widget \*const \_array () const}
  Returns a pointer to the array of children.
- \texttt{Fl\_Group const \* as\_group () const FL\_OVERRIDE}
  Returns an \texttt{Fl\_Group} pointer if this widget is an \texttt{Fl\_Group}.
- \texttt{void begin ()}
  Sets the current group so you can build the widget tree by just constructing the widgets.
- \texttt{Fl\_Widget \* child (int n) const}
  Returns \texttt{array()[n]}.
- \texttt{int children () const}
  Returns how many child widgets the group has.
- \texttt{void clear ()}
  Deletes all child widgets from memory recursively.
- \texttt{unsigned int clip\_children ()}
  Returns the current clipping mode.
- \texttt{void clip\_children (int c)}
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- \texttt{virtual int delete\_child (int n)}
  Removes the widget at index from the group and deletes it.
- \texttt{void end ()}
  Exactly the same as current(this->parent()).
- \texttt{int find (const Fl\_Widget \&o) const}
  See int \texttt{Fl\_Group::find(const Fl\_Widget \*w) const}.
- \texttt{int find (const Fl\_Widget \*) const}
  Searches the child array for the widget and returns the index.
- \texttt{Fl\_Group (int, int, int, int, const char \*\_label=0)}
  Creates a new \texttt{Fl\_Group} widget using the given position, size, and label string.
- \texttt{void focus (Fl\_Widget \*W)}
- \texttt{void forms\_end ()}
  This is for forms compatibility only.
- \texttt{void init\_sizes ()}
  Resets the internal array of widget sizes and positions.
- \texttt{void insert (Fl\_Widget \&, int i)}
  The widget is removed from its current group (if any) and then inserted into this group.
- \texttt{void insert (Fl\_Widget \&o, Fl\_Widget \*before)}
  This does insert(w, find(before)).
- \texttt{void remove (Fl\_Widget \&)}
  Removes a widget from the group but does not delete it.
- \texttt{void remove (Fl\_Widget \*o)}
  Removes the widget o from the group.
- \texttt{void remove (int index)}
Removes the widget at index from the group but does not delete it.

- **Fl_Widget** *resizable () const*

  Returns the group's resizable widget.

- **void resizable (Fl_Widget &o)**

  Sets the group's resizable widget.

- **void resizable (Fl_Widget *o)**

  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual ~Fl_Group ()**

  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- **void _clear_fullscreen ()**

- **void _set_fullscreen ()**

- **void activate ()**

  Activates the widget.

- **unsigned int active () const**

  Returns whether the widget is active.

- **int active_r () const**

  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**

  Gets the label alignment.

- **void align (Fl_Align alignment)**

  Sets the label alignment.

- **long argument () const**

  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**

  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window *as_gl_window ()**

  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const *as_gl_window () const**

- **virtual Fl_Window *as_window ()**

  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **virtual Fl_Window const *as_window () const**

- **void bind_deimage (Fl_Image *img)**

  Sets the image to use as part of the widget label when in the inactive state.

- **void bind_deimage (int f)**

  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image (Fl_Image *img)**

  Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**

  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**

  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**

  Sets the box type for the widget.

- **Fl_Callback_p callback () const**

  Gets the current callback function for the widget.

- **void callback (Fl_Callback *cb)**

  Sets the current callback function for the widget.

- **void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**
Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, void *)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the default label type.
11.141 Fl_Tabs Class Reference

- **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width ww and height hh accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group *parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.

- **void set_visible ()**
  
  Makes the widget visible.

- **void set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  
  Makes a widget visible.

- **void size (int W, int H)**
  
  Changes the size of the widget.

- **int take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  
  Returns if the widget is able to take events.

- **int testShortcut ()**
  
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char *tooltip () const**
  
  Gets the current tooltip text.
• void *tooltip (const char *text)
  
  Sets the current tooltip text.

• Fl_Window *top_window () const
  
  Returns a pointer to the top-level window for the widget.

• Fl_Window *top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  
  Gets the widget type.

• void type (uchar t)
  
  Sets the widget type.

• int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void *user_data () const
  
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  
  Sets the user data for this widget.

• void user_data (void *v)
  
  Sets the user data for this widget.

• unsigned int visible () const
  
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  
  Modifies keyboard focus navigation.

• int visible_r () const
  
  Returns whether a widget and all its parents are visible.

• int w () const
  
  Gets the widget width.

• Fl_When when () const
  
  Returns the conditions under which the callback is called.

• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Window *window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Protected Member Functions

• void check_overflow_menu ()
  
  Check if the tabs overflow and sets the has_overflow_menu flag accordingly.

• virtual void clear_tab_positions ()
  
  Clear internal array of tab positions and widths.

• void draw () FL_OVERRIDE
  
  Draw the tabs area, the optional pulldown button, and all children.

• void draw_overflow_menu_button ()
  
  Draw square button-like graphics with a down arrow in the top or bottom right corner.
• virtual void draw_tab (int x1, int x2, int W, int H, Fl_Widget *o, int flags, int sel)
  Draw a tab in the top or bottom tabs area.
• void handle_overflow_menu ()
  This is called when the user clicks the overflow pulldown menu button.
• virtual int hit_close (Fl_Widget *o, int event_x, int event_y)
  Check whether the coordinates fall within the “close” button area of the tab.
• virtual int hit_overflow_menu (int event_x, int event_y)
  Determine if the coordinates are in the area of the overflow menu button.
• virtual int hit_tabs_area (int event_x, int event_y)
  Determine if the coordinates are within the tabs area.
• int on_insert (Fl_Widget *, int) FL_OVERRIDE
  Make sure that we redraw all tabs when new children are added.
• int on_move (int, int) FL_OVERRIDE
  Make sure that we redraw all tabs when children are moved.
• void on_remove (int) FL_OVERRIDE
  Make sure that we redraw all tabs when new children are removed.
• virtual void redraw_tabs ()
  Redraw all tabs (and only the tabs).
• void resize (int, int, int, int) FL_OVERRIDE
  Make sure that we redraw all tabs when the widget size changes.
• virtual int tab_height ()
  Return space (height) in pixels usable for tabs.
• virtual int tab_positions ()
  Calculate tab positions and widths.

Protected Member Functions inherited from Fl_Group

• Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
• void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
• void draw_children ()
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

Protected Attributes

- int has_overflow_menu
  set in OVERFLOW_PULLDOWN mode if tabs overflow. The actual menu array is created only on demand

- int overflow_type

- Fl_Align tab_align_
  tab label alignment

- int tab_count
  Array size of tab positions etc.

- int ∗tab_flags
  Array of tab flag of tabs per child.

- int ∗tab_offset
  for pulldown and drag overflow, this is the horizontal offset when the tabs bar is dragged by the user

- int ∗tab_pos
  Array of x-offsets of tabs per child + 1.

- int ∗tab_width
  Array of widths of tabs per child.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group ∗current ()
  Returns the currently active group.

- static void current (Fl_Group ∗g)
  Sets the current group.
Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,

  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
flags possible values enumeration.

11.141.1 Detailed Description

The Fl_Tabs widget is a container widget that displays a set of tabs, with each tab representing a different child widget.

The user can select a tab by clicking on it, and the corresponding child widget will be displayed. The Fl_Tabs widget is useful for organizing a large number of controls or other widgets into a compact space, allowing the user to switch between different sets of controls as needed.

![Figure 11.50 Fl_Tabs](image_url)

Clicking the tab makes a child visible() by calling show() on it, and all other children are made invisible by calling hide() on them. Usually the children are Fl_Group widgets containing several widgets themselves.

Each child makes a card, and its label() is printed on the card tab, including the label font and style. The selection color of that child is used to color the tab, while the color of the child determines the background color of the pane. '&' in labels are used to prefix a shortcut that is drawn underlined and that activates the corresponding tab; repeated '&&' avoids that.

The size of the tabs is controlled by the bounding box of the children (there should be some space between the children and the edge of the Fl_Tabs), and the tabs may be placed "inverted" on the bottom - this is determined by...
which gap is larger. It is easiest to lay this out in FLUID, using the FLUID browser to select each child group and
resize them until the tabs look the way you want them to.

The background area behind and to the right of the tabs is "transparent", exposing the background detail of the
parent. The value of Fl_Tabs::box() does not affect this area. So if Fl_Tabs is resized by itself without the parent,
force the appropriate parent (visible behind the tabs) to redraw() to prevent artifacts.

See "Resizing Caveats" below on how to keep tab heights constant. See "Callback's Use Of when()" on how to
control the details of how clicks invoke the callback().

A typical use of the Fl_Tabs widget:

```cpp
// Typical use of Fl_Tabs
Fl_Tabs *tabs = new Fl_Tabs(10,10,300,200);
{
    Fl_Group *grp1 = new Fl_Group(20,30,280,170,"Tab1");
    { ..widgets that go in tab#1..
    }
    grp1->end();
    Fl_Group *grp2 = new Fl_Group(20,30,280,170,"Tab2");
    { ..widgets that go in tab#2..
    }
    grp2->end();
}
tabs->end();
```

**Default Appearance**

The appearance of each "tab" is taken from the label() and color() of the child group corresponding to that "tab" and
panel. Where the "tabs" appear depends on the position and size of the child groups that make up the panels within
the Fl_Tab, i.e. whether there is more space above or below them. The height of the "tabs" depends on how much
free space is available.

![Figure 11.51 Fl_Tabs Default Appearance](image.png)

**Highlighting The Selected Tab**

The selected "tab" can be highlighted further by setting the selection_color() of the Fl_Tab itself, e.g.

```cpp
..
tabs = new Fl_Tabs(..);
tabs->selection_color(FL_DARK3);
..```

The result of the above looks like:

![Figure 11.52 Highlighting the selected tab](image.png)

**Uniform Tab and Panel Appearance**

In order to have uniform tab and panel appearance, not only must the color() and selection_color() for each child
group be set, but also the selection_color() of the Fl_Tab itself any time a new "tab" is selected. This can be achieved
within the Fl_Tab callback, e.g.
```c
void MyTabCallback(Fl_Widget *w, void*) {
    Fl_Tabs *tabs = (Fl_Tabs*)w;
    // When tab changed, make sure it has same color as its group
    tabs->selection_color( (tabs->value())->color() );
}
```

```c
int main(..) {
    // Define tabs widget
    tabs = new Fl_Tabs(...);
    tabs->callback(MyTabCallback);

    // Create three tabs each colored differently
    grp1 = new Fl_Group(.. "One");
    grp1->color(9);
    grp1->selection_color(9);
    grp1->end();

    grp2 = new Fl_Group(.. "Two");
    grp2->color(10);
    grp2->selection_color(10);
    grp2->end();

    grp3 = new Fl_Group(.. "Three");
    grp3->color(14);
    grp3->selection_color(14);
    grp3->end();

    // Make sure default tab has same color as its group
    tabs->selection_color( (tab->value())->color() );

    return Fl::run();
}
```

The result of the above looks like:

![Figure 11.53 Fl_Tabs with uniform colors](image)

If **Fl_Tabs** has no children, the widget will be drawn as a flat rectangle in the background color set by **color()**.

### Close Button on Tabs

The **Fl_Tabs** widget allows you to specify that a child widget should display a close button in its tab. If the **FL_WHEN_CLOSED** flag is set for the child widget, an “X” symbol will be displayed to the left of the label text in the tab. When the close button is clicked, the child widget’s callback function will be called with the **FL_REASON_CLOSED** reason. It is then the responsibility of the child widget to remove itself from the **Fl_Tabs** container.

Tabs that are in a compressed state will not display a close button until they are fully expanded.

### Overflowing Tabs

When the combined width of the tabs exceeds that of the **Fl_Tabs** widget, the tabs will overflow. **Fl_Tabs** provides four options for managing tabs overflow:

- **Fl_Tabs::OVERFLOW_COMPRESS**: proportionally compress the tabs to the left and right of the selected tab until they all fit within the widget.
- **Fl_Tabs::OVERFLOW_CLIP**: clips any tabs that extend beyond the right edge of the **Fl_Tabs** widget, making some tabs unreachable.
- **Fl_Tabs::OVERFLOW_PULLDOWN**: doesn’t compress the tabs but instead generates a pulldown menu at the right end of the tabs area, displaying all available tabs.
- **Fl_Tabs::OVERFLOW_DRAG**: maintains the tabs’ original sizes, allowing horizontal dragging of the tabs area using the mouse, a horizontal mouse wheel, or the horizontal scrolling gesture on touchpads.

### Resizing Caveats

When **Fl_Tabs** is resized vertically, the default behavior scales the tab’s height as well as its children. To keep the tab height constant during resizing, set the tab widget’s **resizable()** to one of the tab’s child groups, i.e.
As of FLTK 1.3.3, \texttt{Fl_Tabs()} supports the following flags for \texttt{when()}:

- \textbf{FL\_WHEN\_NEVER} – callback never invoked (all flags off)
- \textbf{FL\_WHEN\_CHANGED} – if flag set, invokes callback when a tab has been changed (on click or keyboard navigation)
- \textbf{FL\_WHEN\_NOT\_CHANGED} – if flag set, invokes callback when the tabs remain unchanged (on click or keyboard navigation)
- \textbf{FL\_WHEN\_RELEASE} – if flag set, invokes callback on RELEASE of mouse button or keyboard navigation

Notes:

1. The above flags can be logically OR-ed (|) or added (+) to combine behaviors.
2. The default value for \texttt{when()} is \texttt{FL\_WHEN\_RELEASE} (inherited from \texttt{Fl\_Widget}).
3. If \texttt{FL\_WHEN\_RELEASE} is the only flag specified, the behavior will be as if (\texttt{FL\_WHEN\_RELEASE}|\texttt{FL\_WHEN\_CHANGED}) was specified.
4. The value of \texttt{changed()} will be valid during the callback.
5. If both \texttt{FL\_WHEN\_CHANGED} and \texttt{FL\_WHEN\_NOT\_CHANGED} are specified, the callback is invoked whether the tab has been changed or not. The \texttt{changed()} method can be used to determine the cause.
6. \texttt{FL\_WHEN\_NOT\_CHANGED} can happen if someone clicks on an already selected tab, or if a keyboard navigation attempt results in no change to the tabs, such as using the arrow keys while at the left or right end of the tabs.
7. \texttt{Fl::callback\_reason()} returns \texttt{FL\_REASON\_SELECTED} or \texttt{FL\_REASON\_RESELECTED}

### 11.141.2 Member Enumeration Documentation

#### 11.141.2.1 anonymous enum

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVERFLOW_COMPRESS</td>
<td>Tabs will be compressed and overlaid on top of each other.</td>
</tr>
<tr>
<td>OVERFLOW_CLIP</td>
<td>Only the first tabs that fit will be displayed.</td>
</tr>
<tr>
<td>OVERFLOW_PULLDOWN</td>
<td>Tabs that do not fit will be placed in a pull-down menu.</td>
</tr>
<tr>
<td>OVERFLOW_DRAG</td>
<td>The tab bar can be dragged horizontally to reveal additional tabs.</td>
</tr>
</tbody>
</table>

### 11.141.3 Constructor & Destructor Documentation

#### 11.141.3.1 \texttt{Fl\_Tabs()}

\texttt{Fl\_Tabs::Fl\_Tabs{} (}
Creates a new Fl_Tabs widget using the given position, size, and label string. The default boxtype is FL_THIN_UP_BOX.

Use add(Fl_Widget*) to add each child, which are usually Fl_Group widgets. The children should be sized to stay away from the top or bottom edge of the Fl_Tabs widget, which is where the tabs will be drawn. All children of Fl_Tabs should have the same size and exactly fit on top of each other. They should only leave space above or below where the tabs will go, but not on the sides. If the first child of Fl_Tabs is set to "resizable()"), the riders will not resize when the tabs are resized.

The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the Fl_Tabs and all of its children can be automatic (local) variables, but you must declare the Fl_Tabs widget first so that it is destroyed last.

11.141.4 Member Function Documentation

11.141.4.1 clear_tab_positions()

void Fl_Tabs::clear_tab_positions ( ) [protected], [virtual]

Clear internal array of tab positions and widths.

See also
tab_positions().

11.141.4.2 client_area()

void Fl_Tabs::client_area ( int & rx,
                           int & ry,
                           int & rw,
                           int & rh,
                           int tabh = 0 )

Returns the position and size available to be used by its children. If there isn't any child yet the tabh parameter will be used to calculate the return values. This assumes that the children's labelsize is the same as the Fl_Tabs' labelsize and adds a small border. If there are already children, the values of child(0) are returned, and tabh is ignored.

Note

Children should always use the same positions and sizes.

tabh can be one of

- 0: calculate label size, tabs on top
- -1: calculate label size, tabs on bottom
- > 0: use given tabh value, tabs on top (height = tabh)
- < -1: use given tabh value, tabs on bottom (height = -tabh)

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>tabh</th>
<th>position and optional height of tabs (see above)</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>rx,ry,rw,rh</td>
<td>(x,y,w,h) of client area for children</td>
</tr>
</tbody>
</table>
Since

FLTK 1.3.0

11.141.4.3 draw()

void Fl_Tabs::draw () [protected], [virtual]
Draw the tabs area, the optional pulldown button, and all children.
Reimplemented from Fl_Group.

11.141.4.4 draw_tab()

void Fl_Tabs::draw_tab ( int x1, int x2, int W, int H, Fl_Widget * o, int flags, int what ) [protected], [virtual]
Draw a tab in the top or bottom tabs area.
Tabs can be selected, or on the left or right side of the selected tab. If overlapping, left tabs are drawn bottom to top
using clipping. The selected tab is then the topmost, followed by the right side tabs drawn top to bottom.
Tabs with the FL_WHEN_CLOSE bit set will draw a cross on their left side only if they are not com-
pressed/overlapping.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x1</th>
<th>horizontal position of the left visible edge of the tab</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>x2</td>
<td>horizontal position of the following tab</td>
</tr>
<tr>
<td></td>
<td>W,H</td>
<td>width and height of the tab</td>
</tr>
<tr>
<td></td>
<td>o</td>
<td>the child widget that corresponds to this tab</td>
</tr>
<tr>
<td></td>
<td>flags</td>
<td>if bit 1 is set, this tab is overlapped by another tab</td>
</tr>
<tr>
<td></td>
<td>what</td>
<td>can be LEFT, SELECTED, or RIGHT to indicate if the tab is to the left side or the right side of the selected tab, or the selected tab itself</td>
</tr>
</tbody>
</table>

11.141.4.5 handle()

int Fl_Tabs::handle ( int event ) [virtual]
Handle all events in the tabs area and forward the rest to the selected child.

Parameters

| in   | event | handle this event |

Returns

1 if the event was handled

Reimplemented from Fl_Group.

11.141.4.6 handle_overflow()

void Fl_Tabs::handle_overflow ( int ov )
Set a method to handle an overflowing tab bar. The Fl_Tabs widget allows you to specify how to handle the situation where there are more tabs than can be displayed at once. The available options are:

- **OVERFLOW_COMPRESS**: Tabs will be compressed and overlaid on top of each other.
- **OVERFLOW_CLIP**: Only the first tabs that fit will be displayed.
- **OVERFLOW_PULLDOWN**: Tabs that do not fit will be placed in a pull-down menu.
- **OVERFLOW_DRAG**: The tab bar can be dragged horizontally to reveal additional tabs.

You can set the desired behavior using the overflow() method.

Parameters

`overflow type`

See also

OVERFLOW_COMPRESS, OVERFLOW_CLIP, OVERFLOW_PULLDOWN, OVERFLOW_DRAG

11.141.4.7 handle_overflow_menu()

```cpp
void Fl_Tabs::handle_overflow_menu ( ) [protected]
```

This is called when the user clicks the overflow pulldown menu button.

This method creates a menu item array that contains the titles of all tabs in the Fl_Tabs group. Visible and invisible tabs are separated by dividers to indicate their state.

The menu is then presented until the user selects an item or cancels. The chosen tab is then selected and made visible.

The menu item array is deleted.

11.141.4.8 hit_close()

```cpp
int Fl_Tabs::hit_close ( Fl_Widget * o, int event_x, int event_y ) [protected], [virtual]
```

Check whether the coordinates fall within the "close" button area of the tab.

The Fl_Tabs::hit_close() method checks whether the given event coordinates fall within the area of the "close" button on the tab of the specified child widget. This method should be called after the Fl_Tabs::which() method, which updates a lookup table used to determine the width of each tab.

Parameters

| o | check the tab of this widget |
| event_x, event_y | event coordinates |

Returns

1 if we hit the close button, and 0 otherwise

11.141.4.9 hit_overflow_menu()

```cpp
int Fl_Tabs::hit_overflow_menu ( int event_x, int event_y ) [protected], [virtual]
```
Determine if the coordinates are in the area of the overflow menu button.
Parameters

| event_x, event_y | event coordinates |

Returns

1 if we hit the overflow menu button, and 0 otherwise

### 11.141.4.10 hit_tabs_area()

```cpp
def hit_tabs_area(event_x, event_y):
    return 1 if self.tabs_area(event_x, event_y) else 0
```

Determine if the coordinates are within the tabs area.

Parameters

| event_x, event_y | event coordinates |

Returns

1 if we hit the tabs area, and 0 otherwise

### 11.141.4.11 on_insert()

```cpp
def on_insert(candidate, index):
    return self.tabs_insert(candidate, index)
```

Make sure that we redraw all tabs when new children are added.

Reimplemented from Fl_Group.

### 11.141.4.12 on_move()

```cpp
def on_move(a, b):
    return self.tabs_move(a, b)
```

Make sure that we redraw all tabs when children are moved.

Reimplemented from Fl_Group.

### 11.141.4.13 on_remove()

```cpp
def on_remove(index):
    return self.tabs_remove(index)
```

Make sure that we redraw all tabs when new children are removed.

Reimplemented from Fl_Group.

### 11.141.4.14 push() [1/2]

```cpp
def push()
```

Returns the tab group for the tab the user has currently down-clicked on and remains over until FL_RELEASE. Otherwise, returns NULL.

While the user is down-clicked on a tab, the return value is the tab group for that tab. But as soon as the user releases, or drags off the tab with the button still down, the return value will be NULL.
See also

push(Fl_Widget*).

11.141.4.15 push() [2/2]

int Fl_Tabs::push (Fl_Widget * o)

This is called by the tab widget's handle() method to set the tab group widget the user last FL_PUSH'ed on. Set back to zero on FL_RELEASE.

As of this writing, the value is mainly used by draw_tab() to determine whether or not to draw a 'down' box for the tab when it's clicked, and to turn it off if the user drags off it.

See also push().

11.141.4.16 redraw_tabs()

void Fl_Tabs::redraw_tabs ( ) [protected], [virtual]

Redraw all tabs (and only the tabs).

This method sets the Fl_Tab's damage flags so the tab area is redrawn.

11.141.4.17 resize()

void Fl_Tabs::resize (int X, int Y, int W, int H) [protected], [virtual]

Make sure that we redraw all tabs when the widget size changes. Reimplemented from Fl_Group.

11.141.4.18 tab_align() [1/2]

Fl_Align Fl_Tabs::tab_align ( ) const [inline]

Gets the tab label alignment.

See also tab_align(Fl_Align)

11.141.4.19 tab_align() [2/2]

void Fl_Tabs::tab_align (Fl_Align a) [inline]

Sets the tab label alignment.

The default is FL_ALIGN_CENTER so tab labels are centered, but since the label space is measured (per label) to fit the labels, there wouldn't be any difference if labels were aligned left or right.

If you want to show an image (icon) next to the group's label you can set a different label alignment. FL_ALIGN_IMAGE_NEXT_TO_TEXT is the recommended alignment to show the icon left of the text.

11.141.4.20 tab_height()

int Fl_Tabs::tab_height ( ) [protected], [virtual]

Return space (height) in pixels usable for tabs.

The calculated height is the largest space between all children and the upper and lower widget boundaries, respectively. If the space at the bottom is larger than at the top, the value will be negative and the tabs should be placed at the bottom.
Returns

Vertical space that can be used for the tabs.

Return values

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;</td>
<td>0 To put the tabs at the top of the widget.</td>
</tr>
<tr>
<td>&lt;</td>
<td>0 To put the tabs on the bottom.</td>
</tr>
<tr>
<td><em>Full</em></td>
<td>height, if children() == 0.</td>
</tr>
</tbody>
</table>

### 11.141.4.21 tab_positions()

```cpp
int Fl_Tabs::tab_positions ( ) [protected], [virtual]
```

Calculate tab positions and widths.

This protected method calculates the horizontal display positions and widths of all tabs. If the number of children 'nc' (see below) is > 0 three internal arrays are allocated, otherwise the arrays are free’d and the pointers are set to NULL. Note that the first array is larger (nc+1).

- **tab_pos[nc+1]**: The left edges of each tab plus a fake left edge for a tab past the right-hand one.
- **tab_width[nc]**: The width of each tab
- **tab_flags[nc]**: Flags, bit 0 is set if the tab is compressed

If needed, these arrays are (re)allocated.

These positions are actually of the left edge of the slope. They are either separated by the correct distance or by EXTRASPACE or by zero.

In OVERFLOW_COMPRESS mode, tab positions and widths are compressed to make the entire tabs bar fit into the width of Fl_Tabs while keeping the selected tab fully visible.

In other overflow modes, the tabs area may be dragged horizontally using tab_offset. The tab_pos array is not adjusted to the horizontal offset, but starts at this->x() plus the box's left margin.

The protected variable `tab_count` is set to the currently allocated size, i.e. the number of children (nc).

Returns

Index of the selected item

Return values

| -1 | If the number of children is 0 (zero). |

**Note**

Return values in 1.3 were not documented. Return values before Sep 2023 were documented as 1 based index and 0 if there were no children. This was actually never the case. It always returned a 0 based index and the (useless) value of also 0 if there were no children. The current version return -1 if there are no children.

For this method to work, only on single child should be selected. Calling the method `value()` before calling `tab_positions()` will ensure that exactly one child is selected and return a pointer to that child.

See also

`clear_tab_positions()`

### 11.141.4.22 value() [1/2]

```cpp
FL_Widget * Fl_Tabs::value ( )
```

Gets the currently visible widget/tab.
The `Fl_Tabs::value()` method returns a pointer to the currently visible child widget of the `Fl_Tabs` container. The visible child is the first child that is currently being displayed, or the last child if none of the children are being displayed.

If child widgets have been added, moved, or deleted, this method ensures that only one tab is visible at a time.

Returns

a pointer to the currently visible child

### 11.141.4.23 value()

```cpp
int Fl_Tabs::value (Fl_Widget *newvalue)
```

Sets the widget to become the current visible widget/tab.

The `Fl_Tabs::value()` method allows you to set a particular child widget of the `Fl_Tabs` container to be the currently visible widget. If the specified widget is a child of the `Fl_Tabs` container, it will be made visible and all other children will be hidden. The method returns 1 if the value was changed, and 0 if the specified value was already set.

Parameters

| in | newvalue | a pointer to a child widget |

Returns

1 if a different tab was chosen

0 if there was no change (new value already set)

### 11.141.4.24 which()

```cpp
Fl_Widget *Fl_Tabs::which (int event_x, int event_y) [virtual]
```

Return a pointer to the child widget with a tab at the given coordinates.

The `Fl_Tabs::which()` method returns a pointer to the child widget of the `Fl_Tabs` container that corresponds to the tab at the given event coordinates. If the event coordinates are outside the area of the tabs or if the `Fl_Tabs` container has no children, the method returns NULL.

Parameters

| event_x.event←_y | event coordinates |

Returns

pointer to the selected child widget, or NULL

### 11.141.5 Member Data Documentation

#### 11.141.5.1 overflow_type

```cpp
int Fl_Tabs::overflow_type [protected]
```

See also

`OVERFLOW_COMPRESS`, `OVERFLOW_CLIP`, etc.

#### 11.141.5.2 tab_count

```cpp
int Fl_Tabs::tab_count [protected]
```
Array size of tab positions etc.
See also
tab_positions()

### 11.141.5.3 `tab_flags`

```cpp
int* Fl_Tabs::tab_flags  [protected]
```

Array of tab flag of tabs per child.
See also
tab_positions()

### 11.141.5.4 `tab_pos`

```cpp
int* Fl_Tabs::tab_pos  [protected]
```

Array of x-offsets of tabs per child + 1.
See also
tab_positions()

### 11.141.5.5 `tab_width`

```cpp
int* Fl_Tabs::tab_width  [protected]
```

Array of widths of tabs per child.
See also
tab_positions()

The documentation for this class was generated from the following files:
- Fl_Tabs.H
- Fl_Tabs.cxx

### 11.142 Fl_Terminal Class Reference

Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control.

```cpp
#include <Fl_Terminal.H>
```

Inheritance diagram for `Fl_Terminal`:

```
Fl_Widget
  ↓
Fl_Group
  ↓
Fl_Terminal
```

#### Classes
- class CharStyle
- class Cursor
- class EscapeSeq
- class Margin
- class PartialUtf8Buf
- class RingBuffer
- class Selection
- class Utf8Char
Public Types

- enum Attrib {
  NORMAL = 0x00 , BOLD = 0x01 , DIM = 0x02 , ITALIC = 0x04 ,
  UNDERLINE = 0x08 , _RESERVED_1 = 0x10 , INVERSE = 0x20 , _RESERVED_2 = 0x40 ,
  STRIKEOUT = 0x80 }

  Bits for the per-character attributes, which control text features such as italic, bold, underlined text, etc.

- enum CharFlags {
  FG_XTERM = 0x01 , BG_XTERM = 0x02 , EOL = 0x04 ,
  RESV_A = 0x08 , RESV_B = 0x10 , RESV_C = 0x20 , RESV_D = 0x40 , RESV_E = 0x80 ,
  COLORMASK = (FG_XTERM | BG_XTERM) }

  Per-character 8 bit flags (uchar) used to manage special states for characters.

- enum OutFlags { OFF = 0x00 , CR_TO_LF = 0x01 , LF_TO_CR = 0x02 , LF_TO_CRLF = 0x04 }

  Output translation flags for special control character translations.

- enum RedrawStyle { NO_REDRAW =0 , RATE_LIMITED , PER_WRITE }

  Determines when Fl_Terminal calls redraw() if new text is added.

Public Member Functions

- void ansi (bool val)
  Enable/disable the ANSI mode flag.

- bool ansi (void) const
  Return the state of the ANSI flag.

- void append (const char *s, int len=-1)
  Appends string s to the terminal at the current cursor position using the current text color/attributes.

- void append_ascii (const char *s)
  Append NULL terminated ASCII string to terminal, slightly more efficient than append_utf8().

- void append_utf8 (const char *buf, int len=-1)
  Append NULL terminated UTF-8 string to terminal.

- void box (Fl_Boxtype val)
  Sets the box type, updates terminal margins et al.

- Fl_Boxtype box (void) const
  Returns the current box type.

- void clear (Fl_Color val)
  Clears the screen to a specific color val and homes the cursor.

- void clear (void)
  Clears the screen to the current textbgcolor(), and homes the cursor.

- void clear_history (void)
  Clears the scroll history buffer and adjusts scrollbar, forcing it to redraw().

- void clear_screen (bool scroll_to_hist=true)
  Clear the terminal screen only; does not affect the cursor position.

- void clear_screen_home (bool scroll_to_hist=true)
  Clear the terminal screen and home the cursor.

- void color (Fl_Color val)
  Sets the background color for the terminal's Fl_Group::box().

- Fl_Color color (void) const
  Return base widget Fl_Group::box() color()

- int cursor_col (void) const
  Return the cursor's current column position on the screen.

- void cursor_home (void)
  Move cursor to the home position (top/left).

- int cursor_row (void) const
  Return the cursor's current row position on the screen.
• void **cursorbgcolor** (Fl_Color val)
  
  Set the cursor's background color used for the cursor itself.

• Fl_Color **cursorbgcolor** (void) const
  
  Get the cursor's background color used for the cursor itself.

• void **cursorfgcolor** (Fl_Color val)
  
  Set the cursor's foreground color used for text under the cursor.

• Fl_Color **cursorfgcolor** (void) const
  
  Get the cursor's foreground color used for text under the cursor.

• void **display_columns** (int val)
  
  Set terminal's display width in columns of text characters.

• int **display_columns** (void) const
  
  Return terminal's display width in columns of text characters.

• void **display_rows** (int val)
  
  Set terminal's display height in lines of text (rows).

• int **display_rows** (void) const
  
  Return terminal's display height in lines of text (rows).

• void **draw** (void) FL_OVERRIDE
  
  Draws the entire Fl_Terminal.

• Fl_Terminal (int X, int Y, int W, int H, const char ∗L=*0, int rows, int cols, int hist)
  
  Same as the default FLTK constructor, but lets the user force the rows, columns and history to specific sizes on creation.

• Fl_Terminal (int X, int Y, int W, int H, const char ∗L=0)
  
  The constructor for Fl_Terminal.

• int **handle** (int e) FL_OVERRIDE
  
  Handle FLTK events.

• void **history_lines** (int val)
  
  Set the number of lines of screen history.

• int **history_lines** (void) const
  
  Return the number of lines of screen history.

• void **history_rows** (int val)
  
  Set terminal's scrollback history buffer size in lines of text (rows).

• int **history_rows** (void) const
  
  Return terminal's scrollback history buffer size in lines of text (rows).

• int **history_use** (void) const
  
  Returns how many lines are “in use” by the screen history buffer.

• void **margin_bottom** (int val)
  
  Set the bottom margin; see Margins.

• int **margin_bottom** (void) const
  
  Return the bottom margin; see Margins.

• void **margin_left** (int val)
  
  Set the left margin; see Margins.

• int **margin_left** (void) const
  
  Return the left margin; see Margins.

• void **margin_right** (int val)
  
  Set the right margin; see Margins.

• int **margin_right** (void) const
  
  Return the right margin; see Margins.

• void **margin_top** (int val)
  
  Set the top margin; see Margins.

• int **margin_top** (void) const
  
  Return the top margin; see Margins.
• void output_translate (Fl_Terminal::OutFlags val)
  Sets the combined output translation flags to val.

• Fl_Terminal::OutFlags output_translate (void) const
  Return the current combined output translation flags.

• void print_char (char c)
  Prints single ASCII char c at current cursor position, and advances the cursor.

• void print_char (const char *text, int len=-1)
  Prints single UTF-8 char text of optional byte length len at current cursor position, and advances the cursor if the character is printable.

• void printf (const char *fmt,...)
  Appends printf formatted messages to the terminal.

• void putchar (char c, int drow, int dcol)
  Print the ASCII character c at the terminal's display position (drow,dcol).

• void putchar (const char *text, int len, int drow, int dcol)
  Print UTF-8 character text of length len at display position (drow,dcol).

• void redraw_rate (float val)
  Set the maximum rate redraw speed in floating point seconds if redraw_style() is set to RATE_Limited.

• float redraw_rate (void) const
  Get max rate redraw speed in floating point seconds.

• void redraw_style (RedrawStyle val)
  Set how Fl_Terminal manages screen redrawing.

• RedrawStyle redraw_style (void) const
  Get the redraw style.

• void reset_terminal (void)
  Resets terminal to default colors, clears screen, history and mouse selection, homes cursor, resets tabstops.

• void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Handle widget resizing, such as if user resizes parent window.

• int scrollbar_actual_size (void) const
  Returns the scrollbar's actual size; actual width for vertical scrollbars, actual height for horizontal scrollbars.

• void scrollbar_size (int val)
  Set the width of the scrollbar's trough to val, in pixels.

• int scrollbar_size (void) const
  Get the current size of the scrollbar's trough, in pixels.

• void selectionbgcolor (Fl_Color val)
  Set mouse selection background color.

• Fl_Color selectionbgcolor (void) const
  Get mouse selection background color.

• void selectionfgcolor (Fl_Color val)
  Set mouse selection foreground color.

• Fl_Color selectionfgcolor (void) const
  Get mouse selection foreground color.

• void show_unknown (bool val)
  Set the "show unknown" flag.

• bool show_unknown (void) const
  Return the "show unknown" flag.

• void textattrib (uchar val)
  Set text attribute bits (underline, inverse, etc).

• void textbgcolor (Fl_Color val)
  Set text background color to fltk color val used by any new text added.

• Fl_Color textbgcolor (void) const
  Return text's current background color.
• void textbgcolor_default (Fl_Color val)
  
  Set the default text background color used by any new text added after a reset (<ESC>c, <ESC>[0m, or reset_terminal()).

• Fl_Color textbgcolor_default (void) const
  
  Return text's default background color.

• void textbgcolor_xterm (uchar val)
  
  Sets the background text color as one of the 8 'xterm color' values.

• void textcolor (Fl_Color val)
  
  Set the text color for the terminal.

• Fl_Color textcolor (void) const
  
  Return textcolor(). This is a convenience method that returns textfgcolor_default()

• void textfgcolor (Fl_Color val)
  
  Set text foreground drawing color to fltk color val used by any new text added.

• Fl_Color textfgcolor (void) const
  
  Return text's current foreground color.

• void textfgcolor_default (Fl_Color val)
  
  Set the default text foreground color used by <ESC>c, <ESC>[0m, and reset_terminal().

• Fl_Color textfgcolor_default (void) const
  
  Return text's default foreground color.

• void textfgcolor_xterm (uchar val)
  
  Sets the foreground text color as one of the 8 'xterm color' values.

• void textfont (Fl_Font val)
  
  Sets the font used for all text displayed in the terminal.

• Fl_Font textfont (void) const
  
  Return text's font used to draw all text in the terminal.

• void textsize (Fl_Fontsize val)
  
  Sets the font size used for all text displayed in the terminal.

• Fl_Fontsize textsize (void) const
  
  Return text font size used to draw all text in the terminal.

• void vprintf (const char *fmt, va_list ap)
  
  Appends printf formatted messages to the terminal.

• ~Fl_Terminal (void)
  
  The destructor for Fl_Terminal.

Public Member Functions inherited from Fl_Group

• Fl_Widget *&_ddfdesign_kludge ()
  
  This is for forms compatibility only.

• void add (Fl_Widget &)
  
  The widget is removed from its current group (if any) and then added to the end of this group.

• void add (Fl_Widget *)
  
  See void Fl_Group::add(Fl_Widget &w)

• void add_resizable (Fl_Widget &)
  
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget *const + array () const
  
  Returns a pointer to the array of children.

• Fl_Group const + as_group () const FL_OVERRIDE

• Fl_Group * as_group () FL_OVERRIDE
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• void begin ()
  
  Sets the current group so you can build the widget tree by just constructing the widgets.
• `FL_Widget * child (int n) const`
  Returns array()[n].

• `int children () const`
  Returns how many child widgets the group has.

• `void clear ()`
  Deletes all child widgets from memory recursively.

• `unsigned int clip_children ()`
  Returns the current clipping mode.

• `void clip_children (int c)`
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• `virtual int delete_child (int n)`
  Removes the widget at index from the group and deletes it.

• `void end ()`
  Exactly the same as current(this->parent()).

• `int find (const Fl_Widget &o) const`
  See int Fl_Group::find(const Fl_Widget *w) const.

• `int find (const Fl_Widget *) const`
  Searches the child array for the widget and returns the index.

• `FL_Group (int, int, int, int, const char * =0)`
  Creates a new Fl_Group widget using the given position, size, and label string.

• `void focus (Fl_Widget *W)`

• `void forms_end ()`
  This is for forms compatibility only.

• `void init_sizes ()`
  Resets the internal array of widget sizes and positions.

• `void insert (Fl_Widget &, int i)`
  The widget is removed from its current group (if any) and then inserted into this group.

• `void insert (Fl_Widget &, Fl_Widget *before)`
  This does insert(w, find(before)).

• `void remove (Fl_Widget &)`
  Removes a widget from the group but does not delete it.

• `void remove (Fl_Widget *o)`
  Removes the widget o from the group.

• `void remove (int index)`
  Removes the widget at index from the group but does not delete it.

• `FL_Widget * resizable () const`
  Returns the group's resizable widget.

• `void resizable (Fl_Widget &o)`
  Sets the group's resizable widget.

• `void resizable (Fl_Widget *o)`
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• `virtual ~Fl_Group ()`
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Copies the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• **void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

• **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• **int h () const**
  Gets the widget height.

• **virtual void hide ()**
  Makes a widget invisible.

• **FL_Image ∗image ()**
  Gets the image that is used as part of the widget label when in the active state.

• **FL_Image ∗image () const**
  Gets the image that is used as part of the widget label when in the active state.

• **void image (FL_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

• **void image (FL_Image ∗img)**
  Sets the image to use as part of the widget label when in the active state.

• **int image_bound () const**
  Returns whether the image is managed by the widget.

• **int inside (const Fl_Widget ∗wgt) const**
  Checks if this widget is a child of wgt.

• **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

• **const char ∗label () const**
  Gets the current label text.

• **void label (const char ∗text)**
  Sets the current label pointer.

• **void label (Fl_Labeltype a, const char ∗b)**
  Shortcut to set the label text and type in one call.

• **Fl_Color labelcolor () const**
  Gets the label color.

• **void labelcolor (Fl_Color c)**
  Sets the label color.

• **Fl_Font labelfont () const**
  Gets the font to use.

• **void labelfont (Fl_Font f)**
  Sets the font to use.

• **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.

• **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.

• **Fl_Labeltype labeltype () const**
  Gets the label type.

• **void labeltype (Fl_Labeltype a)**
  Sets the label type.

• **void measure_label (int &ww, int &hh) const**
  Sets width ww and height hh accordingly with the label size.

• **bool needs_keyboard () const**
  Returns whether this widget needs a keyboard.

• **void needs_keyboard (bool needs)**
  Sets whether this widget needs a keyboard.

• **unsigned int output () const**
Returns if a widget is used for output only.

- `FL_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (FL_Group *p)`
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `FL_Color selection_color () const`
  Gets the selection color.

- `void selection_color (FL_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.

- `void set_visible ()`
  Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  Returns whether the widget's label uses '&' to indicate shortcuts.

- `void shortcut_label (int value)`
  Sets whether the widget's label uses '&' to indicate shortcuts.

- `virtual void show ()`
  Makes a widget visible.

- `void size (int W, int H)`
  Changes the size of the widget.

- `int take_focus ()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.

- `int test_shortcut ()`
  Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.

- `void tooltip (const char *text)`
  Sets the current tooltip text.

- `FL_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `FL_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void *user_data () const
  Gets the user data for this widget.

• void user_data (FL_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window *window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~FL_Widget ()
  Destroys the widget.

Protected Member Functions

• void clear_eod (void)
  Clear from cursor to End Of Display (EOD), like "<ESC>[J<ESC>[0J".

• void clear_eol (void)
  Clear from cursor to End Of Line (EOL), like "<ESC>[K".

• void clear_line (int row)
  Clear entire line for specified row.

• void clear_line (void)
  Clear entire line cursor is currently on.

• void clear_mouse_selection (void)
  Clear any current mouse selection.

• void clear_sod (void)
  Clear from cursor to Start Of Display (EOD), like "<ESC>[1J".

• void clear_sol (void)
  Clear from cursor to Start Of Line (SOL), like "<ESC>[1K".

• void current_style (const CharStyle &sty)
  Set current style for rendering text.

• const CharStyle &current_style (void) const
  Return current style for rendering text.
• void **cursor_col** (int col)
  Move cursor to the specified column col.

• void **cursor_cr** (void)
  Move cursor as if a CR (\r) was received.

• void **cursor_crlf** (int count=1)
  Move cursor as if a CR/LF pair (\r\n) was received.

• void **cursor_down** (int count=1, bool do_scroll=false)
  Moves cursor down count lines.

• void **cursor_eol** (void)
  Move cursor to the last column (at the far right) on the current line.

• void **cursor_left** (int count=1)
  Moves cursor left count columns, and cursor stops (does not wrap) if it hits screen edge.

• void **cursor_right** (int count=1, bool do_scroll=false)
  Moves cursor right count columns.

• void **cursor_row** (int row)
  Move cursor to the specified row row.

• void **cursor_sol** (void)
  Move cursor to the first column (at the far left) on the current line.

• void **cursor_tab_left** (int count=1)
  Tab left, do not wrap beyond left edge.

• void **cursor_tab_right** (int count=1)
  Tab right, do not wrap beyond right edge.

• void **cursor_up** (int count=1, bool do_scroll=false)
  Moves cursor up count lines.

• void **delete_chars** (int drow, int dcol, int rep)
  Delete char(s) at (drow,dcol) for 'rep' times.

• void **delete_chars** (int rep)
  Delete char(s) at cursor position for 'rep' times.

• void **delete_rows** (int count)
  Delete (count) rows at cursor position.

• int **disp_cols** (void) const
  Return the number of columns in the display area.

• int **disp_erow** (void) const
  Return the ending row# in the display area.

• int **disp_rows** (void) const
  Return the number of rows in the display area.

• int **disp_srow** (void) const
  Return the starting row# in the display area.

• void **draw_buff** (int Y) const
  Draws the buffer position we are scrolled to onto the FLTK screen starting at pixel position Y.

• void **draw_row** (int grow, int Y) const
  Draw the specified global row, which is the row in ring_chars[].

• void **draw_row_bg** (int grow, int X, int Y) const
  Draw the background for the specified ring_chars[] global row grow starting at FLTK coords X and Y.

• bool **get_selection** (int &srow, int &scol, int &erow, int &ecol) const
  Return mouse selection's start/end position in the ring buffer, if any.

• int **h_to_row** (int H) const
  Given a height in pixels, return number of rows that "fits" into that area.

• int **handle_unknown_char** (void)
  Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of show_unknown().
- `int hist_cols (void) const`  
  Return the number of columns in the scrollback history.

- `int hist_erow (void) const`  
  Return the ending row# of the scrollback history.

- `int hist_rows (void) const`  
  Return the number of rows in the scrollback history.

- `int hist_srow (void) const`  
  Return the starting row# of the scrollback history.

- `int hist_use (void) const`  
  Return number of rows in use by the scrollback history.

- `int hist_use_srow (void) const`  
  Return the starting row of the “in use” scrollback history.

- `void insert_char (char c, int rep)`  
  Insert char ‘c’ at the current cursor position for ‘rep’ times.

- `void insert_char_eol (char c, int drow, int dcol, int rep)`  
  Insert char ‘c’ for ‘rep’ times at display row ‘drow’ and column ‘dcol’.

- `void insert_rows (int count)`  
  Insert (count) rows at current cursor position.

- `bool is_inside_selection (int row, int col) const`  
  Is global row/column inside the current mouse selection?

- `bool is_selection (void) const`  
  Returns true if there’s a mouse selection.

- `int offset (void) const`  
  Returns the current offset into the ring buffer.

- `void restore_cursor (void)`  
  Restore previously saved cursor position, if any. Used by ESC [ u.

- `int ring_cols (void) const`  
  Return the number of columns in the ring buffer.

- `int ring_erow (void) const`  
  Return the ending row# in the ring buffer (Always ring_rows()-1)

- `int ring_rows (void) const`  
  Return the number of rows in the ring buffer.

- `int ring_srow (void) const`  
  Return the starting row# in the ring buffer. (Always 0)

- `void save_cursor (void)`  
  Save current cursor position. Used by ESC [ s.

- `void scroll (int rows)`  
  Scroll the display up(+) or down(-) the specified rows.

- `bool selection_extend (int X, int Y)`  
  Extend selection to FLTK coords X,Y.

- `const char * selection_text (void) const`  
  Return text selection (for copy()/paste() operations)

- `int selection_text_len (void) const`  
  Return byte length of all UTF-8 chars in selection, or 0 if no selection.

- `Utf8Char * u8c.cursor (void)`  
  Return the Utf8Char for character under cursor.

- `Utf8Char * u8c_disp_row (int drow)`  
  Return pointer to the first u8c character in row drow of the display.

- `const Utf8Char * u8c_disp_row (int drow) const`  
  See docs for non-const version of u8c_disp_row(int)

- `Utf8Char * u8c_hist_row (int hrow)`
Return u8c for beginning of a row inside the scrollback history.

- const Utf8Char * u8c_hist_row (int hrow) const
  See docs for non-const version of u8c_hist_row(int)
- const Utf8Char * u8c_hist_use_row (int hrow) const
  See docs for non-const version of u8c_hist_use_row(int)
- Utf8Char * u8c_hist_use_row (int hurow)
  Return u8c for beginning of row hurow inside the 'in use' part of the scrollback history.
- Utf8Char * u8c_ring_row (int grow)
  Return UTF-8 char for row grow in the ring buffer.
- const Utf8Char * u8c_ring_row (int grow) const
  See docs for non-const version of u8c_ring_row(int)
- int vscroll_width (void) const
  Return scrollbar width if visible, or 0 if not visible.
- int w_to_col (int W) const
  Given a width in pixels, return number of columns that "fits" into that area.
- const Utf8Char * walk_selection (const Utf8Char *u8c, int &row, int &col) const
  Walk the mouse selection one character at a time from beginning to end, returning a Utf8Char* to the next character in the selection, or NULL if the end was reached, or if there's no selection.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

• static Fl_Group ∗current ()
  Returns the currently active group.
• static void current (Fl_Group ∗g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
}
11.142.1 Detailed Description

Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control.

11.142.2 Fl_Terminal

Fl_Terminal is an output-only text widget supporting ASCII and UTF-8/Unicode. It supports most terminal text features, such as most VT100/xterm style escape sequences (see The Escape Codes Fl_Terminal Supports), text colors/attributes, scrollback history, mouse selection, etc.

It is recommended that accessing features such as setting text colors and cursor positioning is best done with ANSI/XTERM escape sequences. But if one sets ansi(false) then this is not possible, so the public API can be used for common operations, e.g.

<table>
<thead>
<tr>
<th>Public API</th>
<th>ESC code equivalent</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear_screen_home()</td>
<td>ESC [ H ESC [ 2 J</td>
<td>Clear screen, home cursor</td>
</tr>
<tr>
<td>cursor_home()</td>
<td>ESC [ H</td>
<td>Home the cursor</td>
</tr>
<tr>
<td>clear_history()</td>
<td>ESC [ 3 J</td>
<td>Clear scrollback history</td>
</tr>
<tr>
<td>reset_terminal()</td>
<td>ESC [ c</td>
<td>Reset terminal</td>
</tr>
</tbody>
</table>

To access more advanced API calls, one can derive a class from Fl_Terminal to access protected methods manipulate the terminal more directly, e.g.

<table>
<thead>
<tr>
<th>Protected API</th>
<th>ESC code equiv.</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current_style()</td>
<td>ESC [ # m</td>
<td>Set text attributes</td>
</tr>
<tr>
<td>clear_eod()</td>
<td>ESC [ 0 J</td>
<td>Clear from cursor to end of display</td>
</tr>
<tr>
<td>clear_sod()</td>
<td>ESC [ 1 J</td>
<td>Clear from cursor to start of display</td>
</tr>
<tr>
<td>clear_eol()</td>
<td>ESC [ 0 K</td>
<td>Clear from cursor to end of line</td>
</tr>
<tr>
<td>clear_sol()</td>
<td>ESC [ 1 K</td>
<td>Clear from cursor to start of line</td>
</tr>
<tr>
<td>clear_line()</td>
<td>ESC [ 2 K</td>
<td>Clear line cursor is on</td>
</tr>
<tr>
<td>scroll(int)</td>
<td>ESC [ 1 S</td>
<td>Scroll up one line</td>
</tr>
<tr>
<td>scroll(int)</td>
<td>ESC [ 1 T</td>
<td>Scroll down one line</td>
</tr>
<tr>
<td>cursor_left()</td>
<td>ESC [ 1 D</td>
<td>Move cursor left (no wrap)</td>
</tr>
<tr>
<td>Protected API</td>
<td>ESC code equiv.</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------</td>
<td>----------------------------------------------</td>
</tr>
<tr>
<td>cursor_right()</td>
<td>ESC [ 1 C</td>
<td>Move cursor right (no wrap)</td>
</tr>
<tr>
<td>cursor_up()</td>
<td>ESC [ 1 B</td>
<td>Move cursor up (no scroll or wrap)</td>
</tr>
<tr>
<td>cursor_down()</td>
<td>ESC [ 1 A</td>
<td>Move cursor down (no scroll or wrap)</td>
</tr>
<tr>
<td>cursor_row()</td>
<td>ESC [ # ; # H</td>
<td>Move cursor to row# / column#</td>
</tr>
<tr>
<td>insert_char()</td>
<td>ESC [ # @</td>
<td>Insert a char at cursor position</td>
</tr>
<tr>
<td>delete_chars()</td>
<td>ESC [ # P</td>
<td>Delete chars at cursor position</td>
</tr>
<tr>
<td>insert_rows()</td>
<td>ESC [ # L</td>
<td>Insert rows at cursor position</td>
</tr>
<tr>
<td>delete_rows()</td>
<td>ESC [ # M</td>
<td>Delete rows at cursor position</td>
</tr>
<tr>
<td>etc...</td>
<td>etc...</td>
<td>etc...</td>
</tr>
</tbody>
</table>

Many commonly used API functions are public, such as textfgcolor() for setting text colors. Others, such as cursor_up() are protected to prevent common misuse, and are available only to subclasses.

For applications that need input support, the widget can be subclassed to provide keyboard input, and advanced features like pseudo ttys, termio, serial port I/O, etc., as such features are beyond the scope of FLTK.

### 11.142.2.1 Examples

```c
// Fl_Terminal: Simple Use

Fl_Terminal *tty = new Fl_Terminal(...);

tty->append("Hello world.\n"); // simple strings
tty->append("This text is red.\033[31m\n"); // colored text
tty->printf("The value of x is %.02f\n", x); // printf() formatting
```

There are also public methods for doing what most "\033[ escape codes do, so that if ansi(bool) is set to "false", one can still change text colors or clear the screen via application control, e.g.

```c
tty->home(); // home the cursor
tty->clear_screen(); // clear the screen
tty->textfgcolor(0xff000000); // change the text color to RED
tty->textbgcolor(0x0000ff00); // change the background color to BLUE
```

When creating the widget, the width/height determine the default column and row count for the terminal's display based on the current font size. The column width determines where text will wrap.

You can specify wider column sizes than the screen using display_columns(colwidth). When this value is larger than the widget's width, text will wrap off-screen, and can be revealed by resizing the widget wider.

### 11.142.2.2 Writing To Terminal From Applications

An application needing terminal output as part of its user interface can instance Fl_Terminal, and write text strings with:

- `append()` to append strings
- `printf()` to append formatted strings
Single character output can be done with:

- print_char() to print a single ASCII/UTF-8 char at the cursor
- putchar() to put single ASCII/UTF-8 char at an x,y position

11.142.2.3 Text Attributes

The terminal's text supports these attributes:

- Italic - italicized text: \033[3m
- Bold - brighter/thicker text: \033[1m
- Dim - lower brightness text: \033[2m
- Underline - text that is underlined: \033[4m
- Strikeout - text that has a line through the text: \033[9m
- Inverse - text whose background and foreground colors are swapped: \033[7m
- Normal - normal text: \033[0m

![Figure 11.55 Fl_Terminal screen](image1)

11.142.2.4 Text and Background Colors

There's at least two ways to specify colors for text and background colors:

- 3 bit / 8 Color Values
- Full 24 bit R/G/B colors

Example of 3 bit colors:

![Figure 11.56 Fl_Terminal 3 bit colors](image2)
Example application source code using 3 bit colors:

```cpp
// Text colors
tty->append("\033[31m Red text.\033[0m\n"); // Print red text..

// Background colors
tty->append("\033[41m Red Background.\033[0m\n"); // background will be red
```

Example of 24 bit colors:

```cpp
// 24 bit Text Color
tty->append("\033[38;2;0;0;255m Text is BLUE.\033[0m\n"); // RGB: R=0, G=0, B=255

tty->append("\033[38;2;255;0;0m Text is RED.\033[0m\n"); // RGB: R=255, G=0, B=0

tty->append("\033[38;2;127;64;0m Text is DARK ORANGE.\033[0m\n"); // RGB: R=127, G=64, B=0
```

Example application source code using 24 bit colors:

```cpp
// 24 bit Text Color
tty->append("\033[38;2;0;0;255m Text is BLUE.\033[0m\n"); // RGB: R=0, G=0, B=255

tty->append("\033[38;2;255;0;0m Text is RED.\033[0m\n"); // RGB: R=255, G=0, B=0

tty->append("\033[38;2;127;64;0m Text is DARK ORANGE.\033[0m\n"); // RGB: R=127, G=64, B=0
```

For more on the ANSI escape codes, see The Escape Codes Fl_Terminal Supports.

### 11.142.2.5 Features

Most standard terminal behaviors are supported, e.g.

- ASCII + UTF-8/Unicode
- scrollback history management
- mouse selection + copy/paste (`^C`, `^A`)
- autoscroll during selection
Most popular ANSI/DEC VT100/Xterm escape sequences are supported (see The Escape Codes Fl_Terminal Supports), including:

- per-character colors for text and background
- per-character text attributes: bold/dim, underline, strikeout
- scrolling up/down
- character insert/delete for characters/rows/screen
- clearing characters/rows/screen

Does not (yet) support:

- programmable regions (scroll regions and attribute blocks)
- dynamic line wrap (where resizing display dynamically re-wraps long lines)

Will likely never implement as part of this widget:

- pty/termio management (such features should be subclassed)
- Different per-character font family + sizes (font family/size is global only)
- variable width fonts

Regarding the font family+size; the way the terminal is currently designed, the font family and size must not vary within text; rows have to be consistent height. Varying widths are tricky too, esp. when it comes to moving the cursor up/down within a column; varying widths are supported (due to Unicode characters sometimes being "wide", but not heights.

11.142.2.6 Margins

The margins define the amount of space (in pixels) around the outside of the text display area, the space between the widget's inner edge (inside the box()) and the text display area's outer edge. The margins can be inspected and changed with the margin_left(), margin_right(), margin_top() and margin_bottom() methods.
11.142.2.7 Caveats

- This widget is not a full terminal emulator; it does not do stdin redirection, pseudo tty/termios/character cooking, keyboard input processing, full curses(3) support. However, such features CAN be implemented with subclassing.

- The printf() and vprintf() functions are limited to strings no longer than 1024 characters (including NULL). For printing longer strings, use append() which has no string limits.

- For background colors textbgcolor() and textbgcolor_default(), the special color value 0xffffffff lets the widget's box() color() show through behind the text.

11.142.3 Member Enumeration Documentation

11.142.3.1 Attrib

enum Fl_Terminal::Attrib

Bits for the per-character attributes, which control text features such as italic, bold, underlined text, etc.

NOTE: enum names with a leading underbar must not be used, and are reserved for future use.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>all attributes off</td>
</tr>
<tr>
<td>BOLD</td>
<td>bold text: uses bold font, color brighter than normal</td>
</tr>
<tr>
<td>DIM</td>
<td>dim text: color slightly darker than normal</td>
</tr>
<tr>
<td>ITALIC</td>
<td>italic font text</td>
</tr>
<tr>
<td>UNDERLINE</td>
<td>underlined text</td>
</tr>
<tr>
<td>_RESERVED--</td>
<td>_1 (reserved for internal future use)</td>
</tr>
<tr>
<td>INVERSE</td>
<td>inverse text; fg/bg color are swapped</td>
</tr>
<tr>
<td>_RESERVED--</td>
<td>_2 (reserved for internal future use)</td>
</tr>
<tr>
<td>STRIKEOUT</td>
<td>strikeout text</td>
</tr>
</tbody>
</table>

11.142.3.2 CharFlags

enum Fl_Terminal::CharFlags

Per-character 8 bit flags (uchar) used to manage special states for characters.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FG_XTERM</td>
<td>this char's fg color is an XTERM color; can be affected by Dim+Bold</td>
</tr>
<tr>
<td>BG_XTERM</td>
<td>this char's bg color is an XTERM color; can be affected by Dim+Bold</td>
</tr>
<tr>
<td>EOL</td>
<td>TODO: char at EOL, used for line re-wrap during screen resizing.</td>
</tr>
</tbody>
</table>
11.142.3.3 OutFlags

enum Fl_Terminal::OutFlags
Output translation flags for special control character translations.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>no output translation</td>
</tr>
<tr>
<td>CR_TO_LF</td>
<td>carriage return generates a vertical line-feed (\r -&gt; \n)</td>
</tr>
<tr>
<td>LF_TO_CR</td>
<td>line-feed generates a carriage return (\n -&gt; \r)</td>
</tr>
<tr>
<td>LF_TO_CRLF</td>
<td>line-feed generates a carriage return line-feed (\n -&gt; \r\n)</td>
</tr>
</tbody>
</table>

11.142.3.4 RedrawStyle

enum Fl_Terminal::RedrawStyle
Determines when Fl_Terminal calls redraw() if new text is added.
RATE_LIMITED is the recommended setting, using redraw_rate(float) to determine the maximum rate of redraws.

See also
redraw_style(), redraw_rate()

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_REDRAW</td>
<td>app must call redraw() as needed to update text to screen</td>
</tr>
<tr>
<td>RATE_LIMITED</td>
<td>timer controlled redraws. (DEFAULT)</td>
</tr>
<tr>
<td>PER_WRITE</td>
<td>redraw triggered after every append() / printf() / etc. operation</td>
</tr>
</tbody>
</table>

11.142.4 Constructor & Destructor Documentation

11.142.4.1 Fl_Terminal() {1/2}

Fl_Terminal::Fl_Terminal (  
int X,  
int Y,  
int W,  
int H,  
const char * L = 0 )
The constructor for Fl_Terminal.
This creates an empty terminal with defaults:
• white on black text; see textfgcolor(Fl_Color), textbgcolor(Fl_Color)
• rows/cols based on the W and H values, see display_rows(), display_columns()
• scrollback history of 100 lines, see history_rows()
• redraw_style() set to RATE_LIMITED, redraw_rate() set to 0.10 seconds
Note: While Fl_Terminal derives from Fl_Group, it's not intended for user code to use it as a parent for other widgets, so end() is called.

Parameters
| in X,Y,W,H | position and size.                                           |
| in L       | label string (optional), may be NULL.                        |
11.142.4.2  Fl_Terminal() [2/2]

Fl_Terminal::Fl_Terminal (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char * L,  
  int rows,  
  int cols,  
  int hist )

Same as the default FLTK constructor, but lets the user force the rows, columns and history to specific sizes on creation.
Since the row/cols/hist are specified directly, this prevents the widget from auto-calculating the initial text buffer size based on the widget's pixel width/height, bypassing calls to the font system before the widget is displayed.

Note
fluid uses this constructor internally to avoid font calculations that opens the display, useful for when running in a headless context. (issue 837)

11.142.4.3  ~Fl_Terminal()

Fl_Terminal::~Fl_Terminal (  
  void )

The destructor for Fl_Terminal.
Destroys the terminal display, scroll history, and associated widgets.

11.142.5  Member Function Documentation

11.142.5.1  ansi() [1/2]

void Fl_Terminal::ansi (  
  bool val )

Enable/disable the ANSI mode flag.
If true, ANSI and VT100/xterm codes will be processed. If false, these codes won't be processed and will either be ignored or print the error character "¿", depending on the value of show_unknown().

See also
   show_unknown(), The Escape Codes Fl_Terminal Supports

11.142.5.2  ansi() [2/2]

bool Fl_Terminal::ansi (  
  void ) const

Return the state of the ANSI flag.

See also
   ansi(bool)

11.142.5.3  append()

void Fl_Terminal::append (  
  const char * s,  
  int len = -1 )

Appends string s to the terminal at the current cursor position using the current text color/attributes.
If s is NULL, the UTF-8 character cache is cleared, which is recommended before starting a block reading loop, and again after the block loop has completed.
If `len` is not specified, it's assumed `s` is a NULL terminated string. If `len` IS specified, it can be used for writing strings that aren't NULL terminated, such as block reads on a pipe, network, or other block oriented data source. Redraws of the terminal widget are by default handled automatically, but can be changed with `redraw_rate()` and `redraw_style()`.

**Block I/O**

When reading block oriented sources (such as pipes), `append()` will handle partial UTF-8 chars straddling the block boundaries. It does this using an internal byte cache, which should be cleared before and after block I/O loops by calling `append(NULL)` as shown in the example below, to prevent the possibilities of partial UTF-8 characters left behind by an interrupted or incomplete block loop.

```c
// Example block reading a command pipe in Unix

// Run command and read as a pipe
FILE *fp = popen("ls -la", "r");
if (!fp) { ..error_handling.. ;

// Enable non-blocking I/O
int fd = fileno(fp);
fcntl(fd, F_SETFL, O_NONBLOCK);

// Clear UTF-8 character cache before starting block loop
G_tty->append(NULL); // prevents leftover partial UTF-8 bytes

// Block read loop
while (1) {
    Fl::wait(0.05); // give fltk .05 secs of cpu to manage UI
    ssize_t bytes = read(fd, s, sizeof(s)); // read block from pipe
    if (bytes == -1 && errno == EAGAIN) continue; // no data yet? continue
    if (bytes > 0) G_tty->append(s); // append output to terminal
    else break; // end of pipe?
}

// Flush cache again after block loop completes
G_tty->append(NULL);

// Close pipe, done
pclose(fp);
```

**Note**

- String can contain ASCII or UTF-8 chars
- `len` is optional; if unspecified, expects `s` to be a NULL terminated string
- Handles partial UTF-8 chars split between calls (e.g. block oriented writes)
- If `s` is NULL, this clears the "partial UTF-8" character cache
- Redraws are managed automatically by default; see `redraw_style()`

### 11.142.5.4 append_ascii()

```c
void Fl_Terminal::append_ascii (const char * s )
```

Append NULL terminated ASCII string to terminal, slightly more efficient than `append_utf8()`.

- If `s` is NULL, behavior is to do nothing
- Redraws are triggered automatically, depending on `redraw_style()`

### 11.142.5.5 append_utf8()

```c
void Fl_Terminal::append_utf8 ( const char * buf,
    int len = -1 )
```

Append NULL terminated UTF-8 string to terminal.

- If `buf` is NULL, UTF-8 cache buffer is cleared
- If optional `len` isn't specified or is -1, `strlen(text)` is used.
• If `len` is 0 or <-1, no changes are made
• Handles UTF-8 chars split across calls (e.g. block writes from pipes, etc)
• Redraws are triggered automatically, depending on `redraw_style()`

11.142.5.6 box()

```cpp
void Fl_Terminal::box (Fl_Boxtype val) [inline]
```

Sets the box type, updates terminal margins et al.
Default is FL_DOWN_FRAME.
FL_XXX_FRAME types are handled in a special way by this widget, and guarantee the background is a flat field.
FL_XXX_BOX may draw gradients as inherited by `Fl::scheme()`.

11.142.5.7 clear() [1/2]

```cpp
void Fl_Terminal::clear (Fl_Color val)
```

Clears the screen to a specific color `val` and homes the cursor.
See also
`clear_screen(), clear_screen_home(), cursor_home()`

11.142.5.8 clear() [2/2]

```cpp
void Fl_Terminal::clear (void)
```

Clears the screen to the current `textbgcolor()`, and homes the cursor.
See also
`clear_screen(), clear_screen_home(), cursor_home()`

11.142.5.9 clear_screen()

```cpp
void Fl_Terminal::clear_screen (bool scroll_to_hist = true)
```

Clear the terminal screen only; does not affect the cursor position.
Also clears the current mouse selection.
If `scroll_to_hist` is true, the screen is cleared by scrolling the contents into the scrollback history, where it can be retrieved with the scrollbar. This is the default behavior. If false, the screen is cleared and the scrollback history is unchanged.
Similar to the escape sequence "<ESC>[2J".
See also
`clear_screen_home()`

11.142.5.10 clear_screen_home()

```cpp
void Fl_Terminal::clear_screen_home (bool scroll_to_hist = true)
```

Clear the terminal screen and home the cursor.
Also clears the current mouse selection.
If `scroll_to_hist` is true, the screen is cleared by scrolling the contents into the scrollback history, where it can be retrieved with the scrollbar. This is the default behavior. If false, the screen is cleared and the scrollback history is unchanged.
Similar to the escape sequence "<ESC>[2J<ESC>[H".
See also

clear_screen()

11.142.5.11  color()

void Fl_Terminal::color (Fl_Color val)

Sets the background color for the terminal's Fl_Group::box().
If the txtbgcolor() and txtbgcolor_default() are set to the special "see through" color 0xffffffff when any text was added, changing color() affects the color that shows through behind that existing text.
Otherwise, whatever specific background color was set for existing text will persist after changing color().
To see the effects of a change to color(), follow up with a call to redraw().
The default value is 0x0.

11.142.5.12  cursor_col()

void Fl_Terminal::cursor_col (int col) [protected]

Move cursor to the specified column col.
This value is clamped to the range (0..display_columns()-1).

11.142.5.13  cursor_cr()

void Fl_Terminal::cursor_cr () [protected]

Move cursor as if a CR ('r) was received.
Same as cursor_sol()  

11.142.5.14  cursor_down()

void Fl_Terminal::cursor_down (int count = 1, bool do_scroll = false) [protected]

Moves cursor down count lines.
If cursor hits screen bottom, it either stops (does not wrap) if do_scroll is false, or wraps and scrolls up if do_scroll is true.

Parameters

<table>
<thead>
<tr>
<th>count</th>
<th>Number of lines to move cursor down</th>
</tr>
</thead>
<tbody>
<tr>
<td>do_scroll</td>
<td>Enable scrolling if set to true</td>
</tr>
</tbody>
</table>

11.142.5.15  cursor_right()

void Fl_Terminal::cursor_right (int count = 1, bool do_scroll = false) [protected]

Moves cursor right count columns.
If cursor hits right edge of screen, it either stops (does not wrap) if do_scroll is false, or wraps and scrolls up one line if do_scroll is true.

11.142.5.16  cursor_row()

void Fl_Terminal::cursor_row (int row) [protected]

Move cursor to the specified row row.
This value is clamped to the range (0..display_rows()-1).
11.142.5.17 cursor_up()

```cpp
void Fl_Terminal::cursor_up (  int count = 1,  bool do_scroll = false ) [protected]
```

Moves cursor up `count` lines. If cursor hits screen top, it either stops (does not wrap) if `do_scroll` is false, or scrolls down if `do_scroll` is true.

11.142.5.18 delete_rows()

```cpp
void Fl_Terminal::delete_rows (  int count ) [protected]
```

Delete `count` rows at cursor position. Causes rows to scroll up, and empty lines created at bottom of screen. Lines deleted by scroll up are NOT moved into the scroll history.

11.142.5.19 display_columns() [1/2]

```cpp
void Fl_Terminal::display_columns (  int dcols )
```

Set terminal's display width in columns of text characters. This value is normally managed automatically by `resize()` based on the current font size, and should not be changed. You CAN make the `display_columns()` larger than the width of the widget; text in the terminal will simply run off the screen edge and be clipped; the only way to reveal that text is if the user enlarges the widget, or the font size made smaller.

To change the display width, it is best to use `resize()` instead.

11.142.5.20 display_columns() [2/2]

```cpp
int Fl_Terminal::display_columns (  void ) const
```

Return terminal's display width in columns of text characters. This value is normally managed automatically by `resize()` based on the current font size.

11.142.5.21 display_rows() [1/2]

```cpp
void Fl_Terminal::display_rows (  int drows )
```

Set terminal's display height in lines of text (rows). This value is normally managed automatically by `resize()` based on the current font size, and should not be changed.

To change the display height, use `resize()` instead.

11.142.5.22 display_rows() [2/2]

```cpp
int Fl_Terminal::display_rows (  void ) const
```

Return terminal's display height in lines of text (rows). This value is normally managed automatically by `resize()` based on the current font size.

11.142.5.23 draw()

```cpp
void Fl_Terminal::draw (  void ) [virtual]
```

Draws the entire `Fl_Terminal`.

Lets the group draw itself first (scrollbar should be only member), followed by the terminal's screen contents. Reimplemented from `Fl_Group`.

Generated by Doxygen
11.142.5.24  draw_buff()

void Fl_Terminal::draw_buff (  
    int Y) const [protected]
Draws the buffer position we are scrolled to onto the FLTK screen starting at pixel position Y.
This can be anywhere in the ring buffer, not just the 'active display'; depends on what position the scrollbar is set to.
Handles attributes, colors, text selections, cursor.

11.142.5.25  draw_row()

void Fl_Terminal::draw_row (  
    int grow,  
    int Y) const [protected]
Draw the specified global row, which is the row in ring_chars[].
The global row includes history + display buffers.

11.142.5.26  draw_row_bg()

void Fl_Terminal::draw_row_bg (  
    int grow,  
    int X,  
    int Y) const [protected]
Draw the background for the specified ring_chars[] global row
starting at FLTK coords X and Y.
Note we may be called to draw display, or even history if we're scrolled back. If there's any change in bg color, we
draw the filled rects here.
If the bg color for a character is the special "see through" color 0xffffffff, no pixels are drawn.

11.142.5.27  get_selection()

bool Fl_Terminal::get_selection (  
    int & srow,  
    int & scol,  
    int & erow,  
    int & ecol) const [protected]
Return mouse selection's start/end position in the ring buffer, if any.
Ensures (start < end) to allow walking 'forward' thru selection, left-to-right, top-to-bottom. The row/col values are
indexes into the entire ring buffer.
Example: walk the characters of the mouse selection:

```
// Get selection
int srow,scol,erow,ecol;
if (get_selection(srow,scol,erow,ecol)) { // mouse selection exists?
    // Walk entire selection from start to end
    for (int row=srow; row<erow; row++) { // walk rows of selection
        const Utf8Char *u8c = u8c_ring_row(row); // ptr to first character in row
        int col_start = (row==srow) ? scol : 0; // start row? start at scol
        int col_end = (row==erow) ? ecol : ring_cols(); // end row? end at ecol
        u8c += col_start; // include col offset (if any)
        for (int col=col_start; col<col_end; col++,u8c++) { // walk columns
            // do something with each char at *u8c..
        }
    }
}
```

Returns:

- true – valid selection values returned
- false – no selection was made, returned values undefined

See also

walk_selection(), is_selection()
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srow</td>
<td>starting row for selection</td>
</tr>
<tr>
<td>scol</td>
<td>starting column for selection</td>
</tr>
<tr>
<td>erow</td>
<td>ending row for selection</td>
</tr>
<tr>
<td>ecol</td>
<td>ending column for selection</td>
</tr>
</tbody>
</table>

### 11.142.5.28  h_to_row()

```cpp
type Fl_Terminal::h_to_row (int H) const [protected]
```

Given a height in pixels, return number of rows that "fits" into that area. This is used by the constructor to size the row/cols to fit the widget size.

### 11.142.5.29  handle()

```cpp
type Fl_Terminal::handle (int e) [virtual]
```

Handle FLTK events. Reimplemented from Fl_Group.

### 11.142.5.30  handle_unknown_char()

```cpp
type Fl_Terminal::handle_unknown_char (void) [protected]
```

Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of show_unknown(). Returns 1 if tty modified, 0 if not.

See also

- show_unknown()

### 11.142.5.31  history_lines()

```cpp
type Fl_Terminal::history_lines (int val)
```

Set the number of lines of screen history. Large values can be briefly heavy on cpu and memory usage.

### 11.142.5.32  history_use()

```cpp
type Fl_Terminal::history_use (void) const
```

Returns how many lines are "in use" by the screen history buffer. This value will be 0 if history was recently cleared with e.g. clear_history() or "<ESC>c". Return value will be in the range 0 .. (history_lines()-1).

### 11.142.5.33  insert_char()

```cpp
type Fl_Terminal::insert_char (char c, int rep) [protected]
```

Insert char 'c' at the current cursor position for 'rep' times. Does not wrap; characters at end of line are lost.
11.142.5.34  **insert_rows()**

```cpp
void Fl_Terminal::insert_rows (  
    int count ) [protected]
```

Insert (count) rows at current cursor position.
Causes rows below to scroll down, and empty lines created. Lines deleted by scroll down are NOT moved into the
scroll history.

11.142.5.35  **is_inside_selection()**

```cpp
bool Fl_Terminal::is_inside_selection (  
    int grow,  
    int gcol ) const [protected]
```

Is global row/column inside the current mouse selection?

Returns

- true – (grow, gcol) is inside a valid selection.
- false – (grow, gcol) is outside, or no valid selection.

11.142.5.36  **output_translate()**

```cpp
void Fl_Terminal::output_translate (  
    Fl_Terminal::OutFlags val )
```

Sets the combined output translation flags to val.
val can be sensible combinations of the OutFlags bit flags.
The default is LF_TO_CRLF, so that \n will generate both carriage-return (CR) and line-feed (LF).
For \r and \n to be handled literally, use output_translate(Fl_Terminal::OutFlags::OFF);
To disable all output translations, use 0 or Fl_Terminal::OutFlags::OFF.

11.142.5.37  **print_char()** [1/2]

```cpp
void Fl_Terminal::print_char (  
    char c )
```

Prints single ASCII char `c` at current cursor position, and advances the cursor.
The character is displayed at the current cursor position using the current text color/attributes.

- `c` must be ASCII, not utf-8
- Does not trigger redraws

11.142.5.38  **print_char()** [2/2]

```cpp
void Fl_Terminal::print_char (  
    const char * text,  
    int len = -1 )
```

Prints single UTF-8 char `text` of optional byte length `len` at current cursor position, and advances the cursor if
the character is printable.
Handles ASCII and control codes (CR, LF, etc).
The character is displayed at the current cursor position using the current text color/attributes.
Handles control codes and can be used to construct ANSI/XTERM escape sequences.

- If optional `len` isn't specified or <0, strlen(text) is used.
- `text` must not be NULL.
- `len` must not be 0.
- `text` must be a single char only (whether UTF-8 or ASCII)
- `text` can be an ASCII character, though not as efficient as `print_char()`
• Invalid UTF-8 chars show the error character (¿) depending on show_unknown(bool).
• Does not trigger redraws

See also

show_unknown(bool), handle_unknown_char()

11.142.5.39 printf()

void Fl_Terminal::printf (const char * fmt,
  ...
)

Appends printf formatted messages to the terminal.
The string can contain UTF-8, crlf's, and ANSI sequences are also supported. Example:

```c
#include <FL/Fl_Terminal.H>
int main(..) { 
  // Create a terminal, and append some messages to it
  Fl_Terminal *tty = new Fl_Terminal(..);
  // Append three lines of formatted text to the buffer
  tty->printf("The current date is: %s\nThe time is: %s\n", date_str, time_str);
  tty->printf("The current PID is %ld\n", (long)getpid());
}
```

Note

The expanded string is currently limited to 1024 characters (including NULL). For longer strings use append() which has no string limits.

11.142.5.40 putchar() [1/2]

void Fl_Terminal::putchar (char c,
  int drow,
  int dcol )

Print the ASCII character c at the terminal's display position (drow,dcol).
The character MUST be printable (in range 0x20 - 0x7e), and is displayed using the current text color/attributes. Characters outside that range are either ignored or print the error character (¿), depending on show_unknown(bool). This is a very low level method.

No range checking is done on drow,dcol:
• drow must be in range 0..(display_rows()-1)
• dcol must be in range 0..(display_columns()-1)
• Does not trigger redraws
• Does NOT handle control codes, ANSI or XTERM escape sequences.

See also

show_unknown(bool), handle_unknown_char(), is_printable()
11.142.5.41 putchar() [2/2]

```cpp
void Fl_Terminal::putchar (
    const char * text,
    int len,
    int drow,
    int dcol)
```

Print UTF-8 character `text` of length `len` at display position `(drow,dcol)`. The character is displayed using the current text color/attributes. This is a very low level method. No range checking is done on drow,dcol:

- `drow` must be in range `0..(display_rows()-1)`
- `dcol` must be in range `0..(display_columns()-1)`
- Does not trigger redraws
- Does not handle ANSI or XTERM escape sequences
- Invalid UTF-8 chars show the error character (¿) depending on `show_unknown(bool)`.

See also

- `handle_unknown_char()`

11.142.5.42 redraw_rate()

```cpp
void Fl_Terminal::redraw_rate (float val)
```

Set the maximum rate redraw speed in floating point seconds if `redraw_style()` is set to RATE_LIMITED. When output is sent to the terminal, rather than calling `redraw()` right away, a timer is started with this value indicating how long to wait before calling `redraw()`, causing the output to be shown. 0.10 is recommended (1/10th of a second), to limit redraws to no more than 10 redraws per second.

The value that works best depends on how fast data arrives, and how fast the font system can draw text at runtime. Values too small cause too many redraws to occur, causing the terminal to get backlogged if large bursts of data arrive quickly. Values too large cause realtime output to be too “choppy”.

11.142.5.43 redraw_style() [1/2]

```cpp
void Fl_Terminal::redraw_style (RedrawStyle val)
```

Set how `Fl_Terminal` manages screen redrawing. This setting is relevant when `Fl_Terminal` is used for high bandwidth data; too many redraws will slow things down, too few cause redraws to be ‘choppy’ when realtime data comes in.

Redrawing can be cpu intensive, depending on how many rows/cols are being displayed; worst case: large display + small font. Speed largely depends on the end user's graphics hardware and font drawing system.

<table>
<thead>
<tr>
<th>RedrawStyle enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_REDRAW</td>
<td>App must call <code>redraw()</code> as needed to update text to screen</td>
</tr>
<tr>
<td>RATE_LIMITED</td>
<td>Rate limited, timer controlled redraws. (DEFAULT) See <code>redraw_rate()</code></td>
</tr>
<tr>
<td>PER_WRITE</td>
<td>Redraw triggered every call to <code>append() / printf()</code> / etc.</td>
</tr>
</tbody>
</table>

The default style is RATE_LIMITED, which is the easiest to use, and automates redrawing to be capped at 10 redraws per second max. See `redraw_rate(float)` to control this automated redraw speed.
11.142.5.44 redraw_style() [2/2]

Fl_Terminal::RedrawStyle Fl_Terminal::redraw_style (  
  void  ) const

Get the redraw style.
This determines when the terminal redraws itself while text is being added to it.
Value will be one of the Fl_Terminal::RedrawStyle enum values.
See also
  redraw_style(Fl_Terminal::RedrawStyle)

11.142.5.45 reset_terminal()

void Fl_Terminal::reset_terminal (  
  void  )

Resets terminal to default colors, clears screen, history and mouse selection, homes cursor, resets tabstops.
Same as "<ESC>c"

11.142.5.46 resize()

void Fl_Terminal::resize (  
  int X,  
  int Y,  
  int W,  
  int H  ) [virtual]

Handle widget resizing, such as if user resizes parent window.
This may increase the column width of the widget if the width of the widget is made larger than it was.

Note

  Resizing currently does not rewrap existing text. Currently enlarging makes room for longer lines, and shrinking
  the size lets long lines run off the right edge of the display, hidden from view. This behavior may change in the
  future to rewrap.

Reimplemented from Fl_Group.

11.142.5.47 scroll()

void Fl_Terminal::scroll (  
  int rows  ) [protected]

Scroll the display up(+) or down(-) the specified rows.

  • Negative value scrolls "down", clearing top line, and history unaffected.
  • Positive value scrolls "up", clearing bottom line, rotating top line into history.

11.142.5.48 scrollbar_size() [1/2]

void Fl_Terminal::scrollbar_size (  
  int val  )

Set the width of the scrollbar's trough to val, in pixels.
Only use this method if you need to override the global scrollbar size.
Setting val to the special value 0 causes the widget to track the global Fl::scrollbar_size().
See also
  Fl::scrollbar_size()
**scrollbar_size() [2/2]**

```cpp
int Fl_Terminal::scrollbar_size (void) const
```

Get the current size of the scrollbar's trough, in pixels.
If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also

Fl::scrollbar_size(int)

**selection_extend()**

```cpp
bool Fl_Terminal::selection_extend (int X, int Y) [protected]
```

Extend selection to FLTK coords X,Y.
Returns true if extended, false if nothing done (X,Y offscreen)

**selection_text()**

```cpp
const char * Fl_Terminal::selection_text (void) const [protected]
```

Return text selection (for copy()/paste() operations)

- Returns allocated NULL terminated string for entire selection.
- Caller must free() this memory when done.
- Unicode safe.

**selection_text_len()**

```cpp
int Fl_Terminal::selection_text_len (void) const [protected]
```

Return byte length of all UTF-8 chars in selection, or 0 if no selection.

NOTE: Length includes trailing white on each line.

**show_unknown() [1/2]**

```cpp
void Fl_Terminal::show_unknown (bool val)
```

Set the "show unknown" flag.
If true, unknown escape sequences and unprintable control characters will be shown with the error character "¿".
If false, those sequences and characters will be ignored.

See also

handle_unknown_char()

**show_unknown() [2/2]**

```cpp
bool Fl_Terminal::show_unknown (void) const
```

Return the "show unknown" flag.
See show_unknown(bool) for more info.
11.142.55  textattrib()

void Fl_Terminal::textattrib (uchar val)
Set text attribute bits (underline, inverse, etc).
This will be the default attribute used for all newly printed text.

See also
Fl_Terminal::Attrib

11.142.56  textbgcolor()

void Fl_Terminal::textbgcolor (Fl_Color val)
Set text background color to fltk color val used by any new text added.
Use this for temporary color changes, similar to <ESC>[48;2;<R>;<G>;<B>m
This setting does not affect the 'default' text colors used by <ESC>[0m, <ESC>c, reset_terminal(), etc. To set that too, also set textbgcolor_default(Fl_Color), e.g.

// Set both 'current' and 'default' colors
Fl_Color darkamber = 0x20100000;
tty->textbgcolor(darkamber); // set 'current' bg color
tty->textbgcolor_default(darkamber); // set 'default' bg color used by ESC[0m reset

The special color value 0xffffffff (all ff's) is the "see through" color, which lets the widget's own Fl_Group::color() show through behind the text. This special text background color is the default, and is what most situations need.

See also
textbgcolor_default(Fl_Color)

11.142.57  textbgcolor_default() [1/2]

void Fl_Terminal::textbgcolor_default (Fl_Color val)
Set the default text background color used by any new text added after a reset (<ESC>c, <ESC>[0m, or reset_terminal()).
Does not affect the 'current' text background color; use textbgcolor(Fl_Color) to set that.
The special color value 0xffffffff (all ff's) is the "see through" color, which lets the widget's own Fl_Group::color() show through behind the text. This special text background color is the default, and is what most situations need.

See also
textbgcolor(Fl_Color)

11.142.58  textbgcolor_default() [2/2]

Fl_Color Fl_Terminal::textbgcolor_default () const [inline]
Return text's default background color.

See also
textbgcolor()
11.142.5.59  textbgcolor_xterm()

void Fl_Terminal::textbgcolor_xterm (uchar val)

Sets the background text color as one of the 8 'xterm color' values.
This will be the foreground color used for all newly printed text, similar to the <ESC>[#m escape sequence, where # is between 40 and 47.
This color will be reset to the default bg color if reset_terminal() is called, or by <ESC>c, <ESC>[0m, etc. The xterm color intensity values can be influenced by the Dim/Bold/Normal modes (which can be set with e.g. <ESC>[1m, textattrib(), etc), so the actual RGB values of these colors allow room for Dim/Bold to influence their brightness. For instance, "Normal Red" is not full brightness to allow "Bold Red" to be brighter. This goes for all colors except 'Black', which is not influenced by Dim or Bold; Black is always Black.
The 8 color xterm values are:

- 0 = Black
- 1 = Red
- 2 = Green
- 3 = Yellow
- 4 = Blue
- 5 = Magenta
- 6 = Cyan
- 7 = White

See also
  textbgcolor_default(Fl_Color)

11.142.5.60  textcolor()

void Fl_Terminal::textcolor (Fl_Color val)

Set the text color for the terminal.
This is a convenience method that sets both textfgcolor() and textfgcolor_default(), ensuring both are set to the same value.

11.142.5.61  textfgcolor()

void Fl_Terminal::textfgcolor (Fl_Color val)

Set text foreground drawing color to fltk color val used by any new text added.
Use this for temporary color changes, similar to <ESC>[38:2;<R>;<G>;<B>m
This setting does not affect the 'default' text colors used by <ESC>[0m, <ESC>c, reset_terminal(), etc. To change both the current and default fg color, also use textfgcolor_default(Fl_Color). Example:

// Set both 'current' and 'default' colors
Fl_Color amber = 0xd0704000;
tty->textfgcolor(amber); // set 'current' fg color
tty->textfgcolor_default(amber); // set 'default' fg color used by ESC[0m reset

See also
  textfgcolor_default(Fl_Color)
11.142.5.62  textfgcolor_default() [1/2]
void Fl_Terminal::textfgcolor_default (  
   Fl_Color  val  )  
Set the default text foreground color used by <ESC>c, <ESC>[0m, and reset_terminal().  
Does not affect the 'current' text foreground color; use textfgcolor(Fl_Color) to set that.  
See also  
   textfgcolor(Fl_Color)

11.142.5.63  textfgcolor_default() [2/2]
Fl_Color Fl_Terminal::textfgcolor_default (  
   void  )  const  [inline]  
Return text's default foreground color.  
See also  
   textfgcolor()

11.142.5.64  textfgcolor_xterm()  
void Fl_Terminal::textfgcolor_xterm (  
   uchar  val  )  
Sets the foreground text color as one of the 8 'xterm color' values.  
This will be the foreground color used for all newly printed text, similar to the <ESC>[#m escape sequence, where  
# is between 30 and 37.  
This color will be reset to the default fg color if reset_terminal() is called, or by <ESC>c, <ESC>[0m, etc.  
The xterm color intensity values can be influenced by the Dim/Bold/Normal modes (which can be set with e.g.  
<ESC>[1m, textattrib(), etc), so the actual RGB values of these colors allow room for Dim/Bold to influence their  
brightness. For instance, "Normal Red" is not full brightness to allow "Bold Red" to be brighter. This goes for all  
colors except 'Black', which is not influenced by Dim or Bold; Black is always Black.  
The 8 color xterm values are:  
• 0 = Black  
• 1 = Red  
• 2 = Green  
• 3 = Yellow  
• 4 = Blue  
• 5 = Magenta  
• 6 = Cyan  
• 7 = White  
See also  
   textfgcolor_default(Fl_Color)

11.142.5.65  textfont()  
void Fl_Terminal::textfont (  
   Fl_Font  val  )  
Sets the font used for all text displayed in the terminal.  
This affects all existing text (in display and history) as well as any newly printed text.  
Only monospace fonts are recommended, such as FL_COURIER or FL_SCREEN. Custom fonts configured with  
FL::set_font() will also work, as long as they are monospace.
11.142.5.66  \texttt{textsize()}

\begin{verbatim}
void Fl_Terminal::textsize (
    Fl_Fontsize val )
\end{verbatim}

Sets the font size used for all text displayed in the terminal.
This affects all existing text (in display and history) as well as any newly printed text.
Changing this will affect the \texttt{display_rows()} and \texttt{display_columns()}.

11.142.5.67  \texttt{u8c\_disp\_row()}

\begin{verbatim}
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_disp_row ( 
    int drow ) [protected]
\end{verbatim}

Return pointer to the first u8c character in row \texttt{drow} of the display.

- ‘drow’ is indexed relative to the beginning of the display buffer.
- This can be used to walk all columns in the specified row, e.g.

\begin{verbatim}
// Print all chars in first row of display (ASCII and UTF-8)
Utf8Char *u8c = u8c_disp_row(0); // first char of first display row
int econl = 0, ecol = disp_cols(); // start/end for column loop
for (int col=ecol; col<ecol; col++,u8c++) { // loop from first char to last
    char *text = u8c->text_utf8(); // text string for char
    int len = u8c->length(); // text string length for char
    ::printf("<%.*s>", len, text); // print potentially multibyte char
}
\end{verbatim}

11.142.5.68  \texttt{u8c\_hist\_row()}

\begin{verbatim}
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_hist_row ( 
    int hrow ) [protected]
\end{verbatim}

Return u8c for beginning of a row inside the scrollback history.
‘hrow’ is indexed relative to the beginning of the scrollback history buffer.

See also
\texttt{u8c\_disp\_row(int)} for example use.

11.142.5.69  \texttt{u8c\_hist\_use\_row()}

\begin{verbatim}
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_hist_use_row ( 
    int hurow ) [protected]
\end{verbatim}

Return u8c for beginning of row \texttt{hurow} inside the ‘in use’ part of the scrollback history.
‘hurow’ is indexed relative to the beginning of the ‘in use’ part of the scrollback history buffer. This may be a different
from \texttt{u8c\_hist\_row(int)} if the history was recently cleared, and there aren't many (or any) rows in the history buffer
that have been populated with scrollback text yet.

See also
\texttt{u8c\_disp\_row(int)} for example use.

11.142.5.70  \texttt{u8c\_ring\_row()}

\begin{verbatim}
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_ring_row ( 
    int grow ) [protected]
\end{verbatim}

Return UTF-8 char for row \texttt{grow} in the ring buffer.
\texttt{grow} is globally indexed relative to the beginning of the ring buffer, so this method can access ANY character in
the entire ring buffer (hist or disp) by the global index.
Scrolling offset is NOT applied; this is raw access to the ring’s rows.
Should really ONLY be used for making a complete copy of the ring.

Example:
\begin{verbatim}
// Walk ALL rows and cols in the ring buffer...
for (int row=0; row<ring.rows(); row++) { 
    Utf8Char *u8c = ring.u8c_ring_row(row);
    for (int col=0; col<ring.cols(); col++,u8c++) { 
        ..make use of u8c->xxx() methods..
    }
}
\end{verbatim}
11.142.5.71  vprintf()

void Fl_Terminal::vprintf (  
    const char * fmt,  
    va_list ap  )  

Appends printf formatted messages to the terminal.  
Subclasses can use this to implement their own printf() functionality.  
The string can contain UTF-8, crlf's, and ANSI sequences are also supported when ansi(bool) is set to 'true'.  

Note  
The expanded string is currently limited to 1024 characters (including NULL). For longer strings use append() which has no string limits.

Parameters

<table>
<thead>
<tr>
<th>fmt</th>
<th>is a printf format string for the message text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>is a va_list created by va_start() and closed with va_end(), which the caller is responsible for handling.</td>
</tr>
</tbody>
</table>

11.142.5.72  w_to_col()

int Fl_Terminal::w_to_col (  
    int W  ) const [protected]  

Given a width in pixels, return number of columns that "fits" into that area.  
This is used by the constructor to size the row/cols to fit the widget size.

11.142.5.73  walk_selection()

const Fl_Terminal::Utf8Char * Fl_Terminal::walk_selection (  
    const Utf8Char * u8c,  
    int & row,  
    int & col ) const [protected]  

Walk the mouse selection one character at a time from beginning to end, returning a Utf8Char* to the next character in the selection, or NULL if the end was reached, or if there's no selection.  
This is easier to use for walking the selection than get_selection().  
u8c should start out as NULL, rewinding to the beginning of the selection. If the returned Utf8Char* is not NULL, row and col return the character's row/column position in the ring buffer.

// EXAMPLE: Walk the entire mouse selection, if any  
int row,col;  // the returned row/col for each char  
Utf8Char *u8c = NULL;  // start with NULL to begin walk  
while ((u8c = walk_selection(u8c, row, col))) { // loop until end char reached  
    ..do something with *u8c..  
}  

See also  
get_selection(), is_selection()  

Parameters

<table>
<thead>
<tr>
<th>u8c</th>
<th>NULL on first iter</th>
</tr>
</thead>
<tbody>
<tr>
<td>row</td>
<td>returned row#</td>
</tr>
<tr>
<td>col</td>
<td>returned col#</td>
</tr>
</tbody>
</table>

Generated by Doxygen

11.143  Fl_Text_Buffer Class Reference

This class manages Unicode text displayed in one or more Fl_Text_Display widgets.
#include <Fl_Text_Buffer.H>

Public Member Functions

• void add_modify_callback (Fl_Text_Modify_Cb bufModifiedCB, void *cbArg)
  Adds a callback function that is called whenever the text buffer is modified.

• void add_predelete_callback (Fl_Text_Predelete_Cb bufPredelCB, void *cbArg)
  Adds a callback routine to be called before text is deleted from the buffer.

• char * address (int pos)
  Convert a byte offset in buffer into a memory address.

• const char * address (int pos) const
  Convert a byte offset in buffer into a memory address.

• void append (const char * t, int addedLength=-1)
  Appends the text string to the end of the buffer.

• int appendfile (const char * file, int buflen=128 * 1024)
  Appends the named file to the end of the buffer.

• char byte_at (int pos) const
  Returns the raw byte at the specified position pos in the buffer.

• void call_modify_callbacks ()
  Calls all modify callbacks that have been registered using the add_modify_callback() method.

• void call_predelete_callbacks ()
  Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.

• bool can_redo () const
  Check if undo is enabled and if the last undo action can be redone.

• bool can_undo () const
  Check if undo is enabled and if the last action can be undone.

• void canUndo (char flag=1)
  Enable or disable undo actions for this text buffer.

• unsigned int char_at (int pos) const
  Returns the character at the specified position pos in the buffer.

• void copy (Fl_Text_Buffer * fromBuf, int fromStart, int fromEnd, int toPos)
  Copies text from another Fl_Text_Buffer to this one.

• int count_displayed_characters (int lineStartPos, int targetPos) const
  Count the number of displayed characters between buffer position lineStartPos and targetPos.

• int count_lines (int startPos, int endPos) const
  Counts the number of newlines between startPos and endPos in buffer.

• int findchar_backward (int startPos, unsigned int searchChar, int *foundPos) const
  Search backwards in buffer buf for character searchChar, starting with the character before startPos, returning the result in foundPos.

• int findchar_forward (int startPos, unsigned searchChar, int *foundPos) const
  Finds the next occurrence of the specified character.

• Fl_Text_Buffer (int requestedSize=0, int preferredGapSize=1024)
  Create an empty text buffer of a pre-determined size.

• int highlight ()
  Returns a non-zero value if text has been highlighted, 0 otherwise.

• void highlight (int start, int end)
  Highlights the specified text within the buffer.

• int highlight_position (int *start, int *end)
11.143 Fl_Text_Buffer Class Reference

Highlights the specified text between start and end within the buffer.

- const Fl_Text_Selection * highlight_selection() const
  Returns the current highlight selection.
- char * highlight_text()
  Returns the highlighted text.
- void insert(int pos, const char *text, int insertedLength=-1)
  Inserts null-terminated string text at position pos.
- int insertfile(const char *file, int pos, int buflen=128 * 1024)
  Inserts a file at the specified position.
- bool is_word_separator(int pos) const
  Returns whether character at position pos is a word separator.
- int length() const
  Returns the number of bytes in the buffer.
- int line_end(int pos) const
  Finds and returns the position of the end of the line containing position pos (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).
- int line_start(int pos) const
  Returns the position of the start of the line containing position pos.
- char * line_text(int pos) const
  Returns the text from the entire line containing the specified character position.
- int loadfile(const char *file, int buflen=128 * 1024)
  Loads a text file into the buffer.
- int next_char(int ix) const
  Returns the index of the next character.
- int next_char_clipped(int ix) const
- int outputfile(const char *file, int start, int end, int buflen=128 * 1024)
  Writes the specified portions of the text buffer to a file.
- int prev_char(int ix) const
  Returns the index of the previous character.
- int prev_char_clipped(int ix) const
- Fl_Text_Selection * primary_selection()
  Returns the primary selection.
- const Fl_Text_Selection * primary_selection() const
- void printf(const char *fmt,...)
  Appends printf formatted messages to the end of the buffer.
- int redo(int *cp=0)
  Redo previous undo action.
- void remove(int start, int end)
  Deletes a range of characters in the buffer.
- void remove_modify_callback(Fl_Text_Modify_Cb bufModifiedCB, void *cbArg)
  Removes a modify callback.
- void remove_predelete_callback(Fl_Text_Predelete_Cb predelCB, void *cbArg)
  Removes a callback routine bufPreDeleteCB associated with argument cbArg to be called before text is deleted from the buffer.
- void remove_secondary_selection()
  Removes the text from the buffer corresponding to the secondary text selection object.
- void remove_selection()
  Removes the text in the primary selection.
- void replace(int start, int end, const char *text, int insertedLength=-1)
Deletes the characters between start and end, and inserts the null-terminated string text in their place in the buffer.

- **void replace_secondary_selection (const char *text)**
  Replaces the text from the buffer corresponding to the secondary text selection object with the new string text.

- **void replace_selection (const char *text)**
  Replaces the text in the primary selection.

- **int rewind_lines (int startPos, int nLines)**
  Finds and returns the position of the first character of the line nLines backwards from startPos (not counting the character pointed to by startPos if that is a newline) in the buffer.

- **int savefile (const char *file, int buflen=128 * 1024)**
  Saves a text file from the current buffer.

- **int search_backward (int startPos, const char *searchString, int *foundPos, int matchCase=0) const**
  Search backwards in buffer for string searchString, starting with the character at startPos, returning the result in foundPos.

- **int search_forward (int startPos, const char *searchString, int *foundPos, int matchCase=0) const**
  Search forwards in buffer for string searchString, starting with the character startPos, and returning the result in foundPos.

- **void secondary_select (int start, int end)**
  Selects a range of characters in the secondary selection.

- **int secondary_selected ()**
  Returns a non-zero value if text has been selected in the secondary text selection, 0 otherwise.

- **const Fl_Text_Selection * secondary_selection () const**
  Returns the secondary selection.

- **int secondary_selection_position (int *start, int *end)**
  Returns the current selection in the secondary text selection object.

- **char * secondary_selection_text ()**
  Returns the text in the secondary selection.

- **void secondary_unselect ()**
  Clears any selection in the secondary text selection object.

- **void select (int start, int end)**
  Selects a range of characters in the buffer.

- **int selected () const**
  Returns a non-zero value if text has been selected, 0 otherwise.

- **int selection_position (int *start, int *end)**
  Gets the selection position.

- **char * selection_text ()**
  Returns the currently selected text.

- **int skip_displayed_characters (int lineStartPos, int nChars)**
  Count forward from buffer position lineStartPos in displayed characters.

- **int skip_lines (int startPos, int nLines)**
  Finds the first character of the line nLines forward from startPos in the buffer and returns its position.

- **int tab_distance () const**
  Gets the tab width.

- **void tab_distance (int tabDist)**
  Set the hardware tab distance (width) used by all displays for this buffer, and used in computing offsets for rectangular selection operations.

- **char * text () const**
  Get a copy of the entire contents of the text buffer.

- **void text (const char *text)**
  Replaces the entire contents of the text buffer.

- **char * text_range (int start, int end) const**
  Get a copy of a part of the text buffer.
• int undo (int *cp=0)
  Undo text modification according to the undo variables or insert text from the undo buffer.

• void unhighlight ()
  Unhighlights text in the buffer.

• void unselect ()
  Cancels any previous selection on the primary text selection object.

• int utf8_align (int) const
  Align an index into the buffer to the current or previous UTF-8 boundary.

• void vprintf (const char *fmt, va_list ap)
  Can be used by subclasses that need their own printf() style functionality.

• int word_end (int pos) const
  Returns the position corresponding to the end of the word.

• int word_start (int pos) const
  Returns the position corresponding to the start of the word.

• ~Fl_Text_Buffer ()
  Frees a text buffer.

Public Attributes

• int input_file_was_transcoded
  true if the loaded file has been transcoded to UTF-8.

• void(* transcoding_warning_action)(Fl_Text_Buffer *)
  Pointer to a function called after reading a non UTF-8 encoded file.

Static Public Attributes

• static const char * file_encoding_warning_message
  This message may be displayed using the fl_alert() function when a file which was not UTF-8 encoded is input.

Protected Member Functions

• int apply_undo (Fl_Text_Undo_Action *action, int *cursorPos)
  Apply the current undo/redo operation, called from undo() or redo().

• void call_modify_callbacks (int pos, int nDeleted, int nInserted, int nRestyled, const char *deletedText) const
  Calls the stored modify callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.

• void call_predelete_callbacks (int pos, int nDeleted) const
  Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.

• int insert_ (int pos, const char *text, int insertedLength=-1)
  Internal (non-redisplaying) version of insert().

• void move_gap (int pos)
  Move the gap to start at a new position.

• void reallocate_with_gap (int newGapStart, int newGapLen)
  Reallocates the text storage in the buffer to have a gap starting at newGapStart and a gap size of newGapLen, preserving the buffer's current contents.

• void redisplay_selection (Fl_Text_Selection *oldSelection, Fl_Text_Selection *newSelection) const
  Calls the stored redisplay procedure(s) for this buffer to update the screen for a change in a selection.

• void remove_ (int start, int end)
  Internal (non-redisplaying) version of remove().

• void remove_selection_ (Fl_Text_Selection *sel)
  Removes the text from the buffer corresponding to sel.
void replace_selection_(Fl_Text_Selection *sel, const char *text)

Replaces the text in selection sel.

char * selection_text_(Fl_Text_Selection *sel) const

void update_selections (int pos, int nDeleted, int nInserted)

Updates all of the selections in the buffer for changes in the buffer's text.

Protected Attributes

char * mBuf

allocated memory where the text is stored

char mCanUndo

if this buffer is used for attributes, it must not do any undo calls

void ** mCbArgs

caller arguments for modifyProcs above

int mCursorPosHint

hint for reasonable cursor position after a buffer modification operation

int mGapEnd

points to the first character after the gap

int mGapStart

points to the first character of the gap

Fl_Text_Selection mHighlight

highlighted areas

int mLength

length of the text in the buffer (the length of the buffer itself must be calculated: gapEnd - gapStart + length)

Fl_Text_Modify_Cb * mModifyProcs

procedures to call when buffer is modified to redisplay contents

int mNModifyProcs

number of modify-redisplay procs attached

int mPredeleteProcs

number of pre-delete procs attached

void ** mPredeleteCbArgs

caller argument for pre-delete proc above

Fl_Text_Predelete_Cb * mPredeleteProcs

procedure to call before text is deleted from the buffer; at most one is supported.

int mPreferredGapSize

the default allocation for the text gap is 1024 bytes and should only be increased if frequent and large changes in buffer size are expected

Fl_Text_Selection mPrimary

highlighted areas

Fl_Text_Undo_Action_List * mRedoList

List of redo event.

Fl_Text_Selection mSecondary

highlighted areas

int mTabDist

equiv.

Fl_Text_Undo_Action * mUndo

local undo event

Fl_Text_Undo_Action_List * mUndoList

List of undo event.
### Detailed Description

This class manages Unicode text displayed in one or more Fl_Text_Display widgets. All text in Fl_Text_Buffer must be encoded in UTF-8. All indices used in the function calls must be aligned to the start of a UTF-8 sequence. All indices and pointers returned will be aligned. All functions that return a single character will return that in an unsigned int in UCS-4 encoding.

The Fl_Text_Buffer class is used by the Fl_Text_Display and Fl_Text_Editor to manage complex text data and is based upon the excellent NEdit text editor engine - see [https://sourceforge.net/projects/nedit/](https://sourceforge.net/projects/nedit/).

### Constructor & Destructor Documentation

#### Fl_Text_Buffer()

```cpp
Fl_Text_Buffer::Fl_Text_Buffer ( int requestedSize = 0,
                                int preferredGapSize = 1024 )
```

Create an empty text buffer of a pre-determined size.

#### Parameters

<table>
<thead>
<tr>
<th>requestedSize</th>
<th>use this to avoid unnecessary re-allocation if you know exactly how much the buffer will need to hold</th>
</tr>
</thead>
<tbody>
<tr>
<td>preferredGapSize</td>
<td>Initial size for the buffer gap (empty space in the buffer where text might be inserted if the user is typing sequential characters)</td>
</tr>
</tbody>
</table>

### Member Function Documentation

#### add_modify_callback()

```cpp
void Fl_Text_Buffer::add_modify_callback ( Fl_Text_Modify_Cb bufModifiedCB,
                                          void * cbArg )
```

Adds a callback function that is called whenever the text buffer is modified.

The callback function is declared as follows:

```cpp
typedef void (*Fl_Text_Modify_Cb)(int pos, int nInserted, int nDeleted,
                                  int nRestyled, const char* deletedText,
                                  void* cbArg);
```

#### address() [1/2]

```cpp
char * Fl_Text_Buffer::address ( int pos ) [inline]
```

Convert a byte offset in buffer into a memory address.

#### Parameters

| pos | byte offset into buffer |

#### Returns

byte offset converted to a memory address

#### address() [2/2]

```cpp
const char * Fl_Text_Buffer::address ( int pos ) const [inline]
```

Convert a byte offset in buffer into a memory address.
Parameters

| pos | byte offset into buffer |

Returns

byte offset converted to a memory address

11.143.3.4 append()

void Fl_Text_Buffer::append (  
    const char * t,  
    int addedLength = -1 ) [inline]

Appends the text string to the end of the buffer.

Parameters

| t | UTF-8 encoded text |
| addedLength | number of bytes to append, or -1 to indicate t is null-terminated |

11.143.3.5 appendfile()

int Fl_Text_Buffer::appendfile (  
    const char * file,  
    int buflen = 128*1024 ) [inline]

Appends the named file to the end of the buffer.
See also insertfile().

11.143.3.6 byte_at()

char Fl_Text_Buffer::byte_at (  
    int pos ) const

Returns the raw byte at the specified position pos in the buffer.
Positions start at 0.

Parameters

| pos | byte offset into buffer |

Returns

unencoded raw byte

11.143.3.7 can_redo()

bool Fl_Text_Buffer::can_redo ( ) const

Check if undo is enabled and if the last undo action can be redone.
Check if undo is enabled and if the last undo action can be redone.
See also
canUndo()

11.143.3.8 can_undo()

bool Fl_Text_Buffer::can_undo ( ) const

Check if undo is enabled and if the last action can be undone.
See also
canUndo()

11.143.9 canUndo()

void Fl_Text_Buffer::canUndo {
    char flag = 1
}
Enable or disable undo actions for this text buffer.
Undo actions are enable for text buffer by default. If used as a style buffer in Fl_Text_Display, undo actions are
disabled as they are handled by the text buffer.
See also
    can_undo()

11.143.10 char_at()

unsigned int Fl_Text_Buffer::char_at (  
    int pos ) const
Returns the character at the specified position pos in the buffer.
Positions start at 0.
Parameters

| pos  | byte offset into buffer, pos must be at a UTF-8 character boundary |

Returns
    Unicode UCS-4 encoded character

11.143.11 copy()

void Fl_Text_Buffer::copy (  
    Fl_Text_Buffer * fromBuf,
    int fromStart,
    int fromEnd,
    int toPos )
Copies text from another Fl_Text_Buffer to this one.
Parameters

| fromBuf | source text buffer, may be the same as this |
| fromStart | byte offset into buffer |
| fromEnd | byte offset into buffer |
| toPos | destination byte offset into buffer |

11.143.12 count_displayed_characters()

int Fl_Text_Buffer::count_displayed_characters (  
    int lineStartPos,
    int targetPos ) const
Count the number of displayed characters between buffer position lineStartPos and targetPos.
Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and
control characters are expanded.
11.143.3.13 count_lines()

```cpp
int Fl_Text_Buffer::count_lines ( 
    int startPos,
    int endPos ) const
```

Counts the number of newlines between `startPos` and `endPos` in buffer. The character at position `endPos` is not counted.

11.143.3.14 findchar_backward()

```cpp
int Fl_Text_Buffer::findchar_backward ( 
    int startPos,
    unsigned int searchChar,
    int * foundPos ) const
```

Search backwards in buffer `buf` for character `searchChar`, starting with the character before `startPos`, returning the result in `foundPos`. Returns 1 if found, 0 if not. The difference between this and `search_backward()` is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: newline.

### Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>byte offset to start position</th>
</tr>
</thead>
<tbody>
<tr>
<td>searchChar</td>
<td>UCS-4 character that we want to find</td>
</tr>
<tr>
<td>foundPos</td>
<td>byte offset where the character was found</td>
</tr>
</tbody>
</table>

### Returns

1 if found, 0 if not

11.143.3.15 findchar_forward()

```cpp
int Fl_Text_Buffer::findchar_forward ( 
    int startPos,
    unsigned searchChar,
    int * foundPos ) const
```

Finds the next occurrence of the specified character. Search forwards in buffer for character `searchChar`, starting with the character `startPos`, and returning the result in `foundPos`. Returns 1 if found, 0 if not. The difference between this and `search_forward()` is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: newline.

### Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>byte offset to start position</th>
</tr>
</thead>
<tbody>
<tr>
<td>searchChar</td>
<td>UCS-4 character that we want to find</td>
</tr>
<tr>
<td>foundPos</td>
<td>byte offset where the character was found</td>
</tr>
</tbody>
</table>

### Returns

1 if found, 0 if not

11.143.3.16 highlight_text()

```cpp
char * Fl_Text_Buffer::highlight_text ( )
```

Returns the highlighted text.

When you are done with the text, free it using the `free()` function.
11.143.3.17  insert()

void Fl_Text_Buffer::insert (  
    int pos,  
    const char * text,  
    int insertedLength = -1 )

Inserts null-terminated string text at position pos.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>insertion position as byte offset (must be UTF-8 character aligned)</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>UTF-8 encoded text</td>
</tr>
<tr>
<td>insertedLength</td>
<td>number of bytes to insert, or -1 to indicate text is null-terminated</td>
</tr>
</tbody>
</table>

11.143.3.18  insert_()

int Fl_Text_Buffer::insert_ (  
    int pos,  
    const char * text,  
    int insertedLength = -1 ) [protected]

Internal (non-redisplaying) version of insert().

Returns the length of text inserted (this is just strlen(text) if insertedLength == -1, however this calculation can be expensive and the length will be required by any caller who will continue on to call redisplay). pos must be contiguous with the existing text in the buffer (i.e. not past the end).

Returns

the number of bytes inserted

11.143.3.19  insertfile()

int Fl_Text_Buffer::insertfile (  
    const char * file,  
    int pos,  
    int buflen = 128*1024 )

Inserts a file at the specified position.

Returns

- 0 on success
- non-zero on error (strerror() contains reason)
- 1 indicates open for read failed (no data loaded)
- 2 indicates error occurred while reading data (data was partially loaded)

File can be UTF-8 or CP1252 encoded. If the input file is not UTF-8 encoded, the Fl_Text_Buffer widget will contain data transcoded to UTF-8. By default, the message Fl_Text_Buffer::file_encoding_warning_message will warn the user about this.

See also

input_file_was_transcoded and transcoding_warning_action.

11.143.3.20  is_word_separator()

bool Fl_Text_Buffer::is_word_separator (  
    int pos ) const

Returns whether character at position pos is a word separator.

Pos must be at a character boundary.
**11.143.3.21 length()**

```cpp
int Fl_Text_Buffer::length ( ) const [inline]
```

Returns the number of bytes in the buffer.

Returns

size of text in bytes

**11.143.3.22 line_end()**

```cpp
int Fl_Text_Buffer::line_end ( int pos ) const
```

Finds and returns the position of the end of the line containing position `pos` (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>byte index into buffer</th>
</tr>
</thead>
</table>

Returns

byte offset to line end

**11.143.3.23 line_start()**

```cpp
int Fl_Text_Buffer::line_start ( int pos ) const
```

Returns the position of the start of the line containing position `pos`.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>byte index into buffer</th>
</tr>
</thead>
</table>

Returns

byte offset to line start

**11.143.3.24 line_text()**

```cpp
char * Fl_Text_Buffer::line_text ( int pos ) const
```

Returns the text from the entire line containing the specified character position. When you are done with the text, free it using the `free()` function.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>byte index into buffer</th>
</tr>
</thead>
</table>

Returns

copy of UTF-8 text, must be free'd

**11.143.3.25 loadfile()**

```cpp
int Fl_Text_Buffer::loadfile ( )
```
const char * file,
        int buflen = 128*1024 ) [inline]
Loads a text file into the buffer.
See also insertfile().

11.143.3.26 next_char()

int Fl_Text_Buffer::next_char (  
    int ix ) const
Returns the index of the next character.
Parameters

ix | index to the current character

11.143.3.27 outputfile()

int Fl_Text_Buffer::outputfile (  
    const char * file,
    int start,
    int end,
    int buflen = 128*1024 )
Writes the specified portions of the text buffer to a file.
Returns

• 0 on success
• non-zero on error (strerror() contains reason)
• 1 indicates open for write failed (no data saved)
• 2 indicates error occurred while writing data (data was partially saved)

See also

savefile(const char *file, int buflen)

11.143.3.28 prev_char()

int Fl_Text_Buffer::prev_char (  
    int ix ) const
Returns the index of the previous character.
Parameters

ix | index to the current character

11.143.3.29 printf()

void Fl_Text_Buffer::printf (  
    const char * fmt,
    ... )
Appends printf formatted messages to the end of the buffer.
Example:
#include <FL/Fl_Text_Display.H>
int main(..) {  
    // Create a text display widget and assign it a text buffer
    Fl_Text_Display *tdsp = new Fl_Text_Display[..];
}
Fl_Text_Buffer *tbuf = new Fl_Text_Buffer();
tdsp->buffer(tbuf);

// Append three lines of formatted text to the buffer
    tbuf->printf("The current date is: %s.\nThe time is: %s\n", date_str, time_str);
    tbuf->printf("The current PID is %ld.\n", (long)getpid());

Note
The expanded string is currently limited to 1024 characters.

Parameters

| in  | fmt | is a printf format string for the message text. |

11.143.3.30 remove()

void Fl_Text_Buffer::remove (    
    int start,               
    int end )

Deletes a range of characters in the buffer.

Parameters

| start | byte offset to first character to be removed |
| end   | byte offset to character after last character to be removed |

11.143.3.31 remove()

void Fl_Text_Buffer::remove_ (    
    int start,               
    int end ) [protected]

Internal (non-redisplaying) version of remove().
Removes the contents of the buffer between start and end (and moves the gap to the site of the delete).

11.143.3.32 replace()

void Fl_Text_Buffer::replace (    
    int start,               
    int end,                
    const char *text,       
    int insertedLength = -1 )

Deletes the characters between start and end, and inserts the null-terminated string text in their place in the buffer.

Parameters

| start | byte offset to first character to be removed and new insert position |
| end   | byte offset to character after last character to be removed |
| text  | UTF-8 encoded text |
| insertedLength | number of bytes to insert, or -1 to indicate text is null-terminated |

11.143.3.33 rewind_lines()

int Fl_Text_Buffer::rewind_lines (    
    int startPos,

int nLines)
Finds and returns the position of the first character of the line nLines backwards from startPos (not counting the character pointed to by startPos if that is a newline) in the buffer. nLines == 0 means find the beginning of the line.

11.143.3.34 savefile()

int Fl_Text_Buffer::savefile {
    const char * file,
    int buflen = 128*1024 } [inline]
Saves a text file from the current buffer.
Returns
• 0 on success
• non-zero on error (strerror() contains reason)
• 1 indicates open for write failed (no data saved)
• 2 indicates error occurred while writing data (data was partially saved)

See also
    outputfile(const char *file, int start, int end, int buflen)

11.143.3.35 search_backward()

int Fl_Text_Buffer::search_backward (  
    int startPos,
    const char * searchString,
    int * foundPos,
    int matchCase = 0 ) const
Search backwards in buffer for string searchString, starting with the character at startPos, returning the result in foundPos.
Returns 1 if found, 0 if not.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startPos</td>
<td>byte offset to start position</td>
</tr>
<tr>
<td>searchString</td>
<td>UTF-8 string that we want to find</td>
</tr>
<tr>
<td>foundPos</td>
<td>byte offset where the string was found</td>
</tr>
<tr>
<td>matchCase</td>
<td>if set, match character case</td>
</tr>
</tbody>
</table>

Returns
1 if found, 0 if not

11.143.3.36 search_forward()

int Fl_Text_Buffer::search_forward {  
    int startPos,
    const char * searchString,
    int * foundPos,
    int matchCase = 0 ) const
Search forwards in buffer for string searchString, starting with the character startPos, and returning the result in foundPos.
Returns 1 if found, 0 if not.
Parameters

| startPos | byte offset to start position |
| searchString | UTF-8 string that we want to find |
| foundPos | byte offset where the string was found |
| matchCase | if set, match character case |

Returns

1 if found, 0 if not

11.143.3.37 secondary_selection_text()  
char * Fl_Text_Buffer::secondary_selection_text ( )  
Returns the text in the secondary selection.  
When you are done with the text, free it using the free() function.

11.143.3.38 selection_text()  
char * Fl_Text_Buffer::selection_text ( )  
Returns the currently selected text.  
When you are done with the text, free it using the free() function.

11.143.3.39 skip_displayed_characters()  
int Fl_Text_Buffer::skip_displayed_characters (  
    int lineStartPos,  
    int nChars )  
Count forward from buffer position startPos in displayed characters.  
Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and control characters are expanded.

Parameters

| lineStartPos | byte offset into buffer |
| nChars | number of bytes that are sent to the display |

Returns

byte offset in input after all output bytes are sent

11.143.3.40 tab_distance()  
int Fl_Text_Buffer::tab_distance ( ) const [inline]  
Gets the tab width.  
The tab width is measured in characters. The pixel position is calculated using an average character width.

11.143.3.41 text()[1/2]  
char * Fl_Text_Buffer::text ( ) const  
Get a copy of the entire contents of the text buffer.  
Memory is allocated to contain the returned string, which the caller must free.

Returns

newly allocated text buffer - must be free'd, text is UTF-8
11.143.3.42  text() [2/2]

void Fl_Text_Buffer::text (  
    const char * text )

Replaces the entire contents of the text buffer.

Parameters

| text          | Text must be valid UTF-8. If null, an empty string is substituted. |

11.143.3.43  text_range()

char * Fl_Text_Buffer::text_range (  
    int start,  
    int end ) const

Get a copy of a part of the text buffer.
Return a copy of the text between start and end character positions from text buffer buf. Positions start at 0, and the range does not include the character pointed to by end. When you are done with the text, free it using the free() function.

Parameters

| start | byte offset to first character |
| end   | byte offset after last character in range |

Returns

newly allocated text buffer - must be free’d, text is UTF-8

11.143.3.44  undo()

int Fl_Text_Buffer::undo (  
    int * cursorPos = 0 )

Undo text modification according to the undo variables or insert text from the undo buffer.
Take the previous changes and undo them.
Return the previous cursor position in cursorPos. Returns 1 if the undo was applied. CursorPos will be at a character boundary.

11.143.3.45  vprintf()

void Fl_Text_Buffer::vprintf (  
    const char * fmt,  
    va_list ap )

Can be used by subclasses that need their own printf() style functionality.

Note

The expanded string is currently limited to 1024 characters.

Parameters

| in  | fmt | is a printf format string for the message text. |
| in  | ap  | is a va_list created by va_start() and closed with va_end(), which the caller is responsible for handling. |
11.143.3.46  word_end()

int Fl_Text_Buffer::word_end (int pos) const
Returns the position corresponding to the end of the word.

Parameters

| pos | byte index into buffer |

Returns

byte offset to word end

11.143.3.47  word_start()

int Fl_Text_Buffer::word_start (int pos) const
Returns the position corresponding to the start of the word.

Parameters

| pos | byte index into buffer |

Returns

byte offset to word start

11.143.4  Member Data Documentation

11.143.4.1  file_encoding_warning_message

const char * Fl_Text_Buffer::file_encoding_warning_message [static]
Initial value:
"Displayed text contains the UTF-8 transcoding\n"of the input file which was not UTF-8 encoded.\n"Some changes may have occurred."
This message may be displayed using the fl_alert() function when a file which was not UTF-8 encoded is input.

11.143.4.2  mTabDist

int Fl_Text_Buffer::mTabDist [protected]
equiv.
number of characters in a tab

11.143.4.3  transcoding_warning_action

void(* Fl_Text_Buffer::transcoding_warning_action) (Fl_Text_Buffer *)
Pointer to a function called after reading a non UTF-8 encoded file.
This function is called after reading a file if the file content was transcoded to UTF-8. Its default implementation calls
fl_alert() with the text of file_encoding_warning_message. No warning message is displayed if this pointer is set to
NULL. Use input_file_was_transcoded to be informed if file input required transcoding to UTF-8.

The documentation for this class was generated from the following files:

- Fl_Text_Buffer.H
- Fl_Text_Buffer.cxx
11.144 FL_Text_Display Class Reference

Rich text display widget.
#include <FL_Text_Display.H>

Inheritance diagram for FL_Text_Display:

```
struct Style_Table_Entry

This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.
```

Classes

- struct Style_Table_Entry

```
Public Types

- enum { NORMAL_CURSOR, CARET_CURSOR, DIM_CURSOR, BLOCK_CURSOR, HEAVY_CURSOR, SIMPLE_CURSOR }:
  text display cursor shapes enumeration
- enum { CURSOR_POS, CHARACTER_POS }:
  the character position is the left edge of a character, whereas the cursor is thought to be between the centers of two consecutive characters.
- enum { DRAG_NONE = -2, DRAG_START_DND = -1, DRAG_CHAR = 0, DRAG_WORD = 1, DRAG_LINE = 2 }:
  drag types - they match Fl::event_clicks() so that single clicking to start a collection selects by character, double clicking selects by word and triple clicking selects by line.
- enum { WRAP_NONE, WRAP_AT_COLUMN, WRAP_AT_PIXEL, WRAP_AT_BOUNDS }:
  wrap types - used in wrap_mode()
- enum {
  ATTR_BGCOLOR = 0x0001, ATTR_BGCOLOR_EXT_ = 0x0002, ATTR_BGCOLOR_EXT = 0x0003, ATTR_UNDERLINE = 0x0004, ATTR_GRAMMAR = 0x0008, ATTR_SPELLING = 0x000C, ATTR_STRIKE_THROUGH = 0x0010, ATTR_LINES_MASK = 0x001C }:
  attribute flags in Style_Table_Entry.attr
- typedef void(* Unfinished_Style_Cb)(int, void *)
```

Public Member Functions

- FL_Text_Buffer * buffer() const:
  Gets the current text buffer associated with the text widget.
- void buffer(FL_Text_Buffer &buf):
  Sets the current text buffer associated with the text widget.
- void buffer(FL_Text_Buffer *buf):
  Attach a text buffer to display, replacing the current buffer (if any).
- double col_to_x (double col) const:
  Convert a column number into an x pixel position.
• int count_lines (int start, int end, bool start_pos_is_line_start) const
  Count the number of lines between two positions.
• Fl_Color cursor_color () const
  Gets the text cursor color.
• void cursor_color (Fl_Color n)
  Sets the text cursor color.
• int cursor_style () const
• void cursor_style (int style)
  Sets the text cursor style.
• Fl_Text_Display (int X, int Y, int W, int H, const char ∗l=0)
  Creates a new text display widget.
• Fl_Color grammar_underline_color () const
  Gets the underline color for style attribute ATTR_GRAMMAR.
• void grammar_underline_color (Fl_Color color)
  Sets the underline color for style attribute ATTR_GRAMMAR.
• int handle (int e) FL_OVERRIDE
  Event handling.
• void hide_cursor ()
  Hides the text cursor.
• void highlight_data (Fl_Text_Buffer ∗styleBuffer, const Style_Table_Entry ∗styleTable, int nStyles, char unfinishedStyle, Unfinished_Style_Cb unfinishedHighlightCB, void ∗cbArg)
  Attach (or remove) highlight information in text display and redisplay.
• int in_selection (int x, int y) const
  Check if a pixel position is within the primary selection.
• void insert (const char ∗text)
  Inserts "text" at the current cursor location.
• int insert_position () const
  Gets the position of the text insertion cursor for text display.
• void insert_position (int newPos)
  Sets the position of the text insertion cursor for text display.
• int line_end (int startPos, bool startPosIsLineStart) const
  Returns the end of a line.
• int line_start (int pos) const
  Returns the beginning of a line.
• Fl_Align linenumber_align () const
  Returns the alignment used for line numbers (if enabled).
• void linenumber_align (Fl_Align val)
  Set alignment for line numbers (if enabled).
• Fl_Color linenumberbgcolor () const
  Returns the background color used for line numbers (if enabled).
• void linenumberbgcolor (Fl_Color val)
  Set the background color used for line numbers (if enabled).
• Fl_Color linenumberfgcolor () const
  Return the foreground color used for line numbers (if enabled).
• void linenumberfgcolor (Fl_Color val)
  Set the foreground color used for line numbers (if enabled).
• Fl_Font linenumberfont () const
  Return the font used for line numbers (if enabled).
• void linenumberfont (Fl_Font val)
  Set the font used for line numbers (if enabled).
• const char ∗linenumberformat () const
Returns the line number printf() format string.

- void linenumber_format (const char *val)
  Sets the printf() style format string used for line numbers.

- Fl_Fontsize linenumber_size () const
  Return the font size used for line numbers (if enabled).

- void linenumber_size (Fl_Fontsize val)
  Set the font size used for line numbers (if enabled).

- int linenumber_width () const
  Return the screen area width provided for line numbers.

- void linenumber_width (int width)
  Set width of screen area for line numbers.

- int move_down ()
  Moves the current insert position down one line.

- int move_left ()
  Moves the current insert position left one character.

- int move_right ()
  Moves the current insert position right one character.

- int move_up ()
  Moves the current insert position up one line.

- void next_word (void)
  Moves the current insert position right one word.

- void overstrike (const char *text)
  Replaces text at the current insert position.

- int position_style (int lineStartPos, int lineLen, int lineIndex) const
  Find the correct style for a character.

- int position_to_xy (int pos, int *x, int *y) const
  Convert a character index into a pixel position.

- void previous_word (void)
  Moves the current insert position left one word.

- virtual void recalc_display ()
  Recalculate the display’s visible lines and scrollbar sizes.

- void redisplay_range (int start, int end)
  Marks text from start to end as needing a redraw.

- void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Change the size of the displayed text area.

- int rewind_lines (int startPos, int nLines)
  Skip a number of lines back.

- void scroll (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

- Fl_Align scrollbar_align () const
  Gets the scrollbar alignment type.

- void scrollbar_align (Fl_Align a)
  Sets the scrollbar alignment type.

- int scrollbar_size () const
  Gets the current size of the scrollbars' troughs, in pixels.

- void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

- int scrollbar_width () const
  Returns the global value Fl::scrollbar_size() unless a specific scrollbar_width_ has been set.

- void scrollbar_width (int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.
• Fl_Color secondary_selection_color () const
  Gets the background color for the secondary selection block.
• void secondary_selection_color (Fl_Color color)
  Sets the background color for the secondary selection block.
• int shortcut () const
• void shortcut (int s)
• void show_cursor (int b=1)
  Shows the text cursor.
• void show_insert_position ()
  Scrolls the text buffer to show the current insert position.
• int skip_lines (int startPos, int nLines, bool startPosIsLineStart)
  Skip a number of lines forward.
• Fl_Color spelling_underline_color () const
  Gets the underline color for style attribute ATTR_SPELLING.
• void spelling_underline_color (Fl_Color color)
  Sets the underline color for style attribute ATTR_SPELLING.
• Fl_Text_Buffer * style_buffer () const
  Gets the current style buffer associated with the text widget.
• Fl_Color textcolor () const
  Gets the default color of text in the widget.
• void textcolor (Fl_Color n)
  Sets the default color of text in the widget.
• Fl_Font textfont () const
  Gets the default font used when drawing text in the widget.
• void textfont (Fl_Font s)
  Sets the default font used when drawing text in the widget.
• Fl_Fontsize textsize () const
  Gets the default size of text in the widget.
• void textsize (Fl_Fontsize s)
  Sets the default size of text in the widget.
• int word_end (int pos) const
  Moves the insert position to the end of the current word.
• int word_start (int pos) const
  Moves the insert position to the beginning of the current word.
• void wrap_mode (int wrap, int wrap_margin)
  Set the new text wrap mode.
• int wrapped_column (int row, int column) const
  Nobody knows what this function does.
• int wrapped_row (int row) const
  Nobody knows what this function does.
• double x_to_col (double x) const
  Convert an x pixel position into a column number.
• ~Fl_Text_Display ()
  Free a text display and release its associated memory.
Public Member Functions inherited from Fl_Group

- Fl_Widget * & _ddffile kludge ()
  This is for forms compatibility only.
- void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
- void add (Fl_Widget *)
  See void Fl_Group::add(Fl_Widget &w)
- void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
- Fl_Widget * const * array () const
  Returns a pointer to the array of children.
- Fl_Group * const as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
- Fl_Widget * child (int n) const
  Returns array()[n].
- int children () const
  Returns how many child widgets the group has.
- void clear ()
  Deletes all child widgets from memory recursively.
- unsigned int clip_children ()
  Returns the current clipping mode.
- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
- void end ()
  Exactly the same as current(this->parent()).
- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *)
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget *)
- void forms_end ()
  This is for forms compatibility only.
- void init_sizes ()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &, Fl_Widget * before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget * o)
  Removes the widget o from the group.
- void remove (int index)
Remove the widget at index from the group but does not delete it.

- **Fl_Widget** * resizable () const
  - Returns the group's resizable widget.
- **void resizable (Fl_Widget &o)**
  - Sets the group's resizable widget.
- **void resizable (Fl_Widget *o)**
  - The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- **virtual ~Fl_Group ()**
  - The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- **void _clearFullscreen ()**
- **void _setFullscreen ()**
- **void activate ()**
  - Activates the widget.
- **unsigned int active () const**
  - Returns whether the widget is active.
- **int active_r () const**
  - Returns whether the widget and all of its parents are active.
- **Fl_Align align () const**
  - Gets the label alignment.
- **void align (Fl_Align alignment)**
  - Sets the label alignment.
- **long argument () const**
  - Gets the current user data (long) argument that is passed to the callback function.
- **void argument (long v)**
  - Sets the current user data (long) argument that is passed to the callback function.
- **virtual class Fl_GL_Window * asGLWindow ()**
  - Returns an Fl_GL_Window pointer if this widget is an Fl_GL_Window.
- **virtual class Fl_GL_Window const * asGLWindow () const**
- **virtual Fl_Window * asWindow ()**
  - Returns an Fl_Window pointer if this widget is an Fl_Window.
- **virtual Fl_Window const * asWindow () const**
- **void bind_deimage (Fl_Imgs * img)**
  - Sets the image to use as part of the widget label when in the inactive state.
- **void bind_deimage (int f)**
  - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- **void bind_image (Fl_Imgs * img)**
  - Sets the image to use as part of the widget label when in the active state.
- **void bind_image (int f)**
  - Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- **Fl_Boxtype box () const**
  - Gets the box type of the widget.
- **void box (Fl_Boxtype new_box)**
  - Sets the box type for the widget.
- **Fl_Callback * callback () const**
  - Gets the current callback function for the widget.
- **void callback (Fl_Callback * cb)**
  - Sets the current callback function for the widget.
- **void callback (Fl_Callback * cb, Fl_Callback_User_Data *p, bool auto_free)**
void callback (Fl_Callback ∗cb, void ∗p)
Sets the current callback function and managed user data for the widget.

void callback (Fl_Callback0 ∗cb)
Sets the current callback function for the widget.

void callback (Fl_Callback1 ∗cb, long p=0)
Sets the current callback function for the widget.

unsigned int changed () const
Checks if the widget value changed since the last callback.

void clear_active ()
Marks the widget as inactive without sending events or changing focus.

void clear_changed ()
Marks the value of the widget as unchanged.

void clear_damage (uchar c=0)
Clears or sets the damage flags.

void clear_output ()
Sets a widget to accept input.

void clear_visible ()
Hides the widget.

void clear_visible_focus ()
Disables keyboard focus navigation with this widget.

Fl_Color color () const
Gets the background color of the widget.

void color (Fl_Color bg)
Sets the background color of the widget.

void color (Fl_Color bg, Fl_Color sel)
Sets the background and selection color of the widget.

Fl_Color color2 () const
For back compatibility only.

void color2 (unsigned a)
For back compatibility only.

int contains (const Fl_Widget ∗w) const
Checks if w is a child of this widget.

void copy_label (const char ∗new_label)
Sets the current label.

void copy_tooltip (const char ∗text)
Sets the current tooltip text.

uchar damage () const
Returns non-zero if draw() needs to be called.

void damage (uchar c)
Sets the damage bits for the widget.

void damage (uchar c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.

int damage_resize (int, int, int, int)
Internal use only.

void deactivate ()
Deactivates the widget.

Fl_Image ∗deimage ()
Gets the image that is used as part of the widget label when in the inactive state.

const Fl_Image ∗deimage () const
Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Img &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Img *img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *wgt, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *wgt, void *arg=0, Fl_Callback_Reason reason=FL_REASONUNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Img * image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Img *image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Img &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Img *img)
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
Gets the label type.

- void labeltype (Fl_Labeltype a)
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut ()
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  
  Sets the current tooltip text.

• Fl_Window ∗top_window () const
  
  Returns a pointer to the top-level window for the widget.

• Fl_Window ∗top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  
  Gets the widget type.

• void type (uchar t)
  
  Sets the widget type.

• int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void ∗user_data () const
  
  Gets the user data for this widget.

• void user_data (Fi_Callback_User_Data ∗v, bool auto_free)
  
  Sets the user data for this widget.

• void user_data (void ∗v)
  
  Sets the user data for this widget.

• unsigned int visible () const
  
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  
  Modifies keyboard focus navigation.

• int visible_r () const
  
  Returns whether a widget and all its parents are visible.

• int w () const
  
  Gets the widget width.

• Fl_When when () const
  
  Returns the conditions under which the callback is called.

• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Link ∗window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Protected Types

• enum {
  
  DRAW_LINE, FIND_INDEX, FIND_INDEX_FROM_ZERO, GET_WIDTH, FIND_CURSOR_INDEX
  
}
Protected Types inherited from Fl_Widget

- enum {

  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31}
flags possible values enumeration.

Protected Member Functions

- void absolute_top_line_number (int oldFirstChar)
  Re-calculate absolute top line number for a change in scroll position.
- void calc_last_char ()
  Update last display character index.
- void calc_line_starts (int startLine, int endLine)
  Update the line starts array.
- void clear_rect (int style, int x, int y, int width, int height) const
  Clear a rectangle with the appropriate background color for style.
- void display_insert ()
  Scroll the display to bring insertion cursor into view.
- void draw () FL_OVERRIDE
  Draw the widget.
- void draw_cursor (int, int)
  Draw a cursor with top center at X, Y.
- void draw_line_numbers (bool clearAll)
  Refresh the line number area.
- void draw_range (int start, int end)
  Draw a range of text.
- void draw_string (int style, int x, int y, int toX, const char ∗string, int nChars) const
  Draw a text segment in a single style.
- void draw_text (int X, int Y, int W, int H)
  Refresh a rectangle of the text display.
- void draw_vline (int visLineNum, int leftClip, int rightClip, int leftCharIndex, int rightCharIndex)
  Draw a single line of text.
- int empty_vlines () const
  Return true if there are lines visible with no corresponding buffer text.
- void extend_range_for_styles (int ∗start, int ∗end)
  I don't know what this does!
- void find_line_end (int pos, bool start_pos_is_line_start, int ∗lineEnd, int ∗nextLineStart) const
  Finds both the end of the current line and the start of the next line.
- void find_wrap_range (const char ∗deletedText, int pos, int nInserted, int nDeleted, int ∗modRangeStart, int ∗modRangeEnd, int ∗linesInserted, int ∗linesDeleted)
  Wrapping calculations.
- int find_x (const char ∗s, int len, int style, int x) const
Find the index of the character that lies at the given x position / closest cursor position.

- int 
  get_absolute_top_line_number () const
  Returns the absolute (non-wrapped) line number of the first line displayed.

- int handle_rmb (int readonly)
  Handle right mouse button down events.

- int handle_vline (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const
  Universal pixel machine.

- int longest_vline () const
  Find the longest line of all visible lines.

- void maintain_absolute_top_line_number (int state)
  Line numbering stuff, currently unused.

- int maintaining_absolute_top_line_number () const
  Returns true if a separate absolute top line number is being maintained.

- void measure_deleted_lines (int pos, int nDeleted)
  Wrapping calculations.

- double measure_proportional_character (const char ∗s, int colNum, int pos) const
  Wrapping calculations.

- int measure_vline (int visLineNum) const
  Returns the width in pixels of the displayed line pointed to by "visLineNum".

- void offset_line_starts (int newTopLineNum)
  Offset line start counters for a new vertical scroll position.

- int position_to_line (int pos, int ∗lineNum) const
  Convert a position index into a line number offset.

- int position_to_linecol (int pos, int ∗lineNum, int ∗column) const
  Find the line and column number of position pos.

- void reset_absolute_top_line_number ()
  Reestablish the absolute (non-wrapped) top line number.

- int scroll_ (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

- double string_width (const char ∗string, int length, int style) const
  Find the width of a string in the font of a particular style.

- void update_h_scrollbar ()
  Update horizontal scrollbar.

- void update_line_starts (int pos, int charsInserted, int charsDeleted, int linesInserted, int linesDeleted, int ∗scrolled)
  Update line start arrays and variables.

- void update_v_scrollbar ()
  Update vertical scrollbar.

- int vline_length (int visLineNum) const
  Count number of bytes in a visible line.

- int wrap_uses_character (int lineEndPos) const
  Check if the line break is caused by a newline or by line wrapping.

- void wrapped_line_counter (Fl_Text_Buffer ∗buf, int startPos, int maxPos, int maxLines, bool startPosIs← LineStart, int styleBufOffset, int ∗retPos, int ∗retLines, int ∗retLineStart, int ∗retLineEnd, bool countLast← LineMissingNewLine=true) const
  Wrapping calculations.

- int xy_to_position (int x, int y, int PosType=CHARACTER_POS) const
  Translate a pixel position into a character index.

- void xy_to_rowcol (int x, int y, int ∗row, int ∗column, int PosType=CHARACTER_POS) const
  Translate pixel coordinates into row and column.
Protected Member Functions inherited from Fl_Group

- `Fl_Rect * bounds ()`
  
  Returns the internal array of widget sizes and positions.

- `void draw_child (Fl_Widget &widget) const`
  
  Forces a child to redraw.

- `void draw_children ()`
  
  Draws all children of the group.

- `void draw_outside_label (const Fl_Widget &widget) const`
  
  Parents normally call this to draw outside labels of child widgets.

- `virtual int on_insert (Fl_Widget *, int)`
  
  Allow derived groups to act when a widget is added as a child.

- `virtual int on_move (int, int)`
  
  Allow derived groups to act when a widget is moved within the group.

- `virtual void on_remove (int)`
  
  Allow derived groups to act when a child widget is removed from the group.

- `int * sizes ()`
  
  Returns the internal array of widget sizes and positions.

- `void update_child (Fl_Widget &widget) const`
  
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- `void clear_flag (unsigned int c)`
  
  Clears a flag in the flags mask.

- `void draw_backdrop () const`
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- `void draw_box () const`
  
  Draws the widget box according its box style.

- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  
  Draws a box of type t, of color c at the widget's position and size.

- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- `void draw_focus () const`
  
  Draws a focus rectangle around the widget.

- `void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const`
  
  Draws a focus rectangle around the widget.

- `void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  
  Draws a focus box for the widget at the given position and size.

- `void draw_label () const`
  
  Draws the widget's label at the defined label position.

- `void draw_label (int, int, int, int) const`
  
  Draws the label in an arbitrary bounding box.

- `Fl_Widget (int x, int y, int w, int h, const char *label=0L)`
  
  Creates a widget at the given position and size.

- `unsigned int flags () const`
  
  Gets the widget flags mask.

- `void h (int v)`
  
  Internal use only.

- `void set_flag (unsigned int c)`
  
  Sets a flag in the flags mask.

- `void w (int v)`

Generated by Doxygen
Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Static Protected Member Functions
• static void buffer_modified_cb (int pos, int nInserted, int nDeleted, int nRestyled, const char ∗deletedText, void ∗cbArg)
  This is called whenever the buffer is modified.
• static void buffer_predelete_cb (int pos, int nDeleted, void ∗cbArg)
  This is called before any characters are deleted.
• static void h_scrollbar_cb (Fl_Scrollbar ∗w, Fl_Text_Display ∗d)
  Callback for drag or valueChanged on horizontal scrollbar.
• static void scroll_timer_cb (void ∗)
  Timer callback for scroll events.
• static void v_scrollbar_cb (Fl_Scrollbar ∗w, Fl_Text_Display ∗d)
  Callback for drag or valueChanged on vertical scrollbar.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group
• static Fl_Group * current ()
  Returns the currently active group.
• static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget
• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int labelShortcut (const char *t)
  Returns the Unicode value of the ’&x’ shortcut in a given text.
• static int testShortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered ’&x’ shortcut.
11.144.1 Detailed Description

Rich text display widget.
This is the FLTK text display widget. It allows the user to view multiple lines of text and supports highlighting, word wrap, mixes of font faces and colors, line numbers and scrolling. The buffer that is displayed in the widget is managed by the `Fl_Text_Buffer` class. A single Text Buffer can be displayed by multiple Text Displays.

```cpp
#include <FL/Fl_Text_Display.H>
...
int main() {
    Fl_Text_Buffer *buff = new Fl_Text_Buffer();
    Fl_Text_Display *disp = new Fl_Text_Display(10, 10, 640, 480);
    disp->buffer(buff); // attach text buffer to display widget
...
```

![Fl_Text_Display widget](image1)

![Fl_Text_Display widget with line numbers enabled](image2)

**Figure 11.58 Fl_Text_Display widget**

**Figure 11.59 Fl_Text_Display widget with line numbers enabled**

Example Use
buff->text("line one
line two"); // add some text to buffer

Features

- Word wrap: wrap_mode(), wrapped_column(), wrapped_row()
- Font control: textfont(), textsize(), textcolor()
- Font styling: highlight_data()
- Cursor: cursor_style(), show_cursor(), hide_cursor(), cursor_color()
- Line numbers: linenum_width(), linenum_font(), linenum_size(), linenum_fgcolor(), linenum_bgcolor(),
  linenum_align(), linenum_format()

Note that other features may be available via Fl_Text_Editor and Fl_Text_Buffer classes.

Note

Line numbers were added in FLTK 1.3.3.

11.144.3 Constructor & Destructor Documentation

11.144.3.1 Fl_Text_Display()

```cpp
Fl_Text_Display::Fl_Text_Display (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ l = 0 )
```

Creates a new text display widget.

**Parameters**

<table>
<thead>
<tr>
<th>X, Y, W, H</th>
<th>position and size of widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>l</td>
<td>label text, defaults to none</td>
</tr>
</tbody>
</table>

11.144.3.2 ~Fl_Text_Display()

```cpp
Fl_Text_Display::~Fl_Text_Display ( )
```

Free a text display and release its associated memory.

**Note**

The text buffer that the text display displays is a separate entity and is not freed, nor are the style buffer or style table.

**See also**

```cpp
Fl_Text_Display::buffer(Fl_Text_Buffer∗ buf)
```

11.144.4 Member Function Documentation

11.144.4.1 absolute_top_line_number()

```cpp
void Fl_Text_Display::absolute_top_line_number (  
    int oldFirstChar ) [protected]
```

Re-calculate absolute top line number for a change in scroll position. Does nothing if the absolute top line number is not being maintained.

11.144.4.2 buffer() [1/3]

```cpp
Fl_Text_Buffer ∗ Fl_Text_Display::buffer ( ) const [inline]
```

Gets the current text buffer associated with the text widget. Multiple text widgets can be associated with the same text buffer.
Returns

current text buffer

See also

Fl_Text_Display::buffer(Fl_Text_Buffer* buf)
Fl_Text_Display::buffer(Fl_Text_Buffer& buf)

11.144.4.3 buffer() [2/3]

void Fl_Text_Display::buffer (  
    Fl_Text_Buffer & buf  ) [inline]

Sets the current text buffer associated with the text widget.
Multiple text widgets can be associated with the same text buffer.

Parameters

buf new text buffer

See also

Fl_Text_Display::buffer(Fl_Text_Buffer* buf)

11.144.4.4 buffer() [3/3]

void Fl_Text_Display::buffer (  
    Fl_Text_Buffer * buf  )

Attach a text buffer to display, replacing the current buffer (if any).
Multiple text widgets can be associated with the same text buffer.

Note

The caller is responsible for the old (replaced) buffer (if any). This method does not delete the old buffer.

Parameters

buf attach this text buffer

11.144.4.5 buffer_modified_cb()

void Fl_Text_Display::buffer_modified_cb (  
    int pos,  
    int nInserted,  
    int nDeleted,  
    int nRestyled,  
    const char * deletedText,  
    void * cbArg ) [static], [protected]

This is called whenever the buffer is modified.
Callback attached to the text buffer to receive modification information.
This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or
text in this callback, or line counting may get out of sync.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>starting index of modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>nInserted</td>
<td>number of bytes we inserted (must be UTF-8 aligned!)</td>
</tr>
</tbody>
</table>
### buffer_predelete_cb()

```c
void Fl_Text_Display::buffer_predelete_cb (int pos, int nDeleted, void * cbArg) [static], [protected]
```

This is called before any characters are deleted. Callback attached to the text buffer to receive delete information before the modifications are actually made. This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or text in this callback, or line counting may get out of sync.

**Parameters**

<table>
<thead>
<tr>
<th>pos</th>
<th>starting index of deletion</th>
</tr>
</thead>
<tbody>
<tr>
<td>nDeleted</td>
<td>number of bytes we will delete (must be UTF-8 aligned!)</td>
</tr>
<tr>
<td>cbArg</td>
<td>“this” pointer for static callback function</td>
</tr>
</tbody>
</table>

### calc_last_char()

```c
void Fl_Text_Display::calc_last_char ( ) [protected]
```

Update last display character index. Given a Fl_Text_Display with a complete, up-to-date lineStarts array, update the lastChar entry to point to the last buffer position displayed.

### calc_line_starts()

```c
void Fl_Text_Display::calc_line_starts (int startLine, int endLine) [protected]
```

Update the line starts array. Scan through the text in the Text Display's buffer and recalculate the line starts array values beginning at index "startLine" and continuing through (including) "endLine". It assumes that the line starts entry preceding "startLine" (or mFirstChar if startLine is 0) is good, and re-counts newlines to fill in the requested entries. Out of range values for "startLine" and "endLine" are acceptable.

**Parameters**

| startLine,endLine | range of lines to scan as line numbers |

### clear_rect()

```c
void Fl_Text_Display::clear_rect ( int style, int X, int Y, int width, int height ) const [protected]
```

## Parameters

<table>
<thead>
<tr>
<th>nDeleted</th>
<th>number of bytes deleted (must be UTF-8 aligned!)</th>
</tr>
</thead>
<tbody>
<tr>
<td>nRestyled</td>
<td>??</td>
</tr>
<tr>
<td>deletedText</td>
<td>this is what was removed, must not be NULL if nDeleted is set</td>
</tr>
<tr>
<td>cbArg</td>
<td>“this” pointer for static callback function</td>
</tr>
</tbody>
</table>
Clear a rectangle with the appropriate background color for style.

Parameters

<table>
<thead>
<tr>
<th>style</th>
<th>index into style table</th>
</tr>
</thead>
<tbody>
<tr>
<td>X,Y, width, height</td>
<td>size and position of background area</td>
</tr>
</tbody>
</table>

11.144.10 col_to_x()

double Fl_Text_Display::col_to_x ( double col ) const

Convert a column number into an x pixel position.

Parameters

| col | an approximate column number based on the main font |

Returns

number of pixels from the left margin to the left of an average sized character

See also

x_to_col()

11.144.11 count_lines()

int Fl_Text_Display::count_lines ( int startPos, int endPos, bool startPosIsLineStart ) const

Count the number of lines between two positions.

Same as Fl_Text_Buffer::count_lines(), but takes into account wrapping if wrapping is turned on. If the caller knows that startPos is at a line start, it can pass startPosIsLineStart as True to make the call more efficient by avoiding the additional step of scanning back to the last newline.

Parameters

| startPos | index to first character |
| startPosIsLineStart | index after last character |

| startPosIsLineStart | avoid scanning back to the line start |

Returns

number of lines

11.144.12 cursor_color() [1/2]

FL_Color Fl_Text_Display::cursor_color ( ) const [inline]

Gets the text cursor color.

Returns

cursor color
11.144.4.13  cursor_color() [2/2]

```cpp
void Fl_Text_Display::cursor_color ( Fl_Color n ) [inline]
```

Sets the text cursor color.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>new cursor color</td>
</tr>
</tbody>
</table>

11.144.4.14  cursor_style()

```cpp
void Fl_Text_Display::cursor_style ( int style )
```

Sets the text cursor style.

Sets the text cursor style to one of the following:

- `Fl_Text_Display::NORMAL_CURSOR` - Shows an I beam.
- `Fl_Text_Display::CARET_CURSOR` - Shows a caret under the text.
- `Fl_Text_Display::DIM_CURSOR` - Shows a dimmed I beam.
- `Fl_Text_Display::BLOCK_CURSOR` - Shows an unfilled box around the current character.
- `Fl_Text_Display::HEAVY_CURSOR` - Shows a thick I beam.

This call also switches the cursor on and may trigger a redraw.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>style</td>
<td>new cursor style</td>
</tr>
</tbody>
</table>

11.144.4.15  display_insert()

```cpp
void Fl_Text_Display::display_insert ( ) [protected]
```

Scroll the display to bring insertion cursor into view.

Note: it would be nice to be able to do this without counting lines twice (scroll_() counts them too) and/or to count from the most efficient starting point, but the efficiency of this routine is not as important to the overall performance of the text display.

11.144.4.16  draw()

```cpp
void Fl_Text_Display::draw ( void ) [protected], [virtual]
```

Draw the widget.

This function tries to limit drawing to smaller areas if possible.

Reimplemented from `Fl_Group`.

11.144.4.17  draw_cursor()

```cpp
void Fl_Text_Display::draw_cursor ( int X, int Y ) [protected]
```

Draw a cursor with top center at X, Y.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X,Y</td>
<td>cursor position in pixels</td>
</tr>
</tbody>
</table>
11.144.4.18 draw_line_numbers()

void Fl_Text_Display::draw_line_numbers (  
  bool clearAll ) [protected]

Refresh the line number area.

Parameters

| clearAll | (currently unused) If False, only draws the line number text, does not clear the area behind it. If True, clears the area and redraws the text. Use False to avoid a 'flash' for single buffered windows. |

11.144.4.19 draw_range()

void Fl_Text_Display::draw_range (  
  int startPos,  
  int endpos ) [protected]

Draw a range of text.
Refresh all of the text between buffer positions startPos and endpos not including the character at the position endpos.
If endpos points beyond the end of the buffer, refresh the whole display after startPos, including blank lines which are not technically part of any range of characters.

Parameters

| startPos | index of first character to draw |
| endpos   | index after last character to draw |

11.144.4.20 draw_string()

void Fl_Text_Display::draw_string (  
  int style,  
  int X,  
  int Y,  
  int toX,  
  const char * string,  
  int nChars ) const [protected]

Draw a text segment in a single style.
Draw a string or blank area according to parameter style, using the appropriate colors and drawing method for that style, with top left corner at X, Y. If style says to draw text, use string as source of characters, and draw nChars, if style is FILL, erase rectangle where text would have drawn from X to toX and from Y to the maximum y extent of the current font(s).

Parameters

| style    | index into style lookup table |
| X, Y     | drawing origin |
| toX      | rightmost position if this is a fill operation |
| string   | text if this is a drawing operation |
| nChars   | number of characters to draw |

11.144.4.21 draw_text()

void Fl_Text_Display::draw_text (  
  int left,  
  int top,  
  int right,  
  int bottom,  
  int style,  
  int X,  
  int Y,  
  int toX,  
  int toY,  
  const char * string,  
  int nChars ) const [protected]
int top,
int width,
int height ) [protected]

Refresh a rectangle of the text display.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>left,top</td>
<td>are in coordinates of the text drawing window.</td>
</tr>
<tr>
<td>width,height</td>
<td>size in pixels</td>
</tr>
</tbody>
</table>

### 11.144.4.22 draw_vline()

```c
void Fl_Text_Display::draw_vline ( 
    int visLineNum,
    int leftClip,  
    int rightClip, 
    int leftCharIndex,  
    int rightCharIndex ) [protected]
```

Draw a single line of text.
Draw the text on a single line represented by visLineNum (the number of lines down from the top of the display), limited by leftClip and rightClip window coordinates and leftCharIndex and rightCharIndex character positions (not including the character at position rightCharIndex).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>visLineNum</td>
<td>index of line in the visible line number lookup</td>
</tr>
<tr>
<td>leftClip, rightClip</td>
<td>pixel position of clipped area</td>
</tr>
<tr>
<td>leftCharIndex, rightCharIndex</td>
<td>index into line of segment that we want to draw</td>
</tr>
</tbody>
</table>

### 11.144.4.23 empty_vlines()

```c
int Fl_Text_Display::empty_vlines ( ) const [protected]
```

Return true if there are lines visible with no corresponding buffer text.

Returns

1 if there are empty lines

### 11.144.4.24 extend_range_for_styles()

```c
void Fl_Text_Display::extend_range_for_styles ( 
    int * startPos,
    int * endpos ) [protected]
```

I don't know what this does!

Extend the range of a redraw request (from *start to *end) with additional redraw requests resulting from changes to the attached style buffer (which contains auxiliary information for coloring or styling text).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startPos</td>
<td>??</td>
</tr>
<tr>
<td>endpos</td>
<td>??</td>
</tr>
</tbody>
</table>

Todo Unicode?
11.144.4.25 find_line_end()

```cpp
void Fl_Text_Display::find_line_end (  
  int startPos,  
  bool startPosIsLineStart,  
  int * lineEnd,  
  int * nextLineStart ) const [protected]
```

Finds both the end of the current line and the start of the next line.
Why? In continuous wrap mode, if you need to know both, figuring out one from the other can be expensive or error prone. The problem comes when there's a trailing space or tab just before the end of the buffer. To translate an end of line value to or from the next lines start value, you need to know whether the trailing space or tab is being used as a line break or just a normal character, and to find that out would otherwise require counting all the way back to the beginning of the line.

Parameters

- **startPos**
- **startPosIsLineStart**
- **lineEnd**
- **nextLineStart**

11.144.4.26 find_wrap_range()

```cpp
void Fl_Text_Display::find_wrap_range (  
  const char * deletedText,  
  int pos,  
  int nInserted,  
  int nDeleted,  
  int * modRangeStart,  
  int * modRangeEnd,  
  int * linesInserted,  
  int * linesDeleted ) [protected]
```

Wrapping calculations.
When continuous wrap is on, and the user inserts or deletes characters, wrapping can happen before and beyond the changed position. This routine finds the extent of the changes, and counts the deleted and inserted lines over that range. It also attempts to minimize the size of the range to what has to be counted and re-displayed, so the results can be useful both for delimiting where the line starts need to be recalculated, and for deciding what part of the text to redisplay.

Parameters

- **deletedText**
- **pos**
- **nInserted**
- **nDeleted**
- **modRangeStart**
- **modRangeEnd**
- **linesInserted**
- **linesDeleted**

11.144.4.27 find_x()

```cpp
int Fl_Text_Display::find_x (  
  const char * s,  
  int len,
```
Find the index of the character that lies at the given x position / closest cursor position.

Parameters

<table>
<thead>
<tr>
<th>s</th>
<th>UTF-8 text string</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>length of string</td>
</tr>
<tr>
<td>style</td>
<td>index into style lookup table</td>
</tr>
<tr>
<td>x</td>
<td>position in pixels - negative returns closest cursor position</td>
</tr>
</tbody>
</table>

Returns

index into buffer

11.144.4.28 get_absolute_top_line_number()

int Fl_Text_Display::get_absolute_top_line_number ( ) const [protected]

Returns the absolute (non-wrapped) line number of the first line displayed.
Returns 0 if the absolute top line number is not being maintained.

11.144.4.29 grammar_underline_color() [1/2]

Fl_Color Fl_Text_Display::grammar_underline_color ( ) const [inline]

Gets the underline color for style attribute ATTR_GRAMMAR.

Returns

underline color

11.144.4.30 grammar_underline_color() [2/2]

void Fl_Text_Display::grammar_underline_color ( Fl_Color color ) [inline]

Sets the underline color for style attribute ATTR_GRAMMAR.

Parameters

| color | underline color |

11.144.4.31 handle()

int Fl_Text_Display::handle ( int e ) [virtual]

Event handling.
Reimplemented from Fl_Group.
Reimplemented in Fl_Text_Editor.

11.144.4.32 handle_rmb()

int Fl_Text_Display::handle_rmb ( int readonly ) [protected]

Handle right mouse button down events.
Returns

0 for no op, 1 to cut, 2 to copy, 3 to paste

11.144.4.33 handle_vline()

```cpp
int Fl_Text_Display::handle_vline (  
    int mode,  
    int lineStartPos,  
    int lineLen,  
    int leftChar,  
    int rightChar,  
    int Y,  
    int bottomClip,  
    int leftClip,  
    int rightClip ) const [protected]
```

Universal pixel machine.
We use a single function that handles all line layout, measuring, and drawing

- draw a text range
- return the width of a text range in pixels
- return the index of a character that is at a pixel position

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mode</code></td>
<td>DRAW_LINE, GET_WIDTH, FIND_INDEX, FIND_INDEX_FROM_ZERO, or FIND_CURSOR_INDEX</td>
</tr>
<tr>
<td><code>lineStartPos</code></td>
<td>index of first character</td>
</tr>
<tr>
<td><code>lineLen</code></td>
<td>size of string in bytes</td>
</tr>
<tr>
<td><code>leftChar</code></td>
<td></td>
</tr>
<tr>
<td><code>rightChar</code></td>
<td></td>
</tr>
<tr>
<td><code>Y</code></td>
<td></td>
</tr>
<tr>
<td><code>bottomClip</code></td>
<td></td>
</tr>
<tr>
<td><code>leftClip</code></td>
<td></td>
</tr>
<tr>
<td><code>rightClip</code></td>
<td></td>
</tr>
</tbody>
</table>

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DRAW_LINE</td>
<td>index of last drawn character</td>
</tr>
<tr>
<td>GET_WIDTH</td>
<td>width in pixels of text segment if we would draw it</td>
</tr>
<tr>
<td>FIND_INDEX</td>
<td>index of character at given x position in window coordinates</td>
</tr>
<tr>
<td>FIND_INDEX_FROM_ZERO</td>
<td>index of character at given x position without scrolling and widget offsets</td>
</tr>
</tbody>
</table>

Todo we need to handle hidden hyphens and tabs here!
we handle all styles and selections
we must provide code to get pixel positions of the middle of a character as well

11.144.4.34 highlight_data()

```cpp
void Fl_Text_Display::highlight_data (  
    Fl_Text_Buffer ∗ styleBuffer,  
    const Style_Table_Entry ∗ styleTable,  
    int nStyles,  
    char unfinishedStyle,  
```
Unfinished_Style_Cb unfinishedHighlightCB,
    void * cbArg )

Attach (or remove) highlight information in text display and redisplay.
Highlighting information consists of a style buffer which parallels the normal text buffer, but codes font and color
information for the display; a style table which translates style buffer codes (indexed by buffer character ‘A’) into fonts
and colors; and a callback mechanism for as-needed highlighting, triggered by a style buffer entry of “unfinished←
Style”. Style buffer can trigger additional redisplay during a normal buffer modification if the buffer contains a primary
Fl_Text_Selection (see extend_range_for_styles() for more information on this protocol).
Style buffers, tables and their associated memory are managed by the caller.
Styles are ranged from 65 (‘A’) to 126.

Note
Style information in the style buffer must have the same byte offset as the corresponding character in the
text buffer. UTF-8 characters can have a maximum length of four bytes. Style information must take this into
account and fill the unused bytes with 0. See fl_utf8len().

Text: "*g* r ü *n*”, where normal style is ‘A’, and bold is ‘B’
Text Buffer(hex): 67 72 c3 bc 6e : gr..n
Style Buffer(hex): 42 41 41 00 42 : BAA.B

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>styleBuffer</td>
<td>this buffer works in parallel to the text buffer. For every character in the text buffer, the style buffer has a byte at the same offset that contains an index into an array of possible styles.</td>
</tr>
<tr>
<td>styleTable</td>
<td>a list of styles indexed by the style buffer</td>
</tr>
<tr>
<td>nStyles</td>
<td>number of styles in the style table</td>
</tr>
<tr>
<td>unfinishedStyle</td>
<td>if this style is found, the callback below is called</td>
</tr>
<tr>
<td>unfinishedHighlightCB</td>
<td>if a character with an unfinished style is found, this callback will be called</td>
</tr>
<tr>
<td>cbArg</td>
<td>an optional argument for the callback above, usually a pointer to the Text Display.</td>
</tr>
</tbody>
</table>

See also
Fl_Text_Display::style_buffer()

11.144.4.35  in_selection()

int Fl_Text_Display::in_selection ( int X, int Y ) const

Check if a pixel position is within the primary selection.

Parameters

| X, Y | pixel position to test |

Returns

1 if position (X, Y) is inside of the primary Fl_Text_Selection

11.144.4.36  insert()

void Fl_Text_Display::insert ( const char * text )

Inserts "text" at the current cursor location.
This has the same effect as inserting the text into the buffer using insert(insert_position(),text) and then moving the
insert position after the newly inserted text, except that it’s optimized to do less redrawing.
Parameters

| text | new text in UTF-8 encoding. |

11.144.4.37  insert_position() [1/2]

```cpp
int Fl_Text_Display::insert_position () const [inline]
```

Gets the position of the text insertion cursor for text display. The insert position is the byte count (offset) from the beginning of the text buffer (starting with 0). Returns 0 (zero) if no buffer is associated to the text display. Returns buffer()->length() if the insert position is at the end of the buffer.

Returns

insert position index into text buffer

See also

insert_position(int)

11.144.4.38  insert_position() [2/2]

```cpp
void Fl_Text_Display::insert_position ( int newPos )
```

Sets the position of the text insertion cursor for text display. Moves the insertion cursor in front of the character at `newPos`. This function may trigger a redraw.

Parameters

| newPos | new caret position |

11.144.4.39  line_end()

```cpp
int Fl_Text_Display::line_end ( int startPos, bool startPosIsLineStart ) const
```

Returns the end of a line.

Same as buffer()->line_end(startPos), but takes into account line breaks when wrapping is turned on. If the caller knows that `startPos` is at a line start, it can pass `startPosIsLineStart` as True to make the call more efficient by avoiding the additional step of scanning back to the last newline.

Note that the definition of the end of a line is less clear when continuous wrap is on. With continuous wrap off, it's just a pointer to the newline that ends the line. When it's on, it's the character beyond the last displayable character on the line, where a whitespace character which has been "converted" to a newline for wrapping is not considered displayable. Also note that a line can be wrapped at a non-whitespace character if the line had no whitespace. In this case, this routine returns a pointer to the start of the next line. This is also consistent with the model used by visLineLength.

Parameters

| startPos | index to starting character |
| startPosIsLineStart | avoid scanning back to the line start |

Returns

new position as index
11.144.4.40  line_start()

```cpp
int Fl_Text_Display::line_start (int pos) const
```

Return the beginning of a line.
Same as buffer() - > line_start(pos), but returns the character after last wrap point rather than the last newline.

Parameters

- `pos` index to starting character

Returns

- new position as index

11.144.4.41  linenumber_align()

```cpp
void Fl_Text_Display::linenumber_align (Fl_Align val)
```

Set alignment for line numbers (if enabled).
Valid values are FL_ALIGN_LEFT, FL_ALIGN_CENTER or FL_ALIGN_RIGHT.

Version

1.3.3

11.144.4.42  linenumber_bgcolor()

```cpp
void Fl_Text_Display::linenumber_bgcolor (Fl_Color val)
```

Set the background color used for line numbers (if enabled).

Version

1.3.3

11.144.4.43  linenumber_fgcolor()

```cpp
void Fl_Text_Display::linenumber_fgcolor (Fl_Color val)
```

Set the foreground color used for line numbers (if enabled).

Version

1.3.3

11.144.4.44  linenumber_font()

```cpp
void Fl_Text_Display::linenumber_font (Fl_Font val)
```

Set the font used for line numbers (if enabled).

Version

1.3.3
11.144.45  linenumber_format()

void Fl_Text_Display::linenumber_format (const char * val )
Sets the printf() style format string used for line numbers.
Default is "%d" for normal unpadded decimal integers.
An internal copy of val is allocated and managed; it is automatically freed whenever a new value is assigned, or
when the widget is destroyed.
The value of val must not be NULL.
Example values:
- "%d" -- For normal line numbers without padding (Default)
- "%03d" -- For 000 padding
- "%x" -- For hexadecimal line numbers
- "%o" -- For octal line numbers

Version
1.3.3

11.144.46  linenumber_size()

void Fl_Text_Display::linenumber_size (Fl_Fontsize val )
Set the font size used for line numbers (if enabled).

Version
1.3.3

11.144.47  linenumber_width()

void Fl_Text_Display::linenumber_width (int width )
Set width of screen area for line numbers.
Use to also enable/disable line numbers. A value of 0 disables line numbering, values >0 enable the line number
display.

Parameters

| width | The new width of the area for line numbers to appear, in pixels. 0 disables line numbers (default) |

11.144.48  longest_vline()

int Fl_Text_Display::longest_vline () const [protected]
Find the longest line of all visible lines.

Returns

the width of the longest visible line in pixels

11.144.49  maintain_absolute_top_line_number()

void Fl_Text_Display::maintain_absolute_top_line_number (int state ) [protected]
Line numbering stuff, currently unused.
In continuous wrap mode, internal line numbers are calculated after wrapping. A separate non-wrapped line count
is maintained when line numbering is turned on. There is some performance cost to maintaining this line count, so
normally absolute line numbers are not tracked if line numbering is off. This routine allows callers to specify that
they still want this line count maintained (for use via Fl_Text_Display::position_to_linecol()). More specifically, this allows the line number reported in the statistics line to be calibrated in absolute lines, rather than post-wrapped lines.

### 11.144.4.50 maintaining_absolute_top_line_number()

```
int Fl_Text_Display::maintaining_absolute_top_line_number ( ) const [protected]
```

Returns true if a separate absolute top line number is being maintained.
The absolute top line number is used for displaying line numbers in continuous wrap mode or showing in the statistics line (the latter is currently not available in FLTK).

### 11.144.4.51 measure_deleted_lines()

```
void Fl_Text_Display::measure_deleted_lines ( int pos, int nDeleted ) [protected]
```

Wrapping calculations.
This is a stripped-down version of the findWrapRange() function above, intended to be used to calculate the number of "deleted" lines during a buffer modification. It is called before the modification takes place.
This function should only be called in continuous wrap mode with a non-fixed font width. In that case, it is impossible to calculate the number of deleted lines, because the necessary style information is no longer available after the modification. In other cases, we can still perform the calculation afterwards (possibly even more efficiently).

**Parameters**

<table>
<thead>
<tr>
<th>pos</th>
<th>nDeleted</th>
</tr>
</thead>
</table>

### 11.144.4.52 measure_proportional_character()

```
double Fl_Text_Display::measure_proportional_character ( const char * s, int xPix, int pos ) const [protected]
```

Wrapping calculations.
Measure the width in pixels of the first character of string "s" at a particular column "colNum" and buffer position "pos". This is for measuring characters in proportional or mixed-width highlighting fonts.
A note about proportional and mixed-width fonts: the mixed width and proportional font code in nedit does not get much use in general editing, because nedit doesn't allow per-language-mode fonts, and editing programs in a proportional font is usually a bad idea, so very few users would choose a proportional font as a default. There are still probably mixed-width syntax highlighting cases where things don't redraw properly for insertion/deletion, though static display and wrapping and resizing should now be solid because they are now used for online help display.

**Parameters**

<table>
<thead>
<tr>
<th>s</th>
<th>xPix</th>
<th>pos</th>
</tr>
</thead>
<tbody>
<tr>
<td>text string</td>
<td>x pixel position needed for calculating tab widths</td>
<td>offset within string</td>
</tr>
</tbody>
</table>
Returns
width of character in pixels

11.144.4.53 measure_vline()

```cpp
int Fl_Text_Display::measure_vline ( int visLineNum ) const [protected]
```

Returns the width in pixels of the displayed line pointed to by "visLineNum".

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>visLineNum</td>
<td>index into visible lines array</td>
</tr>
</tbody>
</table>

Returns
width of line in pixels

11.144.4.54 move_down()

```cpp
int Fl_Text_Display::move_down ( )
```

Moves the current insert position down one line.

Returns
1 if the cursor moved, 0 if the beginning of the text was reached

11.144.4.55 move_left()

```cpp
int Fl_Text_Display::move_left ( )
```

Moves the current insert position left one character.

Returns
1 if the cursor moved, 0 if the beginning of the text was reached

11.144.4.56 move_right()

```cpp
int Fl_Text_Display::move_right ( )
```

Moves the current insert position right one character.

Returns
1 if the cursor moved, 0 if the end of the text was reached

11.144.4.57 move_up()

```cpp
int Fl_Text_Display::move_up ( )
```

Moves the current insert position up one line.

Returns
1 if the cursor moved, 0 if the beginning of the text was reached

11.144.4.58 offset_line_starts()

```cpp
void Fl_Text_Display::offset_line_starts ( int newTopLineNum ) [protected]
```

Offset line start counters for a new vertical scroll position.
Offset the line starts array, mTopLineNum, mFirstChar and lastChar, for a new vertical scroll position given by newTopLineNum. If any currently displayed lines will still be visible, salvage the line starts values, otherwise, count lines from the nearest known line start (start or end of buffer, or the closest value in the mLineStarts array)
11.144.4.59  overstrike()

```c
void Fl_Text_Display::overstrike ( const char * text )
```

Replaces text at the current insert position.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>new text in UTF-8 encoding</td>
</tr>
</tbody>
</table>

Todo  Unicode? Find out exactly what we do here and simplify.

11.144.4.60  position_style()

```c
int Fl_Text_Display::position_style ( int lineStartPos, int lineLen, int lineIndex ) const
```

Find the correct style for a character.

Determine the drawing method to use to draw a specific character from "buf". lineStartPos gives the character index where the line begins, lineIndex, the number of characters past the beginning of the line, and lineLen the number of displayed characters past the beginning of the line. Passing lineStartPos of -1 returns the drawing style for "no text".

Why not just: position_style(pos)? Because style applies to blank areas of the window beyond the text boundaries, and because this routine must also decide whether a position is inside of a rectangular Fl_Text_Selection, and do so efficiently, without re-counting character positions from the start of the line.

Note that style is a somewhat incorrect name, drawing method would be more appropriate. If lineIndex is pointing to the last character in a line, and the second to last character has the ATTR_BGCOLOR_EXT set, the background color will extend into the remaining line.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lineStartPos</td>
<td>beginning of this line</td>
</tr>
<tr>
<td>lineLen</td>
<td>number of bytes in line</td>
</tr>
<tr>
<td>lineIndex</td>
<td>position of character within line</td>
</tr>
</tbody>
</table>

Returns

style for the given character

11.144.4.61  position_to_line()

```c
int Fl_Text_Display::position_to_line ( int pos, int * lineNum ) const [protected]
```

Convert a position index into a line number offset.

Find the line number of position pos relative to the first line of displayed text, counting from 0 to visible lines - 1. The line number is returned in lineNum.

Returns 0 if the line is not displayed. In this case lineNum is 0 as well.

Returns 1 if the line is displayed. In this case lineNum is the relative line number.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>pos</th>
<th>byte position in buffer</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>lineNum</td>
<td>relative line number of byte pos in buffer</td>
</tr>
</tbody>
</table>

Returns

whether the character at byte position pos is currently displayed

Return values

| 0 | pos is not displayed; lineNum is invalid (zero) |
| 1 | pos is displayed; lineNum is valid |

11.144.4.62 position_to_linecol()

int Fl_Text_Display::position_to_linecol ( int pos, int * lineNum, int * column ) const [protected]

Find the line and column number of position pos.
This only works for displayed lines. If the line is not displayed, the function returns 0 (without the mLineStarts array it could turn in to very long calculation involving scanning large amounts of text in the buffer). If continuous wrap mode is on, returns the absolute line number (as opposed to the wrapped line number which is used for scrolling).

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>character index</th>
</tr>
</thead>
<tbody>
<tr>
<td>lineNum</td>
<td>absolute (unwrapped) line number</td>
</tr>
<tr>
<td>column</td>
<td>character offset to the beginning of the line</td>
</tr>
</tbody>
</table>

Returns

0 if pos is off screen, line number otherwise

Todo a column number makes little sense in the UTF-8/variable font width environment. We will have to further define what exactly we want to return. Please check the functions that call this particular function.

11.144.4.63 position_to_xy()

int Fl_Text_Display::position_to_xy ( int pos, int * X, int * Y ) const

Convert a character index into a pixel position.
Translate a buffer text position to the XY location where the top left of the cursor would be positioned to point to that character. Returns 0 if the position is not displayed because it is vertically out of view. If the position is horizontally out of view, returns the X coordinate where the position would be if it were visible.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>character index</th>
</tr>
</thead>
<tbody>
<tr>
<td>X,Y</td>
<td>pixel position of character on screen</td>
</tr>
</tbody>
</table>
Returns

0 if character vertically out of view, X & Y positions otherwise

11.144.4.64  redisplay_range()

```cpp
void Fl_Text_Display::redisplay_range (  
    int startpos,  
    int endpos )
```
Marks text from start to end as needing a redraw.
This function will trigger a damage event and later a redraw of parts of the widget.

Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>index of first character needing redraw</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpos</td>
<td>index after last character needing redraw</td>
</tr>
</tbody>
</table>

11.144.4.65  reset_absolute_top_line_number()

```cpp
void Fl_Text_Display::reset_absolute_top_line_number ( ) [protected]
```
Reestablish the absolute (non-wrapped) top line number.
Count lines from the beginning of the buffer to reestablish the absolute (non-wrapped) top line number. If mode is not continuous wrap, or the number is not being maintained, does nothing.

11.144.4.66  resize()

```cpp
void Fl_Text_Display::resize (  
    int X,  
    int Y,  
    int W,  
    int H ) [virtual]
```
Change the size of the displayed text area.
Calling this function will trigger a recalculation of all visible lines and of all scrollbar sizes.

Parameters

| X, Y, W, H | new position and size of this widget |

Reimplemented from Fl_Group.

11.144.4.67  rewind_lines()

```cpp
int Fl_Text_Display::rewind_lines (  
    int startPos,  
    int nLines )
```
Skip a number of lines back.
Same as buffer()>rewind_lines(startPos, nLines), but takes into account line breaks when wrapping is turned on.

Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>index to starting character</th>
</tr>
</thead>
<tbody>
<tr>
<td>nLines</td>
<td>number of lines to skip back</td>
</tr>
</tbody>
</table>
>Returns
    new position as index

11.144.68 scroll()

```cpp
void Fl_Text_Display::scroll (  
    int topLineNum,  
    int horizOffset )
```

Scrolls the current buffer to start at the specified line and column.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topLineNum</td>
<td>top line number</td>
</tr>
<tr>
<td>horizOffset</td>
<td>column number</td>
</tr>
</tbody>
</table>

**Todo** Column numbers make little sense here.

11.144.69 scroll_()

```cpp
int Fl_Text_Display::scroll_ (  
    int topLineNum,  
    int horizOffset )  [protected]
```

Scrolls the current buffer to start at the specified line and column.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topLineNum</td>
<td>top line number</td>
</tr>
<tr>
<td>horizOffset</td>
<td>in pixels</td>
</tr>
</tbody>
</table>

>Returns
    0 if nothing changed, 1 if we scrolled

11.144.70 scroll_timer_cb()

```cpp
void Fl_Text_Display::scroll_timer_cb (  
    void * user_data )  [static],  [protected]
```

Timer callback for scroll events.

This timer event scrolls the text view proportionally to how far the mouse pointer has left the text area. This allows for smooth scrolling without "wiggeling" the mouse.

11.144.71 scrollbar_align()[1/2]

```cpp
Fl_Align Fl_Text_Display::scrollbar_align ( ) const  [inline]
```

Gets the scrollbar alignment type.

>Returns
    scrollbar alignment

11.144.72 scrollbar_align()[2/2]

```cpp
void Fl_Text_Display::scrollbar_align (  
    Fl_Align a )  [inline]
```

Sets the scrollbar alignment type.
Parameters

|    | new scrollbar alignment |

11.144.4.73 scrollbar_size() [1/2]

```cpp
int Fl_Text_Display::scrollbar_size() const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels. If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also

Fl::scrollbar_size(int)

11.144.4.74 scrollbar_size() [2/2]

```cpp
void Fl_Text_Display::scrollbar_size(int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels. Normally you should not need this method, and should use Fl::scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want. Only use THIS method if you really need to override the global scrollbar size. Setting `newSize` to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the default.

Parameters

<table>
<thead>
<tr>
<th></th>
<th>newSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global Fl::scrollbar_size()</td>
</tr>
</tbody>
</table>

See also

Fl::scrollbar_size()

11.144.4.75 scrollbar_width() [1/2]

```cpp
int Fl_Text_Display::scrollbar_width() const [inline]
```

Returns the global value Fl::scrollbar_size() unless a specific scrollbar_width_ has been set.

**Deprecated** Use scrollbar_size() instead.

**Todo** This method should eventually be removed.

11.144.4.76 scrollbar_width() [2/2]

```cpp
void Fl_Text_Display::scrollbar_width(int width) [inline]
```

Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

**Deprecated** Use scrollbar_size() instead.

**Todo** This method should eventually be removed
11.144.4.77  secondary_selection_color() [1/2]

Fl_Color Fl_Text_Display::secondary_selection_color ( ) const [inline]
Gets the background color for the secondary selection block.

Returns

background color color

11.144.4.78  secondary_selection_color() [2/2]

void Fl_Text_Display::secondary_selection_color ( Fl_Color color ) [inline]
Sets the background color for the secondary selection block.

Parameters

color  background color

11.144.4.79  shortcut() [1/2]

int Fl_Text_Display::shortcut ( ) const [inline]

Todo  FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!

Returns

the current shortcut key

11.144.4.80  shortcut() [2/2]

void Fl_Text_Display::shortcut ( int s ) [inline]

Todo  FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!

Parameters

s  the new shortcut key

11.144.4.81  show_cursor()

void Fl_Text_Display::show_cursor ( int b = 1 )
Shows the text cursor.
This function may trigger a redraw.

Parameters

b  show(1) or hide(0) the text cursor (caret).
11.144.4.82  **show_insert_position()**

```cpp
void Fl_Text_Display::show_insert_position ( )
```

Scrolls the text buffer to show the current insert position.
This function triggers a complete recalculation, ending in a call to `Fl_Text_Display::display_insert()`.

11.144.4.83  **skip_lines()**

```cpp
int Fl_Text_Display::skip_lines ( int startPos, int nLines, bool startPosIsLineStart )
```

Skip a number of lines forward.
Same as `Fl_Text_Buffer::skip_lines(startPos, nLines)`, but takes into account line breaks when wrapping is turned on. If the caller knows that `startPos` is at a line start, it can pass `startPosIsLineStart` as True to make the call more efficient by avoiding the additional step of scanning back to the last newline.

**Parameters**

<table>
<thead>
<tr>
<th>startPos</th>
<th>index to starting character</th>
</tr>
</thead>
<tbody>
<tr>
<td>nLines</td>
<td>number of lines to skip ahead</td>
</tr>
<tr>
<td>startPosIsLineStart</td>
<td>avoid scanning back to the line start</td>
</tr>
</tbody>
</table>

**Returns**

new position as index

11.144.4.84  **spelling_underline_color()** [1/2]

```cpp
Fl_Color Fl_Text_Display::spelling_underline_color ( ) const [inline]
```

Gets the underline color for style attribute ATTR_SPELLING.

**Returns**

underline color

11.144.4.85  **spelling_underline_color()** [2/2]

```cpp
void Fl_Text_Display::spelling_underline_color ( Fl_Color color ) [inline]
```

Sets the underline color for style attribute ATTR_SPELLING.

**Parameters**

| color | underline color |

11.144.4.86  **string_width()**

```cpp
double Fl_Text_Display::string_width ( const char * string, int length, int style ) const [protected]
```

Find the width of a string in the font of a particular style.

**Parameters**

| string | the text |
Parameters

<table>
<thead>
<tr>
<th>length</th>
<th>number of bytes in string</th>
</tr>
</thead>
<tbody>
<tr>
<td>style</td>
<td>index into style table</td>
</tr>
</tbody>
</table>

Returns

width of text segment in pixels

### 11.144.4.87 style_buffer()

`Fl_Text_Buffer * Fl_Text_Display::style_buffer ( ) const [inline]`

Gets the current style buffer associated with the text widget. Multiple text widgets can be associated with the same style buffer.

Returns

current style buffer

See also

`Fl_Text_Display::highlight_data()`

### 11.144.4.88 textcolor() [1/2]

`Fl_Color Fl_Text_Display::textcolor ( ) const [inline]`

Gets the default color of text in the widget.

Returns

text color unless overridden by a style

### 11.144.4.88 textcolor() [2/2]

`void Fl_Text_Display::textcolor ( Fl_Color n ) [inline]`

Sets the default color of text in the widget.

Parameters

| n | new text color |

### 11.144.4.90 textfont() [1/2]

`Fl_Font Fl_Text_Display::textfont ( ) const [inline]`

Gets the default font used when drawing text in the widget.

Returns

current text font face unless overridden by a style

### 11.144.4.91 textfont() [2/2]

`void Fl_Text_Display::textfont ( Fl_Font s ) [inline]`

Sets the default font used when drawing text in the widget.
### Parameters

- **Default Text Font Face**

### 11.144.4.92 `textsize()` [1/2]

**Declares**

```cpp
Fl_Fontsize Fl_Text_Display::textsize ( ) const [inline]
```

**Description**

Gets the default size of text in the widget.

**Returns**

Current text height unless overridden by a style.

### 11.144.4.93 `textsize()` [2/2]

**Declares**

```cpp
void Fl_Text_Display::textsize ( Fl_Fontsize s ) [inline]
```

**Description**

Sets the default size of text in the widget.

### Parameters

- **s** - New text size

### 11.144.4.94 `update_h_scrollbar()`

**Declares**

```cpp
void Fl_Text_Display::update_h_scrollbar ( ) [protected]
```

**Description**

Update horizontal scrollbar.

Update the minimum, maximum, slider size, page increment, and value for the horizontal scrollbar.

### 11.144.4.95 `update_line_starts()`

**Declares**

```cpp
void Fl_Text_Display::update_line_starts ( int pos, int charsInserted, int charsDeleted, int linesInserted, int linesDeleted, int * scrolled ) [protected]
```

**Description**

Update line start arrays and variables.

Update the line start array, mTopLineNum, mFirstChar and lastChar for this text display after a modification to the text buffer, given by the position `pos` where the change began, and the numbers of characters and lines inserted and deleted.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pos</code></td>
<td>Index into buffer of recent changes</td>
</tr>
<tr>
<td><code>charsInserted</code></td>
<td>Number of bytes(!) inserted</td>
</tr>
<tr>
<td><code>charsDeleted</code></td>
<td>Number of bytes(!) deleted</td>
</tr>
<tr>
<td><code>linesInserted</code></td>
<td>Number of lines</td>
</tr>
<tr>
<td><code>linesDeleted</code></td>
<td>Number of lines</td>
</tr>
<tr>
<td><code>scrolled</code></td>
<td>Set to 1 if the text display needs to be scrolled</td>
</tr>
</tbody>
</table>

### 11.144.4.96 `update_v_scrollbar()`

**Declares**

```cpp
void Fl_Text_Display::update_v_scrollbar ( ) [protected]
```
Update vertical scrollbar.
Update the minimum, maximum, slider size, page increment, and value for the vertical scrollbar.

### 11.144.4.97 vline_length()

```cpp
int Fl_Text_Display::vline_length (int visLineNum) const [protected]
```

Count number of bytes in a visible line. Return the length of a line (number of bytes) by examining entries in the line starts array rather than by scanning for newlines.

**Parameters**
- `visLineNum` index of line in visible line array

**Returns**
- number of bytes in this line

### 11.144.4.98 word_end()

```cpp
int Fl_Text_Display::word_end (int pos) const [inline]
```

Moves the insert position to the end of the current word.

**Parameters**
- `pos` start calculation at this index

**Returns**
- index of first character after the end of the word

### 11.144.4.99 word_start()

```cpp
int Fl_Text_Display::word_start (int pos) const [inline]
```

Moves the insert position to the beginning of the current word.

**Parameters**
- `pos` start calculation at this index

**Returns**
- beginning of the words

### 11.144.4.100 wrap_mode()

```cpp
void Fl_Text_Display::wrap_mode (int wrap, int wrapMargin)
```

Set the new text wrap mode.

If `wrap` mode is not zero, this call enables automatic word wrapping at column `wrapMargin`. Word-wrapping does not change the text buffer itself, only the way the text is displayed. Different Text Displays can have different wrap modes, even if they share the same Text Buffer.

Generated by Doxygen
Valid wrap modes are:

- **WRAP_NONE**: don't wrap text at all
- **WRAP_AT_COLUMN**: wrap text at the given text column
- **WRAP_AT_PIXEL**: wrap text at a pixel position
- **WRAP_AT_BOUNDS**: wrap text so that it fits into the widget width

### Parameters

<table>
<thead>
<tr>
<th>wrap</th>
<th>new wrap mode (see above)</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapMargin</td>
<td>In WRAP_AT_COLUMN mode, text will wrap at the n'th character. For variable width fonts, an average character width is calculated. The column width is calculated using the current textfont or the first style when this function is called. If the font size changes, this function must be called again. In WRAP_AT_PIXEL mode, this is the pixel position.</td>
</tr>
</tbody>
</table>

#### 11.144.4.101 wrap_uses_character()

```cpp
int Fl_Text_Display::wrap_uses_character (int lineEndPos) const [protected]
```

Check if the line break is caused by a newline or by line wrapping.

Line breaks in continuous wrap mode usually happen at newlines (`\n`) or whitespace. This line-terminating character is not included in line width measurements and has a special status as a non-visible character. However, lines with no whitespace are wrapped without the benefit of a line terminating character, and this distinction causes endless trouble with all of the text display code which was originally written without continuous wrap mode and always expects to wrap at a newline character.

Given the position of the end of the line, as returned by `Fl_Text_Display::line_end()` or `Fl_Text_Buffer::line_end()`, this returns true if there is a line terminating character, and false if there's not. On the last character in the buffer, this function can't tell for certain whether a trailing space was used as a wrap point, and just guesses that it wasn't. So if an exact accounting is necessary, don't use this function.

### Parameters

| lineEndPos | index of character where the line wraps |

### Returns

1 if a `\n` character causes the line wrap

#### 11.144.4.102 wrapped_column()

```cpp
int Fl_Text_Display::wrapped_column (int row, int column) const
```

Nobody knows what this function does.

Correct a column number based on an unconstrained position (as returned by `TextDXYToUnconstrainedPosition`) to be relative to the last actual newline in the buffer before the row and column position given, rather than the last line start created by line wrapping. This is an adapter for rectangular selections and code written before continuous wrap mode, which thinks that the unconstrained column is the number of characters from the last newline. Obviously this is time consuming, because it involves character re-counting.

### Parameters

<table>
<thead>
<tr>
<th>row</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>column</td>
<td></td>
</tr>
</tbody>
</table>
Returns

something unknown

Todo What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function TextDXYToUnconstrainedPosition does not exist (nedit port?)

Todo Unicode?

11.144.4.103  wrapped_line_counter()

void Fl_Text_Display::wrapped_line_counter (  
  Fl_Text_Buffer ∗ buf,  
  int startPos,  
  int maxPos,  
  int maxLines,  
  bool startPosIsLineStart,  
  int styleBufOffset,  
  int ∗ retPos,  
  int ∗ retLines,  
  int ∗ retLineStart,  
  int ∗ retLineEnd,  
  bool countLastLineMissingNewLine = true ) const [protected]

Wrapping calculations.
Count forward from startPos to either maxPos or maxLines (whichever is reached first), and return all relevant positions and line count. The provided textBuffer may differ from the actual text buffer of the widget. In that case it must be a (partial) copy of the actual text buffer and the styleBufOffset argument must indicate the starting position of the copy, to take into account the correct style information.

Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>buf</td>
<td>The text buffer to operate on</td>
</tr>
<tr>
<td>in</td>
<td>startPos</td>
<td>Starting index position into the buffer</td>
</tr>
<tr>
<td>in</td>
<td>maxPos</td>
<td>Maximum index position into the buffer we'll reach</td>
</tr>
<tr>
<td>in</td>
<td>maxLines</td>
<td>Maximum number of lines we'll reach</td>
</tr>
<tr>
<td>in</td>
<td>startPosIsLineStart</td>
<td>Flag indicating if startPos is start of line. (If set, prevents our having to find the line start)</td>
</tr>
<tr>
<td>in</td>
<td>styleBufOffset</td>
<td>Offset index position into style buffer.</td>
</tr>
<tr>
<td>out</td>
<td>retPos</td>
<td>Position where counting ended. When counting lines, the position returned is the start of the line “maxLines” lines beyond “startPos”.</td>
</tr>
<tr>
<td>out</td>
<td>retLines</td>
<td>Number of line breaks counted</td>
</tr>
<tr>
<td>out</td>
<td>retLineStart</td>
<td>Start of the line where counting ended</td>
</tr>
<tr>
<td>out</td>
<td>retLineEnd</td>
<td>End position of the last line traversed</td>
</tr>
<tr>
<td>out</td>
<td>countLastLineMissingNewLine</td>
<td></td>
</tr>
</tbody>
</table>

11.144.4.104  wrapped_row()

int Fl_Text_Display::wrapped_row (  
  int row ) const

Nobody knows what this function does.
Correct a row number from an unconstrained position (as returned by TextDXYToUnconstrainedPosition) to a straight number of newlines from the top line of the display. Because rectangular selections are based on newlines, rather than display wrapping, and anywhere a rectangular selection needs a row, it needs it in terms of un-wrapped lines.
Parameters

row

Returns

something unknown

Todo What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function TextDXYToUnconstrainedPosition does not exist (nedit port?)

11.144.4.105 x_to_col()

double Fl_Text_Display::x_to_col ( double x ) const
Convert an x pixel position into a column number.

Parameters

x number of pixels from the left margin

Returns

an approximate column number based on the main font

11.144.4.106 xy_to_position()

int Fl_Text_Display::xy_to_position ( int X, int Y, int posType = CHARACTER_POS ) const [protected]
Translate a pixel position into a character index.
Translate window coordinates to the nearest (insert cursor or character cell) text position. The parameter posType specifies how to interpret the position: CURSOR_POS means translate the coordinates to the nearest cursor position, and CHARACTER_POS means return the position of the character closest to (X, Y).

Parameters

<table>
<thead>
<tr>
<th>X, Y</th>
<th>pixel position</th>
</tr>
</thead>
<tbody>
<tr>
<td>posType</td>
<td>CURSOR_POS or CHARACTER_POS</td>
</tr>
</tbody>
</table>

Returns

index into text buffer

11.144.4.107 xy_to_rowcol()

void Fl_Text_Display::xy_to_rowcol ( int X, int Y, int * row, int * column, int posType = CHARACTER_POS ) const [protected]
Translate pixel coordinates into row and column.
Translate window coordinates to the nearest row and column number for positioning the cursor. This, of course, makes no sense when the font is proportional, since there are no absolute columns. The parameter posType

Generated by Doxygen
specifies how to interpret the position: CURSOR_POS means translate the coordinates to the nearest position between characters, and CHARACTER_POS means translate the position to the nearest character cell.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>X,Y</td>
<td>pixel coordinates</td>
</tr>
<tr>
<td>out</td>
<td>row, column nearest row and column</td>
</tr>
<tr>
<td>posType</td>
<td>CURSOR_POS or CHARACTER_POS</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Text_Display.H
- Fl_Text_Display.cxx

This is the FLTK text editor widget.

```c
#include <Fl_Text_Editor.H>
```

attribute flags in `Style_Table_Entry.attr`

- typedef void(* Unfinished_Style_Cb) (int, void*)

### Public Member Functions

- void `add_default_key_bindings (Key_Binding **list)`
  Adds all of the default editor key bindings to the specified key binding list.

- void `add_key_binding (int key, int state, Key_Func f)`
  Adds a key of state state with the function f.

- void `add_key_binding (int key, int state, Key_Func f, Key_Binding **list)`
  Adds a key of state state with the function function to an arbitrary key binding list list.

- Key_Func `bound_key_function (int key, int state) const`  
  Returns the function associated with a key binding.

- Key_Func `bound_key_function (int key, int state, Key_Binding *list) const`  
  Returns the function associated with a key binding.

- void `default_key_function (Key_Func f)`
  Sets the default key function for unassigned keys.

- `Fl_Text_Editor (int X, int Y, int W, int H, const char *l=0)`  
  The constructor creates a new text editor widget.

- int `handle (int e) FL_OVERRIDE`  
  Event handling.

- int `insert_mode ()`  
  Gets the current insert mode; if non-zero, new text is inserted before the current cursor position.

- void `insert_mode (int b)`  
  Sets the current insert mode; if non-zero, new text is inserted before the current cursor position.

- void `remove_all_key_bindings ()`  
  Removes all of the key bindings associated with the text editor or list.

- void `remove_all_key_bindings (Key_Binding **list)`  
  Removes all of the key bindings associated with the text editor or list.

- void `remove_key_binding (int key, int state)`  
  Removes the key binding associated with the key "key" of state "state".

- void `remove_key_binding (int key, int state, Key_Binding **list)`  
  Removes the key binding associated with the key key of state state from the Key_Binding list list.

- int `tab_nav () const`  
  Check if Tab focus navigation is enabled.

- void `tab_nav (int val)`  
  Enables or disables Tab key focus navigation.

### Public Member Functions inherited from `Fl_Text_Display`

- `Fl_Text_Buffer * buffer () const`
  Gets the current text buffer associated with the text widget.

- void `buffer (Fl_Text_Buffer &buf)`  
  Sets the current text buffer associated with the text widget.

- void `buffer (Fl_Text_Buffer +buf)`  
  Attach a text buffer to display, replacing the current buffer (if any).
double col_to_x (double col) const

Convert a column number into an x pixel position.

int count_lines (int start, int end, bool start_pos_is_line_start) const

Count the number of lines between two positions.

Fl_Color cursor_color () const

Gets the text cursor color.

void cursor_color (Fl_Color n)

Sets the text cursor color.

int cursor_style () const

void cursor_style (int style)

Sets the text cursor style.

Fl_Text_Display (int X, int Y, int W, int H, const char *l=0)

Creates a new text display widget.

Fl_Color grammar_underline_color () const

Gets the underline color for style attribute ATTR_GRAMMAR.

void grammar_underline_color (Fl_Color color)

Sets the underline color for style attribute ATTR_GRAMMAR.

void hide_cursor ()

Hides the text cursor.

void highlight_data (Fl_Text_Buffer *styleBuffer, const Style_Table_Entry *styleTable, int nStyles, char unfinishedStyle, Unfinished_Style_Cb unfinishedHighlightCB, void *cbArg)

Attach (or remove) highlight information in text display and redisplay.

int in_selection (int x, int y) const

Check if a pixel position is within the primary selection.

void insert (const char *text)

Inserts "text" at the current cursor location.

int insert_position () const

void insert_position (int newPos)

Sets the position of the text insertion cursor for text display.

int line_end (int startPos, bool startPosIsLineStart) const

Returns the end of a line.

int line_start (int pos) const

Return the beginning of a line.

Fl_Align linenumber_align () const

Returns the alignment used for line numbers (if enabled).

void linenumber_align (Fl_Align val)

Set alignment for line numbers (if enabled).

Fl_Color linenumberbgcolor () const

Returns the background color used for line numbers (if enabled).

void linenumberbgcolor (Fl_Color val)

Set the background color used for line numbers (if enabled).

Fl_Color linenumberfgcolor () const

Return the foreground color used for line numbers (if enabled).

void linenumberfgcolor (Fl_Color val)

Set the foreground color used for line numbers (if enabled).

Fl_Font linenumberfont () const

Return the font used for line numbers (if enabled).

void linenumberfont (Fl_Font val)

Set the font used for line numbers (if enabled).

const char *linenumberformat () const
Returns the line number printf() format string.

• void linenumber_format (const char ∗val)
  Sets the printf() style format string used for line numbers.

• Fl_Fontsize linenumber_size () const
  Return the font size used for line numbers (if enabled).

• void linenumber_size (Fl_Fontsize val)
  Set the font size used for line numbers (if enabled).

• int linenumber_width () const
  Return the screen area width provided for line numbers.

• void linenumber_width (int width)
  Set width of screen area for line numbers.

• int move_down ()
  Moves the current insert position down one line.

• int move_left ()
  Moves the current insert position left one character.

• int move_right ()
  Moves the current insert position right one character.

• int move_up ()
  Moves the current insert position up one line.

• void next_word (void)
  Moves the current insert position right one word.

• void overstrike (const char ∗text)
  Replaces text at the current insert position.

• int position_style (int lineStartPos, int lineLen, int lineIndex) const
  Find the correct style for a character.

• int position_to_xy (int pos, int ∗x, int ∗y) const
  Convert a character index into a pixel position.

• void previous_word (void)
  Moves the current insert position left one word.

• virtual void recalc_display ()
  Recalculate the display’s visible lines and scrollbar sizes.

• void redisplay_range (int start, int end)
  Marks text from start to end as needing a redraw.

• void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Change the size of the displayed text area.

• int rewind_lines (int startPos, int nLines)
  Skip a number of lines back.

• void scroll (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

• Fl_Align scrollbar_align () const
  Gets the scrollbar alignment type.

• void scrollbar_align (Fl_Align a)
  Sets the scrollbar alignment type.

• int scrollbar_size () const
  Gets the current size of the scrollbars’ troughs, in pixels.

• void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars’ troughs to newSize, in pixels.

• int scrollbar_width () const
  Returns the global value Fl::scrollbar_size() unless a specific scrollbar_width_ has been set.

• void scrollbar_width (int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.
- **Fl_Color secondary_selection_color () const**
  Gets the background color for the secondary selection block.

- **void secondary_selection_color (Fl_Color color)**
  Sets the background color for the secondary selection block.

- **int shortcut () const**
- **void shortcut (int s)**

- **void show_cursor (int b=1)**
  Shows the text cursor.

- **void show_insert_position ()**
  Scrolls the text buffer to show the current insert position.

- **int skip_lines (int startPos, int nLines, bool startPosIsLineStart)**
  Skip a number of lines forward.

- **Fl_Color spelling_underline_color () const**
  Gets the underline color for style attribute ATTR_SPELLING.

- **void spelling_underline_color (Fl_Color color)**
  Sets the underline color for style attribute ATTR_SPELLING.

- **Fl_Text_Buffer * style_buffer () const**
  Gets the current style buffer associated with the text widget.

- **Fl_Color textcolor () const**
  Gets the default color of text in the widget.

- **void textcolor (Fl_Color n)**
  Sets the default color of text in the widget.

- **Fl_Font textfont () const**
  Gets the default font used when drawing text in the widget.

- **void textfont (Fl_Font s)**
  Sets the default font used when drawing text in the widget.

- **Fl_Fontsize textsize () const**
  Gets the default size of text in the widget.

- **void textsize (Fl_Fontsize s)**
  Sets the default size of text in the widget.

- **int word_end (int pos) const**
  Moves the insert position to the end of the current word.

- **int word_start (int pos) const**
  Moves the insert position to the beginning of the current word.

- **void wrap_mode (int wrap, int wrap_margin)**
  Set the new text wrap mode.

- **int wrapped_column (int row, int column) const**
  Nobody knows what this function does.

- **int wrapped_row (int row) const**
  Nobody knows what this function does.

- **double x_to_col (double x) const**
  Convert an x pixel position into a column number.

- **~Fl_Text_Display ()**
  Free a text display and release its associated memory.
Public Member Functions inherited from Fl_Group

- **Fl_Widget** & _ddfdesign_kludge ()
  This is for forms compatibility only.
- **void add(Fl_Widget &)**
  The widget is removed from its current group (if any) and then added to the end of this group.
- **void add(Fl_Widget *o)**
  See void Fl_Group::add(Fl_Widget &w)
- **void add_resizable(Fl_Widget &o)**
  Adds a widget to the group and makes it the resizable widget.
- **Fl_Widget *const * array () const**
  Returns a pointer to the array of children.
- **Fl_Group const * as_group () const FL_OVERRIDE**
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- **void begin ()**
  Sets the current group so you can build the widget tree by just constructing the widgets.
- **Fl_Widget *child(int n) const**
  Returns array()[n].
- **int children () const**
  Returns how many child widgets the group has.
- **void clear ()**
  Deletes all child widgets from memory recursively.
- **unsigned int clip_children ()**
  Returns the current clipping mode.
- **void clip_children(int c)**
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- **virtual int delete_child(int n)**
  Removes the widget at index from the group and deletes it.
- **void end ()**
  Exactly the same as current(this->parent()).
- **int find(const Fl_Widget &o) const**
  See int Fl_Group::find(const Fl_Widget *w) const.
- **int find(const Fl_Widget *) const**
  Searches the child array for the widget and returns the index.
- **Fl_Group (int, int, int, int, const char * =0)**
  Creates a new Fl_Group widget using the given position, size, and label string.
- **void focus(Fl_Widget *W)**
- **void forms_end ()**
  This is for forms compatibility only.
- **void init_sizes ()**
  Resets the internal array of widget sizes and positions.
- **void insert(Fl_Widget &, int i)**
  The widget is removed from its current group (if any) and then inserted into this group.
- **void insert(Fl_Widget &o, Fl_Widget *before)**
  This does insert(w, find(before)).
- **void remove (Fl_Widget &)**
  Removes a widget from the group but does not delete it.
- **void remove (Fl_Widget *o)**
  Removes the widget o from the group.
- **void remove (int index)**
Removes the widget at \textit{index} from the group but does not delete it.

- \textbf{Fl_Widget * resizable () const}
  Returns the group's resizable widget.

- \textbf{void resizable (Fl_Widget &o)}
  Sets the group's resizable widget.

- \textbf{void resizable (Fl_Widget *o)}
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- \textbf{virtual \~Fl_Group ()}
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- \textbf{void \_clear_fullscreen ()}
- \textbf{void \_set_fullscreen ()}
- \textbf{void activate ()}
  Activates the widget.

- \textbf{unsigned int active () const}
  Returns whether the widget is active.

- \textbf{int active_r () const}
  Returns whether the widget and all of its parents are active.

- \textbf{Fl_Align align () const}
  Gets the label alignment.

- \textbf{void align (Fl_Align alignment)}
  Sets the label alignment.

- \textbf{long argument () const}
  Gets the current user data (long) argument that is passed to the callback function.

- \textbf{void argument (long v)}
  Sets the current user data (long) argument that is passed to the callback function.

- \textbf{virtual class Fl_Gl_Window * as_gl_window ()}
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- \textbf{virtual class Fl_Gl_Window const * as_gl_window () const}

- \textbf{virtual Fl_Window * as_window ()}
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- \textbf{virtual Fl_Window const * as_window () const}

- \textbf{void bind_deimage (Fl_Image *img)}
  Sets the image to use as part of the widget label when in the inactive state.

- \textbf{void bind_deimage (int f)}
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- \textbf{void bind_image (Fl_Image *img)}
  Sets the image to use as part of the widget label when in the active state.

- \textbf{void bind_image (int f)}
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- \textbf{Fl_Boxtype box () const}
  Gets the box type of the widget.

- \textbf{void box (Fl_Boxtype new_box)}
  Sets the box type for the widget.

- \textbf{Fl_Callback_p callback () const}
  Gets the current callback function for the widget.

- \textbf{void callback (Fl_Callback &cb)}
  Sets the current callback function for the widget.

- \textbf{void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto\_free)}
Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)
  Sets the current label.

- void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *wgt, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *wgt, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labelfont () const
• void labeltype (Fl_Labeltype a)
  
  \textit{Sets the label type.}

• void measure_label (int &ww, int &hh) const
  
  \textit{Sets width \textit{ww} and height \textit{hh} accordingly with the label size.}

• bool needs_keyboard () const
  
  \textit{Returns whether this widget needs a keyboard.}

• void needs_keyboard (bool needs)
  
  \textit{Sets whether this widget needs a keyboard.}

• unsigned int output () const
  
  \textit{Returns if a widget is used for output only.}

• Fl_Group *parent () const
  
  \textit{Returns a pointer to the parent widget.}

• void parent (Fl_Group *p)
  
  \textit{Internal use only - "for hacks only".}

• void position (int X, int Y)
  
  \textit{Repositions the window or widget.}

• void redraw ()
  
  \textit{Schedules the drawing of the widget.}

• void redraw_label ()
  
  \textit{Schedules the drawing of the label.}

• Fl_Color selection_color () const
  
  \textit{Gets the selection color.}

• void selection_color (Fl_Color a)
  
  \textit{Sets the selection color.}

• void set_active ()
  
  \textit{Marks the widget as active without sending events or changing focus.}

• void set_changed ()
  
  \textit{Marks the value of the widget as changed.}

• void set_output ()
  
  \textit{Sets a widget to output only.}

• void set_visible ()
  
  \textit{Makes the widget visible.}

• void set_visible_focus ()
  
  \textit{Enables keyboard focus navigation with this widget.}

• int shortcut_label () const
  
  \textit{Returns whether the widget's label uses \textit{\&} to indicate shortcuts.}

• void shortcut_label (int value)
  
  \textit{Sets whether the widget's label uses \textit{\&} to indicate shortcuts.}

• virtual void show ()
  
  \textit{Makes a widget visible.}

• void size (int W, int H)
  
  \textit{Changes the size of the widget.}

• int take_focus ()
  
  \textit{Gives the widget the keyboard focus.}

• unsigned int takesevents () const
  
  \textit{Returns if the widget is able to take events.}

• int test_shortcut ()
  
  \textit{Returns true if the widget's label contains the entered \textit{\&x} shortcut.}

• const char *tooltip () const
  
  \textit{Gets the current tooltip text.}
• void **tooltip** (const char *text)
  
  Sets the current tooltip text.

• Fl_Window *top_window () const
  
  Returns a pointer to the top-level window for the widget.

• Fl_Window *top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  
  Gets the widget type.

• void type (uchar t)
  
  Sets the widget type.

• int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void *user_data () const
  
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  
  Sets the user data for this widget.

• void user_data (void *v)
  
  Sets the user data for this widget.

• unsigned int visible () const
  
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  
  Modifies keyboard focus navigation.

• int visible_r () const
  
  Returns whether a widget and all its parents are visible.

• int w () const
  
  Gets the widget width.

• Fl_When when () const
  
  Returns the conditions under which the callback is called.

• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Window *window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

**Static Public Member Functions**

• static int kf_backspace (int c, Fl_Text_Editor *e)
  
  Does a backspace for key \texttt{'c'} in the current buffer of editor \texttt{'e'}.

• static int kf_c_s_move (int c, Fl_Text_Editor *e)
  
  Extends the current selection in the direction indicated by control key \texttt{'c'} in editor \texttt{'e'}.

• static int kf_copy (int c, Fl_Text_Editor *e)
  
  Does a copy of selected text or the current character in the current buffer of editor \texttt{'e'}.

• static int kf_ctrl_move (int c, Fl_Text_Editor *e)
  
  Moves the current text cursor in the direction indicated by control key \texttt{'c'} in editor \texttt{'e'}.
• static int kf_cut (int c, Fl_Text_Editor *e)
  
  Does a cut of selected text in the current buffer of editor 'e'.

• static int kf_default (int c, Fl_Text_Editor *e)
  
  Inserts the text associated with key 'c' in editor 'e'.

• static int kf_delete (int c, Fl_Text_Editor *e)
  
  Does a delete of selected text or the current character in the current buffer of editor 'e'.

• static int kf_down (int c, Fl_Text_Editor *e)
  
  Moves the text cursor one line down for editor 'e'.

• static int kf_end (int c, Fl_Text_Editor *e)
  
  Moves the text cursor to the end of the current line in editor 'e'.

• static int kf_enter (int c, Fl_Text_Editor *e)
  
  Inserts a newline for key 'c' at the current cursor position in editor 'e'.

• static int kf_home (int, Fl_Text_Editor *e)
  
  Moves the text cursor to the beginning of the current line in editor 'e'.

• static int kf_ignore (int c, Fl_Text_Editor *e)
  
  Ignores the key 'c' in editor 'e'.

• static int kf_insert (int c, Fl_Text_Editor *e)
  
  Toggles the insert mode for editor 'e'.

• static int kf_left (int c, Fl_Text_Editor *e)
  
  Moves the text cursor one character to the left in editor 'e'.

• static int kf_m_s_move (int c, Fl_Text_Editor *e)
  
  Extends the current selection in the direction indicated by meta key 'c' in editor 'e'.

• static int kf_meta_move (int c, Fl_Text_Editor *e)
  
  Moves the current text cursor in the direction indicated by meta key 'c' in editor 'e'.

• static int kf_move (int c, Fl_Text_Editor *e)
  
  Moves the text cursor in the direction indicated by key 'c' in editor 'e'.

• static int kf_page_down (int c, Fl_Text_Editor *e)
  
  Moves the text cursor down one page for editor 'e'.

• static int kf_page_up (int c, Fl_Text_Editor *e)
  
  Moves the text cursor up one page for editor 'e'.

• static int kf_paste (int c, Fl_Text_Editor *e)
  
  Does a paste of selected text in the current buffer of editor 'e'.

• static int kf_redo (int c, Fl_Text_Editor *e)
  
  Redo last undo action.

• static int kf_right (int c, Fl_Text_Editor *e)
  
  Moves the text cursor one character to the right for editor 'e'.

• static int kf_select_all (int c, Fl_Text_Editor *e)
  
  Selects all text in the current buffer in editor 'e'.

• static int kf_shift_move (int c, Fl_Text_Editor *e)
  
  Extends the current selection in the direction of key 'c' in editor 'e'.

• static int kf_undo (int c, Fl_Text_Editor *e)
  
  Undo last edit in the current buffer of editor 'e'.

• static int kf_up (int c, Fl_Text_Editor *e)
  
  Moves the text cursor one line up for editor 'e'.

Static Public Member Functions inherited from Fl_Group

• static Fl_Group * current ()
  
  Returns the currently active group.

• static void current (Fl_Group *g)
  
  Sets the current group.
Static Public Member Functions inherited from **Fl_Widget**

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Member Functions

- int handle_key ()
  
  Handles a key press in the editor.

- void maybe_do_callback (Fl_Callback_Reason reason=FL_REASON_CHANGED)
  
  does or does not a callback according to changed() and when() settings

Protected Member Functions inherited from **Fl_Text_Display**

- void absolute_top_line_number (int oldFirstChar)
  
  Re-calculate absolute top line number for a change in scroll position.

- void calc_last_char ()
  
  Update last display character index.

- void calc_line_starts (int startLine, int endLine)
  
  Update the line starts array.

- void clear_rect (int style, int x, int y, int width, int height) const
  
  Clear a rectangle with the appropriate background color for style.

- void display_insert ()
  
  Scroll the display to bring insertion cursor into view.

- void draw () FL_OVERRIDE
  
  Draw the widget.

- void draw_cursor (int, int)
  
  Draw a cursor with top center at X, Y.

- void draw_line_numbers (bool clearAll)
  
  Refresh the line number area.

- void draw_range (int start, int end)
  
  Draw a range of text.

- void draw_string (int style, int x, int y, int toX, const char ∗string, int nChars) const
  
  Draw a text segment in a single style.

- void draw_text (int X, int Y, int W, int H)
  
  Refresh a rectangle of the text display.

- void draw_vline (int visLineNum, int leftClip, int rightClip, int leftCharIndex, int rightCharIndex)
  
  Draw a single line of text.

- int empty_vlines () const
  
  Return true if there are lines visible with no corresponding buffer text.

- void extend_range_for_styles (int ∗start, int ∗end)
  
  I don't know what this does!

- void find_line_end (int pos, bool start_pos_is_line_start, int ∗lineEnd, int ∗nextLineStart) const
  
  Finds both the end of the current line and the start of the next line.

- void find_wrap_range (const char ∗deletedText, int pos, int nInserted, int nDeleted, int ∗modRangeStart, int ∗modRangeEnd, int ∗linesInserted, int ∗linesDeleted)
  
  Wrapping calculations.

- int find_x (const char ∗s, int len, int style, int x) const

Generated by Doxygen
Find the index of the character that lies at the given x position / closest cursor position.

- int `get_absolute_top_line_number` () const
  Returns the absolute (non-wrapped) line number of the first line displayed.

- int `handle_rmb` (int readonly)
  Handle right mouse button down events.

- int `handle_vline` (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const
  Universal pixel machine.

- int `longest_vline` () const
  Find the longest line of all visible lines.

- void `maintain_absolute_top_line_number` (int state)
  Line numbering stuff, currently unused.

- int `maintaining_absolute_top_line_number` () const
  Returns true if a separate absolute top line number is being maintained.

- void `measure_deleted_lines` (int pos, int nDeleted)
  Wrapping calculations.

- double `measure_proportional_character` (const char ∗s, int colNum, int pos) const
  Wrapping calculations.

- int `measure_vline` (int visLineNum) const
  Returns the width in pixels of the displayed line pointed to by "visLineNum".

- void `offset_line_starts` (int newTopLineNum)
  Offset line start counters for a new vertical scroll position.

- int `position_to_line` (int pos, int ∗lineNum) const
  Convert a position index into a line number offset.

- int `position_to_linecol` (int pos, int ∗lineNum, int ∗column) const
  Find the line and column number of position pos.

- void `reset_absolute_top_line_number` ()
  Reestablish the absolute (non-wrapped) top line number.

- int `scroll_` (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

- double `string_width` (const char ∗string, int length, int style) const
  Find the width of a string in the font of a particular style.

- void `update_h_scrollbar` ()
  Update horizontal scrollbar.

- void `update_line_starts` (int pos, int charsInserted, int charsDeleted, int linesInserted, int linesDeleted, int ∗scrolled)
  Update line start arrays and variables.

- void `update_v_scrollbar` ()
  Update vertical scrollbar.

- int `vline_length` (int visLineNum) const
  Count number of bytes in a visible line.

- int `wrap_uses_character` (int lineEndPos) const
  Check if the line break is caused by a newline or by line wrapping.

- void `wrapped_line_counter` (Fl_Text_Buffer ∗buf, int startPos, int maxPos, int maxLines, bool startPosIs←false, LineStart, int styleBufOffset, int ∗retPos, int ∗retLines, int ∗retLineStart, int ∗retLineEnd, bool countLast←false, LineMissingNewLabel=true) const
  Wrapping calculations.

- int `xy_to_position` (int x, int y, int PosType=CHARACTER_POS) const
  Translate a pixel position into a character index.

- void `xy_to_rowcol` (int x, int y, int ∗row, int ∗column, int PosType=CHARACTER_POS) const
  Translate pixel coordinates into row and column.
Protected Member Functions inherited from Fl_Group

- `Fl_Rect * bounds ()`
  
  Returns the internal array of widget sizes and positions.

- `void draw_child (Fl_Widget &widget) const`
  
  Forces a child to redraw.

- `void draw_children ()`
  
  Draws all children of the group.

- `void draw_outside_label (const Fl_Widget &widget) const`
  
  Parents normally call this to draw outside labels of child widgets.

- `virtual int on_insert (Fl_Widget *, int)`
  
  Allow derived groups to act when a widget is added as a child.

- `virtual int on_move (int, int)`
  
  Allow derived groups to act when a widget is moved within the group.

- `virtual void on_remove (int)`
  
  Allow derived groups to act when a child widget is removed from the group.

- `int * sizes ()`
  
  Returns the internal array of widget sizes and positions.

- `void update_child (Fl_Widget &widget) const`
  
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- `void clear_flag (unsigned int c)`
  
  Clears a flag in the flags mask.

- `void draw_backdrop () const`
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- `void draw_box () const`
  
  Draws the widget box according its box style.

- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  
  Draws a box of type t, of color c at the widget's position and size.

- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- `void draw_focus () const`
  
  Draws a focus rectangle around the widget.

- `void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const`
  
  Draws a focus rectangle around the widget.

- `void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  
  Draws a focus box for the widget at the given position and size.

- `void draw_label () const`
  
  Draws the widget's label at the defined label position.

- `void draw_label (int, int, int, int) const`
  
  Draws the label in an arbitrary bounding box.

- `Fl_Widget (int x, int y, int w, int h, const char *label=0L)`
  
  Creates a widget at the given position and size.

- `unsigned int flags () const`
  
  Gets the widget flags mask.

- `void h (int v)`
  
  Internal use only.

- `void set_flag (unsigned int c)`
  
  Sets a flag in the flags mask.

- `void w (int v)`
void x (int v)
  Internal use only.

void y (int v)
  Internal use only.

Static Protected Attributes

- static Key_Binding * global_key_bindings
  Global key binding list.

Additional Inherited Members

Protected Types inherited from Fl_Text_Display

- enum {
    DRAW_LINE , FIND_INDEX , FIND_INDEX_FROM_ZERO , GET_WIDTH ,
    FIND_CURSOR_INDEX }

Protected Types inherited from Fl_Widget

- enum {
    INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,

    AUTO_DELETE_USER_DATA = 1<<23 , MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Static Protected Member Functions inherited from Fl_Text_Display

- static void buffer_modified_cb (int pos, int nInserted, int nDeleted, int nRestyled, const char *deletedText, void *cbArg)
  This is called whenever the buffer is modified.

- static void buffer_predelete_cb (int pos, int nDeleted, void *cbArg)
  This is called before any characters are deleted.

- static void h_scrollbar_cb (Fl_Scrollbar *w, Fl_Text_Display *d)
  Callback for drag or valueChanged on horizontal scrollbar.

- static void scroll_timer_cb (void *)
  Timer callback for scroll events.

- static void v_scrollbar_cb (Fl_Scrollbar *w, Fl_Text_Display *d)
  Callback for drag or valueChanged on vertical scrollbar.

11.145.1 Detailed Description

This is the FLTK text editor widget. It allows the user to edit multiple lines of text and supports highlighting and scrolling. The buffer that is displayed in the widget is managed by the Fl_Text_Buffer class.

11.145.2 Member Function Documentation

11.145.2.1 add_key_binding()

void Fl_Text_Editor::add_key_binding ( int key, int state, Key_Func function, Key_Binding ** list )

Adds a key of state state with the function function to an arbitrary key binding list list. This can be used in derived classes to add global key bindings by using the global (static) Key_Binding list Fl_Text_Editor::global_key_bindings.

11.145.2.2 handle()

int Fl_Text_Editor::handle ( int e ) [virtual]

Event handling. Reimplemented from Fl_Text_Display.

11.145.2.3 insert_mode() [1/2]

int Fl_Text_Editor::insert_mode ( ) [inline]

Gets the current insert mode; if non-zero, new text is inserted before the current cursor position. Otherwise, new text replaces text at the current cursor position.

11.145.2.4 insert_mode() [2/2]

void Fl_Text_Editor::insert_mode ( int b ) [inline]

Sets the current insert mode; if non-zero, new text is inserted before the current cursor position. Otherwise, new text replaces text at the current cursor position.

11.145.2.5 kf_backspace()

int Fl_Text_Editor::kf_backspace ( int c, Fl_Text_Editor * e ) [static]

Does a backspace for key 'c' in the current buffer of editor 'e'. Any current selection is deleted. Otherwise, the character left is deleted and the cursor moved. The key value 'c' is currently unused.
11.145.2.6 kf_c_s_move()

```cpp
int Fl_Text_Editor::kf_c_s_move (int c, Fl_Text_Editor * e) [static]
```

Extends the current selection in the direction indicated by control key 'c' in editor 'e'.

See also

```
kf_ctrl_move().
```

11.145.2.7 kf_copy()

```cpp
int Fl_Text_Editor::kf_copy (int c, Fl_Text_Editor * e) [static]
```

Does a copy of selected text or the current character in the current buffer of editor 'e'.
The key value 'c' is currently unused.

11.145.2.8 kf_ctrl_move()

```cpp
int Fl_Text_Editor::kf_ctrl_move (int c, Fl_Text_Editor * e) [static]
```

Moves the current text cursor in the direction indicated by control key 'c' in editor 'e'.

Supported values for 'c' are currently:

- FL_Home -- moves the cursor to the beginning of the document
- FL_End -- moves the cursor to the end of the document
- FL_Left -- moves the cursor left one word
- FL_Right -- moves the cursor right one word
- FL_Up -- scrolls up one line, without moving cursor
- FL_Down -- scrolls down one line, without moving cursor
- FL_Page_Up -- moves the cursor to the beginning of the top line on the current page
- FL_Page_Down -- moves the cursor to the beginning of the last line on the current page

11.145.2.9 kf_cut()

```cpp
int Fl_Text_Editor::kf_cut (int c, Fl_Text_Editor * e) [static]
```

Does a cut of selected text in the current buffer of editor 'e'.
The key value 'c' is currently unused.

11.145.2.10 kf_default()

```cpp
int Fl_Text_Editor::kf_default (int c, Fl_Text_Editor * e) [static]
```

Inserts the text associated with key 'c' in editor 'e'.
Honors the current selection and insert/overstrike mode.

11.145.2.11 kf_delete()

```cpp
int Fl_Text_Editor::kf_delete (int c, Fl_Text_Editor * e) [static]
```

Does a delete of selected text or the current character in the current buffer of editor 'e'.
The key value 'c' is currently unused.
11.145.2.12 kf_down()

int Fl_Text_Editor::kf_down (  
  int c,  
  Fl_Text_Editor * e ) [static]

Moves the text cursor one line down for editor 'e'.  
Same as kf_move(FL_Down, e). The key value 'c' is currently unused.

11.145.2.13 kf_end()

int Fl_Text_Editor::kf_end (  
  int c,  
  Fl_Text_Editor * e ) [static]

Moves the text cursor to the end of the current line in editor 'e'.  
Same as kf_move(FL_End, e). The key value 'c' is currently unused.

11.145.2.14 kf_enter()

int Fl_Text_Editor::kf_enter (  
  int c,  
  Fl_Text_Editor * e ) [static]

Inserts a newline for key 'c' at the current cursor position in editor 'e'.  
The key value 'c' is currently unused.

11.145.2.15 kf_home()

int Fl_Text_Editor::kf_home (  
  int c,  
  Fl_Text_Editor * e ) [static]

Moves the text cursor to the beginning of the current line in editor 'e'.  
Same as kf_move(FL_Home, e). The key value 'c' is currently unused.

11.145.2.16 kf_ignore()

int Fl_Text_Editor::kf_ignore (  
  int c,  
  Fl_Text_Editor * e ) [static]

Ignores the key 'c' in editor 'e'.  
This method can be used as a keyboard binding to disable a key that might otherwise be handled or entered as text.  
An example would be disabling FL_Escape, so that it isn't added to the buffer when invoked by the user.

11.145.2.17 kf_insert()

int Fl_Text_Editor::kf_insert (  
  int c,  
  Fl_Text_Editor * e ) [static]

Toggles the insert mode for editor 'e'.  
The key value 'c' is currently unused.

11.145.2.18 kf_left()

int Fl_Text_Editor::kf_left (  
  int c,  
  Fl_Text_Editor * e ) [static]

Moves the text cursor one character to the left in editor 'e'.  
Same as kf_move(FL_Left, e). The key value 'c' is currently unused.
11.145.2.19  **kf_m_s_move()**

```cpp
int Fl_Text_Editor::kf_m_s_move ( int c,
                                  Fl_Text_Editor * e ) [static]
```

Extends the current selection in the direction indicated by meta key 'c' in editor 'e'.

See also

**kf_meta_move().**

11.145.2.20  **kf_meta_move()**

```cpp
int Fl_Text_Editor::kf_meta_move ( int c,
                                    Fl_Text_Editor * e ) [static]
```

Moves the current text cursor in the direction indicated by meta key 'c' in editor 'e'.

Supported values for 'c' are currently:

- **FL_Up** -- moves cursor to the beginning of the current document
- **FL_Down** -- moves cursor to the end of the current document
- **FL_Left** -- moves the cursor to the beginning of the current line
- **FL_Right** -- moves the cursor to the end of the current line

11.145.2.21  **kf_move()**

```cpp
int Fl_Text_Editor::kf_move ( int c,
                              Fl_Text_Editor * e ) [static]
```

Moves the text cursor in the direction indicated by key 'c' in editor 'e'.

Supported values for 'c' are currently:

- **FL_Home** -- moves the cursor to the beginning of the current line
- **FL_End** -- moves the cursor to the end of the current line
- **FL_Left** -- moves the cursor left one character
- **FL_Right** -- moves the cursor right one character
- **FL_Up** -- moves the cursor up one line
- **FL_Down** -- moves the cursor down one line
- **FL_Page_Up** -- moves the cursor up one page
- **FL_Page_Down** -- moves the cursor down one page

11.145.2.22  **kf_page_down()**

```cpp
int Fl_Text_Editor::kf_page_down ( int c,
                                   Fl_Text_Editor * e ) [static]
```

Moves the text cursor down one page for editor 'e'.

Same as kf_move(FL_Page_Down, e). The key value 'c' is currently unused.

11.145.2.23  **kf_page_up()**

```cpp
int Fl_Text_Editor::kf_page_up ( int c,
                                Fl_Text_Editor * e ) [static]
```

Moves the text cursor up one page for editor 'e'.

Same as kf_move(FL_Page_Up, e). The key value 'c' is currently unused.

11.145.2.24  **kf_paste()**

```cpp
int Fl_Text_Editor::kf_paste ( int c,
                               Fl_Text_Editor * e ) [static]
```

Does a paste of selected text in the current buffer of editor 'e'.

Any current selection is replaced with the pasted content. The key value 'c' is currently unused.
11.145.2.25 kf_redo()

int Fl_Text_Editor::kf_redo (  
    int c,  
    Fl_Text_Editor * e ) [static]

Redo last undo action.  
Also deselects previous selection. The key value 'c' is currently unused.

11.145.2.26 kf_right()

int Fl_Text_Editor::kf_right (  
    int c,  
    Fl_Text_Editor * e ) [static]

Moves the text cursor one character to the right for editor 'e'.  
Same as kf_move(FL_Right, e). The key value 'c' is currently unused.

11.145.2.27 kf_select_all()

int Fl_Text_Editor::kf_select_all (  
    int c,  
    Fl_Text_Editor * e ) [static]

Selects all text in the current buffer in editor 'e'.  
The key value 'c' is currently unused.

11.145.2.28 kf_shift_move()

int Fl_Text_Editor::kf_shift_move (  
    int c,  
    Fl_Text_Editor * e ) [static]

Extends the current selection in the direction of key 'c' in editor 'e'.

See also

    kf_move()

11.145.2.29 kf_undo()

int Fl_Text_Editor::kf_undo (  
    int c,  
    Fl_Text_Editor * e ) [static]

Undo last edit in the current buffer of editor 'e'.  
Also deselects previous selection. The key value 'c' is currently unused.

11.145.2.30 kf_up()

int Fl_Text_Editor::kf_up (  
    int c,  
    Fl_Text_Editor * e ) [static]

Moves the text cursor one line up for editor 'e'.  
Same as kf_move(FL_Up, e). The key value 'c' is currently unused.

11.145.2.31 remove_key_binding()

void Fl_Text_Editor::remove_key_binding (  
    int key,  
    int state,  
    Key_Binding ** list )

Removes the key binding associated with the key key of state state from the Key_Binding list list.  
This can be used in derived classes to remove global key bindings by using the global (static) Key_Binding list Fl_Text_Editor::global_keyBindings.
11.145.2.32  tab_nav() [1/2]

int Fl_Text_Editor::tab_nav ( ) const
Check if Tab focus navigation is enabled.
If disabled (default), hitting Tab inserts a tab character into the editor buffer.
If enabled, hitting Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget.

Returns
if Tab inserts tab characters or moves the focus

Return values

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Tab inserts tab characters (default)</td>
</tr>
<tr>
<td>1</td>
<td>Tab navigation is enabled.</td>
</tr>
</tbody>
</table>

See also

    tab_nav(int), Fl::OPTION_ARROW_FOCUS.

Version

1.3.4 ABI feature

11.145.2.33  tab_nav() [2/2]

void Fl_Text_Editor::tab_nav ( int val )
Enables or disables Tab key focus navigation.
When disabled (default), tab characters are inserted into Fl_Text_Editor. Only the mouse can change focus.
This behavior is desirable when Fl_Text_Editor is used, e.g., in a source code editor.
When enabled, Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget.
This behavior is desirable when Fl_Text_Editor is used e.g., in a database input form.
Currently, this method is implemented as a convenience method that adjusts the key bindings for the Tab key.
This implementation detail may change in the future. Know that changing the editor's key bindings for Tab and Shift-Tab
may affect tab navigation.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>If val is 0, Tab inserts a tab character (default).</td>
</tr>
<tr>
<td>1</td>
<td>If val is 1, Tab navigates widget focus.</td>
</tr>
</tbody>
</table>

See also

    tab_nav(), Fl::OPTION_ARROW_FOCUS.

11.145.3  Member Data Documentation

11.145.3.1  global_key_bindings

Key_Binding* Fl_Text_Editor::global_keyBindings [static], [protected]
Global key binding list.
Derived classes can add key bindings for all Fl_Text_Editor widgets by adding a Key_Binding to this list.
See also

```c
add_key_binding(int key, int state, Key_Func f, Key_Binding** list);
```

The documentation for this class was generated from the following files:

- Fl_Text_Editor.H
- Fl_Text_Editor.cxx

### 11.146 Fl_Text_Selection Class Reference

This is an internal class for Fl_Text_Buffer to manage text selections.

```c
#include <Fl_Text_Buffer.H>
```

#### Public Member Functions

- **int end () const**
  
  Returns the byte offset to the character after the last selected character.

- **int includes (int pos) const**
  
  Returns true if position `pos` is in the Fl_Text_Selection.

- **int length () const**
  
  Returns the size in bytes of the selection.

- **int position (int *startpos, int *endpos) const**
  
  Returns the status and the positions of this selection.

- **bool selected () const**
  
  Returns true if any text is selected.

- **void selected (bool b)**
  
  Modifies the 'selected' flag.

- **int selected (int *startpos, int *endpos) const**
  
  Returns the status and the positions of this selection.

- **void set (int startpos, int endpos)**
  
  Sets the selection range.

- **int start () const**
  
  Returns the byte offset to the first selected character.

- **void update (int pos, int nDeleted, int nInserted)**
  
  Updates a selection after text was modified.

#### Protected Attributes

- **int mEnd**
  
  byte offset to the character after the last selected character

- **bool mSelected**
  
  this flag is set if any text is selected

- **int mStart**
  
  byte offset to the first selected character

#### Friends

- **class Fl_Text_Buffer**
11.146.1 Detailed Description

This is an internal class for Fl_Text_Buffer to manage text selections. All methods use byte (not UTF-8 character) offsets and start at 0. This class works correctly with UTF-8 strings assuming that the parameters for all calls are on character boundaries.

If the selection is inactive (not currently used), then selected() returns false and start() and end() return 0 (zero). The stored offsets are in ascending order, hence the following conditions are true (pseudo code):

```cpp
if ( !selected() ) : (start() == 0) && (end() == 0) && (start() == end())
if ( selected() ) : start() < end()
always : 0 <= start() <= end()
always : length() == end() - start()
```

The selection size in bytes can always (unconditionally) be computed by

```cpp
int size = sel->end() - sel->start();
```

See also

length()

Note

The protected member variables mStart and mEnd are not necessarily 0 (zero) if mSelected == false because they are not cleared when selected(false) is called (as of Jul 2017). This may be changed in the future.

11.146.2 Member Function Documentation

11.146.2.1 end()

```cpp
int Fl_Text_Selection::end ( ) const [inline]
```

Returns the byte offset to the character after the last selected character. The returned offset is only valid if selected() returns true (non-zero). The offset is 0 if no text is selected (since FLTK 1.4.0).

Note

In FLTK 1.3.x the returned offset could be non-zero even if selected() would have returned 0.

Returns

byte offset or 0 if not selected.

11.146.2.2 includes()

```cpp
int Fl_Text_Selection::includes ( int pos ) const
```

Returns true if position pos is in the Fl_Text_Selection. pos must be at a character boundary.

11.146.2.3 length()

```cpp
int Fl_Text_Selection::length ( ) const [inline]
```

Returns the size in bytes of the selection. This is a convenience method. It always returns the same as end() - start() and it returns 0 if selected() == false.

Returns

size in bytes or 0 if not selected.

Since

FLTK 1.4.0
11.146.2.4 position()

```c
int Fl_Text_Selection::position (
    int * startpos,
    int * endpos ) const [inline]
```

**Deprecated** "in 1.4.0 - use selected(startpos, endpos) instead"

11.146.2.5 selected() [1/3]

```c
bool Fl_Text_Selection::selected ( ) const [inline]
```

Returns true if any text is selected.

Returns

true if any text has been selected, or false if no text is selected.

11.146.2.6 selected() [2/3]

```c
void Fl_Text_Selection::selected ( 
    bool b ) [inline]
```

Modifies the 'selected' flag.

**Parameters**

| b   | new flag |

11.146.2.7 selected() [3/3]

```c
int Fl_Text_Selection::selected ( 
    int * startpos,
    int * endpos ) const
```

Returns the status and the positions of this selection.

This method returns the same as `selected()` as an int (0 or 1) in its return value and the offsets to the start of the selection in `startpos` and to the byte after the last selected character in `endpos`, if `selected()` is true. If `selected()` is false, both offsets are set to 0.

**Note**

In FLTK 1.3.x startpos and endpos were not modified if `selected()` was false.

**Parameters**

| startpos | return byte offset to first selected character |
| endpos   | return byte offset pointing after last selected character |

**Returns**

whether the selection is active (selected()) or not

**Return values**

| 0   | if not selected |
| 1   | if selected    |
11.146.2.8 set()

void Fl_Text_Selection::set (  
    int startpos,  
    int endpos )

Sets the selection range.  
startpos and endpos must be at a character boundary.  
If startpos != endpos selected() is set to true, else to false.  
If startpos is greater than endpos they are swapped so that startpos <= endpos.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>startpos</th>
<th>byte offset to first selected character</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>endpos</td>
<td>byte offset pointing after last selected character</td>
</tr>
</tbody>
</table>

11.146.2.9 start()

int Fl_Text_Selection::start ( ) const [inline]

Returns the byte offset to the first selected character.  
The returned offset is only valid if selected() returns true. If the selection is not valid the returned offset is 0 since FLTK 1.4.0.  

Note

In FLTK 1.3.x the returned offset could be non-zero even if selected() would have returned 0.

Returns  
byte offset or 0 if not selected.

11.146.2.10 update()

void Fl_Text_Selection::update (  
    int pos,  
    int nDeleted,  
    int nInserted )

Updates a selection after text was modified.  
Updates an individual selection for changes in the corresponding text.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>byte offset into text buffer at which the change occurred</th>
</tr>
</thead>
<tbody>
<tr>
<td>nDeleted</td>
<td>number of bytes deleted from the buffer</td>
</tr>
<tr>
<td>nInserted</td>
<td>number of bytes inserted into the buffer</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Text_Buffer.H
- Fl_Text_Buffer.cxx

11.147 Fl_Tile Class Reference

The Fl_Tile class lets you resize its children by dragging the border between them.
Inheritance diagram for Fl_Tile:

```
<table>
<thead>
<tr>
<th>Fl_Widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fl_Group</td>
</tr>
<tr>
<td>Fl_Tile</td>
</tr>
</tbody>
</table>
```

Classes

- struct Size_Range

Public Member Functions

- virtual void `drag_intersection` (int oldx, int oldy, int newx, int newy)
  
  Drags the intersection at \((oldx, oldy)\) to \((newx, newy)\).
- `Fl_Tile` (int X, int Y, int W, int H, const char ∗L=0)
  
  Creates a new `Fl_Tile` widget using the given position, size, and label string.
- int `handle` (int event) FL_OVERRIDE
  
  Handles the specified event.
- void `init_size_range` (int default_min_w=-1, int default_min_h=-1)
  
  Initialize the size range mode of `Fl_Tile` and set the default minimum width and height.
- virtual void `move_intersection` (int oldx, int oldy, int newx, int newy)
  
  Drags the intersection at \((oldx, oldy)\) to \((newx, newy)\).
- void `position` (int oldx, int oldy, int newx, int newy)
- void `position` (int x, int y)
- void `resize` (int X, int Y, int W, int H) FL_OVERRIDE
  
  Resizes the `Fl_Tile` widget and its children.
- void `size_range` (Fl_Widget ∗w, int minw, int minh, int maxw=0x7FFFFFFF, int maxh=0x7FFFFFFF)
  
  Set the allowed size range for the give child widget.
- void `size_range` (int index, int minw, int minh, int maxw=0x7FFFFFFF, int maxh=0x7FFFFFFF)
  
  Set the allowed size range for the child at the given index.
- ∼`Fl_Tile` () FL_OVERRIDE
  
  Destructor.

Public Member Functions inherited from Fl_Group

- `Fl_Widget` ∗& `_ddfdesign_kludge` ()
  
  This is for forms compatibility only.
- void `add` (Fl_Widget ∗&)
  
  The widget is removed from its current group (if any) and then added to the end of this group.
- void `add` (Fl_Widget ∗o)
  
  See void Fl_Group::add(Fl_Widget &w)
- void `add_resizable` (Fl_Widget ∗&w)
  
  Adds a widget to the group and makes it the resizable widget.
- `Fl_Widget` ∗const ∗ `array` () const
  
  Returns a pointer to the array of children.
- `Fl_Group` ∗const ∗ `as_group` () const FL_OVERRIDE
- `Fl_Group` ∗ `as_group` () FL_OVERRIDE
  
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.
- void `begin` ()
Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget ∗ child (int n) const**
  Returns array()[n].
- **int children () const**
  Returns how many child widgets the group has.
- **void clear ()**
  Deletes all child widgets from memory recursively.
- **unsigned int clip_children ()**
  Returns the current clipping mode.
- **void clip_children (int c)**
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- **virtual int delete_child (int n)**
  Removes the widget at index from the group and deletes it.
- **void end ()**
  Exactly the same as current(this->parent()).
- **int find (const Fl_Widget &o) const**
  See int Fl_Group::find(const Fl_Widget ∗w) const.
- **int find (const Fl_Widget ∗) const**
  Searches the child array for the widget and returns the index.
- **Fl_Group (int, int, int, int, const char ∗=0)**
  Creates a new Fl_Group widget using the given position, size, and label string.
- **void focus (Fl_Widget ∗W)**
- **void forms_end ()**
  This is for forms compatibility only.
- **void init_sizes ()**
  Resets the internal array of widget sizes and positions.
- **void insert (Fl_Widget &, int i)**
  The widget is removed from its current group (if any) and then inserted into this group.
- **void insert (Fl_Widget &o, Fl_Widget ∗before)**
  This does insert(w, find(before)).
- **void remove (Fl_Widget &)**
  Removes a widget from the group but does not delete it.
- **void remove (Fl_Widget ∗o)**
  Removes the widget o from the group.
- **void remove (int index)**
  Removes the widget at index from the group but does not delete it.
- **Fl_Widget ∗ resizable () const**
  Returns the group's resizable widget.
- **void resizable (Fl_Widget &o)**
  Sets the group's resizable widget.
- **void resizable (Fl_Widget ∗o)**
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- **virtual ~Fl_Group ()**
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output ()**
  Sets a widget to accept input.

- **void clear_visible ()**
  Hides the widget.

- **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const Fl_Widget ∗w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char ∗new_label)**
  Sets the current label.

- **void copy_tooltip (const char ∗text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image ∗deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image ∗deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image ∗img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.
• void **do_callback**(Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **draw_label**(int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int **h** () const
  
  Gets the widget height.

• virtual void **hide** ()
  
  Makes a widget invisible.

• Fl_Images **image** ()
  
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Images **image** () const
  
  Gets the image that is used as part of the widget label when in the active state.

• void **image**(Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

• void **image**(Fl_Images ∗img)
  
  Sets the image to use as part of the widget label when in the active state.

• int **image_bound** () const
  
  Returns whether the image is managed by the widget.

• int **inside**(const Fl_Widget ∗wgt) const
  
  Checks if this widget is a child of wgt.

• int **is_label_copied** () const
  
  Returns whether the current label was assigned with copy_label().

• const char ∗ **label** () const
  
  Gets the current label text.

• void **label**(const char ∗text)
  
  Sets the current label pointer.

• void **label**(const Fl_Labeltype a, const char ∗b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color **labelcolor** () const
  
  Gets the label color.

• void **labelcolor**(Fl_Color c)
  
  Sets the label color.

• Fl_Font **labelfont** () const
  
  Gets the font to use.

• void **labelfont**(Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize **labelsize** () const
  
  Gets the font size in pixels.

• void **labelsize**(Fl_Fontsize pix)
  
  Sets the font size in pixels.

• Fl_Labeltype **labeltype** () const
  
  Gets the label type.

• void **labeltype**(Fl_Labeltype a)
  
  Sets the label type.

• void **measure_label**(int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• bool **needs_keyboard** () const
  
  Returns whether this widget needs a keyboard.

• void **needs_keyboard**(bool needs)
  
  Sets whether this widget needs a keyboard.

• unsigned int **output** () const
Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  Internal use only - “for hacks only”.

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.

- `void set_visible ()`
  Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  Returns whether the widget's label uses '&' to indicate shortcuts.

- `void shortcut_label (int value)`
  Sets whether the widget's label uses '&' to indicate shortcuts.

- `virtual void show ()`
  Makes a widget visible.

- `void size (int W, int H)`
  Changes the size of the widget.

- `int take_focus ()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.

- `int testShortcut ()`
  Returns true if the widget's label contains the entered ‘&x’ shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.

- `void tooltip (const char *text)`
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.
- **int** `use_accents_menu()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void** `user_data()` const
  Gets the user data for this widget.

- **void** `user_data (`FL_Callback_User_Data *v, bool auto_free)`
  Sets the user data for this widget.

- **void** `user_data` (void *v)
  Sets the user data for this widget.

- **unsigned int** `visible()` const
  Returns whether a widget is visible.

- **unsigned int** `visible_focus()` const
  Checks whether this widget has a visible focus.

- **void** `visible_focus` (int v)
  Modifies keyboard focus navigation.

- **int** `visible_r()` const
  Returns whether a widget and all its parents are visible.

- **int** `w()` const
  Gets the widget width.

- **FL_When** `when()` const
  Returns the conditions under which the callback is called.

- **void** `when` (uchar i)
  Sets the flags used to decide when a callback is called.

- **FL_Window ** `window` () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int** `x()` const
  Gets the widget position in its window.

- **int** `y()` const
  Gets the widget position in its window.

- **virtual ~**`Fl_Widget`()
  Destroys the widget.

**Protected Member Functions**

- **FL_Cursor** `cursor` (int n)
  Returns the cursor for cursor index n.

- **int** `on_insert` (Fl_Widget *, int) **FL_OVERRIDE**
  Insert a new entry in the size range list.

- **int** `on_move` (int, int) **FL_OVERRIDE**
  Move the entry in the size range list.

- **void** `on_remove` (int) **FL_OVERRIDE**
  Remove the entry from the size range list.

- **void** `request_grow_b` (int old_b, int &new_b, Fl_Rect *final_size)
  Request for children to change their layout.

- **void** `request_grow_l` (int old_l, int &new_l, Fl_Rect *final_size)
  Request for children to change their layout.

- **void** `request_grow_r` (int old_r, int &new_r, Fl_Rect *final_size)
  Request for children to change their layout.

- **void** `request_grow_t` (int old_t, int &new_t, Fl_Rect *final_size)
  Request for children to change their layout.

- **void** `request_shrink_b` (int old_b, int &new_b, Fl_Rect *final_size)
  Request for children to change their layout.
void request_shrink_l (int old_l, int &new_l, Fl_Rect *final_size)
Request for children to change their layout.

void request_shrink_r (int old_r, int &new_r, Fl_Rect *final_size)
Request for children to change their layout.

void request_shrink_t (int old_t, int &new_t, Fl_Rect *final_size)
Request for children to change their layout.

void set_cursor (int n)
Set one of four cursors used for dragging etc...

Protected Member Functions inherited from Fl_Group

Fl_Rect * bounds ()
Returns the internal array of widget sizes and positions.

void draw () FL_OVERRIDE
Draws the widget.

void draw_child (Fl_Widget &widget) const
Forces a child to redraw.

void draw_children ()
Draws all children of the group.

void draw_outside_label (const Fl_Widget &widget) const
Parents normally call this to draw outside labels of child widgets.

int * sizes ()
Returns the internal array of widget sizes and positions.

void update_child (Fl_Widget &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

void clear_flag (unsigned int c)
Clears a flag in the flags mask.

void draw_backdrop () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

void draw_box () const
Draws the widget box according its box style.

void draw_box (Fl_Boxtype t, Fl_Color c) const
Draws a box of type t, of color c at the widget's position and size.

void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.

void draw_focus () const
Draws a focus rectangle around the widget.

void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.

void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
Draws a focus box for the widget at the given position and size.

void draw_label () const
Draws the widget's label at the defined label position.

void draw_label (int, int, int) const
Draws the label in an arbitrary bounding box.

Fl_Widget (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.

unsigned int flags () const
Gets the widget flags mask.

- void h (int v)
  
  Internal use only.
- void set Flag (unsigned int c)
  
  Sets a flag in the flags mask.
- void w (int v)
  
  Internal use only.
- void x (int v)
  
  Internal use only.
- void y (int v)
  
  Internal use only.

Protected Attributes

- int cursor_
  
  current cursor index (0..3)
- Fl_Cursor * cursors_
  
  points at the array of 4 cursors (may be overridden)
- int default_min_h_
- int default_min_w_
- Size_Range * size_range_
- int size_range_capacity_
- int size_range_size_

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  
  Returns the currently active group.
- static void current (Fl_Group *g)

  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)

  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *t)

  Returns the Unicode value of the ‘&x’ shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)

  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

11.147.1 Detailed Description

The Fl_Tile class lets you resize its children by dragging the border between them.

For the tiling to work correctly, the children of an Fl_Tile must cover the entire area of the widget, but must not overlap. This means that all children must touch each other at their edges, and no gaps can be left inside the Fl_Tile.

Fl_Tile does not normally draw any graphics of its own. The "borders" which can be seen in the snapshot above are actually part of the children. Their boxtypes have been set to FL_DOWN_BOX creating the impression of "ridges" where the boxes touch. What you see are actually two adjacent FL_DOWN_BOX's drawn next to each other. All neighboring widgets share the same edge - the widget's thick borders make it appear as though the widgets aren't actually touching, but they are. If the edges of adjacent widgets do not touch, then it will be impossible to drag the corresponding edges.

Fl_Tile works in two distinctive modes. In classic mode, the range of motion for edges and intersections is controlled using an invisible child that is marked as the resizable() widget of the tile group. Classic mode is described in detail a few paragraphs down.

**Fl_Tile size_range mode**

By assigning a default minimum size to all children with Fl_Tile::init_size_range(int default_minimum_width, int default_minimum_height) or by assigning minimal sizes to individual children with Fl_Tile::size_range(Fl_Widget *child, int minimum_width, int minimum_height, int, int), the tile group is put into size_range operation mode. In this mode, the child that is marked resizable() will behave as it would in a regular Fl_Group widget. When dragging edges or intersections with the mouse, Fl_Tile will ensure that none of the children shrinks to a size that is smaller than requested. When resizing the Fl_Tile group, size ranges are not enforced by the tile. Instead, the size range of the enclosing window should be limited to a valid range.

Fl_Tile does not differentiate between visible and invisible children. If children are created smaller than their assigned minimum size, dragging intersections may cause unexpected jumps in size. Zero width or height widget are not harmful, but should be avoided.

Example for a center document tile and two tool boxes on the left and right

Fl_Window win(400, 300, "My App");
Fl_Tile tile(0, 0, 400, 300);
Fl_Box left_tool_box(0, 0, 100, 300, "Tools");
left_tool_box.box(FL_DOWN_BOX);
tile.size_range(&left_tool_box, 50, 50);
Fl_Box document(100, 0, 200, 300, "Document");
document.box(FL_DOWN_BOX);
tile.size_range(&document, 100, 50);
Fl_Box right_tool_box(300, 0, 100, 300, "More\nTools");
right_tool_box.box(FL_DOWN_BOX);
tile.size_range(&right_tool_box, 50, 50);
tile.end();
tile.resizable(document);

win.end();
win.resizable(tile);
win.show(argc,argv);
win.size_range(200, 50);

**Fl_Tile classic mode**

**Fl_Tile** allows objects to be resized to zero dimensions. To prevent this you can use the `resizable()` to limit where corners can be dragged to. For more information see note below.

Even though objects can be resized to zero sizes, they must initially have non-zero sizes so the **Fl_Tile** can figure out their layout. If desired, call `position()` after creating the children but before displaying the window to set the borders where you want.

**Note on resizable(Fl_Widget &w):** The "resizable" child widget (which should be invisible) limits where the borders can be dragged to. All dragging will be limited inside the resizable widget's borders. If you don't set it, it will be possible to drag the borders right to the edges of the **Fl_Tile** widget, and thus resize objects on the edges to zero width or height. When the entire **Fl_Tile** widget is resized, the `resizable()` widget will keep its border distance to all borders the same (this is normal resize behavior), so that you can effectively set a border width that will never change. To ensure correct event delivery to all child widgets the `resizable()` widget must be the first child of the **Fl_Tile** widget group. Otherwise some events (e.g. FL_MOVE and FL_ENTER) might be consumed by the `resizable()` widget so that they are lost for widgets covered (overlapped) by the `resizable()` widget.

**Note**

You can still resize widgets inside the `resizable()` to zero width and/or height, i.e. box 2b above to zero width and box 3a to zero height.

See also

```cpp
void Fl_Group::resizable(Fl_Widget &w)
```

Example for resizable with 20 pixel border distance:

```cpp
int dx = 20, dy = dx;
Fl_Tile tile(50, 50, 300, 300);
// create resizable() box first
Fl_Box r(tile.x()+dx,tile.y()+dy,tile.w()-2*dx,tile.h()-2*dy);
tile.resizable(r);
// ... create widgets inside tile (see test/tile.cxx) ...
tile.end();
```

See also the complete example program in test/tile.cxx.

### 11.147.2 Constructor & Destructor Documentation

#### 11.147.2.1 Fl_Tile()

```cpp
Fl_Tile::Fl_Tile ( 
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0 )
```

Creates a new **Fl_Tile** widget using the given position, size, and label string. The default boxtype is FL_NO_BOX.

The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the **Fl_Tile** and all of its children can be automatic (local) variables, but you must declare the **Fl_Tile** first, so that it is destroyed last.

See also

```cpp
class Fl_Group
```
11.147.3 Member Function Documentation

11.147.3.1 cursor()

```cpp
Fl_Cursor Fl_Tile::cursor ( int n ) [inline], [protected]
```

Returns the cursor for cursor index \( n \).

See also

Fl_Tile::set_cursor(int)

11.147.3.2 drag_intersection()

```cpp
void Fl_Tile::drag_intersection ( int oldx, int oldy, int newx, int newy ) [virtual]
```

Drags the intersection at \((oldx,oldy)\) to \((newx,newy)\).

See also

Fl_Tile::move_intersection(int oldx, int oldy, int newx, int newy) , but this method does not call init_sizes() and is used for interactive children layout using the mouse.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>oldx,oldy</th>
<th>move the intersection at this coordinate, pass zero to disable drag in that direction.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>newx,newy</td>
<td>move the intersection as close to this new coordinate as possible</td>
</tr>
</tbody>
</table>

11.147.3.3 handle()

```cpp
int Fl_Tile::handle ( int event ) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypreses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in     | event     | the kind of event received |

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>
11.147.3.4 init_size_range()

void Fl_Tile::init_size_range (  
    int default_min_w = -1,  
    int default_min_h = -1  
)  
Initialize the size range mode of Fl_Tile and set the default minimum width and height.  
The default minimum width and height is the size of the mouse pointer grab area at about 4 pixel units.

Parameters

- **in** default_min_w/default_min-h
  - default size range for widgets that don't have an individual range assigned

11.147.3.5 move_intersection()

void Fl_Tile::move_intersection (  
    int oldx,  
    int oldy,  
    int newx,  
    int newy  
)  
[virtual]  
Drags the intersection at (oldx,oldy) to (newx,newy).  
This redraws all the necessary children.  
If no size ranges are set, the new intersection position is limited to the size of the tile group. The resizable() option is not taken into account here.  
If size ranges are set, the actual new position of the intersection will depend on the size range of every individual child. No child will be smaller than their minw and minh. After the new position is found, move_intersection() will call init_sizes(). The resizable() range is ignored.

Parameters

- **in** oldx,oldy
  - move the intersection at this coordinate, pass zero to disable drag in that direction.
- **in** newx,newy
  - move the intersection as close to this new coordinate as possible

11.147.3.6 on_insert()

int Fl_Tile::on_insert (  
    Fl_Widget * candidate,  
    int index  
)  
[protected], [virtual]  
Insert a new entry in the size range list.  
Reimplemented from Fl_Group.

11.147.3.7 on_move()

int Fl_Tile::on_move (  
    int oldIndex,  
    int newIndex  
)  
[protected], [virtual]  
Move the entry in the size range list.  
Reimplemented from Fl_Group.

11.147.3.8 on_remove()

void Fl_Tile::on_remove (  

int index) [protected], [virtual]
Remove the entry from the size range list.
Reimplemented from Fl_Group.

11.147.3.9 position()

```cpp
void Fl_Tile::position {
    int oldx,
    int oldy,
    int newx,
    int newy) [inline]
```

Deprecated “in 1.4.0 - use move_intersection(p) instead”

11.147.3.10 request_grow_b()

```cpp
void Fl_Tile::request_grow_b {
    int old_b,
    int & new_b,
    Fl_Rect * final_size) [protected]
```
Request for children to change their layout.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>old_b</th>
<th>grow all children with this current bottom edge toward the bottom edge of this tile</th>
</tr>
</thead>
<tbody>
<tr>
<td>in,out</td>
<td>new_b</td>
<td>try to grow to this coordinate, return the maximum possible growth (currently maxh is ignored, so we always grow to new_b)</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
<td>write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

11.147.3.11 request_grow_l()

```cpp
void Fl_Tile::request_grow_l {
    int old_l,
    int & new_l,
    Fl_Rect * final_size) [protected]
```
Request for children to change their layout.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>old_l</th>
<th>grow all children with this current left edge toward the left edge of this tile</th>
</tr>
</thead>
<tbody>
<tr>
<td>in,out</td>
<td>new_l</td>
<td>try to grow to this coordinate, return the maximum possible growth (currently maxw is ignored, so we always grow to new_l)</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
<td>write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

11.147.3.12 request_grow_r()

```cpp
void Fl_Tile::request_grow_r {
    int old_r,
    int & new_r,
    Fl_Rect * final_size) [protected]
```
Request for children to change their layout.
Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>in</strong></td>
<td><strong>old_r</strong></td>
<td>grow all children with this current right edge toward the right edge of this tile</td>
</tr>
<tr>
<td><strong>in,out</strong></td>
<td><strong>new_r</strong></td>
<td>try to grow to this coordinate, return the maximum possible growth (currently maxw is ignored, so we always grow to new_r)</td>
</tr>
<tr>
<td><strong>in,out</strong></td>
<td><strong>final_size</strong></td>
<td>write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

### 11.147.3.13 request_grow_t()

```cpp
void Fl_Tile::request_grow_t ( int old_t, int &new_t, Fl_Rect *final_size ) [protected]
```

Request for children to change their layout.

**Parameters**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>in</strong></td>
<td><strong>old_t</strong></td>
<td>grow all children with this current top edge toward the top edge of this tile</td>
</tr>
<tr>
<td><strong>in,out</strong></td>
<td><strong>new_t</strong></td>
<td>try to grow to this coordinate, return the maximum possible growth (currently maxh is ignored, so we always grow to new_t)</td>
</tr>
<tr>
<td><strong>in,out</strong></td>
<td><strong>final_size</strong></td>
<td>write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

### 11.147.3.14 request_shrink_b()

```cpp
void Fl_Tile::request_shrink_b ( int old_b, int &new_b, Fl_Rect *final_size ) [protected]
```

Request for children to change their layout.

**Parameters**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>in</strong></td>
<td><strong>old_b</strong></td>
<td>shrink all children with this current bottom edge toward the top edge of this tile</td>
</tr>
<tr>
<td><strong>in,out</strong></td>
<td><strong>new_b</strong></td>
<td>try to shrink to this coordinate, return the maximum possible shrinkage</td>
</tr>
<tr>
<td><strong>in,out</strong></td>
<td><strong>final_size</strong></td>
<td>If not NULL, write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

### 11.147.3.15 request_shrink_l()

```cpp
void Fl_Tile::request_shrink_l ( int old_l, int &new_l, Fl_Rect *final_size )
```

Request for children to change their layout.

**Parameters**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>in</strong></td>
<td><strong>old_l</strong></td>
<td>shrink all children with this current left edge toward the top edge of this tile</td>
</tr>
<tr>
<td><strong>in,out</strong></td>
<td><strong>new_l</strong></td>
<td>try to shrink to this coordinate, return the maximum possible shrinkage</td>
</tr>
<tr>
<td><strong>in,out</strong></td>
<td><strong>final_size</strong></td>
<td>If not NULL, write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

---

**drag_intersection** requests that all children with the left edge at old_l to shrink to new_l towards the right side of the tile. If the child can not shrink by that amount, it will ask all other children that touch its right side to shrink by the remainder (recursion). new_l will return the the maximum possible value while maintaining minimum width for all children involved.

request_shrink_r asks children to shrink toward the left, so that their right edge is as close as possible to new_r. request_shrink_t and request_shrink_b provide the same functionality for vertical resizing.
Parameters

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>old_l</td>
<td>shrink all children with this current left edge</td>
</tr>
<tr>
<td>in,out</td>
<td>new_l</td>
<td>try to shrink to this coordinate, return the maximum possible shrinkage</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
<td>if not NULL, write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

11.147.3.16 request_shrink_r()

```cpp
void Fl_Tile::request_shrink_r (  
    int old_r,  
    int &new_r,  
    Fl_Rect *final_size ) [protected]
```

Request for children to change their layout.

See also

Fl_Tile::request_shrink_l(int old_l, int &new_l, Fl_Rect *final_size)

Parameters

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>old_r</td>
<td>shrink all children with this current right edge toward the left edge of this tile</td>
</tr>
<tr>
<td>in,out</td>
<td>new_r</td>
<td>try to shrink to this coordinate, return the maximum possible shrinkage</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
<td>if not NULL, write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

11.147.3.17 request_shrink_t()

```cpp
void Fl_Tile::request_shrink_t (  
    int old_t,  
    int &new_t,  
    Fl_Rect *final_size ) [protected]
```

Request for children to change their layout.

See also

Fl_Tile::request_shrink_l(int old_l, int &new_l, Fl_Rect *final_size)

Parameters

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>old_t</td>
<td>shrink all children with this current top edge toward the bottom edge of this tile</td>
</tr>
<tr>
<td>in,out</td>
<td>new_t</td>
<td>try to shrink to this coordinate, return the maximum possible shrinkage</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
<td>if not NULL, write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

11.147.3.18 resize()

```cpp
void Fl_Tile::resize (  
    int X,  
    int Y,  
    int W,  
    int H ) [virtual]
```

Resizes the Fl_Tile widget and its children.

Fl_Tile implements its own resize() method. It does not use Fl_Group::resize() to resize itself and its children.

In size_range mode, the child marked resizable() is resized first. Only if its minimum size is reached, other widgets in the tile will resize too.
In classic mode or when no resizable child is set, enlarging works by moving the lower-right corner and resizing the bottom and right border widgets accordingly. Shrinking the Fl_Tile works in the opposite way by shrinking the bottom and right border widgets, unless they are reduced to zero width or height, resp. or to their minimal sizes defined by the resizable() widget. In this case other widgets will be shrunk as well. See the Fl_Tile class documentation about how the resizable() works. Reimplemented from Fl_Group.

11.147.3.19 set_cursor()

void Fl_Tile::set_cursor (  
    int n ) [protected]

Set one of four cursors used for dragging etc...
Fl_Tile uses an array of four cursors that are set depending on user actions:

- 0: normal cursor
- 1: horizontal dragging
- 2: vertical dragging
- 3: dragging an intersection

This method sets the window cursor for the given index n.

11.147.3.20 size_range() [1/2]

void Fl_Tile::size_range (  
    Fl_Widget * w,  
    int minw,  
    int minh,  
    int maxw = 0x7FFFFFFF,  
    int maxh = 0x7FFFFFFF )

Set the allowed size range for the give child widget.
Fl_Tile currently supports only the minimal width and height setting.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in w</td>
<td>set the range for this child widget</td>
</tr>
<tr>
<td>in minw,minh</td>
<td>minimum width and height for that child</td>
</tr>
<tr>
<td>in maxw,maxh</td>
<td>maximum size, defaults to infinite, currently ignored</td>
</tr>
</tbody>
</table>

11.147.3.21 size_range() [2/2]

void Fl_Tile::size_range (  
    int index,  
    int minw,  
    int minh,  
    int maxw = 0x7FFFFFFF,  
    int maxh = 0x7FFFFFFF )

Set the allowed size range for the child at the given index.
Fl_Tile currently supports only the minimal width and height setting.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in index</td>
<td>set the range for the child at this index</td>
</tr>
<tr>
<td>in minw,minh</td>
<td>minimum width and height for that child</td>
</tr>
<tr>
<td>in maxw,maxh</td>
<td>maximum size, defaults to infinite, currently ignored</td>
</tr>
</tbody>
</table>

- Fl_Tile.H
- Fl_Tile.cxx

11.148 Fl_Tiled_Image Class Reference

This class supports tiling of images over a specified area.
#include <Fl_Tiled_Image.H>

Inheritance diagram for Fl_Tiled_Image:

```
Fl_Tiled_Image
|     |
V     V
Fl_Image
```

Public Member Functions

- void color_average (Fl_Color c, float i) FL_OVERRIDE
  The color_average() method averages the colors in the image with the provided FLTK color value.
- Fl_Image * copy () const
- Fl_Image * copy (int W, int H) const FL_OVERRIDE
  Creates a resized copy of the image.
- void desaturate () FL_OVERRIDE
  The desaturate() method converts an image to grayscale.
- void draw (int X, int Y)
- void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  Draws a tiled image.
- Fl_Tiled_Image (Fl_Image *i, int W=0, int H=0)
  The constructors create a new tiled image containing the specified image.
- Fl_Image * image ()
  Gets The image that is tiled.
- virtual ~Fl_Tiled_Image ()
  The destructor frees all memory and server resources that are used by the tiled image.

Public Member Functions inherited from Fl_Image

- virtual class Fl_Shared_Image * as_shared_image ()
  Returns whether an image is an Fl_Shared_Image or not.
- Fl_Image * copy () const
  Creates a copy of the image in the same size.
- int count () const
  Returns the number of data values associated with the image.
- int d () const
  Returns the image depth.
- const char *const * data () const
  Returns a pointer to the current image data array.
- int data_h () const
  Returns the height of the image data.
- int data_w () const
  Returns the width of the image data.
- void draw (int X, int Y)
Draws the image to the current drawing surface.

- **int fail () const**
  
  Returns a value that is not 0 if there is currently no image available.

- **Fl_Image (int W, int H, int D)**
  
  The constructor creates an empty image with the specified width, height, and depth.

- **int h () const**
  
  Returns the current image drawing height in FLTK units.

- **void inactive ()**
  
  The inactive() method calls color_average(FL_BACKGROUNDCOLOR, 0.33f) to produce an image that appears grayed out.

- **virtual void label (Fl_Menu_Item ∗m)**
  
  This method is an obsolete way to set the image attribute of a menu item.

- **virtual void label (Fl_Widget ∗w)**
  
  This method is an obsolete way to set the image attribute of a widget or menu item.

- **int ld () const**
  
  Returns the current line data size in bytes.

- **virtual void release ()**
  
  Releases an Fl_Image - the same as 'delete this'.

- **virtual void scale (int width, int height, int proportional=1, int can_expand=0)**
  
  Sets the drawing size of the image.

- **virtual void uncache ()**
  
  If the image has been cached for display, delete the cache data.

- **int w () const**
  
  Returns the current image drawing width in FLTK units.

- **virtual ~Fl_Image ()**
  
  The destructor is a virtual method that frees all memory used by the image.

Protected Attributes

- **int alloc_image_**
- **Fl_Image ∗image_**

Additional Inherited Members

Static Public Member Functions inherited from Fl_Image

- **static Fl_Labeltype define_FL_IMAGE_LABEL ()**

- **static Fl_RGB_Scaling RGB_scaling ()**
  
  Returns the currently used RGB image scaling method.

- **static void RGB_scaling (Fl_RGB_Scaling)**
  
  Sets the RGB image scaling method used for copy(int, int).

- **static Fl_RGB_Scaling scaling_algorithm ()**
  
  Gets what algorithm is used when resizing a source image to draw it.

- **static void scaling_algorithm (Fl_RGB_Scaling algorithm)**
  
  Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes inherited from Fl_Image

- **static const int ERR_FILE_ACCESS = -2**
- **static const int ERR_FORMAT = -3**
- **static const int ERR_MEMORY_ACCESS = -4**
- **static const int ERR_NO_IMAGE = -1**
- **static bool register_images_done = false**
  
  True after fl_register_images() was called, false before.
Protected Member Functions inherited from Fl_Image

- void d (int D)
  
  Sets the current image depth.
- void data (const char *p, int c)
  Sets the current data pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled (int X, int Y, int W, int H)
  
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h (int H)
  
  Sets the height of the image data.
- void ld (int LD)
  
  Sets the current line data size in bytes.
- void w (int W)
  
  Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

11.148.1 Detailed Description

This class supports tiling of images over a specified area. The source (tile) image is not copied unless you call the color_average(), desaturate(), or inactive() methods.

11.148.2 Constructor & Destructor Documentation

11.148.2.1 Fl_Tiled_Image()

Fl_Tiled_Image::Fl_Tiled_Image ( 
  Fl_Image *i,
  int W = 0,
  int H = 0 )

The constructors create a new tiled image containing the specified image. Use a width and height of 0 to tile the whole window/widget.

**Note**

Due to implementation constraints in FLTK 1.3.3 and later width and height of 0 may not work as expected when used as background image in widgets other than windows. You may need to center and clip the image (label) and set the label type to FL_NORMAL_LABEL. Doing so will let the tiled image fill the whole widget as its background image. Other combinations of label flags may or may not work.

```cpp
#include "bg.xpm"
Fl_Pixmap *bg_xpm = new Fl_Pixmap(bg_xpm);
Fl_Tiled_Image *bg_tiled = new Fl_Tiled_Image(bg_xpm,0,0);
Fl_Box *box = new Fl_Box(40,40,300,100,"";
box->box(FL_UP_BOX);
box->labeltype(FL_NORMAL_LABEL);
box->align(FL_ALIGN_INSIDE | FL_ALIGN_CENTER | FL_ALIGN_CLIP);
box->image(bg_tiled);
```

**Note**

Setting an image (label) for a window may not work as expected due to implementation constraints in FLTK 1.3.x and maybe later. The reason is the way Fl::scheme() initializes the window's label type and image. A possible workaround is to use another Fl_Group as the only child widget and to set the background image for this group as described above.

**Todo** Fix Fl_Tiled_Image as background image for widgets and windows and fix the implementation of Fl::scheme(const char *).
11.148.3 Member Function Documentation

11.148.3.1 color_average()

```cpp
void Fl_Tiled_Image::color_average (Fl_Color c, float i) [virtual]
```

The `color_average()` method averages the colors in the image with the provided FLTK color value. The first argument specifies the FLTK color to be used. The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory. Reimplemented from `Fl_Image`.

11.148.3.2 copy()

```cpp
Fl_Image * Fl_Tiled_Image::copy (int W, int H) const [virtual]
```

Creates a resized copy of the image. The new image should be released when you are done with it. Note: since FLTK 1.4.0 you can use `Fl_Image::release()` for all types of images (i.e. all subclasses of `Fl_Image`) instead of `operator delete` for `Fl_Image`s and `Fl_Image::release()` for `Fl_Shared_Image`s. The new image data will be converted to the requested size. RGB images are resized using the algorithm set by `Fl_Image::RGB_scaling()`.

For the new image the following equations are true:

- \( w() = \text{data}_w() = W \)
- \( h() = \text{data}_h() = H \)

Parameters

| in  | W/H | Requested width and height of the new image |

Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of `FL_RGB_Image`, `Fl_SVG_Image`, `Fl_Pixmap`, `Fl_Bitmap`, `Fl_Tiled_Image`, `Fl_Anim_GIF_Image` and `Fl_Shared_Image`. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an `FL_RGB_Image` is an object of class `Fl_Pixmap`. Since FLTK 1.4.0 this method is ‘const’. If you derive your own class from `Fl_Image` or any subclass your overridden methods of ‘`Fl_Image::copy() const`’ and ‘`Fl_Image::copy(int, int) const`’ must also be ‘const’ for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been ‘const’.

Reimplemented from `Fl_Image`.

11.148.3.3 desaturate()

```cpp
void Fl_Tiled_Image::desaturate () [virtual]
```

The `desaturate()` method converts an image to grayscale. If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory. Reimplemented from `Fl_Image`.
11.148.3.4 **draw()**

```cpp
void Fl_Tiled_Image::draw (  
    int X,  
    int Y,  
    int W,  
    int H,  
    int cx = 0,  
    int cy = 0 ) [virtual]
```

Draws a tiled image.

Tiled images can be used as background images for widgets and windows. However, due to implementation constraints, you must take care when setting label types and alignment flags. Only certain combinations work as expected, others may yield unexpected results and undefined behavior.

This draw method can draw multiple copies of one image in an area given by \(X, Y, W, H\).

The optional arguments \(cx\) and \(cy\) can be used to crop the image starting at offsets \((cx, cy)\). \(cx\) and \(cy\) must be \(\geq 0\) (negative values are ignored). If one of the values is greater than the image width or height resp. \((cx >\text{image()}->w()\) or \(cy >\text{image()}->h())\) nothing is drawn, because the resulting image would be empty.

After calculating the resulting image size the image is drawn as often as necessary to fill the given area, starting at the top left corner.

If both \(W\) and \(H\) are 0 the image is repeated as often as necessary to fill the entire window, unless there is a valid clip region. If you want to fill only one particular widget's background, then you should either set a clip region in your **draw()** method or use the label alignment flags `FL_ALIGN_INSIDE`\|`FL_ALIGN_CLIP` to make sure the image is clipped.

This may be improved in a later version of the library.

Reimplemented from `Fl_Image`.

The documentation for this class was generated from the following files:

- `Fl_Tiled_Image.H`
- `Fl_Tiled_Image.cxx`

### 11.149 **Fl_Timeout Class Reference**

The internal class `Fl_Timeout` handles all timeout related functions.

```cpp
#include <Fl_Timeout.h>
```

**Static Public Member Functions**

- static void **add_timeout** (double time, `Fl_Timeout_Handler` cb, void *data)  
  
  Adds a one-shot timeout callback.

- static void **do_timeouts** ()  
  
  Elapse timers and call their callbacks if any timers are expired.

- static void **elapse_timeouts** ()  
  
  Elapse all timers w/o calling their callbacks.

- static int **has_timeout** (`Fl_Timeout_Handler` cb, void *data)  
  
  Returns true if the timeout exists and has not been called yet.

- static void **remove_timeout** (`Fl_Timeout_Handler` cb, void *data)  
  
  Remove a timeout callback.

- static void **repeat_timeout** (double time, `Fl_Timeout_Handler` cb, void *data)  
  
  Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.

- static double **time_to_wait** (double ttw)  
  
  Returns the delay in seconds until the next timer expires, limited by `ttw`.

**Protected Member Functions**

- double **delay** ()  
  
  Get the timer's delay in seconds.
• void delay (double t)
  
  *Set the timer’s delay in seconds.*

• void insert ()
  
  *Insert this timer entry into the active timer queue.*

• void make_current ()
  
  *Remove the timeout from the active timer queue and push it onto the stack of currently running callbacks.*

• void release ()
  
  *Remove the top-most timeout from the stack of currently running timeout callbacks and insert it into the list of free timers.*

**Static Protected Member Functions**

• static Fl_Timeout ∗ current ()
  
  *Returns the first (top-most) timeout from the current timeout stack.*

• static Fl_Timeout ∗ get (double time, Fl_Timeout_Handler cb, void ∗data)
  
  *Get an Fl_Timeout instance for further handling.*

**Protected Attributes**

• Fl_Timeout_Handler callback
• void ∗ data
• Fl_Timeout ∗ next
• int skip
• double time

**Static Protected Attributes**

• static Fl_Timeout ∗ current_timeout = 0
  
  *The list of current timeouts is used to store the timeout whose callback is called while the callback is executed.*

• static Fl_Timeout ∗ first_timeout = 0
  
  *List of active timeouts.*

• static Fl_Timeout ∗ free_timeout = 0
  
  *List of free timeouts after use.*

**11.149.1 Detailed Description**

The internal class Fl_Timeout handles all timeout related functions.

All code is platform independent except retrieving a timestamp which requires calling a system driver function and potentially results in different timer resolutions (from milliseconds to microseconds).

Related user documentation:

• Fl::add_timeout(double time, Fl_Timeout_Handler cb, void ∗data)
• Fl::repeat_timeout(double time, Fl_Timeout_Handler cb, void ∗data)
• Fl::has_timeout(Fl_Timeout_Handler cb, void ∗data)
• Fl::remove_timeout(Fl_Timeout_Handler cb, void ∗data)
11.149.2 Member Function Documentation

11.149.2.1 add_timeout()

```c
void Fl_Timeout::add_timeout (  
    double time, 
    Fl_Timeout_Handler cb, 
    void * data )  [static]
```

Add a one-shot timeout callback.
The callback function `cb` will be called by `Fl::wait()` at `time` seconds after this function is called.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>time</code></td>
<td>delta time in seconds until the timer expires</td>
</tr>
<tr>
<td><code>cb</code></td>
<td>callback function</td>
</tr>
<tr>
<td><code>data</code></td>
<td>optional user data (default: NULL)</td>
</tr>
</tbody>
</table>

Implements `Fl::add_timeout(double time, Fl_Timeout_Handler cb, void *data)`

See also

`Fl::add_timeout(double time, Fl_Timeout_Handler cb, void *data)`

11.149.2.2 current()

`Fl_Timeout * Fl_Timeout::current ( ) [static], [protected]`

Returns the first (top-most) timeout from the current timeout stack. This returns a pointer to the timeout but does not remove it from the list of current timeouts. This should be the timeout that is currently executing its callback.

Returns

`Fl_Timeout*` The current timeout whose callback is running.

Return values

| NULL | if no callback is currently running. |

11.149.2.3 elapse_timeouts()

`void Fl_Timeout::elapse_timeouts ( ) [static]`

Elapse all timers w/o calling their callbacks. All timer values are adjusted by the delta time since the last call. This method does **NOT** call timer callbacks if timers are expired. This must be called before new timers are added to the timer queue to make sure that the next timer decrement does not count down too much time.

See also

`Fl_Timeout::do_timeouts()`

11.149.2.4 get()

`Fl_Timeout * Fl_Timeout::get ( double time, Fl_Timeout_Handler cb, void * data ) [static], [protected]`

Get an `Fl_Timeout` instance for further handling. The timer object will be initialized with the input parameters as given by `Fl::add_timeout()` or `Fl::repeat_timeout()`. `Fl_Timeout` objects are maintained in three queues:

- active timer queue
- list (stack, i.e. LIFO) of currently executing timer callbacks
- free timer entries.

When the FLTK program is launched all queues are empty. Whenever a new timer object is required the `get()` method is called and a timer object is either found in the queue of free timer entries or a new timer object is created (operator new).
Active timer entries are inserted into the "active timer queue" until they expire and their callback is called. Before the callback is called the timer entry is inserted into the list of current timers, i.e. it becomes the Fl_Timeout::current() timeout. This can be used in Fl::repeat_timeout() to find out if and how long the current timeout has been delayed.

When a timer is no longer used it is popped from the current list and inserted into the "free timer" list so it can be reused later.

Timer queue entries are never returned to the system, there's no garbage collection. The total number of timer objects is determined by the largest number of concurrently active timers.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>time</th>
<th>requested delta time</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>cb</td>
<td>timer callback</td>
</tr>
<tr>
<td>in</td>
<td>data</td>
<td>userdata for timer callback</td>
</tr>
</tbody>
</table>

Returns

Fl_Timeout* Timer entry

See also

Fl::add_timeout(), Fl::repeat_timeout()

11.149.2.5 has_timeout()

int Fl_Timeout::has_timeout (
    Fl_Timeout_Handler cb,
    void * data ) [static]

Returns true if the timeout exists and has not been called yet.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>cb</th>
<th>Timer callback (must match)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>data</td>
<td>Callback user data (must match)</td>
</tr>
</tbody>
</table>

Returns

whether the timer was found in the queue

Return values

0 not found
1 found

Implements Fl::has_timeout(Fl_Timeout_Handler cb, void *data)

See also

Fl::has_timeout(Fl_Timeout_Handler cb, void *data)

11.149.2.6 insert()

void Fl_Timeout::insert ( ) [protected]

Insert this timer entry into the active timer queue.

The timer is inserted at the required position so the timer queue is always ordered by due time.
11.149.2.7 make_current()

void Fl_Timeout::make_current ( ) [protected]
Remove the timeout from the active timer queue and push it onto the stack of currently running callbacks.
This becomes the current() timeout which can be used in Fl::repeat_timeout().

See also
    Fl_Timeout::current()

11.149.2.8 release()

void Fl_Timeout::release ( ) [protected]
Remove the top-most timeout from the stack of currently running timeout callbacks and insert it into the list of free timers.
Typical code in the library would look like:
// The timeout p Fl_Timeout *t has expired, run its callback
(t->make_current());
(t->callback)(t->data);
(t->release());

11.149.2.9 remove_timeout()

void Fl_Timeout::remove_timeout (  
    Fl_Timeout_Handler cb,  
    void * data ) [static]
Remove a timeout callback.
This method removes all matching timeouts, not just the first one. This may change in the future.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in cb</td>
<td>Timer callback to be removed (must match)</td>
</tr>
<tr>
<td>in data</td>
<td>Wildcard if NULL, must match otherwise</td>
</tr>
</tbody>
</table>

Implements Fl::remove_timeout(Fl_Timeout_Handler cb, void *data)

See also
    Fl::remove_timeout(Fl_Timeout_Handler cb, void *data)

11.149.2.10 repeat_timeout()

void Fl_Timeout::repeat_timeout (  
    double time,  
    Fl_Timeout_Handler cb,  
    void * data ) [static]
Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in time</td>
<td>delta time in seconds until the timer expires</td>
</tr>
<tr>
<td>in cb</td>
<td>callback function</td>
</tr>
<tr>
<td>in data</td>
<td>optional user data (default: NULL)</td>
</tr>
</tbody>
</table>

Implements Fl::repeat_timeout(double time, Fl_Timeout_Handler cb, void *data)

See also
    Fl::repeat_timeout(double time, Fl_Timeout_Handler cb, void *data)
11.149.2.11 time_to_wait()

double Fl_Timeout::time_to_wait (double ttw) [static]

Returns the delay in seconds until the next timer expires, limited by \( ttw \).
This function calculates the time to wait for the FLTK event queue processing, depending on the given value \( ttw \).
If at least one timer is active and its timeout value is smaller than \( ttw \) then this value is returned. \texttt{Fl::wait()} will wait no longer than until the next timer expires.
If no timer is active this returns the input value \( ttw \) unchanged.
If at least one timer is expired this returns 0.0 so the event processing does not wait.

Parameters

\begin{verbatim}
in  ttw time to wait from Fl::wait() etc. (upper limit)
\end{verbatim}

Returns

delay until next timeout or 0.0 (see description)

11.149.3 Member Data Documentation

11.149.3.1 current_timeout

\texttt{Fl_Timeout * Fl_Timeout::current_timeout = 0} [static], [protected]
The list of current timeouts is used to store the timeout whose callback is called while the callback is executed.
This is used like a stack, the current timeout is pushed to the front of the list and once the callback is finished, that timeout is removed and entered into the free list.
Background: \texttt{Fl::repeat_timeout()} needs to know which timeout triggered it and the exact schedule time and/or the delay of that timeout, i.e. how long the scheduled time was missed before the callback was called. A static, global variable is not sufficient since the user code can call other functions, e.g. dialogs, that run a nested event loop which can run another timeout callback. Hence this list of "current" timeouts is used like a stack (last in, first out).

See also

\texttt{Fl_Timeout::push()} Member function (method)

11.149.3.2 first_timeout

\texttt{Fl_Timeout * Fl_Timeout::first_timeout = 0} [static], [protected]
List of active timeouts.
These timeouts can be triggered when due, which calls their callbacks. The lifetime of a timeout:

- active, in this queue
- callback running, in queue \texttt{current_timeout}
- done, in list of free timeouts, ready to be reused.

11.149.3.3 free_timeout

\texttt{Fl_Timeout * Fl_Timeout::free_timeout = 0} [static], [protected]
List of free timeouts after use.
Timeouts can be reused many times.
The documentation for this class was generated from the following files:

- \texttt{Fl_Timeout.h}
- \texttt{Fl_Timeoutcxx}

Generated by Doxygen
11.150 Fl_Timer Class Reference

This is provided only to emulate the Forms Timer widget.

```cpp
#include <Fl_Timer.H>
```

Inheritance diagram for Fl_Timer:

```
+---+---------------------+---+
|   | Fl_Timer             |   |
|   +---------------------+---+
|        +-----------------+   |
|        | Fl_Widget           |   |
|        +-----------------+   |
```

Public Member Functions

- `char direction () const`  
  Gets or sets the direction of the timer.
- `void direction (char d)`  
  Gets or sets the direction of the timer.
- `Fl_Timer (uchar t, int x, int y, int w, int h, const char ∗l)`  
  Creates a new Fl_Timer widget using the given type, position, size, and label string.
- `int handle (int) FL_OVERRIDE`  
  Handles the specified event.
- `char suspended () const`  
  Gets or sets whether the timer is suspended.
- `void suspended (char d)`  
  Gets or sets whether the timer is suspended.
- `double value () const`  
  Gets or sets the current timer value.
  
  ```cpp
  See void Fl_Timer::value(double)
  ```
- `void value (double)`  
  Sets the current timer value.
- `~Fl_Timer ()`  
  Destroys the timer and removes the timeout.

Public Member Functions inherited from Fl_Widget

- `void _clear_fullscreen ()`  
  Activates the widget.
- `void _set_fullscreen ()`  
- `void activate ()`  
- `unsigned int active () const`  
  Returns whether the widget is active.
- `int active_r () const`  
  Returns whether the widget and all of its parents are active.
- `Fl_Align align () const`  
  Gets the label alignment.
- `void align (Fl_Align alignment)`  
  Sets the label alignment.
- `long argument () const`  
  Gets the current user data (long) argument that is passed to the callback function.
- `void argument (long v)`  
  Sets the current user data (long) argument that is passed to the callback function.
- `virtual class Fl_Gl_Window ∗ as_gl_window ()`
Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const & as_gl_window () const
- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const & as_group () const
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- virtual Fl_Image * as_image ()
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
Sets the background and selection color of the widget.

- **FL_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const FL_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **FL_Image * deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const FL_Image * deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (FL_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (FL_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, FL_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **FL_Image * image ()**
  Gets the image that is used as part of the widget label when in the active state.

- **const FL_Image * image () const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image (FL_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image (FL_Image *img)**
  Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`  
  Returns whether the image is managed by the widget.

- `int inside (const Fl_Widget *wgt) const`  
  Checks if this widget is a child of `wgt`.

- `int is_label_copied () const`  
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`  
  Gets the current label text.

- `void label (const char *text)`  
  Sets the current label pointer.

- `void label (Fl_Labeltype a, const char *b)`  
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`  
  Gets the label color.

- `void labelcolor (Fl_Color c)`  
  Sets the label color.

- `Fl_Font labelfont () const`  
  Gets the font to use.

- `void labelfont (Fl_Font f)`  
  Sets the font to use.

- `Fl_Fontsize labelsize () const`  
  Gets the font size in pixels.

- `void labelsize (Fl_Fontsize pix)`  
  Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`  
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`  
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`  
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`  
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`  
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`  
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`  
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`  
  Internal use only - "for hacks only".

- `void position (int X, int Y)`  
  Repositions the window or widget.

- `void redraw ()`  
  Schedules the drawing of the widget.

- `void redraw_label ()`  
  Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`  
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`  
  Gets the selection color.

- `void selection_color (Fl_Color a)`
Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.

• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int test_shortcut ()
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

• const char ∗ tooltip () const
  Gets the current tooltip text.

• void tooltip (const char ∗text)
  Sets the current tooltip text.

• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void ∗ user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void ∗v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according to its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y , int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  *Internal use only.*
• void x (int v)
  *Internal use only.*
• void y (int v)
  *Internal use only.*

### Additional Inherited Members

#### Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  *The default callback for all widgets that don't set a callback.*
- static unsigned int label_shortcut (const char *t)
  *Returns the Unicode value of the '&x' shortcut in a given text.*
- static int test_shortcut (const char *t, const bool require_alt=false)
  *Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from Fl_Widget

  }
  *flags possible values enumeration.*

### 11.150.1 Detailed Description

This is provided only to emulate the Forms Timer widget.

It works by making a timeout callback every 1/5 second. This is wasteful and inaccurate if you just want something to happen a fixed time in the future. You should directly call Fl::add_timeout() instead.

### 11.150.2 Constructor & Destructor Documentation

#### 11.150.2.1 Fl_Timer()

Fl_Timer::Fl_Timer (  
  uchar t,
  int X,
  int Y,
  int W,
  int H,
  const char * l )

Creates a new Fl_Timer widget using the given type, position, size, and label string.

The type parameter can be any of the following symbolic constants:

- FL_NORMAL_TIMER - The timer just does the callback and displays the string "Timer" in the widget.
- FL_VALUE_TIMER - The timer does the callback and displays the current timer value in the widget.
- FL_HIDDEN_TIMER - The timer just does the callback and does not display anything.
## 11.150.3 Member Function Documentation

### 11.150.3.1 direction() [1/2]

```cpp
class Fl_Timer
{
public:
  char direction() const [inline]
}
```

Gets or sets the direction of the timer. If the direction is zero then the timer will count up, otherwise it will count down from the initial value().

### 11.150.3.2 direction() [2/2]

```cpp
class Fl_Timer
{
public:
  void direction(char d) [inline]
}
```

Gets or sets the direction of the timer. If the direction is zero then the timer will count up, otherwise it will count down from the initial value().

### 11.150.3.3 draw()

```cpp
class Fl_Timer
{
public:
  void draw() [protected], [virtual]
}
```

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead. Override this function to draw your own widgets. If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

### 11.150.3.4 handle()

```cpp
class Fl_Timer
{
public:
  int handle(int event) [virtual]
}
```

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

#### Parameters

- **event** the kind of event received

#### Return values

- **0** if the event was not used or understood
- **1** if the event was used and can be deleted

#### See also

- `Fl_Event`

Reimplemented from `Fl_Widget`.

Generated by Doxygen
11.150.3.5 suspended()

char Fl_Timer::suspended () const [inline]
Gets or sets whether the timer is suspended.

The documentation for this class was generated from the following files:

- FL_Timer.H
- forms_timer.cxx

11.151 Fl_Toggle_Button Class Reference

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off.

# include <Fl_Toggle_Button.H>

Inheritance diagram for Fl_Toggle_Button:

```
        Fl_Widget
           |
           v

           |
           v
Fl_Toggle_Button
```

Public Member Functions

- **Fl_Toggle_Button** (int X, int Y, int W, int H, const char ∗=0)
  
  Creates a new Fl_Toggle_Button widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Button

- int **clear ()**
  
  Same as value(0).

- uchar **compact ()**
  
  Return true if buttons are rendered as compact buttons.

- void **compact (uchar v)**
  
  Decide if buttons should be rendered in compact mode.

- **Fl_Boxtype down_box () const**
  
  Returns the current down box type, which is drawn when value() is non-zero.

- void **down_box (Fl_Boxtype b)**
  
  Sets the down box type.

- **Fl_Color down_color () const**
  
  (for backwards compatibility)

- void **down_color (unsigned c)**
  
  (for backwards compatibility)

- **Fl_Button** (int X, int Y, int W, int H, const char ∗=0)
  
  The constructor creates the button using the given position, size, and label.

- int **handle (int) FL_OVERRIDE**
  
  Handles the specified event.

- int **set ()**
  
  Same as value(1).

- void **setonly ()**
  
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set () does not do this).
• int shortcut () const
  Returns the current shortcut key for the button.
• void shortcut (const char ∗s)
  (for backwards compatibility)
• void shortcut (int s)
  Sets the shortcut key to s.
• char value () const
  Returns the current value of the button (0 or 1).
• int value (int v)
  Sets the current value of the button.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Generated by Doxygen
• void callback (Fl_Callback *cb)
  Provides the current callback function for the widget.

• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Provides the current callback function and managed user data for the widget.

• void callback (Fl_Callback *cb, void *p)
  Provides the current callback function and data for the widget.

• void callback (Fl_Callback0 *cb)
  Provides the current callback function for the widget.

• void callback (Fl_Callback1 *cb, long p=0)
  Provides the current callback function for the widget.

• void clear_active ()
  Clears the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Clears the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

• void copy_label (const char *new_label)
  Sets the current label.

• void copy_tooltip (const char *text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.
• FL_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const FL_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (FL_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (FL_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, FL_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• FL_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const FL_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (FL_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (FL_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const FL_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (FL_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• FL_COLOR labelcolor () const
  Gets the label color.
• void labelcolor (FL_COLOR c)
  Sets the label color.
• FL_FONT labelfont () const
  Gets the font to use.
• void labelfont (FL_FONT f)
  Sets the font to use.
• FL_FONTSIZE labelsize () const
Gets the font size in pixels.

- **void** `labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

- **Fl_Labeltype** `labeltype () const`
  Gets the label type.

- **void** `labeltype (Fl_Labeltype a)`
  Sets the label type.

- **void** `measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- **bool** `needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- **void** `needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

- **unsigned int** `output () const`
  Returns if a widget is used for output only.

- **Fl_Group** `∗` `parent () const`
  Returns a pointer to the parent widget.

- **void** `parent (Fl_Group ∗p)`
  Internal use only - “for hacks only”.

- **void** `position (int X, int Y)`
  Repositions the window or widget.

- **void** `redraw ()`
  Schedules the drawing of the widget.

- **void** `re redraw_label ()`
  Schedules the drawing of the label.

- **virtual void** `resize (int x, int y, int w, int h)`
  Changes the size or position of the widget.

- **Fl_Color** `selection_color () const`
  Gets the selection color.

- **void** `selection_color (Fl_Color a)`
  Sets the selection color.

- **void** `set_active ()`
  Marks the widget as active without sending events or changing focus.

- **void** `set_changed ()`
  Marks the value of the widget as changed.

- **void** `set_output ()`
  Sets a widget to output only.

- **void** `set_visible ()`
  Makes the widget visible.

- **void** `set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- **int** `shortcut_label () const`
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void** `shortcut_label (int value)`
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void** `show ()`
  Makes a widget visible.

- **void** `size (int W, int H)`
  Changes the size of the widget.

- **int** `take_focus ()`
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the 'x' shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered 'x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
flags possible values enumeration.

Protected Member Functions inherited from Fl_Button

- void draw () FL_OVERRIDE
  Draws the widget.
- void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according to its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget’s position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget’s label at the defined label position.
- void draw_label (int, int, int, int) const
Draws the label in an arbitrary bounding box.

- **Fl_Widget (int x, int y, int w, int h, const char *label=0L)**
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

**Static Protected Member Functions inherited from Fl_Button**

- static void key_release_timeout (void *)

**Static Protected Attributes inherited from Fl_Button**

- static Fl_Widget_Tracker * key_release_tracker = 0

**11.151.1 Detailed Description**

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off. The `Fl_Toggle_Button` subclass displays the "on" state by drawing a pushed-in button. Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for type() and when().

**11.151.2 Constructor & Destructor Documentation**

**11.151.2.1 Fl_Toggle_Button()**

```cpp
Fl_Toggle_Button::Fl_Toggle_Button (int X, int Y, int W, int H, const char * L = 0)
```

Creates a new Fl_Toggle_Button widget using the given position, size, and label string.

The constructor creates the button using the given position, size, and label.
The inherited destructor deletes the toggle button.
The Button type() is set to FL_TOGGLE_BUTTON.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>X, Y, W, H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Toggle_Button.H
- Fl_Button.cxx
11.152 Fl_Tooltip Class Reference

The Fl_Tooltip class provides tooltip support for all FLTK widgets.
#include <Fl_Tooltip.H>

Static Public Member Functions

- static Fl_Color color ()
  Gets the background color for tooltips.
- static void color (Fl_Color c)
  Sets the background color for tooltips.
- static Fl_Widget * current ()
  Gets the current widget target.
- static void current (Fl_Widget *)
  Sets the current widget target.
- static Fl_Window * current_window (void)
  Returns the window that is used for tooltips.
- static float delay ()
  Gets the tooltip delay.
- static void delay (float f)
  Sets the tooltip delay.
- static void disable ()
  Same as enable(0), disables tooltips on all widgets.
- static void enable (int b=1)
  Enables tooltips on all widgets (or disables if b is false).
- static int enabled ()
  Returns non-zero if tooltips are enabled.
- static void enter_area (Fl_Widget *w, int X, int Y, int W, int H, const char *tip)
  You may be able to use this to provide tooltips for internal pieces of your widget.
- static Fl_Font font ()
  Gets the typeface for the tooltip text.
- static void font (Fl_Font i)
  Sets the typeface for the tooltip text.
- static float hidedeflay ()
  Gets the time until an open tooltip hides again.
- static void hidedeflay (float f)
  Sets the time until an open tooltip hides again.
- static float hoverdelay ()
  Gets the tooltip hover delay, the delay between tooltips.
- static void hoverdelay (float f)
  Sets the tooltip hover delay, the delay between tooltips.
- static int margin_height ()
  Gets the amount of extra space above and below the tooltip’s text.
- static void margin_height (int v)
  Sets the amount of extra space above and below the tooltip’s text.
- static int margin_width ()
  Gets the amount of extra space left/right of the tooltip’s text.
- static void margin_width (int v)
  Sets the amount of extra space left/right of the tooltip’s text.
- static Fl_Fontsize size ()
  Gets the size of the tooltip text.
- static void size (Fl_Fontsize s)
Sets the size of the tooltip text.

- static Fl_Color textcolor ()
  
  Gets the color of the text in the tooltip.

- static void textcolor (Fl_Color c)
  
  Sets the color of the text in the tooltip.

- static int wrap_width ()
  
  Gets the maximum width for tooltip's text before it word wraps.

- static void wrap_width (int v)
  
  Sets the maximum width for tooltip's text before it word wraps.

Static Public Attributes

- static void(∗enter)(Fl_Widget ∗w) = nothing
- static void(∗exit)(Fl_Widget ∗w) = nothing

Friends

- class Fl_TooltipBox
- void Fl_Widget::copy_tooltip (const char ∗)
- void Fl_Widget::tooltip (const char ∗)

11.152.1 Detailed Description

The Fl_Tooltip class provides tooltip support for all FLTK widgets. It contains only static methods.

![Figure 11.61 Fl_Tooltip Options](image)

11.152.2 Member Function Documentation

11.152.2.1 color() [1/2]

static Fl_Color Fl_Tooltip::color ( ) [inline], [static]

Gets the background color for tooltips.
The default background color is a pale yellow.

11.152.2.2 color() [2/2]

static void Fl_Tooltip::color ( Fl_Color c ) [inline], [static]

Sets the background color for tooltips.
The default background color is a pale yellow.
11.152.2.3 current()

```cpp
void Fl_Tooltip::current ( Fl_Widget * w ) [static]
```

Sets the current widget target.
Acts as though enter(widget) was done but does not pop up a tooltip. This is useful to prevent a tooltip from reappearing when a modal overlapping window is deleted. FLTK does this automatically when you click the mouse button.

11.152.2.4 delay() [1/2]

```cpp
static float Fl_Tooltip::delay ( ) [inline], [static]
```

Gets the tooltip delay.
The default delay is 1.0 seconds.

11.152.2.5 delay() [2/2]

```cpp
static void Fl_Tooltip::delay ( float f ) [inline], [static]
```

Sets the tooltip delay.
The default delay is 1.0 seconds.

11.152.2.6 disable()

```cpp
static void Fl_Tooltip::disable ( ) [inline], [static]
```

Same as enable(0), disables tooltips on all widgets.

11.152.2.7 enable()

```cpp
static void Fl_Tooltip::enable ( int b = 1 ) [inline], [static]
```

Enables tooltips on all widgets (or disables if b is false).

11.152.2.8 enabled()

```cpp
static int Fl_Tooltip::enabled ( ) [inline], [static]
```

Returns non-zero if tooltips are enabled.

11.152.2.9 enter_area()

```cpp
void Fl_Tooltip::enter_area ( Fl_Widget * wid,
                                int x,
                                int y,
                                int w,
                                int h,
                                const char * t ) [static]
```

You may be able to use this to provide tooltips for internal pieces of your widget.
Call this after setting Fl::belowmouse() to your widget (because that calls the above enter() method). Then figure out what thing the mouse is pointing at, and call this with the widget (this pointer is used to remove the tooltip if the widget is deleted or hidden, and to locate the tooltip), the rectangle surrounding the area, relative to the top-left
corner of the widget (used to calculate where to put the tooltip), and the text of the tooltip (which must be a pointer to static data as it is not copied).

11.152.2.10 font() [1/2]

static Fl_Font Fl_Tooltip::font ( ) [inline], [static]
Gets the typeface for the tooltip text.

11.152.2.11 font() [2/2]

static void Fl_Tooltip::font ( Fl_Font f ) [inline], [static]
Sets the typeface for the tooltip text.

11.152.2.12 hidedelay() [1/2]

static float Fl_Tooltip::hidedelay ( ) [inline], [static]
Gets the time until an open tooltip hides again.
The default delay is 12.0 seconds.

11.152.2.13 hidedelay() [2/2]

static void Fl_Tooltip::hidedelay ( float f ) [inline], [static]
Sets the time until an open tooltip hides again.
The default delay is 12.0 seconds.

11.152.2.14 hoverdelay() [1/2]

static float Fl_Tooltip::hoverdelay ( ) [inline], [static]
Gets the tooltip hover delay, the delay between tooltips.
The default delay is 0.2 seconds.

11.152.2.15 hoverdelay() [2/2]

static void Fl_Tooltip::hoverdelay ( float f ) [inline], [static]
Sets the tooltip hover delay, the delay between tooltips.
The default delay is 0.2 seconds.

11.152.2.16 margin_height() [1/2]

static int Fl_Tooltip::margin_height ( ) [inline], [static]
Gets the amount of extra space above and below the tooltip's text.
Default is 3.

11.152.2.17 margin_height() [2/2]

static void Fl_Tooltip::margin_height ( int v ) [inline], [static]
Sets the amount of extra space above and below the tooltip's text.
Default is 3.
11.152.2.18  margin_width() [1/2]

static int Fl_Tooltip::margin_width ( ) [inline], [static]
Gets the amount of extra space left/right of the tooltip's text.
Default is 3.

11.152.2.19  margin_width() [2/2]

static void Fl_Tooltip::margin_width (  
    int v ) [inline], [static]
Sets the amount of extra space left/right of the tooltip's text.
Default is 3.

11.152.2.20  size() [1/2]

static Fl_Fontsize Fl_Tooltip::size ( ) [inline], [static]
Gets the size of the tooltip text.

11.152.2.21  size() [2/2]

static void Fl_Tooltip::size (  
    Fl_Fontsize s ) [inline], [static]
Sets the size of the tooltip text.

11.152.2.22  textcolor() [1/2]

static Fl_Color Fl_Tooltip::textcolor ( ) [inline], [static]
Gets the color of the text in the tooltip.
The default is black.

11.152.2.23  textcolor() [2/2]

static void Fl_Tooltip::textcolor (  
    Fl_Color c ) [inline], [static]
Sets the color of the text in the tooltip.
The default is black.

11.152.2.24  wrap_width() [1/2]

static int Fl_Tooltip::wrap_width ( ) [inline], [static]
Gets the maximum width for tooltip's text before it word wraps.
Default is 400.

11.152.2.25  wrap_width() [2/2]

static void Fl_Tooltip::wrap_width (  
    int v ) [inline], [static]
Sets the maximum width for tooltip's text before it word wraps.
Default is 400.
The documentation for this class was generated from the following files:

- Fl_Tooltip.H
- Fl.cxx
- Fl_Tooltip.cxx
11.153 Fl_Tree Class Reference

Tree widget.

```cpp
#include <Fl_Tree.H>
```

Inheritance diagram for Fl_Tree:

    Fl_Group
        |       |
    Fl_Tree
```

Public Member Functions

- ```Fl_Tree_Item * add (const char *path, Fl_Tree_Item *newitem=0)```  
  Adds a new item, given a menu style 'path'.

- ```Fl_Tree_Item * add (Fl_Tree_Item *parent_item, const char *name)```  
  Add a new child item labeled 'name' to the specified 'parent_item'.

- ```void calc_dimensions ()```  
  Recalculate widget dimensions and scrollbar visibility, normally managed automatically.

- ```void calc_tree ()```  
  Recalculates the tree's sizes and scrollbar visibility, normally managed automatically.

- ```Fl_Tree_Item * callback_item ()```  
  Gets the item that caused the callback.

- ```void callback_item (Fl_Tree_Item *item)```  
  Sets the item that was changed for this callback.

- ```Fl_Tree_Reason callback_reason () const```  
  Gets the reason for this callback.

- ```void callback_reason (Fl_Tree_Reason reason)```  
  Sets the reason for this callback.

- ```void clear ()```  
  Clears the entire tree's children, including the root.

- ```void clear_children (Fl_Tree_Item *item)```  
  Clears all the children for 'item'.

- ```int close (const char *path, int docallback=1)```  
  Closes the item specified by 'path'.

- ```int close (Fl_Tree_Item *item, int docallback=1)```  
  Closes the specified 'item'.

- ```Fl_Image * closeicon () const```  
  Returns the icon to be used as the 'close' icon.

- ```void closeicon (Fl_Image *val)```  
  Sets the icon to be used as the 'close' icon.

- ```Fl_Color connectorcolor () const```  
  Get the connector color used for tree connection lines.

- ```void connectorcolor (Fl_Color val)```  
  Set the connector color used for tree connection lines.

- ```Fl_Tree_Connector connectorstyle () const```  
  Returns the line drawing style for inter-connecting items.

- ```void connectorstyle (Fl_Tree_Connector val)```  
  Sets the line drawing style for inter-connecting items.
**int connectorwidth () const**

*Gets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.*

**void connectorwidth (int val)**

*Sets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.*

**int deselect (const char *path, int docallback=1)**

*Deselect an item specified by 'path'.*

**int deselect (Fl_Tree_Item *item, int docallback=1)**

*Deselect the specified item.*

**int deselect_all (Fl_Tree_Item *item=0, int docallback=1)**

*Deselect 'item' and all its children.*

**void display (Fl_Tree_Item *item)**

*Displays 'item', scrolling the tree as necessary.*

**int displayed (Fl_Tree_Item *item)**

*See if 'item' is currently displayed on-screen (visible within the widget).*

**int extend_selection (Fl_Tree_Item *from, Fl_Tree_Item *to, int val=1, bool visible=false)**

*Extend a selection between 'from' and 'to' depending on 'visible'.*

**int extend_selection_dir (Fl_Tree_Item *from, Fl_Tree_Item *to, int dir, int val, bool visible)**

*Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.*

**Fl_Tree_Item * find_clicked (int yonly=0)**

*Non-const version of Fl_Tree::find_clicked(int yonly) const.*

**const Fl_Tree_Item * find_clicked (int yonly=0) const**

*Find the item that was last clicked on.*

**Fl_Tree_Item * find_item (const char *path)**

*Non-const version of Fl_Tree::find_item(const char *path) const.*

**const Fl_Tree_Item * find_item (const char *path) const**

*Find the item, given a menu style path, e.g.*

**Fl_Tree_Item * first ()**

*Returns the first item in the tree, or 0 if none.*

**Fl_Tree_Item * first_selected_item ()**

*Returns the first selected item in the tree.*

**Fl_Tree_Item * first_visible ()**

*Returns the first open(), visible item in the tree, or 0 if none.*

**Fl_Tree_Item * first_visible_item ()**

*Returns the first open(), visible item in the tree, or 0 if none.*

**Fl_Tree (int X, int Y, int W, int H, const char *L=0)**

*Constructor.*

**Fl_Tree_Item * get_item_focus () const**

*Get the item that currently has keyboard focus.*

**int get_selected_items (Fl_Tree_Item_Array &items)**

*Returns the currently selected items as an array of 'ret_items'.*

**int handle (int e) FL_OVERRIDE**

*Standard FLTK event handler for this widget.*

**int hposition () const**

*Returns the horizontal scroll position as a pixel offset.*

**void hposition (int pos)**

*Sets the horizontal scroll offset to position 'pos'.*

**Fl_Tree_Item * insert (Fl_Tree_Item *item, const char *name, int pos)**

*Insert a new item 'name' into 'item's children at position 'pos'.*

**Fl_Tree_Item * insert_above (Fl_Tree_Item *above, const char *name)**

*Inserts a new item 'name' above the specified Fl_Tree_Item 'above'.*
- \textbf{int is_close} (const char *path) const
  
  See if item specified by 'path' is closed.

- \textbf{int is_close} (Fl_Tree_Item *item) const
  
  See if the specified 'item' is closed.

- \textbf{int is_hscroll_visible} () const
  
  See if the horizontal scrollbar is currently visible.

- \textbf{int is_open} (const char *path) const
  
  See if item specified by 'path' is open.

- \textbf{int is_open} (Fl_Tree_Item *item) const
  
  See if 'item' is open.

- \textbf{int is_scrollbar} (Fl_Widget *w)
  
  See if widget 'w' is one of the Fl_Tree widget's scrollbars.

- \textbf{int is_selected} (const char *path)
  
  See if item specified by 'path' is selected.

- \textbf{int is_selected} (Fl_Tree_Item *item) const
  
  See if the specified 'item' is selected.

- \textbf{int is_vscroll_visible} () const
  
  See if the vertical scrollbar is currently visible.

- \textbf{Fl_Tree_Item * item_clicked} ()
  
  Return the item that was last clicked.

- \textbf{Fl_Tree_Item_Draw_Mode item_draw_mode} () const
  
  Get the 'item draw mode' used for the tree.

- \textbf{void item_draw_mode} (Fl_Tree_Item_Draw_Mode mode)
  
  Set the 'item draw mode' used for the tree to 'mode'.

- \textbf{void item_draw_mode} (int mode)
  
  Set the 'item draw mode' used for the tree to integer 'mode'.

- \textbf{void item_labelbgcolor} (Fl_Color val)
  
  Set the default label background color used for creating new items.

- \textbf{Fl_Color item_labelbgcolor} (void) const
  
  Get the default label background color used for creating new items.

- \textbf{void item_labelfgcolor} (Fl_Color val)
  
  Set the default label foreground color used for creating new items.

- \textbf{Fl_Color item_labelfgcolor} (void) const
  
  Get the default label foreground color used for creating new items.

- \textbf{Fl_Font item_labelfont} () const
  
  Get the default font face used for creating new items.

- \textbf{void item_labelfont} (Fl_Font val)
  
  Set the default font face used for creating new items.

- \textbf{Fl_Fontsize item_labelsize} () const
  
  Get the default label fontsize used for creating new items.

- \textbf{void item_labelsize} (Fl_Fontsize val)
  
  Set the default label font size used for creating new items.

- \textbf{int item_pathname} (char *pathname, int pathnamelen, const Fl_Tree_Item *item) const
  
  Return 'pathname' of size 'pathnamelen' for the specified 'item'.

- \textbf{Fl_Tree_Item_Reselect_Mode item_reselect_mode} () const
  
  Returns the current item re/selection mode.

- \textbf{void item_reselect_mode} (Fl_Tree_Item_Reselect_Mode mode)
  
  Sets the item re/selection mode.

- \textbf{int labelmarginleft} () const
  
  Get the amount of white space (in pixels) that should appear to the left of the label text.

- \textbf{void labelmarginleft} (int val)
Set the amount of white space (in pixels) that should appear to the left of the label text.

- `Fl_Tree_Item * last ()`
  Returns the last item in the tree.
- `Fl_Tree_Item * last_selected_item ()`
  Returns the last selected item in the tree.
- `Fl_Tree_Item * last_visible ()`
  Returns the last open(), visible item in the tree.
- `Fl_Tree_Item * last_visible_item ()`
  Returns the last open(), visible item in the tree.

- `int linespacing () const`
  Get the amount of white space (in pixels) that should appear between items in the tree.
- `void linespacing (int val)`
  Sets the amount of white space (in pixels) that should appear between items in the tree.
- `void load (class Fl_Preferences &)`
  Load FLTK preferences.
- `int marginbottom () const`
  Get the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.
- `void marginbottom (int val)`
  Sets the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.
- `int marginleft () const`
  Get the amount of white space (in pixels) that should appear between the widget’s left border and the tree’s contents.
- `void marginleft (int val)`
  Set the amount of white space (in pixels) that should appear between the widget’s left border and the left side of the tree’s contents.
- `int margintop () const`
  Get the amount of white space (in pixels) that should appear between the widget’s top border and the top of the tree’s contents.
- `void margintop (int val)`
  Sets the amount of white space (in pixels) that should appear between the widget’s top border and the top of the tree’s contents.
- `Fl_Tree_Item * next (Fl_Tree_Item *item=0)`
  Return the next item after ‘item’, or 0 if no more items.
- `Fl_Tree_Item * next (Fl_Tree_Item *item, int dir=FL_Down, bool visible=false)`
  Returns next item after ‘item’ in direction ‘dir’ depending on ‘visible’.
- `Fl_Tree_Item * next_selected_item (Fl_Tree_Item *item=0, int dir=FL_Down)`
  Returns the next selected item above or below ‘item’, depending on ‘dir’.
- `Fl_Tree_Item * next_visible_item (Fl_Tree_Item *start, int dir)`
  Returns next open(), visible item above (dir==FL_Up) or below (dir==FL_Down) the specified ‘item’, or 0 if no more items.
- `int open (const char *path, int docallback=1)`
  Opens the item specified by ‘path’.
- `int open (Fl_Tree_Item *item, int docallback=1)`
  Open the specified ‘item’.
- `void open_toggle (Fl_Tree_Item *item, int docallback=1)`
  Toggle the open state of ‘item’.
- `int openchild_marginbottom () const`
  Get the amount of white space (in pixels) that should appear below an open child tree’s contents.
- `void openchild_marginbottom (int val)`
  Set the amount of white space (in pixels) that should appear below an open child tree’s contents.
- `Fl_Image * openicon () const`
Returns the icon to be used as the 'open' icon.

- void openicon (Fl_Image *val)
  Sets the icon to be used as the 'open' icon.

- const Fl_Tree_Prefs & prefs () const
  FLintree_Item * prev (Fl_Tree_Item *item=0)
  Return the previous item before 'item', or 0 if no more items.

- void recalc_tree ()
  Schedule tree to recalc the entire tree size.

- int remove (Fl_Tree_Item *item)
  Remove the specified 'item' from the tree.

- void resize (int, int, int, int) FL_OVERRIDE
  Resizes the Fl_Group widget and all of its children.

- Fl_Tree_Item * root ()
  Returns the root item.

- void root (Fl_Tree_Item *newitem)
  Sets the root item to 'newitem'.

- void root_label (const char *new_label)
  Set the label for the root item to 'new_label'.

- int scrollbar_size () const
  Gets the default size of scrollbars' troughs for this widget in pixels.

- void scrollbar_size (int size)
  Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.

- int select (const char *path, int docallback=1)
  Select the item specified by 'path'.

- int select (Fl_Tree_Item *item, int docallback=1)
  Select the specified 'item'.

- int select_all (Fl_Tree_Item *item=0, int docallback=1)
  Select 'item' and all its children.

- int select_only (Fl_Tree_Item *selitem, int docallback=1)
  Select only the specified item, deselecting all others that might be selected.

- void select_toggle (Fl_Tree_Item *item, int docallback=1)
  Toggle the select state of the specified 'item'.

- Fl_Boxtype selectbox () const
  Sets the style of box used to draw selected items.

- void selectbox (Fl_Boxtype val)
  Gets the style of box used to draw selected items.

- Fl_Tree_Select selectmode () const
  Gets the tree's current selection mode.

- void selectmode (Fl_Tree_Select val)
  Sets the tree's selection mode.

- void set_item_focus (Fl_Tree_Item *item)
  Set the item that currently should have keyboard focus.

- void show_item (Fl_Tree_Item *item)
  Adjust the vertical scrollbar to show 'item' at the top of the display IF it is currently off-screen (for instance show_item_top()).

- void show_item (Fl_Tree_Item *item, int yoff)
  Adjust the vertical scrollbar so that 'item' is visible 'yoff' pixels from the top of the Fl_Tree widget's display.

- void show_item_bottom (Fl_Tree_Item *item)
  Adjust the vertical scrollbar so that 'item' is at the bottom of the display.

- void show_item_middle (Fl_Tree_Item *item)
  Adjust the vertical scrollbar so that 'item' is in the middle of the display.
• void show_item_top (Fl_Tree_Item *item)
  Adjust the vertical scrollbar so that 'item' is at the top of the display.

• void show_self ()
  Print the tree as 'ascii art' to stdout.

• int showcollapse () const
  Returns 1 if the collapse icon is enabled, 0 if not.

• void showcollapse (int val)
  Set if we should show the collapse icon or not.

• int showroot () const
  Returns 1 if the root item is to be shown, or 0 if not.

• void showroot (int val)
  Set if the root item should be shown or not.

• Fl_Tree_Sort sortorder () const
  Set the default sort order used when items are added to the tree.

• void sortorder (Fl_Tree_Sort val)
  Gets the sort order used to add items to the tree.

• Fl_Image * usericon () const
  Returns the Fl_Image being used as the default user icon for all newly created items.

• void usericon (Fl_Image *val)
  Sets the Fl_Image to be used as the default user icon for all newly created items.

• int usericonmarginleft () const
  Get the amount of white space (in pixels) that should appear to the left of the usericon.

• void usericonmarginleft (int val)
  Set the amount of white space (in pixels) that should appear to the left of the usericon.

• int vposition () const
  Returns the vertical scroll position as a pixel offset.

• void vposition (int pos)
  Sets the vertical scroll offset to position 'pos'.

• int widgetmarginleft () const
  Get the amount of white space (in pixels) that should appear to the left of the child fltk widget (if any).

• void widgetmarginleft (int val)
  Set the amount of white space (in pixels) that should appear to the left of the child fltk widget (if any).

• ~Fl_Tree ()
  Destructor.

Public Member Functions inherited from Fl_Group

• Fl_Widget *&_ddfdesign_kludge ()
  This is for forms compatibility only.

• void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

• void add (Fl_Widget *o)
  See void Fl_Group::add(Fl_Widget &w)

• void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget *const * array () const
  Returns a pointer to the array of children.

• Fl_Group const * as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• Fl_Group * as_group () FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
Sets the current group so you can build the widget tree by just constructing the widgets.

- `Fl_Widget * child (int n) const`
  Returns `array()[n].`

- `int children () const`
  Returns how many child widgets the group has.

- `void clear ()`
  Deletes all child widgets from memory recursively.

- `unsigned int clip_children ()`
  Returns the current clipping mode.

- `void clip_children (int c)`
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- `virtual int delete_child (int n)`
  Removes the widget at index from the group and deletes it.

- `void end ()`
  Exactly the same as `current(this->parent()).`

- `int find (const Fl_Widget &o) const`
  See `int Fl_Group::find(const Fl_Widget *w) const.`

- `int find (const Fl_Widget *) const`
  Searches the child array for the widget and returns the index.

- `Fl_Group (int, int, int, int, const char *)=0)`
  Creates a new `Fl_Group` widget using the given position, size, and label string.

- `void focus (Fl_Widget *W)`
- `void forms_end ()`
  This is for forms compatibility only.

- `void init_sizes ()`
  Resets the internal array of widget sizes and positions.

- `void insert (Fl_Widget &, int i)`
  The widget is removed from its current group (if any) and then inserted into this group.

- `void insert (Fl_Widget &, Fl_Widget *before)`
  This does `insert(w, find(before)).`

- `void remove (Fl_Widget &)`
  Removes a widget from the group but does not delete it.

- `void remove (Fl_Widget *)`
  Removes the widget o from the group.

- `void remove (int index)`
  Removes the widget at index from the group but does not delete it.

- `Fl_Widget * resizable () const`
  Returns the group's resizable widget.

- `void resizable (Fl_Widget &o)`
  Sets the group's resizable widget.

- `void resizable (Fl_Widget *)`
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- `virtual ~Fl_Group ()`
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- void **clear_changed** ()
  Marks the value of the widget as unchanged.

- void **clear_damage** (uchar c=0)
  Clears or sets the damage flags.

- void **clear_output** ()
  Sets a widget to accept input.

- void **clear_visible** ()
  Hides the widget.

- void **clear_visible_focus** ()
  Disables keyboard focus navigation with this widget.

- **Fl_Color** **color** () const
  Gets the background color of the widget.

- void **color** (**Fl_Color** bg)
  Sets the background color of the widget.

- void **color** (**Fl_Color** bg, **Fl_Color** sel)
  Sets the background and selection color of the widget.

- **Fl_Color** **color2** () const
  For back compatibility only.

- void **color2** (unsigned a)
  For back compatibility only.

- int **contains** (**const Fl_Widget** ∗w) const
  Checks if w is a child of this widget.

- void **copy_label** (**const char** ∗new_label)
  Sets the current label.

- void **copy_tooltip** (**const char** ∗text)
  Sets the current tooltip text.

- uchar **damage** () const
  Returns non-zero if draw() needs to be called.

- void **damage** (uchar c)
  Sets the damage bits for the widget.

- void **damage** (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int **damage_resize** (int, int, int, int)
  Internal use only.

- void **deactivate** ()
  Deactivates the widget.

- **Fl_Image** ∗ **deimage** ()
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image** ∗ **deimage** () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void **deimage** (**Fl_Image** &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void **deimage** (**Fl_Image** ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

- int **deimage_bound** () const
  Returns whether the inactive image is managed by the widget.

- void **do_callback** (**Fl_Callback_Reas** on reason=**FL_REASON_UNKNOWN**)
  Calls the widget callback function with default arguments.

- void **do_callback** (**Fl_Widget** →widget, long arg, **Fl_Callback_Reas** on reason=**FL_REASONUNKNOWN**)
  Calls the widget callback function with arbitrary arguments.
• void **do_callback** (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void **draw_label** (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void **hide** ()
  Makes a widget invisible.

• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.

• void **image** (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void **image** (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• int **image_bound** () const
  Returns whether the image is managed by the widget.

• int **inside** (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int **is_label_copied** () const
  Returns whether the current label was assigned with copy_label().

• const char * **label** () const
  Gets the current label text.

• void **label** (const char *text)
  Sets the current label pointer.

• void **label** (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color **labelcolor** () const
  Gets the label color.

• void **labelcolor** (Fl_Color c)
  Sets the label color.

• Fl_Font **labelfont** () const
  Gets the font to use.

• void **labelfont** (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize **labelsize** () const
  Gets the font size in pixels.

• void **labelsize** (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype **labelftype** () const
  Gets the label type.

• void **labelftype** (Fl_Labeltype a)
  Sets the label type.

• void **measure_label** (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool **needs_keyboard** () const
  Returns whether this widget needs a keyboard.

• void **needs_keyboard** (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
Returns if a widget is used for output only.

- **Fl_Group** *parent () const*
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int testShortcut ()**
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char * tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.
• int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void *user_data () const
  
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  
  Sets the user data for this widget.

• void user_data (void *v)
  
  Sets the user data for this widget.

• unsigned int visible () const
  
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  
  Modifies keyboard focus navigation.

• int visible_r () const
  
  Returns whether a widget and all its parents are visible.

• int w () const
  
  Gets the widget width.

• Fl_When when () const
  
  Returns the conditions under which the callback is called.

• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Window *window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Protected Member Functions

• void do_callback_for_item (Fl_Tree_Item *item, Fl_Tree_Reason reason)
  
  Do the callback for the specified 'item' using 'reason', setting the callback_item() and callback_reason().

• void draw () FL_OVERRIDE
  
  Standard FLTK draw() method, handles drawing the tree widget.

• void item_clicked (Fl_Tree_Item *val)
  
  Set the item that was last clicked.

Protected Member Functions inherited from Fl_Group

• Fl_Rect *bounds ()
  
  Returns the internal array of widget sizes and positions.

• void draw_child (Fl_Widget &widget) const
  
  Forces a child to redraw.

• void draw_children ()
  
  Draws all children of the group.

• void draw_outside_label (const Fl_Widget &widget) const
  
  Parents normally call this to draw outside labels of child widgets.

• virtual int on_insert (Fl_Widget *, int)
  
  Allow derived groups to act when a widget is added as a child.
- `virtual int on_move(int, int)`  
  Allow derived groups to act when a widget is moved within the group.

- `virtual void on_remove(int)`  
  Allow derived groups to act when a child widget is removed from the group.

- `int * sizes()`  
  Returns the internal array of widget sizes and positions.

- `void update_child(Fl_Widget &widget) const`  
  Draws a child only if it needs it.

### Protected Member Functions inherited from Fl_Widget

- `void clear_flag(unsigned int c)`  
  Clears a flag in the flags mask.

- `void draw_backdrop() const`  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- `void draw_box() const`  
  Draws the widget box according its box style.

- `void draw_box(Fl_Boxtype t, Fl_Color c) const`  
  Draws a box of type t, of color c at the widget's position and size.

- `void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- `void draw_focus() const`  
  Draws a focus rectangle around the widget.

- `void draw_focus(Fl_Boxtype t, int X, int Y, int W, int H) const`  
  Draws a focus rectangle around the widget.

- `void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`  
  Draws a focus box for the widget at the given position and size.

- `void draw_label() const`  
  Draws the widget's label at the defined label position.

- `void draw_label(int, int, int) const`  
  Draws the label in an arbitrary bounding box.

- `Fl_Widget(int x, int y, int w, int h, const char *label=0L)`  
  Creates a widget at the given position and size.

- `unsigned int flags() const`  
  Gets the widget flags mask.

- `void h(int v)`  
  Internal use only.

- `void set_flag(unsigned int c)`  
  Sets a flag in the flags mask.

- `void w(int v)`  
  Internal use only.

- `void x(int v)`  
  Internal use only.

- `void y(int v)`  
  Internal use only.
Protected Attributes

- **Fl_Scrollbar** *-_hscroll
  
  Horizontal scrollbar.
- **int** _tih
  
  Tree widget inner xywh dimension: inside borders + scrollbars.
- **int** _tiw
- **int** _tix
- **int** _tiy
- **int** _toh
  
  Tree widget outer xywh dimension: outside scrollbars, inside widget border.
- **int** _tow
- **int** _tox
- **int** _toy
- **int** _tree_h
  
  the calculated height of the entire tree hierarchy. See calc_tree()
- **int** _tree_w
  
  the calculated width of the entire tree hierarchy. See calc_tree()
- **Fl_Scrollbar** *-_vscroll
  
  Vertical scrollbar.

Friends

- class **Fl_Tree_Item**

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static **Fl_Group** *current ()
  
  Returns the currently active group.
- static void current (**Fl_Group** *g)
  
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (**Fl_Widget** *widget, void *data)
  
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,

flags possible values enumeration.

11.153.1 Detailed Description

Tree widget.

Figure 11.62 Fl_Tree example program

```
Fl_Tree
|--- Fl_Tree_Item
|--- Fl_Tree_Prefs
|   |--- Fl_Tree_Connector (enum)
|   |   |--- Fl_Tree_Select (enum)
|   |--- Fl_Tree_Sort (enum)
```

Similar to Fl_Browser, Fl_Tree is a browser of Fl_Tree_Item's arranged in a parented hierarchy, or 'tree'. Subtrees can be expanded or closed. Items can be added, deleted, inserted, sorted and re-ordered. The tree items may also contain other FLTK widgets, like buttons, input fields, or even "custom" widgets.

The callback() is invoked depending on the value of when():

- FL_WHEN_RELEASE – callback invoked when left mouse button is released on an item
- FL_WHEN_CHANGED – callback invoked when left mouse changes selection state

The simple way to define a tree:

```
#include <FL/Fl_Tree.H>
[..]
Fl_Tree tree(X,Y,W,H);
tree.begin();
tree.add("Flintstones/Fred");
tree.add("Flintstones/Wilma");
tree.add("Flintstones/Pebbles");
tree.add("Simpsons/Homer");
tree.add("Simpsons/Marge");
tree.add("Simpsons/Bart");
tree.add("Simpsons/Lisa");
tree.end();
```

FEATURES

- Items can be added with add(), removed with remove(), completely cleared with clear(), inserted with insert() and insert_above(), selected/deselected with select() and deselect(),
- open/closed with open() and close(),
- positioned on the screen with show_item_top(), show_item_middle() and show_item_bottom(),
- item children can be swapped around with Fl_Tree_Item::swap_children(),
- items can be moved around with Fl_Tree_Item::move(),

Generated by Doxygen
an item's children can be walked with Fl_Tree_Item::first() and Fl_Tree_Item::next(), an item's children can be indexed directly with Fl_Tree_Item::child() and Fl_Tree_Item::children(), items can be moved from one subtree to another with Fl_Tree_Item::deparent() and Fl_Tree_Item::reparent(), sorting can be controlled when items are add()ed via sortorder().
You can walk the entire tree with first() and next().
You can walk visible items with first_visible_item() and next_visible_item().
You can walk selected items with first_selected_item() and next_selected_item().
Items can be found by their pathname using find_item(const char *), and an item's pathname can be found with item_pathname().
The selected items' colors are controlled by selection_color() (inherited from Fl_Widget).
A hook is provided to allow you to redefine how item's labels are drawn via Fl_Tree::item_draw_callback().
Items can be interactively dragged using FL_TREE_SELECT_SINGLE_DRAGGABLE.

SELECTION OF ITEMS

The tree can have different selection behaviors controlled by selectmode(). The background color used for selected items is the Fl_Tree::selection_color(). The foreground color for selected items is controlled internally with fl_contrast().

CHILD WIDGETS

FLTK widgets (including custom widgets) can be assigned to tree items via Fl_Tree_Item::widget().

When an Fl_Tree_Item::widget() is defined, the default behavior is for the widget() to be shown in place of the item's label (if it has one). Only the widget()'s width will be used; the widget()'s x() and y() position will be managed by the tree, and the h() will track the item's height. This default behavior can be altered (ABI 1.3.1): Setting Fl_Tree::item_draw_mode()'s FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET flag causes the label + widget to be displayed together in that order, and adding the FL_TREE_ITEM_HEIGHT_FROM_WIDGET flag causes widget's height to define the widget()'s height.

ICONS

The tree's open/close icons can be redefined with Fl_Tree::openicon(), Fl_Tree::closeicon(). User icons can either be changed globally with Fl_Tree::usericon(), or on a per-item basis with Fl_Tree_Item::usericon().

Various default preferences can be globally manipulated via Fl_Tree_Prefs, including colors, margins, icons, connection lines, etc.

FONTS AND COLORS

When adding new items to the tree, the new items get the defaults for fonts and colors from:

- Fl_Tree::item_labelfont() – The default item label font (default: FL_HELVETICA)
- Fl_Tree::item_labelsize() – The default item label size (default: FL_NORMAL_SIZE)
- Fl_Tree::item_labelfgcolor() – The default item label foreground color (default: FL_FOREGROUND_COLOR)
- Fl_Tree::item_labelbgcolor() – The default item label background color (default: 0xffffffff, which tree uses as 'transparent')

Each item (Fl_Tree_Item) inherits a copy of these font/color attributes when created, and each item has its own methods to let the app change these values on a per-item basis using methods of the same name:
• `Fl_Tree_Item::labelfont()` – The item's label font (default: FL_HELVETICA)
• `Fl_Tree_Item::labelsize()` – The item's label size (default: FL_NORMAL_SIZE)
• `Fl_Tree_Item::labelfgcolor()` – The item's label foreground color (default: FL_FOREGROUND_COLOR)
• `Fl_Tree_Item::labelbgcolor()` – The item's label background color (default: 0xffffffff, which uses the tree's own bg color)

CALLBACKS

The tree's `callback()` will be invoked when items change state or are open/closed. `when()` controls when mouse/keyboard events invoke the callback. `callback_item()` and `callback_reason()` can be used to determine the cause of the callback. e.g.

```c
void MyTreeCallback(Fl_Widget *w, void *data) {
    Fl_Tree *tree = (Fl_Tree*)w;
    Fl_Tree_Item *item = (Fl_Tree_Item*)tree->callback_item(); // get selected item
    switch ( tree->callback_reason() ) {
        case FL_TREE_REASON_SELECTED: // ...
        case FL_TREE_REASON_DESELECTED: // ...
        case FL_TREE_REASON_RESELECTED: // ...
        case FL_TREE_REASON_OPENED: // ...
        case FL_TREE_REASON_CLOSED: // ...
    }
}
```

SIMPLE EXAMPLES

To find all the selected items:

```c
for ( Fl_Tree_Item *i=first_selected_item(); i; i=next_selected_item(i) ) {
    printf("Item %s is selected\n", i->label());
}
```

To get an item's full menu pathname, use `Fl_Tree::item_pathname()`, e.g.

```c
[[..]
char pathname[256] = "???";
tree->item_pathname(pathname, sizeof(pathname), item); // eg. "Parent/Child/Item"
[..]
```

To walk all the items of the tree from top to bottom:

```c
// Walk all the items in the tree, and print their labels
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) ) {
    printf("Item: %s\n", item->label());
}
```

To recursively walk all the children of a particular item, define a function that uses recursion:

```c
// Find all of the item's children and print an indented report of their labels
void my_print_all_children(Fl_Tree_Item *item, int indent=0) {
    for ( int t=0; t<item->children(); t++ ) {
        printf("%s Item: %s\n", indent, "", item->child(t)->label());
        my_print_all_children(item->child(t), indent+4); // recurse
    }
}
```
To change the default label font and color when creating new items:

```cpp
tree = new Fl_Tree(...);
tree->item_labelfont(FL_COURIER); // Use Courier font for all new items
tree->item_labelfgcolor(FL_RED); // Use red color for labels of all new items
// Now create the items in the tree using the above defaults.
tree->add("Aaa");
tree->add("Bbb");
```

To change the font and color of all existing items in the tree:

```cpp
// Change the font and color of all items currently in the tree
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) ) {
    item->labelfont(FL_COURIER);
    item->labelcolor(FL_RED);
}
```

DISPLAY DESCRIPTION

The following image shows the tree's various visual elements and the methods that control them:

![Figure 11.63 Fl_Tree elements](image)

The following shows the protected dimension variables 'tree inner' (tix..) and 'tree outer' (tox..):

![Figure 11.64 Fl_Tree inner/outer dimensions](image)
KEYBOARD BINDINGS

The following table lists keyboard bindings for navigating the tree:

<table>
<thead>
<tr>
<th>Keyboard</th>
<th>FL_TREE_SELECT__MULTI</th>
<th>FL_TREE_SELECT__SINGLE</th>
<th>FL_TREE_SELECT__NONE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-A (Linux/Windows)</td>
<td>Select all items</td>
<td>N/A</td>
<td>N/A</td>

11.153.2 Member Function Documentation

11.153.2.1 add() [1/2]

Fl_Tree_Item * Fl_Tree::add (  
    const char * path,  
    Fl_Tree_Item * item = 0 )

Adds a new item, given a menu style 'path'.
Any parent nodes that don't already exist are created automatically. Adds the item based on the value of sortorder().
If 'item' is NULL, a new item is created.
To specify items or submenus that contain slashes ('/' or '\') use an escape character to protect them, e.g.

```
tree->add("/Holidays/Photos/12\25\2010");  // Adds item "12/25/2010"
tree->add("/Pathnames/c:\\Program Files\\MyApp");  // Adds item "c:\Program Files\MyApp"
```

Parameters

| in | path | The path to the item, e.g. "Flintstone/Fred". |
| in | item | The new item to be added. If NULL, a new item is created with a name that is the last element in 'path'. |

Returns

The new item added, or 0 on error.
## 11.153.2.2 add() [2/2]

```cpp
Fl_Tree_Item * Fl_Tree::add (
    Fl_Tree_Item * parent_item,
    const char * name )
```

Add a new child item labeled 'name' to the specified 'parent_item'.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>parent_item</code></td>
<td>The parent item the new child item will be added to. Must not be NULL.</td>
</tr>
<tr>
<td><code>name</code></td>
<td>The label for the new item</td>
</tr>
</tbody>
</table>

### Returns

The new item added.

## 11.153.2.3 calc_dimensions()

```cpp
void Fl_Tree::calc_dimensions ( )
```

Recalculate widget dimensions and scrollbar visibility, normally managed automatically. Low overhead way to update the tree widget's outer/inner dimensions and re-determine scrollbar visibility based on these changes without recalculating the entire size of the tree data.

Assumes that either the tree's size in _tree_w/_tree_h are correct so that scrollbar visibility can be calculated easily, or are both zero indicating scrollbar visibility can't be calculated yet.

This method is called when the widget is `resize()`ed or if the scrollbar's sizes are changed (affects tree widget's inner dimensions tix/y/w/h), and also used by `calc_tree()`.

## 11.153.2.4 calc_tree()

```cpp
void Fl_Tree::calc_tree ( )
```

Recalculates the tree's sizes and scrollbar visibility, normally managed automatically.

On return:

- `_tree_w` will be the overall pixel width of the entire viewable tree
- `_tree_h` will be the overall pixel height
- scrollbar visibility and pan sizes are updated
- internal `_tix/_tiy/_tiw/_tih` dimensions are updated

`_tree_w/_tree_h` include the tree's margins (e.g. `marginleft()`), whether items are open or closed, label contents and font sizes, etc.

The tree hierarchy's size is managed separately from the widget's size as an optimization; this way `resize()` on the widget doesn't involve recalculating the tree's hierarchy needlessly, as widget size has no bearing on the tree hierarchy.

The tree hierarchy's size only changes when items are added/removed, open/closed, label contents or font sizes changed, margins changed, etc.
This calculation involves walking the entire tree from top to bottom, potentially a slow calculation if the tree has many items (potentially hundreds of thousands), and should therefore be called sparingly. For this reason, *recal* _c* _tree() is used as a way to /schedule/ calculation when changes affect the tree hierarchy's size.

Apps may want to call this method directly if the app makes changes to the tree's geometry, then immediately needs to work with the tree's new dimensions before an actual redraw (and recal) occurs. (This use by an app should only rarely be needed)

### 11.153.2.5 callback_item() [1/2]

```
Fl_Tree_Item * Fl_Tree::callback_item ()
```

Gets the item that caused the callback.

The *callback()* can use this value to see which item changed.

### 11.153.2.6 callback_item() [2/2]

```
void Fl_Tree::callback_item ( 
    Fl_Tree_Item * item )
```

Sets the item that was changed for this callback.

Used internally to pass the item that invoked the callback.

### 11.153.2.7 callback_reason() [1/2]

```
Fl_Tree_Reason Fl_Tree::callback_reason ( ) const
```

Gets the reason for this callback.

The *callback()* can use this value to see why it was called. Example:

```c

void MyTreeCallback(Fl_Widget *w, void *userdata) {
    Fl_Tree *tree = (Fl_Tree*)w;
    Fl_Tree_Item *item = tree->callback_item(); // the item changed (can be NULL if more than one item was changed!)
    switch ( tree->callback_reason() ) { // reason callback was invoked
        case FL_TREE_REASON_OPENED: ..item was opened..
        case FL_TREE_REASON_CLOSED: ..item was closed..
        case FL_TREE_REASON_SELECTED: ..item was selected..
        case FL_TREE_REASON_RESELECTED: ..item was reselected (double-clicked, etc)..
        case FL_TREE_REASON_DESELECTED: ..item was deselected..
    }
}
```

See also

* item_reselect_mode() – enables FL_TREE_REASON_RESELECTED events

### 11.153.2.8 callback_reason() [2/2]

```
void Fl_Tree::callback_reason ( 
    Fl_Tree_Reason reason )
```

Sets the reason for this callback.

Used internally to pass the reason the callback was invoked.

### 11.153.2.9 clear()

```
void Fl_Tree::clear ( 
    void )
```

Clear the entire tree's children, including the root.

The tree will be left completely empty.
11.153.2.10 clear_children()

void Fl_Tree::clear_children (Fl_Tree_Item * item)
Clear all the children for 'item'.
Item may not be NULL.

11.153.2.11 close() [1/2]

int Fl_Tree::close (const char * path, int docallback = 1)
Closes the item specified by 'path'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. close("Holidays/12\25\2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

| in | path | – the tree item's pathname (e.g. "Flintstones/Fred") |
| in | docallback | – A flag that determines if the callback() is invoked or not: |
| | | • 0 - callback() is not invoked |
| | | • 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_CLOSED |

Returns

• 1 – OK: item closed
• 0 – OK: item was already closed, no change
• -1 – ERROR: item was not found

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

11.153.2.12 close() [2/2]

int Fl_Tree::close (Fl_Tree_Item * item, int docallback = 1)
Closes the specified 'item'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

| in | item | – the item to be closed. Must not be NULL |
| in | docallback | – A flag that determines if the callback() is invoked or not: |
| | | • 0 - callback() is not invoked |
| | | • 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_CLOSED |
Returns

- 1 – item was closed
- 0 – item was already closed, no change

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

11.153.2.13 closeicon() [1/2]

\texttt{Fl\_Image * Fl\_Tree::closeicon ( ) const}

Returns the icon to be used as the 'close' icon.
If none was set, the internal default is returned, a simple '[-]' icon.

11.153.2.14 closeicon() [2/2]

\texttt{void Fl\_Tree::closeicon ( Fl\_Image * val )}

Sets the icon to be used as the 'close' icon.
This overrides the built in default '[-]' icon.

Parameters

\begin{tabular}{|c|c|}
\hline
\textbf{name} & \textbf{description} \\
\hline
\texttt{val} & The new image, or zero to use the default [-] icon. \\
\hline
\end{tabular}

11.153.2.15 connectorstyle()

\texttt{void Fl\_Tree::connectorstyle ( Fl\_Tree\_Connector val )}

Sets the line drawing style for inter-connecting items.
See Fl\_Tree\_Connector for possible values.

11.153.2.16 deselect() [1/2]

\texttt{int Fl\_Tree::deselect ( const char * path, int docallback = 1 )}

Deselect an item specified by 'path'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling \texttt{redraw()} if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. deselect("Holidays/12\25\2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

\begin{tabular}{|c|c|}
\hline
\textbf{name} & \textbf{description} \\
\hline
\texttt{path} & the tree item's pathname (e.g. "Flintstones/Fred") \\
\hline
\texttt{docallback} & A flag that determines if the callback() is invoked or not: \\
& \begin{itemize}
& \item 0 - the callback() is not invoked \\
& \item 1 - the callback() is invoked if item changed state (default), \texttt{callback_reason()} will be \texttt{FL\_TREE\_REASON\_DESELECTED} \\
\end{itemize} \\
\hline
\end{tabular}
Returns

- 1 - OK: item's state was changed
- 0 - OK: item was already deselected, no change was made
- -1 - ERROR: item was not found

11.153.2.17 deselect() [2/2]

```cpp
int Fl_Tree::deselect(
    Fl_Tree_Item *item,
    int docallback = 1)
```

Deselect the specified `item`.

Invokes the callback depending on the value of optional parameter `docallback`.

Handles calling `redraw()` if anything changed.

The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

Parameters

| in | item         | the item to be deselected. Must not be NULL. |
| in | docallback   | A flag that determines if the `callback()` is invoked or not: |
|    |              | • 0 - the `callback()` is not invoked |
|    |              | • 1 - the `callback()` is invoked if item changed state (default), `callback_reason()` will be `FL_TREE_REASON_DESELECTED` |

Returns

- 0 - item was already deselected, no change was made
- 1 - item's state was changed

11.153.2.18 deselect_all()

```cpp
int Fl_Tree::deselect_all(
    Fl_Tree_Item *item = 0,
    int docallback = 1)
```

Deselect `item` and all its children.

If `item` is NULL, `first()` is used.

Invokes the callback depending on the value of optional parameter `docallback`.

Handles calling `redraw()` if anything changed.

The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

Parameters

| in  | item         | The item that will be deselected (along with all its children). If NULL, `first()` is used. |
| in  | docallback   | A flag that determines if the `callback()` is invoked or not: |
|     |              | • 0 - the `callback()` is not invoked |
|     |              | • 1 - the `callback()` is invoked for each item that changed state (default), `callback_reason()` will be `FL_TREE_REASON_DESELECTED` |
11.153 Fl_Tree Class Reference

Returns

Count of how many items were actually changed to the deselected state.

11.153.2.19 display()

void Fl_Tree::display ( Fl_Tree_Item * item )
Displays 'item', scrolling the tree as necessary.

Parameters

| in  | item | The item to be displayed. If NULL, first() is used. |

11.153.2.20 displayed()

int Fl_Tree::displayed ( Fl_Tree_Item * item )
See if 'item' is currently displayed on-screen (visible within the widget).
This can be used to detect if the item is scrolled off-screen. Checks to see if the item's vertical position is within the top and bottom edges of the display window. This does NOT take into account the hide() / show() or open() / close() status of the item.

Parameters

| in  | item | The item to be checked. If NULL, first() is used. |

Returns

1 if displayed, 0 if scrolled off screen or no items are in tree.

11.153.2.21 draw()

void Fl_Tree::draw ( )
Standard FLTK draw() method, handles drawing the tree widget.
Reimplemented from Fl_Group.

11.153.2.22 extend_selection()

int Fl_Tree::extend_selection ( Fl_Tree_Item * from, Fl_Tree_Item * to, int val = 1, bool visible = false )
Extend a selection between 'from' and 'to' depending on 'visible'.
Similar to the more efficient extend_selection_dir(Fl_Tree_Item*,Fl_Tree_Item*,int dir,int val,bool vis) method, but direction (up or down) doesn't need to be known.
We're less efficient because we search the tree for to/from, then operate on items in between. The more efficient method avoids the "search", but necessitates a direction to be specified to find 'to'.
Used by SHIFT-click to extend a selection between two items inclusive.
Handles calling redraw() if anything changed.

Parameters

| in  | from | Starting item |
| in  | to   | Ending item  |
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>val</th>
<th>Select or deselected items (0=deselect, 1=select, 2=toggle)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>visible</td>
<td>true=affect only open(), visible items, false=affect open or closed items (default)</td>
</tr>
</tbody>
</table>

Returns

The number of items whose selection states were changed, if any.

Version

1.3.3 ABI feature

11.153.2.23 extend_selection_dir()

```
int Fl_Tree::extend_selection_dir (Fl_Tree_Item * from, Fl_Tree_Item * to, int dir, int val, bool visible)
```

Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.

Efficient: does not walk entire tree; starts with 'from' and stops at 'to' while moving in direction 'dir'. Dir must be specified though.

If dir cannot be known in advance, such as during SHIFT-click operations, the method `extend_selection(Fl_Tree_Item*,Fl_Tree_Item*,int,bool)` should be used.

Handles calling `redraw()` if anything changed.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>from</th>
<th>Starting item</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>to</td>
<td>Ending item</td>
</tr>
<tr>
<td>in</td>
<td>dir</td>
<td>Direction to extend selection (FL_Up or FL_Down)</td>
</tr>
<tr>
<td>in</td>
<td>val</td>
<td>0=deselect, 1=select, 2=toggle</td>
</tr>
<tr>
<td>in</td>
<td>visible</td>
<td>true=affect only open(), visible items, false=affect open or closed items (default)</td>
</tr>
</tbody>
</table>

Returns

The number of items whose selection states were changed, if any.

Version

1.3.3

11.153.2.24 find_clicked()

```
const Fl_Tree_Item * Fl_Tree::find_clicked (int yonly = 0) const
```

Find the item that was last clicked on.

You should use `callback_item()` instead, which is fast, and is meant to be used within a callback to determine the item clicked.

This method walks the entire tree looking for the first item that is under the mouse. (The value of the 'yonly' flag affects whether both x and y events are checked, or just y)
Use this method /only/ if you’ve subclassed Fl_Tree, and are receiving events before Fl_Tree has been able to process and update callback_item().

Parameters

| in  | path   | – 0: check both event’s X and Y values. – 1: only check event’s Y value, don’t care about X. |

Returns

The item clicked, or NULL if no item was under the current event.

Version

1.3.0

1.3.3 ABI feature: added yonly parameter

11.153.2.25 find_item()

const Fl_Tree_Item * Fl_Tree::find_item (const char * path) const

Find the item, given a menu style path, e.g. "/Parent/Child/item". There is both a const and non-const version of this method. Const version allows pure const methods to use this method to do lookups without causing compiler errors.

To specify items or submenus that contain slashes ("/" or "\") use an escape character to protect them, e.g.

```cpp
tree->add("/Holidays/Photos/12\25\2010");  // Adds item "12/25/2010"
tree->add("/Pathnames/c:\4Program Files\4MyApp"); // Adds item "c:\Program Files\MyApp"
```

Parameters

- **path** – the tree item’s pathname to be found (e.g. "Flintstones/Fred")

Returns

The item, or NULL if not found.

See also

- item_pathname()

11.153.2.26 first()

Fl_Tree_Item * Fl_Tree::first ( )

Returns the first item in the tree, or 0 if none.

Use this to walk the tree in the forward direction, e.g.

```cpp
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) )
    printf("Item: %s\n", item->label());
```

Returns

First item in tree, or 0 if none (tree empty).

See also

- first(), next(), last(), prev()
11.153.2.27 first_selected_item()

Fl_Tree_Item * Fl_Tree::first_selected_item()  
Returns the first selected item in the tree.
Use this to walk the tree from top to bottom looking for all the selected items, e.g.:  

```c
// Walk tree forward, from top to bottom
for ( Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i) )
  printf("Selected item: %s\n", i->label());
```

Returns  
The first selected item, or 0 if none.

See also  
first_selected_item(), last_selected_item(), next_selected_item()

11.153.2.28 first_visible()

Fl_Tree_Item * Fl_Tree::first_visible()  
Returns the first open(), visible item in the tree, or 0 if none.

Deprecated in 1.3.3 ABI – use first_visible_item() instead.

11.153.2.29 first_visible_item()

Fl_Tree_Item * Fl_Tree::first_visible_item()  
Returns the first open(), visible item in the tree, or 0 if none.

Returns  
First visible item in tree, or 0 if none.

See also  
first_visible_item(), last_visible_item(), next_visible_item()

Version  
1.3.3

11.153.2.30 get_selected_items()

int Fl_Tree::get_selected_items ( Fl_Tree_Item_Array & ret_items )  
Returns the currently selected items as an array of 'ret_items'.
Example:  

```c
// Get selected items as an array
Fl_Tree_Item_Array items;
tree->get_selected_items(items);
// Manipulate the returned array
for ( int t=0; t<items.total(); t++ ) {  
  Fl_Tree_Item item = items[t];
  // do stuff with each selected item...
}
```
Parameters

| out  | ret_items | The returned array of selected items. |

Returns

The number of items in the returned array.

See also

first_selected_item(), next_selected_item()

Version

1.3.3 ABI feature

11.153.2.31 handle()

int Fl_Tree::handle ( int e ) [virtual]

Standard FLTK event handler for this widget.

Todo add Fl_Widget_Tracker (see Fl_Browser_cxx::handle())

Reimplemented from Fl_Group.

11.153.2.32 hposition() [1/2]

int Fl_Tree::hposition ( ) const

Returns the horizontal scroll position as a pixel offset.

The position returned is how many pixels of the tree are scrolled off the left edge of the screen.

See also

hposition(int), vposition(), vposition(int)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

11.153.2.33 hposition() [2/2]

void Fl_Tree::hposition ( int pos )

Sets the horizontal scroll offset to position 'pos'.

The position is how many pixels of the tree are scrolled off the left edge of the screen.

Parameters

| in   | pos  | The vertical position (in pixels) to scroll the tree to. |

See also

hposition(), vposition(), vposition(int)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.
11.153.2.34  insert()

Fl_Tree_Item * Fl_Tree::insert (  
    Fl_Tree_Item * item,  
    const char * name,  
    int pos )

Insert a new item 'name' into 'item's children at position 'pos'.
If pos is out of range the new item is

• prepended if pos < 0 or
• appended if pos > item->children() .

Note: pos == children() is not considered out of range: the item is appended to the child list.
Example:

```

tree->add("Aaa/000");  // "000" is index 0 in Aaa's children
tree->add("Aaa/111");  // "111" is index 1 in Aaa's children
tree->add("Aaa/222");  // "222" is index 2 in Aaa's children

// How to use insert() to insert a new item between Aaa/111 + Aaa/222
Fl_Tree_Item *item = tree->find_item("Aaa");  // get parent item Aaa
if (item) tree->insert(item, "New item", 2);  // insert as a child of Aaa at index #2
```

Parameters

| in  | item | The existing item to insert new child into. Must not be NULL. |
| in  | name | The label for the new item |
| in  | pos  | The position of the new item in the child list |

Returns

The new item added.

See also

insert_above()

11.153.2.35  insert_above()

Fl_Tree_Item * Fl_Tree::insert_above (  
    Fl_Tree_Item * above,  
    const char * name )

Inserts a new item 'name' above the specified Fl_Tree_Item 'above'.
Example:

```

tree->add("Aaa/000");  // "000" is index 0 in Aaa's children
tree->add("Aaa/111");  // "111" is index 1 in Aaa's children
tree->add("Aaa/222");  // "222" is index 2 in Aaa's children

// How to use insert_above() to insert a new item above Aaa/222
Fl_Tree_Item *item = tree->find_item("Aaa/222");  // get item Aaa/222
if (item) tree->insert_above(item, "New item");  // insert new item above it
```

Parameters

| in  | above | – the item above which to insert the new item. Must not be NULL. |
| in  | name  | – the name of the new item |
Returns
The new item added, or 0 if 'above' could not be found.

See also
insert()

11.153.2.36 is_close() [1/2]

```
int Fl_Tree::is_close ( 
    const char * path ) const
```

See if item specified by 'path' is closed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. is_close("Holidays/12\25\2010").

Parameters
- **in path** – the tree item's pathname (e.g. "Flintstones/Fred")

Returns
- 1 - OK: item is closed
- 0 - OK: item is open
- -1 - ERROR: item was not found

11.153.2.37 is_close() [2/2]

```
int Fl_Tree::is_close ( 
    Fl_Tree_Item * item ) const
```

See if the specified 'item' is closed.

Parameters
- **in item** – the item to be tested. Must not be NULL.

Returns
- 1 : item is closed
- 0 : item is open

11.153.2.38 is_hscroll_visible()

```
int Fl_Tree::is_hscroll_visible ( ) const
```

See if the horizontal scrollbar is currently visible.

Returns
- 1 if scrollbar visible, 0 if not.

Note
Must be using FLTK ABI 1.3.3 or higher for this to be effective.
11.153.2.39  is_open() [1/2]

```cpp
int Fl_Tree::is_open (  
   const char * path ) const
```

See if item specified by 'path' is open.

Items or submenus that themselves contain slashes ("/" or ") should be escaped, e.g. `is_open("← Holidays/12\25\2010")`.

Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

**Parameters**

| in | path | – the tree item's pathname (e.g. "Flintstones/Fred") |

**Returns**

- 1 - OK: item is open
- 0 - OK: item is closed
- -1 - ERROR: item was not found

**See also**

`Fl_Tree_Item::visible_r()`

11.153.2.40  is_open() [2/2]

```cpp
int Fl_Tree::is_open (  
   Fl_Tree_Item * item ) const
```

See if 'item' is open.

Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

**Parameters**

| in | item | – the item to be tested. Must not be NULL. |

**Returns**

- 1 : item is open
- 0 : item is closed

11.153.2.41  is_scrollbar()

```cpp
int Fl_Tree::is_scrollbar (  
   Fl_Widget * w )
```

See if widget 'w' is one of the Fl_Tree widget's scrollbars.

Use this to skip over the scrollbars when walking the child() array. Example:

```cpp
for ( int i=0; i<tree->children(); i++ ) { // walk children
   Fl_Widget * w = tree->child(i);
   if ( tree->is_scrollbar(w) ) continue; // skip scrollbars
   ...do work here..
}
```

**Parameters**

| in | w | Widget to test |
Returns

1 if \( w \) is a scrollbar, 0 if not.

**Todo** should be const

### 11.153.2.42 is_selected() [1/2]

```cpp
int Fl_Tree::is_selected ( const char * path )
```

See if item specified by 'path' is selected.
Items or submenus that themselves contain slashes (‘/’ or ‘\’) should be escaped, e.g. `is_selected("Holidays/12/25/2010")`.

**Parameters**

- **in path** – the tree item’s pathname (e.g. "Flintstones/Fred")

**Returns**

- 1: item selected
- 0: item deselected
- -1: item was not found

### 11.153.2.43 is_selected() [2/2]

```cpp
int Fl_Tree::is_selected ( Fl_Tree_Item * item ) const
```

See if the specified 'item' is selected.

**Parameters**

- **in item** – the item to be tested. Must not be NULL.

**Returns**

- 1: item selected
- 0: item deselected

### 11.153.2.44 is_vscroll_visible()

```cpp
int Fl_Tree::is_vscroll_visible ( ) const
```

See if the vertical scrollbar is currently visible.

**Returns**

1 if scrollbar visible, 0 if not.

### 11.153.2.45 item_clicked() [1/2]

```cpp
Fl_Tree_Item * Fl_Tree::item_clicked ( )
```

Return the item that was last clicked.
Valid only from within the `callback()`.

**Returns**

The item clicked, or 0 if none. 0 may also be used to indicate several items were clicked/changed.

**Deprecated** in 1.3.3 ABI – use `callback_item()` instead.
11.153.2.46 item_clicked() [2/2]

void Fl_Tree::item_clicked ( 
    Fl_Tree_Item * item ) [protected]

Set the item that was last clicked.
Should only be used by subclasses needing to change this value. Normally Fl_Tree manages this value.

Deprecated in 1.3.3 ABI – use callback_item() instead.

11.153.2.47 item_draw_mode() [1/3]

Fl_Tree_Item_Draw_Mode Fl_Tree::item_draw_mode ( ) const

Get the 'item draw mode' used for the tree.

Version

1.3.1 ABI feature

11.153.2.48 item_draw_mode() [2/3]

void Fl_Tree::item_draw_mode ( 
    Fl_Tree_Item_Draw_Mode mode )

Set the 'item draw mode' used for the tree to 'mode'.
This affects how items in the tree are drawn, such as when a widget() is defined. See Fl_Tree_Item_Draw_Mode for possible values.

Version

1.3.1 ABI feature

11.153.2.49 item_draw_mode() [3/3]

void Fl_Tree::item_draw_mode ( 
    int mode )

Set the 'item draw mode' used for the tree to integer 'mode'.
This affects how items in the tree are drawn, such as when a widget() is defined. See Fl_Tree_Item_Draw_Mode for possible values.

Version

1.3.1 ABI feature

11.153.2.50 item_labelbgcolor() [1/2]

void Fl_Tree::item_labelbgcolor ( 
    Fl_Color val )

Set the default label background color used for creating new items.
A special case is made for color 0xffffffff (default) which is treated as 'transparent'. To change the background color on a per-item basis, use Fl_Tree_Item::labelbgcolor(Fl_Color)

11.153.2.51 item_labelbgcolor() [2/2]

Fl_Color Fl_Tree::item_labelbgcolor ( 
    void ) const

Get the default label background color used for creating new items.
If the color is 0xffffffff, it is 'transparent'.

Generated by Doxygen
11.153.2.52 item_labelfgcolor()

```cpp
void Fl_Tree::item_labelfgcolor ( Fl_Color val )
```

Set the default label foreground color used for creating new items.
To change the foreground color on a per-item basis, use `Fl_Tree_Item::labelfgcolor(Fl_Color)`

11.153.2.53 item_labelfont()

```cpp
void Fl_Tree::item_labelfont ( Fl_Font val )
```

Set the default font face used for creating new items.
To change the font face on a per-item basis, use `Fl_Tree_Item::labelfont(Fl_Font)`

11.153.2.54 item_labelsize()

```cpp
void Fl_Tree::item_labelsize ( Fl_Fontsize val )
```

Set the default label font size used for creating new items.
To change the font size on a per-item basis, use `Fl_Tree_Item::labelsize(Fl_Fontsize)`

11.153.2.55 item_pathname()

```cpp
int Fl_Tree::item_pathname ( char * pathname, int pathnamelen, 
const Fl_Tree_Item * item ) const
```

Return 'pathname' of size 'pathnamelen' for the specified 'item'.
If 'item' is NULL, root() is used. The tree's root will be included in the pathname if showroot() is on.
Menu items or submenus that contain slashes ('/' or '\') in their names will be escaped with a backslash. This is
symmetrical with the add() function which uses the same escape pattern to set names.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pathname</code></td>
<td>The string to use to return the pathname</td>
</tr>
<tr>
<td><code>pathnamelen</code></td>
<td>The maximum length of the string (including NULL). Must not be zero.</td>
</tr>
<tr>
<td><code>item</code></td>
<td>The item whose pathname is to be returned.</td>
</tr>
</tbody>
</table>

Returns

- 0 : OK (pathname returns the item's pathname)
- -1 : item not found (pathname="")
- -2 : pathname not large enough (pathname="")

See also

`find_item()`

11.153.2.56 item_reselect_mode() [1/2]

```cpp
Fl_Tree_Item_Reselect_Mode Fl_Tree::item_reselect_mode ( ) const
```

Returns the current item re/selection mode.

Version

1.3.1 ABI feature
11.153.2.57  item_reselect_mode() [2/2]

void Fl_Tree::item_reselect_mode ( 
    Fl_Tree_Item_Reselect_Mode mode )

Sets the item re/selection mode.
See Fl_Tree_Item_Reselect_Mode for possible values.

Version
1.3.1 ABI feature

11.153.2.58  last()

Fl_Tree_Item * Fl_Tree::last ( )

Returns the last item in the tree.
This can be used to walk the tree in reverse, e.g.

    for ( Fl_Tree_Item *item = tree->last(); item; item = tree->prev() )
        printf("Item: %s\n", item->label());

Returns
Last item in the tree, or 0 if none (tree empty).

See also
first(), next(), last(), prev()

11.153.2.59  last_selected_item()

Fl_Tree_Item * Fl_Tree::last_selected_item ( )

Returns the last selected item in the tree.
Use this to walk the tree in reverse from bottom to top looking for all the selected items, e.g.

    // Walk tree in reverse, from bottom to top
    for ( Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up) )
        printf("Selected item: %s\n", i->label());

Returns
The last selected item, or 0 if none.

See also
first_selected_item(), last_selected_item(), next_selected_item()

Version
1.3.3

11.153.2.60  last_visible()

Fl_Tree_Item * Fl_Tree::last_visible ( )

Returns the last open(), visible item in the tree.

Deprecated in 1.3.3 – use last_visible_item() instead.
### last_visible_item()

**Fl_Tree_Item * Fl_Tree::last_visible_item ( )**

Returns the last `open()`, visible item in the tree.

Returns

Last visible item in the tree, or 0 if none.

See also

`first_visible_item()`, `last_visible_item()`, `next_visible_item()`

**Version**

1.3.3

### load()

**void Fl_Tree::load ( class Fl_Preferences & prefs )**

Load FLTK preferences.

Read a preferences database into the tree widget.

A preferences database is a hierarchical collection of data which can be directly loaded into the tree view for inspection.

**Parameters**

| in   | prefs | the Fl_Preferences database |

### next()

**Fl_Tree_Item * Fl_Tree::next ( Fl_Tree_Item * item = 0 )**

Return the next item after `item`, or 0 if no more items.

Use this code to walk the entire tree:

```c
for ( Fl_Tree_Item *i = tree->first(); i; i = tree->next(i) )
    printf("Item: %s
", i->label());
```

**Parameters**

| in   | item | The item to use to find the next item. If NULL, returns 0. |

Returns

Next item in tree, or 0 if at last item.

See also

`first()`, `next()`, `last()`, `prev()`

### next_item()

**Fl_Tree_Item * Fl_Tree::next_item ( Fl_Tree_Item * item,**

Generated by Doxygen
int dir = FL_Down,
bool visible = false)

Returns next item after 'item' in direction 'dir' depending on 'visible'.
Next item will be above (if dir==FL_Up) or below (if dir==FL_Down). If 'visible' is true, only items whose parents are open() will be returned. If 'visible' is false, even items whose parents are closed()ed will be returned.
If item is 0, the return value will be the result of this truth table:

<table>
<thead>
<tr>
<th>visible=true</th>
<th>visible=false</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir=FL_Up:</td>
<td>first_visible_item()</td>
</tr>
<tr>
<td>dir=FL_Down:</td>
<td>first_visible_item()</td>
</tr>
</tbody>
</table>

Example use:

```c
// Walk down the tree showing open(), visible items
for ( Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_item(i, FL_Down, true) )
  printf("Item: %s
", i->label());

// Walk up the tree showing open(), visible items
for ( Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_item(i, FL_Up, true) )
  printf("Item: %s
", i->label());

// Walk down the tree showing all items (open or closed)
for ( Fl_Tree_Item *i=tree->first(); i; i=tree->next_item(i, FL_Down, false) )
  printf("Item: %s
", i->label());

// Walk up the tree showing all items (open or closed)
for ( Fl_Tree_Item *i=tree->last(); i; i=tree->next_item(i, FL_Up, false) )
  printf("Item: %s
", i->label());
```

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item to use to find the next item. If NULL, returns 0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>dir</td>
<td>Can be FL_Up or FL_Down (default=FL_Down or 'next')</td>
</tr>
<tr>
<td>in</td>
<td>visible</td>
<td>true=return only open(), visible items,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>false=return open or closed items (default)</td>
</tr>
</tbody>
</table>

Returns

Next item in tree in the direction and visibility specified, or 0 if no more items of specified visibility in that direction.

See also

first(), last(), next(),
first_visible_item(), last_visible_item(), next_visible_item(),
first_selected_item(), last_selected_item(), next_selected_item()

Version

1.3.3

11.153.2.65 next_selected_item()

Fl_Tree_Item * Fl_Tree::next_selected_item (     
Fl_Tree_Item * item = 0,
int dir = FL_Down )

Returns the next selected item above or below 'item', depending on 'dir'.
If 'item' is 0, search starts at either first() or last(), depending on 'dir': first() if 'dir' is FL_Down (default),
last() if 'dir' is FL_Up.
Use this to walk the tree looking for all the selected items, e.g.
// Walk down the tree (forwards)
for ( Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i, FL_Down) )
    printf("Item: %s\n", i->label());

// Walk up the tree (backwards)
for ( Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up) )
    printf("Item: %s\n", i->label());

Parameters

| in | item | The item above or below which we'll find the next selected item. If NULL, first() is used if FL_Down, last() if FL_Up. (default=NULL) |
| in | dir  | The direction to go. FL_Up for moving up the tree, FL_Down for down the tree (default) |

Returns

The next selected item, or 0 if there are no more selected items.

See also

first_selected_item(), last_selected_item(), next_selected_item()

Version

1.3.3

11.153.2.66 next_visible_item()

Fl_Tree_Item * Fl_Tree::next_visible_item ( Fl_Tree_Item * item, int dir )

Returns next open(), visible item above (dir==FL_Up) or below (dir==FL_Down) the specified 'item', or 0 if no more items.
If 'item' is 0, returns last() if 'dir' is FL_Up, or first() if dir is FL_Down.

// Walk down the tree (forwards)
for ( Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_visible_item(i, FL_Down) )
    printf("Item: %s\n", i->label());

// Walk up the tree (backwards)
for ( Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_visible_item(i, FL_Up) )
    printf("Item: %s\n", i->label());

Parameters

| in | item | The item above/below which we'll find the next visible item |
| in | dir  | The direction to search. Can be FL_Up or FL_Down. |

Returns

The item found, or 0 if there's no visible items above/below the specified item.

Version

1.3.3

Generated by Doxygen
11.153.2.67 open() [1/2]

int Fl_Tree::open (const char * path, int docallback = 1)

Opens the item specified by 'path'.
This causes the item's children (if any) to be shown.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. open("Holidays/12\25\2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

| in path          | -- the tree item's pathname (e.g. "Flintstones/Fred") |
| in docallback    | -- A flag that determines if the callback() is invoked or not: |
|                 | • 0 - callback() is not invoked |
|                 | • 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_OPENED |

Returns

• 1 – OK: item opened
• 0 – OK: item was already open, no change
• -1 – ERROR: item was not found

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

11.153.2.68 open() [2/2]

int Fl_Tree::open (Fl_Tree_Item * item, int docallback = 1)

Open the specified 'item'.
This causes the item's children (if any) to be shown.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

| in item          | -- the item to be opened. Must not be NULL. |
| in docallback    | -- A flag that determines if the callback() is invoked or not: |
|                 | • 0 - callback() is not invoked |
|                 | • 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_OPENED |
Returns

- 1 – item was opened
- 0 – item was already open, no change

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

11.153.2.69 open_toggle()

void Fl_Tree::open_toggle (
    Fl_Tree_Item * item,
    int docallback = 1 )

Toggle the open state of 'item'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the
reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>– the item whose open state is to be toggled. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>– A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - callback() is invoked (default), callback_reason() will be either</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FL_TREE_REASON_OPENED or FL_TREE_REASON_CLOSED</td>
</tr>
</tbody>
</table>

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

11.153.2.70 openicon() [1/2]

Fl_Image * Fl_Tree::openicon () const
Returns the icon to be used as the 'open' icon.
If none was set, the internal default is returned, a simple '[+]' icon.

11.153.2.71 openicon() [2/2]

void Fl_Tree::openicon {
    Fl_Image * val }
Sets the icon to be used as the 'open' icon.
This overrides the built in default '[+]' icon.

Parameters

| in  | val        | – The new image, or zero to use the default [+ ] icon. |

11.153.2.72 prev()

Fl_Tree_Item * Fl_Tree::prev (
    Fl_Tree_Item * item = 0 )
Return the previous item before 'item', or 0 if no more items.
This can be used to walk the tree in reverse, e.g.

```c
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->prev(item) )
  printf("Item: %s\n", item->label());
```

**Parameters**

| in  | item | The item to use to find the previous item. If NULL, returns 0. |

**Returns**

Previous item in tree, or 0 if at first item.

**See also**

first(), next(), last(), prev()

---

**11.153.2.73 recalc_tree()**

```c
void Fl_Tree::recalc_tree ()
```

Schedule tree to recalc the entire tree size.

**Note**

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

---

**11.153.2.74 remove()**

```c
int Fl_Tree::remove ( Fl_Tree_Item *item )
```

Remove the specified 'item' from the tree. 

item may not be NULL. If it has children, all those are removed too. If item being removed has focus, no item will have focus.

**Returns**

0 if done, -1 if 'item' not found.

---

**11.153.2.75 resize()**

```c
void Fl_Tree::resize ( int X, int Y, int W, int H ) [virtual]
```

Resizes the Fl_Group widget and all of its children.

The Fl_Group widget first resizes itself, and then it moves and resizes all its children according to the rules documented for Fl_Group::resizable(Fl_Widget*)

**See also**

Fl_Group::resizable(Fl_Widget*)

Fl_Group::resizable()

Fl_Widget::resize(int,int,int,int)

Reimplemented from Fl_Group.
11.153.2.76  root()

void Fl_Tree::root (  
  Fl_Tree_Item * newitem )

Sets the root item to 'newitem'.
If a root item already exists, clear() is called first to clear it before replacing it with newitem.
Use this to install a custom item (derived from Fl_Tree_Item) as the root of the tree. This allows the derived class to implement custom drawing by overriding Fl_Tree_Item::draw_item_content().

Version

1.3.3

11.153.2.77  root_label()

void Fl_Tree::root_label (  
  const char * new_label )

Set the label for the root item to 'new_label'.
Makes an internally managed copy of 'new_label'.

11.153.2.78  scrollbar_size() [1/2]

int Fl_Tree::scrollbar_size ( ) const

Gets the default size of scrollbars' troughs for this widget in pixels.
If this value is zero (default), this widget will use the global Fl::scrollbar_size() value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also

Fl::scrollbar_size(int)

11.153.2.79  scrollbar_size() [2/2]

void Fl_Tree::scrollbar_size (  
  int size )

Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.
Normally you should not need this method, and should use the global Fl::scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, and is the default behavior.
Normally this is what you want.
Only use this method if you really need to override just THIS instance of the widget's scrollbar size. (This need should be rare.)
Setting size to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the default.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>size</th>
<th>Sets the scrollbar size in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If 0 (default), scrollbar size tracks the global Fl::scrollbar_size()</td>
</tr>
</tbody>
</table>

See also

Fl::scrollbar_size()

11.153.2.80  select() [1/2]

int Fl_Tree::select (  
  const char * path,
Select the item specified by 'path'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. select("Holidays/12\25\2010").

The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>path</th>
<th>-- the tree item’s pathname (e.g. &quot;Flintstones/Fred&quot;)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>-- A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - the callback() is invoked if item changed state (default), callback_reason() will be FL_TREE_REASON.getSelected</td>
</tr>
</tbody>
</table>

Returns

• 1 : OK: item’s state was changed
• 0 : OK: item was already selected, no change was made
• -1 : ERROR: item was not found

11.153.2.81 select() [2/2]

int Fl_Tree::select (  
    Fl_Tree_Item * item,  
    int docallback = 1 )
Select the specified 'item'.
Use 'deselect()' to deselect it.
Invokes the callback depending on the value of optional parameter docallback.
Handles calling redraw() if anything changed.

The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>-- the item to be selected. Must not be NULL</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>-- A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - the callback() is invoked if item changed state, callback_reason() will be FL_TREE_REASON_Selected</td>
</tr>
</tbody>
</table>

Returns

• 1 - item’s state was changed
• 0 - item was already selected, no change was made

11.153.2.82 select_all()

int Fl_Tree::select_all (  
    Fl_Tree_Item * item = 0,  
    int docallback = 1 )
Select 'item' and all its children.
If item is NULL, first() is used.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the
reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item that will be selected (along with all its children). If NULL, first() is used.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td>0 - the callback() is not invoked</td>
<td></td>
</tr>
</tbody>
</table>
|          | 1 - the callback() is invoked for each item that changed state (default),
            | callback_reason() will be FL_TREE_REASON_SELECTED                                   |

Returns

Count of how many items were actually changed to the selected state.

11.153.2.83 select_only()

int Fl_Tree::select_only ( Fl_Tree_Item * selitem,
                          int docallback = 1 )
Select only the specified item, deselecting all others that might be selected.
If 'selitem' is 0, first() is used.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the
reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>selitem</th>
<th>The item to be selected. If NULL, first() is used.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td>0 - the callback() is not invoked</td>
<td></td>
</tr>
</tbody>
</table>
|          | 1 - the callback() is invoked for each item that changed state (default),
            | callback_reason() will be either FL_TREE_REASON_SELECTED or
            | FL_TREE_REASON_DESELECTED                                                      |

Returns

The number of items whose selection states were changed, if any.

11.153.2.84 select_toggle()

void Fl_Tree::select_toggle ( Fl_Tree_Item * item,
                              int docallback = 1 )
Toggle the select state of the specified 'item'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>– the item to be selected. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>– A flag that determines if the <code>callback()</code> is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - the <code>callback()</code> is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - the <code>callback()</code> is invoked (default), <code>callback_reason()</code> will be either <code>FL_TREE_REASON_SELECTED</code> or <code>FL_TREE_REASON_DESELECTED</code></td>
</tr>
</tbody>
</table>

### 11.153.2.85 selectbox() [1/2]

```cpp
Fl_Boxtype Fl_Tree::selectbox ( ) const
```

Sets the style of box used to draw selected items. This is an fltk `Fl_Boxtype`. The default is influenced by FLTK's current `Fl::scheme()`.

### 11.153.2.86 selectbox() [2/2]

```cpp
void Fl_Tree::selectbox ( Fl_Boxtype val )
```

Gets the style of box used to draw selected items. This is an fltk `Fl_Boxtype`. The default is influenced by FLTK's current `Fl::scheme()`.

### 11.153.2.87 selectmode() [1/2]

```cpp
Fl_Tree_Select Fl_Tree::selectmode ( ) const
```

Gets the tree's current selection mode. See `Fl_Tree_Select` for possible values.

### 11.153.2.88 selectmode() [2/2]

```cpp
void Fl_Tree::selectmode ( Fl_Tree_Select val )
```

Sets the tree's selection mode. See `Fl_Tree_Select` for possible values.

### 11.153.2.89 set_item_focus()

```cpp
void Fl_Tree::set_item_focus ( Fl_Tree_Item * item )
```

Set the item that currently should have keyboard focus. Handles calling `redraw()` to update the focus box (if it is visible).

### Parameters

| in | item | The item that should take focus. If NULL, none will have focus. |

### 11.153.2.90 show_item() [1/2]

```cpp
void Fl_Tree::show_item ( Fl_Tree_Item * item )
```

Adjust the vertical scrollbar to show `item` at the top of the display IF it is currently off-screen (for instance `show_item_top()`). If it is already on-screen, no change is made.
Parameters

| in  | item  | The item to be shown. If NULL, first() is used. |

See also

show_item_top(), show_item_middle(), show_item_bottom()

11.153.2.91  show_item() [2/2]

void Fl_Tree::show_item ( Fl_Tree_Item * item, int yoff )

Adjust the vertical scrollbar so that 'item' is visible 'yoff' pixels from the top of the Fl_Tree widget's display. For instance, yoff=0 will position the item at the top. If yoff is larger than the vertical scrollbar's limit, the value will be clipped. So if yoff=100, but scrollbar's max is 50, then 50 will be used.

Parameters

| in  | item  | The item to be shown. If NULL, first() is used. |
| in  | yoff  | The pixel offset from the top for the displayed position. |

See also

show_item_top(), show_item_middle(), show_item_bottom()

11.153.2.92  show_item_bottom()

void Fl_Tree::show_item_bottom ( Fl_Tree_Item * item )

Adjust the vertical scrollbar so that 'item' is at the bottom of the display.

Parameters

| in  | item  | The item to be shown. If NULL, first() is used. |

11.153.2.93  show_item_middle()

void Fl_Tree::show_item_middle ( Fl_Tree_Item * item )

Adjust the vertical scrollbar so that 'item' is in the middle of the display.

Parameters

| in  | item  | The item to be shown. If NULL, first() is used. |

11.153.2.94  show_item_top()

void Fl_Tree::show_item_top ( Fl_Tree_Item * item )

Adjust the vertical scrollbar so that 'item' is at the top of the display.
Parameters

| in   | item | The item to be shown. If NULL, first() is used. |

11.153.2.95  show_self()

```cpp
void Fl_Tree::show_self ( )
```

Print the tree as 'ascii art' to stdout.
Used mainly for debugging.

*Todo* should be const

Version

1.3.0

11.153.2.96  showcollapse() [1/2]

```cpp
int Fl_Tree::showcollapse ( ) const
```

Returns 1 if the collapse icon is enabled, 0 if not.

See also

showcollapse(int)

11.153.2.97  showcollapse() [2/2]

```cpp
void Fl_Tree::showcollapse ( int val )
```

Set if we should show the collapse icon or not.
If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via open() and close().

Parameters

| in   | val | 1: shows collapse icons (default), 0: hides collapse icons. |

11.153.2.98  showroot()

```cpp
void Fl_Tree::showroot ( int val )
```

Set if the root item should be shown or not.

Parameters

| in   | val | 1 – show the root item (default), 0 – hide the root item. |

11.153.2.99  sortorder()

```cpp
Fl_Tree_Sort Fl_Tree::sortorder ( ) const
```

Set the default sort order used when items are added to the tree.
See Fl_Tree_Sort for possible values.
11.153.2.100  usericon() [1/2]

Returns the Fl_Image being used as the default user icon for all newly created items.
Returns zero if no icon has been set, which is the default.

11.153.2.101  usericon() [2/2]

Sets the Fl_Image to be used as the default user icon for all newly created items.
If you want to specify user icons on a per-item basis, use Fl_Tree_Item::usericon() instead.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>val</th>
</tr>
</thead>
<tbody>
<tr>
<td>The new image to be used, or zero to disable user icons.</td>
<td></td>
</tr>
</tbody>
</table>

11.153.2.102  vposition() [1/2]

Returns the vertical scroll position as a pixel offset.
The position returned is how many pixels of the tree are scrolled off the top edge of the screen.

See also

vposition(int), hposition(), hposition(int)

11.153.2.103  vposition() [2/2]

Sets the vertical scroll offset to position ‘pos’.
The position is how many pixels of the tree are scrolled off the top edge of the screen.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>pos</th>
</tr>
</thead>
<tbody>
<tr>
<td>The vertical position (in pixels) to scroll the tree to.</td>
<td></td>
</tr>
</tbody>
</table>

See also

vposition(), hposition(), hposition(int)

The documentation for this class was generated from the following files:

- Fl_Tree.H
- Fl_Tree.cxx

11.154  Fl_Tree_Item Class Reference

Tree widget item.
#include <Fl_Tree_Item.H>

Public Member Functions

- void activate (int val=1)
  
  Change the item’s activation state to the optionally specified ‘val’.

- Fl_Tree_Item * add (const Fl_Tree_Prefs &prefs, char **arr)
Descend into the path specified by 'arr', and add a new child there.

- **Fl_Tree_Item** :: add (const Fl_Tree_Prefs &prefs, char **arr, Fl_Tree_Item *newitem)
  Descend into path specified by 'arr' and add 'newitem' there.

- **Fl_Tree_Item** :: add (const Fl_Tree_Prefs &prefs, const char *new_label)
  Add a new child to this item with the name 'new_label' and defaults from 'prefs'.

- **Fl_Tree_Item** :: add (const Fl_Tree_Prefs &prefs, const char *new_label, Fl_Tree_Item *newitem)
  Add 'item' as immediate child with 'new_label' and defaults from 'prefs'.

- **Fl_Tree_Item** :: child (int index)
  Return the child item for the given 'index'.

- **Fl_Tree_Item** :: child (int t) const
  Return the const child item for the given 'index'.

- **Fl_Tree_Item** :: children () const
  Return the number of children this item has.

- **Fl_Tree_Item** :: clear_children ()
  Clear all the children for this item.

- **Fl_Tree_Item** :: close ()
  Close this item and all its children.

- **Fl_Tree_Item** :: deactivate ()
  Deactivate the item; the callback() won't be invoked when clicked.

- **Fl_Tree_Item** :: deparent (int index)
  Deparent child at index position 'pos'.

- **Fl_Tree_Item** :: depth () const
  Returns how many levels deep this item is in the hierarchy.

- **Fl_Tree_Item** :: deselect ()
  Disable the item's selection state.

- **Fl_Tree_Item** :: deselect_all ()
  Deselect item and all its children.

- **Fl_Tree_Item** :: draw (int X, int &Y , int W, Fl_Tree_Item *itemfocus, int &tree_item_xmax, int lastchild=1, int render=1)
  Draw this item and its children.

- **Fl_Tree_Item** :: draw_item_content (int render)
  Draw the item content.

- **Fl_Tree_Item** :: event_on_collapse_icon (const Fl_Tree_Prefs &prefs) const
  Was the event on the 'collapse' button of this item?

- **Fl_Tree_Item** :: event_on_item (const Fl_Tree_Prefs &prefs) const
  Was event anywhere on the item?

- **Fl_Tree_Item** :: event_on_label (const Fl_Tree_Prefs &prefs) const
  Was event on the label() of this item?

- **Fl_Tree_Item** :: event_on_user_icon (const Fl_Tree_Prefs &prefs) const
  Was the event on the 'user icon' of this item, if any?

- **Fl_Tree_Item** :: find_child (const char *name)
  Return the index of the immediate child of this item that has the label 'name'.

- **Fl_Tree_Item** :: find_child (Fl_Tree_Item *item)
  Find the index number for the specified 'item' in the current item's list of children.

- **Fl_Tree_Item** :: find_child_item (char **arr)
  Non-const version of Fl_Tree_Item::find_child_item(char **arr) const.

- **Fl_Tree_Item** :: find_child_item (char *name)
  Non-const version of Fl_Tree_Item::find_child_item(const char *name) const.

- **Fl_Tree_Item** :: find_child_item (const char *name)
  Return the immediate child of current item that has the label 'name'.
• **Fl_Tree_Item** ∗ find_clicked (const Fl_Tree_Prefs &prefs, int yonly=0)
  Non-const version of Fl_Tree_Item::find_clicked(const Fl_Tree_Prefs&, int) const.
  
• const Fl_Tree_Item ∗ find_clicked (const Fl_Tree_Prefs &prefs, int yonly=0) const
  Find the item that the last event was over.

• **Fl_Tree_Item** ∗ find_item (char **arr)
  Non-const version of Fl_Tree_Item::find_item(char **names) const.
  
• const Fl_Tree_Item ∗ find_item (char **arr) const
  Find item by descending array of 'names'.

• **Fl_Tree_Item** (const Fl_Tree_Item *o)
  Copy constructor.

• **Fl_Tree_Item** (const Fl_Tree_Prefs &prefs)
  Constructor.

• Fl_Tree_Item (Fl_Tree ∗tree)
  Constructor.

• int h () const
  The item's height.

• int has_children () const
  See if this item has children.

• **Fl_Tree_Item** ∗ insert (const Fl_Tree_Prefs &prefs, const char ∗new_label, int pos=0)
  Insert a new item named 'new_label' into current item's children at a specified position 'pos'.

• **Fl_Tree_Item** ∗ insert_above (const Fl_Tree_Prefs &prefs, const char ∗new_label)
  Insert a new item named 'new_label' above this item.

• char is_activated () const
  See if the item is activated.

• char is_active () const
  See if the item is activated. Alias for is_activated().

• int is_close () const
  See if the item is 'closed'.

• int is_open () const
  See if the item is 'open'.

• int is_root () const
  Is this item the root of the tree?

• char is_selected () const
  See if the item is selected.

• int is_visible () const
  See if the item is visible.

• const char ∗ label () const
  Return the label.

• void label (const char ∗val)
  Set the label to 'name'.

• int label_h () const
  The item's label height.

• int label_w () const
  The item's maximum label width to right edge of Fl_Tree's inner width within scrollbars.

• int label_x () const
  The item's label x position relative to the window.

• int label_y () const
  The item's label y position relative to the window.

• Fl_Color labelbgcolor () const
  Return item's label background text color.

• void labelbgcolor (Fl_Color val)
Set item's label background color.

- **Fl_Color** `labelcolor()` const
  Return item's label text color. Alias for `labelfgcolor()` const.

- **void** `labelcolor(Fl_Color val)`
  Set item's label text color. Alias for `labelfgcolor(Fl_Color)`.

- **Fl_Color** `labelfgcolor()` const
  Return item's label foreground text color.

- **void** `labelfgcolor(Fl_Color val)`
  Set item's label foreground text color.

- **Fl_Font** `labelfont()` const
  Get item's label font face.

- **void** `labelfont(Fl_Font val)`
  Set item's label font face.

- **Fl_Fontsize** `labelsze()` const
  Get item's label font size.

- **void** `labelsze(Fl_Fontsize val)`
  Set item's label font size.

- **int** `move(Fl_Tree_Item *item, int op=0, int pos=0)`
  Move the current item above/below/into the specified `item`, where `op` determines the type of move:

- **int** `move(int to, int from)`
  Move an item within its parent using index numbers.

- **int** `move_above(Fl_Tree_Item *item)`
  Move the current item above the specified `item`.

- **int** `move_below(Fl_Tree_Item *item)`
  Move the current item below the specified `item`.

- **int** `move_into(Fl_Tree_Item *item, int pos=0)`
  Parent the current item as a child of the specified `item`.

- **Fl_Tree_Item** `next()`
  Return the next item in the tree.

- **Fl_Tree_Item** `next_displayed(Fl_Tree_Prefs &prefs)`
  Same as `next_visible()`.

- **Fl_Tree_Item** `next_sibling()`
  Return this item's next sibling.

- **Fl_Tree_Item** `next_visible(Fl_Tree_Prefs &prefs)`
  Return the next open(), visible() item.

- **void** `open()`
  Open this item and all its children.

- **void** `open_toggle()`
  Toggle the item's open/closed state.

- **Fl_Tree_Item** `parent()`
  Return the parent for this item. Returns NULL if we are the root.

- **const Fl_Tree_Item** `parent()` const
  Return the const parent for this item. Returns NULL if we are the root.

- **void** `parent(Fl_Tree_Item *val)`
  Set the parent for this item.

- **const Fl_Tree_Prefs & prefs() const**
  Return the parent tree's prefs.

- **Fl_Tree_Item** `prev()`
  Return the previous item in the tree.

- **Fl_Tree_Item** `prev_displayed(Fl_Tree_Prefs &prefs)`
  Same as `prev_visible()`.
• Fl_Tree_Item * prev_sibling ()
  Return this item's previous sibling.
• Fl_Tree_Item * prev_visible (Fl_Tree_Prefs &prefs)
  Return the previous open(), visible() item.
• int remove_child (const char *new_label)
  Remove immediate child (and its children) by its label 'name'.
• int remove_child (Fl_Tree_Item *item)
  Remove 'item' from the current item's children.
• int reparent (Fl_Tree_Item *newchild, int index)
  Reparent specified item as a child of ourself at position 'pos'.
• Fl_Tree_Item * replace (Fl_Tree_Item *new_item)
  Replace the current item with a new item.
• Fl_Tree_Item * replace_child (Fl_Tree_Item *olditem, Fl_Tree_Item *newitem)
  Replace existing child 'olditem' with 'newitem'.
• void select (int val=1)
  Change the item's selection state to the optionally specified 'val'.
• int select_all ()
  Select item and all its children.
• void select_toggle ()
  Toggle the item's selection state.
• void show_self (const char *indent="") const
  Print the tree as 'ascii art' to stdout.
• int swap_children (Fl_Tree_Item *a, Fl_Tree_Item *b)
  Swap two of our immediate children, given item pointers.
• void swap_children (int ax, int bx)
  Swap two of our children, given two child index values 'ax' and 'bx'.
• Fl_Tree * tree ()
  Return the tree for this item.
• const Fl_Tree * tree () const
  Return the tree for this item.
• void update_prev_next (int index)
  Update our _prev_sibling and _next_sibling pointers to point to neighbors given
  index as being our current position in the parent's item array.
• void * user_data () const
  Retrieve the user-data value that has been assigned to the item.
• void user_data (void *data)
  Set a user-data value for the item.
• Fl_Image * userdeicon () const
  Return the deactivated version of the user icon, if any.
• void userdeicon (Fl_Image *val)
  Set the usericon to draw when the item is deactivated.
• Fl_Image * usericon () const
  Get the item's user icon as an Fl_Image. Returns '0' if disabled.
• void usericon (Fl_Image *val)
  Set the item's user icon to an Fl_Image.
• int visible () const
  See if the item is visible. Alias for is_visible().
• int visible_r () const
  See if item and all its parents are open() and visible().
• int w () const
  The entire item's width to right edge of Fl_Tree's inner width within scrollbars.
• `Fl_Widget * widget() const`  
  *Return FLTK widget assigned to this item.*

• `void widget(Fl_Widget *val)`  
  *Assign an FLTK widget to this item.*

• `int x() const`  
  *The item’s x position relative to the window.*

• `int y() const`  
  *The item’s y position relative to the window.*

**Protected Member Functions**

• `void _Init(const Fl_Tree_Prefs &prefs, Fl_Tree *tree)`  
  *Internal: Horizontal connector line based on preference settings.*

• `int calc_item_height(const Fl_Tree_Prefs &prefs) const`  
  *Return the item’s ‘visible’ height.*

• `void draw_horizontal_connector(int x1, int x2, int y, const Fl_Tree_Prefs &prefs)`  
  *Internal: Horizontal connector line based on preference settings.*

• `void draw_vertical_connector(int x, int y1, int y2, const Fl_Tree_Prefs &prefs)`  
  *Internal: Vertical connector line based on preference settings.*

• `Fl_Color drawbgcolor() const`  
  *Returns the recommended background color used for drawing this item.*

• `Fl_Color drawfgcolor() const`  
  *Returns the recommended foreground color used for drawing this item.*

• `void hide_widgets()`  
  *Internal: Hide the FLTK widget() for this item and all children.*

• `int is_flag(unsigned short val) const`  
  *See if flag set. Returns 0 or 1.*

• `void recalc_tree()`  
  *Call this when our geometry is changed.*

• `void set_flag(unsigned short flag, int val)`  
  *Set a flag to an on or off value. val is 0 or 1.*

• `void show_widgets()`  
  *Internal: Show the FLTK widget() for this item and all children.*

### 11.154.1 Detailed Description

Tree widget item.  
This class is a single tree item, and manages all of the item’s attributes. **Fl_Tree_Item** is used by **Fl_Tree**, which is comprised of many instances of **Fl_Tree_Item**.  
**Fl_Tree_Item** is hierarchical; it dynamically manages an **Fl_Tree_Item_Array** of children that are themselves instances of **Fl_Tree_Item**. Each item can have zero or more children. When an item has children, `close()` and `open()` can be used to hide or show them.  
Items have their own attributes; font size, face, color. Items maintain their own hierarchy of children.  
When you make changes to items, you’ll need to tell the tree to `redraw()` for the changes to show up.  
New 1.3.3 ABI feature: You can define custom items by either adding a custom widget to the item with **Fl_Tree_Item::widget()**, or override the `draw_item_content()` method if you want to just redefine how the label is drawn.  
The following shows the **Fl_Tree_Item**’s dimensions, useful when overriding the `draw_item_content()` method:
11.154.2 Constructor & Destructor Documentation

11.154.2.1 Fl_Tree_Item() [1/2]

Fl_Tree_Item::Fl_Tree_Item (  
  const Fl_Tree_Prefs & prefs  )
Constructor.
Makes a new instance of Fl_Tree_Item using defaults from 'prefs'.
Deprecated in 1.3.3 ABI – you must use Fl_Tree_Item(Fl_Tree*) for proper horizontal scrollbar behavior.

11.154.2.2 Fl_Tree_Item() [2/2]

Fl_Tree_Item::Fl_Tree_Item (  
  Fl_Tree * tree  )
Constructor.
Makes a new instance of Fl_Tree_Item for 'tree'.
This must be used instead of the older, deprecated Fl_Tree_Item(Fl_Tree_Prefs) constructor for proper horizontal scrollbar calculation.

Version  
1.3.3 ABI feature

11.154.3 Member Function Documentation

11.154.3.1 activate()

void Fl_Tree_Item::activate (  
  int val = 1  ) [inline]
Change the item's activation state to the optionally specified 'val'.
When deactivated, the item will be 'grayed out'; the callback() won't be invoked if the user clicks on the label. If a widget() is associated with the item, its activation state will be changed as well.
If 'val' is not specified, the item will be activated.

11.154.3.2 add() [1/4]

Fl_Tree_Item * Fl_Tree_Item::add (  
  const Fl_Tree_Prefs & prefs,  
  char ** arr  )
Descend into the path specified by 'arr', and add a new child there.
Should be used only by Fl_Tree's internals. Adds the item based on the value of prefs.sortorder().

Returns  
the item added.

Version  
1.3.0 release
11.154.3.3  add() [2/4]

Fl_Tree_Item * Fl_Tree_Item::add (  
    const Fl_Tree_Prefs & prefs,  
    char ** arr,  
    Fl_Tree_Item * newitem )

Descend into path specified by 'arr' and add 'newitem' there.  
Should be used only by Fl_Tree's internals. If item is NULL, a new item is created. Adds the item based on the  
value of prefs.sortorder().  

Returns  
the item added.

Version  
1.3.3 ABI feature

11.154.3.4  add() [3/4]

Fl_Tree_Item * Fl_Tree_Item::add (  
    const Fl_Tree_Prefs & prefs,  
    const char * new_label )

Add a new child to this item with the name 'new_label' and defaults from 'prefs'.  
An internally managed copy is made of the label string. Adds the item based on the value of prefs.sortorder().  

Returns  
the item added  

Version  
1.3.0 release

11.154.3.5  add() [4/4]

Fl_Tree_Item * Fl_Tree_Item::add (  
    const Fl_Tree_Prefs & prefs,  
    const char * new_label,  
    Fl_Tree_Item * item )

Add 'item' as immediate child with 'new_label' and defaults from 'prefs'.  
If 'item' is NULL, a new item is created. An internally managed copy is made of the label string. Adds the item  
based on the value of prefs.sortorder().  

Returns  
the item added

Version  
1.3.3

11.154.3.6  calc_item_height()

int Fl_Tree_Item::calc_item_height (  
    const Fl_Tree_Prefs & prefs ) const [protected]

Return the item's 'visible' height.  
Takes into account the item's:  
• visibility (if lis_visible(), returns 0)
• `labelfont()` height: if `label()` != NULL
• `widget()` height: if `widget()` != NULL
• `openicon()` height (if not NULL)
• `usericon()` height (if not NULL) Does NOT include `Fl_Tree::linespacing()`;

Returns
maximum pixel height

11.154.3.7 child()

```cpp
class Fl_Tree_Item
{
public:
    const Fl_Tree_Item * child (int t) const
    {
        return this;
    }
};
```

Return the const child item for the given 'index'.
Return const child item for the specified 'index'.

11.154.3.8 deactivate()

```cpp
void deactivate ( ) [inline]
```

Deactivate the item; the callback() won't be invoked when clicked.
Same as activate(0)

11.154.3.9 deparent()

```cpp
Fl_Tree_Item * deparent (int pos)
```

Deparent child at index position 'pos'.
This creates an "orphaned" item that is still allocated, but has no parent or siblings. Normally the caller would want
to immediately reparent the orphan elsewhere.
A successfully orphaned item will have its parent() and prev_sibling()/next_sibling() set to NULL.

Returns
• pointer to orphaned item on success
• NULL on error (could not deparent the item)

See also

reparent()

11.154.3.10 depth()

```cpp
int depth ( ) const
```

Returns how many levels deep this item is in the hierarchy.
For instance; root has a depth of zero, and its immediate children would have a depth of 1, and so on. Use e.g. for
determining the horizontal indent of this item during drawing.

11.154.3.11 deselect_all()

```cpp
int deselect_all ( ) [inline]
```

Deselect item and all its children.
Returns count of how many items were in the 'selected' state, ie. how many items were "changed".
11.154.3.12 draw()

```cpp
void Fl_Tree_Item::draw (  
    int X,  
    int & Y,  
    int W,  
    Fl_Tree_Item * itemfocus,  
    int & tree_item_xmax,  
    int lastchild = 1,  
    int render = 1 )
```

Draw this item and its children.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X</td>
</tr>
<tr>
<td>in, out</td>
<td>Y</td>
</tr>
<tr>
<td>in</td>
<td>W</td>
</tr>
<tr>
<td>in</td>
<td>itemfocus</td>
</tr>
<tr>
<td>in, out</td>
<td>tree_item_xmax</td>
</tr>
<tr>
<td>in</td>
<td>lastchild</td>
</tr>
<tr>
<td>in</td>
<td>render</td>
</tr>
</tbody>
</table>

**Version**

1.3.3 ABI feature: modified parameters

11.154.3.13 draw_horizontal_connector()

```cpp
void Fl_Tree_Item::draw_horizontal_connector (  
    int x1,  
    int x2,  
    int y,  
    const Fl_Tree_Prefs & prefs ) [protected]
```

Internal: Horizontal connector line based on preference settings.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x1</td>
</tr>
<tr>
<td>in</td>
<td>x2</td>
</tr>
<tr>
<td>in</td>
<td>y</td>
</tr>
<tr>
<td>in</td>
<td>prefs</td>
</tr>
</tbody>
</table>

11.154.3.14 draw_item_content()

```cpp
int Fl_Tree_Item::draw_item_content (  
    int render ) [virtual]
```

Draw the item content.

This method can be overridden to implement custom drawing by filling the label_[xywh]() area with content. A minimal example of how to override draw_item_content() and draw just a normal item's background and label ourselves:

```cpp
class MyTreeItem : public Fl_Tree_Item {  
public:  
    MyTreeItem() {  }  
    ~MyTreeItem() {  }  
    // DRAW OUR CUSTOM CONTENT FOR THE ITEM
```
int draw_item_content(int render) {
    // Our item's dimensions + text content
    int X=label_x(), Y=label_y(), W=label_w(), H=label_h();
    const char *text = label() ? label() : "";
    // Rendering? Do any drawing that's needed
    if ( render ) {
        // Draw bg -- a filled rectangle
        fl_color(drawbgcolor()); fl_rectf(X,Y,W,H);
        // Draw label
        fl_color(labelbgcolor()); fl_rectf(X,Y,W,H);  // use item's label font/size
        fl_color(drawfgcolor());    // use recommended fg color
        fl_font(labelfont(), labelsize());   // use item's label
        fl_draw(text, X,Y,W,H, FL_ALIGN_LEFT);   // draw the item's label
    }
    // Rendered or not, we must calculate content's max X position
    int lw=0, lh=0;
    fl_measure(text, lw, lh);   // get width of label text
    return X + lw;  // return X + label width
}

You can draw anything you want inside draw_item_content() using any of the fl_draw.h functions, as long as it's
within the label's xywh area.

To add instances of your custom item to the tree, you can use:

// Example #1: using add()
MyTreeItem *bart = new MyTreeItem(..); // class derived from Fl_Tree_Item
tree->add("/Simpsons/Bart", bart);    // Add item as /Simpsons/Bart

..or you can insert or replace existing items:

// Example #2: using replace()
MyTreeItem *marge = new MyTreeItem(..); // class derived from Fl_Tree_Item
item = tree->add("/Simpsons/Marge");   // create item
item->replace(mi);  // replace it with our own

Parameters

| in  | render | Whether we should render content (1), or just tally the geometry (0). Fl_Tree may want only to
find the widest item in the tree for scrollbar calculations. |

Returns

the right-most X coordinate, or 'xmax' of content we drew, i.e. the "scrollable" content. The tree uses the
largest xmax to determine the maximum width of the tree's content (needed for e.g. computing the horizontal
scrollbar's size).

Version

1.3.3 ABI feature

11.154.3.15 draw_vertical_connector()

void Fl_Tree_Item::draw_vertical_connector ( int x, int y1, int y2,
                                            const Fl_Tree_Prefs & prefs ) [protected]

Internal: Vertical connector line based on preference settings.

Parameters

| in | x | The x position of the vertical connector |
| in | y1 | The top of the vertical connector |
| in | y2 | The bottom of the vertical connector |
| in | prefs | The Fl_Tree prefs |
11.154.3.16  drawbgcolor()

\texttt{Fl\_Color Fl\_Tree\_Item::drawbgcolor ( ) const [protected]}

Returns the recommended background color used for drawing this item.

See also

draw_item_content()

Version

1.3.3 ABI

11.154.3.17  drawfgcolor()

\texttt{Fl\_Color Fl\_Tree\_Item::drawfgcolor ( ) const [protected]}

Returns the recommended foreground color used for drawing this item.

See also

draw_item_content()

Version

1.3.3 ABI ABI

11.154.3.18  find_child() [1/2]

\texttt{int Fl\_Tree\_Item::find_child (}
\hspace{1em} const char * name )

Return the index of the immediate child of this item that has the label 'name'.

Returns

index of found item, or -1 if not found.

Version

1.3.0 release

11.154.3.19  find_child() [2/2]

\texttt{int Fl\_Tree\_Item::find_child (}
\hspace{1em} Fl\_Tree\_Item * item )

Find the index number for the specified 'item' in the current item's list of children.

Returns

the index, or -1 if not found.

11.154.3.20  find_child_item() [1/2]

\texttt{const Fl\_Tree\_Item * Fl\_Tree\_Item::find_child_item (}
\hspace{1em} char ** arr ) const

Find child item by descending array 'arr' of names.
Does not include self in search. Only \texttt{Fl\_Tree} should need this method.

Returns

item, or 0 if not found

Version

1.3.0 release
11.154.3.21 `find_child_item()` [2/2]

```
const Fl_Tree_Item * Fl_Tree_Item::find_child_item (const char * name ) const
```

Return the /immediate/ child of current item that has the label 'name'.

Returns

const found item, or 0 if not found.

Version

1.3.3

11.154.3.22 `find_clicked()`

```
const Fl_Tree_Item * Fl_Tree_Item::find_clicked (const Fl_Tree_Prefs & prefs, int only = 0 ) const
```

Find the item that the last event was over.
If 'only' is 1, only check event's y value, don't care about x.

Parameters

| in   | prefs | The parent tree’s Fl_Tree_Prefs |
| in   | only  | 0: check both event’s X and Y values. – 1: only check event’s Y value, don’t care about X. |

Returns

pointer to clicked item, or NULL if none found

Version

1.3.3 ABI feature

11.154.3.23 `find_item()`

```
const Fl_Tree_Item * Fl_Tree_Item::find_item (char ** names ) const
```

Find item by descending array of 'names'.
Includes self in search. Only Fl_Tree should need this method. Use Fl_Tree::find_item() instead.

Returns

const item, or 0 if not found

11.154.3.24 `hide_widgets()`

```
void Fl_Tree_Item::hide_widgets ( ) [protected]
```

Internal: Hide the FLTK widget() for this item and all children.
Used by close() to hide widgets.

11.154.3.25 `insert()`

```
Fl_Tree_Item * Fl_Tree_Item::insert (const Fl_Tree_Prefs & prefs, const char * new_label, int pos = 0 )
```

Insert a new item named 'new_label' into current item’s children at a specified position 'pos'.
If pos is out of range the new item is
• prepended if \texttt{pos < 0} or
• appended if \texttt{pos > \texttt{items->children()}}.

Returns

the new item inserted

See also

\texttt{Fl_Tree::insert()}

11.154.3.26 \ insert\_above()\

\texttt{Fl\_Tree\_Item} * \texttt{Fl\_Tree\_Item::insert\_above (const Fl\_Tree\_Prefs & \texttt{prefs,}}
\texttt{const char * \texttt{new\_label})}

Insert a new item named 'new\_label' above this item.

Returns

the new item inserted, or 0 if an error occurred.

11.154.3.27 \ label()\

\texttt{void Fl\_Tree\_Item::label (const char * \texttt{name})}

Set the label to 'name'.
Makes and manages an internal copy of 'name'.

11.154.3.28 \ label\_h()\

\texttt{int Fl\_Tree\_Item::label\_h (const [inline]}

The item's label height.

Version

1.3.3

11.154.3.29 \ label\_w()\

\texttt{int Fl\_Tree\_Item::label\_w (const [inline]}

The item's maximum label width to right edge of \texttt{Fl\_Tree's inner width within scrollbars.}

Version

1.3.3

11.154.3.30 \ label\_x()\

\texttt{int Fl\_Tree\_Item::label\_x (const [inline]}

The item's label x position relative to the window.

Version

1.3.3
11.154.3.31 label_y()

int Fl_Tree_Item::label_y ( ) const [inline]
The item's label y position relative to the window.

Version
1.3.3

11.154.3.32 labelbgcolor() [1/2]

Fl_Color Fl_Tree_Item::labelbgcolor ( ) const [inline]
Return item's label background text color.
If the color is 0xffffffff, the default behavior is the parent tree's bg color will be used. (An overloaded
draw_item_content() can override this behavior.)

11.154.3.33 labelbgcolor() [2/2]

void Fl_Tree_Item::labelbgcolor ( 
    Fl_Color val ) [inline]
Set item's label background color.
A special case is made for color 0xffffffff which uses the parent tree's bg color.

11.154.3.34 move() [1/2]

int Fl_Tree_Item::move ( 
    Fl_Tree_Item ∗ item, 
    int op = 0, 
    int pos = 0 )
Move the current item above/below/into the specified 'item', where 'op' determines the type of move:
• 0: move above 'item' ('pos' ignored)
• 1: move below 'item' ('pos' ignored)
• 2: move into 'item' as a child (at optional position 'pos')
..and 'pos' determines an optional index position after the move.

Returns
0 on success. a negative number on error:
• -1: one of the items has no parent
• -2: item's index could not be determined
• -3: bad 'op'
• -4: index range error
• -5: could not deparent
• -6: could not reparent at 'pos'
• (Other return values reserved for future use.)

See also
move_above(), move_below(), move_into(), move(int,int)
11.154.3.35  move() [2/2]

int Fl_Tree_Item::move (  
    int to,  
    int from )

Move an item within its parent using index numbers.  
Item is moved 'to' its new position 'from' its old position.  

Returns  
• 0: Success  
• -1: range error (e.g. if 'to' or 'from' out of range).  
• (Other return values reserved for future use)

See also  
move_above(), move_below(), move_into(), move(Fl_Tree_Item*,int,int)

11.154.3.36  move_above()

int Fl_Tree_Item::move_above (  
    Fl_Tree_Item * item )

Move the current item above the specified 'item'.  
This is the equivalent of calling move(item,0,0).  

Returns  
0 on success.  
On error returns a negative value; see move(Fl_Tree_Item*,int,int) for possible error codes.  

See also  
move_below(), move_into(), move(int,int), move(Fl_Tree_Item*,int,int)

11.154.3.37  move_below()

int Fl_Tree_Item::move_below (  
    Fl_Tree_Item * item )

Move the current item below the specified 'item'.  
This is the equivalent of calling move(item,1,0).  

Returns  
0 on success.  
On error returns a negative value; see move(Fl_Tree_Item*,int,int) for possible error codes.  

See also  
move_above(), move_into(), move(int,int), move(Fl_Tree_Item*,int,int)

11.154.3.38  move_into()

int Fl_Tree_Item::move_into (  
    Fl_Tree_Item * item,  
    int pos = 0 )

Parent the current item as a child of the specified 'item'.  
This is the equivalent of calling move(item,2,pos).
11.154 Fl_Tree_Item Class Reference

Returns

0 on success.
On error returns a negative value; see move(Fl_Tree_Item*,int,int) for possible error codes.

See also

move_above(), move_below(), move(int,int), move(Fl_Tree_Item*,int,int)

11.154.3.39 next()

Fl_Tree_Item * Fl_Tree_Item::next ()
Return the next item in the tree.
This method can be used to walk the tree forward. For an example of how to use this method, see Fl_Tree::first().
Returns

the next item in the tree, or 0 if there's no more items.

11.154.3.40 next_displayed()

Fl_Tree_Item * Fl_Tree_Item::next_displayed ( 
    Fl_Tree_Prefs & prefs )
Same as next_visible().
Deprecated in 1.3.3 for confusing name, use next_visible() instead

11.154.3.41 next_sibling()

Fl_Tree_Item * Fl_Tree_Item::next_sibling ()
Return this item's next sibling.
Moves to the next item below us at the same level (sibling). Use this to move down the tree without changing depth(). effectively skipping over this item's children/descendents.
Returns

item's next sibling, or 0 if none.

11.154.3.42 next_visible()

Fl_Tree_Item * Fl_Tree_Item::next_visible ( 
    Fl_Tree_Prefs & prefs )
Return the next open(), visible() item.
(If this item has children and is closed, children are skipped)
This method can be used to walk the tree forward, skipping items that are not currently open/visible to the user.
Returns

the next open() visible() item below us, or 0 if there's no more items.

Version

1.3.3

11.154.3.43 parent()

void Fl_Tree_Item::parent ( 
    Fl_Tree_Item * val ) [inline]
Set the parent for this item.
Should only be used by Fl_Tree's internals.
11.154.3.44 prefs()

const Fl_Tree_Prefs & Fl_Tree_Item::prefs ( ) const
Return the parent tree's prefs.

Returns

a reference to the parent tree's Fl_Tree_Prefs

Version

1.3.3 ABI feature

11.154.3.45 prev()

Fl_Tree_Item * Fl_Tree_Item::prev ( )
Return the previous item in the tree.
This method can be used to walk the tree backwards. For an example of how to use this method, see Fl_Tree::last().

Returns

the previous item in the tree, or 0 if there's no item above this one (hit the root).

11.154.3.46 prev_displayed()

Fl_Tree_Item * Fl_Tree_Item::prev_displayed ( Fl_Tree_Prefs & prefs )
Same as prev_visible().

Deprecated in 1.3.3 for confusing name, use prev_visible()

11.154.3.47 prev_sibling()

Fl_Tree_Item * Fl_Tree_Item::prev_sibling ( )
Return this item's previous sibling.
Moves to the previous item above us at the same level (sibling). Use this to move up the tree without changing depth().

Returns

This item's previous sibling, or 0 if none.

11.154.3.48 prev_visible()

Fl_Tree_Item * Fl_Tree_Item::prev_visible ( Fl_Tree_Prefs & prefs )
Return the previous open(), visible() item.
(If this item above us has children and is closed, its children are skipped)
This method can be used to walk the tree backward, skipping items that are not currently open/visible to the user.

Returns

the previous open() visible() item above us, or 0 if there's no more items.

11.154.3.49 recalc_tree()

void Fl_Tree_Item::recalc_tree ( ) [protected]
Call this when our geometry is changed.
(Font size, label contents, etc) Schedules tree to recalculate itself, as changes to us may affect tree widget's scrollbar visibility and tab sizes.

Version

1.3.3 ABI
11.154.3.50  remove_child() [1/2]

int Fl_Tree_Item::remove_child (const char ∗ name)

Remove immediate child (and its children) by its label 'name'.
If more than one item matches 'name', only the first matching item is removed.

Parameters

| in | name | The label name of the immediate child to remove |

Returns

0 if removed, -1 if not found.

Version

1.3.3

11.154.3.51  remove_child() [2/2]

int Fl_Tree_Item::remove_child (Fl_Tree_Item ∗ item)

Remove 'item' from the current item's children.

Returns

0 if removed, -1 if item not an immediate child.

11.154.3.52  reparent()

int Fl_Tree_Item::reparent (Fl_Tree_Item ∗ newchild, int pos)

Reparent specified item as a child of ourself at position 'pos'.
Typically 'newchild' was recently orphaned with deparent().

Returns

• 0: on success
• -1: on error (e.g. if 'pos' out of range) with no changes made.

See also

deparent()

11.154.3.53  replace()

Fl_Tree_Item ∗ Fl_Tree_Item::replace (Fl_Tree_Item ∗ newitem)

Replace the current item with a new item.
The current item is destroyed if successful. No checks are made to see if an item with the same name exists.
This method can be used to, for example, install 'custom' items into the tree derived from Fl_Tree_Item; see draw_item_content().

Parameters

| in | newitem | The new item to replace the current item |
Returns

newitem on success, NULL if could not be replaced.

See also

Fl_Tree_Item::draw_item_content(), Fl_Tree::root(Fl_Tree_Item+)

Version

1.3.3 ABI feature

11.154.3.54 replace_child()

Fl_Tree_Item * Fl_Tree_Item::replace_child (  
    Fl_Tree_Item * olditem,  
    Fl_Tree_Item * newitem )

Replace existing child 'olditem' with 'newitem'.
The 'olditem' is destroyed if successful. Can be used to put custom items (derived from Fl_Tree_Item) into the tree. No checks are made to see if an item with the same name exists.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>olditem</th>
<th>The item to be found and replaced</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>newitem</td>
<td>The new item to take the place of 'olditem'</td>
</tr>
</tbody>
</table>

Returns

newitem on success and 'olditem' is destroyed. NULL on error if 'olditem' was not found as an immediate child.

See also

replace(), Fl_Tree_Item::draw()

Version

1.3.3 ABI feature

11.154.3.55 select()

void Fl_Tree_Item::select (  
    int val = 1 ) [inline]

Change the item's selection state to the optionally specified 'val'.
If 'val' is not specified, the item will be selected.

11.154.3.56 select_all()

int Fl_Tree_Item::select_all ( ) [inline]

Select item and all its children.
Returns count of how many items were in the 'deselected' state, ie. how many items were "changed".

11.154.3.57 show_self()

void Fl_Tree_Item::show_self {  
    const char * indent = "" } const

Print the tree as 'ascii art' to stdout.
Used mainly for debugging.
11.154.3.58  show_widgets()

void Fl_Tree_Item::show_widgets ( ) [protected]
Internal: Show the FLTK widget() for this item and all children.
Used by open() to re-show widgets that were hidden by a previous close()

11.154.3.59  swap_children() [1/2]

int Fl_Tree_Item::swap_children (  
    Fl_Tree_Item ∗ a,  
    Fl_Tree_Item ∗ b )
Swap two of our immediate children, given item pointers.
Use e.g. for sorting.
This method is SLOW because it involves linear lookups.
For speed, use swap_children(int,int) instead.

Parameters

| in | a,b | The item ptrs of the two items to swap. Both must be immediate children of the current item. |

Returns

- 0 : OK
- -1 : failed: item 'a' or 'b' is not our child.

11.154.3.60  swap_children() [2/2]

void Fl_Tree_Item::swap_children (  
    int ax,  
    int bx )
Swap two of our children, given two child index values 'ax' and 'bx'.
Use e.g. for sorting.
This method is FAST, and does not involve lookups.
No range checking is done on either index value.

Parameters

| in | ax,bx | the index of the items to swap |

11.154.3.61  tree() [1/2]

Fl_Tree ∗ Fl_Tree_Item::tree ( ) [inline]
Return the tree for this item.

Version

1.3.4

11.154.3.62  tree() [2/2]

const Fl_Tree ∗ Fl_Tree_Item::tree ( ) const [inline]
Return the tree for this item.

Version

1.3.3
11.154.3.63 **update_prev_next()**

```cpp
void Fl_Tree_Item::update_prev_next ( int index )
```

Update our _prev_sibling and _next_sibling pointers to point to neighbors given `index` as being our current position in the parent's item array.
Call this whenever items in the array are added/removed/moved/swapped/etc.

**Parameters**

<table>
<thead>
<tr>
<th></th>
<th><code>index</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>Our index# in the parent. Special case if index=-1: become an orphan; null out all parent/sibling associations.</td>
</tr>
</tbody>
</table>

11.154.3.64 **userdeicon() [1/2]**

```cpp
Fl_Image * Fl_Tree_Item::userdeicon ( ) const [inline]
```

Return the deactivated version of the user icon, if any.
Returns 0 if none.

11.154.3.65 **userdeicon() [2/2]**

```cpp
void Fl_Tree_Item::userdeicon ( Fl_Image * val ) [inline]
```

Set the usericon to draw when the item is deactivated.
Use '0' to disable. No internal copy is made; caller must manage icon's memory.
To create a typical 'grayed out' version of your usericon image, you can do the following:

```cpp
// Create tree + usericon for items
Fl_Tree *tree = new Fl_Tree(..);
Fl_Image *usr_icon = new Fl_Pixmap(..); // your usericon
Fl_Image *de_icon = usr_icon->copy(); // make a copy, and..
de_icon->inactive(); // make it 'grayed out'
...
for ( .. ) { // item loop..
  item = tree->add("..."); // create new item
  item->usericon(usr_icon); // assign usericon to items
  item->userdeicon(de_icon); // assign userdeicon to items
 ..
}
```

In the above example, the app should 'delete' the two icons when they're no longer needed (e.g. after the tree is destroyed)

**Version**

1.3.4

11.154.3.66 **usericon()**

```cpp
void Fl_Tree_Item::usericon ( Fl_Image * val ) [inline]
```

Set the item's user icon to an `Fl_Image`.
Use '0' to disable. No internal copy is made, caller must manage icon's memory.
Note, if you expect your items to be deactivated(), use `userdeicon(Fl_Image*)` to set up a 'grayed out' version of your icon to be used for display.

See also

`userdeicon(Fl_Image*)`

11.154.3.67 **visible_r()**

```cpp
int Fl_Tree_Item::visible_r ( ) const
```

See if item and all its parents are `open()` and `visible()`.
11.155 Fl_Tree_Item_Array Class Reference

Returns

1 – item and its parents are open() and visible() 0 – item (or one of its parents) are invisible or close()ed.

The documentation for this class was generated from the following files:

- Fl_Tree_Item.H
- Fl_Tree_Item.cxx

11.155 Fl_Tree_Item_Array Class Reference

Manages an array of Fl_Tree_Item pointers.

#include <Fl_Tree_Item_Array.H>

Public Member Functions

- void add (Fl_Tree_Item *val)
  Add an item* to the end of the array.
- void clear ()
  Clear the entire array.
- int deparent (int pos)
  Deparent item at 'pos' from our list of children.
- Fl_Tree_Item_Array (const Fl_Tree_Item_Array *o)
  Copy constructor. Makes new copy of array, with new instances of each item.
- Fl_Tree_Item_Array (int new_chunksize=10)
  Constructor; creates an empty array.
- void insert (int pos, Fl_Tree_Item *new_item)
  Insert an item at index position pos.
- int manage_item_destroy () const
  void manage_item_destroy (int val)
  Option to control if Fl_Tree_Item_Array's destructor will also destroy the Fl_Tree_Item's.
- int move (int to, int from)
  Move item at 'from' to new position 'to' in the array.
- Fl_Tree_Item *operator[] (int i)
  Return the item and index i.
- const Fl_Tree_Item *operator[] (int i) const
  Const version of operator[](int i)
- int remove (Fl_Tree_Item *item)
  Remove the item from the array.
- void remove (int index)
  Remove the item at.
- int reparent (Fl_Tree_Item *item, Fl_Tree_Item *newparent, int pos)
  Reparent specified item as a child of ourself.
- void replace (int pos, Fl_Tree_Item *new_item)
  Replace the item at index with newitem.
- void swap (int ax, int bx)
  Swap the two items at index positions ax and bx.
- int total () const
  Return the total items in the array, or 0 if empty.
- ~Fl_Tree_Item_Array ()
  Destructor. Calls each item's destructor, destroys internal_items array.
11.155.1 Detailed Description

Manages an array of Fl_Tree_Item pointers. Because FLTK 1.x.x. has mandated that templates and STL not be used, we use this class to dynamically manage the arrays. None of the methods do range checking on index values; the caller must be sure that index values are within the range 0<index<total() (unless otherwise noted).

11.155.2 Constructor & Destructor Documentation

11.155.2.1 Fl_Tree_Item_Array()

Fl_Tree_Item_Array::Fl_Tree_Item_Array (int new_chunksize = 10)

Constructor; creates an empty array.

The optional ‘chunksize’ can be specified to optimize memory allocation for potentially large arrays. Default chunksize is 10.

11.155.3 Member Function Documentation

11.155.3.1 add()

void Fl_Tree_Item_Array::add (Fl_Tree_Item ∗val)

Add an item to the end of the array. Assumes the item was created with ‘new’, and will remain allocated. Fl_Tree_Item_Array will handle calling the item’s destructor when the array is cleared or the item remove()’ed.

11.155.3.2 clear()

void Fl_Tree_Item_Array::clear ( )

Clear the entire array.

Each item will be deleted (destructors will be called), and the array will be cleared. total() will return 0.

11.155.3.3 deparent()

int Fl_Tree_Item_Array::deparent (int pos)

Deparent item at 'pos' from our list of children. Similar to a remove() without the destruction of the item. This creates an orphaned item (still allocated, has no parent) which soon after is typically reparented elsewhere.

\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

11.155.3.4 insert()

void Fl_Tree_Item_Array::insert (int pos, Fl_Tree_Item ∗new_item)

Insert an item at index position pos. Handles enlarging array if needed, total increased by 1. If \p pos \>= total(), the item is appended to the array. If \p pos \< 0, the item is prepended (works like pos == 0).
11.155.3.5 manage_item_destroy()

```cpp
void Fl_Tree_Item_Array::manage_item_destroy (int val) [inline]
```

Option to control if Fl_Tree_Item_Array's destructor will also destroy the Fl_Tree_Item's.
If set: items and item array is destroyed. If clear: only the item array is destroyed, not items themselves.

11.155.3.6 move()

```cpp
int Fl_Tree_Item_Array::move (int to, int from)
```

Move item at 'from' to new position 'to' in the array.
Due to how the moving an item shuffles the array around, a positional 'move' implies things that may not be obvious:
- When 'from' moved lower in tree, appears BELOW item that was at 'to'.
- When 'from' moved higher in tree, appears ABOVE item that was at 'to'.

Returns
0 on success, -1 on range error (e.g. if 'to' or 'from' out of range)

11.155.3.7 remove() [1/2]

```cpp
int Fl_Tree_Item_Array::remove (Fl_Tree_Item * item)
```

Remove the item from the array.
\returns 0 if removed, or -1 if the item was not in the array.

11.155.3.8 remove() [2/2]

```cpp
void Fl_Tree_Item_Array::remove (int index)
```

Remove the item at.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>index</th>
<th>from the array.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>The item will be delete'd (if non-NULL), so its destructor will be called.</td>
</tr>
</tbody>
</table>

11.155.3.9 reparent()

```cpp
int Fl_Tree_Item_Array::reparent (Fl_Tree_Item * item, Fl_Tree_Item * newparent, int pos)
```

Reparent specified item as a child of ourself.
Typically 'newchild' was recently orphaned with deparent().
\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

11.155.3.10 replace()

```cpp
void Fl_Tree_Item_Array::replace (```
Replace the item at `index` with `newitem`.
Old item at index position will be destroyed, and the new item will take it's place, and stitched into the linked list.
The documentation for this class was generated from the following files:
- `Fl_Tree_Item_Array.H`
- `Fl_Tree_Item_Array.cxx`

### 11.156 Fl_Tree_Prefs Class Reference

Tree widget's preferences.

```cpp
#include <Fl_Tree_Prefs.H>
```

#### Public Member Functions

- **`Fl_Image * closedeicon () const`**
  
  `Return the deactivated version of the close icon, if any.`

- **`Fl_Image * closeicon () const`**

  `Gets the default 'close' icon Returns the Fl_Image of the icon, or 0 if none.`

- **`void closeicon (Fl_Image *val)`**

  `Sets the icon to be used as the 'close' icon.`

- **`Fl_Color connectorcolor () const`**

  `Get the connector color used for tree connection lines.`

- **`void connectorcolor (Fl_Color val)`**

  `Set the connector color used for tree connection lines.`

- **`Fl_Tree_Connector connectorstyle () const`**

  `Get the connector style.`

- **`void connectorstyle (Fl_Tree_Connector val)`**

  `Set the connector style.`

- **`void connectorstyle (int val)`**

  `Set the connector style [integer].`

- **`int connectorwidth () const`**

  `Get the tree connection line's width.`

- **`void connectorwidth (int val)`**

  `Set the tree connection line's width.`

- **`void do_item_draw_callback (Fl_Tree_Item *o) const`**

- **`Fl_Tree_Prefs ()`**

  `Fl_Tree_Prefs constructor.`

- **`Fl_Tree_Item_Draw_Callback * item_draw_callback () const`**

  `Get the 'item draw callback' used for the tree.`

- **`void item_draw_callback (Fl_Tree_Item_Draw_Callback *cb, void *data=0)`**

- **`Fl_Tree_Item_Draw_Mode item_draw_mode () const`**

  `Get the 'item draw mode' used for the tree.`

- **`void item_draw_mode (Fl_Tree_Item_Draw_Mode val)`**

  `Set the 'item draw mode' used for the tree to val.`

- **`void * item_draw_user_data () const`**

  `Get the default label background color.`

- **`void item_labelbgcolor (Fl_Color val)`**

  `Set the default label background color.`

- **`Fl_Color item_labelfgcolor () const`**

  `Get the default label foreground color.`

- **`void item_labelfgcolor (Fl_Color val)`**

  `Set the default label foreground color.`
Set the default label foreground color.

- **FL_Font item_labelfont () const**
  
  Return the label's font.

- **void item_labelfont (FL.FONT val)**
  
  Set the label's font to **val**.

- **FL_Fontsize item_labelsize () const**
  
  Return the label's size in pixels.

- **void item_labelsize (FL_Fontsize val)**
  
  Set the label's size in pixels to **val**.

- **FL_Tree_Item_Reselect_Mode item_reselect_mode () const**
  
  Returns the current item re/select mode.

- **void item_reselect_mode (FL_Tree_Item_Reselect_Mode mode)**
  
  Sets the item re/select mode.

- **FL_Color labelbgcolor () const**
  
  Obsolete: Get the default label background color. Please use item_labelbgcolor() instead.

- **void labelbgcolor (FL_Color val)**
  
  Obsolete: Set the default label background color. Please use item_labelbgcolor(FL_Color) instead.

- **FL_Color labelfgcolor () const**
  
  Obsolete: Get the default label foreground color. Please use item_labelfgcolor() instead.

- **void labelfgcolor (FL_Color val)**
  
  Obsolete: Set the default label foreground color. Please use item_labelfgcolor(FL_Color) instead.

- **FL_Font labelfont () const**
  
  Obsolete: Return the label's font. Please use item_labelfont() instead.

- **void labelfont (FL_Font val)**
  
  Obsolete: Set the label's font to **val**. Please use item_labelfont(FL_Font) instead.

- **int labelmarginleft () const**
  
  Get the label's left margin value in pixels.

- **void labelmarginleft (int val)**
  
  Set the label's left margin value in pixels.

- **FL_Fontsize labelsize () const**
  
  Obsolete: Return the label's size in pixels. Please use item_labelsize() instead.

- **void labelsize (FL_Fontsize val)**
  
  Obsolete: Set the label's size in pixels to **val**. Please use item_labelsize(FL_Fontsize) instead.

- **int linespacing () const**
  
  Get the line spacing value in pixels.

- **void linespacing (int val)**
  
  Set the line spacing value in pixels.

- **int marginbottom () const**
  
  Get the bottom margin's value in pixels.

- **void marginbottom (int val)**
  
  Set the bottom margin's value in pixels This is the extra distance the vertical scroller lets you travel.

- **int marginleft () const**
  
  Get the left margin's value in pixels.

- **void marginleft (int val)**
  
  Set the left margin's value in pixels.

- **int margintop () const**
  
  Get the top margin's value in pixels.

- **void margintop (int val)**
  
  Set the top margin's value in pixels.

- **int openchild_marginbottom () const**
  
  Get the margin below an open child in pixels.
• void **openchild_marginbottom**(int val)
  Set the margin below an open child in pixels.

• **Fl_Image*** **opendeicon** () const
  Return the deactivated version of the open icon, if any.

• **Fl_Image*** **openicon** () const
  Get the current default 'open' icon.

• void **openicon**(Fl_Image* val)
  Sets the default icon to be used as the 'open' icon when items are add()ed to the tree.

• **Fl_Boxtype** **selectbox** () const
  Get the default selection box's box drawing style as an Fl_Boxtype.

• void **selectbox**(Fl_Boxtype val)
  Set the default selection box's box drawing style to val.

• **Fl_Tree_Select** **selectmode** () const
  Get the selection mode used for the tree.

• void **selectmode**(Fl_Tree_Select val)
  Set the selection mode used for the tree to val.

• char **showcollapse** () const
  Returns 1 if the collapse icon is enabled, 0 if not.

• void **showcollapse**(int val)
  Set if we should show the collapse icon or not.

• int **showroot** () const
  Returns 1 if the root item is to be shown, or 0 if not.

• void **showroot**(int val)
  Set if the root item should be shown or not.

• **Fl_Tree_Sort** **sortorder** () const
  Get the default sort order value.

• void **sortorder**(Fl_Tree_Sort val)
  Set the default sort order value.

• **Fl_Image*** **userdeicon** () const
  Return the deactivated version of the user icon, if any.

• **Fl_Image*** **usericon** () const
  Gets the default 'user icon' (default is 0)

• void **usericon**(Fl_Image* val)
  Sets the default 'user icon'. Returns the Fl_Image* of the icon, or 0 if none (default).

• int **usericonmarginleft** () const
  Get the user icon's left margin value in pixels.

• void **usericonmarginleft**(int val)
  Set the user icon's left margin value in pixels.

• int **widgetmarginleft** () const
  Get the widget's left margin value in pixels.

• void **widgetmarginleft**(int val)
  Set the widget's left margin value in pixels.

• ~**Fl_Tree_Prefs**()
  Fl_Tree_Prefs destructor.

### 11.156.1 Detailed Description

Tree widget's preferences.

Fl_Tree's Preferences class.

This class manages the Fl_Tree's defaults. You should probably be using the methods in Fl_Tree instead of trying to accessing tree's preferences settings directly.
11.156.2 Member Function Documentation

11.156.2.1 closedeicon()

```cpp
Fl_Image * Fl_Tree_Prefs::closedeicon ( ) const [inline]
```

Return the deactivated version of the close icon, if any.
Returns 0 if none.

11.156.2.2 closeicon()

```cpp
void Fl_Tree_Prefs::closeicon ( Fl_Image * val )
```

Sets the icon to be used as the 'close' icon.
This overrides the built in default '[-]' icon.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>val</th>
</tr>
</thead>
</table>
|    | – The new image, or zero to use the default [-] icon.

11.156.2.3 item_draw_mode()

```cpp
void Fl_Tree_Prefs::item_draw_mode ( Fl_Tree_Item_Draw_Mode val ) [inline]
```

Set the 'item draw mode' used for the tree to val.
This affects how items in the tree are drawn, such as when a widget() is defined. See Fl_Tree_Item_Draw_Mode for possible values.

11.156.2.4 item_labelbgcolor() [1/2]

```cpp
Fl_Color Fl_Tree_Prefs::item_labelbgcolor ( ) const [inline]
```

Get the default label background color.
This returns the Fl_Tree::color() unless item_labelbgcolor() has been set explicitly.

11.156.2.5 item_labelbgcolor() [2/2]

```cpp
void Fl_Tree_Prefs::item_labelbgcolor ( Fl_Color val ) [inline]
```

Set the default label background color.
Once set, overrides the default behavior of using Fl_Tree::color().

11.156.2.6 marginbottom()

```cpp
int Fl_Tree_Prefs::marginbottom ( ) const [inline]
```

Get the bottom margin's value in pixels.
This is the extra distance the vertical scroller lets you travel.

11.156.2.7 opendeicon()

```cpp
Fl_Image * Fl_Tree_Prefs::opendeicon ( ) const [inline]
```

Return the deactivated version of the open icon, if any.
Returns 0 if none.

11.156.2.8 openicon() [1/2]

```cpp
Fl_Image * Fl_Tree_Prefs::openicon ( ) const [inline]
```

Get the current default 'open' icon.
Returns the Fl_Image of the icon, or 0 if none.
11.156.2.9  openicon()  [2/2]

void Fl_Tree_Prefs::openicon (  
    Fl_Image * val )  
Sets the default icon to be used as the 'open' icon when items are add()ed to the tree.  
This overrides the built in default '[+]' icon.

Parameters

| in | val | – The new image, or zero to use the default [+ ] icon. |

11.156.2.10  selectmode()

void Fl_Tree_Prefs::selectmode (  
    Fl_Tree_Select val )  [inline]  
Set the selection mode used for the tree to val.  
This affects how items in the tree are selected when clicked on and dragged over by the mouse.  
See Fl_Tree_Select for possible values.

11.156.2.11  showcollapse()

void Fl_Tree_Prefs::showcollapse (  
    int val )  [inline]  
Set if we should show the collapse icon or not.  
If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via open() and close().

Parameters

| in | val | 1: shows collapse icons (default), 0: hides collapse icons. |

11.156.2.12  showroot()

void Fl_Tree_Prefs::showroot (  
    int val )  [inline]  
Set if the root item should be shown or not.

Parameters

| in | val | 1 – show the root item (default), 0 – hide the root item. |

11.156.2.13  sortorder()

void Fl_Tree_Prefs::sortorder (  
    Fl_Tree_Sort val )  [inline]  
Set the default sort order value.  
Defines the order new items appear when add()ed to the tree.  
See Fl_Tree_Sort for possible values.

11.156.2.14  userdeicon()

Fl_Image * Fl_Tree_Prefs::userdeicon ( ) const  [inline]  
Return the deactivated version of the user icon, if any.  
Returns 0 if none.  
The documentation for this class was generated from the following files:
11.157 **Fl_Valuator Class Reference**

The `Fl_Valuator` class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

```cpp
#include <Fl_Valuator.H>
```

Inheritance diagram for `Fl_Valuator`:

### Public Member Functions

- `void bounds (double a, double b)`  
  *Sets the minimum (a) and maximum (b) values for the valuator widget.*

- `double clamp (double)`  
  *Clamps the passed value to the valuator range.*

- `virtual int format (char *p)`  
  *Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*

- `double increment (double, int)`  
  *Adds n times the step value to the passed value.*

- `double maximum () const`  
  *Gets the maximum value for the valuator.*

- `void maximum (double a)`  
  *Sets the maximum value for the valuator.*

- `double minimum () const`  
  *Gets the minimum value for the valuator.*

- `void minimum (double a)`  
  *Sets the minimum value for the valuator.*

- `void precision (int digits)`  
  *Sets the step value to 1.0 / 10^digits.*

- `void range (double a, double b)`  
  *Sets the minimum and maximum values for the valuator.*

- `double round (double)`  
  *Round the passed value to the nearest step increment.*

- `double step () const`  
  *Gets or sets the step value.*

- `void step (double a, int b)`  
  *Sets the step value.*
See double Fl_Valuator::step() const

• void step (double s)
  
  See double Fl_Valuator::step() const.

• void step (int a)
  
  See double Fl_Valuator::step() const

• double value () const
  
  Gets the floating point(double) value.

• int value (double)
  
  Sets the current value.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  
  Activates the widget.

• unsigned int active () const
  
  Returns whether the widget is active.

• int active_r () const
  
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  
  Gets the label alignment.

• void align (Fl_Align alignment)
  
  Sets the label alignment.

• long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.
Gets the current callback function for the widget.

- `void callback (Fl_Callback *cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)`
  Sets the current callback function and managed user data for the widget.

- `void callback (Fl_Callback *cb, void *p)`
  Sets the current callback function and data for the widget.

- `void callback (Fl_Callback0 *cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback1 *cb, long p=0)`
  Sets the current callback function for the widget.

- `unsigned int changed () const` Checks if the widget value changed since the last callback.

- `void clear_active ()`
  Marks the widget as inactive without sending events or changing focus.

- `void clear_changed ()`
  Marks the value of the widget as unchanged.

- `void clear_damage (uchar c=0)` Clears or sets the damage flags.

- `void clear_output ()`
  Sets a widget to accept input.

- `void clear_visible ()`
  Hides the widget.

- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.

- `Fl_Color color () const` Gets the background color of the widget.

- `void color (Fl_Color bg)` Sets the background color of the widget.

- `void color (Fl_Color bg, Fl_Color sel)` Sets the background and selection color of the widget.

- `Fl_Color color2 () const` For back compatibility only.

- `void color2 (unsigned a)` For back compatibility only.

- `int contains (const Fl_Widget *w) const` Checks if w is a child of this widget.

- `void copy_label (const char *new_label)` Sets the current label.

- `void copy_tooltip (const char *text)` Sets the current tooltip text.

- `uchar damage () const` Returns non-zero if `draw()` needs to be called.

- `void damage (uchar c)` Sets the damage bits for the widget.

- `void damage (uchar c, int x, int y, int w, int h)` Sets the damage bits for an area inside the widget.

- `int damage_resize (int, int, int, int)` Internal use only.

- `void deactivate ()`
  Deactivates the widget.
• \texttt{FL\_Image \* deimage ()}
  Gets the image that is used as part of the widget label when in the inactive state.

• \texttt{const FL\_Image \* deimage () const}
  Gets the image that is used as part of the widget label when in the inactive state.

• \texttt{void deimage (FL\_Image \&img)}
  Sets the image to use as part of the widget label when in the inactive state.

• \texttt{void deimage (FL\_Image \* img)}
  Sets the image to use as part of the widget label when in the inactive state.

• \texttt{int deimage\_bound () const}
  Returns whether the inactive image is managed by the widget.

• \texttt{void do\_callback (FL\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)}
  Calls the widget callback function with default arguments.

• \texttt{void do\_callback (FL\_Widget \*widget, long arg, FL\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)}
  Calls the widget callback function with arbitrary arguments.

• \texttt{void do\_callback (FL\_Widget \*widget, void \*arg=0, FL\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)}
  Calls the widget callback function with arbitrary arguments.

• \texttt{virtual void draw ()=0}
  Draws the widget.

• \texttt{void draw\_label (int, int, int, int, FL\_Align) const}
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• \texttt{int h () const}
  Gets the widget height.

• \texttt{virtual int handle (int event)}
  Handles the specified event.

• \texttt{virtual void hide ()}
  Makes a widget invisible.

• \texttt{FL\_Image \* image ()}
  Gets the image that is used as part of the widget label when in the active state.

• \texttt{const FL\_Image \* image () const}
  Gets the image that is used as part of the widget label when in the active state.

• \texttt{void image (FL\_Image \&img)}
  Sets the image to use as part of the widget label when in the active state.

• \texttt{void image (FL\_Image \* img)}
  Sets the image to use as part of the widget label when in the active state.

• \texttt{int image\_bound () const}
  Returns whether the image is managed by the widget.

• \texttt{int inside (const FL\_Widget \*wgt) const}
  Checks if this widget is a child of \texttt{wgt}.

• \texttt{int is\_label\_copied () const}
  Returns whether the current label was assigned with \texttt{copy\_label()}.

• \texttt{const char \* label () const}
  Gets the current label text.

• \texttt{void label (const char \*text)}
  Sets the current label pointer.

• \texttt{void label (FL\_Labeltype a, const char \*b)}
  Shortcut to set the label text and type in one call.

• \texttt{FL\_Color labelcolor () const}
  Gets the label color.

• \texttt{void labelcolor (FL\_Color c)}
  Sets the label color.

• \texttt{FL\_Font labelfont () const}
Gets the font to use.

• void labelfont (Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize labelsize () const
  
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  
  Returns if a widget is used for output only.

• Fl_Group * parent () const
  
  Returns a pointer to the parent widget.

• void parent (Fl_Group * p)
  
  Internal use only - "for hacks only".

• void position (int X, int Y)
  
  Repositions the window or widget.

• void redraw ()
  
  Schedules the drawing of the widget.

• void redraw_label ()
  
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  
  Gets the selection color.

• void selection_color (Fl_Color a)
  
  Sets the selection color.

• void set_active ()
  
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  
  Marks the value of the widget as changed.

• void set_output ()
  
  Sets a widget to output only.

• void set_visible ()
  
  Makes the widget visible.

• void set_visible_focus ()
  
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

• void shortcut_label (int value)
  
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

• virtual void show ()
  
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Protected Member Functions

- **Fl_Valuator** (int X, int Y, int W, int H, const char *L)
  - Creates a new Fl_Valuator widget using the given position, size, and label string.

- void **handle_drag** (double newvalue)
  - Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- void **handle_push** ()
  - Stores the current value in the previous value.

- void **handle_release** ()
  - Called after an FL_WHEN_RELEASE event is received and before the callback.

- int **horizontal** () const
  - Tells if the valuator is an FL_HORIZONTAL one.

- double **previous_value** () const
  - Gets the previous floating point value before an event changed it.

- void **set_value** (double v)
  - Sets the current floating point value.

- double **softclamp** (double)
  - Clamps the value, but accepts v if the previous value is not already out of range.

- virtual void **value_damage** ()
  - Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- void **clear_flag** (unsigned int c)
  - Clears a flag in the flags mask.

- void **draw_backdrop** () const
  - If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box** () const
  - Draws the widget box according its box style.

- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  - Draws a box of type t, of color c at the widget's position and size.

- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  - Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus** () const
  - Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  - Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  - Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  - Draws the widget's label at the defined label position.

- void **draw_label** (int, int, int, int) const
  - Draws the label in an arbitrary bounding box.

- Fl_Widget** (int x, int y, int w, int h, const char *label=L0)
  - Creates a widget at the given position and size.

- unsigned int **flags** () const
  - Gets the widget flags mask.

- void **h** (int v)
  - Internal use only.

- void **set_flag** (unsigned int c)
  - Sets a flag in the flags mask.

- void **w** (int v)
Internal use only.

• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

  flags possible values enumeration.

11.157.1 Detailed Description

The Fl_Valuator class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

There are probably more of these classes in FLTK than any others:
In the above diagram each box surrounds an actual subclass. These are further differentiated by setting the \texttt{type()} of the widget to the symbolic value labeling the widget. The ones labelled "0" are the default versions with a \texttt{type(0)}. For consistency the symbol \texttt{FL\_VERTICAL} is defined as zero.

11.157.2 Constructor & Destructor Documentation

11.157.2.1 \texttt{Fl\_Valuator()}

\begin{verbatim}
Fl\_Valuator::Fl\_Valuator (  
    int \_X,  
    int \_Y,  
    int \_W,  
    int \_H,  
    const char * L ) [protected]
\end{verbatim}

Creates a new \texttt{Fl\_Valuator} widget using the given position, size, and label string. The default boxtype is \texttt{FL\_NO\_BOX}.

11.157.3 Member Function Documentation

11.157.3.1 \texttt{format()}

\begin{verbatim}
int Fl\_Valuator::format (  
    char * buffer ) [virtual]
\end{verbatim}

Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter. The actual format used depends on the current step value. If the step value has been set to zero then a \texttt{\%g} format is used. If the step value is non-zero, then a \texttt{\%f} format is used, where the precision is calculated to show sufficient digits for the current step value. An integer step value, such as 1 or 1.0, gives a precision of 0, so the formatted value will appear as an integer. This method is used by the \texttt{Fl\_Valuator\_...} group of widgets to format the current value into a text string. The return value is the length of the formatted text. The formatted value is written into \texttt{buffer}. \texttt{buffer} should have space for at least 128 bytes.

You may override this function to create your own text formatting.

11.157.3.2 \texttt{increment()}

\begin{verbatim}
double Fl\_Valuator::increment (  
\end{verbatim}
double v,
    int n )

Adds n times the step value to the passed value.
If step was set to zero it uses fabs(maximum() - minimum()) / 100.

11.157.3.3 maximum() [1/2]

double Fl_Valuator::maximum ( ) const [inline]

Gets the maximum value for the valuator.

11.157.3.4 maximum() [2/2]

void Fl_Valuator::maximum ( double a ) [inline]

Sets the maximum value for the valuator.

11.157.3.5 minimum() [1/2]

double Fl_Valuator::minimum ( ) const [inline]

Gets the minimum value for the valuator.

11.157.3.6 minimum() [2/2]

void Fl_Valuator::minimum ( double a ) [inline]

Sets the minimum value for the valuator.

11.157.3.7 precision()

void Fl_Valuator::precision ( int digits )

Sets the step value to 1.0 / 10^digits.
Precision digits is limited to 0...9 to avoid internal overflow errors. Values outside this range are clamped.

Note

For negative values of digits the step value is set to A = 1.0 and B = 1, i.e. 1.0/1 = 1.

11.157.3.8 range()

void Fl_Valuator::range ( double a,
    double b ) [inline]

Sets the minimum and maximum values for the valuator.
When the user manipulates the widget, the value is limited to this range. This clamping is done after rounding to
the step value (this makes a difference if the range is not a multiple of the step).
The minimum may be greater than the maximum. This has the effect of "reversing" the object so the larger values
are in the opposite direction. This also switches which end of the filled sliders is filled.
Some widgets consider this a "soft" range. This means they will stop at the range, but if the user releases and grabs
the control again and tries to move it further, it is allowed.
The range may affect the display. You must redraw() the widget after changing the range.
11.157.3.9 round()

```cpp
double Fl_Valuator::round (double v)
```

Round the passed value to the nearest step increment. Does nothing if step is zero.

11.157.3.10 step()

```cpp
double Fl_Valuator::step ( ) const [inline]
```

Gets or sets the step value. As the user moves the mouse the value is rounded to the nearest multiple of the step value. This is done before clamping it to the range. For most widgets the default step is zero. For precision the step is stored as the ratio of a double A and an integer B = A/B. You can set these values directly. Currently setting a floating point value sets the nearest A/1 or 1/B value possible.

11.157.3.11 value() [1/2]

```cpp
double Fl_Valuator::value ( ) const [inline]
```

Gets the floating point(double) value. See int value(double)

11.157.3.12 value() [2/2]

```cpp
int Fl_Valuator::value (double v)
```

Sets the current value. The new value is not clamped or otherwise changed before storing it. Use clamp() or round() to modify the value before calling value(). The widget is redrawn if the new value is different than the current one. The initial value is zero. changed() will return true if the user has moved the slider, but it will be turned off by value(x) and just before doing a callback (the callback can turn it back on if desired).

11.157.3.13 value_damage()

```cpp
void Fl_Valuator::value_damage ( ) [protected], [virtual]
```

Asks for partial redraw. Reimplemented in Fl_Adjuster.

The documentation for this class was generated from the following files:

- Fl_Valuator.H
- Fl_Valuator.cxx

11.158 Fl_Value_Input Class Reference

The Fl_Value_Input widget displays a numeric value.

```cpp
#include <Fl_Value_Input.H>
```

Inheritance diagram for Fl_Value_Input:

Public Member Functions

- **Fl_Color cursor_color () const**
  Gets the color of the text cursor.

- **void cursor_color (Fl_Color n)**
  Sets the color of the text cursor.

- **Fl_Value_Input (int x, int y, int w, int h, const char ∗l=0)**
  Creates a new Fl_Value_Input widget using the given position, size, and label string.

- **int handle (int) FL_OVERRIDE**
  Handles the specified event.

- **void resize (int, int, int, int) FL_OVERRIDE**
  Changes the size or position of the widget.

- **int shortcut () const**
  Returns the current shortcut key for the Input.

- **void shortcut (int s)**
  Sets the shortcut key to s.

- **char soft () const**
  If "soft" is turned on, the user is allowed to drag the value outside the range.

- **void soft (char s)**
  See void Fl_Value_Input::soft(char s)

- **Fl_Color textcolor () const**
  Gets the color of the text in the value box.

- **void textcolor (Fl_Color n)**
  Sets the color of the text in the value box.

- **Fl_Font textfont () const**
  Gets the typeface of the text in the value box.

- **void textfont (Fl_Font s)**
  Sets the typeface of the text in the value box.

- **Fl_Fontsize textsize () const**
  Gets the size of the text in the value box.

- **void textsize (Fl_Fontsize s)**
  Sets the size of the text in the value box.

Public Member Functions inherited from Fl_Valuator

- **void bounds (double a, double b)**
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp (double)**
  Clamps the passed value to the valuator range.

- **virtual int format (char ∗)**
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment (double, int)**
  Adds n times the step value to the passed value.

- **double maximum () const**
  Gets the maximum value for the valuator.

- **void maximum (double a)**
  Sets the maximum value for the valuator.

- **double minimum () const**
  Gets the minimum value for the valuator.

- **void minimum (double a)**
  Sets the minimum value for the valuator.

- **void precision (int digits)**
Sets the step value to 1.0 / 10^{digits}.

- void `range` (double a, double b)
  
  Sets the minimum and maximum values for the valuator.

- double `round` (double)
  
  Round the passed value to the nearest step increment.

- double `step` () const
  
  Gets or sets the step value.

- void `step` (double a, int b)
  
  See double `Fl_Valuator::step()` const

- void `step` (double s)
  
  See double `Fl_Valuator::step()` const.

- void `step` (int a)
  
  See double `Fl_Valuator::step()` const

- double `value` () const
  
  Gets the floating point(double) value.

- int `value` (double)
  
  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void `_clearFullscreen` ()
- void `_setFullscreen` ()
- void `activate` ()
  
  Activates the widget.

- unsigned int `active` () const
  
  Returns whether the widget is active.

- int `active_r` () const
  
  Returns whether the widget and all of its parents are active.

- `Fl_Align align` () const
  
  Gets the label alignment.

- void `align` (Fl_Align alignment)
  
  Sets the label alignment.

- long `argument` () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- void `argument` (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window ∗`as_gl_window` ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const ∗`as_gl_window` () const
- virtual Fl_Group ∗`as_group` ()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const ∗`as_group` () const
- virtual Fl_Window ∗`as_window` ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const ∗`as_window` () const
- void `bind_deimage` (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- void `bind_deimage` (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void `bind_image` (Fl_Image ∗img)
Sets the image to use as part of the widget label when in the active state.

- **void bind_image** (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **FL_Boxtype box** () const
  
  Gets the box type of the widget.

- **void box** (FL_Boxtype new_box)
  
  Sets the box type for the widget.

- **FL_Callback_p callback** () const
  
  Gets the current callback function for the widget.

- **void callback** (FL_Callback cb)
  
  Sets the current callback function for the widget.

- **void callback** (FL_Callback cb, Fl_Callback_User_Data *p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.

- **void callback** (FL_Callback cb, void *p)
  
  Sets the current callback function and data for the widget.

- **void callback** (FL_Callback0 cb)
  
  Sets the current callback function for the widget.

- **void callback** (FL_Callback1 cb, long p=0)
  
  Sets the current callback function for the widget.

- **unsigned int changed** () const
  
  Checks if the widget value changed since the last callback.

- **void clear_active** ()
  
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed** ()
  
  Marks the value of the widget as unchanged.

- **void clear_damage** (uchar c=0)
  
  Clears or sets the damage flags.

- **void clear_output** ()
  
  Sets a widget to accept input.

- **void clear_visible** ()
  
  Hides the widget.

- **void clear_visible_focus** ()
  
  Disables keyboard focus navigation with this widget.

- **FL_Color color** () const
  
  Gets the background color of the widget.

- **void color** (FL_Color bg)
  
  Sets the background color of the widget.

- **void color** (FL_Color bg, FL_Color sel)
  
  Sets the background and selection color of the widget.

- **FL_Color color2** () const
  
  For back compatibility only.

- **void color2** (unsigned a)
  
  For back compatibility only.

- **int contains** (const FL_Widget *w) const
  
  Checks if w is a child of this widget.

- **void copy_label** (const char *new_label)
  
  Sets the current label.

- **void copy_tooltip** (const char *text)
  
  Sets the current tooltip text.

- **uchar damage** () const
  
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)

  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)

  Internal use only.

• void deactivate ()

  Deactivates the widget.

• Fl_Image ∗ deimage ()

  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image ∗ deimage () const

  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image ∗img)

  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)

  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const

  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const

  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const

  Gets the widget height.

• virtual void hide ()

  Makes a widget invisible.

• Fl_Image ∗ image ()

  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image ∗ image () const

  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image ∗img)

  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image &img)

  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const

  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget ∗wgt) const

  Checks if this widget is a child of wgt.

• int is_label_copied () const

  Returns whether the current label was assigned with copy_label().

• const char ∗ label () const

  Gets the current label text.

• void label (const char ∗text)

  Sets the current label text.

• void label (Fl_Labeltype a, const char ∗b)

  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group * p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
  int shortcut_label () const
  Returns whether the widget's label uses ' & ' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses ' & ' to indicate shortcuts.
- virtual void show ()
  Makes a widget visible.
- void size (int W, int H)
  Changes the size of the widget.
- int take_focus ()
  Gives the widget the keyboard focus.
- unsigned int takeevents () const
  Returns if the widget is able to take events.
- int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
- const char * tooltip () const
  Gets the current tooltip text.
- void tooltip (const char *text)
  Sets the current tooltip text.
- Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
- Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
- uchar type () const
  Gets the widget type.
- void type (uchar t)
  Sets the widget type.
- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * user_data () const
  Gets the user data for this widget.
- void user_data (FI_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
- void user_data (void *v)
  Sets the user data for this widget.
- unsigned int visible () const
  Returns whether a widget is visible.
- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
- void visible_focus (int v)
  Modifies keyboard focus navigation.
- int visible_r () const
  Returns whether a widget and all its parents are visible.
- int w () const
  Gets the widget width.
- Fl_When when () const
  Returns the conditions under which the callback is called.
- void when (uchar i)
  Sets the flags used to decide when a callback is called.
- Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- int x () const
  Gets the widget position in its window.
- int y () const
  Gets the widget position in its window.
- virtual ~Fl_Widget ()
  Destroys the widget.
Public Attributes

• **Fl_Input** input

Protected Member Functions

• void **draw () FL_OVERRIDE**
  
  Draws the widget.

Protected Member Functions inherited from **Fl_Valuator**

• **Fl_Valuator** (int X, int Y, int W, int H, const char ∗L)
  
  Creates a new Fl_Valuator widget using the given position, size, and label string.

• void **handle_drag** (double newvalue)
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

• void **handle_push** ()
  
  Stores the current value in the previous value.

• void **handle_release** ()
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.

• int **horizontal** () const
  
  Tells if the valuator is an FL_HORIZONTAL one.

• double **previous_value** () const
  
  Gets the previous floating point value before an event changed it.

• void **set_value** (double v)
  
  Sets the current floating point value.

• double **softclamp** (double)
  
  Clamps the value, but accepts v if the previous value is not already out of range.

Protected Member Functions inherited from **Fl_Widget**

• void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

• void **draw_backdrop** () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void **draw_box** () const
  
  Draws the widget box according its box style.

• void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const
  
  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• **Fl_Widget** (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

• unsigned int **flags** () const
Gets the widget flags mask.

- `void h (int v)`
  
  *Internal use only.*

- `void set_flag (unsigned int c)`
  
  Sets a flag in the flags mask.

- `void w (int v)`
  
  *Internal use only.*

- `void x (int v)`
  
  *Internal use only.*

- `void y (int v)`
  
  *Internal use only.*

### Additional Inherited Members

**Static Public Member Functions inherited from Fl_Widget**

- `static void default_callback (Fl_Widget *widget, void *data)`
  
  The default callback for all widgets that don’t set a callback.

- `static unsigned int label_shortcut (const char *t)`
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- `static int test_shortcut (const char *, const bool require_alt=false)`
  
  Returns true if the given text `t` contains the entered ‘&x’ shortcut.

**Protected Types inherited from Fl_Widget**

- `enum {
    INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
    FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
    OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
    MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,

    NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
    AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
  }
  
  flags possible values enumeration.

### Detailed Description

The `Fl_Value_Input` widget displays a numeric value. The user can click in the text field and edit it - there is in fact a hidden `Fl_Input` widget with type(FL_FLOAT_INPUT) or type(FL_INT_INPUT) in there - and when they hit return or tab the value updates to what they typed and the callback is done.

If `step()` is non-zero and integral, then the range of numbers is limited to integers instead of floating point numbers. As well as displaying the value as an integer, typed input is also limited to integer values, even if the hidden `Fl_Input` widget is of type(FL_FLOAT_INPUT).

If `step()` is non-zero, the user can also drag the mouse across the object and thus slide the value. The left button moves one `step()` per pixel, the middle by 10 `step()`, and the right button by 100 * `step()`. It is therefore impossible to select text by dragging across it, although clicking can still move the insertion cursor.

If `step()` is non-zero and integral, then the range of numbers are limited to integers instead of floating point values.

11.158.2 Constructor & Destructor Documentation

11.158.2.1 Fl_Value_Input()

Fl_Value_Input::Fl_Value_Input (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ l = 0 )  
Creates a new Fl_Value_Input widget using the given position, size, and label string.  
The default boxtype is FL_DOWN_BOX.

11.158.3 Member Function Documentation

11.158.3.1 cursor_color() [1/2]

Fl_Color Fl_Value_Input::cursor_color ( ) const [inline]  
Gets the color of the text cursor.  
The text cursor is black by default.

11.158.3.2 cursor_color() [2/2]

void Fl_Value_Input::cursor_color (  
    Fl_Color n ) [inline]  
Sets the color of the text cursor.  
The text cursor is black by default.

11.158.3.3 draw()

void Fl_Value_Input::draw ( ) [protected], [virtual]  
Draws the widget.  
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as  
soon as possible, call redraw() instead.  
Override this function to draw your own widgets.  
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded  
scrollbar, you can do it (because draw() is virtual) like this:  
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar  
s->draw(); // calls Fl_Scrollbar::draw()  
Implements Fl_Widget.

11.158.3.4 handle()

int Fl_Value_Input::handle (  
    int event ) [virtual]  
Handles the specified event.  
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.  
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.  
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-  
circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your handle() method although you don’t really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may “ring the bell” or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn’t do anything with it.

### Parameters

- **in event** the kind of event received

### Return values

- **0** if the event was not used or understood
- **1** if the event was used and can be deleted

Reimplemented from Fl_Widget.

#### 11.158.3.5 resize()

```cpp
void Fl_Value_Input::resize (int x, int y, int w, int h) [virtual]
```

Changes the size or position of the widget. This is a virtual function so that the widget may implement its own handling of resizing. The default version does not call the redraw() method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call resize() a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for resize(X, Y, w(), h()), and size(W, H) is a shortcut for resize(x(), y(), W, H).

### Parameters

- **in x, y** new position relative to the parent window
- **in w, h** new size

See also

- position(int, int), size(int, int)

Reimplemented from Fl_Widget.

#### 11.158.3.6 shortcut()

```cpp
int Fl_Value_Input::shortcut ( ) const [inline]
```
