  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  
  Gets the widget height.

- **virtual void hide ()**
  
  Makes a widget invisible.

- **Fl_Image * image ()**
  
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image * image () const**
  
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const**
  
  Checks if this widget is a child of `wgt`.

- **int is_label_copied () const**
  
  Returns whether the current label was assigned with `copy_label()`.

- **const char * label () const**
  
  Gets the current label text.

- **void label (const char *text)**
  
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  
  Gets the label color.

• void labelcolor (Fl_Color c)
  
  Sets the label color.

• Fl_Font labelfont () const
  
  Gets the font to use.

• void labelfont (Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize labelsize () const
  
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  
  Returns if a widget is used for output only.

• Fl_Group * parent () const
  
  Returns a pointer to the parent widget.

• void parent (Fl_Group *p)
  
  Internal use only - "for hacks only".

• void position (int X, int Y)
  
  Repositions the window or widget.

• void redraw ()
  
  Schedules the drawing of the widget.

• void redraw_label ()
  
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  
  Gets the selection color.

• void selection_color (Fl_Color a)
  
  Sets the selection color.

• void set_active ()
  
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  
  Marks the value of the widget as changed.

• void set_output ()
  
  Sets a widget to output only.

• void set_visible ()
  
  Makes the widget visible.

• void set_visible_focus ()
  
  

Generated by Doxygen
Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char * tooltip () const
  Gets the current tooltip text.

- void tooltip (const char * text)
  Sets the current tooltip text.

- Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.

- void type (uchar t)
  Sets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void * user_data () const
  Gets the user data for this widget.

- void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

- void user_data (void *v)
  Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  Modifies keyboard focus navigation.

- int visible_r () const
  Returns whether a widget and all its parents are visible.

- int w () const
  Gets the widget width.

- Fl_When when () const
  Returns the conditions under which the callback is called.

- void when (uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE

  Draws the widget.

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char ∗L)

  Creates a new Fl_Valuator widget using the given position, size, and label string.

• void handle_drag (double newvalue)

  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

• void handle_push ()

  Stores the current value in the previous value.

• void handle_release ()

  Called after an FL_WHEN_RELEASE event is received and before the callback.

• int horizontal () const

  Tells if the valuator is an FL_HORIZONTAL one.

• double previous_value () const

  Gets the previous floating point value before an event changed it.

• void set_value (double v)

  Sets the current floating point value.

• double softclamp (double)

  Clamps the value, but accepts v if the previous value is not already out of range.

• virtual void value_damage ()

  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)

  Clears a flag in the flags mask.

• void draw_backdrop () const

  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const

  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const

  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const

  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const

  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const

  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const

  Draws a focus box for the widget at the given position and size.

• void draw_label () const

  Draws the label of the widget.
Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

12.158.1 Detailed Description

The Fl_Value_Output widget displays a floating point value. If step() is not zero, the user can adjust the value by dragging the mouse left and right. The left button moves one step() per pixel, the middle by 10 * step(), and the right button by 100 * step(). This is much lighter-weight than Fl_Value_Input because it contains no text editing code or character buffer.
12.158.2 Constructor & Destructor Documentation

12.158.2.1 Fl_Value_Output()

Fl_Value_Output::Fl_Value_Output (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ l = 0 )  

Creates a new Fl_Value_Output widget using the given position, size, and label string.  
The default boxtype is FL_NO_BOX.  
Inherited destructor destroys the Valuator.

12.158.3 Member Function Documentation

12.158.3.1 draw()

void Fl_Value_Output::draw ( ) [protected], [virtual]  

Draws the widget.  
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.  
Override this function to draw your own widgets.  
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:  
Fl_Widget ∗s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar  
s->draw(); // calls Fl_Scrollbar::draw()  
Implements Fl_Widget.

12.158.3.2 handle()

int Fl_Value_Output::handle (  
    int event ) [virtual]  

Handles the specified event.  
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.  
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.  
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.  
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.  
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in | event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
Return values

\[ \text{if the event was used and can be deleted} \]

See also

Fl_Event

Reimplemented from Fl_Widget.

12.158.3.3  soft() [1/2]

uchar Fl_Value_Output::soft() const [inline]
If "soft" is turned on, the user is allowed to drag the value outside the range.
If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value.
Default is one.

12.158.3.4  soft() [2/2]

void Fl_Value_Output::soft(uchar s) [inline]
If "soft" is turned on, the user is allowed to drag the value outside the range.
If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value.
Default is one.

12.158.3.5  textcolor() [1/2]

Fl_Color Fl_Value_Output::textcolor() const [inline]
Sets the color of the text in the value box.

12.158.3.6  textcolor() [2/2]

void Fl_Value_Output::textcolor(Fl_Color s) [inline]
Gets the color of the text in the value box.

12.158.3.7  textfont() [1/2]

Fl_Font Fl_Value_Output::textfont() const [inline]
Gets the typeface of the text in the value box.

12.158.3.8  textfont() [2/2]

void Fl_Value_Output::textfont(Fl_Font s) [inline]
Sets the typeface of the text in the value box.

12.158.3.9  textsize()

Fl_Fontsize Fl_Value_Output::textsize() const [inline]
Gets the size of the text in the value box.
The documentation for this class was generated from the following files:

- Fl_Value_Output.H
- Fl_Value_Output.cxx

12.159 Fl_Value_Slider Class Reference

The Fl_Value_Slider widget is a Fl_Slider widget with a box displaying the current value.

#include <Fl_Value_Slider.H>

Inheritance diagram for Fl_Value_Slider:

```
Fl_Widget
   |
   |- Fl_Valuator
      |
      |       Fl_Slider
      |         |
      |         |       Fl_Value_Slider
      |         |           |
      |         |           |   Fl_Hor_Value_Slider
```

Public Member Functions

- **Fl_Value_Slider** (int x, int y, int w, int h, const char ∗l=0)
  
  * Creates a new Fl_Value_Slider widget using the given position, size, and label string.

- int **handle** (int) FL_OVERRIDE
  
  * Handles the specified event.

- **Fl_Color** textcolor () const
  
  * Gets the color of the text in the value box.

- void **textcolor** (Fl_Color s)
  
  * Sets the color of the text in the value box.

- **Fl_Font** textfont () const
  
  * Gets the typeface of the text in the value box.

- void **textfont** (Fl_Font s)
  
  * Sets the typeface of the text in the value box.

- **Fl_Fontsize** textsize () const
  
  * Gets the size of the text in the value box.

- void **textsize** (Fl_Fontsize s)
  
  * Sets the size of the text in the value box.

- int **value_height** () const
  
  * Gets the height of the value box in pixels (vertical mode only).

- void **value_height** (int s)
  
  * Sets the height of the value box in pixels (vertical mode only).

- int **value_width** () const
  
  * Gets the width of the value box in pixels (horizontal mode only).

- void **value_width** (int s)
  
  * Sets the width of the value box in pixels (horizontal mode only).
Public Member Functions inherited from Fl_Slider

- void bounds (double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- Fl_Slider (int X, int Y, int W, int H, const char *L=0)
  Creates a new Fl_Slider widget using the given position, size, and label string.
- Fl_Slider (uchar t, int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Slider widget using the given type, position, size, and label string.
- int scrollvalue (int pos, int size, int first, int total)
  Sets the size and position of the sliding knob in the box.
- Fl_Boxtype slider () const
  Gets the slider box type.
- void slider (Fl_Boxtype c)
  Sets the slider box type.
- float slider_size () const
  Get the dimensions of the moving piece of slider.
- void slider_size (double v)
  Set the dimensions of the moving piece of slider.

Public Member Functions inherited from Fl_Valuator

- void bounds (double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- double clamp (double)
  Clamps the passed value to the valuator range.
- virtual int format (char *)
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double increment (double, int)
  Adds n times the step value to the passed value.
- double maximum () const
  Gets the maximum value for the valuator.
- void maximum (double a)
  Sets the maximum value for the valuator.
- double minimum () const
  Gets the minimum value for the valuator.
- void minimum (double a)
  Sets the minimum value for the valuator.
- void precision (int digits)
  Sets the step value to $1.0 / 10^{\text{digits}}$.
- void range (double a, double b)
  Sets the minimum and maximum values for the valuator.
- double round (double)
  Round the passed value to the nearest step increment.
- double step () const
  Gets or sets the step value.
- void step (double a, int b)
  See double Fl_Valuator::step() const
- void step (double s)
  See double Fl_Valuator::step() const.
- void step (int a)
• double value () const
  Gets the floating point(double) value.

• int value (double)
  Sets the current value.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.

• unsigned int active () const
  Returns whether the widget is active.

• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
  Sets the current label.
• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
Sets the image to use as part of the widget label when in the inactive state.

- void deimage(Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound() const
  Returns whether the inactive image is managed by the widget.

- void do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- void do_callback(Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void do_callback(Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void draw_label(int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int h() const
  Gets the widget height.

- virtual void hide()
  Makes a widget invisible.

- Fl_Image *image()
  Gets the image that is used as part of the widget label when in the active state.

- const Fl_Image *image() const
  Gets the image that is used as part of the widget label when in the active state.

- void image(Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

- void image(Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

- int image_bound() const
  Returns whether the image is managed by the widget.

- int inside(const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

- int is_label_copied() const
  Returns whether the current label was assigned with copy_label().

- const char *label() const
  Gets the current label text.

- void label(const char *text)
  Sets the current label pointer.

- void label(Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

- Fl_Color labelcolor() const
  Gets the label color.

- void labelcolor(Fl_Color c)
  Sets the label color.

- Fl_Font labelfont() const
  Gets the font to use.

- void labelfont(Fl_Font f)
  Sets the font to use.

- Fl_Fontsize labelsize() const
  Gets the font size in pixels.

- void labelsize(Fl_Fontsize pix)
  Sets the font size in pixels.

- Fl_Labeltype labeltype() const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - “for hacks only”.
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• void tooltip (const char ∗text)
  Sets the current tooltip text.

• FL_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.

• FL_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void ∗ user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void ∗v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• FL_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• FL_Window ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ∼Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Slider

• void draw (int, int, int, int)

• int handle (int, int, int, int)
Protected Member Functions inherited from Fl_Valuator

- **Fl_Valuator**(int X, int Y, int W, int H, const char \*L)
  
  Creates a new Fl_Valuator widget using the given position, size, and label string.

- **void** handle_drag(double newvalue)
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- **void** handle_push()
  
  Stores the current value in the previous value.

- **void** handle_release()
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.

- **int** horizontal() const
  
  Tells if the valuator is an FL_HORIZONTAL one.

- **double** previous_value() const
  
  Gets the previous floating point value before an event changed it.

- **void** set_value(double v)
  
  Sets the current floating point value.

- **double** softclamp(double)
  
  Clamps the value, but accepts v if the previous value is not already out of range.

- **virtual void** value_damage()
  
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- **void** clear_flag(unsigned int c)
  
  Clears a flag in the flags mask.

- **void** draw_backdrop() const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void** draw_box() const
  
  Draws the widget box according its box style.

- **void** draw_box(Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

- **void** draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void** draw_focus() const
  
  Draws a focus rectangle around the widget.

- **void** draw_focus(Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

- **void** draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

- **void** draw_label() const
  
  Draws the widget's label at the defined label position.

- **void** draw_label(int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- **Fl_Widget**(int x, int y, int w, int h, const char \*label=0L)
  
  Creates a widget at the given position and size.

- **unsigned int** flags() const
  
  Gets the widget flags mask.

- **void** h(int v)
  
  Internal use only.

- **void** set_flag(unsigned int c)
  
  Sets a flag in the flags mask.

- **void** w(int v)
Internal use only.

- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,

} flags possible values enumeration.

12.159.1 Detailed Description

The Fl_Value_Slider widget is a Fl_Slider widget with a box displaying the current value.

![Figure 12.69 Fl_Value_Slider](image)

Figure 12.69 Fl_Value_Slider

12.159.2 Constructor & Destructor Documentation

12.159.2.1 Fl_Value_Slider()

Fl_Value_Slider::Fl_Value_Slider (  
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0 )
1864 Class Documentation

Creates a new Fl_Value_Slider widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

12.159.3 Member Function Documentation

12.159.3.1 draw()

```cpp
void Fl_Value_Slider::draw ( ) [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from Fl_Slider.

12.159.3.2 handle()

```cpp
int Fl_Value_Slider::handle ( int event ) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

**Parameters**

<table>
<thead>
<tr>
<th>in event</th>
</tr>
</thead>
<tbody>
<tr>
<td>the kind of event received</td>
</tr>
</tbody>
</table>

**Return values**

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

See also

Fl_Event

Reimplemented from Fl_Slider.

12.159.3.3 value_height() [1/2]

```cpp
int Fl_Value_Slider::value_height ( ) const [inline]
```

Gets the height of the value box in pixels (vertical mode only).

Since

1.4.0
12.159.3.4 value_height() [2/2]

void Fl_Value_Slider::value_height (
    int s  ) [inline]

Sets the height of the value box in pixels (vertical mode only).
Limited range checking is applied but drawing errors may occur if the size \( s \) is set too high or too low, particularly if
the widget is resized (later).
The programmer is responsible for setting sensible values and widget sizes.
The default value set by the constructor is 25.

Parameters

| in  | s  | new height of the value box |

Since

1.4.0

12.159.3.5 value_width() [1/2]

int Fl_Value_Slider::value_width ( ) const [inline]

Gets the width of the value box in pixels (horizontal mode only).

Since

1.4.0

12.159.3.6 value_width() [2/2]

void Fl_Value_Slider::value_width ( 
    int s  ) [inline]

Sets the width of the value box in pixels (horizontal mode only).
Limited range checking is applied but drawing errors may occur if the size \( s \) is set too high or too low, particularly if
the widget is resized (later).
The programmer is responsible for setting sensible values and widget sizes.
The default value set by the constructor is 35.

Parameters

| in  | s  | new width of the value box |

Since

1.4.0

The documentation for this class was generated from the following files:

- Fl_Value_Slider.H
- Fl_Value_Slider.cxx

12.160 Fl_Widget Class Reference

Fl_Widget is the base class for all widgets in FLTK.

#include <Fl_Widget.H>

Inheritance diagram for Fl_Widget:

Generated by Doxygen
Public Member Functions

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group () const
- virtual Fl_Window * as_window ()
  virtual Fl_Window const * as_window () const
Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const & as_window() const
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage(Fl_Imagex img)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image(Fl_Imagex img)
  Sets the image to use as part of the widget label when in the active state.

- void bind_image(int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box() const
  Gets the box type of the widget.

- void box(Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p callback() const
  Gets the current callback function for the widget.

- void callback(Fl_Callback cb)
  Sets the current callback function for the widget.

- void callback(Fl_Callback cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback(Fl_Callback cb, void *p)
  Sets the current callback function and data for the widget.

- void callback(Fl_Callback0 cb)
  Sets the current callback function for the widget.

- void callback(Fl_Callback1 cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed() const
  Checks if the widget value changed since the last callback.

- void clear_active()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed()
  Marks the value of the widget as unchanged.

- void clear_damage(uchar c=0)
  Clears or sets the damage flags.

- void clear_output()
  Sets a widget to accept input.

- void clear_visible()
  Hides the widget.

- void clear_visible_focus()
  Disables keyboard focus navigation with this widget.

- Fl_Color color() const
  Gets the background color of the widget.

- void color(Fl_Color bg)
  Sets the background color of the widget.

- void color(Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2() const
  For back compatibility only.

- void color2(unsigned a)
  For back compatibility only.

- int contains(const Fl_Widget *w) const
Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- virtual void draw ()=0
  Draws the widget.

- void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int h () const
  Gets the widget height.

- virtual int handle (int event)
  Handles the specified event.

- virtual void hide ()
  Makes a widget invisible.

- Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.

- const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.

- void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

- void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

- int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labellabeltype () const
  Gets the label type.
• void labellabeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - “for hacks only”.
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses ' &' to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget's label uses ' &' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.

• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int test_shortcut ()
  Returns true if the widget's label contains the entered ' &x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char * text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl__When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl__Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl__Widget ()
  Destroys the widget.

Static Public Member Functions

• static void default_callback (Fl__Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char *t, const bool requireAlt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19, NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
flags possible values enumeration.

Protected Member Functions

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
**Draws a focus rectangle around the widget.**

- void `draw_focus` (Fl_Boxtype t, int X, int Y, int W, int H) const
  - Draws a focus rectangle around the widget.

- void `draw_focus` (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  - Draws a focus box for the widget at the given position and size.

- void `draw_label` () const
  - Draws the widget's label at the defined label position.

- void `draw_label` (int, int, int, int) const
  - Draws the label in an arbitrary bounding box.

- `Fl_Widget` (int x, int y, int w, int h, const char ∗label=0L)
  - Creates a widget at the given position and size.

- unsigned int `flags` () const
  - Gets the widget flags mask.

- void `h` (int v)
  - Internal use only.

- void `set_flag` (unsigned int c)
  - Sets a flag in the flags mask.

- void `w` (int v)
  - Internal use only.

- void `x` (int v)
  - Internal use only.

- void `y` (int v)
  - Internal use only.

---

### 12.160.1 Detailed Description

`Fl_Widget` is the base class for all widgets in FLTK. You can't create one of these because the constructor is not public. However you can subclass it. All "property" accessing methods, such as `color()`, `parent()`, or `argument()` are implemented as trivial inline functions and thus are as fast and small as accessing fields in a structure. Unless otherwise noted, the property setting methods such as `color(n)` or `label(s)` are also trivial inline functions, even if they change the widget's appearance. It is up to the user code to call `redraw()` after these.

---

### 12.160.2 Member Enumeration Documentation

#### 12.160.2.1 anonymous enum

**anonymous enum** [protected]

flags possible values enumeration.

### 12.160.3 Constructor & Destructor Documentation

#### 12.160.3.1 Fl_Widget()

```cpp
Fl_Widget::Fl_Widget ( int x, int y, int w, int h, const char ∗ label = 0L ) [protected]
```

Creates a widget at the given position and size.

The `Fl_Widget` is a protected constructor, but all derived widgets have a matching public constructor. It takes a value for `x()`, `y()`, `w()`, `h()`, and an optional value for `label()`.

**Parameters**

<table>
<thead>
<tr>
<th>in x,y</th>
<th>the position of the widget relative to the enclosing window</th>
</tr>
</thead>
<tbody>
<tr>
<td>in w,h</td>
<td>size of the widget in pixels</td>
</tr>
<tr>
<td>in label</td>
<td>optional text for the widget label</td>
</tr>
</tbody>
</table>
12.160.3.2 \texttt{\textasciitilde}FL\_Widget() 

\texttt{FL\_Widget::\textasciitilde\texttt{FL\_Widget} ( ) [virtual]}

Destroys the widget.

Destroys the widget, taking care of throwing focus before if any.

Destroying single widgets is not very common. You almost always want to destroy the parent group instead, which
will destroy all of the child widgets and groups in that group.

\begin{itemize}
\item Since FLTK 1.3, the widget's destructor removes the widget from its parent group, if it is member of a group.
\end{itemize}

Destruction removes the widget from any parent group! And groups when destroyed destroy all their children. This
is convenient and fast.

12.160.4 Member Function Documentation

12.160.4.1 activate() 

\texttt{void FL\_Widget::activate ( )}

Activates the widget.

Changing this value will send FL\_ACTIVATE to the widget if \texttt{active\_r()} is true.

See also \texttt{active(), active\_r(), deactivate()}

12.160.4.2 active() 

\texttt{unsigned int FL\_Widget::active ( ) const [inline]}

Returns whether the widget is active.

\begin{itemize}
\item Return values
\end{itemize}

\begin{itemize}
\item \texttt{0} if the widget is inactive
\end{itemize}

See also \texttt{active\_r(), activate(), deactivate()}

12.160.4.3 active\_r() 

\texttt{int FL\_Widget::active\_r ( ) const}

Returns whether the widget and all of its parents are active.

\begin{itemize}
\item Return values
\end{itemize}

\begin{itemize}
\item \texttt{0} if this or any of the parent widgets are inactive
\end{itemize}

See also \texttt{active(), activate(), deactivate()}

12.160.4.4 align() [1/2]

\texttt{FL\_Align FL\_Widget::align ( ) const [inline]}

Gets the label alignment.
Returns

label alignment

See also

label(), align(Fl_Align), Fl_Align

12.160.4.5 align() [2/2]

void Fl_Widget::align (Fl_Align alignment) [inline]

Sets the label alignment.
This controls how the label is displayed next to or inside the widget. The default value is FL_ALIGN_CENTER, which centers the label inside the widget.

Parameters

in alignment new label alignment

See also

align(), Fl_Align

12.160.4.6 argument() [1/2]

long Fl_Widget::argument ( ) const [inline]

Gets the current user data (long) argument that is passed to the callback function.

Note

On platforms with sizeof(long) < sizeof(void*), particularly on Windows 64-bit platforms, this method can truncate stored addresses (void*) to the size of a long value. Use with care and only if you are sure that the stored user_data value fits in a long value because it was stored with argument(long) or another method using only long values. You may want to use user_data() instead.

See also

user_data()

12.160.4.7 argument() [2/2]

void Fl_Widget::argument ( long v ) [inline]

Sets the current user data (long) argument that is passed to the callback function.

See also

argument()

12.160.4.8 as_gl_window()

virtual class Fl_Gl_Window * Fl_Widget::as_gl_window ( ) [inline], [virtual]

Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl Window.
Use this method if you have a widget (pointer) and need to know whether this widget is derived from Fl_Gl_Window. If it returns non-NULL, then the widget in question is derived from Fl_Gl_Window.
Return values

**NULL** if this widget is not derived from **Fl_Gl_Window**.

Note

This method is provided to avoid dynamic_cast.

See also

**Fl_Widget::as_group(), Fl_Widget::as_window()**

Reimplemented in **Fl_Gl_Window**.

### 12.160.4.9 as_group()

**virtual Fl_Group * Fl_Widget::as_group () [inline], [virtual]**

Returns an **Fl_Group** pointer if this widget is an **Fl_Group**. Use this method if you have a widget (pointer) and need to know whether this widget is derived from **Fl_Group**. If it returns non-NULL, then the widget in question is derived from **Fl_Group**, and you can use the returned pointer to access its children or other **Fl_Group**-specific methods.

Example:

```c
void my_callback (Fl_Widget *w, void *) {
    Fl_Group *g = w->as_group();
    if (g)
        printf ("This group has %d children\n", g->children());
    else
        printf ("This widget is not a group!\n");
}
```

Return values

**NULL** if this widget is not derived from **Fl_Group**.

Note

This method is provided to avoid dynamic_cast.

See also

**Fl_Widget::as_window(), Fl_Widget::as_gl_window()**

Reimplemented in **Fl_Group**.

### 12.160.4.10 as_window()

**virtual Fl_Window * Fl_Widget::as_window () [inline], [virtual]**

Returns an **Fl_Window** pointer if this widget is an **Fl_Window**. Use this method if you have a widget (pointer) and need to know whether this widget is derived from **Fl_Window**. If it returns non-NULL, then the widget in question is derived from **Fl_Window**, and you can use the returned pointer to access its children or other **Fl_Window**-specific methods.

Return values

**NULL** if this widget is not derived from **Fl_Window**.

Note

This method is provided to avoid dynamic_cast.
See also

Fl_Widget::as_group(), Fl_Widget::as_gl_window()

Reimplemented in Fl_Window.

### 12.160.4.11 bind_deimage() [1/2]

```cpp
void Fl_Widget::bind_deimage (Fl_Image *img)
```

Sets the image to use as part of the widget label when in the inactive state.

**Parameters**

| in | img | the new image for the deactivated widget |

**Note**

The image will be bound to the widget. When the widget is deleted, the image will be deleted as well.

See also

void deimage(Fl_Image* img)

### 12.160.4.12 bind_deimage() [2/2]

```cpp
void Fl_Widget::bind_deimage (int f) [inline]
```

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

**Parameters**

| f | 1: mark the image as bound, 0: mark the image as managed by the user |

See also

deimage_bound(), bind_image()

### 12.160.4.13 bind_image() [1/2]

```cpp
void Fl_Widget::bind_image (Fl_Image *img)
```

Sets the image to use as part of the widget label when in the active state.

The image will be bound to the widget. When the widget is deleted, the image will be deleted as well.

Calling bind_image() with a new image will delete the old image if it was bound, and then set the new image, and bind that. If old and new image are the same, nothing happens.

Calling bind_image() with NULL will delete the old image if it was bound and not set a new image.

**Parameters**

| in | img | the new image for the label |
See also

```cpp
void image(Fl_Imagew* img)
```

### 12.160.4.14 bind_image() [2/2]

```cpp
void Fl_Widget::bind_image ( int f ) [inline]
```

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

**Parameters**

| f | 1: mark the image as bound, 0: mark the image as managed by the user |

See also

```cpp
image_bound(), bind_deimage()
```

### 12.160.4.15 box() [1/2]

```cpp
Fl_Boxtype Fl_Widget::box ( ) const [inline]
```

Gets the box type of the widget.

**Returns**

the current box type

See also

```cpp
box(Fl_Boxtype), Fl_Boxtype
```

### 12.160.4.16 box() [2/2]

```cpp
void Fl_Widget::box ( Fl_Boxtype new_box ) [inline]
```

Sets the box type for the widget.

This identifies a routine that draws the background of the widget. See Fl_Boxtype for the available types. The default depends on the widget, but is usually FL_NO_BOX or FL_UP_BOX.

**Parameters**

| new_box | the new box type |

See also

```cpp
box(), Fl_Boxtype
```

### 12.160.4.17 callback() [1/6]

```cpp
Fl_Callback_p Fl_Widget::callback ( ) const [inline]
```

Gets the current callback function for the widget.

Each widget has a single callback.

**Returns**

current callback
12.160.4.18 callback() [2/6]

void Fl_Widget::callback (  
    Fl_Callback * cb ) [inline]

Sets the current callback function for the widget.  
Each widget has a single callback.

Parameters

| in  | cb     | new callback |

12.160.4.19 callback() [3/6]

void Fl_Widget::callback (  
    Fl_Callback * cb,  
    Fl_Callback_User_Data * p,  
    bool auto_free ) [inline]

Sets the current callback function and managed user data for the widget.  
Setting auto_free will transfer ownership of the callback user data to the widget. Deleting the widget will then also delete the user data.

Parameters

| in  | cb     | new callback |
| in  | p      | user data    |
| in  | auto_free | if set, the widget will free user data when destroyed |

12.160.4.20 callback() [4/6]

void Fl_Widget::callback (  
    Fl_Callback * cb,  
    void * p ) [inline]

Sets the current callback function and data for the widget.  
Each widget has a single callback.

Parameters

| in  | cb     | new callback |
| in  | p      | user data    |

12.160.4.21 callback() [5/6]

void Fl_Widget::callback (  
    Fl_Callback0 * cb ) [inline]

Sets the current callback function for the widget.  
Each widget has a single callback.

Parameters

| in  | cb     | new callback |

12.160.4.22 callback() [6/6]

void Fl_Widget::callback (  

Generated by Doxygen
Sets the current callback function for the widget.
Each widget has a single callback.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cb</td>
<td>Fl_Callback</td>
<td>new callback</td>
</tr>
<tr>
<td>p</td>
<td>long</td>
<td>user data</td>
</tr>
</tbody>
</table>

### 12.160.4.23  changed()

```cpp
unsigned int Fl_Widget::changed ( ) const [inline]
```

Checks if the widget value changed since the last callback.

"Changed" is a flag that is turned on when the user changes the value stored in the widget. This is only used by subclasses of `Fl_Widget` that store values, but is in the base class so it is easier to scan all the widgets in a panel and `do_callback()` on the changed ones in response to an "OK" button.

Most widgets turn this flag off when they do the callback, and when the program sets the stored value.

**Note**

`do_callback()` turns this flag off after the callback.

**Return values**

- `0` if the value did not change

**See also**

- `set_changed()`, `clear_changed()`
- `do_callback(Fl_Widget *widget, void *data)`

### 12.160.4.24  clear_active()

```cpp
void Fl_Widget::clear_active ( ) [inline]
```

Marks the widget as inactive without sending events or changing focus.
This is mainly for specialized use, for normal cases you want `deactivate()`.

**See also**

- `deactivate()`

### 12.160.4.25  clear_changed()

```cpp
void Fl_Widget::clear_changed ( ) [inline]
```

Marks the value of the widget as unchanged.

**See also**

- `changed()`, `set_changed()`

### 12.160.4.26  clear_damage()

```cpp
void Fl_Widget::clear_damage ( uchar c = 0 ) [inline]
```

Clears or sets the damage flags.
Damage flags are cleared when parts of the widget drawing is repaired.
The optional argument `c` specifies the bits that are set after the call (default: 0) and not the bits that are cleared!
Therefore it is possible to set damage bits with this method, but this should be avoided. Use `damage(uchar)` instead.

**Parameters**

| in  | c | new bitmask of damage flags (default: 0) |

See also

`damage(uchar), damage()`

### 12.160.4.27 clear_output()

```cpp
void Fl_Widget::clear_output () [inline]
```

Sets a widget to accept input.

See also

`set_output(), output()`

### 12.160.4.28 clear_visible()

```cpp
void Fl_Widget::clear_visible () [inline]
```

Hides the widget.

You must still redraw the parent to see a change in the window. Normally you want to use the `hide()` method instead.

### 12.160.4.29 clear_visible_focus()

```cpp
void Fl_Widget::clear_visible_focus () [inline]
```

Disables keyboard focus navigation with this widget.

Normally, all widgets participate in keyboard focus navigation.

See also

`set_visible_focus(), visible_focus(), visible_focus(int)`

### 12.160.4.30 color () [1/3]

```cpp
Fl_Color Fl_Widget::color ( void ) const [inline]
```

 Gets the background color of the widget.

**Returns**

current background color

See also

`color(Fl_Color), color(Fl_Color, Fl_Color)`

### 12.160.4.31 color () [2/3]

```cpp
void Fl_Widget::color ( Fl_Color bg ) [inline]
```

Sets the background color of the widget.

The color is passed to the box routine. The color is either an index into an internal table of RGB colors or an RGB color value generated using `fl_rgb_color()`.

The default for most widgets is FL_BACKGROUND_COLOR. Use `Fl::set_color()` to redefine colors in the color map.
Parameters

- **in** `bg` background color

See also

- `color()`, `color(Fl_Color, Fl_Color)`, `selection_color(Fl_Color)`

### 12.160.4.32 color()

```cpp
void Fl_Widget::color (Fl_Color bg, Fl_Color sel) [inline]
```

Sets the background and selection color of the widget. The two color form sets both the background and selection colors.

Parameters

- **in** `bg` background color
- **in** `sel` selection color

See also

- `color(unsigned)`, `selection_color(unsigned)`

### 12.160.4.33 color2()

```cpp
Fl_Color Fl_Widget::color2 () const [inline]
```

For back compatibility only.

**Deprecated** Use `selection_color()` instead.

### 12.160.4.34 color2()

```cpp
void Fl_Widget::color2 (unsigned a) [inline]
```

For back compatibility only.

**Deprecated** Use `selection_color(unsigned)` instead.

### 12.160.4.35 contains()

```cpp
int Fl_Widget::contains (const Fl_Widget * w) const
```

Checks if `w` is a child of this widget.

Parameters

- **in** `w` potential child widget

Returns

- Returns 1 if `w` is a child of this widget, or is equal to this widget. Returns 0 if `w` is NULL.
12.160.4.36  copy_label()

```cpp
void Fl_Widget::copy_label ( const char * new_label )
```

Sets the current label.
Unlike `label()`, this method allocates a copy of the label string instead of using the original string pointer. The internal copy will automatically be freed whenever you assign a new label or when the widget is destroyed.

**Parameters**

- `new_label` the new label text

**See also**

- `label()`

12.160.4.37  copy_tooltip()

```cpp
void Fl_Widget::copy_tooltip ( const char * text )
```

Sets the current tooltip text.
 Unlike `tooltip()`, this method allocates a copy of the tooltip string instead of using the original string pointer. The internal copy will automatically be freed whenever you assign a new tooltip or when the widget is destroyed.
If no tooltip is set, the tooltip of the parent is inherited. Setting a tooltip for a group and setting no tooltip for a child will show the group's tooltip instead. To avoid this behavior, you can set the child's tooltip to an empty string ("").

**Parameters**

- `text` New tooltip text (an internal copy is made and managed)

**See also**

- `tooltip(const char*)`, `tooltip()`

12.160.4.38  damage() [1/3]

```cpp
uchar Fl_Widget::damage ( ) const [inline]
```

Returns non-zero if `draw()` needs to be called.
The damage value is actually a bit field that the widget subclass can use to figure out what parts to draw.

**Returns**

- a bitmap of flags describing the kind of damage to the widget

**See also**

- `damage(uchar)`, `clear_damage(uchar)`

12.160.4.39  damage() [2/3]

```cpp
void Fl_Widget::damage ( uchar c )
```

Sets the damage bits for the widget.
Setting damage bits will schedule the widget for the next redraw.

**Parameters**

- `c` bitmask of flags to set
See also

\texttt{damage()}, \texttt{clear\_damage(uchar)}

\subsection*{12.160.4.40 \texttt{damage}() [3/3]}

\texttt{void Fl\_Widget::damage (}
\texttt{
\texttt{uchar c,}
\texttt{int x,}
\texttt{int y,}
\texttt{int w,}
\texttt{int h )}
\texttt{)}

Sets the damage bits for an area inside the widget.
Setting damage bits will schedule the widget for the next redraw.

\begin{tabular}{|l|l|}
\hline
\textbf{in} & \texttt{c} & bitmask of flags to set \\
\hline
\textbf{in} & \texttt{x,y,w,h} & size of damaged area \\
\hline
\end{tabular}

See also

\texttt{damage()}, \texttt{clear\_damage(uchar)}

\subsection*{12.160.4.41 \texttt{deactivate}()}

\texttt{void Fl\_Widget::deactivate ( )}
Deactivates the widget.
Inactive widgets will be drawn "grayed out", e.g. with less contrast than the active widget. Inactive widgets will
not receive any keyboard or mouse button events. Other events (including FL\_ENTER, FL\_MOVE, FL\_LEAVE,
FL\_SHORTCUT, and others) will still be sent. A widget is only active if \texttt{active()} is true on it \textit{and all of its parents}.
Changing this value will send FL\_DEACTIVATE to the widget if \texttt{active\_r()} is true.
Currently you cannot deactivate \texttt{Fl\_Window} widgets.
See also

\texttt{activate()}, \texttt{active()}, \texttt{active\_r()}

\subsection*{12.160.4.42 \texttt{default\_callback}()}

\texttt{void Fl\_Widget::default\_callback (}
\texttt{
\texttt{Fl\_Widget \texttt{*} widget,}
\texttt{void \texttt{*} data ) \ [static]}
\texttt{)}

The \texttt{default\_callback} for all widgets that don't set a callback.
This callback function puts a pointer to the widget on the queue returned by \texttt{Fl\_readqueue()}. This is the default for
all widgets if you don't set a callback.
You can avoid the overhead of this default handling if you set the callback to \texttt{NULL} explicitly.
Relying on the default callback and reading the callback queue with \texttt{Fl\_readqueue()} is not recommended. If you
need a callback, you should set one with \texttt{Fl\_Widget::callback(Fl\_Callback cb, void \texttt{*} data)} or one of its variants.

\begin{tabular}{|l|l|}
\hline
\textbf{in} & \texttt{widget} & the \texttt{Fl\_Widget} given to the callback \\
\hline
\textbf{in} & \texttt{data} & user data associated with that callback \\
\hline
\end{tabular}
See also

callback(), Fl::readqueue()
do_callback(Fl_Widget *widget, void *data)

12.160.4.43 deimage() [1/4]

Fl_Image * Fl_Widget::deimage () [inline]
Gets the image that is used as part of the widget label when in the inactive state.

Returns

the current image for the deactivated widget

12.160.4.44 deimage() [2/4]

const Fl_Image * Fl_Widget::deimage () const [inline]
Gets the image that is used as part of the widget label when in the inactive state.

Returns

the current image for the deactivated widget

12.160.4.45 deimage() [3/4]

void Fl_Widget::deimage ( Fl_Image & img )
Sets the image to use as part of the widget label when in the inactive state.

Parameters

| in  | img  | the new image for the deactivated widget |

See also

void deimage(Fl_Image* img)

12.160.4.46 deimage() [4/4]

void Fl_Widget::deimage ( Fl_Image * img )
Sets the image to use as part of the widget label when in the inactive state.

Parameters

| in  | img  | the new image for the deactivated widget |

Note

The caller is responsible for making sure img is not deleted while it's used by the widget, and, if appropriate, for deleting it after the widget's deletion.

See also

void bind_deimage(Fl_Image* img)
12.160.4.47 deimage_bound()

```cpp
int Fl_Widget::deimage_bound ( ) const [inline]
```

Returns whether the inactive image is managed by the widget.

### Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The image is not bound to the widget</td>
</tr>
<tr>
<td>1</td>
<td>The image will be deleted when the widget is deleted</td>
</tr>
</tbody>
</table>

See also

- `image_bound()`, `bind_deimage()`

12.160.4.48 do_callback () [1/3]

```cpp
void Fl_Widget::do_callback ( Fl_Callback_Reason reason = FL_REASON_UNKNOWN ) [inline]
```

Calls the widget callback function with default arguments.

This is the same as calling

```cpp
do_callback(this, user_data(), reason);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>reason</code></td>
<td>Give a reason to why this callback was called, defaults to <code>FL_REASON_UNKNOWN</code></td>
</tr>
</tbody>
</table>

See also

- `callback()`
  - `do_callback(Fl_Widget *widget, void *data, Fl_Callback_Reason reason), Fl_Callback_Reason`

12.160.4.49 do_callback () [2/3]

```cpp
void Fl_Widget::do_callback ( Fl_Widget * widget, long arg,
                            Fl_Callback_Reason reason = FL_REASON_UNKNOWN ) [inline]
```

Calls the widget callback function with arbitrary arguments.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>widget</code></td>
<td>Call the callback with <code>widget</code> as the first argument</td>
</tr>
<tr>
<td><code>arg</code></td>
<td>Call the callback with <code>arg</code> as the user data (second) argument</td>
</tr>
<tr>
<td><code>reason</code></td>
<td>Give a reason to why this callback was called, defaults to <code>FL_REASON_UNKNOWN</code></td>
</tr>
</tbody>
</table>

See also

- `callback()`
  - `do_callback(Fl_Widget *widget, void *data), Fl_Callback_Reason`

12.160.4.50 do_callback () [3/3]

```cpp
void Fl_Widget::do_callback ( Fl_Widget * widget, void * arg = 0,
                            Fl_Callback_Reason reason = FL_REASON_UNKNOWN )
```

Generated by Doxygen
Calls the widget callback function with arbitrary arguments.
All overloads of do_callback() call this method. It does nothing if the widget's callback() is NULL. It clears the widget's changed flag after the callback was called unless the callback is the default callback. Hence it is not necessary to call clear_changed() after calling do_callback() in your own widget's handle() method.

A reason must be set for widgets if different actions can trigger the same callback.

Note
It is legal to delete the widget in the callback (i.e. in user code), but you must not access the widget in the handle() method after calling do_callback() if the widget was deleted in the callback. We recommend to use Fl_Widget_Tracker to check whether the widget was deleted in the callback.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>widget</th>
<th>call the callback with widget as the first argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>arg</td>
<td>use arg as the user data (second) argument</td>
</tr>
<tr>
<td>in</td>
<td>reason</td>
<td>give a reason to why this callback was called, defaults to FL_REASON_UNKNOWN</td>
</tr>
</tbody>
</table>

See also
- default_callback()
- callback()
- class Fl_Widget_Tracker
- Fl::callback_reason()

12.160.4.51 draw()

virtual void Fl_Widget::draw ( ) [pure virtual]

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget’s draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

12.160.4.52 draw_focus() [1/3]

void Fl_Widget::draw_focus ( ) const [inline], [protected]

Draws a focus rectangle around the widget.
This method uses the widget’s boxtype and coordinates and its background color color().

See also
- Fl_Widget::draw_focus(Fl_Boxtype, int, int, int, Fl_Color) const

12.160.4.53 draw_focus() [2/3]

void Fl_Widget::draw_focus ( Fl_Boxtype t,
Draws a focus rectangle around the widget.
This method uses the given boxtype and coordinates and the widget's background color color().

See also

`Fl_Widget::draw_focus(Fl_Boxtype, int, int, int, int, Fl_Color) const`

12.160.4.54 draw_focus() [3/3]

```cpp
void Fl_Widget::draw_focus (Fl_Boxtype bt, int X, int Y, int W, int H, Fl_Color bg) const [protected]
```

Draws a focus box for the widget at the given position and size.
This method does nothing if

- the global option Fl::visible_focus() or
- the per-widget option visible_focus() is false (off).

This means that Fl_Widget::draw_focus() or one of the more specialized methods can be called without checking these visible focus options.

Note

This method must only be called if the widget has the focus. This is not tested internally.

The boxtype `bt` is used to calculate the inset so the focus box is drawn inside the box borders.
The default focus box drawing color is black. The background color `bg` is used to determine a better visible color if necessary by using fl_contrast() with the given background color.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>bt</th>
<th>Boxtyle that needs to be considered (frame width)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X,Y,W,H</td>
<td>Bounding box</td>
</tr>
<tr>
<td>in</td>
<td>bg</td>
<td>Background color</td>
</tr>
</tbody>
</table>

See also

`Fl_Widget::draw_focus()`

`Fl_Widget::draw_focus(Fl_Boxtype, int, int, int, int) const`

12.160.4.55 draw_label() [1/3]

```cpp
void Fl_Widget::draw_label () const [protected]
```

Draws the widget's label at the defined label position.
This is the normal call for a widget's draw() method.

12.160.4.56 draw_label() [2/3]

```cpp
void Fl_Widget::draw_label (int X,
```
12.160 Fl_Widget Class Reference

int Y,
int W,
int H) const [protected]

Draws the label in an arbitrary bounding box.
draw()) can use this instead of draw_label(void) to change the bounding box

12.160.4.57 draw_label() [3/3]

void Fl_Widget::draw_label {
    int X,
    int Y,
    int W,
    int H,
    Fl_Align a ) const

Draws the label in an arbitrary bounding box with an arbitrary alignment.
Anybody can call this to force the label to draw anywhere.

12.160.4.58 h() [1/2]

int Fl_Widget::h ( ) const [inline]

Gets the widget height.

Returns

the height of the widget in pixels.

12.160.4.59 h() [2/2]

void Fl_Widget::h {
    int v ) [inline], [protected]

Internal use only.
Use position(int,int), size(int,int) or resize(int,int,int,int) instead.

12.160.4.60 handle()

int Fl_Widget::handle {
    int event ) [virtual]

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-
circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The
effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses)
in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In
such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by
returning 1 even if you didn't do anything with it.

Parameters

<table>
<thead>
<tr>
<th></th>
<th>event</th>
<th>the kind of event received</th>
</tr>
</thead>
</table>

Return values

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>if the event was not used or understood</td>
</tr>
<tr>
<td>1</td>
<td></td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>
See also

Fi_Event

Reimplemented in Fl_Color_Chooser, Fl_Free, Fl_Table, Fl_Terminal, Fl_Text_Display, Fl_Text_Editor, Fl_Tree,
Fl_Browser, Fl_File_Input, Fl_Scheme_Choice, Fl_Spinner::Fl_Spinner_Input, Fl_Spinner, Fl_Table_Row,
Fl_Tile, Fl_Adjuster, Fl_Box, Fl_Button, Fl_Check_Browser, Fl_Check_Button, Fl_Clock, Fl_Count, Fl_Dial,
Fl_Gl_Window, Fl_Group, Fl_Help_View, Fl_Input, Fl_Light_Button, Fl_Menu_Bar, Fl_Menu_Button, Fl_Positioner,
Fl_Repeat_Button, Fl_Return_Button, Fl_Roller, Fl_Scroll, Fl_Scrollbar, Fl_Secret_Input, Fl_Shortcut_Button,
Fl_Slider, Fl_Tabs, Fl_Timer, Fl_Value_Input, Fl_Value_Output, Fl_Value_Slider, Fl_Window, and Fl_Glut_Window.

### 12.160.4.61 hide()

```cpp
void Fl_Widget::hide ( ) [virtual]
```

Makes a widget invisible.

See also

- show(), visible(), visible_r()

Reimplemented in Fl_Browser, Fl_Double_Window, Fl_Gl_Window, Fl_Overlay_Window, and Fl_Window.

### 12.160.4.62 image() [1/4]

```cpp
Fl_Image * Fl_Widget::image ( ) [inline]
```

Gets the image that is used as part of the widget label when in the active state.

Returns

the current image

### 12.160.4.63 image() [2/4]

```cpp
const Fl_Image * Fl_Widget::image ( ) const [inline]
```

Gets the image that is used as part of the widget label when in the active state.

Returns

the current image

### 12.160.4.64 image() [3/4]

```cpp
void Fl_Widget::image ( Fl_Image & img )
```

Sets the image to use as part of the widget label when in the active state.

Parameters

- **in img** the new image for the label

See also

- void image(Fl_Image* img)

### 12.160.4.65 image() [4/4]

```cpp
void Fl_Widget::image ( Fl_Image * img )
```

Sets the image to use as part of the widget label when in the active state.

The caller is responsible for making sure `img` is not deleted while it's used by the widget, and, if appropriate, for deleting it after the widget's deletion.
Calling \texttt{image()} with a new image will delete the old image if it was bound, and set the new image without binding it. If old and new are the same, the image will not be deleted, but it will be unbound.

Calling \texttt{image()} with NULL will delete the old image if it was bound and not set a new image.

\begin{verbatim}
Parameters
\begin{tabular}{l|l}
in & \texttt{img} \quad \text{the new image for the label}
\end{tabular}
\end{verbatim}

See also
\begin{verbatim}
bind_image(Fl(Image) img)
\end{verbatim}

\textbf{12.160.4.66 image_bound()}

\begin{verbatim}
int Fl_Widget::image_bound ( ) const [inline]
\end{verbatim}

Returns whether the image is managed by the widget.

\begin{verbatim}
Return values
\begin{tabular}{l|l}
0 & if the image is not bound to the widget
1 & if the image will be deleted when the widget is deleted
\end{tabular}
\end{verbatim}

See also
\begin{verbatim}
deimage_bound(), bind_image()
\end{verbatim}

\textbf{12.160.4.67 inside()}

\begin{verbatim}
int Fl_Widget::inside ( const Fl_Widget * wgt ) const [inline]
\end{verbatim}

Checks if this widget is a child of \texttt{wgt}.

Returns 1 if this widget is a child of \texttt{wgt}, or is equal to \texttt{wgt}. Returns 0 if \texttt{wgt} is NULL.

\begin{verbatim}
Parameters
\begin{tabular}{l|l}
in & \texttt{wgt} \quad \text{the possible parent widget}
\end{tabular}
\end{verbatim}

See also
\begin{verbatim}
contains()
\end{verbatim}

\textbf{12.160.4.68 is_label_copied()}

\begin{verbatim}
int Fl_Widget::is_label_copied ( ) const [inline]
\end{verbatim}

Returns whether the current label was assigned with \texttt{copy_label()}.

This can be useful for temporarily overwriting the widget's label and restoring it later.

\begin{verbatim}
Return values
\begin{tabular}{l|l}
0 & current label was assigned with \texttt{label()}. \\
1 & current label was assigned with \texttt{copy_label()}. \\
\end{tabular}
\end{verbatim}
12.160.4.69 label() [1/3]

const char * Fl_Widget::label() const [inline]

Gets the current label text.

Returns

a pointer to the current label text

See also

label(const char *), copy_label(const char *)

12.160.4.70 label() [2/3]

void Fl_Widget::label(const char * text)

Sets the current label pointer.
The label is shown somewhere on or next to the widget. See Labels and Label Types for details about what can be put in a label. The passed pointer is stored unchanged in the widget (the string is not copied), so if you need to set the label to a formatted value, make sure the buffer is static, global, or allocated. The copy_label() method can be used to make a copy of the label string automatically.

Parameters

\textbf{in} \hspace{1em} text \hspace{1em} pointer to new label text

See also

copy_label()

12.160.4.71 label() [3/3]

void Fl_Widget::label(Fl_Labeltype a, const char * b) [inline]

Shortcut to set the label text and type in one call.

See also

label(const char *), labeltype(Fl_Labeltype)

12.160.4.72 label_shortcut()

unsigned int Fl_Widget::label_shortcut(const char * t) [static]

Returns the Unicode value of the '&x' shortcut in a given text.
The given text \texttt{t} (usually a widget's label or a menu text) is searched for a '&x' shortcut label, and if found, the Unicode value (code point) of the '&x' shortcut is returned.

Parameters

\textbf{f} \hspace{1em} text or label to search for '&x' shortcut.

Returns

Unicode (UCS-4) value of shortcut in \texttt{t} or 0.
Note

Internal use only.

12.160.4.73  labelcolor() [1/2]

```cpp
Fl_Color Fl_Widget::labelcolor () const [inline]
```

Gets the label color.
The default color is FL_FOREGROUND_COLOR.

Returns

the current label color

12.160.4.74  labelcolor() [2/2]

```cpp
void Fl_Widget::labelcolor ( Fl_Color c ) [inline]
```

Sets the label color.
The default color is FL_FOREGROUND_COLOR.

Parameters

| in  | c          | the new label color |

12.160.4.75  labelfont() [1/2]

```cpp
Fl_Font Fl_Widget::labelfont () const [inline]
```

Gets the font to use.
Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft® Windows®). The function Fl::set_font() can define new typefaces.

Returns

current font used by the label

See also

Fl_Font

12.160.4.76  labelfont() [2/2]

```cpp
void Fl_Widget::labelfont ( Fl_Font f ) [inline]
```

Sets the font to use.
Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft® Windows®). The function Fl::set_font() can define new typefaces.

Parameters

| in  | f          | the new font for the label |
12.160.4.77 labelsize() [1/2]

`Fl_Fontsize Fl_Widget::labelsize ( ) const [inline]`

Gets the font size in pixels.
The default size is 14 pixels.

Returns

the current font size

12.160.4.78 labelsize() [2/2]

`void Fl_Widget::labelsize ( Fl_Fontsize pix ) [inline]`

Sets the font size in pixels.

Parameters

in pix the new font size

See also

`Fl_Fontsize labelsize()`

12.160.4.79 labeltype() [1/2]

`Fl_Labeltype Fl_Widget::labeltype ( ) const [inline]`

Gets the label type.

Returns

the current label type.

See also

`Fl_Labeltype`

12.160.4.80 labeltype() [2/2]

`void Fl_Widget::labeltype ( Fl_Labeltype a ) [inline]`

Sets the label type.
The label type identifies the function that draws the label of the widget. This is generally used for special effects such as embossing or for using the label() pointer as another form of data such as an icon. The value `FL_NORMAL_LABEL` prints the label as plain text.

Parameters

in a new label type

See also

`Fl_Labeltype`
### 12.160.4.81 measure_label()

```cpp
void Fl_Widget::measure_label (  
    int & ww,  
    int & hh ) const [inline]
```

Sets width `ww` and height `hh` accordingly with the label size. Labels with images will return `w()` and `h()` of the image.

This calls `fl_measure()` internally. For more information about the arguments `ww` and `hh` and word wrapping, see also:

- `fl_measure(const char*, int&, int&, int)`

### 12.160.4.82 needs_keyboard() [1/2]

```cpp
bool Fl_Widget::needs_keyboard ( ) const [inline]
```

Returns whether this widget needs a keyboard.

Returns

- `true` or `false`

See also

- `needs_keyboard(bool)`

### 12.160.4.83 needs_keyboard() [2/2]

```cpp
void Fl_Widget::needs_keyboard (  
    bool needs ) [inline]
```

Sets whether this widget needs a keyboard. Set this on touch screen devices if a widget needs a keyboard when it gets the focus.

**Note**

This flag can be set but is not yet **used** in FLTK 1.4.0. It is intended to be used in the future on real touch devices.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>needs</th>
<th>Set this to true or false</th>
</tr>
</thead>
</table>

### 12.160.4.84 output()

```cpp
unsigned int Fl_Widget::output ( ) const [inline]
```

Returns if a widget is used for output only.

**output()** means the same as `!active()` except it does not change how the widget is drawn. The widget will not receive any events. This is useful for making scrollbars or buttons that work as displays rather than input devices.

**Return values**

| 0   | if the widget is used for input and output |
12.160.4.85  parent() [1/2]

Fl_Group * Fl_Widget::parent () const [inline]

Returns a pointer to the parent widget.
Usually this is a Fl_Group or Fl_Window.

Return values

NULL if the widget has no parent

See also

Fl_Group::add(Fl_Widget+)

12.160.4.86  parent() [2/2]

void Fl_Widget::parent ( Fl_Group * p ) [inline]

Internal use only - "for hacks only".
It is STRONGLY recommended not to use this method, because it short-circuits Fl_Group's normal widget adding and removing methods, if the widget is already a child widget of another Fl_Group.
Use Fl_Group::add(Fl_Widget+) and/or Fl_Group::remove(Fl_Widget+) instead.

12.160.4.87  position()

void Fl_Widget::position ( int X, int Y ) [inline]

Repositions the window or widget.
position(X, Y) is a shortcut for resize(X, Y, w(), h()).

Parameters

in X,Y new position relative to the parent window

See also

resize(int,int,int,int), size(int,int)

12.160.4.88  redraw()

void Fl_Widget::redraw ( )

Schedules the drawing of the widget.
Marks the widget as needing its draw() routine called.

12.160.4.89  redraw_label()

void Fl_Widget::redraw_label ( )

Schedules the drawing of the label.
Marks the widget or the parent as needing a redraw for the label area of a widget.

12.160.4.90  resize()

void Fl_Widget::resize ( 

See also

set_output(), clear_output()
Changes the size or position of the widget.
This is a virtual function so that the widget may implement its own handling of resizing. The default version does not call the `redraw()` method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.
Some window managers under X11 call `resize()` a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.
`position(X, Y)` is a shortcut for `resize(X, Y, w(), h())`, and `size(W, H)` is a shortcut for `resize(x(), y(), W, H)`.

### Parameters

| in | x, y | new position relative to the parent window |
|    | w, h | new size |

See also

- `position(int, int)`, `size(int, int)`

### 12.160.4.91 selection_color() [1/2]

#### Fl_Color Fl_Widget::selection_color ( ) const [inline]

Gets the selection color.

Returns

the current selection color

See also

- `selection_color(Fl_Color)`, `color(Fl_Color, Fl_Color)`

### 12.160.4.92 selection_color() [2/2]

#### void Fl_Widget::selection_color ( Fl_Color a ) [inline]

Sets the selection color.
The selection color is defined for Forms compatibility and is usually used to color the widget when it is selected, although some widgets use this color for other purposes. You can set both colors at once with `color(Fl_Color bg, Fl_Color sel)`.

Parameters

| in | a | the new selection color |

See also

- `selection_color()`, `color(Fl_Color, Fl_Color)`

### 12.160.4.93 set_active()

#### void Fl_Widget::set_active ( ) [inline]

Generated by Doxygen
Marks the widget as active without sending events or changing focus. This is mainly for specialized use, for normal cases you want `activate()`.

See also `activate()`

### 12.160.4.94 set_changed()
```cpp
void Fl_Widget::set_changed ( ) [inline]
```
Marks the value of the widget as changed.

See also `changed()`, `clear_changed()`

### 12.160.4.95 set_output()
```cpp
void Fl_Widget::set_output ( ) [inline]
```
Sets a widget to output only.

See also `output()`, `clear_output()`

### 12.160.4.96 set_visible()
```cpp
void Fl_Widget::set_visible ( ) [inline]
```
Makes the widget visible.

You must still redraw the parent widget to see a change in the window. Normally you want to use the `show()` method instead.

### 12.160.4.97 set_visible_focus()
```cpp
void Fl_Widget::set_visible_focus ( ) [inline]
```
Enables keyboard focus navigation with this widget.

Note, however, that this will not necessarily mean that the widget will accept focus, but for widgets that can accept focus, this method enables it if it has been disabled.

See also `visible_focus()`, `clear_visible_focus()`, `visible_focus(int)`

### 12.160.4.98 shortcut_label() [1/2]
```cpp
int Fl_Widget::shortcut_label ( ) const [inline]
```
Returns whether the widget's label uses `&` to indicate shortcuts.

See also `void shortcut_label(int value)`

### 12.160.4.99 shortcut_label() [2/2]
```cpp
void Fl_Widget::shortcut_label ( int value ) [inline]
```
Sets whether the widget's label uses `&` to indicate shortcuts.

By default, all objects of classes `Fl_Menu_` (and derivatives), `Fl_Button` (and derivatives), `Fl_Text_Display`, `Fl_Value_Input`, and `Fl_Input_` (and derivatives) use character `&` in their label, unless `&` is repeated, to indicate shortcuts: `&` does not appear in the drawn label, the next character after `&` in the label is drawn underlined, and typing this character triggers the corresponding menu window, button, or other widget. If the label contains 2 consecutive `&`, only one is drawn and the next character is not underlined and not used as a shortcut. If `value` is set to 0, all these labels don't process character `&` as indicating a shortcut: `&` is drawn in the label, the next character is not underlined and does not define a shortcut.
12.160.4.100  show()

void Fl_Widget::show ( ) [virtual]

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other
events like FL_SHOW.

The visible() method returns true if the widget is set to be visible. The visible_r() method returns true if the widget
and all of its parents are visible. A widget is only visible if visible() is true on it and all of its parents.

Changing it will send FL_SHOW or FL_HIDE events to the widget. Do not change it if the parent is not visible, as
this will send false FL_SHOW or FL_HIDE events to the widget. redraw() is called if necessary on this or the parent.

See also

hide(), visible(), visible_r()

Reimplemented in Fl_Browser, Fl_Double_Window, Fl_Gl_Window, Fl_Overlay_Window, Fl_Single_Window, and
Fl_Window.

12.160.4.101  size()

void Fl_Widget::size (  
    int W,
    int H ) [inline]

Changes the size of the widget.

size(W, H) is a shortcut for resize(x(), y(), W, H).

Parameters

| in | W/H | new size |

See also

position(int,int), resize(int,int,int,int)

12.160.4.102  take_focus()

int Fl_Widget::take_focus ( )

Gives the widget the keyboard focus.

Tries to make this widget be the Fl::focus() widget, by first sending it an FL_FOCUS event, and if it returns non-zero,
setting Fl::focus() to this widget. You should use this method to assign the focus to a widget.

Returns

true if the widget accepted the focus.

12.160.4.103  takesevents()

unsigned int Fl_Widget::takesevents ( ) const [inline]

Returns if the widget is able to take events.

This is the same as (active() && !output() && visible()) but is faster.

Return values

| 0 | if the widget takes no events |

12.160.4.104  test_shortcut() [1/2]

int Fl_Widget::test_shortcut ( )
Returns true if the widget's label contains the entered '&x' shortcut. This method must only be called in handle() methods or callbacks after a keypress event (usually FL_KEYDOWN or FL_SHORTCUT). The widget's label is searched for a '&x' shortcut, and if found, this is compared with the entered key value. Fl::event_text() is used to get the entered key value.

Note
Useful when a widget's handle(int) method needs dedicated processing of FL_SHORTCUT.

12.160.4.105 test_shortcut() [2/2]

int Fl_Widget::test_shortcut (const char *, const bool require_alt = false) [static]

Returns true if the given text t contains the entered '&x' shortcut. This method must only be called in handle() methods or callbacks after a keypress event (usually FL_KEYDOWN or FL_SHORTCUT). The given text t (usually a widget's label or menu text) is searched for a '&x' shortcut, and if found, this is compared with the entered key value. Fl::event_text() is used to get the entered key value. Fl::event_state() is used to get the Alt modifier, if require_alt is true.

Parameters

<table>
<thead>
<tr>
<th>t</th>
<th>text or label to search for '&amp;x' shortcut.</th>
</tr>
</thead>
<tbody>
<tr>
<td>require_alt</td>
<td>if true: match only if Alt key is pressed.</td>
</tr>
</tbody>
</table>

Returns

true, if the entered text matches the '&x' shortcut in t, false (0) otherwise.

Note
Useful when a widget's handle(int) method needs dedicated processing of FL_SHORTCUT.

12.160.4.106 tooltip() [1/2]

const char * Fl_Widget::tooltip ( ) const [inline]

Gets the current tooltip text.

Returns

a pointer to the tooltip text or NULL

See also

tooltip(const char*), copy_tooltip(const char*)

12.160.4.107 tooltip() [2/2]

void Fl_Widget::tooltip (const char * text )

Sets the current tooltip text.
Sets a string of text to display in a popup tooltip window when the user hovers the mouse over the widget. The string is *not* copied, so make sure any formatted string is stored in a static, global, or allocated buffer. If you want a copy made and managed for you, use the `copy_tooltip()` method, which will manage the tooltip string automatically. If no tooltip is set, the tooltip of the parent is inherited. Setting a tooltip for a group and setting no tooltip for a child will show the group's tooltip instead. To avoid this behavior, you can set the child's tooltip to an empty string (""").

**Parameters**

| In | text | New tooltip text (no copy is made) |

See also

- `copy_tooltip(const char*)`, `tooltip()`

### 12.160.4.108 top_window()

```cpp
Fl_Widget::top_window ( ) const
```

Returns a pointer to the top-level window for the widget.

In other words, the 'window manager window' that contains this widget. This method differs from `window()` in that it won't return sub-windows (if there are any).

**Returns**

the top-level window, or NULL if no top-level window is associated with this widget.

See also

- `window()`

### 12.160.4.109 top_window_offset()

```cpp
Fl_Widget::top_window_offset ( int & xoff, int & yoff ) const
```

Finds the x/y offset of the current widget relative to the top-level window.

**Parameters**

| Out | xoff, yoff | Returns the x/y offset |

**Returns**

the top-level window (or NULL for a widget that's not in any window)

### 12.160.4.110 type() [1/2]

```cpp
Fl_Widget::type ( ) const [inline]
```

Gets the widget type.

Returns the widget type value, which gives some information about the derived widget class to which the object belongs. Noticeably, the condition `type() >= FL_WINDOW` indicates a widget is an `Fl_Widget` or derived object.

### 12.160.4.111 type() [2/2]

```cpp
Fl_Widget::type ( uchar t ) [inline]
```

Sets the widget type.
12.160.4.112 user_data()

void * Fl_Widget::user_data ( ) const [inline]

Gets the user data for this widget.
Gets the current user data (void *) argument that is passed to the callback function.

Returns
    user data as a pointer

12.160.4.113 visible()

unsigned int Fl_Widget::visible ( ) const [inline]

Returns whether a widget is visible.

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the widget is not drawn and hence invisible.</td>
</tr>
</tbody>
</table>

See also
    show(), hide(), visible_r()

12.160.4.114 visible_focus() [1/2]

unsigned int Fl_Widget::visible_focus ( ) const [inline]

Checks whether this widget has a visible focus.

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if this widget has no visible focus.</td>
</tr>
</tbody>
</table>

See also
    visible_focus(int), set_visible_focus(), clear_visible_focus()

12.160.4.115 visible_focus() [2/2]

void Fl_Widget::visible_focus ( int v ) [inline]

Modifies keyboard focus navigation.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int v</td>
<td>set or clear visible focus</td>
</tr>
</tbody>
</table>

See also
    set_visible_focus(), clear_visible_focus(), visible_focus()

12.160.4.116 visible_r()

int Fl_Widget::visible_r ( ) const
Returns whether a widget and all its parents are visible.

Return values

0 if the widget or any of its parents are invisible.

See also

show(), hide(), visible()

12.160.4.117 w() [1/2]

int Fl_Widget::w ( ) const [inline]

Gets the widget width.

Returns

the width of the widget in pixels.

12.160.4.118 w() [2/2]

void Fl_Widget::w ( int v ) [inline], [protected]

Internal use only. Use position(int,int), size(int,int) or resize(int,int,int,int) instead.

12.160.4.119 when() [1/2]

Fl_When Fl_Widget::when ( ) const [inline]

Returns the conditions under which the callback is called.
You can set the flags with when(uchar), the default value is FL_WHEN_RELEASE.

Returns

set of flags

See also

when(uchar), Fl_When, do_callback(), Fl::callback_reason()

12.160.4.120 when() [2/2]

void Fl_Widget::when ( uchar i ) [inline]

Sets the flags used to decide when a callback is called.
This controls when callbacks are done. The following values are useful, the default value is FL_WHEN_RELEASE:

- 0: The callback is not done, but changed() is turned on.
- FL_WHEN_CHANGED: The callback is done each time the text is changed by the user.
- FL_WHEN_RELEASE: The callback will be done when this widget loses the focus, including when the window is unmapped. This is a useful value for text fields in a panel where doing the callback on every change is wasteful. However the callback will also happen if the mouse is moved out of the window, which means it should not do anything visible (like pop up an error message). You might do better setting this to zero, and scanning all the items for changed() when the OK button on a panel is pressed.
- FL_WHEN_ENTER_KEY: If the user types the Enter key, the entire text is selected, and the callback is done if the text has changed. Normally the Enter key will navigate to the next field (or insert a newline for a Fl_Multiline_Input) - this changes the behavior.
• **FL_WHEN_ENTER_KEY**/**FL_WHEN_NOT_CHANGED**: The Enter key will do the callback even if the text has not changed. Useful for command fields.

• **FL_WHEN_CLOSED**: If the user requests that the widget is closed, the callback is called with **FL_REASON_CLOSED**. The **Fl_Tabs** widget checks this flag on its children to determine whether to display a close button on the tab of that widget.

**Fl_Widget::when()** is a set of bitflags used by subclasses of **Fl_Widget** to decide when to do the callback. If the value is zero then the callback is never done. Other values are described in the individual widgets. This field is in the base class so that you can scan a panel and **do_callback()** on all the ones that don't do their own callbacks in response to an "OK" button.

**Parameters**

| in | i | set of flags |

See also

**Fl_When, do_callback(), Fl::callback_reason()**

**12.160.4.121 window()**

**Fl_Window * Fl_Widget::window ( ) const**

Returns a pointer to the nearest parent window up the widget hierarchy. This will return sub-windows if there are any, or the parent window if there's no sub-windows. If this widget IS the top-level window, NULL is returned.

**Return values**

| NULL | if no window is associated with this widget |

**Note**

for an **Fl_Window** widget, this returns its parent window (if any), not this window.

See also

**top_window()**

**12.160.4.122 x() [1/2]**

**int Fl_Widget::x ( ) const [inline]**

Gets the widget position in its window.

**Returns**

the x position relative to the window

**12.160.4.123 x() [2/2]**

**void Fl_Widget::x (**

| int v | [inline], [protected] |

Internal use only.

Use **position(int,int)**, **size(int,int)** or **resize(int,int,int,int)** instead.
12.160.4.124 y() [1/2]

int Fl_Widget::y ( ) const [inline]

Gets the widget position in its window.

Returns

the y position relative to the window

12.160.4.125 y() [2/2]

void Fl_Widget::y ( int v ) [inline], [protected]

Internal use only.

Use position(int,int), size(int,int) or resize(int,int,int) instead.

The documentation for this class was generated from the following files:

12.161 Fl_Widget_Surface Class Reference

A surface on which any FLTK widget can be drawn.

#include <Fl_Widget_Surface.H>

Inheritance diagram for Fl_Widget_Surface:

```plaintext
Fl_Surface_Device
Fl_Widget_Surface
 Fl_Copy_Surface
Fl_EPS_File_Surface
Fl_Image_Surface
Fl_Paged_Device
Fl_SVG_File_Surface
Fl_PostScript_File_Device
Fl_Printer
```

Public Member Functions

- void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Draws the widget on the drawing surface.

- void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Draws a window with its title bar and frame if any.

- virtual void origin (int *x, int *y)
  
  Computes the coordinates of the current origin of graphics functions.

- virtual void origin (int x, int y)
  
  Sets the position of the origin of graphics in the drawable part of the drawing surface.

- void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  
  Draws a rectangular part of an on-screen window.

- virtual int printable_rect (int *w, int *h)
  
  Computes the width and height of the drawable area of the drawing surface.

- virtual void translate (int x, int y)
  
  Translates the current graphics origin accounting for the current rotation.

- virtual void untranslate ()
  
  Undoes the effect of a previous translate() call.
Public Member Functions inherited from Fl_Surface_Device

- Fl_Graphics_Driver ∗ driver ()
  
  Returns the graphics driver of this drawing surface.

- virtual bool is_current ()
  
  Is this surface the current drawing surface?

- virtual void set_current (void)
  
  Make this surface the current drawing surface.

- virtual ∼ Fl_Surface_Device ()
  
  The destructor.

Protected Member Functions

- Fl_Widget_Surface (Fl_Graphics_Driver ∗d)
  
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

- void driver (Fl_Graphics_Driver ∗graphics_driver)
  
  Sets the graphics driver of this drawing surface.

- virtual void end_current ()
  
  FLTK calls this each time a surface ceases to be the current drawing surface.

- Fl_Surface_Device (Fl_Graphics_Driver ∗graphics_driver)
  
  Constructor that sets the graphics driver to use for the created surface.

Protected Attributes

- int x_offset
  
  Horizontal offset to the origin of graphics coordinates

- int y_offset
  
  Vertical offset to the origin of graphics coordinates

Additional Inherited Members

Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device ∗ pop_current ()
  
  Removes the top element from the current drawing surface stack, and makes the new top element current.

- static void push_current (Fl_Surface_Device ∗new_current)
  
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.

- static Fl_Surface_Device ∗ surface ()
  
  The current drawing surface.

12.161.1 Detailed Description

A surface on which any FLTK widget can be drawn.

12.161.2 Constructor & Destructor Documentation

12.161.2.1 Fl_Widget_Surface()

Fl_Widget_Surface::Fl_Widget_Surface ( 
                    Fl_Graphics_Driver ∗ d ) [protected]

The constructor.
Parameters

\(d\) can be nul.

12.161.3 Member Function Documentation

12.161.3.1 draw()

```cpp
void Fl_Widget_Surface::draw ( Fl_Widget * widget, int delta_x = 0, int delta_y = 0 )
```

Draws the widget on the drawing surface.
The widget's position on the surface is determined by the last call to `origin()` and by the optional `delta_x` and `delta_y` arguments. Its dimensions are in points unless there was a previous call to `scale()`.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>widget</th>
<th>Any FLTK widget (e.g., standard, custom, window).</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>(delta_x, delta_y)</td>
<td>Optional horizontal and vertical offsets for positioning the widget top left relatively to the current origin of graphics.</td>
</tr>
</tbody>
</table>

12.161.3.2 draw_decorated_window()

```cpp
void Fl_Widget_Surface::draw_decorated_window ( Fl_Window * win, int win_offset_x = 0, int win_offset_y = 0 )
```

Draws a window with its title bar and frame if any. `win_offset_x` and `win_offset_y` are optional coordinates of where to position the window top left. Equivalent to `draw()` if `win` is a subwindow or has no border. Use `Fl_Window::decorated_w()` and `Fl_Window::decorated_h()` to get the size of the framed window.

12.161.3.3 origin() [1/2]

```cpp
void Fl_Widget_Surface::origin ( int * x, int * y ) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

Parameters

| out | \(x,y\) | If non-null, \(+x\) and \(+y\) are set to the horizontal and vertical coordinates of the graphics origin. |

12.161.3.4 origin() [2/2]

```cpp
void Fl_Widget_Surface::origin ( int x, int y ) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.
Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive `origin()` calls don't combine their effects. Origin() calls are not affected by `rotate()` calls (for classes derived
from Fl_Paged_Device).

Parameters

\begin{center}
\begin{tabular}{|l|}
\hline
in \texttt{x,y} & Horizontal and vertical positions in the drawing surface of the desired origin of graphics. \\
\hline
\end{tabular}
\end{center}

12.161.3.5 print_window_part()

\begin{verbatim}
void Fl_Widget_Surface::print_window_part ( 
   Fl_Window * win, 
   int x, 
   int y, 
   int w, 
   int h, 
   int delta_x = 0, 
   int delta_y = 0 )
\end{verbatim}

Draws a rectangular part of an on-screen window.

Parameters

\begin{center}
\begin{tabular}{|l|l|}
\hline
\texttt{win} & The window from where to capture. Can be an Fl_Gl_Window. Sub-windows that intersect 
   the rectangle are also captured. \\
\texttt{x} & The rectangle left \\
\texttt{y} & The rectangle top \\
\texttt{w} & The rectangle width \\
\texttt{h} & The rectangle height \\
\texttt{delta_x,delta_y} & Optional horizontal and vertical offsets from current graphics origin where to draw the top left 
   of the captured rectangle. \\
\hline
\end{tabular}
\end{center}

12.161.3.6 printable_rect()

\begin{verbatim}
int Fl_Widget_Surface::printable_rect ( 
   int * w, 
   int * h ) [virtual]
\end{verbatim}

Computes the width and height of the drawable area of the drawing surface. Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to origin(). If the object is derived from class Fl_Paged_Device, values account for the user-selected paper type and print orientation and are changed by scale() calls.

Returns

0 if OK, non-zero if any error

12.161.3.7 translate()

\begin{verbatim}
void Fl_Widget_Surface::translate ( 
   int x, 
   int y ) [virtual]
\end{verbatim}

Translates the current graphics origin accounting for the current rotation. Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects.

12.161.3.8 untranslate()

```cpp
void Fl_Widget_Surface::untranslate (
    void ) [virtual]
```

Undoes the effect of a previous translate() call.

The documentation for this class was generated from the following files:

- Fl_Widget_Surface.H
- Fl_Widget_Surface.cxx

12.162 Fl_Widget_Tracker Class Reference

This class should be used to control safe widget deletion.

```cpp
#include <Fl.H>
```

Public Member Functions

- int deleted ()
  
  Returns 1, if the watched widget has been deleted.

- int exists ()
  
  Returns 1, if the watched widget exists (has not been deleted).

- Fl_Widget_Tracker (Fl_Widget *wi)
  
  The constructor adds a widget to the watch list.

- Fl_Widget * widget ()
  
  Returns a pointer to the watched widget.

- ~Fl_Widget_Tracker ()
  
  The destructor removes a widget from the watch list.

12.162.1 Detailed Description

This class should be used to control safe widget deletion.

You can use an Fl_Widget_Tracker object to watch another widget, if you need to know whether this widget has been deleted during a callback.

This simplifies the use of the “safe widget deletion” methods Fl::watch_widget_pointer() and Fl::release_widget_pointer() and makes their use more reliable, because the destructor automatically releases the widget pointer from the widget watch list.

Fl_Widget_Tracker is intended to be used as an automatic (local/stack) variable, such that its destructor is called when the object’s scope is left. This ensures that no stale widget pointers are left in the widget watch list (see example below).

You can also create Fl_Widget_Tracker objects with `new`, but then it is your responsibility to delete the object (and thus remove the widget pointer from the watch list) when it is no longer needed.

**Example:**

```cpp
int MyClass::handle (int event) {
    if (...) {
        Fl_Widget_Tracker wp{this}; // watch myself
        do_callback(); // call the callback
        if (wp.deleted()) return 1; // exit, if deleted
        // Now we are sure that the widget has not been deleted,
        // and it is safe to access the widget:
        box(FL_FLAT_BOX);
        color(Fl_WHITE);
        redraw();
    }
}
```

Generated by Doxygen
12.162.2 Member Function Documentation

12.162.2.1 deleted()

```cpp
int Fl_Widget_Tracker::deleted () [inline]
```
Returns 1, if the watched widget has been deleted.
This is a convenience method. You can also use something like
if (wp.widget() == 0) // ... where `wp` is an `Fl_Widget_Tracker` object.

12.162.2.2 exists()

```cpp
int Fl_Widget_Tracker::exists ( ) [inline]
```
Returns 1, if the watched widget exists (has not been deleted).
This is a convenience method. You can also use something like
if (wp.widget() != 0) // ... where `wp` is an `Fl_Widget_Tracker` object.

12.162.2.3 widget()

```cpp
Fl_Widget * Fl_Widget_Tracker::widget ( ) [inline]
```
Returns a pointer to the watched widget.
The documentation for this class was generated from the following files:

- `FL.H`
- `FL.cxx`

12.163 Fl_Window Class Reference

This widget produces an actual window.
```cpp
#include <Fl_Window.H>
```
Inheritance diagram for Fl_Window:

```
Fl_Window
   |           |
   |           |
Fl_Group  Fl_Widget
   |   +------+
   |         |
Fl_Double_Window Fl_Gl_Window Fl_Single_Window
   |   |   |
   |   |   Fl_Cairo_Window Fl_Overlay_Window Fl_Glut_Window Fl_Menu_Window
```

Public Types

- `typedef struct HICON__ * HICON`

Public Member Functions

- `virtual class Fl_Double_Window * as_double_window ()`  
  Return non-null if this is an Fl_Double_Window object.
- `virtual class Fl_Overlay_Window * as_overlay_window ()`  
  Return non-null if this is an Fl_Overlay_Window object.
- `Fl_Window const * as_window () const FL_OVERRIDE`

Generated by Doxygen
• **Fl_Window * as_window () FL_OVERRIDE**
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• **unsigned int border () const**
  
  Returns whether the window possesses a border.

• **void border (int b)**
  
  Sets whether or not the window manager border is around the window.

• **void clear_border ()**
  
  Fast inline function to turn the window manager border off.

• **void clear_modal_states ()**
  
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

• **void copy_label (const char * a)**
  
  Sets the window titlebar label to a copy of a character string.

• **void cursor (const Fl_RGB_Image *, int, int)**
  
  Changes the cursor for this window using the provided image as cursor's shape.

• **void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)**
  
  For back compatibility only.

• **void cursor (Fl_Cursor)**
  
  Changes the cursor for this window.

• **int decorated_h () const**
  
  Returns the window height including any window title bar and any frame added by the window manager.

• **int decorated_w () const**
  
  Returns the window width including any frame added by the window manager.

• **void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)**
  
  For back compatibility only.

• **void default_cursor (Fl_Cursor)**
  
  Sets the default window cursor.

• **void draw_backdrop ()**
  
  Draw the background image if one is set and is aligned inside.

• **Fl_Window (int w, int h, const char * title=0)**
  
  Creates a window from the given width w, height h, and title.

• **Fl_Window (int x, int y, int w, int h, const char * title=0)**
  
  Creates a window from the given position (x, y), size (w, h) and title.

• **void free_position ()**
  
  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.

• **void fullscreen ()**
  
  Makes the window completely fill one or more screens, without any window manager border visible.

• **unsigned int fullscreen_active () const**
  
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.

• **void fullscreen_off ()**
  
  Turns off any side effects of fullscreen()

• **void fullscreen_off (int X, int Y, int W, int H)**
  
  Turns off any side effects of fullscreen() and does resize(x,y,w,h).

• **void fullscreen_screens (int top, int bottom, int left, int right)**
  
  Sets which screens should be used when this window is in full screen mode.

• **int handle (int) FL_OVERRIDE**
  
  Handles the specified event.

• **void hide () FL_OVERRIDE**
  
  Removes the window from the screen.

• **void hotspot (const Fl_Widget & p, int offscreen=0)**
  
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)
• void hotspot (const Fl_Widget *, int offscreen=0)
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)
• void hotspot (int x, int y, int offscreen=0)
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.
• const void * icon () const
  Gets the current icon window target dependent data.
• void icon (const Fl_RGB_Image *)
  Sets or resets a single window icon.
• void icon (const void * ic)
  Platform-specific method to set the window icon usable on Windows and X11 only.
• void iconize ()
  Iconifies the window.
• const char * iconlabel () const
  See void Fl_Window::iconlabel(const char *)
• void iconlabel (const char *)
  Sets the icon label.
• void icons (const Fl_RGB_Image *[][], int)
  Sets the window icons.
• void icons (HICON big_icon, HICON small_icon)
  Sets the window icons using HICON handles (Windows platform only).
• const char * label () const
  See void Fl_Window::label(const char *)
• void label (const char *)
  Sets the window title bar label.
• void label (const char *label, const char *iconlabel)
  Sets the icon label.
• void make_current ()
  Sets things up so that the drawing functions in <FL/fl_draw.H> will go into this window.
• void maximize ()
  Maximizes a top-level window to its current screen.
• unsigned int maximize_active () const
  Returns whether the window is currently maximized.
• unsigned int menu_window () const
  Returns true if this window is a menu window.
• unsigned int modal () const
  Returns true if this window is modal.
• unsigned int non_modal () const
  Returns true if this window is modal or non-modal.
• fl_uintptr_t os_id ()
  Returns a platform-specific identification of a shown window, or 0 if not shown.
• unsigned int override () const
  Returns non zero if OVERRIDE flag is set, 0 otherwise.
• void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Changes the size and position of the window.
• int screen_num ()
  The number of the screen containing the mapped window.
• void screen_num (int screen_num)
  Set the number of the screen where to map the window.
• void **set_menu_window** ()
  Marks the window as a menu window.

• void **set_modal** ()
  A "modal" window, when **shown()**, will prevent any events from being delivered to other windows in the same program,
  and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

• void **set_non_modal** ()
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a **modal()** one in that it remains on
  top, but it has no effect on event delivery.

• void **set_override** ()
  Activates the flags NOBORDER|OVERRIDE.

• void **set_tooltip_window** ()
  Marks the window as a tooltip window.

• const Fl_Image **shape** ()
  Returns the image controlling the window shape or NULL.

• void **shape** (const Fl_Image &b)
  Set the window’s shape with an Fl_Image.

• void **shape** (const Fl_Image *img)
  Assigns a non-rectangular shape to the window.

• void **show** () FL_OVERRIDE
  Puts the window on the screen.

• void **show** (int argc, char **argv)
  Puts the window on the screen with **show()** and parses command-line arguments.

• int **shown** ()
  Returns non-zero if **show()** has been called (but not **hide()**).

• void **size_range** (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
  Sets the allowable range the user can resize this window to.

• unsigned int **tooltip_window** () const
  Returns true if this window is a tooltip window.

• void **un_maximize** ()
  Returns a previously maximized top-level window to its previous size.

• void **wait_for_expose** ()
  Waits for the window to be displayed after calling **show()**.

• int **x_root** () const
  Gets the x position of the window on the screen.

• const char * **xclass** () const
  Returns the xclass for this window, or a default.

• void **xclass** (const char *c)
  Sets the xclass for this window.

• int **y_root** () const
  Gets the y position of the window on the screen.

• virtual ~**Fl_Window** ()
  The destructor also deletes all the children.

Public Member Functions inherited from **Fl_Group**

• Fl_Widget *& **_ddfdesign_kludge** ()
  This is for forms compatibility only.

• void **add** (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

• void **add** (Fl_Widget *)
  See void **Fl_Group::add(Fl_Widget &w)**
• void **add_resizable** (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget **const** + array () **const**
  Returns a pointer to the array of children.

• Fl_Group **const** + as_group () **const** FL_OVERRIDE

• Fl_Group **const** + as_group () FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

• Fl_Widget * child (int n) **const**
  Returns array()[n].

• int children () **const**
  Returns how many child widgets the group has.

• void clear ()
  Deletes all child widgets from memory recursively.

• unsigned int clip_children ()
  Returns the current clipping mode.

• void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

• void end ()
  Exactly the same as current(this->parent()).

• int find (const Fl_Widget &o) **const**
  See int Fl_Group::find(const Fl_Widget *w) **const**.

• int find (const Fl_Widget *) **const**
  Searches the child array for the widget and returns the index.

• Fl_Group (int, int, int, int, const char *) =0)
  Creates a new Fl_Group widget using the given position, size, and label string.

• void focus (Fl_Widget *W)

• void forms_end ()
  This is for forms compatibility only.

• void init_sizes ()
  Resets the internal array of widget sizes and positions.

• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

• void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).

• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

• void remove (Fl_Widget *o)
  Removes the widget o from the group.

• void remove (int index)
  Removes the widget at index from the group but does not delete it.

• Fl_Widget * resizable () **const**
  Returns the group's resizable widget.

• void resizable (Fl_Widget &o)
  Sets the group's resizable widget.

• void resizable (Fl_Widget *)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• virtual ~Fl_Group ()
  The destructor also deletes all the children.
Public Member Functions inherited from `Fl_Widget`

- `void _clear_fullscreen ();`
- `void _set_fullscreen ();`
- `void activate ()` (Activates the widget.)
- `unsigned int active () const` (Returns whether the widget is active.)
- `int active_r () const` (Returns whether the widget and all of its parents are active.)
- `Fl_Align align () const` (Gets the label alignment.)
- `void align (Fl_Align alignment)` (Sets the label alignment.)
- `long argument () const` (Gets the current user data (long) argument that is passed to the callback function.)
- `void argument (long v)` (Sets the current user data (long) argument that is passed to the callback function.)
- `virtual class Fl_Gl_Window * as_gl_window ()` (Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.)
- `virtual class Fl_Gl_Window const * as_gl_window () const`
- `void bind_deimage (Fl_Image * img)` (Sets the image to use as part of the widget label when in the inactive state.)
- `void bind_deimage (int f)` (Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.)
- `void bind_image (Fl_Image * img)` (Sets the image to use as part of the widget label when in the active state.)
- `void bind_image (int f)` (Bind the image to the widget, so the widget will delete the image when it is no longer needed.)
- `Fl_Boxtype box () const` (Gets the box type of the widget.)
- `void box (Fl_Boxtype new_box)` (Sets the box type for the widget.)
- `Fl_Callback_p callback () const` (Gets the current callback function for the widget.)
- `void callback (Fl_Callback * cb)` (Sets the current callback function for the widget.)
- `void callback (Fl_Callback * cb, Fl_Callback_User_Data *p, bool auto_free)` (Sets the current callback function and managed user data for the widget.)
- `void callback (Fl_Callback * cb, void *p)` (Sets the current callback function and data for the widget.)
- `void callback (Fl_Callback0 * cb)` (Sets the current callback function for the widget.)
- `void callback (Fl_Callback1 * cb, long p=0)` (Sets the current callback function for the widget.)
- `unsigned int changed () const` (Checks if the widget value changed since the last callback.)
- `void clear_active ()` (Marks the widget as inactive without sending events or changing focus.)
- `void clear_changed ()` (Marks the value of the widget as unchanged.)
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Enables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Imag e *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, Fl_Align) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  
  Gets the widget height.

- **Fl_Image * image ()**
  
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image * image () const**
  
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const**
  
  Checks if this widget is a child of `wgt`.

- **int is_label_copied () const**
  
  Returns whether the current label was assigned with `copy_label()`.

- **const char * label () const**
  
  Gets the current label text.

- **void label (const char *text)**
  
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  
  Sets the label color.

- **Fl_Font labelfont () const**
  
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width `ww` and height `hh` accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - "for hacks only".

Generated by Doxygen
• void **position** (int X, int Y)
  Repositions the window or widget.

• void **redraw** ()
  Schedules the drawing of the widget.

• void **redraw_label** ()
  Schedules the drawing of the label.

• Fl_Color **selection_color** () const
  Gets the selection color.

• void **selection_color** (Fl_Color a)
  Sets the selection color.

• void **set_active** ()
  Marks the widget as active without sending events or changing focus.

• void **set_changed** ()
  Marks the value of the widget as changed.

• void **set_output** ()
  Sets a widget to output only.

• void **set_visible** ()
  Makes the widget visible.

• void **set_visible_focus** ()
  Enables keyboard focus navigation with this widget.

• int **shortcut_label** () const
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

• void **shortcut_label** (int value)
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

• void **size** (int W, int H)
  Changes the size of the widget.

• int **take_focus** ()
  Gives the widget the keyboard focus.

• unsigned int **takesevents** () const
  Returns if the widget is able to take events.

• int **test_shortcut** ()
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

• const char ∗ **tooltip** () const
  Gets the current tooltip text.

• void **tooltip** (const char ∗text)
  Sets the current tooltip text.

• Fl_Window ∗ **top_window** () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window ∗ **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar **type** () const
  Gets the widget type.

• void **type** (uchar t)
  Sets the widget type.

• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void ∗ **user_data** () const
  Gets the user data for this widget.

• void **user_data** (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

• void **user_data** (void ∗v)
Sets the user data for this widget.

- `unsigned int visible () const`
  Returns whether a widget is visible.

- `unsigned int visible_focus () const`
  Checks whether this widget has a visible focus.

- `void visible_focus (int v)`
  Modifies keyboard focus navigation.

- `int visible_r () const`
  Returns whether a widget and all its parents are visible.

- `int w () const`
  Gets the widget width.

- `Fl_When when () const`
  Returns the conditions under which the callback is called.

- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window ∗ window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- `virtual ∼Fl_Widget ()`
  Destroys the widget.

**Static Public Member Functions**

- `static Fl_Window ∗ current ()`
  Returns the last window that was made current.

- `static void default_callback (Fl_Window ∗, void ∗v)`
  Back compatibility: Sets the default callback v for win to call on close event.

- `static void default_icon (const Fl_RGB_Image ∗)`
  Sets a single default window icon.

- `static void default_icons (const Fl_RGB_Image ∗[] , int)`
  Sets the default window icons.

- `static void default_icons (HICON big_icon, HICON small_icon)`
  Sets the default window icons (Windows platform only).

- `static const char ∗ default_xclass ()`
  Returns the default xclass.

- `static void default_xclass (const char ∗)`
  Sets the default window xclass.

- `static bool is_a_rescale ()`
  Returns true when a window is being rescaled.

- `static char show_next_window_iconic ()`
  Returns the static flag whether the next window should be opened iconified.

- `static void show_next_window_iconic (char stat)`
  Sets a static flag whether the next window should be opened iconified.

**Static Public Member Functions inherited from Fl_Group**

- `static Fl_Group ∗ current ()`
  Returns the currently active group.

- `static void current (Fl_Group ∗g)`
  Sets the current group.
Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Member Functions

- void default_size_range ()
  Protected method to calculate the default size range of a window.
- void draw () FL_OVERRIDE
  Draws the widget.
- virtual void flush ()
  Forces the window to be drawn, this window is also made current and calls draw().
- int force_position () const
  Returns the internal state of the window's FORCE_POSITION flag.
- void force_position (int force)
  Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void free_icons ()
  Deletes all icons previously attached to the window.
- int is_resizable ()
  Protected method to determine whether a window is resizable.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.
Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Static Protected Attributes

- static Fl_Window ∗current_
  Stores the last window that was made current.

12.163.1 Detailed Description

This widget produces an actual window. This can either be a main window, with a border and title and all the window management controls, or a "subwindow" inside a window. This is controlled by whether or not the window has a parent(). Once you create a window, you usually add children Fl_Widget's to it by using window->add(child) for each new widget. See Fl_Group for more information on how to add and remove children.

There are several subclasses of Fl_Window that provide double-buffering, overlay, menu, and OpenGL support. The window's callback is done if the user tries to close a window using the window manager and Fl::modal() is zero or equal to the window. Fl_Window has a default callback that calls Fl_Window::hide(). Callback reasons can be FL_REASON_CANCELLED if the Escape key was pressed, or FL_REASON_CLOSED when the close button is clicked. FL_WHEN... flags are ignored.

12.163.2 Constructor & Destructor Documentation

12.163.2.1 Fl_Window() [1/2]

Fl_Window::Fl_Window (  
  int w,  
  int h,  
  const char * title = 0 )

Creates a window from the given width w, height h, and title. If Fl_Group::current() is not NULL, the window is created as a subwindow of the parent window. The (w, h) form of the constructor creates a top-level window and asks the window manager to position the window. The (x, y, w, h) form of the constructor either creates a subwindow or a top-level window at the specified location (x, y), subject to window manager configuration. If you do not specify the position of the window, the window manager will pick a place to show the window or allow the user to pick a location. Use position(x, y) or hotspot() before calling show() to request a position on the screen. See Fl_Window::resize() for some more details on positioning windows. Top-level windows initially have visible() set to 0 and parent() set to NULL. Subwindows initially have visible() set to 1 and parent() set to the parent window pointer. Fl_Widget::box() defaults to FL_FLAT_BOX. If you plan to completely fill the window with children widgets you should change this to FL_NO_BOX. If you turn the window border off you may want to change this to FL_UP_BOX.

See also

Fl_Window(int x, int y, int w, int h, const char *title)

12.163.2.2 Fl_Window() [2/2]

Fl_Window::Fl_Window (  
  int x,  
  int y,  
  int w,  
  int h,  
  const char * title = 0 )

Creates a window from the given width w, height h, and title. If Fl_Group::current() is not NULL, the window is created as a subwindow of the parent window. The (w, h) form of the constructor creates a top-level window and asks the window manager to position the window. The (x, y, w, h) form of the constructor either creates a subwindow or a top-level window at the specified location (x, y), subject to window manager configuration. If you do not specify the position of the window, the window manager will pick a place to show the window or allow the user to pick a location. Use position(x, y) or hotspot() before calling show() to request a position on the screen. See Fl_Window::resize() for some more details on positioning windows. Top-level windows initially have visible() set to 0 and parent() set to NULL. Subwindows initially have visible() set to 1 and parent() set to the parent window pointer. Fl_Widget::box() defaults to FL_FLAT_BOX. If you plan to completely fill the window with children widgets you should change this to FL_NO_BOX. If you turn the window border off you may want to change this to FL_UP_BOX.

See also

Fl_Window(int x, int y, int w, int h, const char *title)
int y,
int w,
int h,
const char *title = 0)

Creates a window from the given position (x, y), size (w, h) and title.
On a multi-screen system, the values computed by Fl::screen_xywh(int &X, int &Y, int &W, int &H, int n) can be used
to discover the coordinates of the area of screen #n. When these screens have various scale factor values, an (x, y) pair may not be enough to specify the targeted screen for the window, because the same (x,y) pair can belong to several screens. In that situation, a call to Fl_Window::screen_num(int) is to be used to identify unambiguously the
targeted screen.

See also

Fl_Window(int w, int h, const char ∗title)
Fl::screen_xywh(int &X, int &Y, int &W, int &H, int n)

Note

Under Wayland, it's generally not possible for the client app to control the position of a window in the system.
It's only possible to specify on what screen should the compositor place a fullscreen window.

12.163.2.3 ~Fl_Window()

Fl_Window::~Fl_Window ( ) [virtual]
The destructor also deletes all the children.
This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code.
A kludge has been done so the Fl_Window and all of its children can be automatic (local) variables, but you must
declare the Fl_Window first so that it is destroyed last.

12.163.3 Member Function Documentation

12.163.3.1 as_double_window()

virtual class Fl_Double_Window ∗ Fl_Window::as_double_window ( ) [inline], [virtual]
Return non-null if this is an Fl_Double_Window object.
Reimplemented in Fl_Double_Window.

12.163.3.2 as_overlay_window()

virtual class Fl_Overlay_Window ∗ Fl_Window::as_overlay_window ( ) [inline], [virtual]
Return non-null if this is an Fl_Overlay_Window object.
Reimplemented in Fl_Overlay_Window.

12.163.3.3 as_window() [1/2]

Fl_Window const ∗ Fl_Window::as_window ( ) const [inline], [virtual]
Reimplemented from Fl_Widget.

12.163.3.4 as_window() [2/2]

Fl_Window ∗ Fl_Window::as_window ( ) [inline], [virtual]
Returns an Fl_Window pointer if this widget is an Fl_Window.
Use this method if you have a widget (pointer) and need to know whether this widget is derived from Fl_Window. If
it returns non-NULL, then the widget in question is derived from Fl_Window, and you can use the returned pointer
to access its children or other Fl_Window-specific methods.

Return values

NULL if this widget is not derived from Fl_Window.
Note

This method is provided to avoid dynamic_cast.

See also

Fl_Widget::as_group(), Fl_Widget::as_gl_window()

Reimplemented from Fl_Widget.

12.163.3.5 border()

```cpp
void Fl_Window::border (int b)
```

Sets whether or not the window manager border is around the window.
The default value is true. With some X window managers, this does not work after show() has been called.

12.163.3.6 clear_border()

```cpp
void Fl_Window::clear_border () [inline]
```

Fast inline function to turn the window manager border off.
It only works before show() is called.

12.163.3.7 clear_modal_states()

```cpp
void Fl_Window::clear_modal_states () [inline]
```

Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
Note that there are three states for a window: modal, non-modal, and normal.
You can not change the "modality" of a window whilst it is shown, so it is necessary to first hide() the window, change its "modality" as required, then re-show the window for the new state to take effect.
This method can also be used to change a "modal" window into a "non-modal" one. On several supported platforms, the "modal" state over-rides the "non-modal" state, so the "modal" state must be cleared before the window can be set into the "non-modal" state. In general, the following sequence should work:

```cpp
win->hide();
win->clear_modal_states();
// Set win to new state as desired, or leave "normal", e.g...
win->set_non_modal();
win->show();
```

Note

Under some window managers, the sequence of hiding the window and changing its modality will often cause it to be re-displayed at a different position when it is subsequently shown. This is an irritating feature but appears to be unavoidable at present. As a result we would advise to use this method only when absolutely necessary.

See also

void set_modal(), void set_non_modal()

12.163.3.8 current()

```cpp
FL_Window ∗ Fl_Window::current () [static]
```

Returns the last window that was made current.

See also

Fl_Window::make_current()
12.163.3.9 cursor() [1/3]

```cpp
void Fl_Window::cursor {
    const Fl_RGB_Image * image,
    int hotx,
    int hoty }
```

Changes the cursor for this window using the provided image as cursor's shape.
The window must be show()n for this function to have any effect. This always calls the system. If you are changing
the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor
is different.
The default cursor will be used if the provided image cannot be used as a cursor.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>image</td>
<td>Sets the cursor size and shape</td>
</tr>
<tr>
<td>hotx,hoty</td>
<td>Sets the cursor's active location relatively to top-left of image when clicking</td>
</tr>
</tbody>
</table>

See also

cursor(Fl_Cursor), default_cursor()

12.163.3.10 cursor() [2/3]

```cpp
void Fl_Window::cursor {
    Fl_Cursor c,
    Fl_Color ,
    Fl_Color = FL_WHITE }
```

For back compatibility only.
Same as Fl_Window::cursor(Fl_Cursor)

12.163.3.11 cursor() [3/3]

```cpp
void Fl_Window::cursor {
    Fl_Cursor c }
```

Changes the cursor for this window.
The window must be show()n for this function to have any effect. This always calls the system. If you are changing
the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor
is different.
The type Fl_Cursor is an enumeration defined in `<FL/Enumerations.H>`.

See also

cursor(const Fl_RGB_Image*, int, int), default_cursor()

12.163.3.12 decorated_h()

```cpp
int Fl_Window::decorated_h ( ) const
```

Returns the window height including any window title bar and any frame added by the window manager.
Same as h() if applied to a subwindow, or if window is not yet mapped.

Note

Under X11, FLTK is able to compute the size of window titlebars and borders only if these decoration elements are strictly X11-based. When that's not the case, decorated_h() returns the same value as h() and decorated_w() as w(), and FLTK cannot access window decorations.

Under X11 again, the values returned by decorated_h() and decorated_w() may not be reliable during a resize operation. The size of decoration elements of a window is best computed when the window is first mapped.
12.163.3.13  decorated_w()

```cpp
int Fl_Window::decorated_w ( ) const
```

Returns the window width including any frame added by the window manager.  
Same as w() if applied to a subwindow, or if window is not yet mapped.

See also

```cpp
decorated_h().
```

12.163.3.14  default_cursor() [1/2]

```cpp
void Fl_Window::default_cursor ( 
    Fl_Cursor c,
    Fl_Color ,
    Fl_Color = FL_WHITE )
```

For back compatibility only.

same as Fl_Window::default_cursor(Fl_Cursor)

12.163.3.15  default_cursor() [2/2]

```cpp
void Fl_Window::default_cursor ( 
    Fl_Cursor c )
```

Sets the default window cursor.  
This is the cursor that will be used after the mouse pointer leaves a widget with a custom cursor set.

See also

```cpp
cursor(const Fl_RGB_Image*, int, int), default_cursor()
```

12.163.3.16  default_icon()

```cpp
void Fl_Window::default_icon ( 
    const Fl_RGB_Image * icon ) [static]
```

Sets a single default window icon.  
If icon is NULL the current default icons are removed.

**Parameters**

| in | icon | default icon for all windows subsequently created or NULL |

See also

```cpp
Fl_Window::default_icons(const Fl_RGB_Image [][], int)
Fl_Window::icon(const Fl_RGB_Image *)
Fl_Window::icons(const Fl_RGB_Image [], int)
```

**Note**

See Window icons for the Wayland platform.

12.163.3.17  default_icons() [1/2]

```cpp
void Fl_Window::default_icons ( 
    const Fl_RGB_Image * icons[],
    int count ) [static]
```

Sets the default window icons.
The default icons are used for all windows that don't have their own icons set before `show()` is called. You can change the default icons whenever you want, but this only affects windows that are created (and shown) after this call.

The given images in `icons` are copied. You can use a local variable or free the images immediately after this call.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th><code>icons</code></th>
<th>default icons for all windows subsequently created</th>
</tr>
</thead>
<tbody>
<tr>

- `Fl_Window::icons(const Fl_RGB_Image *[], int)`

Note

See Window icons for the Wayland platform.

### 12.163.3.18 default_icons()

```
static void Fl_Window::default_icons (             
    HICON big_icon,                               
    HICON small_icon ) [static]                 
```

Sets the default window icons (Windows platform only).
Convenience function to set the default icons using Windows' native HICON icon handles.
The given icons are copied. You can free the icons immediately after this call.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th><code>big_icon</code></th>
<th>default large icon for all windows subsequently created</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td><code>small_icon</code></td>
<td>default small icon for all windows subsequently created</td>
</tr>
</tbody>
</table>

- `Fl_Window::default_icon(const Fl_RGB_Image *)`
- `Fl_Window::default_icons(const Fl_RGB_Image *[], int)`
- `Fl_Window::icon(const Fl_RGB_Image *)`
- `Fl_Window::icons(const Fl_RGB_Image *[], int)`
- `Fl_Window::icons(HICON, HICON)`

### 12.163.3.19 default_size_range()

```
void Fl_Window::default_size_range ( ) [protected]
```

Protected method to calculate the default size range of a window.
This method is called internally prior to showing a window to ensure that the window's size range values are calculated if a `resizable()` widget has been set but `size_range()` has not been called explicitly.
This method does nothing if `size_range()` has been called before.
Otherwise FLTK tries to figure out the window's size range from the setting of the window's `resizable()` widget as follows and roughly in the given order.

1. If `resizable()` is NULL (this is the default) then the window cannot be resized and the resize border and max-size control will not be displayed for the window.
2. If either dimension of `resizable()` is zero, then the window cannot resize in that direction.

3. The `resizable()` widget is clipped to the window area.

4. The non-resizable portion of the window is calculated as the difference of the window's size and the clipped `resizable()` widget's size.

5. If either dimension of the clipped `resizable()` widget is greater than 100, then 100 is considered its minimum width/height. This allows the resizable widget to shrink below its original size.

6. Finally the minimum width/height of the window is set to the non-resizable portion plus the width/height of the `resizable()` widget as calculated above.

In simple words:

- It is assumed that the `resizable()` widget can be indefinitely enlarged and/or shrunk to a minimum width/height of 100 unless it is smaller than that, which is then considered the minimum.

- The window's `size_range()` minimum values are set to the sum of the non-resizable portion of the window and the previously calculated minimum size of the `resizable()` widget.

Examples:

```cpp
Fl_Window win(400, 400);
win.resizable(win);
// win.size_range(100, 100, 0, 0);
The minimum size of the resizable is 100, hence the minimum size of the total window is also 100 in both directions.
Fl_Window win(400, 400);
Fl_Box box(20, 20, 360, 360);
win.resizable(box);
// win.size_range(140, 140, 0, 0);
The calculated minimum width and height would be 20 + 100 + 20 in both dimensions.
Fl_Window win(400, 400);
Fl_Box box(200, 0, 500, 300); // note: width 500 too large: clipped
win.resizable(box);
// win.size_range(300, 200, 0, 0);
The width of the resizable is clipped to 200, hence the minimum size of the total window is also 200 (fix) + 100 (min. resizable) in x direction. The minimum value in y direction is 100 (resizable) + 100 (fixed part).
The calculation is based on clipping the resizable widget to the window area to prevent programming errors and the assumption that the resizable widget can be shrunk to 100x100 or its original size, whichever is smaller.
If this is not what you want, please use `Fl_Window::size_range()` explicitly so you can set any appropriate range.
```

12.163.3.20 default_xclass() [1/2]

```cpp
class Fl_Window{

public:

  const char * default_xclass () [static]

  Returns the default xclass.

  See also

  `Fl_Window::default_xclass(const char *)`

}
```

12.163.3.21 default_xclass() [2/2]

```cpp
void Fl_Window::default_xclass (const char * xc) [static]

Sets the default window xclass.
The default xclass is used for all windows that don't have their own xclass set before `show()` is called. You can change the default xclass whenever you want, but this only affects windows that are created (and shown) after this call.
The given string `xc` is copied. You can use a local variable or free the string immediately after this call.
If you don't call this, the default xclass for all windows will be "FLTK". You can reset the default xclass by specifying `NULL` for `xc`.
If you call `Fl_Window::xclass(const char *)` for any window, then this also sets the default xclass, unless it has been set before.
```
Parameters

| in  | xc | default xclass for all windows subsequently created |

See also

Fl_Window::xclass(const char *)

### 12.163.3.22 draw()

```cpp
void Fl_Window::draw() [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from `Fl_Group`.

### 12.163.3.23 flush()

```cpp
void Fl_Window::flush() [protected], [virtual]
```

Forces the window to be drawn, this window is also made current and calls `draw()`.

Reimplemented in `Fl_Double_Window`, `Fl_Gl_Window`, and `Fl_Overlay_Window`.

### 12.163.3.24 force_position() [1/2]

```cpp
int Fl_Window::force_position() const [inline], [protected]
```

Returns the internal state of the window's FORCE_POSITION flag.

**Return values**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if flag is set</td>
</tr>
<tr>
<td>0</td>
<td>otherwise</td>
</tr>
</tbody>
</table>

See also

force_position(int)

### 12.163.3.25 force_position() [2/2]

```cpp
void Fl_Window::force_position(int force) [inline], [protected]
```

Sets an internal flag that tells FLTK and the window manager to honor position requests.

This is used internally and should not be needed by user code.

**Parameters**

| in  | force | 1 to set the FORCE_POSITION flag, 0 to clear it |

### 12.163.3.26 free_icons()

```cpp
void Fl_Window::free_icons() [protected]
```

Deletes all icons previously attached to the window.

Generated by Doxygen
12.163.3.27 free_position()

void Fl_Window::free_position() [inline]
Undo the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.
This is for Forms compatibility only.

Deprecated please use force_position(0) instead

12.163.3.28 fullscreen()

void Fl_Window::fullscreen()
Makes the window completely fill one or more screens, without any window manager border visible.
You must use fullscreen_off() to undo this.

Note
On some platforms, this can result in the keyboard being grabbed. The window may also be recreated, meaning hide() and show() will be called.

See also
void Fl_Window::fullscreen_screens()

12.163.3.29 fullscreen_screens()

void Fl_Window::fullscreen_screens {
  int top,
  int bottom,
  int left,
  int right
}
Sets which screens should be used when this window is in fullscreen mode.
The window will be resized to the top of the screen with index top, the bottom of the screen with index bottom, etc.
If this method is never called, or if any argument is < 0, then the window will be resized to fill the screen it is currently on.

See also
void Fl_Window::fullscreen()

12.163.3.30 handle()

int Fl_Window::handle() [virtual]
Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.
Parameters

| in  | event | the kind of event received |

Return values

| 0   | if the event was not used or understood |
| 1   | if the event was used and can be deleted |

See also

[Fl_Event](#)

Reimplemented from [Fl_Group](#).

### 12.163.3.31 hide()

```cpp
void Fl_Window::hide ( ) [virtual]
```

Removes the window from the screen.

If the window is already hidden or has not been shown then this does nothing and is harmless.

Reimplemented from [Fl_Widget](#).

### 12.163.3.32 hotspot()

```cpp
void Fl_Window::hotspot ( int x, int y, int offscreen = 0 )
```

Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

If the optional offscreen parameter is non-zero, then the window is allowed to extend off the screen (this does not work with some X window managers).

See also

[position()](#)

### 12.163.3.33 icon() [1/3]

```cpp
const void * Fl_Window::icon ( ) const
```

Gets the current icon window target dependent data.

**Deprecated** in 1.3.3

### 12.163.3.34 icon() [2/3]

```cpp
void Fl_Window::icon ( const Fl_RGB_Image * icon )
```

Sets or resets a single window icon.

A window icon can be changed while the window is shown, but this may be platform and/or window manager dependent. To be sure that the window displays the correct window icon you should always set the icon before the window is shown.

If a window icon has not been set for a particular window, then the default window icon (see links below) or the system default icon will be used.

This method makes an internal copy of the `icon` pixel buffer, so once set, the `Fl_RGB_Image` instance can be freed by the caller.
Parameters

| in | icon | icon for this window, NULL to reset window icon. |

See also

- `Fl_Window::default_icon(const Fl_RGB_Image *)`
- `Fl_Window::default_icons(const Fl_RGB_Image *[ ], int)`
- `Fl_Window::icons(const Fl_RGB_Image *[ ], int)`

Note

See Window icons for the Wayland platform.

### 12.163.3.35 icon()

```cpp
void Fl_Window::icon (const void * ic )
```

Platform-specific method to set the window icon usable on Windows and X11 only.

See Setting the Icon of a Window for its use under X11, and Setting the Icon of a Window under Windows.

**Deprecated** in 1.3.3 in favor of platform-independent methods `Fl_Window::icon(const Fl_RGB_Image *icon)` and `Fl_Window::icons(const Fl_RGB_Image *icons[ ], int count)`.

### 12.163.3.36 iconize()

```cpp
void Fl_Window::iconize ( )
```

Iconifies the window.

If you call this when `shown()` is false it will `show()` it as an icon. If the window is already iconified this does nothing. Call `show()` to restore the window.

When a window is iconified/restored (either by these calls or by the user) the `handle()` method is called with FL_HIDE and FL_SHOW events and `visible()` is turned on and off.

There is no way to control what is drawn in the icon except with the string passed to `Fl_Window::xclass()`. You should not rely on window managers displaying the icons.

### 12.163.3.37 icons()

```cpp
void Fl_Window::icons (const Fl_RGB_Image * icons[ ], int count )
```

Sets the window icons.

You may set multiple window icons with different sizes. Dependent on the platform and system settings the best (or the first) icon will be chosen.

The given images in `icons` are copied. You can use a local variable or free the images immediately after this call. If `count` is zero, current icons are removed. If `count` is greater than zero (must not be negative), then `icons[]` must contain at least `count` valid image pointers (not NULL). Otherwise the behavior is undefined.

Parameters

| in | icons | icons for this window |
| in | count | number of images in `icons`. Set to 0 to remove the current icons |

See also

- `Fl_Window::default_icon(const Fl_RGB_Image *)`
- `Fl_Window::default_icons(const Fl_RGB_Image *[ ], int)`
Fl_Window::icon(const Fl_RGB_Image *)

Note
See Window icons for the Wayland platform.

12.163.3.38 icons() [2/2]
void Fl_Window::icons (  
    HICON big_icon,  
    HICON small_icon  
)
Sets the window icons using HICON handles (Windows platform only). The given icons are copied. You can free the icons immediately after this call.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>big_icon</th>
<th>large window icon</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>small_icon</td>
<td>small window icon</td>
</tr>
</tbody>
</table>

12.163.3.39 is_resizable()
int Fl_Window::is_resizable ( ) [protected]
Protected method to determine whether a window is resizable. If size_range() has not yet been called this method calculates the default size range values by calling default_size_range(). This method is for internal use only. The returned value is a bit mask and non-zero if the window is resizable in at least one direction.

Returns
non-zero if the window is resizable

Return values

| 0 | the window is not resizable |
| 1 | the window is resizable in horizontal direction (w) |
| 2 | the window is resizable in vertical direction (h) |
| 3 | the window is resizable in both directions (w and h) |

See also
default_size_range()  

12.163.3.40 make_current()
void Fl_Window::make_current ( )
Sets things up so that the drawing functions in <FL/fl_draw.H> will go into this window. This is useful for incremental update of windows, such as in an idle callback, which will make your program behave much better if it draws a slow graphic. Danger: incremental update is very hard to debug and maintain! This method only works for the Fl_Window and Fl_Gl_Window derived classes.

12.163.3.41 maximize()
void Fl_Window::maximize ( )
Maximizes a top-level window to its current screen.
This function is effective only with a show()'n, resizable, top-level window. Bordered and borderless windows can be used.

See also

   Fl_Window::un_maximize(), Fl_Window::maximize_active()

12.163.3.42  modal()

unsigned int Fl_Window::modal ( ) const [inline]
Returns true if this window is modal.

12.163.3.43  os_id()

fl_uintptr_t Fl_Window::os_id ( )
Returns a platform-specific identification of a shown window, or 0 if not shown.

Note

This identification may differ from the platform-specific reference of an Fl_Window object used by functions
fl_x11_xid(), fl_mac_xid(), fl_x11_find(), and fl_mac_find().

   • X11 platform: the window’s XID.
   • macOS platform: The window number of the window's window device.
   • other platforms: 0.

12.163.3.44  resize()

void Fl_Window::resize ( int X, int Y, int W, int H ) [virtual]
Changes the size and position of the window.
If shown() is true, these changes are communicated to the window server (which may refuse that size and cause a further resize). If shown() is false, the size and position are used when show() is called. See Fl_Group for the effect of resizing on the child widgets.
You can also call the Fl_Widget methods size(x,y) and position(w,h), which are inline wrappers for this virtual function.
A top-level window can not force, but merely suggest a position and size to the operating system. The window manager may not be willing or able to display a window at the desired position or with the given dimensions. It is up to the application developer to verify window parameters after the resize request.
Reimplemented from Fl_Group.

12.163.3.45  screen_num()

void Fl_Window::screen_num ( int screen_num )
Set the number of the screen where to map the window.
Call this and set also the window's desired position before show()'ing the window. This can be necessary when a system has several screens with distinct scaling factor values because the window's x() and y() may not suffice to uniquely identify one screen. To see that, consider a system with two screens where the screen at left is A pixel-wide and has a scale factor of 1 whereas the screen at right has a scale factor of 2. For the sake of simplicity, consider only the X coordinates of windows. FLTK coordinates translate directly to pixel coordinates on the left screen, whereas FLTK coordinates multiplied by 2 correspond to pixel coordinates on the right screen. Consequently, FLTK coordinates between A/2 + 1 and A-1 can map to both screens. Both window coordinates and screen number are necessary to uniquely identify where a window is to be mapped.
12.163.3.46 set_menu_window()

void Fl_Window::set_menu_window ( ) [inline]
Marks the window as a menu window.
This is intended for internal use, but it can also be used if you write your own menu handling. However, this is not
recommended.
This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window
managers can use different flags to distinguish menu and tooltip windows from normal windows.
This must be called before the window is shown and cannot be changed later.

12.163.3.47 set_modal()

void Fl_Window::set_modal ( ) [inline]
A "modal" window, when shown(), will prevent any events from being delivered to other windows in the same
program, and will also remain on top of the other windows (if the X window manager supports the "transient for"
property).
Several modal windows may be shown at once, in which case only the last one shown gets events. You can see
which window (if any) is modal by calling Fl::modal().

12.163.3.48 set_non_modal()

void Fl_Window::set_non_modal ( ) [inline]
A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a modal() one in that it remains on
top, but it has no effect on event delivery.
There are three states for a window: modal, non-modal, and normal.

12.163.3.49 set_tooltip_window()

void Fl_Window::set_tooltip_window ( ) [inline]
Marks the window as a tooltip window.
This is intended for internal use, but it can also be used if you write your own tooltip handling. However, this is not
recommended.
This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window
managers can use different flags to distinguish menu and tooltip windows from normal windows.
This must be called before the window is shown and cannot be changed later.

Note
Since Fl_Tooltip_Window is derived from Fl_Menu_Window, this also clears the menu_window() state.

12.163.3.50 shape() [1/2]

void Fl_Window::shape (const Fl_Image & img )
Set the window's shape with an Fl_Image.
See also

void shape(const Fl_Image* img)

12.163.3.51 shape() [2/2]

void Fl_Window::shape (const Fl_Image * img )
Assigns a non-rectangular shape to the window.
This function gives an arbitrary shape (not just a rectangular region) to an Fl_Window. An Fl_Image of any dimen-
sion can be used as mask; it is rescaled to the window's dimension as needed.
The layout and widgets inside are unaware of the mask shape, and most will act as though the window's rectangular
bounding box is available to them. It is up to you to make sure they adhere to the bounds of their masking shape.
The img argument can be an Fl_Bitmap, Fl_Pixmap, Fl_RGB_Image or Fl_Shared_Image:
With Fl_Bitmap or Fl_Pixmap, the shaped window covers the image part where bitmap bits equal one, or where the pixmap is not fully transparent.

With an Fl_RGB_Image with an alpha channel (depths 2 or 4), the shaped window covers the image part that is not fully transparent.

With an Fl_RGB_Image of depth 1 (gray-scale) or 3 (RGB), the shaped window covers the non-black image part.

With an Fl_Shared_Image, the shape is determined by rules above applied to the underlying image. The shared image should not have been scaled through Fl_Image::scale().

Platform details:

• On the unix/linux platform, the SHAPE extension of the X server is required. This function does control the shape of Fl_Gl_Window instances.

• On the Windows platform, this function does nothing with class Fl_Gl_Window.

• On the Mac platform, OS version 10.4 or above is required. An 8-bit shape-mask is used when img is an Fl_RGB_Image: with depths 2 or 4, the image alpha channel becomes the shape mask such that areas with alpha = 0 are out of the shaped window; with depths 1 or 3, white and black are in and out of the shaped window, respectively, and other colors give intermediate masking scores. This function does nothing with class Fl_Gl_Window.

The window borders and caption created by the window system are turned off by default. They can be re-enabled by calling Fl_Window::border(1).

A usage example is found at example/shapedwindow.cxx.

Version 1.3.3

12.163.3.52 show() [1/2]

void Fl_Window::show ( ) [virtual]

Puts the window on the screen.
This has the side effect of opening the display, if not done before. If the window is already shown then it is restored and raised to the top. This is really convenient because your program can call show() at any time, even if the window is already up. It also means that show() serves the purpose of raise() in other toolkits.

Fl_Window::show(int argc, char **argv) is used for top-level windows and allows standard arguments to be parsed from the command-line.

Note

For some obscure reasons Fl_Window::show() resets the current group by calling Fl_Group::current(0). The comments in the code say "get rid of very common user bug: forgot end()". Although this is true it may have unwanted side effects if you show() an unrelated window (maybe for an error message or warning) while building a window or any other group widget.

Todo Check if we can remove resetting the current group in a later FLTK version (after 1.3.x). This may break "already broken" programs though if they rely on this "feature".

See also

Fl_Window::show(int argc, char **argv)

Reimplemented from Fl_Widget.
void Fl_Window::show (
    int argc,
    char ** argv )
Puts the window on the screen with show() and parses command-line arguments.
This call should be used for top-level windows, at least for the first (main) window. It allows standard arguments to be parsed, as done by Fl::args(int, char **), from the command-line. You can use argc and argv from main(int argc, char ** argv) for this call.
This call also sets up some system-specific internal variables, that is, it sets FL_SELECTION_COLOR and calls Fl::background(), Fl::background2(), Fl::foreground() with default or X resources-given values, and calls Fl::scheme(const char *) for the current scheme. On X11, it also calls Fl::dnd_text_ops(int), Fl::ToolTip::enable(int), Fl::visible_focus(int) with X resources-given values.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>argc</td>
<td>command-line argument count, usually from main()</td>
</tr>
<tr>
<td>argv</td>
<td>command-line argument vector, usually from main()</td>
</tr>
</tbody>
</table>

See also

virtual void Fl_Window::show()
    Fl::args(int, char **)

static char Fl_Window::show_next_window_iconic ( ) [inline], [static]
Returns the static flag whether the next window should be opened iconified.

Note

This is an internal function, you should not use this in user code.
Please use Fl_Window::iconize() to iconify a window.

static void Fl_Window::show_next_window_iconic ( char stat ) [inline], [static]
Sets a static flag whether the next window should be opened iconified.

Note

This is an internal function, you should not use this in user code.
Please use Fl_Window::iconize() instead.

int Fl_Window::shown ( ) [inline]
Returns non-zero if show() has been called (but not hide()).
You can tell if a window is iconified with (w->shown() && lw->visible()).

void Fl_Window::size_range ( 
    int minWidth,
    int minHeight,
    int maxWidth = 0,
    int maxHeight = 0,
Sets the allowable range the user can resize this window to.

We recommend to call `size_range()` if you have a `resizable()` widget in a main window, and to call it after setting the `resizable()` and before `show()`ing the window for best cross platform compatibility.

If this function is not called, FLTK tries to figure out the range when the window is shown. Please see the protected method `default_size_range()` for details.

It is undefined what happens if the current window size does not fit in the constraints passed to `size_range()`.

**Note**

This only works for top-level windows and the exact behavior can be platform specific. To work correctly across all platforms `size_range()` must be called after setting the `resizable()` widget of the window and before the window is `show()`'n.

Calling `size_range()` after the window has been shown may work on some but not all platforms. If you need to change the `size_range()` after the window has been shown, then you should consider to `hide()` and `show()` the window again, i.e. call `hide()`, `size_range()`, and `show()` in this order.

Typical usage: call `size_range(minWidth, minHeight);`

after setting the resizable widget and before calling `show()`. This ensures that the window cannot be resized smaller than the given values by user interaction.

`maxWidth` and `maxHeight` might be useful in some special cases but less frequently used.

The other optional parameters `deltaX`, `deltaY`, and `aspectRatio` are not recommended because they may not work on all platforms and may even under X11 not be supported by all Window Managers.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>minWidth,minHeight</code></td>
<td>The smallest the window can be. Either value must be greater than 0.</td>
</tr>
<tr>
<td><code>maxWidth,maxHeight</code></td>
<td>The largest the window can be. If either is equal to the minimum then you cannot resize in that direction. If either is zero then FLTK picks a maximum size in that direction such that the window will fill the screen.</td>
</tr>
<tr>
<td><code>deltaX,deltaY</code></td>
<td>These are size increments. The window will be constrained to widths of <code>minWidth + N * deltaX</code>, where N is any non-negative integer. If these are less or equal to 1 they are ignored (this is always ignored on Windows).</td>
</tr>
<tr>
<td><code>aspectRatio</code></td>
<td>A flag that indicates that the window should preserve its aspect ratio. This only works if both the maximum and minimum have the same aspect ratio (ignored on Windows and by many X window managers).</td>
</tr>
</tbody>
</table>

### 12.163.3.58 un_maximize()

`void Fl_Window::un_maximize ( )`

Returns a previously maximized top-level window to its previous size.

See also

`Fl_Window::maximize()`

### 12.163.3.59 wait_for_expose()

`void Fl_Window::wait_for_expose ( )`

 Waits for the window to be displayed after calling `show()`.

`Fl_Window::show()` is not guaranteed to show and draw the window on all platforms immediately. Instead this is done in the background; particularly on X11 it will take a few messages (client server roundtrips) to display the window. Usually this small delay doesn't matter, but in some cases you may want to have the window instantiated and displayed synchronously.

Currently (as of FLTK 1.3.4) this method has an effect on X11 and Mac OS. On Windows, `show()` is always synchronous. The effect of `show()` varies with versions of Mac OS X: early versions have the window appear on the
screen when `show()` returns, later versions don't. If you want to write portable code and need this synchronous `show()` feature, add `win->wait_for_expose()` on all platforms, and FLTK will just do the right thing.

This method can be used for displaying splash screens before calling `Fl::run()` or for having exact control over which window has the focus after calling `show()`.

If the window is not `shown()`, this method does nothing.

Note

Depending on the platform and window manager `wait_for_expose()` may not guarantee that the window is fully drawn when it is called. Under X11 it may only make sure that the window is mapped, i.e. the internal (OS dependent) window object was created (and maybe shown on the desktop as an empty frame or something like that). You may need to call `Fl::flush()` after `wait_for_expose()` to make sure the window and all its widgets are drawn and thus visible.

FLTK does the best it can do to make sure that all widgets get drawn if you call `wait_for_expose()` and `Fl::flush()`. However, dependent on the window manager it can not be guaranteed that this does always happen synchronously. The only guaranteed behavior that all widgets are eventually drawn is if the FLTK event loop is run continuously, for instance with `Fl::run()`.

See also

```c
virtual void Fl_Window::show()
```

Example code for displaying a window before calling `Fl::run()`

```c
Fl_Double_Window win = new Fl_Double_Window(...);
// do more window initialization here ...
win->show(); // show window
win->wait_for_expose(); // wait, until displayed
Fl::flush(); // make sure everything gets drawn
// do more initialization work that needs some time here ...
Fl::run(); // start FLTK event loop
```

Note that the window will not be responsive until the event loop is started with `Fl::run()`.

### 12.163.3.60 xclass() [1/2]

```c
const char * Fl_Window::xclass() const
```

Returns the xclass for this window, or a default.

See also

```c
Fl_Window::default_xclass(const char *)
Fl_Window::xclass(const char *)
```

### 12.163.3.61 xclass() [2/2]

```c
void Fl_Window::xclass(
    const char * xc
)
```

Sets the xclass for this window. A string used to tell the system what type of window this is. Mostly this identifies the picture to draw in the icon. This only works if called before calling `show()`.

*Under X*, this is turned into a `XA_WM_CLASS` pair by truncating at the first non-alphanumeric character and capitalizing the first character, and the second one if the first is 'x'. Thus "foo" turns into "foo, Foo", and "xprog.1" turns into "xprog, XProg".

*Under Microsoft Windows*, this string is used as the name of the `WNDCLASS` structure, though it is not clear if this can have any visible effect.

Since

FLTK 1.3 the passed string is copied. You can use a local variable or free the string immediately after this call. Note that FLTK 1.1 stores the `pointer` without copying the string.

If the default xclass has not yet been set, this also sets the default xclass for all windows created subsequently.
12.163.4 Member Data Documentation

12.163.4.1 current_

Fl_Window * Fl_Window::current_ [static], [protected]
Stores the last window that was made current.
See current() const
The documentation for this class was generated from the following files:

- Fl_Window.H
- Fl_arg.cxx
- fl_cursor.cxx
- Fl_Window.cxx
- Fl_Window_fullscreen.cxx
- Fl_Window_hotspot.cxx
- Fl_Window_iconize.cxx

12.164 Fl_Wizard Class Reference

This widget is based off the Fl_Tabs widget, but instead of displaying tabs it only changes "tabs" under program control.

#include <Fl_Wizard.H>

Inheritance diagram for Fl_Wizard:

```
Fl_Widget
   |      ___________
   |      |          |
   |      |          |
   v      Fl_Group
         |          |
         v          |
         Fl_Wizard
```

Public Member Functions

- **Fl_Wizard** (int, int, int, int, const char * = 0)
  
  The constructor creates the Fl_Wizard widget at the specified position and size.

- **void next ()**
  
  This method shows the next child of the wizard.

- **void prev ()**
  
  Shows the previous child.

- **Fl_Widget * value ()**
  
  Gets the current visible child widget.

- **void value (Fl_Widget *)**
  
  Sets the child widget that is visible.

Public Member Functions inherited from Fl_Group

- **Fl_Widget * & _ddfdesign_kludge ()**
  
  This is for forms compatibility only.

- **void add (Fl_Widget &)**
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void add (Fl_Widget *o)**
See void Fl_Group::add(Fl_Widget &w)
• void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
• Fl_Widget +const + array () const
  Returns a pointer to the array of children.
• Fl_Group const + as_group () const FL OVERRIDE
• Fl_Group + as_group () FL OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
• Fl_Widget * child (int n) const
  Returns array()[n].
• int children () const
  Returns how many child widgets the group has.
• void clear ()
  Deletes all child widgets from memory recursively.
• unsigned int clip_children ()
  Returns the current clipping mode.
• void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
• virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
• void end ()
  Exactly the same as current(this->parent()).
• int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
• int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
• Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.
• void focus (Fl_Widget *)
• void forms_end ()
  This is for forms compatibility only.
• int handle (int) FL OVERRIDE
  Handles the specified event.
• void init_sizes ()
  Resets the internal array of widget sizes and positions.
• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
• void insert (Fl_Widget &o, Fl_Widget * before)
  This does insert(w, find(before)).
• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
• void remove (Fl_Widget *)
  Removes the widget o from the group.
• void remove (int index)
  Removes the widget at index from the group but does not delete it.
• Fl_Widget * resizable () const
  Returns the group's resizable widget.
• void resizable (Fl_Widget &o)
  Sets the group's resizable widget.
• void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• void resize (int, int, int, int) FL_OVERRIDE
  Resizes the Fl_Group widget and all of its children.

• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.

• unsigned int active () const
  Returns whether the widget is active.

• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * as_gl_window () const

• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * as_window () const

• void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
Sets the image to use as part of the widget label when in the inactive state.

- int `deimage_bound()` const
  Returns whether the inactive image is managed by the widget.

- void `do_callback (Fl_Callback* reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.

- void `do_callback (Fl_Widget* widget, long arg, Fl_Callback* reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- void `do_callback (Fl_Widget* widget, void* arg=0, Fl_Callback* reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- void `draw_label (int, int, int, int, Fl_Align) const`
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int `h()` const
  Gets the widget height.

- virtual void `hide()`
  Makes a widget invisible.

- Fl_Image* `image()`
  Gets the image that is used as part of the widget label when in the active state.

- const Fl_Image* `image() const`
  Gets the image that is used as part of the widget label when in the active state.

- void `image (Fl_Image& img)`
  Sets the image to use as part of the widget label when in the active state.

- void `image (Fl_Image* img)`
  Sets the image to use as part of the widget label when in the active state.

- int `image_bound()` const
  Returns whether the image is managed by the widget.

- int `inside (const Fl_Widget* wgt) const`
  Checks if this widget is a child of `wgt`.

- int `is_label_copied()` const
  Returns whether the current label was assigned with `copy_label()`.

- const char* `label()` const
  Gets the current label text.

- void `label (const char* text)`
  Sets the current label pointer.

- void `label (Fl_Labeltype a, const char* b)`
  Shortcut to set the label text and type in one call.

- Fl_Color `labelcolor()` const
  Gets the label color.

- void `labelcolor (Fl_Color c)`
  Sets the label color.

- Fl_Font `labelfont()` const
  Gets the font to use.

- void `labelfont (Fl_Font f)`
  Sets the font to use.

- Fl_Fontsize `labelsiz()` const
  Gets the font size in pixels.

- void `labelsiz (Fl_Fontsize pix)`
  Sets the font size in pixels.

- Fl_Labeltype `labeltype()` const
  Gets the label type.

- void `labeltype (Fl_Labeltype a)`
  Sets the label type.
- `void measure_label (int &ww, int &hh) const`
  
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  
  Internal use only - “for hacks only”.

- `void position (int X, int Y)`
  
  Repositions the window or widget.

- `void redraw ()`
  
  Schedules the drawing of the widget.

- `void redraw_label ()`
  
  Schedules the drawing of the label.

- `Fl_Color selection_color () const`
  
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  
  Sets the selection color.

- `void set_active ()`
  
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  
  Marks the value of the widget as changed.

- `void set_output ()`
  
  Sets a widget to output only.

- `void set_visible ()`
  
  Makes the widget visible.

- `void set_visible_focus ()`
  
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- `void shortcut_label (int value)`
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- `virtual void show ()`
  
  Makes a widget visible.

- `void size (int W, int H)`
  
  Changes the size of the widget.

- `int take_focus ()`
  
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  
  Returns if the widget is able to take events.

- `int testShortcut ()`
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- `const char * tooltip () const`
  
  Gets the current tooltip text.

- `void tooltip (const char *text)`
  
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.

- `int use_accents_menu ()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void * user_data () const`
  Gets the user data for this widget.

- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
  Sets the user data for this widget.

- `void user_data (void *v)`
  Sets the user data for this widget.

- `unsigned int visible () const`
  Returns whether a widget is visible.

- `unsigned int visible_focus () const`
  Checks whether this widget has a visible focus.

- `void visible_focus (int v)`
  Modifies keyboard focus navigation.

- `int visible_r () const`
  Returns whether a widget and all its parents are visible.

- `int w () const`
  Gets the widget width.

- `Fl_When when () const`
  Returns the conditions under which the callback is called.

- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- `virtual ~Fl_Widget ()`
  Destroys the widget.

Protected Member Functions

- `void draw () FL_OVERRIDE`
  Draws the wizard border and visible child.

Protected Member Functions inherited from Fl_Group

- `Fl_Rect * bounds ()`
  Returns the internal array of widget sizes and positions.

- `void draw_child (Fl_Widget &widget) const`
  Forces a child to redraw.

- `void draw_children ()`
  Draws all children of the group.

- `void draw_outside_label (const Fl_Widget &widget) const`
Parents normally call this to draw outside labels of child widgets.

- virtual int on_insert (Fl_Widget *, int)
  
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  
  Allow derived groups to act when a child widget is removed from the group.
- int * sizes ()
  
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.
- void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.
- void FL_Widget (int x, int y, int w, int h, const char *label=0L)
  
  Creates a widget at the given position and size.
- unsigned int flags () const
  
  Gets the widget flags mask.
- void h (int v)
  
  Internal use only.
- void set_flag (unsigned int c)
  
  Sets a flag in the flags mask.
- void w (int v)
  
  Internal use only.
- void x (int v)
  
  Internal use only.
- void y (int v)
  
  Internal use only.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  
  Returns the currently active group.
- static void current (Fl_Group *g)
  
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
    INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
    FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
    OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
    MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
    GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCEPTS_MENU = 1<<19 ,
    NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
    AUTO_DELETE_USER_DATA = 1<<23 ,
    MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }

  flags possible values enumeration.

12.164.1 Detailed Description

This widget is based off the Fl_Tabs widget, but instead of displaying tabs it only changes "tabs" under program control.
Its primary purpose is to support "wizards" that step a user through configuration or troubleshooting tasks.
As with Fl_Tabs, wizard panes are composed of child (usually Fl_Group) widgets. Navigation buttons must be added separately.

12.164.2 Constructor & Destructor Documentation

12.164.2.1 Fl_Wizard()

Fl_Wizard::Fl_Wizard (  
  int xx,
  int yy,
  int ww,
  int hh,
  const char * l = 0 )

The constructor creates the Fl_Wizard widget at the specified position and size.
The inherited destructor destroys the widget and its children.
12.164.3 Member Function Documentation

12.164.3.1 draw()

void Fl_Wizard::draw (  
  void ) [protected], [virtual]  
Draws the wizard border and visible child.  
Reimplemented from Fl_Group.

12.164.3.2 next()

void Fl_Wizard::next ( )  
This method shows the next child of the wizard.  
If the last child is already visible, this function does nothing.

The documentation for this class was generated from the following files:

- Fl_Wizard.H
- Fl_Wizard.cxx

12.165 Fl_XBM_Image Class Reference

The Fl_XBM_Image class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.

#include <Fl_XBM_Image.H>

Inheritance diagram for Fl_XBM_Image:

```
Fl_XBM_Image
  Fl_Bitmap
  Fl_Image
```

Public Member Functions

- **Fl_XBM_Image** (const char ∗filename)  
  The constructor loads the named XBM file from the given name filename.

Public Member Functions inherited from Fl_Bitmap

- int cache_h ()
- int cache_w ()
- Fl_Image ∗copy () const  
  Creates a resized copy of the image.
- void draw (int X, int Y)  
- void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE  
  Draws the image to the current drawing surface with a bounding box.
- Fl_Bitmap (const char ∗bits, int bits_length, int W, int H)  
  The constructors create a new bitmap from the specified bitmap data.
- Fl_Bitmap (const char ∗bits, int W, int H)  
  The constructors create a new bitmap from the specified bitmap data.
- Fl_Bitmap (const uchar ∗bits, int bits_length, int W, int H)  
  The constructors create a new bitmap from the specified bitmap data.
- Fl_Bitmap (const uchar ∗bits, int W, int H)  
  The constructors create a new bitmap from the specified bitmap data.
The constructors create a new bitmap from the specified bitmap data.

- `void label (Fl_Menu_Item *m) FL_OVERRIDE`  
  This method is an obsolete way to set the image attribute of a menu item.

- `void label (Fl_Widget *w) FL_OVERRIDE`  
  This method is an obsolete way to set the image attribute of a widget or menu item.

- `void uncache () FL_OVERRIDE`  
  If the image has been cached for display, delete the cache data.

- `virtual ~Fl_Bitmap ()`  
  The destructor frees all memory and server resources that are used by the bitmap.

Public Member Functions inherited from `Fl_Image`

- `virtual class Fl_Shared_Image * as_shared_image ()`  
  Returns whether an image is an `Fl_Shared_Image` or not.

- `virtual void color_average (Fl_Color c, float i)`  
  The `color_average()` method averages the colors in the image with the provided FLTK color value.

- `Fl_Image * copy () const`  
  Creates a copy of the image in the same size.

- `int count () const`  
  Returns the number of data values associated with the image.

- `int d () const`  
  Returns the image depth.

- `const char * const * data () const`  
  Returns a pointer to the current image data array.

- `int data_h () const`  
  Returns the height of the image data.

- `int data_w () const`  
  Returns the width of the image data.

- `virtual void desaturate ()`  
  The `desaturate()` method converts an image to grayscale.

- `void draw (int X, int Y)`  
  Draws the image to the current drawing surface.

- `int fail () const`  
  Returns a value that is not 0 if there is currently no image available.

- `Fl_Image (int W, int H, int D)`  
  The constructor creates an empty image with the specified width, height, and depth.

- `int h () const`  
  Returns the current image drawing height in FLTK units.

- `void inactive ()`  
  The `inactive()` method calls `color_average(FL_BACKGROUND_COLOR, 0.33f)` to produce an image that appears grayed out.

- `int ld () const`  
  Returns the current line data size in bytes.

- `virtual void release ()`  
  Releases an `Fl_Image` - the same as 'delete this'.

- `virtual void scale (int width, int height, int proportional=1, int can_expand=0)`  
  Sets the drawing size of the image.

- `int w () const`  
  Returns the current image drawing width in FLTK units.

- `virtual ~Fl_Image ()`  
  The destructor is a virtual method that frees all memory used by the image.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Image

- static Fl_Labeltype define_FL_IMAGE_LABEL()
- static Fl_RGB_Scaling RGB_scaling()
  Returns the currently used RGB image scaling method.
- static void RGB_scaling(Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
- static Fl_RGB_Scaling scaling_algorithm()
  Gets what algorithm is used when resizing a source image to draw it.
- static void scaling_algorithm(Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.

Public Attributes inherited from Fl_Bitmap

- int alloc_array
  Non-zero if array points to bitmap data allocated internally.
- const uchar *array
  Pointer to raw bitmap data

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  True after fl_register_images() was called, false before.

Protected Member Functions inherited from Fl_Image

- void d(int D)
  Sets the current image depth.
- void data(const char *const *p, int c)
  Sets the current data pointer and count of pointers in the array.
- void draw_empty(int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled(int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h(int H)
  Sets the height of the image data.
- void ld(int LD)
  Sets the current line data size in bytes.
- void w(int W)
  Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype(const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure(const Fl_Label *lo, int &lw, int &lh)

12.165.1 Detailed Description

The Fl_XBM_Image class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.
12.165.2 Constructor & Destructor Documentation

12.165.2.1 Fl_XBM_Image()

Fl_XBM_Image::Fl_XBM_Image (const char ∗ name )
The constructor loads the named XBM file from the given name filename.
The destructor frees all memory and server resources that are used by the image.
The documentation for this class was generated from the following files:

- Fl_XBM_Image.H
- Fl_XBM_Image.cxx

12.166 Fl_XColor Struct Reference

Public Attributes

- unsigned char b
- unsigned char g
- unsigned char mapped
- unsigned long pixel
- unsigned char r

The documentation for this struct was generated from the following file:

- Fl_XColor.H

12.167 Fl_XPM_Image Class Reference

The Fl_XPM_Image class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.
#include <Fl_XPM_Image.H>

Inheritance diagram for Fl_XPM_Image:

```
Fl_Web
    Fl_XPM_Image
```

Public Member Functions

- Fl_XPM_Image (const char ∗ filename)
  The constructor loads the XPM image from the name filename.

Public Member Functions inherited from Fl_Pixmap

- int cache_h ()
- int cache_w ()
- void color_average (Fl_Color c, float i) FL_OVERRIDE
  The color_average() method averages the colors in the image with the provided FLTK color value.
- Fl_Image ∗ copy () const
- Fl_Image ∗ copy (int W, int H) const FL_OVERRIDE
  Creates a resized copy of the image.
- void desaturate () FL_OVERRIDE

Generated by Doxygen
The desaturate() method converts an image to grayscale.

- void **draw** (int X, int Y)
- void **draw** (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  Draws the image to the current drawing surface with a bounding box.

- **Fl_Pixmap** (char ∗ const ∗ D)
  The constructors create a new pixmap from the specified XPM data.

- **Fl_Pixmap** (const char ∗ const ∗ D)
  The constructors create a new pixmap from the specified XPM data.

- **Fl_Pixmap** (const uchar ∗ const ∗ D)
  The constructors create a new pixmap from the specified XPM data.

- **Fl_Pixmap** (uchar ∗ const ∗ D)
  The constructors create a new pixmap from the specified XPM data.

- void **label** (Fl_Menu_Item ∗ m) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a menu item.

- void **label** (Fl_Widget ∗ w) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a widget or menu item.

- void **uncache** () FL_OVERRIDE
  If the image has been cached for display, delete the cache data.

- virtual ~**Fl_Pixmap** ()
  The destructor frees all memory and server resources that are used by the pixmap.

### Public Member Functions inherited from Fl_Image

- virtual class **Fl_Shared_Image** ∗ **as_shared_image** ()
  Returns whether an image is an Fl_Shared_Image or not.

- **Fl_Image** ∗ **copy** () const
  Creates a copy of the image in the same size.

- int **count** () const
  Returns the number of data values associated with the image.

- int **d** () const
  Returns the image depth.

- const char ∗ const ∗ **data** () const
  Returns a pointer to the current image data array.

- int **data_h** () const
  Returns the height of the image data.

- int **data_w** () const
  Returns the width of the image data.

- void **draw** (int X, int Y)
  Draws the image to the current drawing surface.

- int **fail** () const
  Returns a value that is not 0 if there is currently no image available.

- **Fl_Image** (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.

- int **h** () const
  Returns the current image drawing height in FLTK units.

- void **inactive** ()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

- int **ld** () const
  Returns the current line data size in bytes.

- virtual void **release** ()
Releases an `Fl_Image` - the same as `delete this`.

- virtual void `scale` (int width, int height, int proportional=1, int can_expand=0)
  
  Sets the drawing size of the image.

- int `w` () const

  Returns the current image drawing width in FLTK units.

- virtual `~Fl_Image` ()

  The destructor is a virtual method that frees all memory used by the image.

### Additional Inherited Members

#### Static Public Member Functions inherited from `Fl_Image`

- static `Fl_Labeltype define_FL_IMAGE_LABEL`

- static `Fl_RGB_Scaling RGB_scaling`

  Returns the currently used RGB image scaling method.

- static void `RGB_scaling (Fl_RGB_Scaling)`

  Sets the RGB image scaling method used for `copy(int, int)`.

- static `Fl_RGB_Scaling scaling_algorithm`

  Gets what algorithm is used when resizing a source image to draw it.

- static void `scaling_algorithm (Fl_RGB_Scaling algorithm)`

  Sets what algorithm is used when resizing a source image to draw it.

#### Public Attributes inherited from `Fl_Pixmap`

- int `alloc_data`

#### Static Public Attributes inherited from `Fl_Image`

- static const int `ERR_FILE_ACCESS = -2`

- static const int `ERR_FORMAT = -3`

- static const int `ERR_MEMORY_ACCESS = -4`

- static const int `ERR_NO_IMAGE = -1`

- static bool `register_images_done = false`

  True after `fl_register_images()` was called, false before.

#### Protected Member Functions inherited from `Fl_Pixmap`

- void `measure` ()

#### Protected Member Functions inherited from `Fl_Image`

- void `d` (int D)

  Sets the current image depth.

- void `data` (const char *const *p, int c)

  Sets the current data pointer and count of pointers in the array.

- void `draw_empty` (int X, int Y)

  The protected method `draw_empty()` draws a box with an `X` in it.

- int `draw_scaled` (int X, int Y, int W, int H)

  Draw the image to the current drawing surface rescaled to a given width and height.

- void `h` (int H)

  Sets the height of the image data.

- void `ld` (int LD)

  Sets the current line data size in bytes.

- void `w` (int W)

  Sets the width of the image data.
Static Protected Member Functions inherited from Fl_image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

12.167.1 Detailed Description

The Fl_XPM_Image class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.

12.167.2 Constructor & Destructor Documentation

12.167.2.1 Fl_XPM_Image()

Fl_XPM_Image::Fl_XPM_Image (const char * name )

The constructor loads the XPM image from the name filename.
The destructor frees all memory and server resources that are used by the image.
The documentation for this class was generated from the following files:
- Fl_XPM_Image.H
- Fl_XPM_Image.cxx

12.168 Fl_GIF_Image::GIF_FRAME Struct Reference

Classes

- struct CPAL

Public Member Functions

- void colors (int nclrs, int bg, int tp)

12.171  Fl_ICO_Image::IconDirEntry Struct Reference

Windows ICONDIRENTRY structure

#include <Fl_ICO_Image.H>

Public Attributes

- `int bColorCount`
  
  Number of colors (0 if 8bpp)
- `int bHeight`
  
  Image height.
- `int bReserved`
  
  Reserved.
- `int bWidth`
  
  Image width.
- `int dwBytesInRes`
  
  Resource size in bytes.
- `int dwImageOffset`
  
  Offset to the image.
- `int wBitCount`
  
  Bits per pixel.
- `int wPlanes`
  
  Color Planes.
12.171.1 Detailed Description

Windows ICONDIRENTRY structure

The documentation for this struct was generated from the following file:

- Fl_ICO_Image.H

12.172 Fl_Text_Editor::Key_Binding Struct Reference

Simple linked list item associating a key/state to a function.

```
#include <Fl_Text_Editor.H>
```

**Public Attributes**

- `Key_Func` function
  - associated function
- `int key`
  - the key pressed
- `Key_Binding * next`
  - next key binding in the list
- `int state`
  - the state of key modifiers

12.172.1 Detailed Description

Simple linked list item associating a key/state to a function.

The documentation for this struct was generated from the following file:

- Fl_Text_Editor.H

12.173 Fl_Terminal::Margin Class Reference

**Public Member Functions**

- `void bottom (int val)`
- `int bottom (void) const`
- `void left (int val)`
- `int left (void) const`
- `void right (int val)`
- `int right (void) const`
- `void top (int val)`
- `int top (void) const`

The documentation for this class was generated from the following file:

- Fl_Terminal.H

12.174 Fl_Preferences::Name Class Reference

'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.

```
#include <Fl_Preferences.H>
```
Public Member Functions

- **Name** (const char ∗format,...)
  Creates a group name or entry name on the fly.
- **Name** (unsigned int n)
  Creates a group name or entry name on the fly.
- **operator const char ∗()**
  Return the Name as a "C" string.

12.174.1 Detailed Description

`Name` provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.

Example: prefs.set(Fl_Preferences::Name("File%d",i),file[i]);
See test/preferences.cxx as a sample for writing arrays into preferences.

`Name` is actually implemented as a class inside Fl_Preferences. It casts into const char* and gets automatically destroyed after the enclosing call ends.

12.174.2 Constructor & Destructor Documentation

12.174.2.1 Name() [1/2]

Fl_Preferences::Name::Name (unsigned int n)

Creates a group name or entry name on the fly.
This version creates a simple unsigned integer as an entry name.

int n, i;
Fl_Preferences prev( appPrefs, "PreviousFiles" );
prev.get( "n", 0 );
for ( i=0; i<n; i++ )
  prev.get( Fl_Preferences::Name(i), prevFile[i], "" );

12.174.2.2 Name() [2/2]

Fl_Preferences::Name::Name (const char ∗format, ...)

Creates a group name or entry name on the fly.
This version creates entry names as in 'printf'.

int n, i;
Fl_Preferences prefs( USER, "matthiasm.com", "test" );
prefs.get( "nFiles", 0 );
for ( i=0; i<n; i++ )
  prefs.get( Fl_Preferences::Name("File%d", i), prevFile[i], "" );

The documentation for this class was generated from the following files:

- Fl_Preferences.H
- Fl_Preferences.cxx

12.175 Fl_Preferences::Node Class Reference

Public Member Functions

- **void add** (const char ∗line)
- **Node ∗addChild** (const char ∗path)
- **const char ∗child** (int ix)
- **Node ∗childNode** (int ix)
- **void clearDirtyFlags** ()
- **void deleteAllChildren** ()
- **void deleteAllEntries** ()
- **char deleteEntry** (const char ∗name)
• char dirty ()
• Entry & entry (int i)
• Node * find (const char *path)
• RootNode * findRoot ()
const char * get (const char *name)
• int getEntry (const char *name)
• const char * name ()

The documentation for this class was generated from the following files:

* FI_Preferences.H
* FI_Preferences.cxx

### 12.180 FI_Scroll::ScrollInfo Struct Reference

Structure to manage scrollbar and widget interior sizes.

```
#include <Fl_Scroll.H>
```

#### Public Attributes

- FL_Region_LRTB child
  - child bounding box: left/right/top/bottom
- int hneeded
  - horizontal scrollbar visibility
- FI_Scrollbar_Data hscroll
  - horizontal scrollbar region + values
- FL_Region_XYWH innerbox
  - widget's inner box, excluding scrollbars
- FL_Region_XYWH innerchild
  - widget's inner box, including scrollbars
- int scrollsize
  - the effective scrollbar thickness (local or global)
- int vneeded
  - vertical scrollbar visibility
- FI_Scrollbar_Data vscroll
  - vertical scrollbar region + values
12.180.1 Detailed Description

Structure to manage scrollbar and widget interior sizes. This is filled out by `recalc_scrollbars()` for use in calculations that need to know the visible scroll area size, etc.

Version

1.3.3

The documentation for this struct was generated from the following file:

- Fl_Scroll.H

12.181 Fl_Terminal::Selection Class Reference

Public Member Functions

- bool `clear` (void)
- bool `dragged_off` (int row, int col)
- int `ecol` (void) const
- void `end` (void)
- int `erow` (void) const
- bool `extend` (int row, int col)
- bool `get_selection` (int &srow, int &scol, int &erow, int &ecol) const
  
  Return selection start/end.
- bool `is_selection` (void) const
- void `push_clear` ()
- void `push_rowcol` (int row, int col)
- int `scol` (void) const
- void `scroll` (int nrows)
- void `select` (int srow, int scol, int erow, int ecol)
- void `selectionbgcolor` (Fl_Color val)
- Fl_Color `selectionbgcolor` (void) const
- void `selectionfgcolor` (Fl_Color val)
- Fl_Color `selectionfgcolor` (void) const
- int `srow` (void) const
- bool `start` (int row, int col)
- void `start_push` ()
- int `state` (void) const

12.181.1 Member Function Documentation

12.181.1.1 get_selection()

```cpp
bool Fl_Terminal::Selection::get_selection (  
    int & srow,
    int & scol,
    int & erow,
    int & ecol ) const
```

Return selection start/end.

Ensure (start < end) to allow walking 'forward' thru selection, left-to-right, top-to-bottom.

Returns:

- true – valid selection values returned
- false – no selection was made, returned values undefined

The documentation for this class was generated from the following files:

- Fl_Terminal.H
- Fl_Terminal.cxx

Generated by Doxygen
12.182  **Fl_Tile::Size_Range Struct Reference**

Public Attributes

- int maxh
- int maxw
- int minh
- int minw

The documentation for this struct was generated from the following file:

- Fl_Tile.H

12.183  **Fl_Text_Display::Style_Table_Entry Struct Reference**

This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.

#include <Fl_Text_Display.H>

Public Attributes

- unsigned attr
  further attributes for the text style (see ATTR_BGCOLOR, etc.)
- Fl_Color bgcolor
  text background color if ATTR_BGCOLOR or ATTR_BGCOLOR_EXT is set
- Fl_Color color
  text color
- Fl_Font font
  text font
- Fl_Fontsize size
  text font size

12.183.1 Detailed Description

This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr. There must be one entry for each style that can be used in an Fl_Text_Display for displaying text. The style table is an array of struct Style_Table_Entry. The style table is associated with an Fl_Text_Display by using Fl_Text_Display::highlight_data().

• FL_Terminal.hxx
Chapter 13

File Documentation

13.1 Enumerations.H File Reference

This file contains type definitions and general enumerations.
#include <FL/fl_config.h>
#include "Fl_Export.H"
#include "fl_types.h"
#include <FL/platform_types.h>

Macros

• #define FL_IMAGE_WITH_ALPHA 0x40000000

Version Numbers

FLTK defines some constants to help the programmer to find out, for which FLTK version a program is compiled.
The following constants are defined:

• #define FL_ABI_VERSION FL_API_VERSION
  The FLTK ABI (Application Binary Interface) version number as an int.
• #define FL_API_VERSION (FL_MAJOR_VERSION*10000 + FL_MINOR_VERSION*100 + FL_PATCH_VERSION)
  The FLTK API version number as an int.
• #define FL_MAJOR_VERSION 1
  The major release version of this FLTK library.
• #define FL_MINOR_VERSION 4
  The minor release version for this library.
• #define FL_PATCH_VERSION 0
  The patch version for this library.
• #define FL_VERSION
  The FLTK version number as a double.

Names of Non-ASCII keys and mouse buttons

The following constants define the names of non-ASCII keys on the keyboard and of mouse buttons for FL←KEYBOARD and FL_SHORTCUT events.

See also

Fl::event_key() and Fl::get_key(int) (use ASCII letters for all other keys):

• #define FL_Alt_L 0xffe9
  The left alt key.
• #define FL_Alt_R 0xffea
  The right alt key.
• #define FL_Back 0xEF26
  Like back on a browser.
• \#define FL_BackSpace 0xff08
  The backspace key.
• \#define FL_Button 0xfee8
  A mouse button; use FL_Button + n for mouse button n.
• \#define FL_Caps_Lock 0xffe5
  The caps lock key.
• \#define FL_Control_L 0xffe3
  The lefthand control key.
• \#define FL_Control_R 0xffe4
  The righthand control key.
• \#define FL_Delete 0xffff
  The delete key.
• \#define FL_Down 0xff54
  The down arrow key.
• \#define FL_Eisu 0xff2f
  The Eisu key of JIS keyboards.
• \#define FL_End 0xff57
  The end key.
• \#define FL_Enter 0xff0d
  The enter key.
• \#define FL_Escape 0xff1b
  The escape key.
• \#define FL_F 0xffbd
  One of the function keys; use FL_F + n for function key n.
• \#define FL_F_Last 0xffe0
  The last function key; use to range-check function keys.
• \#define FL_Favorites 0xEF30
  Show favorite locations.
• \#define FL_Forward 0xEF27
  Like forward on a browser.
• \#define FL_Help 0xff68
  The 'help' key on Mac keyboards.
• \#define FL_Home 0xff50
  The home key.
• \#define FL_Home_Page 0xEF18
  Display user's home page.
• \#define FL_Insert 0xff63
  The insert key.
• \#define FL_Iso_Key 0xff0c
  The additional key of ISO keyboards.
• \#define FL_JIS_Underscore 0xff31
  The underscore key of JIS keyboards.
• \#define FL_Kana 0xff2e
  The Kana key of JIS keyboards.
• \#define FL_KP 0xff80
  One of the keypad numbers; use FL_KP + 'n' for digit n.
• \#define FL_KP_Enter 0xff8d
  The enter key on the keypad, same as FL_KP+'r'.
• \#define FL_KP_Last 0xffbd
  The last keypad key; use to range-check keypad.
• \#define FL_Left 0xff51
  The left arrow key.
• \#define FL_Mail 0xEF19
  Invoke user's mail program.
• \#define FL_Media_Next 0xEF17
  Next track.
• \#define FL_Media_Play 0xEF14
  Start playing of audio.
• \#define FL_Media_Prev 0xEF16
# Enumerations.H

**File Reference 1967**

- **#define FL_Media_Stop** 0xEF15
  - Stop playing audio.
- **#define FL_Menu** 0xff67
  - The menu key.
- **#define FL_Meta_L** 0xffe7
  - The left meta/Windows key.
- **#define FL_Meta_R** 0xffe8
  - The right meta/Windows key.
- **#define FL_Num_Lock** 0xff7f
  - The num lock key.
- **#define FL_Page_Down** 0xff56
  - The page-down key.
- **#define FL_Page_Up** 0xff55
  - The page-up key.
- **#define FL_Pause** 0xff13
  - The pause key.
- **#define FL_Print** 0xff61
  - The print (or print-screen) key.
- **#define FL_Refresh** 0xEF29
  - Refresh the page.
- **#define FL_Right** 0xff53
  - The right arrow key.
- **#define FL_Scroll_Lock** 0xff14
  - The scroll lock key.
- **#define FL_Search** 0xEF1B
  - Search.
- **#define FL_Shift_L** 0xffe1
  - The lefthand shift key.
- **#define FL_Shift_R** 0xffe2
  - The righthand shift key.
- **#define FL_Sleep** 0xEF2F
  - Put system to sleep.
- **#define FL_Stop** 0xEF28
  - Stop current operation.
- **#define FL_Tab** 0xff09
  - The tab key.
- **#define FL_Up** 0xff52
  - The up arrow key.
- **#define FL_Volume_Down** 0xEF11
  - Volume control down.
- **#define FL_Volume_Mute** 0xEF12
  - Mute sound from the system.
- **#define FL_Volume_Up** 0xEF13
  - Volume control up.
- **#define FL_Yen** 0xff30
  - The Yen key of JIS keyboards.

**Mouse Buttons**

These constants define the button numbers for FL_PUSH and FL_RELEASE events.

See also

`Fl::event_button()`

- **#define FL_LEFT_MOUSE** 1
  - The left mouse button.
- **#define FL_MIDDLE_MOUSE** 2
  - The middle mouse button.
- **#define FL_RIGHT_MOUSE** 3

Generated by Doxygen
The right mouse button.

### Event States

The following constants define bits in the Fl::event_state() value.

- ```#define FL_ALT 0x00080000```
  One of the alt keys is down.
- ```#define FL_BUTTON(n) (0x00800000<<(n))```
  Mouse button n (n > 0) is pushed.
- ```#define FL_BUTTON1 0x01000000```
  Mouse button 1 is pushed.
- ```#define FL_BUTTON2 0x02000000```
  Mouse button 2 is pushed.
- ```#define FL_BUTTON3 0x04000000```
  Mouse button 3 is pushed.
- ```#define FL_BUTTONS 0x7f000000```
  Any mouse button is pushed.
- ```#define FL_CAPS_LOCK 0x00020000```
  The caps lock is on.
- ```#define FL_CTRL 0x00040000```
  One of the ctrl keys is down.
- ```#define FL_KEY_MASK 0x0000ffff```
  All keys are 16 bit for now.
- ```#define FL_META 0x00400000```
  One of the meta/Windows keys is down.
- ```#define FL_NUM_LOCK 0x00100000```
  The num lock is on.
- ```#define FL_SCROLL_LOCK 0x00800000```
  The scroll lock is on.
- ```#define FL_SHIFT 0x00010000```
  One of the shift keys is down.

### Typedefs

- ```typedef int Fl_Fontsize```
  Size of a font in pixels.

### Enumerations

- ```enum { FL_READ = 1 , FL_WRITE = 4 , FL_EXCEPT = 8 }```
  FD "when" conditions.
- ```enum Fl_Arrow_Type { FL_ARROW_SINGLE = 0x01 , FL_ARROW_DOUBLE = 0x02 , FL_ARROW_CHOICE = 0x03 , FL_ARROW_RETURN = 0x04 }```
  Arrow types define the type of arrow drawing function.
- ```enum Fl_Damage {
  FL_DAMAGE_CHILD = 0x01 , FL_DAMAGE_EXPOSE = 0x02 , FL_DAMAGE_SCROLL = 0x04 ,
  FL_DAMAGE_OVERLAY = 0x08 ,
  FL_DAMAGE_USER1 = 0x10 , FL_DAMAGE_USER2 = 0x20 , FL_DAMAGE_ALL = 0x80 }
```
  Damage masks.
- ```enum Fl_Event {
  FL_NO_EVENT = 0 , FL_PUSH = 1 , FL_RELEASE = 2 , FL_ENTER = 3 ,
  FL_LEAVE = 4 , FL_DRAG = 5 , FL_FOCUS = 6 , FL_UNFOCUS = 7 ,
  FL_KEYDOWN = 8 , FL_KEYBOARD = 9 , FL_KEYUP = 9 , FL_CLOSE = 10 ,
  FL_MOVE = 11 , FL_SHORTCUT = 12 , FL_DEACTIVATE = 13 , FL_ACTIVATE = 14 ,
  FL_HIDE = 15 , FL_SHOW = 16 , FL_PASTE = 17 , FL_SELECTIONCLEAR = 18 ,
  FL_MOUSEWHEEL = 19 , FL_DND_ENTER = 20 , FL_DND_DRAG = 21 , FL_DND_LEAVE = 22 ,
  FL_DND_RELEASE = 23 , FL_SCREEN_CONFIGURATION_CHANGED = 24 , FL_FULLSCREEN = 25 ,
  FL_ZOOM_GESTURE = 26 ,
  FL_ZOOM_EVENT = 27 }
```
Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application.

- `enum Fl_Labeltype {
  FL_NORMAL_LABEL = 0, FL_NO_LABEL, FL_SHADOW_LABEL, FL_ENGRAVED_LABEL,
  FL_EMBOSSED_LABEL, FL_MULTI_LABEL, FL_ICON_LABEL, FL_IMAGE_LABEL,
  FL_FREE_LABELTYPE
}

The `labeltype()` method sets the type of the label.

- `enum Fl_Mode {
  FL_RGB = 0, FL_INDEX = 1, FL_SINGLE = 0, FL_DOUBLE = 2,
  FL_ACCUM = 4, FL_ALPHA = 8, FL_DEPTH = 16, FL_STENCIL = 32,
  FL_RGB8 = 64, FL_MULTISAMPLE = 128, FL_STEREO = 256, FL_FAKE_SINGLE = 512,
  FL_OPENGL3 = 1024
}

These constants match `Glut`.

- `enum Fl_Orientation {
  FL_ORIENTATION_NONE = 0x00, FL_ORIENTATION_RIGHT = 0x00, FL_ORIENTATION_NE = 0x01,
  FL_ORIENTATION_UP = 0x02, FL_ORIENTATION_NW = 0x03, FL_ORIENTATION_LEFT = 0x04,
  FL_ORIENTATION_SW = 0x05, FL_ORIENTATION_DOWN = 0x06,
  FL_ORIENTATION_SE = 0x07
}

`Fl_Orientation` describes the orientation of a GUI element.

- `enum Fl_When {
  FL_WHEN_NEVER = 0, FL_WHEN_CHANGED = 1, FL_WHEN_NOT_CHANGED = 2, FL_WHEN_RELEASE = 4,
  FL_WHEN_RELEASE_ALWAYS = 6, FL_WHEN_ENTER_KEY = 8, FL_WHEN_ENTER_KEY_ALWAYS = 10,
  FL_WHEN_ENTER_KEY_CHANGED = 11, FL_WHEN_CLOSED = 16
}

These constants determine when a callback is performed.

- `enum Fl_Callback_Reason {
  FL_REASON_UNKNOWN = 0, FL_REASON_SELECTED, FL_REASON_DESELECTED, FL_REASON_RESELECTED,
  FL_REASON_OPENED, FL_REASON_CLOSED, FL_REASON_DRAGGED, FL_REASON_CANCELLED,
  FL_REASON_CHANGED, FL_REASON_GOT_FOCUS, FL_REASON_LOST_FOCUS, FL_REASON_RELEASED,
  FL_REASON_ENTER_KEY, FL_REASON_USER = 32
}

These constants describe why a callback is performed.

- `enum Fl_Cursor {
  FL_CURSOR_DEFAULT = 0, FL_CURSOR_ARROW = 35, FL_CURSOR_CROSS = 66,
  FL_CURSOR_WAIT = 76, FL_CURSOR_INSERT = 77, FL_CURSOR_HAND = 31, FL_CURSOR_HELP = 47,
  FL_CURSOR_MOVE = 27, FL_CURSOR_NS = 78, FL_CURSOR_WE = 79, FL_CURSOR_NWSE = 80,
  FL_CURSOR_NESW = 81, FL_CURSOR_N = 70, FL_CURSOR_NE = 69, FL_CURSOR_E = 49,
  FL_CURSOR_SE = 8, FL_CURSOR_S = 9, FL_CURSOR_SW = 7, FL_CURSOR_W = 36,
  FL_CURSOR_NW = 68, FL_CURSOR_NONE = 255
}

The following constants define the mouse cursors that are available in FLTK.
Variables

- **FL_Fontsize FL_NORMAL_SIZE**
  
  normal font size

Box Types

FLTK standard box types

This enum defines the standard box types included with FLTK.

**Note**

The documented enum `Fl_Boxtype` contains some values (names) with leading underscores, e.g. `FL_SHADOW_BOX`. This is due to technical reasons - please use the same values (names) without the leading underscore in your code! Enum values with leading underscores are reserved for internal use and subject to change without notice!

FL_NO_BOX means nothing is drawn at all, so whatever is already on the screen remains. The FL_..._FRAME types only draw their edges, leaving the interior unchanged. The blue color in the image below is the area that is not drawn by the frame types.

![Figure 13.1 FLTK Standard Box Types](image)

**Figure 13.1 FLTK Standard Box Types**

**Note**

Not all box types are depicted in the figure above. See enum `Fl_Boxtype` below for the complete list of box types.

**See also**

`Fl::get_system_colors()`

- **Fl_Boxtype fl_box (Fl_Boxtype b)**

  Get the filled version of a frame.
• enum FL_Boxtype {
    FL_NO_BOX = 0, FL_FLAT_BOX, FL_UP_BOX, FL_DOWN_BOX,
    FL_UP_FRAME, FL_DOWN_FRAME, FL_THIN_UP_BOX, FL_THIN_DOWN_BOX,
    FL_THIN_UP_FRAME, FL_THIN_DOWN_FRAME, FL_ENGRAVED_BOX, FL_EMBOSSED_BOX,
    FL_ENGRAVED_FRAME, FL_EMBOSSED_FRAME, FL_BORDER_BOX, FL_SHADOW_BOX,
    FL_BORDER_FRAME, FL_SHADOW_FRAME, FL_ROUNDED_BOX, FL_SHADOW_BOX,
    FL_ROUNDED_FRAME, FL_RFLAT_BOX, FL_ROUND_UP_BOX, FL_ROUND_DOWN_BOX,
    FL_DIAMOND_UP_BOX, FL_DIAMOND_DOWN_BOX, FL_OVAL_BOX, FL_OSHADOW_BOX,
    FL_OVAL_FRAME, FL_OFLAT_BOX, FL_PLASTIC_UP_BOX, FL_PLASTIC_DOWN_BOX,
    FL_PLASTIC_UP_FRAME, FL_PLASTIC_DOWN_FRAME, FL_PLASTIC_THIN_UP_BOX,
    FL_PLASTIC_THIN_DOWN_BOX,
    FL_PLASTIC_ROUND_UP_BOX, FL_PLASTIC_ROUND_DOWN_BOX, FL_GTK_UP_BOX,
    FL_GTK_DOWN_BOX,
    FL_GTK_UP_FRAME, FL_GTK_DOWN_FRAME, FL_GTK_THIN_UP_BOX, FL_GTK_THIN_DOWN_BOX,
    FL_GTK_THIN_UP_FRAME, FL_GTK_THIN_DOWN_FRAME, FL_GTK_ROUND_UP_BOX,
    FL_GTK_ROUND_DOWN_BOX, FL_GLEAM_UP_BOX, FL_GLEAM_DOWN_BOX, FL_GLEAM_UP_FRAME, FL_GLEAM_DOWN_FRAME,
    FL_GLEAM_THIN_UP_BOX, FL_GLEAM_THIN_DOWN_BOX, FL_GLEAM_ROUND_UP_BOX,
    FL_GLEAM_ROUND_DOWN_BOX, FL_OXY_UP_BOX, FL_OXY_DOWN_BOX, FL_OXY_UP_FRAME, FL_OXY_DOWN_FRAME,
    FL_OXY_THIN_UP_BOX, FL_OXY_THIN_DOWN_BOX, FL_OXY_THIN_UP_FRAME, FL_OXY_THIN_DOWN_FRAME,
    FL_OXY_BUTTON_UP_BOX, FL_OXY_BUTTON_DOWN_BOX,
    FL_FREE_BOXTYPE}

    FLTK standard box types.
• #define FL_CIRCLE_BOX FL_ROUND_DOWN_BOX
• #define FL_DIAMOND_BOX FL_DIAMOND_DOWN_BOX
• FL_Boxtype fl_down (FL_Boxtype b)
  Get the "pressed" or "down" version of a box.
• FL_Boxtype fl_frame (FL_Boxtype b)
  Get the unfilled, frame only version of a box.
• #define FL_FRAME FL_ENGRAVED_FRAME
• #define FL_FRAME_BOX FL_ENGRAVED_BOX
• FL_Labeltype fl_define_FL_EMBOSSED_LABEL ()
  Initializes the internal table entry for FL_EMBOSSED_LABEL and returns its internal value.
• FL_Labeltype fl_define_FL_ENGRAVED_LABEL ()
  Initializes the internal table entry for FL_ENGRAVED_LABEL and returns its internal value.
• FL_Labeltype fl_define_FL_ICON_LABEL ()
  Initializes the internal table entry for FL_ICON_LABEL and returns its internal value.
• FL_Labeltype fl_define_FL_IMAGE_LABEL ()
  Initializes the internal table entry for FL_IMAGE_LABEL and returns its internal value.
• FL_Labeltype fl_define_FL_MULTI_LABEL ()
  Initializes the internal table entry for FL_MULTI_LABEL and returns its internal value.
• FL_Labeltype fl_define_FL_SHADOW_LABEL ()
  Initializes the internal table entry for FL_SHADOW_LABEL and returns its internal value.
• #define FL_EMBOSSED_LABEL fl_define_FL_EMBOSSED_LABEL()
  Draws a label with embossed text.
• #define FL_ENGRAVED_LABEL fl_define_FL_ENGRAVED_LABEL()
  Draws a label with engraved text.
• #define FL_ICON_LABEL fl_define_FL_ICON_LABEL()
  Draws an icon as the label.
• #define FL_IMAGE_LABEL fl_define_FL_IMAGE_LABEL()
  Draws an image (Fl_Image) as the label.
• #define FL_MULTI_LABEL fl_define_FL_MULTI_LABEL()
  Draws a label that can comprise several parts like text and images.
• #define FL_SHADOW_LABEL fl_define_FL_SHADOW_LABEL()
  Draws a label with shadows behind the text.
• #define FL_SYMBOL_LABEL FL_NORMAL_LABEL
  Sets the current label type and returns its corresponding Fl_Labeltype value.

Colors

The Fl_Color type holds an FLTK color value. Colors are either 8-bit indexes into a virtual colormap or 24-bit RGB color values. (See Colors for the default FLTK colormap)

Color indices occupy the lower 8 bits of the value, while RGB colors occupy the upper 24 bits, for a byte organization of RGBI.

Fl_Color => 0xrrggbbii
  | | | +---- index between 0 and 255
  | | +------- blue color component (8 bit)
  | +-------- green component (8 bit)
  +--------- red component (8 bit)

A color can have either an index or an rgb value. Colors with rgb set and an index >0 are reserved for special use.

• const Fl_Color FL_BACKGROUND2_COLOR = 7
  the default background color for text, list, and valuactor widgets
• const Fl_Color FL_BACKGROUND_COLOR = 49
  Default background color.
• const Fl_Color FL_BLACK = 56
• const Fl_Color FL_BLUE = 216
• typedef unsigned int Fl_Color
  An FLTK color value; see also Colors

• Fl_Color fl_color_average (Fl_Color c1, Fl_Color c2, float weight)
  Returns the weighted average color between the two given colors.
• #define FL_COLOR_CUBE (Fl_Color)56
• Fl_Color fl_color_cube (int r, int g, int b)
  Returns a color out of the color cube.
• Fl_Color fl_contrast (Fl_Color fg, Fl_Color bg, Fl_Fontsize fs=0, int context=0)
  Returns a color that contrasts with the background color.
• typedef Fl_Color() Fl_Contrast_Function(Fl_Color, Fl_Color, Fl_Fontsize, int)
  Type of a custom fl_contrast() function.
• void fl_contrast_function (Fl_Contrast_Function *f)
  Register a custom contrast function.
• int fl_contrast_level ()
  Get the contrast level (sensitivity) of the fl_contrast() method.
• void fl_contrast_level (int level)
  Set the contrast level (sensitivity) of the fl_contrast() method.
• enum Fl_Contrast_Mode {
  FL_CONTRAST_NONE = 0 , FL_CONTRAST_LEGACY , FL_CONTRAST_CIELAB , FL_CONTRAST_CUSTOM ,
  FL_CONTRAST_LAST }
13.1 Enumerations.H File Reference

Define the possible modes to calculate `fl_contrast()`.

- `int fl_contrast_mode ()`
  Return the current contrast algorithm (mode).
- `void fl_contrast_mode (int mode)`
  Set the contrast algorithm (mode).

- `const Fl_Color FL_CYAN = 223`
- `const Fl_Color FL_DARK1 = 47`
- `const Fl_Color FL_DARK2 = 45`
- `const Fl_Color FL_DARK3 = 39`
- `const Fl_Color FL_DARK_BLUE = 136`
- `const Fl_Color FL_DARK_CYAN = 140`
- `const Fl_Color FL_DARK_GREEN = 60`
- `const Fl_Color FL_DARK_MAGENTA = 152`
- `const Fl_Color FL_DARK_RED = 72`
- `const Fl_Color FL_DARK_YELLOW = 76`
- `Fl_Color fl_darker (Fl_Color c)`
  Returns a darker version of the specified color.

- `const Fl_Color FL_FOREGROUND_COLOR = 0`
  the default foreground color (0) used for labels and text
- `#define FL_FREE_COLOR (Fl_Color)16`
  Colors numbered between FL_FREE_COLOR and FL_FREE_COLOR + FL_NUM_FREE_COLOR - 1 are free for the user to be given any value using Fl::set_color().

- `#define FL_GRAY (Fl_Color)32`
- `Fl_Color fl_gray_ramp (int i)`
  Returns a gray color value from black (i == 0) to white (i == FL_NUM_GRAY - 1).

- `const Fl_Color FL_GRAY0 = 32`
- `#define FL_GRAY_RAMP (Fl_Color)32`
- `Fl_Color fl_lighter (Fl_Color c)`
  Returns a lighter version of the specified color.

- `const Fl_Color FL_INACTIVE_COLOR = 8`
  the inactive foreground color

- `const Fl_Color FL_LIGHT1 = 50`
- `const Fl_Color FL_LIGHT2 = 52`
- `const Fl_Color FL_LIGHT3 = 54`
- `Fl_Color fl_lighter (Fl_Color c)`
  Returns a lighter version of the specified color.

- `double fl_lightness (Fl_Color color)`
  Return the perceived lightness of a color.
- `double fl_luminance (Fl_Color color)`
  Return the raw / physical luminance of a color.

- `const Fl_Color FL_MAGENTA = 248`
- `#define FL_NUM_BLUE 5`
- `#define FL_NUM_FREE_COLOR 16`
- `#define FL_NUM_GRAY 24`
- `#define FL_NUM_GREEN 8`
- `#define FL_NUM_RED 5`
- `const Fl_Color FL_RED = 88`
- `Fl_Color fl_rgb_color (uchar g)`
  Returns the 24-bit color value closest to g (grayscale).
- `Fl_Color fl_rgb_color (uchar r, uchar g, uchar b)`
  Returns the 24-bit color value closest to r, g, b.
- `const Fl_Color FL_SELECTION_COLOR = 15`
  the default selection/highlight color
- `const Fl_Color FL_WHITE = 255`
- `const Fl_Color FL_YELLOW = 95`
Alignment Flags

Flags to control the label alignment. This controls how the label is displayed next to or inside the widget. The default value is FL_ALIGN_CENTER (0) for most widgets, which centers the label inside the widget.

All alignment flags use the common prefix "FL_ALIGN_." In the following descriptions this prefix is sometimes omitted for brevity.

Flags can be or'd to achieve a combination of alignments, but there are some "magic values" (e.g. combinations of TOP and BOTTOM and of LEFT and RIGHT) that have special meanings (see below). For instance:

\[
\text{FL_ALIGN_TOP_LEFT} = (\text{FL_ALIGN_TOP} | \text{FL_ALIGN_LEFT}) \neq \text{FL_ALIGN_LEFT_TOP}.
\]

Outside alignments (FL_ALIGN_INSIDE is not set):

```
+---------------------------------+  
| TOP_LEFT | TOP | TOP_RIGHT |
| LEFT_TOP| | | RIGHT_TOP |
| | CENTER | | |
| LEFT | | RIGHT |
| LEFT_BOTTOM| | | RIGHT_BOTTOM |
+---------------------------------+  
| BOTTOM_LEFT | BOTTOM | BOTTOM_RIGHT |
```

Inside alignments (FL_ALIGN_INSIDE is set):

```
+---------------------------------+  
| TOP_LEFT | TOP | TOP_RIGHT |
| LEFT | CENTER | RIGHT |
| BOTTOM_LEFT | BOTTOM | BOTTOM_RIGHT |
```

See also

\( \text{Fl.Align}, \text{FL_ALIGN_CENTER}, \text{etc.} \)

Note

1. Bit positions not defined in the following constants of type \text{Fl.Align} are reserved for future extensions. Do not use.

2. The "magic values" (FL_ALIGN_LEFT, TOP_RIGHT, LEFT_BOTTOM, and RIGHT_BOTTOM) must not be used together with FL_ALIGN_INSIDE. Use TOP_LEFT, TOP_RIGHT, BOTTOM_LEFT, or BOTTOM_RIGHT instead.

3. Although bits can be or'd together there are some unused/illegal combinations, for instance:
   - setting both FL_ALIGN_TOP and FL_ALIGN_BOTTOM in combinations other than those given in the Fl.Align constants below (magic values)
   - setting both FL_ALIGN_LEFT and FL_ALIGN_RIGHT in combinations other than those given in the Fl.Align constants below (magic values)
   - using one of the "magic values" (2) together with FL_ALIGN_INSIDE

Using illegal bit combinations or undefined bits may yield unexpected behavior, and this behavior may be changed without notice in future FLTK versions.

- typedef unsigned \text{Fl.Align}

   FLTK type for alignment control.

- const \text{Fl.Align} \text{FL_ALIGN_BOTTOM} = 0x0002

   Align the label at the bottom of the widget.

- const \text{Fl.Align} \text{FL_ALIGN_BOTTOM_LEFT} = FL_ALIGN_BOTTOM | FL_ALIGN_LEFT

- const \text{Fl.Align} \text{FL_ALIGN_BOTTOM_RIGHT} = FL_ALIGN_BOTTOM | FL_ALIGN_RIGHT

- const \text{Fl.Align} \text{FL_ALIGN_CENTER} = 0x0000

   Align the label horizontally in the middle.

- const \text{Fl.Align} \text{FL_ALIGN_CLIP} = 0x0040

   All parts of the label that are larger than the widget will not be drawn.

- const \text{Fl.Align} \text{FL_ALIGN_IMAGE_BACKDROP} = 0x0200

   If the label contains an image, draw the image or deimage in the background.
• const Fl_Align FL_ALIGN_IMAGE_MASK = 0x0320
  Mask value to test for image alignment flags.
• const Fl_Align FL_ALIGN_IMAGE_NEXT_TO_TEXT = 0x0100
  If the label contains an image, draw the text to the right of the image.
• const Fl_Align FL_ALIGN_IMAGE_OVER_TEXT = 0x0000
  If the label contains an image, draw the text below the image.
• const Fl_Align FL_ALIGN_INSIDE = 0x0010
  Draw the label inside of the widget.
• const Fl_Align FL_ALIGN_LEFT = 0x0004
  Align the label at the left of the widget.
• const Fl_Align FL_ALIGN_LEFT_BOTTOM = 0x000d
  Outside only, left of widget, bottom position, magic value: TOP | LEFT | RIGHT.
• const Fl_Align FL_ALIGN_LEFT_TOP = 0x0007
  Outside only, left of widget, top position, magic value: TOP | BOTTOM | LEFT.
• const Fl_Align FL_ALIGN_NOWRAP = 0x0000
  Nothing, same as FL_ALIGN_CENTER, for back compatibility.
• const Fl_Align FL_ALIGN_POSITION_MASK = 0x000f
  Mask value to test for TOP, BOTTOM, LEFT, and RIGHT flags.
• const Fl_Align FL_ALIGN_RIGHT = 0x0008
  Align the label to the right of the widget.
• const Fl_Align FL_ALIGN_RIGHT_BOTTOM = 0x000e
  Outside only, right of widget, bottom position, magic value: BOTTOM | LEFT | RIGHT.
• const Fl_Align FL_ALIGN_RIGHT_TOP = 0x000b
  Outside only, right of widget, top position, magic value: TOP | BOTTOM | RIGHT.
• const Fl_Align FL_ALIGN_TEXT_NEXT_TO_IMAGE = 0x0120
  If the label contains an image, draw the text to the left of the image.
• const Fl_Align FL_ALIGN_TEXT_OVER_IMAGE = 0x0020
  If the label contains an image, draw the text on top of the image.
• const Fl_Align FL_ALIGN_TOP = 0x0001
  Align the label at the top of the widget.
• const Fl_Align FL_ALIGN_TOP_LEFT = FL_ALIGN_TOP | FL_ALIGN_LEFT
• const Fl_Align FL_ALIGN_TOP_RIGHT = FL_ALIGN_TOP | FL_ALIGN_RIGHT
• const Fl_Align FL_ALIGN_WRAP = 0x0080
  Wrap text that does not fit the width of the widget.

Font Numbers
The following constants define the standard FLTK fonts:

• const Fl_Font FL_BOLD = 1
  add this to Helvetica, Courier, or Times
• const Fl_Font FL_BOLD_ITALIC = 3
  add this to Helvetica, Courier, or Times
• const Fl_Font FL_COURIER = 4
  Courier normal.
• const Fl_Font FL_COURIER_BOLD = 5
  Courier bold.
• const Fl_Font FL_COURIER_BOLD_ITALIC = 7
  Courier bold-italic.
• const Fl_Font FL_COURIER_ITALIC = 6
  Courier italic.
• typedef int Fl_Font

Generated by Doxygen
A font number is an index into the internal font table.

- const Fl_Font FL_FREE_FONT = 16
  first one to allocate
- const Fl_Font FL_HELVETICA = 0
  Helvetica (or Arial) normal (0)
- const Fl_Font FL_HELVETICA_BOLD = 1
  Helvetica (or Arial) bold.
- const Fl_Font FL_HELVETICA_BOLD_ITALIC = 3
  Helvetica (or Arial) bold-oblique.
- const Fl_Font FL_HELVETICA_ITALIC = 2
  Helvetica (or Arial) oblique.
- const Fl_Font FLITALIC = 2
  add this to Helvetica, Courier, or Times
- const Fl_Font FL_SCREEN = 13
  Default monospaced screen font.
- const Fl_Font FL_SCREEN_BOLD = 14
  Default monospaced bold screen font.
- const Fl_Font FL_SYMBOL = 12
  Standard symbol font.
- const Fl_Font FL_TIMES = 8
  Times roman.
- const Fl_Font FL_TIMES_BOLD = 9
  Times roman bold.
- const Fl_Font FL_TIMES_BOLD_ITALIC = 11
  Times roman bold-italic.
- const Fl_Font FL_TIMES_ITALIC = 10
  Times roman italic.
- const Fl_Font FL_ZAPF_DINGBATS = 15
  Zapf-dingbats font.

13.1.1 Detailed Description
This file contains type definitions and general enumerations.

13.1.2 Macro Definition Documentation

13.1.2.1 FL_ABI_VERSION

#define FL_ABI_VERSION FL_API_VERSION

The FLTK ABI (Application Binary Interface) version number as an int.
FL_ABI_VERSION is an int that describes the major, minor, and patch ABI version numbers in the same format as FL_API_VERSION.
The ABI version number FL_ABI_VERSION is usually the same as the API version FL_API_VERSION with the last two digits set to '00'.
FLTK retains the ABI (Application Binary Interface) during patch releases of the same major and minor versions. Examples:

<table>
<thead>
<tr>
<th>Version</th>
<th>FL_API_VERSION</th>
<th>FL_ABI_VERSION</th>
<th>FL_VERSION (deprecated)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.3.0</td>
<td>10300</td>
<td>10300</td>
<td>1.0300</td>
</tr>
<tr>
<td>1.3.4</td>
<td>10304</td>
<td>10300</td>
<td>1.0304</td>
</tr>
</tbody>
</table>

Version 1.2.3 is actually stored as 10203 to allow for more than 9 minor and patch releases.
The FL_MAJOR_VERSION, FL_MINOR_VERSION, and FL_PATCH_VERSION constants give the integral values for the major, minor, and patch releases respectively.
To enable new ABI-breaking features in patch releases you can configure FLTK to use a higher FL_ABI_VERSION.
See also

README.abi-version.txt

### 13.1.2.2 FL_API_VERSION

```c
#define FL_API_VERSION (FL_MAJOR_VERSION*10000 + FL_MINOR_VERSION*100 + FL_PATCH_VERSION)
```

The FLTK API version number as an `int`.

FL_API_VERSION is an `int` that describes the major, minor, and patch version numbers.

Version 1.2.3 is actually stored as 10203 to allow for more than 9 minor and patch releases.

The FL_MAJOR_VERSION, FL_MINOR_VERSION, and FL_PATCH_VERSION constants give the integral values for the major, minor, and patch releases respectively.

**Note**

FL_API_VERSION is intended to replace the deprecated `double` FL_VERSION.

See also

Fl::api_version()

### 13.1.2.3 FL_IMAGE_LABEL

```c
#define FL_IMAGE_LABEL fl_define_FL_IMAGE_LABEL()
```

Draws an image (`Fl::Image`) as the label.

This is useful for one particular part of an `Fl::Multi_Label`. Use `Fl_Widget::image()` and/or `Fl_Widget::deimage()` for normal widgets with images as labels.

### 13.1.2.4 FL_MAJOR_VERSION

```c
#define FL_MAJOR_VERSION 1
```

The major release version of this FLTK library.

See also

FL_VERSION

### 13.1.2.5 FL_MINOR_VERSION

```c
#define FL_MINOR_VERSION 4
```

The minor release version for this library.

FLTK remains mostly source-code compatible between minor version changes.

### 13.1.2.6 FL_MULTI_LABEL

```c
#define FL_MULTI_LABEL fl_define_FL_MULTI_LABEL()
```

Draws a label that can comprise several parts like text and images.

See also

Fl::Multi_Label

### 13.1.2.7 FL_PATCH_VERSION

```c
#define FL_PATCH_VERSION 0
```

The patch version for this library.

FLTK remains binary compatible between patches.
13.1.2.8 FL_SYMBOL_LABEL

#define FL_SYMBOL_LABEL FL_NORMAL_LABEL
Sets the current label type and returns its corresponding Fl_Labeltype value.
FL_SYMBOL_LABEL is an alias for FL_NORMAL_LABEL.
'@' symbols can be drawn with normal labels as well.
This definition is for historical reasons only (forms compatibility). You should use FL_NORMAL_LABEL instead.

13.1.2.9 FL_VERSION

#define FL_VERSION
Value:

    ( (double)FL_MAJOR_VERSION + \\
      (double)FL_MINOR_VERSION * 0.01 + \\
      (double)FL_PATCH_VERSION * 0.0001 )

The FLTK version number as a double.
FL_VERSION is a double that describes the major, minor, and patch version numbers.
Version 1.2.3 is actually stored as 1.0203 to allow for more than 9 minor and patch releases.

Deprecated This double version number is retained for compatibility with existing program code. New code
should use int FL_API_VERSION instead. FL_VERSION is deprecated because comparisons of
floating point values may fail due to rounding errors. However, there are currently no plans to remove
this deprecated constant.

FL_VERSION is equivalent to (double)FL_API_VERSION / 10000.

Fl::version() (deprecated as well)
FL_API_VERSION
Fl::api_version()

13.1.3 Typedef Documentation

13.1.3.1 Fl_Contrast_Function
typedef Fl_Color() Fl_Contrast_Function(Fl_Color, Fl_Color, Fl_Fontsize, int)
Type of a custom fl_contrast() function.
Use this signature to define your own custom fl_contrast() function together with fl_contrast_mode(FL_CONTRAST_CUSTOM). Example:

Fl_Color my_contrast(Fl_Color fg, Fl_Color bg, Fl_Fontsize fs, int context) {
    // calculate contrast and ...
    return color;
}

// call this early in your main() program:
fl_contrast_function(my_contrast);
fl_contrast_mode(FL_CONTRAST_CUSTOM);

See also

fl_contrast(Fl_Color, Fl_Color, Fl_Fontsize, int)
fl_contrast_mode(int)

13.1.3.2 Fl_Fontsize
typedef int Fl_Fontsize
Size of a font in pixels.
This is the approximate height of a font in pixels.

13.1.4 Enumeration Type Documentation

13.1.4.1 anonymous enum
anonymous enum
FD "when" conditions.
13.1 Enumerations.H File Reference

### 13.1.4.2 Fl_Arrow_Type

enum Fl_Arrow_Type

Arrow types define the type of arrow drawing function.

FLTK schemes can draw several graphical elements in their particular way. One of these elements is an arrow type that can be in different GUI elements like scrollbars, choice buttons, and FLTK's `Fl_Return_Button`.

**Note**

This enum is not yet stable (as of FLTK 1.4.0) and may be changed without notice as necessary.

**Since**

1.4.0

**Enumerator**

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_ARROW_SINGLE</td>
<td>Single arrow, e.g. in <code>Fl_Scrollbar</code>.</td>
</tr>
<tr>
<td>FL_ARROW_DOUBLE</td>
<td>Double arrow, e.g. in <code>Fl_Counter</code>.</td>
</tr>
<tr>
<td>FL_ARROW_CHOICE</td>
<td>Dropdown box, e.g. in <code>Fl_Choice</code>.</td>
</tr>
<tr>
<td>FL_ARROW_RETURN</td>
<td>Return arrow, e.g. in <code>Fl_Return_Button</code>.</td>
</tr>
</tbody>
</table>

### 13.1.4.3 Fl_Boxtype

enum Fl_Boxtype

FLTK standard box types.

This enum defines the standard box types included with FLTK.

**Note**

The documented enum Fl_Boxtype contains some values (names) with leading underscores, e.g. `FL_SHADOW_BOX`. This is due to technical reasons - please use the same values (names) without the leading underscore in your code! Enum values with leading underscores are reserved for internal use and subject to change without notice!

**Enumerator**

<table>
<thead>
<tr>
<th>Enumerator</th>

</tr>
<tr>
<td>FL_CONTRAST_CIELAB</td>
<td>new (FLTK 1.4.0) default function</td>
</tr>
<tr>
<td>FL_CONTRAST_CUSTOM</td>
<td>optional custom contrast function</td>
</tr>
<tr>
<td>FL_CONTRAST_LAST</td>
<td>internal use only (invalid contrast mode)</td>
</tr>
</tbody>
</table>

13.1.4.6 Fl_Cursor

```cpp
enum Fl_Cursor
The following constants define the mouse cursors that are available in FLTK. Cursors are provided by the system when available, or bitmaps built into FLTK as a fallback.
```

#### Enumerator

<table>
<thead>
<tr>
<th>Enumerators</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_CURSOR_DEFAULT</td>
<td>the default cursor, usually an arrow:</td>
</tr>
<tr>

<td>invisible.</td>
</tr>
</tbody>
</table>
13.1.4.7 Fl_Damage

enum Fl_Damage
Damage masks.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_DAMAGE_CHILD</td>
<td>A child needs to be redrawn.</td>
</tr>
<tr>
<td>FL_DAMAGE_EXPOSE</td>
<td>The window was exposed.</td>
</tr>
<tr>
<td>FL_DAMAGE_SCROLL</td>
<td>The Fl_Scroll widget was scrolled. Used by other widgets for other widget specific damages.</td>
</tr>
<tr>
<td>FL_DAMAGE_OVERLAY</td>
<td>The overlay planes need to be redrawn.</td>
</tr>
<tr>
<td>FL_DAMAGE_USER1</td>
<td>First user-defined damage bit.</td>
</tr>
<tr>
<td>FL_DAMAGE_USER2</td>
<td>Second user-defined damage bit.</td>
</tr>
<tr>
<td>FL_DAMAGE_ALL</td>
<td>Everything needs to be redrawn.</td>
</tr>
</tbody>
</table>

13.1.4.8 Fl_Event

enum Fl_Event
Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application.

Events can also come from other programs like the window manager.

Events are identified by the integer argument passed to the Fl_Widget::handle() virtual method. Other information about the most recent event is stored in static locations and acquired by calling the Fl::event_*() methods. This static information remains valid until the next event is read from the window system, so it is ok to look at it outside of the handle() method.

Event numbers can be converted to their actual names using the fl_eventnames[] array defined in #include <FL/names.h>

See also
Fl::event_text(), Fl::event_key(), class Fl::

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_NO_EVENT</td>
<td>No event.</td>
</tr>
<tr>
<td>FL_PUSH</td>
<td>A mouse button has gone down with the mouse pointing at this widget. You can find out what button by calling Fl::event_button(). You find out the mouse position by calling Fl::event_x() and Fl::event_y(). A widget indicates that it &quot;wants&quot; the mouse click by returning non-zero from its Fl_Widget::handle() method. It will then become the Fl::pushed() widget and will get FL_DRAG and the matching FL_RELEASE events. If Fl_Widget::handle() returns zero then FLTK will try sending the FL_PUSH to another widget.</td>
</tr>
<tr>
<td>FL_RELEASE</td>
<td>A mouse button has been released. You can find out what button by calling Fl::event_button(). In order to receive the FL_RELEASE event, the widget must return non-zero when handling FL_PUSH.</td>
</tr>
<tr>
<td>FL_ENTER</td>
<td>The mouse has been moved to point at this widget. This can be used for highlighting feedback. If a widget wants to highlight or otherwise track the mouse, it indicates this by returning non-zero from its handle() method. It then becomes the Fl::belowmouse() widget and will receive FL_MOVE and FL_LEAVE events.</td>
</tr>
</tbody>
</table>
## Enumerators

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_LEAVE</td>
<td>The mouse has moved out of the widget. In order to receive the FL_LEAVE event, the widget must return non-zero when handling FL_ENTER.</td>
</tr>
<tr>
<td>FL_DRAG</td>
<td>The mouse has moved with a button held down. The current button state is in Fl::event_state(). The mouse position is in Fl::event_x() and Fl::event_y(). In order to receive FL_DRAG events, the widget must return non-zero when handling FL_PUSH.</td>
</tr>
<tr>
<td>FL_FOCUS</td>
<td>This indicates an attempt to give a widget the keyboard focus. If a widget wants the focus, it should change itself to display the fact that it has the focus, and return non-zero from its handle() method. It then becomes the Fl::focus() widget and gets FL_KEYDOWN, FL_KEYUP, and FL_UNFOCUS events. The focus will change either because the window manager changed which window gets the focus, or because the user tried to navigate using tab, arrows, or other keys. You can check Fl::event_key() to figure out why it moved. For navigation it will be the key pressed and for interaction with the window manager it will be zero.</td>
</tr>
<tr>
<td>FL_UNFOCUS</td>
<td>This event is sent to the previous Fl::focus() widget when another widget gets the focus or the window loses focus.</td>
</tr>
<tr>
<td>FL_KEYDOWN</td>
<td>A key was pressed (FL_KEYDOWN) or released (FL_KEYUP). FL_KEYBOARD is a synonym for FL_KEYDOWN. The key can be found in Fl::event_key(). The text that the key should insert can be found with Fl::event_text() and its length is in Fl::event_length(). If you use the key handle() should return 1. If you return zero then FLTK assumes you ignored the key and will then attempt to send it to a parent widget. If none of them want it, it will change the event into a FL_SHORTCUT event. To receive FL_KEYBOARD events you must also respond to the FL_FOCUS and FL_UNFOCUS events. If you are writing a text-editing widget you may also want to call the Fl::compose() function to translate individual keystrokes into non-ASCII characters. FL_KEYUP events are sent to the widget that currently has focus. This is not necessarily the same widget that received the corresponding FL_KEYDOWN event because focus may have changed between events.</td>
</tr>
<tr>
<td>FL_KEYBOARD</td>
<td>Equivalent to FL_KEYDOWN. See also FL_KEYDOWN</td>
</tr>
<tr>
<td>FL_KEYUP</td>
<td>Key release event. See also FL_KEYDOWN</td>
</tr>
<tr>
<td>FL_CLOSE</td>
<td>The user clicked the close button of a window. This event is used internally only to trigger the callback of Fl_Window derived classes. The default callback closes the window calling Fl_Window::hide().</td>
</tr>
<tr>
<td>Enumerator</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FL_MOVE</td>
<td>The mouse has moved without any mouse buttons held down. This event is sent to the <code>Fl::belowmouse()</code> widget. In order to receive FL_MOVE events, the widget must return non-zero when handling FL_ENTER.</td>
</tr>
<tr>
<td>FL_SHORTCUT</td>
<td>If the <code>Fl::focus()</code> widget is zero or ignores an FL_KEYBOARD event then FLTK tries sending this event to every widget it can, until one of them returns non-zero. FL_SHORTCUT is first sent to the <code>Fl::belowmouse()</code> widget, then its parents and siblings, and eventually to every widget in the window, trying to find an object that returns non-zero. FLTK tries really hard to not to ignore any keystrokes! You can also make &quot;global&quot; shortcuts by using <code>Fl::add_handler()</code>. A global shortcut will work no matter what windows are displayed or which one has the focus.</td>
</tr>
<tr>
<td>FL_DEACTIVATE</td>
<td>This widget is no longer active, due to <code>Fl_Widget::deactivate()</code> being called on it or one of its parents. <code>Fl_Widget::active()</code> may still be true after this, the widget is only active if <code>Fl_Widget::active()</code> is true on it and all its parents (use <code>Fl_Widget::active_r()</code> to check this).</td>
</tr>
<tr>
<td>FL_ACTIVATE</td>
<td>This widget is now active, due to <code>Fl_Widget::activate()</code> being called on it or one of its parents.</td>
</tr>
<tr>
<td>FL_HIDE</td>
<td>This widget is no longer visible, due to <code>Fl_Widget::hide()</code> being called on it or one of its parents, or due to a parent window being minimized. <code>Fl_Widget::visible()</code> may still be true after this, but the widget is visible only if visible() is true for it and all its parents (use <code>Fl_Widget::visible_r()</code> to check this).</td>
</tr>
<tr>
<td>FL_SHOW</td>
<td>This widget is visible again, due to <code>Fl_Widget::show()</code> being called on it or one of its parents, or due to a parent window being restored. Child <code>Fl_Windows</code> respond to this by actually creating the window if not done already, so if you subclass a window, be sure to pass FL_SHOW to the base class <code>Fl_Widget::handle()</code> method!</td>
</tr>
<tr>
<td>FL_PASTE</td>
<td>You should get this event some time after you call <code>Fl::paste()</code>. The contents of <code>Fl::event_text()</code> is the text to insert and the number of characters is in <code>Fl::event_length()</code>.</td>
</tr>
<tr>
<td>FL_SELECTIONCLEAR</td>
<td>The <code>Fl::selection_owner()</code> will get this event before the selection is moved to another widget. This indicates that some other widget or program has claimed the selection. Motif programs used this to clear the selection indication. Most modern programs ignore this.</td>
</tr>
<tr>
<td>FL_MOUSEWHEEL</td>
<td>The user has moved the mouse wheel. The <code>Fl::event_dx()</code> and <code>Fl::event_dy()</code> methods can be used to find the amount to scroll horizontally and vertically.</td>
</tr>
<tr>
<td>FL_DND_ENTER</td>
<td>The mouse has been moved to point at this widget. A widget that is interested in receiving drag'n'drop data must return 1 to receive FL_DND_DRAG, FL_DND_LEAVE and FL_DND_RELEASE events.</td>
</tr>
<tr>
<td>FL_DND_DRAG</td>
<td>The mouse has been moved inside a widget while dragging data. A widget that is interested in receiving drag'n'drop data should indicate the possible drop position.</td>
</tr>
<tr>
<td>FL_DND_LEAVE</td>
<td>The mouse has moved out of the widget.</td>
</tr>
<tr>
<td>FL_DND_RELEASE</td>
<td>The user has released the mouse button dropping data into the widget. If the widget returns 1, it will receive the data in the immediately following FL_PASTE event.</td>
</tr>
</tbody>
</table>
## 13.1.4.9 Fl_Labeltype

**enum Fl_Labeltype**

The labeltype() method sets the type of the label.

**Note**

The documented enum Fl_Labeltype contains some values (names) with leading underscores, e.g. _FL_IMAGE_LABEL. This is due to technical reasons - please use the same values (names) without the leading underscore in your code! Enum values with leading underscores are reserved for internal use and subject to change without notice!

The following standard label types are included:

**Enumerator**

<table>
<thead>
<tr>
<th>Labeltype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_NORMAL_LABEL</td>
<td>draws the text (0)</td>
</tr>
<tr>
<td>FL_NO_LABEL</td>
<td>does nothing</td>
</tr>
<tr>
<td>_FL_SHADOW_LABEL</td>
<td>draws a drop shadow under the text</td>
</tr>
<tr>
<td>_FL_ENGRAVED_LABEL</td>
<td>draws edges as thought the text is engraved</td>
</tr>
<tr>
<td>_FL_EMBOSSED_LABEL</td>
<td>draws edges as thought the text is raised</td>
</tr>
<tr>
<td>_FL_MULTI_LABEL</td>
<td>draws a composite label</td>
</tr>
<tr>
<td>_FL_ICON_LABEL</td>
<td>draws the icon associated with the text</td>
</tr>
<tr>
<td>_FL_IMAGE_LABEL</td>
<td>the label displays an &quot;icon&quot; based on a Fl_Image</td>
</tr>
<tr>
<td>FL_FREE_LABELTYPE</td>
<td>first free labeltype to use for creating own labeltypes</td>
</tr>
</tbody>
</table>

## 13.1.4.10 Fl_Orientation

**enum Fl_Orientation**

Fl_Orientation describes the orientation of a GUI element.

FLTK schemes can draw several graphical elements, for instance arrows, pointing at different directions. This enum defines the direction to use for drawing a particular GUI element.

The definition of this enum was chosen such that the enum value can be multiplied by 45 to get a rotation angle in degrees starting at the horizontal axis (0 = right, 1 = NE, 2 = up, ...) that can be used with fl_rotate(). Note: angle is counter-clockwise in degrees.

The 'unspecified' value FL_ORIENTATION_NONE shall be used for elements that would usually not be rotated, like the return arrow of the Fl_Return_Button. It can still be used as an angle though since it is the same value as FL_Orient_Right (0 degrees).
This enum is not yet stable (as of FLTK 1.4.0) and may be changed without notice as necessary.

Since
1.4.0

Enumerator

<table>
<thead>
<tr>
<th>FL_ORIENTATION</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_ORIENTATION_NONE</td>
<td>GUI element direction is unspecified.</td>
</tr>
<tr>
<td>FL_ORIENTATION_RIGHT</td>
<td>GUI element pointing right (0°)</td>
</tr>
<tr>
<td>FL_ORIENTATION_NE</td>
<td>GUI element pointing NE (45°)</td>
</tr>
<tr>
<td>FL_ORIENTATION_UP</td>
<td>GUI element pointing up (90°)</td>
</tr>
<tr>
<td>FL_ORIENTATION_NW</td>
<td>GUI element pointing NW (135°)</td>
</tr>
<tr>
<td>FL_ORIENTATION_LEFT</td>
<td>GUI element pointing left (180°)</td>
</tr>
<tr>
<td>FL_ORIENTATION_SW</td>
<td>GUI element pointing SW (225°)</td>
</tr>
<tr>
<td>FL_ORIENTATION_DOWN</td>
<td>GUI element pointing down (270°)</td>
</tr>
<tr>
<td>FL_ORIENTATION_SE</td>
<td>GUI element pointing SE (315°)</td>
</tr>
</tbody>
</table>

13.1.4.11 Fl_When

enum Fl_When

These constants determine when a callback is performed. Fl_When is a bit field. Some values are merely shortcuts for common bit combinations. New flags may be added in the future, so it's important to mask the required bit when reading via when().

Note

Some widgets may not fully support Fl_WHEN_... flags.

See also

Fl_Widget::when(), Fl::callback_reason(), Fl_Callback_Reason, Fl_Widget::do_callback()

Enumerator

<table>
<thead>
<tr>
<th>Fl_When</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_WHEN_NEVER</td>
<td>Never call the callback.</td>
</tr>
<tr>
<td>FL_WHEN_CHANGED</td>
<td>Do the callback only when the widget value changes.</td>
</tr>
<tr>
<td>FL_WHEN_NOT_CHANGED</td>
<td>Do the callback whenever the user interacts with the widget.</td>
</tr>
<tr>
<td>FL_WHEN_RELEASE</td>
<td>Do the callback when the button or key is released and the value changes.</td>
</tr>
<tr>
<td>FL_WHEN_RELEASE_ALWAYS</td>
<td>Do the callback when the button or key is released, even if the value doesn't change.</td>
</tr>
<tr>
<td>FL_WHEN_ENTER_KEY</td>
<td>Do the callback when the user presses the ENTER key and the value changes.</td>
</tr>
<tr>
<td>FL_WHEN_ENTER_KEY_ALWAYS</td>
<td>Do the callback when the user presses the ENTER key, even if the value doesn't change.</td>
</tr>
<tr>
<td>FL_WHEN_ENTER_KEY_CHANGED</td>
<td>Do callbacks whether the value changed or not, and when the ENTER key is pressed.</td>
</tr>
<tr>
<td>FL_WHEN_CLOSED</td>
<td>Do the callback when a child of Fl_Tabs is closed.</td>
</tr>
</tbody>
</table>
13.1.5 Function Documentation

13.1.5.1 fl_box()

Fl_Boxtype fl_box ( Fl_Boxtype b ) [inline]

Get the filled version of a frame.
If no filled version of a given frame exists, the behavior of this function is undefined and some random box or frame
is returned.

13.1.5.2 fl_color_cube()

Fl_Color fl_color_cube ( int r, int g, int b ) [inline]

Returns a color out of the color cube.
r must be in the range 0 to FL_NUM_RED (5) minus 1, g must be in the range 0 to FL_NUM_GREEN (8) minus 1,
b must be in the range 0 to FL_NUM_BLUE (5) minus 1.
To get the closest color to a 8-bit set of R,G,B values use:

fl_color_cube(R * (FL_NUM_RED - 1) / 255,
            G * (FL_NUM_GREEN - 1) / 255,
            B * (FL_NUM_BLUE - 1) / 255);

13.1.5.3 fl_define_FL_EMBOSSED_LABEL()

Fl_Labeltype fl_define_FL_EMBOSSED_LABEL ( ) [extern]

Initializes the internal table entry for FL_EMBOSSED_LABEL and returns its internal value.
Internal use only.

13.1.5.4 fl_define_FL_ENGRAVED_LABEL()

Fl_Labeltype fl_define_FL_ENGRAVED_LABEL ( ) [extern]

Initializes the internal table entry for FL_ENGRAVED_LABEL and returns its internal value.
Internal use only.

13.1.5.5 fl_define_FL_ICON_LABEL()

Fl_Labeltype fl_define_FL_ICON_LABEL ( ) [extern]

Initializes the internal table entry for FL_ICON_LABEL and returns its internal value.
Internal use only.

13.1.5.6 fl_define_FL_IMAGE_LABEL()

Fl_Labeltype fl_define_FL_IMAGE_LABEL ( ) [extern]

Initializes the internal table entry for FL_IMAGE_LABEL and returns its internal value.
Internal use only.

13.1.5.7 fl_define_FL_MULTI_LABEL()

Fl_Labeltype fl_define_FL_MULTI_LABEL ( ) [extern]

Initializes the internal table entry for FL_MULTI_LABEL and returns its internal value.
Internal use only.

13.1.5.8 fl_define_FL_SHADOW_LABEL()

Fl_Labeltype fl_define_FL_SHADOW_LABEL ( ) [extern]

Initializes the internal table entry for FL_SHADOW_LABEL and returns its internal value.
Internal use only.
13.1.5.9  fl_down()

**Fl_Boxtype fl_down (Fl_Boxtype b)** [inline]

Get the "pressed" or "down" version of a box. If no "down" version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

13.1.5.10  fl_frame()

**Fl_Boxtype fl_frame (Fl_Boxtype b)** [inline]

Get the unfilled, frame only version of a box. If no frame version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

13.1.5.11  fl_gray_ramp()

**Fl_Color fl_gray_ramp (int i)** [inline]

Returns a gray color value from black (i == 0) to white (i == FL_NUM_GRAY - 1). FL_NUM_GRAY is defined to be 24 in the current FLTK release. To get the closest FLTK gray value to an 8-bit grayscale color I use:

```
fl_gray_ramp(I * (FL_NUM_GRAY - 1) / 255)
```

13.1.6 Variable Documentation

13.1.6.1  FL_ALIGN_LEFT

**const Fl_Align FL_ALIGN_LEFT = 0x0004**

Align the label at the left of the widget. Inside labels appear left-justified starting at the left side of the widget, outside labels are right-justified and drawn to the left of the widget.

13.1.6.2  FL_ALIGN_TOP

**const Fl_Align FL_ALIGN_TOP = 0x0001**

Align the label at the top of the widget. Inside labels appear below the top, outside labels are drawn on top of the widget.

13.1.6.3  FL_NORMAL_SIZE

**Fl_Fontsize FL_NORMAL_SIZE [extern]**

normal font size

13.3  filename.H File Reference

File names and URI utility functions.
#include "Fl_Export.H"
#include <FL/platform_types.h>

Macros

• #define FL_PATH_MAX 2048
   all path buffers should use this length

Typedefs

• typedef int() Fl_File_Sort_F(struct dirent **, struct dirent **)
  File sorting function.

Functions

• void fl_decode_uri (char *uri)
  Decodes a URL-encoded string.
• int fl_filename_absolute (char *to, int tolen, const char *from)
  Makes a filename absolute from a relative filename to the current working directory.
• int fl_filename_absolute (char *to, int tolen, const char *from, const char *cwd)
  Concatenate the absolute path base with from to form the new absolute path in to.
• int fl_filename_expand (char *to, int tolen, const char *from)
  Expands a filename containing shell variables and tilde (~).
• const char * fl_filename_ext (const char *buf)
  Gets the extension of a filename.
• void fl_filename_free_list (struct dirent ***, int n)
  Free the list of filenames that is generated by fl_filename_list().
• int fl_filename_isdir (const char *name)
  Determines if a file exists and is a directory from its filename.
• int fl_filename_list (const char *d, struct dirent ***, Fl_File_Sort_F *s=fl_numericsort)
  Portable and const-correct wrapper for the scandir() function.
• int fl_filename_match (const char *name, const char *pattern)
  Checks if a string s matches a pattern p.
• const char * fl_filename_name (const char *filename)
  Gets the file name from a path.
• int fl_filename_relative (char *to, int tolen, const char *from)
  Makes a filename relative to the current working directory.
• int fl_filename_relative (char *to, int tolen, const char *from, const char *cwd)
  Makes a filename relative to any other directory.
• char * fl_filename_setext (char *to, int tolen, const char *ext)
  Replaces the extension in buf of max.
• int fl_open_uri (const char *uri, char *msg, int msglen)
  Opens the specified Uniform Resource Identifier (URI).

## 13.5 Fl.H File Reference

**Fl** static class.

```c
#include <FL/fl_config.h>
#include <FL/Fl_Export.H>
#include <FL/platform_types.h>
#include <FL/fl_casts.H>
#include <FL/Fl_Cairo.H>
#include "fl_utf8.h"
#include "Enumerations.H"
#include <string.h>
```

### Classes

- **class Fl**
  
  The **Fl** is the FLTK global (static) class containing state information and global methods for the current application.

- **class Fl_Widget_Tracker**
  
  This class should be used to control safe widget deletion.

### Macros

- `#define Fl_Object Fl_Widget`
for back compatibility - use Fl_Widget!

**Typedefs**

- typedef void(\* Fl_Abort_Handler) (const char \*format,...)  
  Signature of set_abort functions passed as parameters.
- typedef int(\* Fl_Args_Handler) (int argc, char \*\*argv, int &i)  
  Signature of args functions passed as parameters.
- typedef void(\* Fl_Atclose_Handler) (Fl_Window \*window, void \*data)  
  Signature of set_atclose functions passed as parameters.
- typedef void(\* Fl_Awake_Handler) (void \*data)  
  Signature of some wakeup callback functions passed as parameters.
- typedef void() Fl_Box_Draw_F(int x, int y, int w, int h, Fl_Color color)  
  Signature of some box drawing functions passed as parameters.
- typedef void(\* Fl_Clipboard_Notify_Handler) (int source, void \*data)  
  Signature of add_clipboard_notify functions passed as parameters.
- typedef int(\* Fl_Event_Dispatch) (int event, Fl_Window \*w)  
  Signature of event_dispatch functions passed as parameters.
- typedef int(\* Fl_Event_Handler) (int event)  
  Signature of add_handler functions passed as parameters.
- typedef void(\* Fl_FD_Handler) (FL_SOCKET fd, void \*data)  
  Signature of add_fd functions passed as parameters.
- typedef void(\* Fl_Idle_Handler) (void \*data)  
  Signature of add_idle callback functions passed as parameters.
- typedef void() Fl_Label_Draw_F(const Fl_Label \*label, int x, int y, int w, int h, Fl_Align align)  
  Signature of some label drawing functions passed as parameters.
- typedef void() Fl_Label_Measure_F(const Fl_Label \*label, int \&width, int \&height)  
  Signature of some label measurement functions passed as parameters.
- typedef void(\* Fl_Old_Idle_Handler) ()  
  Signature of set_idle callback functions passed as parameters.
- typedef int(\* Fl_System_Handler) (void \*event, void \*data)  
  Signature of add_system_handler functions passed as parameters.
- typedef void(\* Fl_Timeout_Handler) (void \*data)  
  Signature of timeout callback functions passed as parameters.

**Variables**

- const char \* fl_local_alt  
  string pointer used in shortcuts, you can change it to another language
- const char \* fl_local_ctrl  
  string pointer used in shortcuts, you can change it to another language
- const char \* fl_local_meta  
  string pointer used in shortcuts, you can change it to another language
- const char \* fl_local_shift  
  string pointer used in shortcuts, you can change it to another language

### 13.5.1 Detailed Description

Fl static class.

### 13.9 fl_ask.H File Reference

API for common dialogs.

```
#include <FL/Enumerations.H>
#include <FL/fl_attr.h>
```

#### Enumerations

```
enum Fl_Beep {
    FL_BEEP_DEFAULT = 0, FL_BEEP_MESSAGE, FL_BEEP_ERROR, FL_BEEP_QUESTION,
    FL_BEEP_PASSWORD, FL_BEEP_NOTIFICATION
}
```

Defines the different system beeps available.

#### Functions

```
void void fl_alert (const char *,...) __fl_attr((__format__(__printf__

void void fl_input (const char *,const char *,...) __fl_attr((__format__(__printf__

void fl_beep (int type=FL_BEEP_DEFAULT)
```

Emits a system beep.

```
int fl_choice (const char *,...,) __fl_attr((__format__(__printf__

int const char const char *fl_choice_n (const char *,...,) __fl_attr((__format__(__printf__

int const char const char const char *fl_input (const char *,...,) __fl_attr((__format__(__printf__
```
13.9 fl_ask.H File Reference 2011

- int const char const char * fl_input (int maxchar, const char *label, const char *deflt=0,...) __fl_attr(__format__(__printf__)
- void fl_message (const char *,...) __fl_attr(__format__(__printf__)
- void fl_message_font (Fl_Font f, Fl_Fontsize s)
- void fl_message_hotspot (int enable)
  Sets whether or not to move the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer.
- int fl_message_hotspot (void)
  Gets whether or not to move the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer.
- int const char const char int const char const char Fl_Widget * fl_message_icon ()
  Gets the Fl_Box icon container of the current default dialog used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().
- void fl_message_icon_label (const char *str)
  Sets the icon label of the dialog window used in many common dialogs.
- void fl_message_position (const int x, const int y, const int center=0)
  Sets the preferred position for the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().
- void fl_message_position (Fl_Widget &widget)
- void fl_message_position (Fl_Widget *widget)
  Sets the preferred position for the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().
- int fl_message_position (int *x=0, int *y=0)
  Gets the preferred position for the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().
- void fl_message_title (const char *title)
  Sets the title of the dialog window used in many common dialogs.
- void fl_message_title_default (const char *title)
  Sets the default title of the dialog window used in many common dialogs.
- int const char const char * fl_password (const char *label, const char *deflt=0,...) __fl_attr(__format__(__printf__)
- int const char const char int const char const char * fl_password (int maxchar, const char *label, const char *deflt=0,...) __fl_attr(__format__(__printf__

Variables

- void void int __deprecated__
- const char * fl_cancel
  string pointer used in common dialogs, you can change it to another language
- const char * fl_close
  string pointer used in common dialogs, you can change it to another language
- Fl_Font fl_message_font_
- Fl_Fontsize fl_message_size_
- const char * fl_no
  string pointer used in common dialogs, you can change it to another language
- const char * fl_ok
  string pointer used in common dialogs, you can change it to another language
- const char * fl_yes
  string pointer used in common dialogs, you can change it to another language

13.9.1 Detailed Description

API for common dialogs.
13.9.2 Enumeration Type Documentation

13.9.2.1 Fl_Beep

```c
enum Fl_Beep
```

Defines the different system beeps available. Some systems may play different sounds or use different sound volume depending on the Fl_Beep value. The implementation is platform dependent.

Generated by Doxygen
This file defines compiler-specific macros.

Macros

- `#define __fl_attr(x)`
  This section lists macros for Doxygen documentation only.

- `#define FL_DEPRECATED(msg, func)`
  Enclosing a function or method in `FL_DEPRECATED` marks it as no longer recommended.

- `#define FL_OVERRIDE` override
  This macro makes it safe to use the C++11 keyword `override` with older compilers.

### 13.11.1 Detailed Description

This file defines compiler-specific macros.

#### 13.11.2 Macro Definition Documentation

**13.11.2.1 __fl_attr**

```
#define __fl_attr( 
    x )
```

This section lists macros for Doxygen documentation only.

The next section will define the actual macros based on the compile used and based on the capabilities of the version of that compiler. To be used in prototypes with a variable list of arguments. This macro helps detection of mismatches between format string and argument list at compilation time.

Usage example: FL/fl_ask.H

**13.11.2.2 FL_DEPRECATED**

```
#define FL_DEPRECATED( 
    msg, 
    func )
```

Value:

```
/**/ \deprecated msg \*/ 
func
```

Enclosing a function or method in `FL_DEPRECATED` marks it as no longer recommended.

This macro syntax can not be used if the return type contains a comma, which is not the case in FLTK.

```
FL_DEPRECATED("Outdated, don't use", int position()) { return position_; }
```

### 13.12 fl_attr.h

Go to the documentation of this file.
/*

Declare macros specific to Visual Studio.

Visual Studio defines __cplusplus = '199711L' in all its versions which is not helpful for us here. For VS version number encoding see:

This document specifies that the macro _MSVC_LANG is defined since "Visual Studio 2015 Update 3" as 201402L (default) and undefined in earlier versions. It can be used to determine the C++ standard as specified by the /std:c++ compiler option:
- /std:c++14 201402L (also if /std:c++ is not used)
- /std:c++17 201703L
- /std:c++20 202002L
- /std:c++latest a "higher, unspecified value" (docs of VS 2022)

As of this writing (02/2023) _MSVC_LANG is not yet used in this file but it is documented for future use.

*/

Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland).
#include <FL/Fl.H>
#include <cairo.h>

Classes

• class Fl_Cairo_State

Contains all the necessary info on the current cairo context.

Detailed Description

Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland).

Note

In FLTK 1.3.x this header file (Fl_Cairo.H) included the platform specific Cairo headers. This is no longer true since 1.4.0.

This header file is platform agnostic. If you need platform specific Cairo headers you need to #include them in your source file.

To use FLTK's builtin Cairo support you need to #include <FL/Fl.H> before you include any other FLTK header which is officially required anyway. Since FLTK 1.4.0 the preprocessor constants FLTK_HAVE_CAIRO and/or FLTKHAVE_CAIROEXT are defined in <FL/Fl.H> by including <FL/fl_config.h>.

Go to the documentation of this file.
Main Cairo support header file for the Fast Light Tool Kit (FLTK).

            Fl::cairo_make_current(this);
            draw_cb_(this, Fl::cairo_cc());
            Fl::cairo_flush(Fl::cairo_cc());
        }
    }

public:
    typedef void ( *cairo_draw_cb) (Fl_Cairo_Window* self, cairo_t* def);
    void set_draw_cb(cairo_draw_cb cb) { draw_cb_ = cb; }

private:
    cairo_draw_cb draw_cb_;

Creates code to declare a callback function in line with instantiating a widget.

- \#define FL_METHOD_CALLBACK_1(WIDGET, CLASS, SELF, METH, TYPE0, VALUE0)

Declares a non-static class method callback with custom parameters.

13.24.1 Detailed Description

This file provides macros for easy function and method callbacks with multiple type-safe arguments.

13.24.2 Macro Definition Documentation

13.24.2.1 FL_FUNCTION_CALLBACK_3

\#define FL_FUNCTION_CALLBACK_3(
  WIDGET,
  FUNC,
  TYPE0,
  VALUE0,
  TYPE1,
  VALUE1,
  TYPE2,
  VALUE2
)

Declares a C function callback with custom parameters.

You can declare a plain C function callback or a static method callback with custom parameters using this macro. It simplifies the process of calling arbitrary functions with up to five custom parameters. The macro generates code that ensures type safety and expands FLTK’s standard callbacks, which are limited to a single `void*` or `long` argument.

To use the macro, you provide the widget that will handle the callback as the first argument. The second argument can be either a regular function or a static method in any class.

Following these arguments, you can include up to five pairs, where each pair consists of a type and a value. For example, `int, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two pairs, like this: `int, 3, int, 4`. The last digit of the macro name must be the same as the number of pairs (0..5)

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```
#include <FL/fl_callback_macros.H>
...
Fl_Button *btn1 = new Fl_Button(10, 10, 100, 20, "Beep");
FL_FUNCTION_CALLBACK_0(btn1, fl_beep);
...
Fl_Button *btn2 = new Fl_Button(10, 40, 100, 20, "Hello");
FL_FUNCTION_CALLBACK_5(btn2,
  fl_message,
  const char *, text, "Hello\n%d %d %d %d",
  int, a, 1, int, b, 2, int, c, 3, int, d, 4
);
```

You can find a small demonstration program showcasing the usage of `FL_*CALLBACK_*` in the `examples/callbacks.cxx` file.

`FL_METHOD_CALLBACK_1, FL_INLINE_CALLBACK_2`

13.24.2.2 FL_INLINE_CALLBACK_2

\#define FL_INLINE_CALLBACK_2(
  WIDGET,
  ...
)
Creates code to declare a callback function in line with instantiating a widget.

You can use this macro to create a function as a callback, allowing you to define the callback function right where the widget and callback are declared, similar to a Lambda function.

The first argument of the macro specifies the widget that will handle the callback. Next, you can include up to five triplets, where each triplet consists of a type, a parameter name, and a value. For example, `int, x, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two triplets, such as `int, x, 3, int, y, 4`. The last digit of the macro name must be the same as the number of triplets (0..5).

The last argument is the actual function body itself.

The function body is limited to a syntax that the macro preprocessor can handle. It should include the leading '{' and trailing '}' and may contain local variable declarations, use global variables and functions, and use also the variables listed and initialized in the argument triples of the macro. Very large function bodies should be avoided because they may exceed the admissible size of a macro argument.

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```c++
#include <FL/fl_callback_macros.H>
...
Fl_Button *btn = new Fl_Button(10, 10, 100, 20, "Test");
FL_INLINE_CALLBACK_1(btn,
    const char *, name, btn->label(),
    { fl_message("Greetings from the %s button", name); }
);
```

You can find a small demonstration program showcasing the usage of `FL_*CALBACK_*` in the examples/callbacks.cxx file.

**Parameters**

<table>
<thead>
<tr>
<th><strong>Parameter</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>WIDGET</td>
<td>the widget that will call the callback</td>
</tr>
<tr>
<td>TYPE0</td>
<td>the type of the first parameter in the function call</td>
</tr>
<tr>
<td>NAME0</td>
<td>an arbitrary variable name that can be used as a parameter in the function body</td>
</tr>
<tr>
<td>VALUE0</td>
<td>a constant value or a variable; the value of the variable is copied when the callback is created</td>
</tr>
<tr>
<td>TYPE1, NAME1, VALUE1</td>
<td>as above; there are six macros that support 0 to 5 parameters</td>
</tr>
<tr>
<td>LAMBDA</td>
<td>the function body within the limits of the C macro preprocessor</td>
</tr>
</tbody>
</table>

### 13.24.2.3 FL_METHOD_CALLBACK_1

```c++
#define FL_METHOD_CALLBACK_1(
    WIDGET,
    CLASS,
    SELF,
    METH,
    TYPE0,
    VALUE0 )
```

Declare a non-static class method callback with custom parameters.

You can declare a callback for a non-static class method with custom parameters using this macro. It provides a convenient way to call arbitrary methods in any class, overcoming FLTK's limitation of passing only a single `void*` or `long` argument. Furthermore, it ensures type safety.
The first argument of the macro specifies the widget that will handle the callback. The second argument indicates the class type to be called. The third argument must be a pointer to an instance of that class. The fourth argument is the name of the method within the class. That method must be public and should not be static.

Following these arguments, you can include up to five pairs, where each pair consists of a type and a value. For example, `int, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two pairs, like this: `int, 3, int, 4`. The last digit of the macro name must be the same as the number of pairs (0..5).

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```c
#include <FL/fl_callback_macros.H>

FL_Button *btn = new FL_Button(10, 10, 100, 20, "Test");
FL_METHOD_CALLBACK_1(btn, Fl_Button, self, color, Fl_Color, FL_GREEN);
```

You can find a small demonstration program showcasing the usage of `FL_+CALLBACK_*` in the examples/callbacks.cxx file.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WIDGET</td>
<td>the widget that will call the callback</td>
</tr>
<tr>
<td>CLASS</td>
<td>the class type</td>
</tr>
<tr>
<td>SELF</td>
<td>a pointer to an instance of the class</td>
</tr>
<tr>
<td>METH</td>
<td>a C++ class method that must be public and not static</td>
</tr>
<tr>
<td>TYPE0,VALUE0</td>
<td>a list of zero to five type/value pairs, all separated by commas</td>
</tr>
</tbody>
</table>

### 13.25 fl_callback_macros.H

Go to the documentation of this file.
These macros create boilerplate code for callbacks to functions and static class methods with up to five arguments.

This macro invocation for example

```
FL_FUNCTION_CALLBACK_2(func_cb_btn_2, hello_2_args_cb,
    const char *, text, "FLTK",
    int, number, 2);
```

will generate the following code:

```
do {
    class Fl_Callback_User_Data_92 : public Fl_Callback_User_Data {
        public:
            const char * p0_; int p1_;
        static void cb(Fl_Widget *w, void *user_data) {
            Fl_Callback_User_Data_92 *d = (Fl_Callback_User_Data_92*)user_data;
            hello_2_args_cb(d->p0_, d->p1_);
        }
        Fl_Callback_User_Data_92(const char * p0, int p1)
            : p0_(p0), p1_(p1) {
    };
    func_cb_btn_2->callback(Fl_Callback_User_Data_92::cb,
        new Fl_Callback_User_Data_92("FLTK", 2),
        true);
} while(0)
```

Clicking the Fl_Button `func_cb_btn_2' will call `hello_2_args_cb("FLTK", 2)'.

Deleting the button will also delete the data that was created in our boilerplate code.

```
#define FL_FUNCTION_CALLBACK_5(WIDGET, FUNC, TYPE0, VALUE0, TYPE1, VALUE1, TYPE2, VALUE2, TYPE3, VALUE3, TYPE4, VALUE4)
    do {
        class _FL_CBD_CLASS_NAME : public Fl_Callback_User_Data {
            public:
                TYPE0 p0_; TYPE1 p1_; TYPE2 p2_; TYPE3 p3_; TYPE4 p4_; 
        static void cb(Fl_Widget *w, void *user_data) {
            _FL_CBD_CLASS_NAME *d = (_FL_CBD_CLASS_NAME*)user_data;
            FUNC(d->p0_, d->p1_, d->p2_, d->p3_, d->p4_);
        }
        _FL_CBD_CLASS_NAME(TYPE0 p0, TYPE1 p1, TYPE2 p2, TYPE3 p3, TYPE4 p4)
            : p0_(p0), p1_(p1), p2_(p2), p3_(p3), p4_(p4) {};
        };
        WIDGET->callback(_FL_CBD_CLASS_NAME::cb,
            new _FL_CBD_CLASS_NAME(VALUE0, VALUE1, VALUE2, VALUE3, VALUE4), true);
    } while(0)
```

```
#define FL_FUNCTION_CALLBACK_4(WIDGET, FUNC, TYPE0, VALUE0, TYPE1, VALUE1, TYPE2, VALUE2, TYPE3, VALUE3)
    do {
        class _FL_CBD_CLASS_NAME : public Fl_Callback_User_Data {
            public:
                TYPE0 p0_; TYPE1 p1_; TYPE2 p2_; TYPE3 p3_; 
        static void cb(Fl_Widget *w, void *user_data) {
            _FL_CBD_CLASS_NAME *d = (_FL_CBD_CLASS_NAME*)user_data;
            FUNC(d->p0_, d->p1_, d->p2_, d->p3_);
        }
        _FL_CBD_CLASS_NAME(TYPE0 p0, TYPE1 p1, TYPE2 p2, TYPE3 p3)
            : p0_(p0), p1_(p1), p2_(p2), p3_(p3) {};
        };
        WIDGET->callback(_FL_CBD_CLASS_NAME::cb,
            new _FL_CBD_CLASS_NAME(VALUE0, VALUE1, VALUE2, VALUE3), true);
    } while(0)
```

```
#define FL_FUNCTION_CALLBACK_3(WIDGET, FUNC, TYPE0, VALUE0, TYPE1, VALUE1, TYPE2, VALUE2)
    do {
        class _FL_CBD_CLASS_NAME : public Fl_Callback_User_Data {
            public:
                TYPE0 p0_; TYPE1 p1_; TYPE2 p2_; 
        static void cb(Fl_Widget *w, void *user_data) {
            _FL_CBD_CLASS_NAME *d = (_FL_CBD_CLASS_NAME*)user_data;
            FUNC(d->p0_, d->p1_, d->p2_);
        }
        _FL_CBD_CLASS_NAME(TYPE0 p0, TYPE1 p1, TYPE2 p2)
            : p0_(p0), p1_(p1), p2_(p2) {};
    };
```

    WIDGET->callback(_FL_CBD_CLASS_NAME::cb, new _FL_CBD_CLASS_NAME(SELF, VALUE0), true); 
}
```c
#define FL_METHOD_CALLBACK_0(WIDGET, CLASS, SELF, METHOD) \
  do { \n    class _FL_CBD_CLASS_NAME : public Fl_Callback_User_Data { \n      public: \n        CLASS *self_; \n        static void cb(Fl_Widget *w, void *user_data) { \n          _FL_CBD_CLASS_NAME *d = (_FL_CBD_CLASS_NAME*)user_data; \n          d->self_->METHOD(); \n        } \n        _FL_CBD_CLASS_NAME(CLASS *self) : self_(self) { } \n    }; \n    WIDGET->callback(_FL_CBD_CLASS_NAME::cb, new _FL_CBD_CLASS_NAME(SELF), true); \n  } while(0) \n/*
These macros create boilerplate code for callback functions inlined into
the widget creation code (similar to lambda functions in C++11 and up)
with up to five arguments.

This macro invocation for example

```
#define FL_INLINE_CALLBACK_2( // callback has two parameters
  WIDGET, TYPE0, NAME0, VALUE0, TYPE1, NAME1, VALUE1, LAMBDA) \
  do { \n    class _FL_CBD_CLASS_NAME : public Fl_Callback_User_Data { \n      public: \n        TYPE0 p0_; TYPE1 p1_; static void fn(TYPE0 NAME0, TYPE1 NAME1) LAMBDA; \n        static void cb(Fl_Widget *w, void *user_data) { \n          _FL_CBD_CLASS_NAME *d = (_FL_CBD_CLASS_NAME*)user_data; \n          d->fn(d->p0_, d->p1_); \n        } \n        _FL_CBD_CLASS_NAME(TYPE0 p0, TYPE1 p1) : p0_(p0), p1_(p1) { } \n    }; \n    WIDGET->callback(_FL_CBD_CLASS_NAME::cb, new _FL_CBD_CLASS_NAME(VALUE0, VALUE1), true); \n  } while(0); \n```

Clicking the Fl_Button `btn' will call
`fl_message("We received the message %s with %d!", "FLTK", 2);'.
Deleting the button will also delete the data that was created in our
boilerplate code.

13.27 Fl_Chart.H File Reference

**Fl_Chart** widget.

```
#include "Fl_Widget.H"
```

**Classes**

- class **Fl_Chart**
  
  `Fl_Chart` displays simple charts.

- struct **FL_CHART_ENTRY**
  
  For internal use only.

**Macros**

- `#define FL_BAR_CHART 0`
  
  `type()` for Bar Chart variant

- `#define FL_CHART_LABEL_MAX 18`
  
  max label length for entry

- `#define FL_CHART_MAX 128`
  
  max entries per chart

- `#define FL_FILL_CHART 3`
  
  `type()` for Fill Line Chart variant

- `#define FL_FILLED_CHART FL_FILL_CHART`
  
  for compatibility

- `#define FL_HORBAR_CHART 1`
  
  `type()` for Horizontal Bar Chart variant
• `#define FL_LINE_CHART` 2
type() for Line Chart variant

• `#define FL_PIE_CHART` 5
type() for Pie Chart variant

• `#define FL_SPECIALPIE_CHART` 6
type() for Special Pie Chart variant

• `#define FL_SPIKE_CHART` 4
type() for Spike Chart variant

### 13.27.1 Detailed Description

**Fl_Chart** widget.

13.38 Fl_Device.H File Reference

declaration of classes Fl_Surface_Device, Fl_Display_Device, Fl_Device_Plugin.
#include <FL/Fl_Plugin.H>
#include <FL/platform_types.h>

Classes

- class Fl_Device_Plugin
  This plugin socket allows the integration of new device drivers for special window or screen types.
- class Fl_Display_Device
  The computer's display.
- class Fl_Surface_Device
  A drawing surface that's susceptible to receive graphical output.

13.38.1 Detailed Description

declaration of classes Fl_Surface_Device, Fl_Display_Device, Fl_Device_Plugin.

13.39 Fl_Device.H

Go to the documentation of this file.
class Fl_RGB_Image;

void resize(int,int,int,int) FL_OVERRIDE;
void hide() FL_OVERRIDE;
void flush() FL_OVERRIDE;
~Fl_Double_Window();
Fl_Double_Window(int W, int H, const char *l = 0);
Fl_Double_Window(int X, int Y, int W, int H, const char *l = 0);
```

### 13.42 fl_draw.H File Reference

Utility header to pull drawing functions together

```cpp
#include <FL/Enumerations.H>
#include <FL/Fl_Graphics_Driver.H>
#include <FL/Fl_Rect.H>
```

**Enumerations**

```cpp
enum {
    FL_SOLID = 0, FL_DASH = 1, FL_DOT = 2, FL_DASHDOT = 3,
    FL_DASHDOTDOT = 4, FL_CAP_FLAT = 0x100, FL_CAP_ROUND = 0x200, FL_CAP_SQUARE = 0x300,
    FL_JOIN_MITER = 0x1000, FL_JOIN_ROUND = 0x2000, FL_JOIN_BEVEL = 0x3000
}
```
Functions

- `int fl_add_symbol (const char *name, void(*)(Fl_Color), int scalable)`
  
  Adds a symbol to the system.

- `int fl_antialias ()`
  
  Return whether line drawings are currently antialiased.

- `void fl_antialias(int state)`
  
  Turn antialiased line drawings ON or OFF, if supported by platform.

- `void fl_arc (double x, double y, double r, double start, double end)`
  
  Add a series of points to the current path on the arc of a circle.

- `void fl_arc (int x, int y, int w, int h, double a1, double a2)`
  
  Draw ellipse sections using integer coordinates.

- `void fl_begin_complex_polygon ()`
  
  Start drawing a complex filled polygon.

- `void fl_begin_line ()`
  
  Start drawing a list of lines.

- `void fl_begin_loop ()`
  
  Start drawing a closed sequence of lines.

- `void fl_begin_offscreen (Fl_Offscreen ctx)`
  
  Send all subsequent drawing commands to this offscreen buffer.

- `void fl_begin_points ()`
  
  Start drawing a list of points.

- `void fl_begin_polygon ()`
  
  Start drawing a convex filled polygon.

- `char fl_can_do_alpha_blending ()`
  
  Check whether platform supports true alpha blending for RGBA images.

- `Fl_RGB_Image * fl_capture_window (Fl_Window *win, int x, int y, int w, int h)`
  
  Captures the content of a rectangular zone of a mapped window.

- `void fl_chord (int x, int y, int w, int h, double a1, double a2)`
  
  fl_chord declaration is a place holder - the function does not yet exist

- `void fl_circle (double x, double y, double r)`
  
  fl_circle(x,y,r) is equivalent to fl_arc(x,y,r,0,360), but may be faster.

- `void fl_clip (int x, int y, int w, int h)`
  
  Intersect the current clip region with a rectangle and push this new region onto the stack (deprecated).

- `int fl_clip_box (int x, int y, int w, int h, int &X, int &Y, int &W, int &H)`
  
  Intersect a rectangle with the current clip region and return the bounding box of the result.

- `Fl_Region fl_clip_region ()`
  
  Return the current clipping region.

- `void fl_clip_region (Fl_Region r)`
  
  Replace the top of the clipping stack with a clipping region of any shape.

- `Fl_Color fl_color ()`
  
  Return the last fl_color() that was set.

- `void fl_color (Fl_Color c)`
  
  Set the color for all subsequent drawing operations.

- `void fl_color (int c)`
  
  for back compatibility - use fl_color(Fl_Color c) instead

- `void fl_color (uchar r, uchar g, uchar b)`
  
  Set the color for all subsequent drawing operations.

- `void fl_copy_offscreen (int x, int y, int w, int h, Fl_Offscreen pixmap, int srcx, int srcy)`
  
  Copy a rectangular area of the given offscreen buffer into the current drawing destination.

- `Fl_Offscreen fl_create_offscreen (int w, int h)`
Creation of an offscreen graphics buffer.

- `void fl_cursor (Fl_Cursor)`
  
  Sets the cursor for the current window to the specified shape and colors.

- `void fl_cursor (Fl_Cursor, Fl_Color fg, Fl_Color bg=FL_WHITE)`
  
  Add a series of points on a Bézier curve to the path.

- `void fl_delete_offscreen (Fl_Offscreen ctx)`
  
  Deletion of an offscreen graphics buffer.

- `int fl_descent ()`
  
  Return the recommended distance above the bottom of a fl_height() tall box to draw the text at so it looks centered vertically in that box.

- `void fl_draw (const char *str, int n, int x, int y)`
  
  Draws starting at the given x, y location a UTF-8 string of length n bytes.

- `void fl_draw (const char *str, int x, int y)`
  
  Draw a nul-terminated UTF-8 string starting at the given x, y location.

- `void fl_draw (const char *str, int x, int y, int w, int h, Fl_Align align, Fl_Image *img=0, int draw_symbols=1)`
  
  Fancy string drawing function which is used to draw all the labels.

- `void fl_draw (const char *str, int x, int y, int n, int w, int h, Fl_Align align, Fl_Image *img=0, int draw_symbols=1)`

  The same as fl_draw(const char *,int,int,int,Fl_Align,Fl_Image*,int) with the addition of the callthis parameter, which is a pointer to a text drawing function such as fl_draw(const char *, int, int, int) to do the real work.

- `void fl_draw (int angle, const char *str, int n, int x, int y)`
  
  Draw at the given x, y location a UTF-8 string of length n bytes rotating angle degrees counter-clockwise.

- `void fl_draw (int angle, const char *str, int x, int y)`
  
  Draw a nul-terminated UTF-8 string starting at the given x, y location and rotating angle degrees counter-clockwise.

- `void fl_draw_arrow (Fl_Rect bb, Fl_Arrow_Type t, Fl_Orientation o, Fl_Color color)`
  
  Draw an "arrow like" GUI element for the selected scheme.

- `void fl_draw_box (Fl_Boxtype, int x, int y, int w, int h, Fl_Color)`
  
  Draws a box using given type, position, size and color.

- `void fl_draw_check (Fl_Rect bb, Fl_Color col)`
  
  Draw a check mark inside the given bounding box.

- `void fl_draw_circle (int x, int y, int d, Fl_Color color)`
  
  Draw a potentially small, filled circle using a given color.

- `void fl_draw_image (const uchar *buf, int X, int Y, int W, int H, int D=3, int L=0)`
  
  Draw an 8-bit per color RGB or luminance image.

- `void fl_draw_image (Fl_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=3)`
  
  Draw an image using a callback function to generate image data.

- `void fl_draw_image_mono (const uchar *buf, int X, int Y, int W, int H, int D=1, int L=0)`
  
  Draw a gray-scale (1 channel) image.

- `void fl_draw_image_mono (Fl_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=1)`
  
  Draw a gray-scale (1 channel) image using a callback function to generate image data.

- `int fl_draw_pixmap (char const *data, int x, int y, Fl_Color bg=FL_GRAY)`
  
  Draw XPM image data, with the top-left corner at the given position.

- `int fl_draw_pixmap (Fl_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=1)`
  
  Draw XPM image data, with the top-left corner at the given position.

- `void fl_draw_radio (int x, int y, int d, Fl_Color color)`
  
  Draw a round check mark (circle) of a radio button.

- `int fl_draw_symbol (const char *label, int x, int y, int w, int h, Fl_Color)`

  Draw the named symbol in the given rectangle using the given color.

- `void fl_end_complex_polygon ()`

  End complex filled polygon, and draw.
- `void fl_end_line ()`
  End list of lines, and draw.
- `void fl_end_loop ()`
  End closed sequence of lines, and draw.
- `void fl_end_offscreen ()`
  Quit sending drawing commands to the current offscreen buffer.
- `void fl_end_points ()`
  End list of points, and draw.
- `void fl_end_polygon ()`
  End convex filled polygon, and draw.
- `const char * fl_expand_text (const char *from, char *buf, int maxbuf, double maxw, int &n, double &width, int wrap, int draw_symbols=0)`
  Copy from to buf, replacing control characters with ^X.
- `void fl_focus_rect (int x, int y, int w, int h)`
  Draw a dotted rectangle, used to indicate keyboard focus on a widget.
- `Fl_Font fl_font ()`
  Return the face set by the most recent call to fl_font().
- `void fl_font (Fl_Font face, Fl_Fontsize fsize)`
  Sets the current font, which is then used in various drawing routines.
- `void fl_frame (const char *s, int x, int y, int w, int h)`
  Draws a series of line segments around the given box.
- `void fl_frame2 (const char *s, int x, int y, int w, int h)`
  Draws a series of line segments around the given box.
- `void fl_gap ()`
  Separate loops of the path.
- `int fl_height ()`
  Return the recommended minimum line spacing for the current font.
- `int fl_height (int font, int size)`
  This function returns the actual height of the specified font and size.
- `const char * fl_latin1_to_local (const char *t, int n=-1)`
  Convert text from Windows/X11 latin1 character set to local encoding.
- `const char * fl_mac_roman_to_local (const char *t, int n=-1)`
  Convert text from Mac Roman character set to local encoding.
• void fl_measure (const char *str, int &x, int &y, int draw_symbols=1)
  Measure how wide and tall the string will be when printed by the fl_draw() function with align parameter.
• int fl_measure_pixmap (char *const *data, int &w, int &h)
  Get the dimensions of a pixmap.
• int fl_measure_pixmap (const char *const *cdata, int &w, int &h)
  Get the dimensions of a pixmap.
• void fl_mult_matrix (double a, double b, double c, double d, double x, double y)
  Concatenate another transformation onto the current one.
• int fl_not_clipped (int x, int y, int w, int h)
  Does the rectangle intersect the current clip region?
• unsigned int fl_oldShortcut (const char *s)
  Emulation of XForms named shortcuts.
• void fl_overlay_clear ()
  Erase a selection rectangle without drawing a new one.
• void fl_overlay_rect (int x, int y, int w, int h)
  Draw a transient dotted selection rectangle.
• float fl_override_scale ()
  Removes any GUI scaling factor in subsequent drawing operations.
• void fl_pie (int x, int y, int w, int h, double a1, double a2)
  Draw filled ellipse sections using integer coordinates.
• void fl_point (int x, int y)
  Draw a single pixel at the given coordinates.
• void fl_polygon (int x, int y, int x1, int y1, int x2, int y2)
  Fill a 3-sided polygon.
• void fl_polygon (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
  Fill a 4-sided polygon.
• void fl_pop_clip ()
  Restore the previous clip region.
• void fl_pop_matrix ()
  Restore the current transformation matrix from the stack.
• void fl_push_clip (int x, int y, int w, int h)
  Intersect the current clip region with a rectangle and push this new region onto the stack.
• void fl_push_matrix ()
  Save the current transformation matrix on the stack.
• void fl_push_no_clip ()
  Push an empty clip region onto the stack so nothing will be clipped.
• uchar * fl_read_image (uchar *p, int X, int Y, int W, int H, int alpha=0)
  Reads an RGB(A) image from the current window or off-screen buffer.
• void fl_rect (Fl_Rect r)
  Draw a border inside the given bounding box.
• void fl_rect (int x, int y, int w, int h)
  Draw a border inside the given bounding box.
• void fl_rect (int x, int y, int w, int h, Fl_Color c)
  Draw with passed color a border inside the given bounding box.
• void fl_rectf (Fl_Rect bb, uchar r, uchar g, uchar b)
  Color a rectangle with "exactly" the passed r, g, b color.
• void fl_rectf (Fl_Rect r)
  Color with current color a rectangle that exactly fills the given bounding box.
• void fl_rectf (Fl_Rect r, Fl_Color c)
  Color with passed color a rectangle that exactly fills the given bounding box.
• void fl_rectf (int x, int y, int w, int h)
Color with current color a rectangle that exactly fills the given bounding box.

- `void fl_rectf (int x, int y, int w, int h, Fl_Color c)`

  Color with passed color a rectangle that exactly fills the given bounding box.

- `void fl_rectf (int x, int y, int w, int h, uchar r, uchar g, uchar b)`

  Color a rectangle with "exactly" the passed r, g, b color.

- `void fl_rescale_offscreen (Fl_Offscreen &ctx)`

  Adapts an offscreen buffer to a changed value of the scale factor.

- `void fl_reset_spot (void)`

  Resets marked text.

- `void fl_restore_clip ()`

  Undo any clobbering of the clip region done by your program.

- `void fl_restore_scale (float s)`

  Restores the GUI scaling factor and the clipping region in subsequent drawing operations.

- `void fl_rotate (double d)`

  Concatenate rotation transformation onto the current one.

- `void fl_rounded_rect (int x, int y, int w, int h, int r)`

  Draw a rounded border inside the given bounding box.

- `void fl_rounded_rectf (int x, int y, int w, int h, int r)`

  Color with current color a rounded rectangle that exactly fills the given bounding box.

- `void fl_rtl_draw (const char *str, int n, int x, int y)`

  Draw a UTF-8 string of length n bytes right to left starting at the given x, y location.

- `void fl_scale (double x)`

  Concatenate scaling transformation onto the current one.

- `void fl_scale (double x, double y)`

  Concatenate scaling transformation onto the current one.

- `void fl_scroll (int X, int Y, int W, int H, int dx, int dy, void (draw_area)(void *, int, int, int, int), void *data)`

  Scroll a rectangle and draw the newly exposed portions.

- `void fl_set_spot (int font, int size, int X, int Y, int W, int H, Fl_Window *win=0)`

  Inform text input methods about the current text insertion cursor.

- `void fl_set_status (int X, int Y, int W, int H)`

  Related to text input methods under X11.

- `const char *flShortcut_label (unsigned int shortcut)`

  Get a human-readable string from a shortcut value.

- `const char *flShortcut_label (unsigned int shortcut, const char **eom)`

  Get a human-readable string from a shortcut value.

- `Fl_Fontsize fl_size ()`

  Return the size set by the most recent call to fl_font().

- `void fl_text_extents (const char *, int &dx, int &dy, int &w, int &h)`

  Determine the minimum pixel dimensions of a null-terminated string using the current fl_font().

- `void fl_text_extents (const char *t, int n, int &dx, int &dy, int &w, int &h)`

  Determine the minimum pixel dimensions of a sequence of n characters (bytes) using the current fl_font().

- `double fl_transform_dx (double x, double y)`

  Transform distance using current transformation matrix.

- `double fl_transform_dy (double x, double y)`

  Transform distance using current transformation matrix.

- `double fl_transform_x (double x, double y)`

  Transform coordinate using the current transformation matrix.

- `double fl_transform_y (double x, double y)`

  Transform coordinate using the current transformation matrix.

- `void fl_transformed_vertex (double xf, double yf)`

  Add coordinate pair to the vertex list without further transformations.
• void fl_translate (double x, double y)
  Concatenate translation transformation onto the current one.

• void fl_vertex (double x, double y)
  Add a single vertex to the current path.

• double fl_width (const char ∗txt)
  Return the typographical width of a nul-terminated string using the current font face and size.

• double fl_width (const char ∗txt, int n)
  Return the typographical width of a sequence of n characters using the current font face and size.

• double fl_width (unsigned int c)
  Return the typographical width of a single character using the current font face and size.

• void fl_xyline (int x, int y, int x1)
  Draw a horizontal line from (x,y) to (x1,y).

• void fl_xyline (int x, int y, int x1, int y2)
  Draw a horizontal line from (x,y) to (x1,y), then vertical from (x1,y) to (x1,y2).

• void fl_xyline (int x, int y, int x1, int y2, int x3)
  Draw a horizontal line from (x,y) to (x1,y), then a vertical from (x1,y) to (x1,y2) and then another horizontal from (x1,y2) to (x3,y2).

• void fl_yxline (int x, int y, int y1)
  Draw a vertical line from (x,y) to (x,y1)

• void fl_yxline (int x, int y, int y1, int x2)
  Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1).

• void fl_yxline (int x, int y, int y1, int x2, int y3)
  Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1), then another vertical from (x2,y1) to (x2,y3).

Variables

• char fl_draw_shortcut

13.42.1 Detailed Description

typedef void (*Fl_Draw_Image_Cb)(void* data, int x, int y, int w, uchar* buf);

virtual void draw_pixmap(Fl_Pixmap *pxm, int XP, int YP, int WP, int HP, int cx, int cy);

The graphics driver can implement up to 6 virtual member functions to draw images:

- Fl_Graphics_Driver::gl_start()
- Fl_Graphics_Driver::fl_convert_pixmap(const char *const* cdata, uchar* out, Fl_Color bg)
- Fl_Graphics_Driver::fl_copy_offscreen(int x, int y, int w, int h, Fl_Offscreen pixmap, int srcx, int srcy);
- Fl_Graphics_Driver::fl_draw_image(Fl_Draw_Image_Cb cb, void * data, int X, int Y, int W, int H, int D);
- Fl_Graphics_Driver::fl_draw_image_mono(Fl_Draw_Image_Cb cb, void * data, int X, int Y, int W, int H, int D);
- Fl_Graphics_Driver::fl_draw_image(const uchar * buf, int X, int Y, int W, int H, int D, int L);
- Fl_Graphics_Driver::fl_draw_image_mono(const uchar * buf, int X, int Y, int W, int H, int D, int L);

- Fl_SVG_Image
- Fl_Pixmap
- Fl_Bitmap
- Fl_RGB_Image

virtual void draw_rgb(Fl_RGB_Image *,....).

- Consider an image object, say from class Fl_RGB_Image. Fl_RGB_Image::draw() takes care of resizing and caching the Pixmap to the adequate drawing size. If Fl_XXX_Graphics_Driver does not re-implement this function, Fl_Graphics_Driver::draw_rgb(Fl_RGB_Image *,....) runs. It internally calls Fl_XXX_Graphics_Driver::draw_fixed(Fl_RGB_Image *,....) which draws the image from its cached form which already has the adequate size.

- Some drivers implement, for a given image class, the function of both groups, e.g. : Fl_Quartz_Graphics_Driver.

Each resizes the image, caches it, and calls the platform-specific implementation of draw_fixed(image-class,....,....) with the cached image.

- Only draw_fixed() as in these examples:
- Fl_GDI_Graphics_Driver::draw_rgb() which runs Fl_GDI_Graphics_Driver::draw_fixed(Fl_RGB_Image *,....) because scale-and-draw may require function Alphablend() that draws the image from its cached form which already has the adequate size.

- Some drivers implement, for a given image class, only the function of the 1st group or only draw_fixed() as in these examples:
- Fl_Xlib_Graphics_Driver implements only draw_fixed(Fl_RGB_Image *,....) as in these examples:
- Fl_GDI_Graphics_Driver::draw_fixed(Fl_RGB_Image *,....) runs. It internally calls Fl_XXX_Graphics_Driver::draw_fixed(Fl_RGB_Image *,....) that draws the image from its cached form which already has the adequate size.

- Some drivers implement, for a given image class, only the function of each group.

- Fl_Quartz_Graphics_Driver implements only draw_rgb(Fl_RGB_Image *,....) as in these examples:
- Fl_Xlib_Graphics_Driver implements only draw_fixed(Fl_RGB_Image *,....). The library takes care of resizing and caching the Pixmap to the adequate drawing size.

- Fl_Quartz_Graphics_Driver::draw_rgb() which runs Fl_Quartz_Graphics_Driver::draw_fixed(Fl_RGB_Image *,....) because function FlAlphaBlend requires the RGB image. If Fl_XXX_Graphics_Driver does not re-implement this function, this code runs and is expected to draw the image adequately scaled to its drawing size. If Fl_XXX_Graphics_Driver does not re-implement this function, Fl_Graphics_Driver::draw_rgb(Fl_RGB_Image *,....) runs. It internally calls Fl_XXX_Graphics_Driver::draw_rgb(Fl_RGB_Image *,....) that draws the image from its cached form which already has the adequate size.

- Some drivers implement, for a given image class, only the function of the 1st group or only draw_fixed() as in these examples:
- Fl_GDI_Graphics_Driver::draw_rgb() which runs Fl_GDI_Graphics_Driver::draw_fixed(Fl_RGB_Image *,....) as in these examples:
- Fl_Xlib_Graphics_Driver implements only draw_fixed(Fl_RGB_Image *,....) as in these examples:
- Fl_Quartz_Graphics_Driver.

- Some drivers implement, for a given image class, only the function of the 1st group or only draw_fixed() as in these examples:
- Fl_GDI_Graphics_Driver::draw_rgb() which runs Fl_GDI_Graphics_Driver::draw_fixed(Fl_RGB_Image *,....) as in these examples:
- Fl_Xlib_Graphics_Driver implements only draw_fixed(Fl_RGB_Image *,....) as in these examples:
- Fl_Quartz_Graphics_Driver.

- Some drivers implement, for a given image class, only the function of the 1st group or only draw_fixed() as in these examples:

/* Abstract class Fl_Scalable_Graphics_Driver is platform-independent. It supports the scaling of all graphics coordinates by a float factor helpful to support HiDPI displays. This class does:
- compute scaled coordinates
- scale the cached offscreen of image objects
- scale the pixel arrays used when performing direct image draws
- call the member functions of a platform-specific, Fl_Scalable_Graphics_Driver-derived class that do the drawings with adequately scaled coordinates. The member functions are named with the _unscaled suffix.
- scale and unscale the clipping region.

This class is presently used by the X11 and Windows platforms to support HiDPI displays. In the future, it may also be used by other platforms. */

class Fl_Grid::Cell

class Fl_Grid

Fl_Grid is a container (layout) widget with multiple columns and rows.
Typedefs

- typedef unsigned short Fl_Grid_Align
  
  Fl_Grid type for child widget alignment control.

Variables

- const Fl_Grid_Align FL_GRID_BOTTOM = 0x0002
  
  Align the widget at the bottom of the cell.

- const Fl_Grid_Align FL_GRID_BOTTOM_LEFT = FL_GRID_BOTTOM | FL_GRID_LEFT
- const Fl_Grid_Align FL_GRID_BOTTOM_RIGHT = FL_GRID_BOTTOM | FL_GRID_RIGHT
- const Fl_Grid_Align FL_GRID_CENTER = 0x0000
  
  Align the widget in the middle of the cell (default).

- const Fl_Grid_Align FL_GRID_FILL = 0x0030
  
  Stretch the widget in both directions to fill the cell.

- const Fl_Grid_Align FL_GRID_HORIZONTAL = 0x0010
  
  Stretch the widget horizontally to fill the cell.

- const Fl_Grid_Align FL_GRID_LEFT = 0x0004
  
  Align the widget at the left side of the cell.

- const Fl_Grid_Align FL_GRID_PROPORTIONAL = 0x0040
  
  Stretch the widget proportionally.

- const Fl_Grid_Align FL_GRID_RIGHT = 0x0008
  
  Align the widget at the right side of the cell.

- const Fl_Grid_Align FL_GRID_TOP = 0x0001
  
  Align the widget at the top of the cell.

- const Fl_Grid_Align FL_GRID_TOP_LEFT = FL_GRID_TOP | FL_GRID_LEFT
- const Fl_Grid_Align FL_GRID_TOP_RIGHT = FL_GRID_TOP | FL_GRID_RIGHT
- const Fl_Grid_Align FL_GRID_VERTICAL = 0x0020
  
  Stretch the widget vertically to fill the cell.

13.59.1 Detailed Description

Fl_Grid container widget.

13.71 Fl_image.H File Reference

Fl_image, Fl_RGB_Image classes.
#include "Enumerations.H"
#include "Fl_Widget.H"

Classes

- class Fl_image
  
  Base class for image caching, scaling and drawing.

Generated by Oxygen
• class Fl_RGB_Image

The Fl_RGB_Image class supports caching and drawing of full-color images with 1 to 4 channels of color information.

Enumerations

• enum Fl_RGB_Scaling { FL_RGB_SCALING_NEAREST = 0, FL_RGB_SCALING_BILINEAR }

The scaling algorithm to use for RGB images.

13.71.1 Detailed Description

Fl_Image, Fl_RGB_Image classes.

13.71.2 Enumeration Type Documentation

13.71.2.1 Fl_RGB_Scaling

enum Fl_RGB_Scaling

The scaling algorithm to use for RGB images.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_RGB_SCALING_NEAREST</td>
<td>default RGB image scaling algorithm</td>
</tr>
<tr>
<td>FL_RGB_SCALING_BILINEAR</td>
<td>more accurate, but slower RGB image scaling algorithm</td>
</tr>
</tbody>
</table>

13.72 Fl_Image.H

Go to the documentation of this file.

```c
#ifndef Fl_Image_H
#define Fl_Image_H

#include "Enumerations.H"
#include "Fl_Widget.H" // for fl_uintptr_t

class Fl_Widget;
class Fl_Pixmap;
struct Fl_Menu_Item;
struct Fl_Label;
class Fl_RGB_Image;

enum Fl_RGB_Scaling {
    FL_RGB_SCALING_NEAREST = 0,
    FL_RGB_SCALING_BILINEAR
};

class Fl_EXPORT Fl_Image {

friend class Fl_Graphics_Driver;

# Image Handling

The code snippet provided is from a C++ library that deals with image handling and rendering. It includes methods for creating and manipulating images, as well as functions for scaling and drawing images. Here are some key points extracted from the code:

- **Image Creation and Initialization**: The class `Fl_Image` provides constructors for creating images of specific sizes and types. It also includes methods for setting image dimensions, data, and scale sizes.

- **Image Scaling and Drawing**: The class includes methods for scaling images before drawing and for drawing the image at specific sizes and positions. These methods are critical for ensuring that images are displayed correctly across different screen sizes.

- **Image Data Handling**: The class manages image data through pointers to arrays of characters, allowing for dynamic data manipulation and access.

- **Methods and Functions**: The class includes various methods for accessing image dimensions, drawing, and releasing image resources. It also has static methods for setting and getting RGB scaling algorithms, which are used for rescaling images before drawing.

- **PlatformIndependence**: The code is designed to be platform-independent, allowing it to work across different operating systems and hardware configurations.

The `Fl_SVG_Image` class is also mentioned, indicating that the library supports SVG images, which are scalable vector graphics.

Classes

• struct Fl_Menu_Item

  The Fl_Menu_Item structure defines a single menu item that is used by the Fl_Menu_ class.

Typedefs

• typedef Fl_Menu_Item Fl_Menu

Enumerations

• enum {
  FL_MENU_INACTIVE = 1, FL_MENU_TOGGLE = 2, FL_MENU_VALUE = 4, FL_MENU_RADIO = 8,
  FL_MENU_INVISIBLE = 0x10, FL_SUBMENU_POINTER = 0x20, FL_SUBMENU = 0x40, FL_MENU_DIVIDER
  = 0x80,
  FL_MENU_HORIZONTAL = 0x100, FL_MENU_RESERVED = 0xffffffff
}

• enum {
  FL_PUP_NONE = 0, FL_PUP_GREY = FL_MENU_INACTIVE, FL_PUP_GRAY = FL_MENU_INACTIVE,
  FL_MENU_BOX = FL_MENU_TOGGLE,
  FL_PUP_BOX = FL_MENU_TOGGLE, FL_MENU_CHECK = FL_MENU_VALUE, FL_PUP_CHECK = FL_PUP
  _VALUE, FL_PUPADIO = FL_MENU_RADIO, FL_PUP_INVISIBLE = FL_MENU_INVISIBLE, FL_PUP_SUBMENU
  = FL_SUBMENU_POINTER
}

Functions

• Fl_Shortcut fl_old_shortcut (const char *)

  Emulation of XForms named shortcuts.
```
## 13.85.1 Enumeration Type Documentation

### 13.85.1.1 anonymous enum

**anonymous enum**

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_MENU_INACTIVE</td>
<td>Deactivate menu item (gray out)</td>
</tr>
<tr>
<td>FL_MENU_TOGGLE</td>
<td>Item is a checkbox toggle (shows checkbox for on/off state)</td>
</tr>
<tr>
<td>FL_MENU_VALUE</td>
<td>The on/off state for checkbox/radio buttons (if set, state is 'on')</td>
</tr>
<tr>
<td>FL_MENU_RADIO</td>
<td>Item is a radio button (one checkbox of many can be on)</td>
</tr>
<tr>
<td>FL_MENU_INVISIBLE</td>
<td>Item will not show up (shortcut will work)</td>
</tr>
<tr>
<td>FL_SUBMENU_POINTER</td>
<td>Indicates user_data() is a pointer to another menu array.</td>
</tr>
<tr>
<td>FL_SUBMENU</td>
<td>Item is a submenu to other items.</td>
</tr>
<tr>
<td>FL_MENU_DIVIDER</td>
<td>Creates divider line below this item. Also ends a group of radio buttons.</td>
</tr>
<tr>
<td>FL_MENU_HORIZONTAL</td>
<td>??? – reserved, internal (do not use)</td>
</tr>
<tr>
<td>FL_MENU_RESERVED</td>
<td>These bits are reserved for internal or future usage (do not use)</td>
</tr>
</tbody>
</table>

```

Classes

- class Fl_Native_File_Chooser

  This class lets an FLTK application easily and consistently access the operating system's native file chooser.

13.93.1 Detailed Description

Fl_Native_File_Chooser widget.

13.94 Fl_Native_File_Chooser.H

Go to the documentation of this file.
and the KDE file chooser runs under the KDE desktop.

class Fl_Quartz_Native_File_Chooser_Driver  
<== this API implementation runs a Mac OS X file chooser

class Fl_WinAPI_Native_File_Chooser_Driver  
<== this API implementation runs a Windows file chooser

each platform must implement the constructor of the Fl_Native_File_Chooser class.

This particular implementation:

Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
  platform_fnfc = new Fl_Native_File_Chooser_FLTK_Driver(val);
}

This other implementation:

Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
  platform_fnfc = 0;
}

No more code is required. The cross-platform Fl_Native_File_Chooser_FLTK.cxx file must be compiled in libfltk,
and the default FLTK file chooser will be used.

This other implementation:

Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
  platform_fnfc = 0;
}

can be used by any platform.

No more code is required. The cross-platform Fl_Native_File_Chooser_FLTK.cxx file must be compiled in libfltk,
and the default FLTK file chooser will be used.

This other implementation:

Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
  platform_fnfc = 0;
}

can be used by a platform that needs no file chooser.

13.100 Fl_Paged_Device.H File Reference

declaration of class Fl_Paged_Device.
#include <FL/Fl_Widget_Surface.H>

Classes

- class Fl_Paged_Device
  Represents page-structured drawing surfaces.
- struct Fl_Paged_Device::page_format
  width, height and name of a page format

Macros

- #define NO_PAGE_FORMATS 30 /* MSVC6 compilation fix */
  Number of elements in enum Page_Format.

13.100.1 Detailed Description

declaration of class Fl_Paged_Device.

### 13.107 Fl_PostScript.H File Reference

Declaration of classes `Fl_PostScript_File_Device` and `Fl_EPS_File_Surface`.

```
#include <FL/Fl_Paged_Device.H>
#include <FL/fl_draw.H>
#include <stdarg.h>
```

#### Classes

- **class Fl_EPS_File_Surface**
  
  Encapsulated PostScript drawing surface.

- **class Fl_PostScript_File_Device**
  
  To send graphical output to a PostScript file.

#### Typedefs

- **typedef int(* Fl_PostScript_Close_Command) (FILE *)**
  
  Signature of functions FLTK may use to close FILE variables after PostScript/EPS output.

### 13.107.1 Detailed Description

Declaration of classes `Fl_PostScript_File_Device` and `Fl_EPS_File_Surface`.

### 13.107.2 Typedef Documentation

#### 13.107.2.1 Fl_PostScript_Close_Command

**typedef int(* Fl_PostScript_Close_Command) (FILE *)**

Signature of functions FLTK may use to close FILE variables after PostScript/EPS output.

A non-null return value indicates output error.

**See also**

`Fl_PostScript_File_Device::close_command()` and `Fl_EPS_File_Surface::Fl_EPS_File_Surface()`.

### 13.108 Fl_PostScript.H

Classes

- class Fl_Shared_Image
  
  This class supports caching, loading, and drawing of image files.

Typedefs

- typedef Fl_Image *(* Fl_Shared_Handler) (const char *name, uchar *header, int headerlen)
Test function (typedef) for adding new shared image formats.

Functions

- void fl_register_images ()
  Register the known image formats.

13.129.1 Detailed Description

Fl_Shared_Image class.

13.129.2 Typedef Documentation

13.129.2.1 Fl_Shared_Handler

typedef Fl_Image *( Fl_Shared_Handler) (const char *name, uchar *header, int headerlen)

Test function (typedef) for adding new shared image formats.

This defines the function type you can use to add a handler for unknown image formats that can be opened and
loaded as an Fl_Shared_Image.

fl_register_images() adds all image formats known to FLTK. Call Fl_Shared_Image::add_handler() to add your own
check function to the list of known image formats.

Your function will be passed the filename (name), some header bytes already read from the image file and the
size headerlen of the data read. The max value of size is implementation dependent. If your handler function
needs to check more bytes you must open the image file yourself.

The provided buffer header must not be overwritten.

If your handler function can identify the file type you must open the file and return a valid Fl_Image or derived type,
otherwise you must return NULL. Example:

```c
static Fl_Image *check_my_image(const char *name,
uchar *header,
int headerlen) {
  // (test image type using header and headerlen)
  if (known) {
    // (load image data from file \p name)
    return new Fl_RGB_Image(data, ...);
  } else
    return 0;
}
```

// add your handler:
Fl_Shared_Image::add_handler(check_my_image);

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>name</th>
<th>filename to be checked and opened if applicable</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>header</td>
<td>portion of the file that has already been read</td>
</tr>
<tr>
<td>in</td>
<td>headerlen</td>
<td>length of provided header data</td>
</tr>
</tbody>
</table>

Returns

valid Fl_Image or NULL.

The fl_show_colormap() function hides the implementation classes used to provide the popup window and color selection mechanism.
Functions

- Fl_Color fl_show_colormap (Fl_Color oldcol)
  
Pops up a window to let the user pick a colormap entry.

### 13.132.1 Detailed Description

The `fl_show_colormap()` function hides the implementation classes used to provide the popup window and color selection mechanism.

### 13.133 fl_show_colormap.H

**Go to the documentation of this file.**

```c
#ifndef fl_show_colormap_H
#define fl_show_colormap_H

/* doxygen comment here to avoid exposing ColorMenu in fl_show_colormap.cxx */

FL_EXPORT Fl_Color fl_show_colormap(Fl_Color oldcol);
#endif
```

### 13.134 fl_show_input.H

```c
// Standard input dialog header file for the Fast Light Tool Kit (FLTK).

#include "fl_ask.H"
```

### 13.135 Fl_Simple_Counter.H

```c
// Simple counter header file for the Fast Light Tool Kit (FLTK).

```

Generated by Doxygen
13.136 Fl_Single_Window.H

```cpp
#include "Fl_Window.H"

class FL_EXPORT Fl_Single_Window : public Fl_Window {
  public:
    Fl_Single_Window(int W, int H, const char *l=0);

    void show() FL_OVERRIDE;
    void show(int a, char **b) {Fl_Window::show(a,b);}

    Fl_Single_Window(int X, int Y, int W, int H, const char *l=0);

};
```

13.137 Fl_Slider.H

```cpp
#include "Fl_Valuator.H"

class FL_EXPORT Fl_Slider : public Fl_Valuator {
  public:
    Fl_Slider(int X, int Y, int W, int H, const char *l=0);

};

13.143 Fl_Sys_Menu_Bar.H File Reference

Definition of class Fl_Sys_Menu_Bar.
#include <FL/Fl_Menu_Bar.H>

Classes

• class Fl_Sys_Menu_Bar
  A class to create and modify menus that appear on macOS in the menu bar at the top of the screen.

Variables

• Fl_Sys_Menu_Bar * fl_sys_menu_bar
  The system menu bar.

13.143.1 Detailed Description

Definition of class Fl_Sys_Menu_Bar.

Classes

- class Fl_Terminal::CharStyle
- class Fl_Terminal::Cursor
- class Fl_Terminal::EscapeSeq
- class Fl_Terminal

Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control.

- class Fl_Terminal::Margin
- class Fl_Terminal::PartialUtf8Buf
- class Fl_Terminal::RingBuffer
- class Fl_Terminal::Selection
- class Fl_Terminal::Utf8Char

13.148.1 Detailed Description

/*
character size" is the size of a UTF-8 character in bytes
"character width" is the width of a Unicode character in pixels
"column" was originally defined as a character offset from the left margin.
It was identical to the byte offset. In UTF-8, we have neither a byte offset
nor truly fixed width fonts [*]. Column could be a pixel value multiplied with
an average character width (which is a bearable approximation).

* in Unicode, there are no fixed width fonts! Even if the ASCII characters may
happen to be all the same width in pixels, Chinese characters surely are not.
There are plenty of exceptions, like ligatures, that make special handling of
"fixed" character widths a nightmare. I decided to remove all references to
fixed fonts and see "columns" as a multiple of the average width of a
character in the main font.

### 13.165 Fl_Tree_Item_Array.H

This file is part of the Fl_Tree widget for FLTK.

### 13.166 Fl_Tree_Prefs.H File Reference

This file contains the definitions for Fl_Tree's preferences.

---

Generated by Doxygen
Classes

- class Fl_Tree_Prefs
  
  Tree widget's preferences.

TypeDefs

- typedef void() Fl_Tree_Item_Draw_Callback(Fl_Tree_Item *, void *)

Enumerations

- enum Fl_Tree_Connector { FL_TREE_CONNECTOR_NONE =0, FL_TREE_CONNECTOR_DOTTED =1, FL_TREE_CONNECTOR_SOLID =2 }

  Defines the style of connection lines between items.

- enum Fl_Tree_Item_Draw_Mode { FL_TREE_ITEM_DRAW_DEFAULT =0, FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET =1, FL_TREE_ITEM_HEIGHT_FROM_WIDGET =2 }

  Bit flags that control how item's labels and widget()s are drawn in the tree via item_draw_mode().

- enum Fl_Tree_Item_Reselect_Mode { FL_TREE_SELECTABLE_ONCE =0, FL_TREE_SELECTABLE_ALWAYS }

  Defines the ways an item can be (re) selected via item_reselect_mode().

- enum Fl_Tree_Select { FL_TREE_SELECT_NONE =0, FL_TREE_SELECT_SINGLE =1, FL_TREE_SELECT_MULTI =2, FL_TREE_SELECT_SINGLE_DRAGGABLE =3 }

  Tree selection style.

- enum Fl_Tree_Sort { FL_TREE_SORT_NONE =0, FL_TREE_SORT_ASCENDING =1, FL_TREE_SORT_DESCENDING =2 }

  Sort order options for items added to the tree.

13.166.1 Detailed Description

This file contains the definitions for Fl_Tree's preferences.

```
Fl_Tree_Prefs

Fl_Tree

Fl_Tree_Item
```

13.166.2 Enumeration Type Documentation

13.166.2.1 Fl_Tree_Connector

```
enum Fl_Tree_Connector

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_TREE_CONNECTOR_NONE</td>
<td>Use no lines connecting items.</td>
</tr>
<tr>
<td>FL_TREE_CONNECTOR_DOTTED</td>
<td>Use dotted lines connecting items (default)</td>
</tr>
<tr>
<td>FL_TREE_CONNECTOR_SOLID</td>
<td>Use solid lines connecting items.</td>
</tr>
</tbody>
</table>
```

13.166.2.2 Fl_Tree_Item_Draw_Mode

```
enum Fl_Tree_Item_Draw_Mode

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_TREE_ITEM_DRAW_DEFAULT</td>
<td>If widget() defined, draw in place of label, and widget() tracks item height (default)</td>
</tr>
</tbody>
</table>
```
### FL_Tree_Item_Reselect_Mode

```c
enum FL_Tree_Item_Reselect_Mode
```

Defines the ways an item can be (re) selected via item_reselect_mode().

- **FL_TREE_SELECTABLE_ONCE**: Item can only be selected once (default).
- **FL_TREE_SELECTABLE_ALWAYS**: Enables FL_TREE_REASON_RESELECTED events for callbacks.

### FL_Tree_Select

```c
enum FL_Tree_Select
```

Tree selection style.

- **FL_TREE_SELECT_NONE**: Nothing selected when items are clicked.
- **FL_TREE_SELECT_SINGLE**: Single item selected when item is clicked (default).
- **FL_TREE_SELECT_MULTI**: Multiple items can be selected by clicking with SHIFT, CTRL or mouse drags.
- **FL_TREE_SELECT_SINGLE_DRAGGABLE**: Single items may be selected, and they may be reordered by mouse drag.

### FL_Tree_Sort

```c
enum FL_Tree_Sort
```

Sort order options for items added to the tree.

- **FL_TREE_SORT_NONE**: No sorting; items are added in the order defined (default).
- **FL_TREE_SORT_ASCENDING**: Add items in ascending sort order.
- **FL_TREE_SORT_DESCENDING**: Add items in descending sort order.

### 13.168 fl_types.h File Reference

This file contains simple "C"-style type definitions.

```c
#include "fl_attr.h"
```

#### Typedefs

##### Miscellaneous

- `typedef unsigned int Fl_Shortcut`
  
  16-bit Unicode character + 8-bit indicator for keyboard flags.

- `typedef unsigned char uchar`

- `typedef unsigned long ulong`

#### 13.168.1 Detailed Description

This file contains simple "C"-style type definitions.

#### 13.168.2 Typedef Documentation

##### 13.168.2.1 Fl_Shortcut

`typedef unsigned int Fl_Shortcut`

16-bit Unicode character + 8-bit indicator for keyboard flags.

**Note**

This should be 24-bit Unicode character + 8-bit indicator for keyboard flags. The upper 8 bits are currently unused but reserved.

Due to compatibility issues this type and all FLTK shortcuts can only be used with 16-bit Unicode characters (U+0000 .. U+FFFF) and not with the full range of unicode characters (U+0000 .. U+10FFFF). This is caused by the bit flags FL_SHIFT, FL_CTRL, FL_ALT, and FL_META being all in the range 0x010000 .. 0x400000.

**Todo**

Discuss and decide whether we can "shift" these special keyboard flags to the upper byte to enable full 21-bit Unicode characters (U+0000 .. U+10FFFF) plus the keyboard indicator bits as this was originally intended. This would be possible if we could rely on all programs being coded with symbolic names and not hard coded bit values.

#### 13.169 fl_types.h

Go to the documentation of this file.
13.170 fl_utf8.h File Reference

header for Unicode and UTF-8 character handling
#include "FL_Export.H"
#include "fl_types.h"
#include <stdio.h>
#include <sys/stat.h>

Functions

- int fl_access (const char *f, int mode)
  Cross-platform function to test a files access() with a UTF-8 encoded name or value.

- int fl_chdir (const char *path)
  Cross-platform function to change the current working directory, given as a UTF-8 encoded string.

- int fl_chmod (const char *f, int mode)
  Cross-platform function to set a files mode() with a UTF-8 encoded name or value.

- int fl_close_fd (int fd)
  Cross-platform function to close a file descriptor.

- int fl_execvp (const char *file, char **const argv)
  Cross-platform function to open files with a UTF-8 encoded name.

- FILE * fl_fopen (const char *f, const char *mode)
  Cross-platform function to open files with a UTF-8 encoded name or value.

- char * fl_getcwd (char *buf, int len)
  Cross-platform function to get the current working directory as a UTF-8 encoded value.

- char * fl_getenv (const char *v)
  Cross-platform function to get environment variables with a UTF-8 encoded name or value.

- char fl_make_path (const char *path)
  Cross-platform function to recursively create a path in the file system.

- void fl_make_path_for_file (const char *path)
  Cross-platform function to create a path for the file in the file system.

- int fl_mkdir (const char *f, int mode)
  Cross-platform function to create a directory with a UTF-8 encoded name.

- unsigned int fl_nonspacing (unsigned int ucs)
  Returns true if the Unicode character ucs is non-spacing.

- int fl_open (const char *fname, int oflags,...)
  Cross-platform function to open files with a UTF-8 encoded name.

- int fl_open_ext (const char *fname, int binary, int oflags,...)
  Cross-platform function to open files with a UTF-8 encoded name.
• int fl_putenv (const char *var)
  Cross-platform function to write environment variables with a UTF-8 encoded name or value.
• int fl_rename (const char *f, const char *n)
  Cross-platform function to rename a filesystem object using UTF-8 encoded names.
• int fl_rmdir (const char *f)
  Cross-platform function to remove a directory with a UTF-8 encoded name.
• int fl_stat (const char *f, struct stat *b)
  Cross-platform function to stat() a file using a UTF-8 encoded name or value.
• int fl_system (const char *cmd)
  Cross-platform function to run a system command with a UTF-8 encoded string.
• int fl_tolower (unsigned int ucs)
  Returns the Unicode lower case value of ucs.
• int fl_toupper (unsigned int ucs)
  Returns the Unicode upper case value of ucs.
• unsigned fl_ucs_to_Utf16 (const unsigned ucs, unsigned short *dst, const unsigned dstlen)
  Convert a single 32-bit Unicode codepoint into an array of 16-bit characters.
• int fl_unlink (const char *fname)
  Cross-platform function to unlink() (that is, delete) a file using a UTF-8 encoded filename.
• char * fl_utf2mbcs (const char *s)
  Converts UTF-8 string s to a local multi-byte character string.
• const char * fl_utf8back (const char *p, const char *start, const char *end)
  Move p backward until it points to the start of a UTF-8 character.
• int fl_utf8bytes (unsigned ucs)
  Return the number of bytes needed to encode the given UCS4 character in UTF-8.
• unsigned fl_utf8decode (const char *p, const char *end, int *len)
  Decode a single UTF-8 encoded character starting at p.
• int fl_utf8encode (unsigned ucs, char *buf)
  Write the UTF-8 encoding of ucs into buf and return the number of bytes written.
• unsigned fl_utf8from_mb (char *dst, unsigned dstlen, const char *src, unsigned srclen)
  Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK.
• unsigned fl_utf8froma (const char *dst, unsigned dstlen, const char *src, unsigned srclen)
  Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.
• unsigned fl_utf8fromwc (char *dst, unsigned dstlen, const wchar_t *src, unsigned srclen)
  Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.
• const char * fl_utf8fwd (const char *p, const char *start, const char *end)
  Move p forward until it points to the start of a UTF-8 character.
• int fl_utf8len (char c)
  Returns the byte length of the UTF-8 sequence with first byte c, or -1 if c is not valid.
• int fl_utf8len1 (char c)
  Returns the byte length of the UTF-8 sequence with first byte c, or 1 if c is not valid.
• int fl_utf8locale ()
  Return true if the "locale" seems to indicate that UTF-8 encoding is used.
• int fl_utf8strlen (const char *text, int len)
  Return the length in bytes of a UTF-8 string.
• int fl_utf8test (const char *src, unsigned srclen)
  Examines the first srclen bytes in src and returns a verdict on whether it is UTF-8 or not.
• unsigned fl_utf8to_mb (const char *src, unsigned srclen, char *dst, unsigned dstlen)
  Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).
• unsigned fl_utf8toa (const char *src, unsigned srclen, char *dst, unsigned dstlen)
  Convert a UTF-8 sequence into an array of 1-byte characters.
• unsigned fl_utf8toUtf16 (const char *src, unsigned srclen, unsigned short *dst, unsigned dstlen)
   *Convert a UTF-8 sequence into an array of 16-bit characters.*

• unsigned fl_utf8towc (const char *src, unsigned srclen, wchar_t *dst, unsigned dstlen)
   *Converts a UTF-8 string into a wide character string.*

• int fl_utf_nb_char (const unsigned char *buf, int len)
   *Returns the number of Unicode chars in the UTF-8 string.*

• int fl_utf_strcasecmp (const char *s1, const char *s2)
   *UTF-8 aware strcasecmp - converts to Unicode and tests.*

• int fl_utf_strncasecmp (const char *s1, const char *s2, int n)
   *UTF-8 aware strncasecmp - converts to lower case Unicode and tests.*

• int fl_utf_tolower (const unsigned char *str, int len, char *buf)
   *Converts the string str to its lower case equivalent into buf.*

• int fl_utf_toupper (const unsigned char *str, int len, char *buf)
   *Converts the string str to its upper case equivalent into buf.*

• int fl_wcwidth (const char *src)
   *extended wrapper around fl_wcwidth_(unsigned int ucs) function.*

• int fl_wcwidth_ (unsigned int ucs)
   *Wrapper to adapt Markus Kuhn's implementation of wcwidth() for FLTK.*

13.170.1 Detailed Description

header for Unicode and UTF-8 character handling

13.176  Fl_Widget.H File Reference

Fl_Widget and Fl_Label classes.
#include "Fl.H"

Classes

- class Fl_Callback_User_Data
  A class prototype that allows for additional data in callbacks.
- struct Fl_Label
  This struct stores all information for a text or mixed graphics label.
- class Fl_Widget
  Fl_Widget is the base class for all widgets in FLTK.

Macros

- #define FL_RESERVED_TYPE 100
  Reserved type numbers (necessary for my cheapo RTTI) start here.

Typedefs

- typedef void() Fl_Callback(Fl_Widget *, void *)
  Default callback type definition for all fltk widgets (by far the most used)
- typedef void() Fl_Callback0(Fl_Widget *)
  One parameter callback type definition passing only the widget.
- typedef void() Fl_Callback1(Fl_Widget *, long)
  Callback type definition passing the widget and a long data value.
- typedef Fl_Callback * Fl_Callback_p
  Default callback type pointer definition for all fltk widgets.

13.176.1  Detailed Description

Fl_Widget and Fl_Label classes.

// meaning of FL_ALIGN_INSIDE. Implementation in forms.cxx
This file defines wrapper functions for OpenGL in FLTK.

### Functions

- **void gl_color (Fl_Color i)**
  
  Sets the current OpenGL color to an FLTK color.

- **void gl_color (int c)**
  
  Back compatibility

- **int gl_descent ()**

  Returns the current font's descent.

- **void gl_draw (const char *)**

  Draws a nul-terminated string in the current font at the current position.

- **void gl_draw (const char *, float x, float y)**

  Draws a nul-terminated string in the current font at the given position.

- **void gl_draw (const char *, int n)**

  Draws an array of n characters of the string in the current font at the current position.

- **void gl_draw (const char *, int n, float x, float y)**

  Draws n characters of the string in the current font at the current position.

- **void gl_draw (const char *, int n, int x, int y)**

  Draws n characters of the string in the current font at the given position.

- **void gl_draw (const char *, int x, int y)**

  Draws a nul-terminated string in the current font at the given position.

- **void gl_draw (const char *, int x, int y, int w, int h, Fl_Align)**

  Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to ^X.

- **void gl_draw_image (const uchar *, int x, int y, int w, int h, int d=3, int ld=0)**

- **void gl_finish ()**

  Releases an OpenGL context.

- **void gl_font (int fontid, int size)**

  Sets the current OpenGL font to the same font as calling fl_font().
- **int gl_height()**
  
  Returns the current font's height.

- **void gl_measure(const char *, int &x, int &y)**
  
  Measures how wide and tall the string will be when drawn by the gl_draw() function.

- **void gl_rect(int x, int y, int w, int h)**
  
  Outlines the given rectangle with the current color.

- **void gl_rectf(int x, int y, int w, int h)**
  
  Fills the given rectangle with the current color.

- **void gl_start()**
  
  Creates an OpenGL context.

- **int gl_texture_pile_height()**
  
  Returns the current maximum height of the pile of pre-computed string textures.

- **void gl_texture_pile_height(int max)**
  
  Changes the maximum height of the pile of pre-computed string textures.

- **void gl_texture_reset()**
  
  To call after GL operations that may invalidate textures used to draw text in GL scenes (e.g., switch between FL←DOUBLE / FL_SINGLE modes).

- **double gl_width(const char *)**
  
  Returns the width of the string in the current font.

- **double gl_width(const char *, int n)**
  
  Returns the width of n characters of the string in the current font.

- **double gl_width(uchar)**
  
  Returns the width of the character in the current font.

### 13.185.1 Detailed Description

This file defines wrapper functions for OpenGL in FLTK.

To use OpenGL from within an FLTK application you MUST use gl_visual() to select the default visual before doing show() on any windows. Mesa will crash if you try to use a visual not returned by glxChooseVisual.

Historically, this did not always work well with Fl_Double_Window's! It can try to draw into the front buffer. Depending on the system this might either crash or do nothing (when pixmaps are being used as back buffer and GL is being done by hardware), work correctly (when GL is done with software, such as Mesa), or draw into the front buffer and be erased when the buffers are swapped (when double buffer hardware is being used).

### 13.185.2 Function Documentation

#### 13.185.2.1 gl_color()

```c
void gl_color(Fl_Color i)
```

Sets the current OpenGL color to an FLTK color.

For color-index modes it will use fl_xpixel(c), which is only right if the window uses the default colormap!

#### 13.185.2.2 gl_draw() [1/7]

```c
void gl_draw(const char * str)
```

Draws a null-terminated string in the current font at the current position.

See also

- **gl_texture_pile_height(int)**
13.185.2.3  gl_draw() [2/7]
void gl_draw (
    const char * str,
    float x,
    float y )
Draws a nul-terminated string in the current font at the given position.
See also
    gl_texture_pile_height(int)

13.185.2.4  gl_draw() [3/7]
void gl_draw (    
    const char * str,
    int n )
Draws an array of n characters of the string in the current font at the current position.
See also
    gl_texture_pile_height(int)

13.185.2.5  gl_draw() [4/7]
void gl_draw (    
    const char * str,    
    int n,    
    float x,    
    float y )
Draws n characters of the string in the current font at the given position.
See also
    gl_texture_pile_height(int)

13.185.2.6  gl_draw() [5/7]
void gl_draw (    
    const char * str,    
    int n,    
    int x,    
    int y )
Draws n characters of the string in the current font at the given position.
See also
    gl_texture_pile_height(int)

13.185.2.7  gl_draw() [6/7]
void gl_draw (    
    const char * str,    
    int x,    
    int y )
Draws a nul-terminated string in the current font at the given position.
See also
    gl_texture_pile_height(int)
13.185.2.8  gl_draw() [7/7]

```c
void gl_draw (const char * str,
               int x,
               int y,
               int w,
               int h,
               Fl_Align align )
```

Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to `\X`. and aligned with the edges or center. Exactly the same output as fl_draw().

13.185.2.9  gl_font()

```c
void gl_font (int fontid,
              int size )
```

Sets the current OpenGL font to the same font as calling fl_font().

See also

```c
Fl::draw_GL_text_with_textures(int val)
```

13.185.2.10  gl_rect()

```c
void gl_rect (int x,
              int y,
              int w,
              int h )
```

Outlines the given rectangle with the current color.
If Fl_Gl_Window::ortho() has been called, then the rectangle will exactly fill the given pixel rectangle.

13.185.2.11  gl_rectf()

```c
void gl_rectf (int x,
               int y,
               int w,
               int h )
```

Fills the given rectangle with the current color.

See also

```c
gl_rect(int x, int y, int w, int h)
```

13.185.2.12  gl_texture_pile_height() [1/2]

```c
int gl_texture_pile_height ( void )
```

Returns the current maximum height of the pile of pre-computed string textures.
The default value is 100

See also

```c
Fl::draw_GL_text_with_textures(int)
```
void gl_texture_pile_height (  
    int max  )

Changes the maximum height of the pile of pre-computed string textures.
Strings that are often re-displayed can be processed much faster if this pile is set high enough to hold all of them.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max</td>
<td>Maximum height of the texture pile</td>
</tr>
</tbody>
</table>

13.191 mac.H File Reference

Mac OS X-specific symbols.

Classes

• class Fl_Mac_App_Menu

Functions

• Fl_Window * fl_mac_find (FLWindow *)
  Returns the Fl_Window corresponding to the given macOS-specific window reference.

• CGContextRef fl_mac_gc ()
  Returns the macOS-specific graphics context for the current window.

• void fl_mac_set_about (Fl_Callback *cb, void *user_data, int shortcut=0)
  Attaches a callback to the "About myprog" item of the system application menu.

• FLWindow * fl_mac_xid (const Fl_Window *win)
  Returns the macOS-specific window reference corresponding to the given Fl_Window object.

Variables

• int fl_mac_os_version
  The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2).

Definitions of platform-dependent types.

**Macros**

- `#define FL_COMMAND opaque
  An alias for FL_CTRL on Windows and X11, or FL_META on MacOS X.

- `#define FL_CONTROL opaque
  An alias for FL_META on Windows and X11, or FL_CTRL on MacOS X.

**Typedefs**

- `typedef opaque fl_intptr_t
  An integral type large enough to store a pointer or a long value.

- `typedef opaque Fl_Offscreen
  Platform-specific value representing an offscreen drawing buffer.

- `typedef struct opaque Fl_Region
  Pointer to a platform-specific structure representing a collection of rectangles.

- `typedef opaque FL_SOCKET

Generated by Doxygen
socket or file descriptor

- typedef opaque Fl_Timestamp
  Platform-specific point in time, used for delta time calculation.
- typedef opaque fl_uintptr_t
  An unsigned integral type large enough to store a pointer or an unsigned long value.
- typedef struct opaque * GLContext
  Pointer to a platform-specific structure representing the window's OpenGL rendering context.

### 13.197.1 Detailed Description

Definitions of platform-dependent types.

The exact nature of these types varies with the platform. Therefore, portable FLTK applications should not assume these types have a specific size, or that they are pointers.

### 13.197.2 Typedef Documentation

#### 13.197.2.1 fl_intptr_t

typedef opaque fl_intptr_t

An integral type large enough to store a pointer or a long value.

A pointer value can be safely cast to fl_intptr_t, and later cast back to its initial pointer type without change to the pointer value. A variable of type fl_intptr_t can also store a long int value.

#### 13.197.2.2 Fl_Offscreen

typedef opaque Fl_Offscreen

Platform-specific value representing an offscreen drawing buffer.

Note

This value can be safely cast to these types on each platform:

- X11: Pixmap
- Wayland: cairo_t *
- Windows: HBITMAP
- macOS: CGContextRef

#### 13.197.2.3 Fl_Region

typedef struct opaque* Fl_Region

Pointer to a platform-specific structure representing a collection of rectangles.

Note

This pointer can be safely cast to these types on each platform:

- X11: Region as defined by X11
- Wayland: struct flCairoRegion *
- Windows: HRGN
- macOS: struct flCocoaRegion *

#### 13.197.2.4 Fl_Timestamp

typedef opaque Fl_Timestamp

Platform-specific point in time, used for delta time calculation.

Note

This type may be a struct. sizeof(Fl_Timestamp) may be different on different platforms. Fl_Timestamp may change with future ABI changes.
**fl guintptr_t**

typedef opaque fl guintptr_t

An unsigned integral type large enough to store a pointer or an unsigned long value. A pointer value can be safely cast to fl guintptr_t, and later cast back to its initial pointer type without change to the pointer value. A variable of type fl guintptr_t can also store an unsigned long int value.

**GLContext**

typedef struct opaque GLContext

Pointer to a platform-specific structure representing the window's OpenGL rendering context.

**Note**

This pointer can be safely cast to these types on each platform:

- X11: GLXContext
- Wayland: EGLContext
- Windows: HGLRC
- macOS: NSOpenGLContext

*/ 

13.199 wayland.H File Reference

Definitions of functions specific to the Wayland platform.

Typedefs

- typedef struct _cairo cairo_t
- typedef void * EGLContext

Functions

- struct wl_compositor * fl_wl_compositor ()
  Returns the wl_compositor of the current Wayland session.
- struct wl_display * fl_wl_display ()
  Returns the Wayland display in use.
- Fl_Window * fl_wl_find (struct wl_window *)
  Returns the Fl_Window corresponding to a given the platform-specific window reference.
- cairo_t * fl_wl_gc ()
  Returns the cairo context associated to the current window or Fl_Image_Surface.
Definitions of functions specific to the Wayland platform.

13.199.2 Function Documentation

13.199.2.1 fl_wl_compositor()

```
struct wl_compositor * fl_wl_compositor ( ) [extern]
```

Returns the wl_compositor of the current Wayland session. This allows, for example, to create a wl_surface with
```
struct wl_surface *my_wl_surface = wl_compositor_create_surface(fl_wl_compositor());
```

13.200 wayland.H

Go to the documentation of this file.

Definitions of functions specific to the Windows platform.

13.201 win32.H File Reference

Definitions of functions specific to the Windows platform.
Functions

- **HINSTANCE fl_win32_display ()**
  
  Returns the Windows-specific display in use

- **FL_Window * fl_win32_find (HWND)**
  
  Returns the *FL_Window* corresponding to the given Windows-specific window reference.

- **HDC fl_win32_gc ()**
  
  Returns the Windows-specific graphics context for the current window

- **HGLRC fl_win32_glcontext (GLContext rc)**
  
  Returns the Windows-specific GL rendering context corresponding to the given GLContext

- **HWND fl_win32_xid (const FL_Window *win)**
  
  Returns the Windows-specific window reference corresponding to the given *FL_Window* object.

### 13.201.1 Detailed Description

Definitions of functions specific to the Windows platform.

### 13.202 win32.H

Go to the documentation of this file.
13.203 x.H

00001 // IMPORTANT: This file is deprecated since FLTK 1.4.0. DO NOT include it.
00002 // Fl/x.H will be removed in a future FLTK release.
00003 // Please include <FL/platform.H> instead if you really need it. See
00004 // documentation in FL/platform.H to decide whether you need that file.
00005
00006 #if !defined(Fl_X_H) && !defined(FL_DOXYGEN)
00007 # define Fl_X_H
00008 # include <FL/platform.H>
00009 #endif // !Fl_X_H

13.204 x11.H File Reference

Definitions of functions specific to the X11 platform.

Functions

- cairo_t * fl_cairo_gc ()
  Returns the Cairo-specific currently active graphics context (OPTION_USE_CAIRO=On)

- Display * fl_x11_display ()
  Returns the X11 Display in use.

- Fl_Window * fl_x11_find (Window xid)
  Returns the Fl_Window corresponding to the given Window reference.
• GC fl_x11_gc ()
  Returns the X11-specific currently active graphics context.
• void fl_x11_use_display (Display *d)
  Have FLTK use a pre-established X11 connection.
• Window fl_x11_xid (const Fl_Window *win)
  Returns the Window reference for the given Fl_Window, or zero if not shown().

13.204.1 Detailed Description
Definitions of functions specific to the X11 platform.

13.204.2 Function Documentation

13.204.2.1 fl_x11_find()

FL_Window * fl_x11_find (Window xid) [extern]
Returns the Fl_Window corresponding to the given Window reference.

13.204.2.2 fl_x11_gc()

GC fl_x11_gc () [extern]
Returns the X11-specific currently active graphics context.

13.204.2.3 fl_x11_use_display()

void fl_x11_use_display (Display *d) [extern]
Have FLTK use a pre-established X11 connection.
This function must be called before FLTK attempts to open its own X11 connection, that is, as long as fl_x11_display() returns NULL.

Parameters

```
d  the X11 Display* value representing a valid, pre-established X11 connection
```

13.204.2.4 fl_x11_xid()

Window fl_x11_xid (const Fl_Window * win) [extern]
Returns the Window reference for the given Fl_Window, or zero if not shown().

// This file allows easier debugging of Mac OS X Core Graphics
// but since it has proven to be tremendously useful in debugging
// I decided to add this file in case
// more bugs show up.
// This header is activated by adding the following
// line to "config.h"
// #include "src/cgdebug.h"
// Running "./configure" will remove this line from "config.h".
// When used erroneously, Core Graphics prints warnings to
// stderr. This is helpful, however it is not possible to
// associate a line number or source file with the warning message.
// This header file outputs a trace of CG calls, interweaving
// them with CG warnings.
// Matthias

#include "flstring.h"
Macros

- \#define FOREVER 1e20

Functions

- bool fl_clipboard_notify_empty (void)
- void fl_close_display ()
- const char * fl_filename_name (const char *name)
  
  Gets the file name from a path.
- FL_Window * fl_find (Window xid)

  Returns the FL_Window that corresponds to the given window reference, or NULL if not found.
- void fl_fix_focus ()
- void fl_open_callback (void(*)(const char *cb))(const char *)
  
  Register a function called for each file dropped onto an application icon.
- void fl_open_display ()

  Opens the display.
- int fl_send_system_handlers (void *e)
- void fl_throw_focus (Fl_Widget *w)
- void fl_trigger_clipboard_notify (int source)
- Window fl_xid_(const Fl_Window *w)

Variables

- bool fl_disable_wayland = true
  
  Prevent the FLTK library from using its Wayland backend and forces it to use its X11 backend.
- const char * fl_local_alt = Fl::system_driver()->alt_name()
  
  string pointer used in shortcuts, you can change it to another language
- const char * fl_local_ctrl = Fl::system_driver()->control_name()
  
  string pointer used in shortcuts, you can change it to another language
- int(* fl_local_grab )(int)
- const char * fl_local_meta = Fl::system_driver()->meta_name()
  
  string pointer used in shortcuts, you can change it to another language
- const char * fl_local_shift = Fl::system_driver()->shift_name()
  
  string pointer used in shortcuts, you can change it to another language
- Fl_Widget * fl_oldfocus
- Fl_Widget * fl_selection_requestor

13.208.1 Detailed Description

Implementation of the member functions of class Fl.

13.208.2 Function Documentation

13.208.2.1 fl_find()

FL_Window * fl_find (Window xid)

Returns the FL_Window that corresponds to the given window reference, or NULL if not found.

Deprecated  

Kept in the X11, Windows, and macOS platforms for compatibility with FLTK versions before 1.4. Please use fl_x11_find(Window), fl_wl_find(struct wid_window*), fl_win32_find(HWND) or fl_mac_find(FLWindow*) with FLTK 1.4.0 and above.
13.208.2.2 \texttt{fl\_open\_display()}

\begin{verbatim}
void fl_open_display()
Opens the display.
Automatically called by the library when the first window is show()’n. Does nothing if the display is already open.
\end{verbatim}

13.208.3 Variable Documentation

13.208.3.1 \texttt{fl\_disable\_wayland}

\begin{verbatim}
bool fl_disable_wayland = true
Prevent the FLTK library from using its Wayland backend and forces it to use its X11 backend.
Put this declaration somewhere in your code outside the body of any function :
FL_EXPORT bool fl_disable_wayland = true;
This declaration makes sure source code developed for FLTK 1.3, including X11-specific code, will build and run
with FLTK 1.4 and its Wayland platform with this single source code level change. This declaration has no effect on
non-Wayland platforms. Don’t put this declaration if you want the Wayland backend to be used when it’s available.
\end{verbatim}

13.209 \texttt{fl\_arc.cxx} File Reference

Utility functions for drawing arcs and circles.
\begin{verbatim}
#include <FL/fl_draw.H>
#include <FL/math.h>
\end{verbatim}

13.209.1 Detailed Description

Utility functions for drawing arcs and circles.

13.210 \texttt{fl\_ask.cxx} File Reference

Utility functions for common dialogs.
\begin{verbatim}
#include <FL/Fl.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_Input_.H>
#include "flstring.h"
#include "Fl_Screen_Driver.H"
#include <FL/fl_ask.H>
#include "Fl_Message.h"
#include <stdio.h>
#include <stdarg.h>
\end{verbatim}

\textbf{Functions}

- void \texttt{fl\_alert} (const char *fmt, ...)
  \emph{Shows an alert message dialog box.}

- int \texttt{fl\_ask} (const char *fmt, ...)
  \emph{Shows a dialog displaying the fmt message, this dialog features 2 yes/no buttons.}

- void \texttt{fl\_beep} (int type)
  \emph{Emits a system beep.}

- int \texttt{fl\_choice} (const char *fmt, const char *b0, const char *b1, const char *b2, ...)
  \emph{Shows a dialog displaying the printf style fmt message.}

- int \texttt{fl\_choice\_n} (const char *fmt, const char *b0, const char *b1, const char *b2, ...)
  \emph{Shows a dialog displaying the printf style fmt message.}

- const char * \texttt{fl\_input} (const char *fmt, const char *defstr, ...)

Generated by Doxygen
Shows an input dialog displaying the `fmt` message with variable arguments.

- `const char * fl_input (int maxchar, const char *fmt, const char *defstr,...)`
  Shows an input dialog displaying the `fmt` message with variable arguments.

- `void fl_message (const char *fmt,....)`
  Shows an information message dialog box.

- `int fl_message_hotspot ()`
  Gets whether or not to move the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()` to follow the mouse pointer.

- `void fl_message_hotspot (int enable)`
  Sets whether or not to move the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()` to follow the mouse pointer.

- `Fl_Widget * fl_message_icon ()`
  Gets the Fl_Box icon container of the current default dialog used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.

- `void fl_message_icon_label (const char *str)`
  Sets the icon label of the dialog window used in many common dialogs.

- `void fl_message_position (const int x, const int y, const int center)`
  Sets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.

- `void fl_message_position (Fl_Widget *widget)`
  Sets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.

- `int fl_message_position (int *x, int *y)`
  Gets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.

- `void fl_message_title (const char *title)`
  Sets the title of the dialog window used in many common dialogs.

- `void fl_message_title_default (const char *title)`
  Sets the default title of the dialog window used in many common dialogs.

- `const char * fl_password (const char *fmt, const char *defstr,...)`
  Shows an input dialog displaying the `fmt` message with variable arguments.

- `const char * fl_password (int maxchar, const char *fmt, const char *defstr,...)`
  Shows an input dialog displaying the `fmt` message with variable arguments.

Variables

- `const char * fl_cancel = "Cancel"`
  string pointer used in common dialogs, you can change it to another language

- `const char * fl_close = "Close"`
  string pointer used in common dialogs, you can change it to another language

- `Fl_Font fl_message_font_ = FL_HELVETICA`
- `Fl_Fontsize fl_message_size_ = -1`
- `const char * fl_no = "No"`
  string pointer used in common dialogs, you can change it to another language

- `const char * fl_ok = "OK"`
  string pointer used in common dialogs, you can change it to another language

- `const char * fl_yes = "Yes"`
  string pointer used in common dialogs, you can change it to another language
13.210.1 Detailed Description

Utility functions for common dialogs.
This file defines the functions

- `fl_alert()
- `fl_beep()
- `fl_message()
- `fl_ask()
- `fl_choice()
- `fl_input()
- `fl_input_str()
- `fl_password()
- `fl_password_str()

and some more functions to change their behavior (positioning, window title, and more).
Since FLTK 1.4.0 a big part of these functions is implemented in class Fl_Message.

13.211 fl_boxtype.cxx File Reference

Drawing code for common box types.
#include <FL/Fl.H>
#include <FL/Fl_Widget.H>
#include <FL/fl_draw.H>
#include <config.h>

Macros

- `#define D1 BORDER_WIDTH
- `#define D2 (BORDER_WIDTH+BORDER_WIDTH)
- `#define fl_border_box fl_rectbound
  allow consistent naming

Functions

- `void fl_border_frame (int x, int y, int w, int h, Fl_Color c)
  Draws a frame of type FL_BORDER_FRAME.
- `void fl_down_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_DOWN_BOX.
- `void fl_down_frame (int x, int y, int w, int h, Fl_Color)
  Draws a frame of type FL_DOWN_FRAME.
- `void fl_draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c)
  Draws a box using given type, position, size and color.
- `void fl_embossed_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_EMBOSSED_BOX.
- `void fl_embossed_frame (int x, int y, int w, int h, Fl_Color)
  Draws a frame of type FL_EMBOSSED_FRAME.
- `void fl_engraved_box (int x, int y, int w, int h, Fl_Color c)
  Draws a box of type FL_ENGRAVED_BOX.
- `void fl_engraved_frame (int x, int y, int w, int h, Fl_Color)
Draws a frame of type FL_ENGRAVED_FRAME.

- **void fl_flat_box** (int x, int y, int w, int h, Fl_Color c)
  
  Draws a box of type FL_FLAT_BOX.

- **void fl_frame** (const char *s, int x, int y, int w, int h)
  
  Draws a series of line segments around the given box.

- **void fl_frame2** (const char *s, int x, int y, int w, int h)
  
  Draws a series of line segments around the given box.

- **const uchar * fl_gray_ramp ()**

- **void fl_internal_boxtype (Fl_Boxtype t, Fl_Box_Draw_F *f)**
  
  Sets the drawing function for a given box type.

- **void fl_no_box** (int, int, int, int, Fl_Color)
  
  Draws a box of type FL_NO_BOX.

- **void fl_rectbound** (int x, int y, int w, int h, Fl_Color bgcolor)
  
  Draws a bounded rectangle with a given position, size and color.

- **void fl_thin_down_box** (int x, int y, int w, int h, Fl_Color c)
  
  Draws a box of type FL_THIN_DOWN_BOX.

- **void fl_thin_down_frame** (int x, int y, int w, int h, Fl_Color)
  
  Draws a frame of type FL_THIN_DOWN_FRAME.

- **void fl_thin_up_box** (int x, int y, int w, int h, Fl_Color c)
  
  Draws a box of type FL_THIN_UP_BOX.

- **void fl_thin_up_frame** (int x, int y, int w, int h, Fl_Color)
  
  Draws a frame of type FL_UP_BOX.

- **void fl_up_box** (int x, int y, int w, int h, Fl_Color c)
  
  Draws a box of type FL_UP_BOX.

- **void fl_up_frame** (int x, int y, int w, int h, Fl_Color)
  
  Draws a frame of type FL_UP_FRAME.

### 13.211.1 Detailed Description

Drawing code for common box types.

### 13.211.2 Function Documentation

#### 13.211.2.1 fl_internal_boxtype()

```c
void fl_internal_boxtype ( 
    Fl_Boxtype t, 
    Fl_Box_Draw_F * f )
```

Sets the drawing function for a given box type.

**Parameters**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>t</td>
<td>box type</td>
</tr>
<tr>
<td>in</td>
<td>f</td>
<td>box drawing function</td>
</tr>
</tbody>
</table>

#### 13.211.2.2 fl_rectbound()

```c
void fl_rectbound ( 
    int x, 
    int y, 
    int w, 
    int h, 
    Fl_Color bgcolor )
```
Draws a bounded rectangle with a given position, size and color.
Equivalent to drawing a box of type FL_BORDER_BOX.

13.213 fl_color.cxx File Reference

Color handling.
#include <FL/Fl.H>
#include <FL/Fl_Device.H>
#include <FL/Fl_Graphics_Driver.H>
#include "fl_cmap.h"

Functions

- Fl_Color fl_color_average (Fl_Color color1, Fl_Color color2, float weight)
  Returns the weighted average color between the two given colors.
- Fl_Color fl_inactive (Fl_Color c)
  Returns the inactive, dimmed version of the given color.

Variables

- unsigned fl_cmap [256]

13.213.1 Detailed Description

Color handling.

13.213.2 Variable Documentation

13.213.2.1 fl_cmap

unsigned f1_cmap[256]
Initial value:
= {
}

13.214 FlCompose.cxx File Reference

Utility functions to support text input.
#include <FL/Fl.H>
#include "Fl_Screen_Driver.H"
13.214.1 Detailed Description
Utility functions to support text input.

13.215 fl_contrast.cxx File Reference
Color contrast handling.
#include <FL/Fl.H>
#include <math.h>

Functions
- Fl_Color fl_contrast (Fl_Color fg, Fl_Color bg, Fl_Fontsize fs, int context)
  Returns a color that contrasts with the background color.
- void fl_contrast_function (Fl_Contrast_Function *f)
  Register a custom contrast function.
- int fl_contrast_level ()
  Get the contrast level (sensitivity) of the fl_contrast() method.
- void fl_contrast_level (int level)
  Set the contrast level (sensitivity) of the fl_contrast() method.
- int fl_contrast_mode ()
  Return the current contrast algorithm (mode).
- void fl_contrast_mode (int mode)
  Set the contrast algorithm (mode).
- double fl_lightness (Fl_Color color)
  Return the perceived lightness of a color.
- double fl_luminance (Fl_Color color)
  Return the raw / physical luminance of a color.
- unsigned get_color (Fl_Color i)

Variables
- unsigned fl_cmap [256]

13.215.1 Detailed Description
Color contrast handling.
Implementation of fl_contrast() and its variants.

13.216 fl_curve.cxx File Reference
Utility for drawing Bézier curves, adding the points to the current fl_begin/fl_vertex/fl_end path.
#include <FL/fl_draw.H>
#include <math.h>

13.216.1 Detailed Description
Utility for drawing Bézier curves, adding the points to the current fl_begin/fl_vertex/fl_end path.
Incremental math implementation: I very much doubt this is optimal! From Foley/vanDam page 511. If anybody has a better algorithm, please send it!
13.217  **Fl_Double_Window.cxx File Reference**

**Fl_Double_Window** implementation.

```c
#include <FL/Fl.H>
#include <FL/platform.H>
#include <FL/Fl_Double_Window.H>
#include <FL/fl_draw.H>
#include "Fl_Window_Driver.H"
```

13.217.1  Detailed Description

**Fl_Double_Window** implementation.

13.218  **Fl_get_system_colors.cxx File Reference**

System color support.

```c
#include <FL/Fl.H>
#include "Fl_Screen_Driver.H"
#include "Fl_System_Driver.H"
#include <FL/fl_draw.H>
#include <FL/platform.H>
#include <FL/math.h>
#include <FL/fl_utf8.h>
#include <FL/fl_string_functions.h>
#include "flstring.h"
#include <stdio.h>
#include <stdlib.h>
#include <FL/Fl_Pixmap.H>
#include <FL/Fl_Tiled_Image.H>
#include "tile.xpm"
```

**Macros**

- `#define D1 BORDER_WIDTH`
- `#define D2 (BORDER_WIDTH+BORDER_WIDTH)`

**Functions**

- `void fl_down_box (int, int, int, int, Fl_Color)`
  
  Draws a box of type FL_DOWN_BOX.

- `void fl_down_frame (int, int, int, int, Fl_Color)`
  
  Draws a frame of type FL_DOWN_FRAME.

- `int fl_parse_color (const char *p, uchar &r, uchar &g, uchar &b)`

  Parses a string containing a description of a color and write r, g, and b.

- `void fl_round_down_box (int, int, int, int, Fl_Color)`

- `void fl_round_up_box (int, int, int, int, Fl_Color)`

- `void fl_thin_down_box (int, int, int, int, Fl_Color)`

  Draws a box of type FL_THIN_DOWN_BOX.

- `void fl_thin_down_frame (int, int, int, int, Fl_Color)`

  Draws a frame of type FL_THIN_DOWN_FRAME.

- `void fl_thin_up_box (int, int, int, int, Fl_Color)`

  Draws a box of type FL_THIN_UP_BOX.

- `void fl_thin_up_frame (int, int, int, int, Fl_Color)`

  Draws a frame of type FL_THIN_UP_FRAME.
• **void fl_up_box** (int, int, int, int, Fl_Color)
  Draws a box of type FL_UP_BOX.

• **void fl_up_frame** (int, int, int, int, Fl_Color)
  Draws a frame of type FL_UP_FRAME.

### Variables

• const char * fl_bg = NULL
• const char * fl_bg2 = NULL
• const char * fl_fg = NULL

### 13.218.1 Detailed Description

System color support.

### 13.218.2 Function Documentation

#### 13.218.2.1 fl_parse_color()

```c
int fl_parse_color (const char * p, uchar & r, uchar & g, uchar & b )
```

Parse a string containing a description of a color and write r, g, and b.

This call is used by the Pixmap file format interpreter and by the command line arguments parser to set UI colors. RGB color triplets usually start with a '#' character, but it can be omitted if it does not conflict with the later rules. Color components are defined in hexadecimal notation with 1, 2, 3, or four hex digits per component, making color triplets 3, 6, 9, or 12 characters long. The interpreter is case insensitive. Valid code examples include "FF0000" for red, "#0F0" for green, and "000000004444" for a dark blue.

On the X11 platform, color values can also be given a color name like "red". The list of accepted color names is provided by the X11 server.

If none of the color interpretations work, `fl_parse_color` returns 0. The Pixmap reader interprets those as transparent, and are usually written as "None", "#transparent", or "bg".

#### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>p</th>
<th>a C-string describing the color</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>r,g,b</td>
<td>the color components in the 0...255 range</td>
</tr>
</tbody>
</table>

#### Returns

0 if the color cannot be interpreted, 1 otherwise

### 13.219 FL_Gl_Choice.H

00001 //
00002 // OpenGL definitions for the Fast Light Tool Kit (FLTK).

00017 // Internal interface to set up OpenGL.
A "Fl_Gl_Choice" is created from an OpenGL mode and holds information necessary to create a window (on X) and to create an OpenGL "context" (on both X and Win32).

create_gl_context takes a window (necessary only on Win32) and an Fl_Gl_Choice and returns a new OpenGL context. All contexts share display lists with each other.

On X another create_gl_context is provided to create it for any X visual.

create_gl_context takes a window (necessary only on Win32) and an Fl_Gl_Choice and returns a new OpenGL context. All contexts share display lists with each other.

don't do this themselves...

delete_gl_context destroys the context.

This code is used by Fl_Gl_Window, gl_start(), and gl_visual()

This code is used by Fl_Gl_Window, gl_start(), and gl_visual()

13.236  Fl_Timeout.h File Reference

Fl_Timeout handling.
#include <FL/Fl.H>

Classes
- class Fl_Timeout
The internal class Fl_Timeout handles all timeout related functions.

Macros

- `#define FL_TIMEOUT_DEBUG 0`

13.236.1 Detailed Description

Fl_Timeout handling.

This file contains implementations of:

- `Fl::add_timeout()`
- `Fl::repeat_timeout()`
- `Fl::has_timeout()`
- `Fl::remove_timeout()`

and related methods of class Fl_Timeout.

13.237 Fl_Timeout.h

PNG image support functions.
#include <config.h>
#include <FL/Fl_PNG_Image.H>
#include <FL/Fl_RGB_Image.H>
#include <FL/fl_string_functions.h>
#include <FL/fl_utf8.h>
#include <stdio.h>
#include <time.h>

Functions

• int fl_write_png (const char *filename, const char *pixels, int w, int h, int d, int ld)
  Write raw image data to a PNG image file.

• int fl_write_png (const char *filename, const unsigned char *pixels, int w, int h, int d, int ld)
  Write raw image data to a PNG image file.

• int fl_write_png (const char *filename, Fl_RGB_Image *img)
  Write an RGB(A) image to a PNG image file.

13.240.1 Detailed Description
PNG image support functions.

13.240.2 Function Documentation

13.240.2.1 fl_write_png() [1/3]

int fl_write_png (const char *filename, const char *pixels, int w, int h, int d, int ld)
Write raw image data to a PNG image file.
This is a very basic and restricted function to create a PNG image file from raw image data, e.g. a screenshot.
The image data must be aligned w/o gaps after each row (ld = 0 or ld = w * d) or ld must be the total length of each row, i.e. w * d + gapsize. If ld == 0 then ld = w * d is assumed.
The total data size must be (w * d + gapsize) * h = ld' * h where ld' = w * d if ld == 0.
For further restrictions and return values please see fl_write_png(const char *filename, Fl_RGB_Image *img).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>filename</th>
<th>Output filename, extension should be ‘.png’</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>pixels</td>
<td>Image data</td>
</tr>
<tr>
<td>in</td>
<td>w</td>
<td>Image data width</td>
</tr>
<tr>
<td>in</td>
<td>h</td>
<td>Image data height</td>
</tr>
<tr>
<td>in</td>
<td>d</td>
<td>Image depth: 1 = GRAY, 2 = GRAY + alpha, 3 = RGB, 4 = RGBA</td>
</tr>
<tr>
<td>in</td>
<td>ld</td>
<td>Line delta: default (0) = w * d</td>
</tr>
</tbody>
</table>
Returns

success (0) or error code, see ...

See also

fl_write_png(const char *filename, Fl_RGB_Image *img)

13.240.2.2 fl_write_png() [2/3]

int fl_write_png (  
    const char * filename,  
    const unsigned char * pixels,  
    int w,  
    int h,  
    int d,  
    int ld )

Write raw image data to a PNG image file.

See also

fl_write_png(const char *filename, const char *pixels, int w, int h, int d, int ld)

13.240.2.3 fl_write_png() [3/3]

int fl_write_png (  
    const char * filename,  
    Fl_RGB_Image * img )

Write an RGB(A) image to a PNG image file.
This is a very basic and restricted function to create a PNG image file from an RGB image (Fl_RGB_Image). The image data must be aligned w/o gaps, i.e. ld() MUST be zero or equal to data_w() * data_h(). The image file is always written with the original image size data_w() and data_h(), even if the image has been scaled. Image depth 1 (gray), 2 (gray + alpha channel), 3 (RGB) and 4 (RGBA) are supported.

Note

Currently there is no error handling except for errors when opening the file. This may be changed in the future.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>filename</th>
<th>Output filename, extension should be '.png'</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>img</td>
<td>RGB image to be written</td>
</tr>
</tbody>
</table>

Returns

success (0) or error code: negative values are errors

Return values

| 0  | success, file has been written            |
| -1 | png or zlib library not available        |
| -2 | file open error                           |

#include <FL/platform_types.h>
#include <FL/filename.H>
#include <FL/fl_utf8.h>

Functions

- int fl_casenumericsort (struct dirent **A, struct dirent **B)
  
  Compares directory entries alphanumerically (case-insensitive).

- int fl_numericsort (struct dirent **A, struct dirent **B)
  
  Compares directory entries alphanumerically (case-sensitive).

13.246.1 Function Documentation

13.246.1.1 fl_casenumericsort()

```c
int fl_casenumericsort (  
    struct dirent **A, 
    struct dirent **B )
```

Compares directory entries alphanumerically (case-insensitive).

Note

This comparison is UTF-8 aware.

See also

fl_numericsort()

13.246.1.2 fl_numericsort()

```c
int fl_numericsort (  
    struct dirent **A, 
    struct dirent **B )
```

Compares directory entries alphanumerically (case-sensitive).

Numbers are compared without sign, i.e. "-" is not taken as a sign of following numerical values. The following list of files would be in ascending order (examples are ASCII and numbers only for simplicity):

1. 1zzz.txt
2. 2xxx.txt
3. 19uuu.txt
4. 100aaa.txt
5. file1z.txt
6. file5a.txt
7. file5z.txt
8. file30z.txt
9. file200a.txt
10. temp+5.txt ("+" is lexically lower than ")
11. temp-5.txt ("-" is not a sign)
12. temp-100.txt (100 is bigger than 5, no sign)
Parameters

| in | A  | first directory entry |
|    | in | B  | second directory entry |

Returns

comparison result (-1, 0, or +1)

Return values

| -1 | A < B |
| 0  | A == B |
| +1 | A > B |

Note

This comparison is UTF-8 aware.

Generated by Doxygen
13.251 vsnprintf.c File Reference

Portable vsnprintf() implementation.

#include <stdio.h>
#include "flstring.h"

Functions

- int fl_snprintf (char *str, size_t size, const char *fmt,...)
- int fl_vsnprintf (char *buffer, size_t bufsize, const char *format, va_list ap)

FLTKit’s platform independent wrapper for the vsnprintf() C library function.

13.251.1 Detailed Description

Portable vsnprintf() implementation.

13.251.2 Function Documentation

13.251.2.1 fl_vsnprintf()

int fl_vsnprintf (char *buffer, size_t bufsize, const char *format, va_list ap)

FLTKit’s platform independent wrapper for the vsnprintf() C library function.

This function guarantees:

- access to vsnprintf(), even on systems that don’t have it (FLTKit’s own built-in code is used)
- Guarantees NUL termination. Even if string expands larger than the buffer, a terminating NUL is included, unlike some implementations of vsnprintf(), notably Microsoft Visual Studio (pre-2015), which can leave the string unterminated when truncated.

If the build environment for FLTKit has vsnprintf(), fl_vsnprintf() is just a wrapper around the compiler’s provided function. Otherwise, if the function is NOT available, FLTKit’s own built-in version is provided.

The FLTKit built in provides these style options:

- %[ -+#]
- * – padding width
- .* – precision width
- Data types: h, l, ll, L

Generated by Doxygen
• Floating point formats: E, G, e, f, g
• Integer formats: B, X, b, d, i, o, u, x
• Pointer format: p
• String/char: c, s, n

      }
    }
  }
  return RET_ILSEQ;
}

#endif /* NEED_TOMB */
Conversion (s1,s2) -> (c1,c2):

\[
t := 157 * (s1 - 0xA1) + (s2 < 0x80 ? s2 - 0x40 : s2 - 0x62)
\]
\[
c1 := (t div 94) + 0x21
\]
\[
c2 := (t mod 94) + 0x21
\]

Conversion (c1,c2) -> (s1,s2):

\[
t := 94 * (c1 - 0x21) + (c2 - 0x21)
\]
\[
s1 := (t div 157) + 0xA1
\]
\[
s2 := (t mod 157) <= 0x7E
\]

Conversion between BIG5 codes (s1,s2) and BIG5-1 codes (c1,c2):

Example. (s1,s2) = 0xC940, (c1,c2) = 0x2121.

\[
0xC9 <= s1 <= 0xF9, 0x40 <= s2 <= 0x7E \text{ or } 0xA1 <= s2 <= 0xFE,
\]
\[
0x21 <= c1 <= 0x72, 0x21 <= c2 <= 0x7E.
\]

Invariant:

\[
157 * (s1 - 0xC9) + (s2 < 0x80 ? s2 - 0x40 : s2 - 0x62) = 94 * (c1 - 0x21) + (c2 - 0x21)
\]

Conversion (s1,s2) -> (c1,c2):

\[
t := 157 * (s1 - 0xC9) + (s2 < 0x80 ? s2 - 0x40 : s2 - 0x62)
\]
\[
c1 := (t div 94) + 0xA1
\]
\[
t2 := t mod 157
\]
\[
s2 := (t2 < 0x3F ? t2 + 0x40 : t2 + 0x62)
\]

Conversion (c1,c2) -> (s1,s2):

\[
t := 94 * (c1 - 0x21) + (c2 - 0x21)
\]
\[
t2 := t mod 157
\]
\[
s1 := (t div 157) + 0xC9
\]
\[
s2 := (t2 < 0x3F ? t2 + 0x40 : t2 + 0x62)
\]

13.300 mk_wcwidth.c

```
This is an implementation of wcwidth() and wcswidth() (defined in IEEE Std 1002.1-2001) for Unicode.

In fixed-width output devices, Latin characters all occupy a single "cell" position of equal width, whereas ideographic CJK characters occupy two such cells. Interoperability between terminal-line applications and (teletype-style) character terminals using the UTF-8 encoding requires agreement on which character should advance how many cell positions. No established formal standards exist at present on which Unicode character shall occupy how many cell positions on character terminals. These routines are a first attempt of defining such behavior based on simple rules applied to data provided by the Unicode Consortium.

For some graphical characters, the Unicode standard explicitly defines a character-cell width via the definition of the East Asian FullWidth (F), Wide (W), Half-width (H), and Narrow (Na) classes. Class, the width choice depends purely on a preference of backward compatibility with either historic CJK or Western practice. Choosing single-width for these characters is easy to justify as the appropriate long-term solution, as the CJK practice of displaying these characters as double-width comes from historic implementation simplicity (8-bit encoded characters were displayed single-width and 16-bit ones double-width, even for Greek, Cyrillic, etc.) and not any typographic considerations.

Much less clear is the choice of width for the Not East Asian (Neutral) class. Existing practice does not dictate a width for any of these characters. It would nevertheless make sense typographically to allocate two character cells to characters such as for instance EM SPACE or VOLUME INTEGRAL, which cannot be represented adequately with a single-width glyph. The following routines at present merely assign a single-cell width to all neutral characters, in the interest of simplicity. This is not entirely satisfactory and should be reconsidered before establishing a formal standard in this area. At the moment, the decision which Not East Asian (Neutral) characters should be represented by double-width glyphs cannot yet be answered by applying a simple rule from the Unicode database content. Setting up a proper standard for the behavior of UTF-8 character terminals will require a careful analysis not only of each Unicode character, but also of each presentation form, something the author of these routines has avoided to do so far.

FLTK - avoid possible problems on systems with 32-bit wchar_t. Don't include wchar.h, and change wchar_t to unsigned int.
