  Returns the internal array of widget sizes and positions.
• void draw_child (Fl_Widget &widget) const
  
  Forces a child to redraw.
• void draw_children ()
  
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  
  Parents normally call this to draw outside labels of child widgets.
• virtual int on_insert (Fl_Widget ∗, int)
  
  Allow derived groups to act when a widget is added as a child.
• virtual int on_move (int, int)
  
  Allow derived groups to act when a widget is moved within the group.
• virtual void on_remove (int)
  
  Allow derived groups to act when a child widget is removed from the group.
• int ∗ sizes ()
  
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  
  Draws a child only if it needs it.
Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y , int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group ∗ current ()
  Returns the currently active group.
- static void current (Fl_Group ∗g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int labelShortcut (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
- static int testShortcut (const char ∗, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.
Protected Types inherited from Fl_Widget

\end{align*}
\]
flags possible values enumeration.

12.64.1 Detailed Description

The Fl_Help_View widget displays HTML text. Most HTML 2.0 elements are supported, as well as a primitive implementation of tables. GIF, JPEG, and PNG images are displayed inline. Supported HTML tags:

- A: HREF/NAME
- B
- BODY: BGCOLOR/TEXT/LINK
- BR
- CENTER
- CODE
- DD
- DL
- DT
- EM
- FONT: COLOR/SIZE/FACE=(helvetica/arial/sans/times/serif/symbol/courier)
- H1/H2/H3/H4/H5/H6
- HEAD
- HR
- I
- IMG: SRC/ WIDTH/HEIGHT/ALT
- KBD
- LI
- OL
- P
- PRE

Generated by Doxygen
• STRONG
• TABLE: TH/TD/TR/BORDER/BGCOLOR/COLSPAN/ALIGN=CENTER|RIGHT|LEFT
• TITLE
• TT
• U
• UL
• VAR

Supported color names:
  • black, red, green, yellow, blue, magenta, fuchsia, cyan, aqua, white, gray, grey, lime, maroon, navy, olive, purple, silver, teal.

Supported urls:
  • Internal: file:
  • External: http: ftp: https: ipp: mailto: news:

Quoted char names:

  • Yacute yacute
  • yen Yuml yuml

Note
You can't effectively set the box() to FL_NO_BOX, this would result in FL_DOWN_BOX being used as the boxtype of the widget. This is unexpected but can't be changed for backwards compatibility. If you don't want a frame around the widget you can use FL_FLAT_BOX instead.
12.64.2 Constructor & Destructor Documentation

12.64.2.1 ∼Fl_Help_View()

Fl_Help_View::~Fl_Help_View ()

Destroys the Fl_Help_View widget.
The destructor destroys the widget and frees all memory that has been allocated for the current document.

12.64.3 Member Function Documentation

12.64.3.1 draw()

void Fl_Help_View::draw (void) [protected], [virtual]

Draws the Fl_Help_View widget.
Reimplemented from Fl_Group.

12.64.3.2 find()

int Fl_Help_View::find (const char * s, int p = 0)

Finds the specified string s at starting position p.
The argument p and the return value are offsets in Fl_Help_View::value(), counting from 0. If p is out of range, 0 is used.
The string comparison is simple but honors some special cases:

- the specified string s must be in UTF-8 encoding
- HTML tags in value() are filtered (not compared as such, they never match)
- HTML entities like '&lt;' or '&x#20ac;' are converted to Unicode (UTF-8)
- ASCII characters (7-bit, < 0x80) are compared case insensitive
- every newline (LF, \n) in value() is treated like a single space
- all other strings are compared as-is (byte by byte)

Todo complex HTML entities for Unicode code points > 0x80 are currently treated like one byte (not character!) and do not (yet) match correctly ("<" matches "<" but "€" doesn't match "€", and "Ü" doesn't match "Ü")

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>s</th>
<th>search string in UTF-8 encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>p</td>
<td>starting position for search (0,...), Default = 0</td>
</tr>
</tbody>
</table>

Returns

the matching position or -1 if not found

12.64.3.3 handle()

int Fl_Help_View::handle (int event) [virtual]

Handles events in the widget.
Reimplemented from Fl_Group.
12.64.3.4 leftline()

```cpp
void Fl_Help_View::leftline ( int left )
```

Scrolls the text to the indicated position, given a pixel column. If the given pixel value `left` is out of range, then the text is scrolled to the left or right side of the document, resp.

**Parameters**

| in | `left` | left column number in pixels (0 = left side) |

12.64.3.5 link()

```cpp
void Fl_Help_View::link ( Fl_Help_Func * fn ) [inline]
```

This method assigns a callback function to use when a link is followed or a file is loaded (via `Fl_Help_View::load()`) that requires a different file or path. The callback function receives a pointer to the `Fl_Help_View` widget and the URI or full pathname for the file in question. It must return a pathname that can be opened as a local file or NULL:

```cpp
const char * fn(Fl_Widget *w, const char *uri);
```

The link function can be used to retrieve remote or virtual documents, returning a temporary file that contains the actual data. If the link function returns NULL, the value of the `Fl_Help_View` widget will remain unchanged. If the link callback cannot handle the URI scheme, it should return the uri value unchanged or set the `value()` of the widget before returning NULL.

12.64.3.6 load()

```cpp
int Fl_Help_View::load ( const char * f )
```

Loads the specified file. This method loads the specified file or URL. The filename may end in a `#name` style target. If the URL starts with `ftp, http, https, ipp, mailto, or news`, followed by a colon, FLTK will use `fl_open_uri()` to show the requested page in an external browser. In all other cases, the URL is interpreted as a filename. The file is read and displayed in this browser. Note that MSWindows style backslashes are not supported in the file name.

**Parameters**

| in | `f` | filename or URL |

**Returns**

0 on success, -1 on error

**See also**

`fl_open_uri()`

12.64.3.7 resize()

```cpp
void Fl_Help_View::resize ( int xx, int yy, int ww, int hh ) [virtual]
```

Resizes the help widget. Reimplemented from `Fl_Group`. 

Generated by Doxygen
### scrollbar_size() [1/2]

```cpp
int Fl_Help_View::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels. If this value is zero (default), this widget will use the Fl:scrollbar_size() value as the scrollbar's width. Returns

Scrollbar size in pixels, or 0 if the global Fl:scrollbar_size() is being used.

**See also**

Fl:scrollbar_size(int)

### scrollbar_size() [2/2]

```cpp
void Fl_Help_View::scrollbar_size (int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to newSize, in pixels. Normally you should not need this method, and should use Fl:scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want. Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare. Setting newSize to the special value of 0 causes the widget to track the global Fl:scrollbar_size(), which is the default.

**Parameters**

| in  | newSize | Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global Fl:scrollbar_size() |

**See also**

Fl:scrollbar_size()

### topline() [1/2]

```cpp
void Fl_Help_View::topline (const char * n )
```

Scrolls the text to the indicated position, given a named destination.

**Parameters**

| in  | n | target name |

### topline() [2/2]

```cpp
void Fl_Help_View::topline (int top )
```

Scrolls the text to the indicated position, given a pixel line. If the given pixel value top is out of range, then the text is scrolled to the top or bottom of the document, resp.

**Parameters**

| in  | top | top line number in pixels (0 = start of document) |
12.64.3.12 value()

void Fl_Help_View::value (const char ∗val)
Sets the current help text buffer to the string provided and reformats the text.
The provided character string val is copied internally and will be freed when value() is called again, or when the
widget is destroyed.
If val is NULL, then the widget is cleared.
The documentation for this class was generated from the following files:

• Fl_Help_View.H
• Fl_Help_View.cxx

12.65 Fl_Hold_Browser Class Reference

The Fl_Hold_Browser is a subclass of Fl_Browser which lets the user select a single item, or no items by clicking
on the empty space.
#include <Fl_Hold_Browser.H>
Inheritance diagram for Fl_Hold_Browser:

<table>
<thead>
<tr>
<th>Fl_Widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fl_Group</td>
</tr>
<tr>
<td>Fl_Browser_</td>
</tr>
<tr>
<td>Fl_Browser</td>
</tr>
<tr>
<td>Fl_Hold_Browser</td>
</tr>
</tbody>
</table>

Public Member Functions

• Fl_Hold_Browser (int X, int Y, int W, int H, const char ∗L=0)
  Creates a new Fl_Hold_Browser widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Browser

• void add (const char ∗newtext, void ∗d=0)
  Adds a new line to the end of the browser.
• void bottomline (int line)
  Scrolls the browser so the bottom item in the browser is showing the specified line.
• void clear ()
  Removes all the lines in the browser.
• char column_char () const
  Gets the current column separator character.
• void column_char (char c)
  Sets the column separator to c.
• const int ∗column_widths () const
  Gets the current column width array.
• void column_widths (const int ∗arr)
  Sets the current array to arr.
• void ∗data (int line) const
Returns the user data() for specified line.

- void data (int line, void *d)
  Sets the user data for specified line to d.

- void display (int line, int val=1)
  For back compatibility.

- int displayed (int line) const
  Returns non-zero if line has been scrolled to a position where it is being displayed.

- Fl_Browser (int X, int Y, int W, int H, const char *L=0)
  The constructor makes an empty browser.

- char format_char () const
  Gets the current format code prefix character, which by default is '@'.

- void format_char (char c)
  Sets the current format code prefix character to c.

- void hide () FL_OVERRIDE
  Hides the entire Fl_Browser widget – opposite of show().

- void hide (int line)
  Makes line invisible, preventing selection by the user.

- Fl_Image * icon (int line) const
  Returns the icon currently defined for line.

- void icon (int line, Fl_Image *icon)
  Set the image icon for line to the value icon.

- void insert (int line, const char *newtext, void *d=0)
  Insert a new entry whose label is newtext above given line, optional data d.

- void lineposition (int line, Fl_Line_Position pos)
  Updates the browser so that line is shown at position pos.

- int load (const char *filename)
  Clears the browser and reads the file, adding each line from the file to the browser.

- void make_visible (int line)
  Make the item at the specified line visible().

- void middleline (int line)
  Scrolls the browser so the middle item in the browser is showing the specified line.

- void move (int to, int from)
  Line from is removed and reinserted at to.

- void remove (int line)
  Remove entry for given line number, making the browser one line shorter.

- void remove_icon (int line)
  Removes the icon for line.

- void replace (int a, const char *b)
  For back compatibility only.

- int select (int line, int val=1)
  Sets the selection state of the item at line to the value val.

- int selected (int line) const
  Returns 1 if specified line is selected, 0 if not.

- void show () FL_OVERRIDE
  Shows the entire Fl_Browser widget – opposite of hide().

- void show (int line)
  Makes line visible, and available for selection by user.

- int size () const
  Returns how many lines are in the browser.

- void size (int W, int H)

- void swap (int a, int b)
Swaps two browser lines a and b.

- `const char* text(int line) const`
  - Returns the label text for the specified line.
- `void text(int line, const char* newtext)`
  - Sets the text for the specified line to newtext.
- `Fl_Fontsize textsize() const`
  - Gets the default text size (in pixels) for the lines in the browser.
- `void textsize(Fl_Fontsize newSize)`
  - Sets the default text size (in pixels) for the lines in the browser to newSize.
- `int topline() const`
  - Returns the line that is currently visible at the top of the browser.
- `void topline(int line)`
  - Scrolls the browser so the top item in the browser is showing the specified line.
- `int value() const`
  - Returns the line number of the currently selected line, or 0 if none selected.
- `void value(int line)`
  - Sets the browser’s value(), which selects the specified line.
- `int visible(int line) const`
  - Returns non-zero if the specified line is visible, 0 if hidden.

The destructor deletes all list items and destroys the browser.

Public Member Functions inherited from Fl_Browser

- `int deselect(int docallbacks=0)`
  - Deselects all items in the list and returns 1 if the state changed or 0 if it did not.
- `void display(void* item)`
  - Displays the item, scrolling the list as necessary.
- `int handle(int event) FL_OVERRIDE`
  - Handles the event within the normal widget bounding box.
- `uchar has_scrollbar() const`
  - Returns the current scrollbar mode, see Fl_Browser::has_scrollbar(uchar)
- `void has_scrollbar(uchar mode)`
  - Sets whether the widget should have scrollbars or not (default Fl_Browser::BOTH).
- `int hposition() const`
  - Gets the horizontal scroll position of the list as a pixel position.
- `void hposition(int)`
  - Sets the horizontal scroll position of the list to pixel position.
- `int linespacing() const`
  - Return the height of additional spacing between browser lines.
- `void linespacing(int pixels)`
  - Add some space between browser lines.
- `int position() const`
  - Get the position.
- `void position(int pos)`
  - Position.
- `void position(int x, int y)`
  - Position.
- `void resize(int X, int Y, int W, int H) FL_OVERRIDE`
  - Repositions and/or resizes the browser.
- `void scrollbar_left()`
  - Moves the vertical scrollbar to the lefthand side of the list.
- `void scrollbar_right()`
  - Moves the vertical scrollbar to the righthand side of the list.
• int scrollbar_size () const
  Gets the current size of the scrollbars' troughs, in pixels.
• void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.
• int scrollbar_width () const
  Returns the global value Fl::scrollbar_size().
• void scrollbar_width (int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.
• int select (void ∗item, int val=1, int docallbacks=0)
  Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.
• int select_only (void ∗item, int docallbacks=0)
  Selects item and returns 1 if the state changed or 0 if it did not.
• void sort (int flags=0)
  Sorts the items in the browser based on flags.
• Fl_Color textcolor () const
  Gets the default text color for the lines in the browser.
• void textcolor (Fl_Color col)
  Sets the default text color for the lines in the browser to color col.
• Fl_Font textfont () const
  Gets the default text font for the lines in the browser.
• void textfont (Fl_Font font)
  Sets the default text font for the lines in the browser to font.
• Fl_Fontsize textsize () const
  Gets the default text size (in pixels) for the lines in the browser.
• void textsize (Fl_Fontsize newSize)
  Sets the default text size (in pixels) for the lines in the browser to size.
• int vposition () const
  Gets the vertical scroll position of the list as a pixel position pos.
• void vposition (int pos)
  Sets the vertical scroll position of the list to pixel position pos.

Public Member Functions inherited from Fl_Group

• FL_Widget ∗&_dddesign_kludge ()
  This is for forms compatibility only.
• void add (FL_Widget ∗)
  The widget is removed from its current group (if any) and then added to the end of this group.
• void add (FL_Widget &w)
  See void FL_Group::add(FL_Widget &w)
• void add_resizable (FL_Widget ∗w)
  Adds a widget to the group and makes it the resizable widget.
• FL_Widget ∗const ∗array () const
  Returns a pointer to the array of children.
• FL_Group const ∗as_group () const FL_OVERRIDE
  Returns an FL_Group pointer if this widget is an FL_Group.
• void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
• FL_Widget ∗child (int n) const
  Returns array()[n].
• int children () const
Returns how many child widgets the group has.

- void clear ()
  Deletes all child widgets from memory recursively.

- unsigned int clip_children ()
  Returns the current clipping mode.

- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

- void end ()
  Exactly the same as current(this->parent()).

- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.

- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.

- Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.

- void focus (Fl_Widget *W)
- void forms_end ()
  This is for forms compatibility only.

- int handle (int) FL_OVERRIDE
  Handles the specified event.

- void init_sizes ()
  Resets the internal array of widget sizes and positions.

- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).

- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

- void remove (Fl_Widget *o)
  Removes the widget o from the group.

- void remove (int index)
  Removes the widget at index from the group but does not delete it.

- Fl_Widget * resizable () const
  Returns the group’s resizable widget.

- void resizable (Fl_Widget &o)
  Sets the group’s resizable widget.

- void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- void resize (int, int, int, int) FL_OVERRIDE
  Resizes the Fl_Group widget and all of its children.

- virtual ~Fl_Group ()
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  
  Activates the widget.

• unsigned int active () const
  
  Returns whether the widget is active.

• int active_r () const
  
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  
  Gets the label alignment.

• void align (Fl_Align alignment)
  
  Sets the label alignment.

• long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const ∗ as_gl_window () const
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const ∗ as_window () const
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• void bind_deimage (Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.

• void callback (Fl_Callback ∗ cb)
  
  Sets the current callback function for the widget.

• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback ∗ cb, void ∗ p)
  
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 ∗ cb)
  
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 ∗ cb, long p=0)
  
  Sets the current callback function for the widget.

• unsigned int changed () const
  
  Checks if the widget value changed since the last callback.

• void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- int contains (const Fl_Widget ∗ w) const
  Checks if w is a child of this widget.
- void copy_label (const char ∗ new_label)
  Sets the current label.
- void copy_tooltip (const char ∗ text)
  Sets the current tooltip text.
- uchar damage () const
  Returns non-zero if draw() needs to be called.
- void damage (uchar c)
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
- int damage_resize (int, int, int, int)
  Internal use only.
- void deactivate ()
  Deactivates the widget.
- Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
- const Fl_Image ∗ deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
- void deimage (Fl_Image & img)
  Sets the image to use as part of the widget label when in the inactive state.
- void deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
- void do_callback (Fl_Widget ∗ widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

• **void draw_label (int, int, int, int, Fl_Align) const**
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• **int h () const**
  
  Gets the widget height.

• **Fl_Image * image ()**
  
  Gets the image that is used as part of the widget label when in the active state.

• **const Fl_Image * image () const**
  
  Gets the image that is used as part of the widget label when in the active state.

• **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

• **void image (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the active state.

• **int image_bound () const**
  
  Returns whether the image is managed by the widget.

• **int inside (const Fl_Widget *wgt) const**
  
  Checks if this widget is a child of wgt.

• **int is_label_copied () const**
  
  Returns whether the current label was assigned with copy_label().

• **const char * label () const**
  
  Gets the current label text.

• **void label (const char *text)**
  
  Sets the current label pointer.

• **void label (Fl_Labeltype a, const char *b)**
  
  Shortcut to set the label text and type in one call.

• **Fl_Color labelcolor () const**
  
  Gets the label color.

• **void labelcolor (Fl_Color c)**
  
  Sets the label color.

• **Fl_Font labelfont () const**
  
  Gets the font to use.

• **void labelfont (Fl_Font f)**
  
  Sets the font to use.

• **Fl_Fontsize labelsize () const**
  
  Gets the font size in pixels.

• **void labelsize (Fl_Fontsize pix)**
  
  Sets the font size in pixels.

• **Fl_Labeltype labeltype () const**
  
  Gets the label type.

• **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

• **void measure_label (int &ww, int &hh) const**
  
  Sets width ww and height hh accordingly with the label size.

• **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

• **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

• **unsigned int output () const**
  
  Returns if a widget is used for output only.
Returns a pointer to the parent widget.

- void parent (FL_Group *p)
  
  Internal use only - "for hacks only".

- void position (int X, int Y)
  
  Repositions the window or widget.

- void redraw()
  
  Schedules the drawing of the widget.

- void redraw_label()
  
  Schedules the drawing of the label.

- FL_Color selection_color () const
  
  Gets the selection color.

- void selection_color (FL_Color a)
  
  Sets the selection color.

- void set_active()
  
  Marks the widget as active without sending events or changing focus.

- void set_changed()
  
  Marks the value of the widget as changed.

- void set_output()
  
  Sets a widget to output only.

- void set_visible()
  
  Makes the widget visible.

- void set_visible_focus()
  
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label (int value)
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- void size (int W, int H)
  
  Changes the size of the widget.

- int take_focus()
  
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  
  Returns if the widget is able to take events.

- int test_shortcut()
  
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char * tooltip () const
  
  Gets the current tooltip text.

- void tooltip (const char *text)
  
  Sets the current tooltip text.

- FL_Window * top_window () const
  
  Returns a pointer to the top-level window for the widget.

- FL_Window * top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  
  Gets the widget type.

- void type (uchar t)
  
  Sets the widget type.

- int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void * user_data () const
  
  Gets the user data for this widget.
• void **user_data** (Fl_Callback_User_Data ∗v, bool auto_free)
  
  Sets the user data for this widget.

• void **user_data** (void ∗v)
  
  Sets the user data for this widget.

• unsigned int **visible () const**
  
  Returns whether a widget is visible.

• unsigned int **visible_focus () const**
  
  Checks whether this widget has a visible focus.

• void **visible_focus (int v)**
  
  Modifies keyboard focus navigation.

• int **visible_r () const**
  
  Returns whether a widget and all its parents are visible.

• int **w () const**
  
  Gets the widget width.

• Fl_When **when () const**
  
  Returns the conditions under which the callback is called.

• void **when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

• Fl_Window ∗**window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int **x () const**
  
  Gets the widget position in its window.

• int **y () const**
  
  Gets the widget position in its window.

• virtual ∼**Fl_Widget ()**
  
  Destroys the widget.

**Additional Inherited Members**

**Public Types inherited from Fl_Browser**

• enum Fl_Line_Position { TOP, BOTTOM, MIDDLE }
  
  For internal use only?

**Public Types inherited from Fl_Browser_**

• enum {
  
  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7 }

  Values for has_scrollbar().

**Static Public Member Functions inherited from Fl_Group**

• static Fl_Group ∗**current ()**
  
  Returns the currently active group.

• static void **current (Fl_Group ∗g)**
  
  Sets the current group.
Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Public Attributes inherited from Fl_Browser_

- Fl_Scrollbar hscrollbar
  Horizontal scrollbar.

- Fl_Scrollbar scrollbar
  Vertical scrollbar.

Protected Types inherited from Fl_Widget

```c
enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPYED_TOOLtip = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCErNTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
```
flags possible values enumeration.

Protected Member Functions inherited from Fl_Browser

- FL_BLINE * _remove (int line)
  Removes the item at the specified line.

- FL_BLINE * find_line (int line) const
  Returns the item for specified line.

- int full_height () const FL_OVERRIDE
  The height of the entire list of all visible() items in pixels.

- int incr_height () const FL_OVERRIDE
  The default 'average' item height (including inter-item spacing) in pixels.

- void insert (int line, FL_BLINE *item)
  Insert specified item above line.

- void * item_at (int line) const FL_OVERRIDE
  Return the item at specified line.

- void item_draw (void *item, int X, int Y , int W, int H) const FL_OVERRIDE
  Draws item at the position specified by XYWH.

- void * item_first () const FL_OVERRIDE
  Returns the very first item in the list.

- int item_height (void *item) const FL_OVERRIDE
  Returns height of item in pixels.

- void * item_last () const FL_OVERRIDE
Returns the very last item in the list.

- void item_next (void *item) const FL_OVERRIDEx Returns the next item after item.
- void item_prev (void *item) const FL_OVERRIDEx Returns the previous item before item.
- void item_select (void *item, int val) FL_OVERRIDEx Change the selection state of item to the value val.
- int item_selected (void *item) const FL_OVERRIDEx See if item is selected.
- void item_swap (void *a, void *b) FL_OVERRIDEx Swap the items a and b.
- const char * item_text (void *item) const FL_OVERRIDEx Returns the label text for item.
- int item_width (void *item) const FL_OVERRIDEx Returns width of item in pixels.
- int lineno (void *item) const FL_OVERRIDEx Returns line number corresponding to item, or zero if not found.
- void swap (FL_BLINE *a, FL_BLINE *b) FL_OVERRIDEx Swap the two items a and b.

Protected Member Functions inherited from Fl_Browser_

- void bbox (int &X, int &Y, int &W, int &H) const FL_OVERRIDEx Returns the bounding box for the interior of the list's display window, inside the scrollbars.
- void deleting (void *item) FL_OVERRIDEx This method should be used when item is being deleted from the list.
- int displayed (void *item) const FL_OVERRIDEx Returns non-zero if item has been scrolled to a position where it is being displayed.
- void draw () FL_OVERRIDEx Draws the list within the normal widget bounding box.
- void * find_item (int ypos) FL_OVERRIDEx This method returns the item under mouse y position ypos.
- Fl_Browser_ (int X, int Y, int W, int H, const char *L=0) FL_OVERRIDEx The constructor makes an empty browser.
- virtual int full_width () const FL_OVERRIDEx This method may be provided by the subclass to indicate the full width of the item list, in pixels.
- void inserting (void *a, void *b) FL_OVERRIDEx This method should be used when an item is in the process of being inserted into the list.
- virtual int item_quick_height (void *item) const FL_OVERRIDEx This method may be provided by the subclass to return the height of the item, in pixels.
- int leftedge () const FL_OVERRIDEx This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.
- void new_list () FL_OVERRIDEx This method should be called when the list data is completely replaced or cleared.
- void redraw_line (void *item) FL_OVERRIDEx This method should be called when the contents of item has changed, but not its height.
- void redraw_lines () FL_OVERRIDEx This method will cause the entire list to be redrawn.
- void replacing (void *a, void *b) FL_OVERRIDEx This method should be used when item a is being replaced by item b.
- void * selection () const FL_OVERRIDEx
Returns the item currently selected, or NULL if there is no selection.

- **void swapping (void ∗a, void ∗b)**
  This method should be used when two items a and b are being swapped.

- **void ∗top () const**
  Returns the item that appears at the top of the list.

**Protected Member Functions inherited from Fl_Group**

- **Fl_Rect ∗bounds ()**
  Returns the internal array of widget sizes and positions.

- **void draw () FL_OVERRIDE**
  Draws the widget.

- **void draw_child (Fl_Widget &widget) const**
  Forces a child to redraw.

- **void draw_children ()**
  Draws all children of the group.

- **void draw_outside_label (const Fl_Widget &widget) const**
  Parents normally call this to draw outside labels of child widgets.

- **virtual int on_insert (Fl_Widget ∗, int)**
  Allow derived groups to act when a widget is added as a child.

- **virtual int on_move (int, int)**
  Allow derived groups to act when a widget is moved within the group.

- **virtual void on_remove (int)**
  Allow derived groups to act when a child widget is removed from the group.

- **int ∗sizes ()**
  Returns the internal array of widget sizes and positions.

- **void update_child (Fl_Widget &widget) const**
  Draws a child only if it needs it.

**Protected Member Functions inherited from Fl_Widget**

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

- **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box () const**
  Draws the widget box according its box style.

- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus () const**
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const**
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  Draws a focus box for the widget at the given position and size.

- **void draw_label () const**
  Draws the widget's label at the defined label position.

- **void draw_label (int, int, int, int) const**
  Draws the label in an arbitrary bounding box.

- **Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)**
Creates a widget at the given position and size.

- unsigned int flags () const
  
  Gets the widget flags mask.

- void h (int v)
  
  Internal use only.

- void set_flag (unsigned int c)
  
  Sets a flag in the flags mask.

- void w (int v)
  
  Internal use only.

- void x (int v)
  
  Internal use only.

- void y (int v)
  
  Internal use only.

12.65.1 Detailed Description

The Fl_Hold_Browser is a subclass of Fl_Browser which lets the user select a single item, or no items by clicking on the empty space.

![Figure 12.24 Fl_Hold_Browser](image)

As long as the mouse button is held down the item pointed to by it is highlighted, and this highlighting remains on when the mouse button is released. Normally the callback is done when the user releases the mouse, but you can change this with when().

See Fl_Browser for methods to add and remove lines from the browser.

12.65.2 Constructor & Destructor Documentation

12.65.2.1 Fl_Hold_Browser()

```cpp
Fl_Hold_Browser::Fl_Hold_Browser ( int X,
                                   int Y,
                                   int W,
                                   int H,
                                   const char * L = 0 )
```

Creates a new Fl_Hold_Browser widget using the given position, size, and label string.

The default boxtype is FL_DOWN_BOX. The constructor specializes Fl_Browser() by setting the type to FL_HOLD_BROWSER. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- Fl_Hold_Browser.H
- Fl_Browser.cxx

12.66 Fl_Hor_Fill_Slider Class Reference

Inheritance diagram for Fl_Hor_Fill_Slider:
Public Member Functions

- **Fl_Hor_Fill_Slider** (int X, int Y, int W, int H, const char *L=0)

Public Member Functions inherited from Fl_Slider

- void **bounds** (double a, double b)
  - Sets the minimum (a) and maximum (b) values for the valuator widget.
- **Fl_Slider** (int X, int Y, int W, int H, const char *L=0)
  - Creates a new Fl_Slider widget using the given position, size, and label string.
- **Fl_Slider** (uchar t, int X, int Y, int W, int H, const char *L)
  - Creates a new Fl_Slider widget using the given type, position, size, and label string.
- int **handle** (int) FL_OVERRIDE
  - Handles the specified event.
- int **scrollvalue** (int pos, int size, int first, int total)
  - Sets the size and position of the sliding knob in the box.
- **Fl_Boxtype** **slider** () const
  - Gets the slider box type.
- void **slider** (Fl_Boxtype c)
  - Sets the slider box type.
- float **slider_size** () const
  - Get the dimensions of the moving piece of slider.
- void **slider_size** (double v)
  - Set the dimensions of the moving piece of slider.

Public Member Functions inherited from Fl_Valuator

- void **bounds** (double a, double b)
  - Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
  - Clamps the passed value to the valuator range.
- virtual int **format** (char *)
  - Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double **increment** (double, int)
  - Adds n times the step value to the passed value.
- double **maximum** () const
  - Gets the maximum value for the valuator.
- void **maximum** (double a)
  - Sets the maximum value for the valuator.
- double **minimum** () const
  - Gets the minimum value for the valuator.
- void **minimum** (double a)
Sets the minimum value for the valuator.

- void precision (int digits)
  Sets the step value to $1.0 / 10^{\text{digits}}$.

- void range (double a, double b)
  Sets the minimum and maximum values for the valuator.

- double round (double)
  Round the passed value to the nearest step increment.

- double step () const
  Gets or sets the step value.

- void step (double a, int b)
  See double Fl_Valuator::step() const

- void step (double s)
  See double Fl_Valuator::step() const.

- void step (int a)
  See double Fl_Valuator::step() const

- double value () const
  Gets the floating point(double) value.

- int value (double)
  Sets the current value.

### Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.

- unsigned int active () const
  Returns whether the widget is active.

- int active_r () const
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  Gets the label alignment.

- void align (Fl_Align alignment)
  Sets the label alignment.

- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const * as_gl_window () const

- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const * as_group () const

- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const * as_window () const

- void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image(Fl_Image *img)**
  - Sets the image to use as part of the widget label when in the active state.

- **void bind_image(int f)**
  - Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box() const**
  - Gets the box type of the widget.

- **void box(Fl_Boxtype new_box)**
  - Sets the box type for the widget.

- **Fl_Callback *callback() const**
  - Gets the current callback function for the widget.

- **void callback(Fl_Callback *cb)**
  - Sets the current callback function for the widget.

- **void callback(Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**
  - Sets the current callback function and managed user data for the widget.

- **void callback(Fl_Callback *cb, void *p)**
  - Sets the current callback function and data for the widget.

- **void callback(Fl_Callback0 *cb)**
  - Sets the current callback function for the widget.

- **void callback(Fl_Callback1 *cb, long p=0)**
  - Sets the current callback function for the widget.

- **unsigned int changed() const**
  - Checks if the widget value changed since the last callback.

- **void clear_active()**
  - Marks the widget as inactive without sending events or changing focus.

- **void clear_changed()**
  - Marks the value of the widget as unchanged.

- **void clear_damage(uchar c=0)**
  - Clears or sets the damage flags.

- **void clear_output()**
  - Sets a widget to accept input.

- **void clear_visible()**
  - Hides the widget.

- **void clear_visible_focus()**
  - Disables keyboard focus navigation with this widget.

- **Fl_Color color() const**
  - Gets the background color of the widget.

- **void color(Fl_Color bg)**
  - Sets the background color of the widget.

- **void color(Fl_Color bg, Fl_Color sel)**
  - Sets the background and selection color of the widget.

- **Fl_Color color2() const**
  - For back compatibility only.

- **void color2(unsigned a)**
  - For back compatibility only.

- **int contains(const Fl_Widget *w) const**
  - Checks if w is a child of this widget.

- **void copy_label(const char *new_label)**
  - Sets the current label.

- **void copy_tooltip(const char *text)**
  - Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  - Gets the label color.

- `void labelcolor (Fl_Color c)`
  - Sets the label color.

- `Fl_Font labelfont () const`
  - Gets the font to use.

- `void labelfont (Fl_Font f)`
  - Sets the font to use.

- `Fl_Fontsize labelsizes () const`
  - Gets the font size in pixels.

- `void labelsizes (Fl_Fontsize pix)`
  - Sets the font size in pixels.

- `Fl_Labeltype labelfontype () const`
  - Gets the label type.

- `void labelfontype (Fl_Labeltype a)`
  - Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  - Sets width ww and height hh accordingly with the label size.

- `bool needs_keyboard () const`
  - Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  - Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  - Returns if a widget is used for output only.

- `Fl_Group *parent () const`
  - Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  - Internal use only - "for hacks only".

- `void position (int X, int Y)`
  - Repositions the window or widget.

- `void redraw ()`
  - Schedules the drawing of the widget.

- `void redraw_label ()`
  - Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  - Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  - Gets the selection color.

- `void selection_color (Fl_Color a)`
  - Sets the selection color.

- `void set_active ()`
  - Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  - Marks the value of the widget as changed.

- `void set_output ()`
  - Sets a widget to output only.

- `void set_visible ()`
  - Makes the widget visible.

- `void set_visible_focus ()`
  - Enables keyboard focus focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
Gets the widget position in its window.

- `int y () const`

Gets the widget position in its window.

- `virtual ~Fl_Widget ()`
  Destroys the widget.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

- `static void default_callback (Fl_Widget *,void *)`
  The default callback for all widgets that don't set a callback.

- `static unsigned int label_shortcut (const char *)`
  Returns the Unicode value of the '&x' shortcut in a given text.

- `static int test_shortcut (const char *, const bool require_alt=false)`
  Returns true if the given text \( t \) contains the entered '&x' shortcut.

**Protected Types inherited from Fl_Widget**

- `enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<25 , USERFLAG2 = 1<<26 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

**Protected Member Functions inherited from Fl_Slider**

- `void draw () FL_OVERRIDE`
  Draws the widget.

- `void draw (int, int, int, int)`
- `int handle (int, int, int, int)`

**Protected Member Functions inherited from Fl_Valuator**

- `Fl_Valuator (int X, int Y , int W, int H, const char *)`
  Creates a new Fl_Valuator widget using the given position, size, and label string.

- `void handle_drag (double newvalue)`
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- `void handle_push ()`
  Stores the current value in the previous value.

- `void handle_release ()`
  Called after an FL_WHEN_RELEASE event is received and before the callback.

- `int horizontal () const`
  Tells if the valuator is an FL_HORIZONTAL one.

- `double previous_value () const`
  Gets the previous floating point value before an event changed it.
• **void** **set_value**(double v)
  
  Sets the current floating point value.

• **double** **softclamp**(double)
  
  Clamps the value, but accepts v if the previous value is not already out of range.

• **virtual void** **value_damage**()
  
  Asks for partial redraw.

**Protected Member Functions inherited from Fl_Widget**

• **void** **clear_flag**(unsigned int c)
  
  Clears a flag in the flags mask.

• **void** **draw_backdrop**(const)
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• **void** **draw_box**(Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget’s position and size.

• **void** **draw_box**(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• **void** **draw_focus**(const)
  
  Draws a focus rectangle around the widget.

• **void** **draw_focus**(Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

• **void** **draw_focus**(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

• **void** **draw_label**(const)
  
  Draws the widget’s label at the defined label position.

• **void** **draw_label**(int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• **Fl_Widget**(int x, int y, int w, int h, const char *label=0L)
  
  Creates a widget at the given position and size.

• **unsigned int** **flags**(const)
  
  Gets the widget flags mask.

• **void** **h**(int v)
  
  Internal use only.

• **void** **set_flag**(unsigned int c)
  
  Sets a flag in the flags mask.

• **void** **w**(int v)
  
  Internal use only.

• **void** **x**(int v)
  
  Internal use only.

• **void** **y**(int v)
  
  Internal use only.

The documentation for this class was generated from the following files:

- Fl_Hor_Fill_Slider.H
- Fl_Slider.cxx
**12.67  Fl_Hor_Nice_Slider Class Reference**

Single thumb tab slider.

```
#include <Fl_Hor_Nice_Slider.H>
```

**Public Member Functions**

- `Fl_Hor_Nice_Slider(int X, int Y, int W, int H, const char *L=0)`

**Public Member Functions inherited from Fl_Slider**

- `void bounds(double a, double b)`
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- `Fl_Slider(int X, int Y, int W, int H, const char *L=0)`
  Creates a new Fl_Slider widget using the given position, size, and label string.
- `Fl_Slider(uchar t, int X, int Y, int W, int H, const char *L)`
  Creates a new Fl_Slider widget using the given type, position, size, and label string.
- `int handle(int)` FL_OVERRIDE
  Handles the specified event.
- `int scrollvalue(int pos, int size, int first, int total)`
  Sets the size and position of the sliding knob in the box.
- `Fl_Boxtype slider() const`
  Gets the slider box type.
- `void slider(Fl_Boxtype c)`
  Sets the slider box type.
- `float slider_size() const`
  Gets the dimensions of the moving piece of slider.
- `void slider_size(double v)`
  Set the dimensions of the moving piece of slider.

**Public Member Functions inherited from Fl_Valuator**

- `void bounds(double a, double b)`
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- `double clamp(double)`
  Clamps the passed value to the valuator range.
- `virtual int format(char *)`
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- `double increment(double, int)`
  Adds n times the step value to the passed value.
- `double maximum() const`
  Gets the maximum value for the valuator.
• void **maximum** (double a)
  
  *Sets the maximum value for the valuator.*

• double **minimum** () const
  
  *Gets the minimum value for the valuator.*

• void **minimum** (double a)
  
  *Sets the minimum value for the valuator.*

• void **precision** (int digits)
  
  *Sets the step value to 1.0 / 10^digits.*

• void **range** (double a, double b)
  
  *Sets the minimum and maximum values for the valuator.*

• double **round** (double)
  
  *Round the passed value to the nearest step increment.*

• double **step** () const
  
  *Gets or sets the step value.*

• void **step** (double a, int b)
  
  See double **Fl_Valuator::step()** const

• void **step** (double s)
  
  See double **Fl_Valuator::step()** const.

• void **step** (int a)
  
  See double **Fl_Valuator::step()** const

• double **value** () const
  
  *Gets the floating point(double) value.*

• int **value** (double)
  
  *Sets the current value.*

### Public Member Functions inherited from Fl_Widget

• void **_clearFullscreen** ()

• void **_setFullscreen** ()

• void **activate** ()
  
  *Activates the widget.*

• unsigned int **active** () const
  
  *Returns whether the widget is active.*

• int **active_r** () const
  
  *Returns whether the widget and all of its parents are active.*

• **Fl_Align align** () const
  
  *Gets the label alignment.*

• void **align** (Fl_Align alignment)
  
  *Sets the label alignment.*

• long **argument** () const
  
  *Gets the current user data (long) argument that is passed to the callback function.*

• void **argument** (long v)
  
  *Sets the current user data (long) argument that is passed to the callback function.*

• virtual class Fl_Gl_Window **as_gl_window** ()
  
  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

• virtual class Fl_Gl_Window const **as_gl_window** () const

• virtual Fl_Group **as_group** ()
  
  *Returns an Fl_Group pointer if this widget is an Fl_Group.*

• virtual Fl_Group const **as_group** () const

• virtual Fl_Window **as_window** () const

Generated by Doxygen
Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const & as_window() const
  - Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage(Fl_Image * img)
  - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image(Fl_Image * img)
  - Sets the image to use as part of the widget label when in the active state.
- void bind_image(int f)
  - Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box() const
  - Gets the box type of the widget.
- void box(Fl_Boxtype new_box)
  - Sets the box type for the widget.
- Fl_Callback_p callback() const
  - Gets the current callback function for the widget.
- void callback(Fl_Callback * cb)
  - Sets the current callback function for the widget.
- void callback(Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  - Sets the current callback function and managed user data for the widget.
- void callback(Fl_Callback * cb, void * p)
  - Sets the current callback function and data for the widget.
- void callback(Fl_Callback0 * cb)
  - Sets the current callback function for the widget.
- void callback(Fl_Callback1 * cb, long p=0)
  - Sets the current callback function for the widget.
- unsigned int changed() const
  - Checks if the widget value changed since the last callback.
- void clear_active()
  - Marks the widget as inactive without sending events or changing focus.
- void clear_changed()
  - Marks the value of the widget as unchanged.
- void clear_damage(uchar c=0)
  - Clears or sets the damage flags.
- void clear_output()
  - Sets a widget to accept input.
- void clear_visible()
  - Hides the widget.
- void clear_visible_focus()
  - Disables keyboard focus navigation with this widget.
- Fl_Color color() const
  - Gets the background color of the widget.
- void color(Fl_Color bg)
  - Sets the background color of the widget.
- void color(Fl_Color bg, Fl_Color sel)
  - Sets the background and selection color of the widget.
- Fl_Color color2() const
  - For back compatibility only.
- void color2(unsigned a)
  - For back compatibility only.
- int contains(const Fl_Widget * w) const
Checks if w is a child of this widget.

- **void copy_label (const char ∗new_label)**
  Sets the current label.

- **void copy_tooltip (const char ∗text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image ∗deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image ∗deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image ∗img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **Fl_Image ∗image ()**
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image ∗image () const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image ∗img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget ∗wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

Generated by Doxygen
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - “for hacks only”.
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char * tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.

- **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void * user_data () const**
  Gets the user data for this widget.

- **void user_data (Fl_Callback_User_Data *v, bool auto_free)**
  Sets the user data for this widget.

- **void user_data (void *v)**
  Sets the user data for this widget.

- **unsigned int visible () const**
  Returns whether a widget is visible.

- **unsigned int visible_focus () const**
  Checks whether this widget has a visible focus.

- **void visible_focus (int v)**
  Modifies keyboard focus navigation.

- **int visible_r () const**
  Returns whether a widget and all its parents are visible.

- **int w () const**
  Gets the widget width.

- **Fl_When when () const**
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget * widget, void *data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char * t)
  Returns the Unicode value of the ’&x’ shortcut in a given text.
• static int test_shortcut (const char * t, const bool require_alt=false)
  Returns true if the given text t contains the entered ’&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,

  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
flags possible values enumeration.

Protected Member Functions inherited from Fl_Slider

• void draw () FL_OVERRIDE
  Draws the widget.
• void draw (int, int, int, int)
• int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
• void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
• void handle_push ()
  Stores the current value in the previous value.
• void handle_release ()

Generated by Doxygen
Called after an FL_WHEN_RELEASE event is received and before the callback.

- **int horizontal() const**
  
  Tells if the valuator is an FL_HORIZONTAL one.

- **double previous_value() const**
  
  Gets the previous floating point value before an event changed it.

- **void set_value(double v)**
  
  Sets the current floating point value.

- **double softclamp(double)**
  
  Clamps the value, but accepts v if the previous value is not already out of range.

- **virtual void value_damage()**
  
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- **void clear_flag(unsigned int c)**
  
  Clears a flag in the flags mask.

- **void draw_backdrop() const**
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box() const**
  
  Draws the widget box according its box style.

- **void draw_box(Fl_Boxtype t, Fl_Color c) const**
  
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus() const**
  
  Draws a focus rectangle around the widget.

- **void draw_focus(Fl_Boxtype t, int X, int Y, int W, int H) const**
  
  Draws a focus rectangle around the widget.

- **void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  
  Draws a focus box for the widget at the given position and size.

- **void draw_label() const**
  
  Draws the widget's label at the defined label position.

- **void draw_label(int, int, int, int) const**
  
  Draws the label in an arbitrary bounding box.

- **void Fl_Widget(int x, int y, int w, int h, const char *label=0L)**
  
  Creates a widget at the given position and size.

- **unsigned int flags() const**
  
  Gets the widget flags mask.

- **void h(int v)**
  
  Internal use only.

- **void set_flag(unsigned int c)**
  
  Sets a flag in the flags mask.

- **void w(int v)**
  
  Internal use only.

- **void x(int v)**
  
  Internal use only.

- **void y(int v)**
  
  Internal use only.
12.67.1 Detailed Description

Single thumb tab slider.

![Figure 12.25 Fl_Hor_Nice_Slider with various Fl::scheme() values](image)

The documentation for this class was generated from the following files:

- Fl_Hor_Nice_Slider.H
- Fl_Slider.cxx

12.68 Fl_Hor_Slider Class Reference

Horizontal Slider class.

```cpp
#include <Fl_Hor_Slider.H>
```

Fl_Hor_Slider
```

Public Member Functions

- **Fl_Hor_Slider** (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new Fl_Hor_Slider widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Slider

- void bounds (double a, double b)

  Sets the minimum (a) and maximum (b) values for the valuator widget.

- Fl_Slider (int X, int Y, int W, int H, const char *L=0)

  Creates a new Fl_Slider widget using the given position, size, and label string.

- Fl_Slider (uchar t, int X, int Y, int W, int H, const char *L)

  Creates a new Fl_Slider widget using the given type, position, size, and label string.

- int handle (int) FL_OVERRIDE

  Handles the specified event.

- int scrollvalue (int pos, int size, int first, int total)

  Sets the size and position of the sliding knob in the box.

- **Fl_Boxtype slider ()** const

  Gets the slider box type.

- void slider (Fl_Boxtype c)
Sets the slider box type.

- float `slider_size()` const
  
  Get the dimensions of the moving piece of slider.

- void `slider_size(double v)`
  
  Set the dimensions of the moving piece of slider.

### Public Member Functions inherited from `Fl_Valuator`

- void `bounds(double a, double b)`
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- double `clamp(double)`
  
  Clamps the passed value to the valuator range.

- virtual int `format(char*)`
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- double `increment(double, int)`
  
  Adds n times the step value to the passed value.

- double `maximum()` const
  
  Gets the maximum value for the valuator.

- void `maximum(double a)`
  
  Sets the maximum value for the valuator.

- double `minimum()` const
  
  Gets the minimum value for the valuator.

- void `minimum(double a)`
  
  Sets the minimum value for the valuator.

- void `precision(int digits)`
  
  Sets the step value to $1.0 / 10^{\text{digits}}$.

- void `range(double a, double b)`
  
  Sets the minimum and maximum values for the valuator.

- double `round(double)`
  
  Round the passed value to the nearest step increment.

- double `step()` const
  
  Gets or sets the step value.

- void `step(double a, int b)`
  
  See double `Fl_Valuator::step() const`

- void `step(double s)`
  
  See double `Fl_Valuator::step() const`.

- void `step(int a)`
  
  See double `Fl_Valuator::step() const`

- double `value()` const
  
  Gets the floating point(double) value.

- int `value(double)`
  
  Sets the current value.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const ∗ as_group () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Returns the current user data (long) argument that is passed to the callback function.
Checks if the widget value changed since the last callback.
• void clear_active ()
   Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
   Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
   Clears or sets the damage flags.
• void clear_output ()
   Sets a widget to accept input.
• void clear_visible ()
   Hides the widget.
• void clear_visible_focus ()
   Disables keyboard focus navigation with this widget.
• Fl_Color color () const
   Gets the background color of the widget.
• void color (Fl_Color bg)
   Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
   Sets the background and selection color of the widget.
• Fl_Color color2 () const
   For back compatibility only.
• void color2 (unsigned a)
   For back compatibility only.
• int contains (const Fl_Widget ∗w) const
   Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
   Sets the current label.
• void copy_tooltip (const char ∗text)
   Sets the current tooltip text.
• uchar damage () const
   Returns non-zero if draw() needs to be called.
• void damage (uchar c)
   Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
   Sets the damage bits for an area inside the widget.
• int damage_size (int, int, int)
   Internal use only.
• void deactivate ()
   Deactivates the widget.
• Fl_Image ∗deimage ()
   Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image ∗deimage () const
   Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
   Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image ∗img)
   Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
   Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
   Calls the widget callback function with default arguments.
void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
Calls the widget callback function with arbitrary arguments.

void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
Calls the widget callback function with arbitrary arguments.

void draw_label (int, int, int, int, Fl_Align) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.

int h () const
Gets the widget height.

virtual void hide ()
Makes a widget invisible.

Fl_Image *image ()
Gets the image that is used as part of the widget label when in the active state.

const Fl_Image *image () const
Gets the image that is used as part of the widget label when in the active state.

void image (Fl_Image &img)
Sets the image to use as part of the widget label when in the active state.

void image (Fl_Image *img)
Sets the image to use as part of the widget label when in the active state.

int image_bound () const
Returns whether the image is managed by the widget.

int inside (const Fl_Widget *wgt) const
Checks if this widget is a child of wgt.

int is_label_copied () const
Returns whether the current label was assigned with copy_label().

const char *label () const
Gets the current label text.

void label (const char *text)
Sets the current label pointer.

void label (Fl_Labeltype a, const char *b)
Shortcut to set the label text and type in one call.

Fl_Color labelcolor () const
Gets the label color.

void labelcolor (Fl_Color c)
Sets the label color.

Fl_Font labelfont () const
Gets the font to use.

void labelfont (Fl_Font f)
Sets the font to use.

Fl_Fontsize labelsize () const
Gets the font size in pixels.

void labelsize (Fl_Fontsize pix)
Sets the font size in pixels.

Fl_Labeltype labeltype () const
Gets the label type.

void labeltype (Fl_Labeltype a)
Sets the label type.

void measure_label (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.

bool needs_keyboard () const
Returns whether this widget needs a keyboard.

void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  
  Repositions the window or widget.

- `void redraw ()`
  
  Schedules the drawing of the widget.

- `void redraw_label ()`
  
  Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  
  Sets the selection color.

- `void set_active ()`
  
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  
  Marks the value of the widget as changed.

- `void set_output ()`
  
  Sets a widget to output only.

- `void set_visible ()`
  
  Makes the widget visible.

- `void set_visible_focus ()`
  
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- `void shortcut_label (int value)`
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- `virtual void show ()`
  
  Makes a widget visible.

- `void size (int W, int H)`
  
  Changes the size of the widget.

- `int take_focus ()`
  
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  
  Returns if the widget is able to take events.

- `int test_shortcut ()`
  
  Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
  
  Gets the current tooltip text.

- `void tooltip (const char *text)`
  
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• FL_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• FL_Window *window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the ’&x’ shortcut in a given text.
• static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered ’&x’ shortcut.
Protected Types inherited from Fl_Widget

```c
enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLKIT = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
```

flags possible values enumeration.

Protected Member Functions inherited from Fl_Slider

- void draw () FL_OVERRIDE
  Draws the widget.
- void draw (int, int, int, int)
- int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y , int W, int H, const char ∗L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void handle_push ()
  Stores the current value in the previous value.
- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
- double previous_value () const
  Gets the previous floating point value before an event changed it.
- void set_value (double v)
  Sets the current floating point value.
- double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void value_damage ()
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
Draws a box of type t, of color c at the widget's position and size.

- void **draw_box** ([Fl_Boxtype](#) t, int x, int y, int w, int h, [Fl_Color](#) c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus** () const
  Draws a focus rectangle around the widget.

- void **draw_focus** ([Fl_Boxtype](#) t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void **draw_focus** ([Fl_Boxtype](#) t, int x, int y, int w, int h, [Fl_Color](#) bg) const
  Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  Draws the widget's label at the defined label position.

- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- **FL_Widget** (int x, int y, int w, int h, const char +label=0L)
  Creates a widget at the given position and size.

- unsigned int **flags** () const
  Gets the widget flags mask.

- void **h** (int v)
  *Internal use only.*

- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.

- void **w** (int v)
  *Internal use only.*

- void **x** (int v)
  *Internal use only.*

- void **y** (int v)
  *Internal use only.*

### 12.68.1 Detailed Description

Horizontal Slider class.

Public Member Functions

- **Fl_Hor_Value_Slider** (int X, int Y, int W, int H, const char *l=0)

Public Member Functions inherited from Fl_Value_Slider

- **Fl_Value_Slider** (int x, int y, int w, int h, const char *l=0)
  
  Creates a new Fl_Value_Slider widget using the given position, size, and label string.

- **int handle** (int) FL_OVERRIDE
  
  Handles the specified event.

- **Fl_Color textcolor** () const
  
  Gets the color of the text in the value box.

- void **textcolor** (Fl_Color s)
  
  Sets the color of the text in the value box.

- **Fl_Font textfont** () const
  
  Gets the typeface of the text in the value box.

- void **textfont** (Fl_Font s)
  
  Sets the typeface of the text in the value box.

- **Fl_Fontsize textsize** () const
  
  Gets the size of the text in the value box.

- void **textsize** (Fl_Fontsize s)
  
  Sets the size of the text in the value box.

- **int value_height** () const
  
  Gets the height of the value box in pixels (vertical mode only).

- void **value_height** (int s)
  
  Sets the height of the value box in pixels (vertical mode only).

- **int value_width** () const
  
  Gets the width of the value box in pixels (horizontal mode only).

- void **value_width** (int s)
  
  Sets the width of the value box in pixels (horizontal mode only).

Public Member Functions inherited from Fl_Slider

- void **bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **Fl_Slider** (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new Fl_Slider widget using the given position, size, and label string.

- **Fl_Slider** (uchar t, int X, int Y, int W, int H, const char *l)
  
  Creates a new Fl_Slider widget using the given type, position, size, and label string.

- **int scrollvalue** (int pos, int size, int first, int total)
  
  Sets the size and position of the sliding knob in the box.

- **Fl_Boxtype slider** () const
  
  Gets the slider box type.

- void **slider** (Fl_Boxtype c)
  
  Sets the slider box type.

- float **slider_size** () const
  
  Get the dimensions of the moving piece of slider.

- void **slider_size** (double v)
  
  Set the dimensions of the moving piece of slider.
Public Member Functions inherited from Fl_Valuator

- void **bounds** (double a, double b)
  
  *Sets the minimum (a) and maximum (b) values for the valuator widget.*

- double **clamp** (double)
  
  *Clamps the passed value to the valuator range.*

- virtual int **format** (char ∗)
  
  *Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*

- double **increment** (double, int)
  
  *Adds n times the step value to the passed value.*

- double **maximum** () const
  
  *Gets the maximum value for the valuator.*

- void **maximum** (double a)
  
  *Sets the maximum value for the valuator.*

- double **minimum** () const
  
  *Gets the minimum value for the valuator.*

- void **minimum** (double a)
  
  *Sets the minimum value for the valuator.*

- void **precision** (int digits)
  
  *Sets the step value to 1.0 / 10^digits.*

- void **range** (double a, double b)
  
  *Sets the minimum and maximum values for the valuator.*

- double **round** (double)
  
  *Round the passed value to the nearest step increment.*

- double **step** () const
  
  *Gets or sets the step value.*

- void **step** (double a, int b)
  
  *See double Fl_Valuator::step() const*

- void **step** (double s)
  
  *See double Fl_Valuator::step() const.*

- void **step** (int a)
  
  *See double Fl_Valuator::step() const*

- double **value** () const
  
  *Gets the floating point(double) value.*

- int **value** (double)
  
  *Sets the current value.*

Public Member Functions inherited from Fl_Widget

- void **_clear_fullscreen** ()

- void **_set_fullscreen** ()

- void **activate** ()
  
  *Activates the widget.*

- unsigned int **active** () const
  
  *Returns whether the widget is active.*

- int **active_r** () const
  
  *Returns whether the widget and all of its parents are active.*

- Fl_Align **align** () const
  
  *Gets the label alignment.*

- void **align** (Fl_Align alignment)

---

Generated by Doxygen
Sets the label alignment.

- **long argument () const**
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window * as_gl_window ()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const * as_gl_window () const**
  virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **virtual Fl_Group const * as_group () const**
  virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **virtual Fl_Window const * as_window () const**

- **void bind_deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void bind_deimage (int f)**
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  Gets the current callback function for the widget.

- **void callback (Fl_Callback *cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**
  Sets the current callback function and managed user data for the widget.

- **void callback (Fl_Callback *cb, void *p)**
  Sets the current callback function and data for the widget.

- **void callback (Fl_Callback0 *cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback1 *cb, long p=0)**
  Sets the current callback function for the widget.

- **unsigned int changed () const**
  Checks if the widget value changed since the last callback.

- **void clear_active ()**
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output ()**
  Sets a widget to accept input.

- **void clear_visible ()**
  Hides the widget.

- **void clear_visible_focus ()**
Disables keyboard focus navigation with this widget.

- `Fl_Color color () const`
  Gets the background color of the widget.

- `void color (Fl_Color bg)`
  Sets the background color of the widget.

- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- `Fl_Color color2 () const`
  For back compatibility only.

- `void color2 (unsigned a)`
  For back compatibility only.

- `int contains (const Fl_Widget *w) const`
  Checks if w is a child of this widget.

- `void copy_label (const char *new_label)`
  Sets the current label.

- `void copy_tooltip (const char *text)`
  Sets the current tooltip text.

- `uchar damage () const`
  Returns non-zero if draw() needs to be called.

- `void damage (uchar c)`
  Sets the damage bits for the widget.

- `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.

- `int damage_resize (int, int, int, int)`
  Internal use only.

- `void deactivate ()`
  Deactivates the widget.

- `Fl_Image *deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image *deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound () const`
  Returns whether the inactive image is managed by the widget.

- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.

- `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- `void draw_label (int, int, int, int, Fl_Align) const`
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h () const`
  Gets the widget height.

- `virtual void hide ()`
  Makes a widget invisible.

- `Fl_Image *image ()`
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  
  Gets the current label text.

• void label (const char *text)
  
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  
  Gets the label color.

• void labelcolor (Fl_Color c)
  
  Sets the label color.

• Fl_Font labelfont () const
  
  Gets the font to use.

• void labelfont (Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize labelsize () const
  
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  
  Returns if a widget is used for output only.

• Fl_Group *parent () const
  
  Returns a pointer to the parent widget.

• void parent (Fl_Group *p)
  
  Internal use only - “for hacks only”.

• void position (int X, int Y)
  
  Repositions the window or widget.

• void redraw ()
  
  Schedules the drawing of the widget.

• void redraw_label ()
Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.

- `void set_visible ()`
  Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  Returns whether the widget's label uses '&' to indicate shortcuts.

- `void shortcut_label (int value)`
  Sets whether the widget's label uses '&' to indicate shortcuts.

- `virtual void show ()`
  Makes a widget visible.

- `void size (int W, int H)`
  Changes the size of the widget.

- `int take_focus ()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.

- `int test_shortcut ()`
  Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.

- `void tooltip (const char *text)`
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.

- `int use_accents_menu ()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void * user_data () const`
  Gets the user data for this widget.

- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
  Sets the user data for this widget.

- `void user_data (void *v)`
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ∼Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Value_Slider

• void draw () FL_OVERRIDE
  Draws the widget.
Protected Member Functions inherited from Fl_Slider

- void draw (int, int, int, int)
- int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y, int W, int H, const char ∗L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void handle_push ()
  Stores the current value in the previous value.
- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
- double previous_value () const
  Gets the previous floating point value before an event changed it.
- void set_value (double v)
  Sets the current floating point value.
- double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void value_damage ()
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  *Internal use only.*
• void set_flag (unsigned int c)
  *Sets a flag in the flags mask.*
• void w (int v)
  *Internal use only.*
• void x (int v)
  *Internal use only.*
• void y (int v)
  *Internal use only.*

The documentation for this class was generated from the following files:

• Fl_Value_Slider.cxx

12.70  **Fl_ICO_Image Class Reference**

The **Fl_ICO_Image** class supports loading, caching, and drawing of Windows icon (.ico) files.

```c
#include <Fl_ICO_Image.H>
```

Inheritance diagram for **Fl_ICO_Image**:

![Inheritance Diagram](inclusion_diagram.png)

**Classes**

• struct IconDirEntry
  *Windows ICONDIRENTRY structure*

**Public Member Functions**

• **Fl_ICO_Image** (const char *filename, int id=-1, const unsigned char *data=NULL, const size_t datasize=0)
  *Loads the named icon image from the given .ico filename or from memory.*
• const IconDirEntry * icondirentry () const
  *Returns the array of idcount() loaded IconDirEntry structures.*
• int idcount () const
  *Returns the number of icons of various resolutions present in the ICO object.*
• ~**Fl_ICO_Image** ()
  *Destructor.*

**Public Member Functions inherited from Fl_BMP_Image**

• **Fl_BMP_Image** (const char *filename)
  *This constructor loads the named BMP image from the given BMP filename.*
• **Fl_BMP_Image** (const char *imagename, const unsigned char *data, const long length=-1)
  *This constructor loads a BMP image from memory.*
Public Member Functions inherited from Fl_RGB_Image

- virtual Fl_SVG_Image * as_svg_image ()
  Returns whether an image is an Fl_SVG_Image or not.
- int cache_h ()
- int cache_w ()
- void color_average (Fl_Color c, float i) FL_OVERRIDE
  The color_average() method averages the colors in the image with the provided FLTK color value.
- Fl_Image * copy () const
- Fl_Image * copy (int W, int H) const FL_OVERRIDE
  Creates a resized copy of the image.
- void desaturate () FL_OVERRIDE
  The desaturate() method converts an image to grayscale.
- void draw (int X, int Y)
- void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  Draws the image to the current drawing surface with a bounding box.
- Fl_RGB_Image (const Fl_Pixmap * pxm, Fl_Color bg=FL_GRAY)
  The constructor creates a new RGBA image from the specified Fl_Pixmap.
- Fl_RGB_Image (const uchar * bits, int bits_length, int W, int H, int D, int LD)
  The constructor creates a new image from the specified data.
- Fl_RGB_Image (const uchar * bits, int W, int H, int D=3, int LD=0)
  The constructor creates a new image from the specified data.
- void label (Fl_Menu_Item * m) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a menu item.
- void label (Fl_Widget * w) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a widget or menu item.
- virtual void normalize ()
  Makes sure the object is fully initialized.
- void uncache () FL_OVERRIDE
  If the image has been cached for display, delete the cache data.
- ~Fl_RGB_Image () FL_OVERRIDE
  The destructor frees all memory and server resources that are used by the image.

Public Member Functions inherited from Fl_Image

- virtual class Fl_Shared_Image * as_shared_image ()
  Returns whether an image is an Fl_Shared_Image or not.
- Fl_Image * copy () const
  Creates a copy of the image in the same size.
- int count () const
  Returns the number of data values associated with the image.
- int d () const
  Returns the image depth.
- const char * const * data () const
  Returns a pointer to the current image data array.
- int data_h () const
  Returns the height of the image data.
- int data_w () const
  Returns the width of the image data.
- void draw (int X, int Y)
  Draws the image to the current drawing surface.
- int fail () const
Returns a value that is not 0 if there is currently no image available.

- **FL_Image** (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.

- int h () const
  Returns the current image drawing height in FLTK units.

- void inactive()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

- int ld () const
  Returns the current line data size in bytes.

- virtual void release()
  Releases an Fl_Image - the same as 'delete this'.

- virtual void scale (int width, int height, int proportional=1, int can_expand=0)
  Sets the drawing size of the image.

- int w () const
  Returns the current image drawing width in FLTK units.

- virtual ~Fl_Image ()
  The destructor is a virtual method that frees all memory used by the image.

Additional Inherited Members

### Static Public Member Functions inherited from **FL_RGB_Image**

- static size_t max_size()
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

- static void max_size (size_t size)
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

### Static Public Member Functions inherited from **Fl_Image**

- static Fl_Labeltype define_FL_IMAGE_LABEL()
  Returns the currently used RGB image scaling method.

- static Fl_RGB_Scaling RGB_scaling()
  Sets the RGB image scaling method used for copy(int, int).

- static Fl_RGB_Scaling scaling_algorithm()
  Gets what algorithm is used when resizing a source image to draw it.

- static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.

### Public Attributes inherited from **FL_RGB_Image**

- int alloc_array
  If non-zero, the object's data array is delete[]'d when deleting the object.

- const uchar * array
  Points to the start of the object's data array.

### Static Public Attributes inherited from **Fl_Image**

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  True after fl_register_images() was called, false before.
Protected Member Functions inherited from Fl_BMP_Image

- void load_bmp_(class Fl_Image_Reader &rdr, int ico_height=0, int ico_width=0)

Protected Member Functions inherited from Fl_Image

- void d (int D)
  *Sets the current image depth.*
- void data (const char ∗const ∗p, int c)
  *Sets the current data pointer and count of pointers in the array.*
- void draw_empty (int X, int Y)
  *The protected method draw_empty() draws a box with an X in it.*
- int draw_scaled (int X, int Y, int W, int H)
  *Draw the image to the current drawing surface rescaled to a given width and height.*
- void h (int H)
  *Sets the height of the image data.*
- void ld (int LD)
  *Sets the current line data size in bytes.*
- void w (int W)
  *Sets the width of the image data.*

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label ∗lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label ∗lo, int &lw, int &lh)

12.70.1 Detailed Description

The Fl_ICO_Image class supports loading, caching, and drawing of Windows icon (.ico) files.

12.70.2 Constructor & Destructor Documentation

12.70.2.1 Fl_ICO_Image()

Fl_ICO_Image::Fl_ICO_Image (  
  const char ∗ filename,
  int id = -1,
  const unsigned char ∗ data = NULL,
  const size_t datasize = 0 )

Loads the named icon image from the given .ico filename or from memory.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of a .ico file, or of the in-memory image</td>
</tr>
<tr>
<td>id</td>
<td>When id is -1 (default), the highest-resolution icon is loaded; when id 0, load the icon with this ID; when id = -2, load all IconDirEntry structures but no image.</td>
</tr>
<tr>
<td>data</td>
<td>NULL, or in-memory icon data</td>
</tr>
<tr>
<td>datasize</td>
<td>Size in bytes of the data byte array (used when data is not NULL)</td>
</tr>
</tbody>
</table>

```

Public Member Functions

- virtual class Fl_Shared_Image ∗ as_shared_image ()
  Returns whether an image is an Fl_Shared_Image or not.
- virtual void color_average (Fl_Color c, float i)
  The color_average() method averages the colors in the image with the provided FLTK color value.
- Fl_Image ∗ copy () const
  Creates a copy of the image in the same size.
- virtual Fl_Image ∗ copy (int W, int H) const
  Creates a resized copy of the image.
- int count () const
  Returns the number of data values associated with the image.
- int d () const
  Returns the image depth.
- const char ∗ const ∗ data () const
  Returns a pointer to the current image data array.
- int data_h () const
  Returns the height of the image data.
- int data_w () const
  Returns the width of the image data.
- virtual void desaturate ()
  The desaturate() method converts an image to grayscale.
- void draw (int X, int Y)
  Draws the image to the current drawing surface.
- virtual void draw (int X, int Y, int W, int H, int cx=0, int cy=0)
  Draws the image to the current drawing surface with a bounding box.
- int fail () const
  Returns a value that is not 0 if there is currently no image available.
- Fl_Image (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.
- int h () const
  Returns the current image drawing height in FLTK units.
- void inactive ()
The `inactive()` method calls `color_average(FL_BACKGROUND_COLOR, 0.33f)` to produce an image that appears grayed out.

- **virtual void label (Fl_Menu_Item ∗m)**
  This method is an obsolete way to set the image attribute of a menu item.

- **virtual void label (Fl_Widget ∗w)**
  This method is an obsolete way to set the image attribute of a widget or menu item.

- **int ld () const**
  Returns the current line data size in bytes.

- **virtual void release ()**
  Releases an Fl_Image - the same as 'delete this'.

- **virtual void scale (int width, int height, int proportional=1, int can_expand=0)**
  Sets the drawing size of the image.

- **virtual void uncache ()**
  If the image has been cached for display, delete the cache data.

- **int w () const**
  Returns the current image drawing width in FLTK units.

- **virtual ~Fl_Image ()**
  The destructor is a virtual method that frees all memory used by the image.

**Static Public Member Functions**

- **static Fl_Labeltype define_FL_IMAGE_LABEL ()**
- **static Fl_RGB_Scaling RGB_scaling ()**
  Returns the currently used RGB image scaling method.

- **static void RGB_scaling (Fl_RGB_Scaling)**
  Sets the RGB image scaling method used for copy(int, int).

- **static Fl_RGB_Scaling scaling_algorithm ()**
  Gets what algorithm is used when resizing a source image to draw it.

- **static void scaling_algorithm (Fl_RGB_Scaling algorithm)**
  Sets what algorithm is used when resizing a source image to draw it.

**Static Public Attributes**

- **static const int ERR_FILE_ACCESS = -2**
- **static const int ERR_FORMAT = -3**
- **static const int ERR_MEMORY_ACCESS = -4**
- **static const int ERR_NO_IMAGE = -1**
- **static bool register_images_done = false**
  True after `fl_register_images()` was called, false before.

**Protected Member Functions**

- **void d (int D)**
  Sets the current image depth.

- **void data (const char ∗const ∗p, int c)**
  Sets the current data pointer and count of pointers in the array.

- **void draw_empty (int X, int Y)**
  The protected method `draw_empty()` draws a box with an X in it.

- **int draw_scaled (int X, int Y, int W, int H)**
  Draw the image to the current drawing surface rescaled to a given width and height.

- **void h (int H)**
  Sets the height of the image data.

- **void ld (int LD)**
Sets the current line data size in bytes.

- void w (int W)
  Sets the width of the image data.

Static Protected Member Functions

- static void labeltype (const Fl_Label ∗lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label ∗lo, int &lw, int &lh)

Friends

- class Fl_Graphics_Driver

### 12.71.1 Detailed Description

Base class for image caching, scaling and drawing.

*Fl_Image* is the base class used for caching, scaling and drawing all kinds of images in FLTK. This class keeps track of common image data such as the pixels, colormap, width, height, and depth. Virtual methods are used to provide type-specific image handling.

Each image possesses two (width, height) pairs:

1. The width and height of the raw image data are returned by *data_w()* and *data_h()*. These values are set when the image is created and remain unchanged.

2. The width and height of the area filled by the image when it gets drawn are returned by *w()* and *h()*.
   These values are equal to *data_w()* and *data_h()* when the image is created and can be changed by the *scale()* member function.

Since the *Fl_Image* class does not support image drawing by itself, calling the *Fl_Image::draw()* method results in a box with an X in it being drawn instead.

### 12.71.2 Constructor & Destructor Documentation

#### 12.71.2.1 Fl_Image()

```cpp
Fl_Image::Fl_Image ( int W, int H, int D )
```

The constructor creates an empty image with the specified width, height, and depth.

The width and height are in pixels. The depth is 0 for bitmaps, 1 for pixmap (colormap) images, and 1 to 4 for color images.

### 12.71.3 Member Function Documentation

#### 12.71.3.1 as_shared_image()

```cpp
virtual class Fl_Shared_Image ∗ Fl_Image::as_shared_image ( ) [inline], [virtual]
```

Returns whether an image is an *Fl_Shared_Image* or not.

This virtual method returns a pointer to an *Fl_Shared_Image* if this object is an instance of *Fl_Shared_Image* or NULL if not. This can be used to detect if a given *Fl_Image* object is a shared image, i.e., derived from *Fl_Shared_Image*.

Since

1.4.0

Reimplemented in *Fl_Shared_Image*. 

---

*Generated by Doxygen*
12.71.3.2  color_average()

void Fl_Image::color_average (  
    Fl_Color c,  
    float i ) [virtual]

The color_average() method averages the colors in the image with the provided FLTK color value.  
The first argument specifies the FLTK color to be used.  
The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.  
An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.  
Reimplemented in Fl_Anim_GIF_Image, Fl_RGB_Image, Fl_Pixmap, Fl_Shared_Image, Fl_SVG_Image, and Fl_Tiled_Image.

12.71.3.3  copy() [1/2]

Fl_Image * Fl_Image::copy ( ) const [inline]

Creates a copy of the image in the same size.  
The new image should be released when you are done with it.  
This does exactly the same as 'Fl_Image::copy(int W, int H) const' where W and H are the width and height of the source image, respectively. This applies also to all subclasses of Fl_Image in the FLTK library.  
The following two copy() calls are equivalent:  
Fl_image *img1 = new Fl_image(...);  
// ...  
Fl_image *img2 = img1->copy();  
Fl_image *img3 = img1->copy(img1->w(), img1->h());  
For details see 'Fl_Image::copy(int w, int h) const'.  
See also  
Fl_Image::release()

Note  
Since FLTK 1.4.0 this method is 'const'. If you derive your own class from Fl_Image or any subclass your overridden methods of 'Fl_Image::copy() const' and 'Fl_Image::copy(int, int) const' must also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

12.71.3.4  copy() [2/2]

Fl_Image * Fl_Image::copy (  
    int W,  
    int H ) const [virtual]

Creates a resized copy of the image.  
The new image should be released when you are done with it.  
Note: since FLTK 1.4.0 you can use Fl_Image::release() for all types of images (i.e. all subclasses of Fl_Image) instead of operator delete for Fl_Image's and Fl_Image::release() for Fl_Shared_Image's.  
The new image data will be converted to the requested size. RGB images are resized using the algorithm set by Fl_Image::RGB_scaling().  
For the new image the following equations are true:  
\[ w() == \text{data}_w() == W \]  
\[ h() == \text{data}_h() == H \]

Parameters

| in | W/H | Requested width and height of the new image |
Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of Fl_RGB_Image, Fl_SVG_Image, Fl_Pixmap, Fl_Bitmap, Fl_Tiled_Image, Fl_Anim_GIF_Image and Fl_Shared_Image. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an Fl_GIF_Image is an object of class Fl_Pixmap.

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from Fl_Image or any subclass your overridden methods of 'Fl_Image::copy() const' and 'Fl_Image::copy(int, int) const' must also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented in Fl_Anim_GIF_Image, Fl_Bitmap, Fl_RGB_Image, Fl_Pixmap, Fl_Shared_Image, Fl_SVG_Image, and Fl_Tiled_Image.

12.71.3.5 count()

int Fl_Image::count ( ) const [inline]
Returns the number of data values associated with the image.
The value will be 0 for images with no associated data, 1 for bitmap and color images, and greater than 2 for pixmap images.
See also
data()

12.71.3.6 d()

int Fl_Image::d ( ) const [inline]
Returns the image depth.
The return value will be 0 for bitmaps, 1 for pixmaps, and 1 to 4 for color images.

12.71.3.7 data() [1/2]

const char *const * Fl_Image::data ( ) const [inline]
Returns a pointer to the current image data array.
There can be 0, 1, or more pointers to actual image data in an image.
Use the count() method to find the size of the data array. You must not dereference the data() pointer if count() equals zero.

Note
data() may return NULL.

Example:
Fl_RGB_Image has exactly one pointer which points at the R, G, B [, A] data array of the image. The total size of this array depends on several attributes like data_w(), data_h(), d() and ld() and is basically data_w() * data_h() * d() but there are exceptions if ld() is non-zero: see description of ld(). Since FLTK 1.4.0 w() and h() are no longer significant for the image data size if scale() has been called on the image to set a different display size.
Other image types have different numbers and types of data pointers which are implementation details and not documented here.
See also

count(), w(), h(), data_w(), data_h(), d(), ld()

12.71.3.8 data() [2/2]

void Fl_Image::data ( 
    const char *const * p,
    int c ) [inline], [protected]
Sets the current data pointer and count of pointers in the array.
There can be 0, 1, or more pointers to actual image data in an image.
12.71 Fl_Image Class Reference

See also

const char* const* data(), count(), w(), h(), data_w(), data_h(), d(), ld()

12.71.3.9 desaturate()

void Fl_Image::desaturate () [virtual]

The desaturate() method converts an image to grayscale.
If the image contains an alpha channel (depth = 4), the alpha channel is preserved.
An internal copy is made of the original image data before changes are applied, to avoid modifying the original
image data in memory.
Reimplemented in Fl_Anim_GIF_Image, Fl_RGB_Image, Fl_Pixmap, Fl_Shared_Image, Fl_SVG_Image, and
Fl_Tiled_Image.

12.71.3.10 draw() [1/2]

void Fl_Image::draw (  
  int X,  
  int Y ) [inline]

Draws the image to the current drawing surface.

Parameters

X, Y  specify the upper-lefthand corner of the image.

12.71.3.11 draw() [2/2]

void Fl_Image::draw (  
  int X,  
  int Y,  
  int W,  
  int H,  
  int cx = 0,  
  int cy = 0 ) [virtual]

Draws the image to the current drawing surface with a bounding box.
Arguments X, Y, W, H specify a bounding box for the image, with the origin (upper-left corner) of the image offset
by the cx and cy arguments.
In other words: fl_push_clip(X,Y,W,H) is applied, the image is drawn with its upper-left corner at
X-cx,Y-cy and its own width and height, fl_pop_clip() is applied.
Reimplemented in Fl_Anim_GIF_Image, Fl_Bitmap, Fl_RGB_Image, Fl_Pixmap, Fl_Shared_Image, Fl_SVG_Image,
and Fl_Tiled_Image.

12.71.3.12 draw_empty()

void Fl_Image::draw_empty (  
  int X,  
  int Y ) [protected]

The protected method draw_empty() draws a box with an X in it.
It can be used to draw any image that lacks image data.

12.71.3.13 draw_scaled()

int Fl_Image::draw_scaled (  
  int X,  
  int Y,  
  int W,  
  int H ) [protected]

Draw the image to the current drawing surface rescaled to a given width and height.
Intended for internal use by the FLTK library.

Parameters

<table>
<thead>
<tr>
<th>X,Y</th>
<th>position of the image's top-left</th>
</tr>
</thead>
<tbody>
<tr>
<td>W,H</td>
<td>width and height for the drawn image</td>
</tr>
</tbody>
</table>

Returns

1

Deprecated Only for API compatibility with FLTK 1.3.4.

12.71.3.14 fail()

int Fl_Image::fail () const

Returns a value that is not 0 if there is currently no image available.

Example use:

```c
// [...]  
Fl_Box box(X, Y, W, H);  
Fl_JPEG_Image jpg("/tmp/foo.jpg");  
switch (jpg.fail()) {  
  case Fl_Image::ERR_NO_IMAGE:  
    case Fl_Image::ERR_FILE_ACCESS:  
      fl_alert("/tmp/foo.jpg: %s", strerror(errno)); // shows actual os error to user  
      exit(1);  
    case Fl_Image::ERR_FORMAT:  
      fl_alert("/tmp/foo.jpg: couldn't decode image");  
      exit(1);  
  }  
box.image(jpg);  
```

Returns

Image load failure if non-zero

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>the image was loaded successfully</td>
</tr>
<tr>
<td>ERR_NO_IMAGE</td>
<td>no image was found</td>
</tr>
<tr>
<td>ERR_FILE_ACCESS</td>
<td>there was a file access related error (errno should be set)</td>
</tr>
<tr>
<td>ERR_FORMAT</td>
<td>image decoding failed</td>
</tr>
<tr>
<td>ERR_MEMORY_ACCESS</td>
<td>image decoder tried to access memory outside of given memory block</td>
</tr>
</tbody>
</table>

12.71.3.15 h() [1/2]

int Fl_Image::h () const [inline]

Returns the current image drawing height in FLTK units.

The values of h() and data_h() are identical unless scale() has been called after which they may differ.

12.71.3.16 h() [2/2]

void Fl_Image::h (  
  int H ) [inline], [protected]

Sets the height of the image data.

This protected function sets both image heights: the height of the image data returned by data_h() and the image drawing height in FLTK units returned by h().

---

Generated by Doxygen
12.71.3.17 \textbf{inactive()}

```cpp
void Fl_Image::inactive ( ) [inline]
```

The \texttt{inactive()} method calls \texttt{color\_average(FL\_BACKGROUND\_COLOR, 0.33f)} to produce an image that appears grayed out.

An internal copy is made of the original image before changes are applied, to avoid modifying the original image.

\textbf{Note}

The RGB color of \texttt{FL\_BACKGROUND\_COLOR} may change when the connection to the display is made. See \texttt{fl\_open\_display()}.

12.71.3.18 \textbf{label() [1/2]}

```cpp
void Fl_Image::label ( Fl_Menu_Item ∗ m ) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

\textbf{Deprecated} Please use \texttt{Fl\_Menu\_Item::image()} instead.

Reimplemented in \texttt{Fl\_Bitmap}, \texttt{Fl\_RGB\_Image}, and \texttt{Fl\_Pixmap}.

12.71.3.19 \textbf{label() [2/2]}

```cpp
void Fl_Image::label ( Fl_Widget ∗ widget ) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

\textbf{Deprecated} Please use \texttt{Fl\_Widget::image()} or \texttt{Fl\_Widget::deimage()} instead.

Reimplemented in \texttt{Fl\_Bitmap}, \texttt{Fl\_RGB\_Image}, and \texttt{Fl\_Pixmap}.

12.71.3.20 \textbf{ld() [1/2]}

```cpp
int Fl_Image::ld ( ) const [inline]
```

Returns the current line data size in bytes.

See also

\texttt{ld(int)}

12.71.3.21 \textbf{ld() [2/2]}

```cpp
void Fl_Image::ld ( int LD ) [inline], [protected]
```

Sets the current line data size in bytes.

Color images may contain extra data (padding) that is included after every line of color image data and is normally not present.

If \texttt{LD} is zero, then line data size is assumed to be \texttt{data\_w()} \texttt{* d()} bytes.

If \texttt{LD} is non-zero, then it must be positive and larger than \texttt{data\_w()} \texttt{* d()} to account for the extra data per line.

12.71.3.22 \textbf{release()}

```cpp
virtual void Fl_Image::release ( ) [inline], [virtual]
```

Releases an \texttt{Fl\_Image} - the same as 'delete this'.

This virtual method is for almost all image classes the same as calling \texttt{delete image;}

where \texttt{image} is an \texttt{Fl\_Image ∗ pointer}.

However, for subclass \texttt{Fl\_Shared\_Image} and its subclasses this virtual method is reimplemented and maintains shared images.

This virtual method makes it possible to \texttt{destroy} all image types in the same way by calling...
Reasoning: If you have an `Fl_Image` base class pointer and don’t know if the object is one of the class `Fl_Shared_Image` or any other subclass of `Fl_Image` (for instance `Fl_RGB_Image`) then you can't just use operator delete since this is not appropriate for `Fl_Shared_Image` objects. The virtual method `release()` handles this properly.

Since 1.4.0 in the base class `Fl_Image` and virtual in `Fl_Shared_Image`.

Reimplemented in `Fl_Shared_Image`.

### 12.71.3.23 RGB_scaling()

```cpp
void Fl_Image::RGB_scaling (Fl_RGB_Scaling method) [static]
```

Sets the RGB image scaling method used for `copy(int, int)`. Applies to all RGB images, defaults to `FL_RGB_SCALING_NEAREST`.

### 12.71.3.24 scale()

```cpp
void Fl_Image::scale (int width, int height, int proportional = 1, int can_expand = 0) [virtual]
```

Sets the drawing size of the image. This function controls the values returned by member functions `w()` and `h()` which in turn control how the image is drawn: the full image data (whose size is given by `data_w()` and `data_h()` are drawn scaled to an area of the drawing surface sized at `w()` x `h()` FLTK units. This can make a difference if the drawing surface has more than 1 pixel per FLTK unit because the image can be drawn at the full resolution of the drawing surface. Examples of such drawing surfaces: HiDPI displays, laser printers, PostScript files, PDF printers.

**Parameters**

<table>
<thead>
<tr>
<th>width, height</th>
<th>maximum values, in FLTK units, that <code>w()</code> and <code>h()</code> should return</th>
</tr>
</thead>
<tbody>
<tr>
<td>proportional</td>
<td>if not null, keep the values returned by <code>w()</code> and <code>h()</code> proportional to <code>data_w()</code> and <code>data_h()</code></td>
</tr>
<tr>
<td>can_expand</td>
<td>if null, the values returned by <code>w()</code> and <code>h()</code> will not be larger than <code>data_w()</code> and <code>data_h()</code>, respectively</td>
</tr>
</tbody>
</table>

**Note**

This function generally changes the values returned by the `w()` and `h()` member functions. In contrast, the values returned by `data_w()` and `data_h()` remain unchanged.

**Version**

1.4 (1.3.4 and FL_ABI_VERSION for `Fl_Shared_Image` only)

**Example code: scale an image to fit in a box**

```cpp
Fl_Box *b = ... // a box
Fl_Image *img = new Fl_PNG_Image("/path/to/picture.png"); // read a picture file
img->scale(b->w(), b->h()); // set the drawing size of the image to the size of the box keeping its aspect ratio
b->image(img); // use the image as the box image
```

### 12.71.3.25 scaling_algorithm()

```cpp
static void Fl_Image::scaling_algorithm (Fl_RGB_Scaling algorithm) [inline], [static]
```

Sets what algorithm is used when resizing a source image to draw it. The default algorithm is `FL_RGB_SCALING_BILINEAR`. Drawing an `Fl_Image` is sometimes performed by first resizing the source image and then drawing the resized copy. This occurs, e.g., when drawing to screen under X11.
without Xrender support after having called scale(). This function controls what method is used when the image to
be resized is an Fl_RGB_Image.

Version

1.4

### 12.71.3.26 uncache()

```cpp
void Fl_Image::uncache () [virtual]
```

If the image has been cached for display, delete the cache data.
This allows you to change the data used for the image and then redraw it without recreating an image object.
Reimplemented in Fl_Anim_GIF_Image, Fl_Bitmap, Fl_RGB_Image, Fl_Pixmap, and Fl_Shared_Image.

### 12.71.3.27 w() [1/2]

```cpp
int Fl_Image::w () const [inline]
```

Returns the current image drawing width in FLTK units.
The values of w() and data_w() are identical unless scaled() has been called after which they may differ.

### 12.71.3.28 w() [2/2]

```cpp
void Fl_Image::w (int \ W\ ) [inline], [protected]
```

Sets the width of the image data.
This protected function sets both image widths: the width of the image data returned by data_w() and the image
drawing width in FLTK units returned by w().

The documentation for this class was generated from the following files:

- Fl_Image.H
- Fl_Image.cxx

12.73  Fl_Image_Surface Class Reference

Directs all graphics requests to an Fl_Image.
#include <Fl_Image_Surface.H>

Inheritance diagram for Fl_Image_Surface:

```
Fl_Surface_Device
   ↓
Fl_Widget_Surface
   ↓
Fl_Image_Surface
```

Public Member Functions

- **Fl_Image_Surface** (int w, int h, int high_res=0, Fl_Offscreen off=0)
  Constructor with optional high resolution.
- **Fl_Shared_Image** * highres_image ()
  Returns a possibly high resolution image made of all drawings sent to the Fl_Image_Surface object.
- **Fl_RGB_Image** * image ()
  Returns a depth-3 image made of all drawings sent to the Fl_Image_Surface object.
- bool is_current () FL_OVERRIDE
  Is this surface the current drawing surface?
- void mask (const Fl_RGB_Image *)
  Defines a mask applied to drawings made after use of this function.
- Fl_Offscreen offscreen ()
  Returns the Fl_Offscreen object associated to the image surface.
- void origin (int *x, int *y) FL_OVERRIDE
  Computes the coordinates of the current origin of graphics functions.
- void origin (int x, int y) FL_OVERRIDE
  Sets the position of the origin of graphics in the drawable part of the drawing surface.
- int printable_rect (int *w, int *h) FL_OVERRIDE
  Computes the width and height of the drawable area of the drawing surface.
- void rescale ()
  Adapts the Fl_Image_Surface object to the new value of the GUI scale factor.
- void set_current () FL_OVERRIDE
  Make this surface the current drawing surface.
- ~Fl_Image_Surface ()
  The destructor.

Public Member Functions inherited from Fl_Widget_Surface

- void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  Draws the widget on the drawing surface.
- void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  Draws a window with its title bar and frame if any.
- void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  Draws a rectangular part of an on-screen window.
Public Member Functions inherited from Fl_Surface_Device

- Fl_Graphics_Driver * driver ()
  Returns the graphics driver of this drawing surface.
- virtual ~Fl_Surface_Device ()
  The destructor.

Protected Member Functions

- void translate (int x, int y) FL_OVERRIDE
  Translates the current graphics origin accounting for the current rotation.
- void untranslated () FL_OVERRIDE
  Undoes the effect of a previous translate() call.

Protected Member Functions inherited from Fl_Widget_Surface

- Fl_Widget_Surface (Fl_Graphics_Driver *d)
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

- void driver (Fl_Graphics_Driver *graphics_driver)
  Sets the graphics driver of this drawing surface.
- virtual void end_current ()
  FLTK calls this each time a surface ceases to be the current drawing surface.
- Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)
  Constructor that sets the graphics driver to use for the created surface.

Friends

- class Fl_Graphics_Driver

Additional Inherited Members

Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * pop_current ()
  Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void push_current (Fl_Surface_Device *new_current)
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static Fl_Surface_Device * surface ()
  The current drawing surface.

Protected Attributes inherited from Fl_Widget_Surface

- int x_offset
  horizontal offset to the origin of graphics coordinates
- int y_offset
  vertical offset to the origin of graphics coordinates
12.73.1 Detailed Description

Directs all graphics requests to an Fl_Image.

After creation of an Fl_Image_Surface object, make it the current drawing surface calling Fl_Surface_Device::push_current(), and all subsequent graphics requests will be recorded in the image. It's possible to draw widgets (using Fl_Image_Surface::draw()) or to use any of the Drawing functions or the Color & Font functions. Finally, call image() on the object to obtain a newly allocated Fl_RGB_Image object. Fl_Gl_Window objects can be drawn in the image as well.

Usage example:

```c
// this is the widget that you want to draw into an image
Fl_Widget *g = ...;

// create an Fl_Image_Surface object
Fl_Image_Surface *image_surface = new Fl_Image_Surface(g->w(), g->h());

// direct all further graphics requests to the image
Fl_Surface_Device::push_current(image_surface);

// draw a white background
fl_color(FL_WHITE);
fl_rectf(0, 0, g->w(), g->h());

// direct the g widget in the image
image_surface->draw(g);

// get the resulting image
Fl_RGB_Image* image = image_surface->image();

// direct graphics requests back to their previous destination
Fl_Surface_Device::pop_current();

// delete the image_surface object, but not the image itself
delete image_surface;
```

12.73.2 Constructor & Destructor Documentation

12.73.2.1 Fl_Image_Surface()

Fl_Image_Surface::Fl_Image_Surface (int w, int h, int high_res = 0, Fl_Offscreen off = 0)

Constructor with optional high resolution.

Parameters

| w,h | Width and height of the resulting image. The value of the high_res parameter controls whether w and h are interpreted as pixels or FLTK units. |
| high_res | If zero, the created image surface is sized at w * h pixels. If non-zero, the pixel size of the created image surface depends on the value of the display scale factor (see Fl::screen_scale(int)): the resulting image has the same number of pixels as an area of the display of size w * h expressed in FLTK units. |
| off | If not null, the image surface is constructed around a pre-existing Fl_Offscreen. The caller is responsible for both construction and destruction of this Fl_Offscreen object. Is mostly intended for internal use by FLTK. |

Version

1.3.4 (1.3.3 without the highres parameter)

12.73.3 Member Function Documentation

12.73.3.1 highres_image()

Fl_Shared_Image * Fl_Image_Surface::highres_image ()

Returns a possibly high resolution image made of all drawings sent to the Fl_Image_Surface object.
The **Fl_Image_Surface** object should have been constructed with `Fl_Image_Surface(W, H, 1)`. The returned **Fl_Shared_Image** object is scaled to a size of WxH FLTK units and may have a pixel size larger than these values. The returned object should be deallocated with `Fl_Shared_Image::release()` after use.

**Deprecated** Use `image()` instead.

**Version**

1.4 (1.3.4 for MacOS platform only)

### 12.73.3.2 image()

```c
Fl_RGB_Image * Fl_Image_Surface::image ()
```

Returns a depth-3 image made of all drawings sent to the **Fl_Image_Surface** object. The returned object contains its own copy of the RGB data; the caller is responsible for deleting it.

See also

`Fl_Image_Surface::mask(Fl_RGB_Image*)`

### 12.73.3.3 is_current()

```c
bool Fl_Image_Surface::is_current () [virtual]
```

Is this surface the current drawing surface?

Reimplemented from **Fl_Surface_Device**.

### 12.73.3.4 mask()

```c
void Fl_Image_Surface::mask (const Fl_RGB_Image * mask)
```

Defines a mask applied to drawings made after use of this function.

The mask is an **Fl_RGB_Image** made of a white scene drawn on a solid black background; the drawable part of the image surface is reduced to the white areas of the mask after this member function gets called. If necessary, the **mask** image is internally replaced by a copy resized to the surface's pixel size. Overall, the image returned by `Fl_Image_Surface::image()` contains all drawings made until the `mask()` method assigned a mask, at which point subsequent drawing operations to the image surface were passed through the white areas of the mask. On some platforms, shades of gray in the mask image control the blending of foreground and background pixels; mask pixels closer in color to white produce image pixels closer to the image surface pixel, those closer to black produce image pixels closer to what the image surface pixel was before the call to `mask()`.

The mask is easily constructed using an **Fl_Image_Surface** object, drawing white areas on a black background there, and calling `Fl_Image_Surface::image()`.

**Parameters**

| **mask** | A depth-3 image determining the drawable areas of the image surface. The **mask** object is not used after return from this member function. |

**Note**

- The image surface must not be the current drawing surface when this function gets called.
- The mask can have any size but is best when it has the size of the image surface.
- It's possible to use several masks in succession on the same image surface provided member function `Fl_Image_Surface::image()` is called between successive calls to `Fl_Image_Surface::mask(const Fl_RGB_Image*)`.

**Example of procedure to construct a masked image:**

```c
int W = ..., H = ...; // width and height of the image under construction
Fl_Image_Surface *surf = new Fl_Image_Surface(W, H, 1);
// first, construct the mask
Fl_Surface_Device::push_current(surf);
fl_color(FL_BLACK); // draw a black background
```
```
fl_rectf(0, 0, W, H);
fl_color(FL_WHITE); // next, draw in white what the mask should not filter out
fl_pie(0, 0, W, H, 0, 360); // here, an ellipse with axes lengths WxH
Fl_RGB_Image *mask = surf->image(); // get the mask
// second, draw the image background
fl_color(FL_YELLOW); // here, draw a yellow background
fl_rectf(0, 0, W, H);
// third, apply the mask
Fl_Surface_Device::pop_current();
surf->mask(mask);
delete mask; // the mask image can be safely deleted at this point
Fl_Surface_Device::push_current(surf);
// fourth, draw the image foreground, part of which will be filtered out by the mask
surf->draw(widget, 0, 0); // here the foreground is a drawn widget
Fl_RGB_Image *masked_image = surf->image();
// Only the part of the foreground, here a drawn widget, that has not been
// filtered out by the mask, here the white ellipse, is in masked_image;
// the background, here solid yellow, shows up in the remaining areas of masked_image.
Fl_Surface_Device::pop_current();
delete surf;
```

Since

1.4.0

### 12.73.3.5 `offscreen()`

**Fl_Offscreen Fl_Image_Surface::offscreen ()**

Returns the Fl_Offscreen object associated to the image surface.

The returned Fl_Offscreen object is deleted when the Fl_Image_Surface object is deleted, unless the Fl_Image_Surface was constructed with non-null Fl_Offscreen argument.

### 12.73.3.6 `origin()` [1/2]

```c
void Fl_Image_Surface::origin ( 
    int */ x,
    int */ y ) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**

| out x,y | If non-null, +x and +y are set to the horizontal and vertical coordinates of the graphics origin. |

Reimplemented from Fl_Widget_Surface.

### 12.73.3.7 `origin()` [2/2]

```c
void Fl_Image_Surface::origin ( 
    int x,
    int y ) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive `origin()` calls don't combine their effects. Origin() calls are not affected by `rotate()` calls (for classes derived from Fl_Paged_Device).

**Parameters**

| in x,y | Horizontal and vertical positions in the drawing surface of the desired origin of graphics. |

Reimplemented from Fl_Widget_Surface.
12.73.3.8 printable_rect()

int Fl_Image_Surface::printable_rect (  
    int * w,  
    int * h )  [virtual]  
Computes the width and height of the drawable area of the drawing surface.  
Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to origin(). If the object is derived from class Fl_Paged_Device, values account for the user-selected paper type and print orientation and are changed by scale() calls.  

Returns  
0 if OK, non-zero if any error  
Reimplemented from Fl_Widget_Surface.

12.73.3.9 rescale()

void Fl_Image_Surface::rescale ( )  
Adapts the Fl_Image_Surface object to the new value of the GUI scale factor.  
The Fl_Image_Surface object must not be the current drawing surface. This function is useful only for an object constructed with non-zero high_res parameter.  

Version  
1.4

12.73.3.10 set_current()

void Fl_Image_Surface::set_current (  
    void )  [virtual]  
Make this surface the current drawing surface.  
This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().  

Note  
It's recommended to use this function only as follows:  
• The current drawing surface is the display;  
• make current another surface, e.g., an Fl_Printer or an Fl_Image_Surface object, calling set_current() on this object;  
• draw to that surface;  
• make the display current again with Fl_Display_Device::display_device() -> set_current();. Don't do any other call to set_current() before this one.  

Other scenarios of drawing surface changes should be performed via Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().  
Reimplemented from Fl_Surface_Device.

12.73.3.11 translate()

void Fl_Image_Surface::translate (  
    int x,  
    int y )  [protected], [virtual]  
Translates the current graphics origin accounting for the current rotation.  
Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects.  
Reimplemented from Fl_Widget_Surface.
12.73.3.12 untranslate()

void Fl_Image_Surface::untranslate ( 
    void ) [protected], [virtual]

Undoes the effect of a previous translate() call.
Reimplemented from Fl_Widget_Surface.
The documentation for this class was generated from the following files:

• Fl_Image_Surface.H
• Fl_Image_Surface.cxx

12.74 Fl_Input Class Reference

This is the FLTK text input widget.
#include <Fl_Input.H>

Inheritance diagram for Fl_Input:

Public Member Functions

• Fl_Input (int, int, int, int, const char ∗=0)
  Creates a new Fl_Input widget using the given position, size, and label string.
• int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Input_

• int append (const char ∗t, int l=0, char keep_selection=0)
  Append text at the end.
• bool can_redo () const
  Check if there is a redo action available.
• bool can_undo () const
  Check if the last operation can be undone.
• int copy (int clipboard)
  Put the current selection into the clipboard.
• int copy_cuts ()
  Copies the yank buffer to the clipboard.
• Fl_Color cursor_color () const
  Gets the color of the cursor.
• void cursor_color (Fl_Color n)
  Sets the color of the cursor.
• int cut ()
  Deletes the current selection.
• int cut (int a, int b)
  Deletes all characters between index a and b.
• int cut (int n)
  Deletes the next n bytes rounded to characters before or after the cursor.
• double dvalue () const
Returns the widget text interpreted as a floating point number.

- `Fl_Input_ (int, int, int, int, const char * = 0)`
  Creates a new `Fl_Input_` widget.

- `unsigned int index (int i) const`
  Returns the character at index `i`.

- `int input_type () const`
  Gets the input field type.

- `void input_type (int t)`
  Sets the input field type.

- `int insert (const char * t, int l = 0)`
  Inserts text at the cursor position.

- `int insert_position () const`
  Gets the position of the text cursor.

- `int insert_position (int p)`
  Sets the text cursor position and mark.

- `int insert_position (int p, int m)`
  Sets the index for the cursor and mark.

- `int ivalue () const`
  Returns the widget text interpreted as a signed integer.

- `int mark () const`
  Gets the current selection mark.

- `int mark (int m)`
  Sets the current selection mark.

- `int maximum_size () const`
  Gets the maximum length of the input field in characters.

- `void maximum_size (int m)`
  Sets the maximum length of the input field in characters.

- `int position () const`
  Gets the read-only state of the input field.

- `void position (int p)`
  Sets the read-only state of the input field.

- `int redo ()`
  Redo previous undo operation.

- `int replace (int b, int e, const char * text, int ilen = 0)`
  Deletes text from `b` to `e` and inserts the new string `text`.

- `void resize (int, int, int, int) FL_OVERRIDE`
  Changes the size of the widget.

- `int shortcut () const`
  Return the shortcut key associated with this widget.

- `void shortcut (int s)`
  Sets the shortcut key associated with this widget.

- `int size () const`
  Returns the number of bytes in `value()`.

- `void size (int W, int H)`
  Sets the width and height of this widget.

- `int static_value (const char * s)`
  Changes the widget text.

- `int static_value (const char * s, int)`
  Changes the widget text.
Changes the widget text.

- **int tab_nav () const**  
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

- **void tab_nav (int val)**  
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

- **Fl_Color textcolor () const**  
  Gets the color of the text in the input field.

- **void textcolor (Fl_Color n)**  
  Sets the color of the text in the input field.

- **Fl_Font textfont () const**  
  Gets the font of the text in the input field.

- **void textfont (Fl_Font s)**  
  Sets the font of the text in the input field.

- **Fl_Fontsize textsize () const**  
  Gets the size of the text in the input field.

- **void textsize (Fl_Fontsize s)**  
  Sets the size of the text in the input field.

- **int undo ()**  
  Undoes previous changes to the text buffer.

- **const char ∗ value () const**  
  Returns the text displayed in the widget.

- **int value (const char ∗)***  
  Changes the widget text.

- **int value (const char ∗, int)**  
  Changes the widget text.

- **int value (double value)***  
  Changes the widget text to a floating point number ("%g").

- **int value (int value)**  
  Changes the widget text to a signed integer number.

- **int wrap () const**  
  Gets the word wrapping state of the input field.

- **void wrap (int b)**  
  Sets the word wrapping state of the input field.

- **~Fl_Input_ ()**  
  Destroys the widget.

**Public Member Functions inherited from Fl_Widget**

- **void _clear_fullscreen ()**
- **void _set_fullscreen ()**
- **void activate ()**  
  Activates the widget.

- **unsigned int active () const**  
  Returns whether the widget is active.

- **int active_r () const**  
  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**  
  Gets the label alignment.

- **void align (Fl_Align alignment)**  
  Sets the label alignment.

- **long argument () const**
Gets the current user data (long) argument that is passed to the callback function.

- `void argument (long v)`
  Sets the current user data (long) argument that is passed to the callback function.

- `virtual class Fl_Gl_Window ∗ as_gl_window ()`
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- `virtual class Fl_Gl_Window const ∗ as_gl_window () const`
- `virtual Fl_Group ∗ as_group ()`
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- `virtual Fl_Group const ∗ as_group () const`
- `virtual Fl_Window ∗ as_window ()`
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- `virtual Fl_Window const ∗ as_window () const`
- `void bind_deimage (Fl_Image ∗ img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `void bind_deimage (int f)`
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- `void bind_image (Fl_Image ∗ img)`
  Sets the image to use as part of the widget label when in the active state.

- `void bind_image (int f)`
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- `Fl_Boxtype box () const`
  Gets the box type of the widget.

- `void box (Fl_Boxtype new_box)`
  Sets the box type for the widget.

- `Fl_Callback_p callback () const`
  Gets the current callback function for the widget.

- `void callback (Fl_Callback ∗ cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)`
  Sets the current callback function and managed user data for the widget.

- `void callback (Fl_Callback ∗ cb, void ∗ p)`
  Sets the current callback function and data for the widget.

- `void callback (Fl_Callback0 ∗ cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback1 ∗ cb, long p=0)`
  Sets the current callback function for the widget.

- `unsigned int changed () const`
  Checks if the widget value changed since the last callback.

- `void clear_active ()`
  Marks the widget as inactive without sending events or changing focus.

- `void clear_changed ()`
  Marks the value of the widget as unchanged.

- `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.

- `void clear_output ()`
  Sets a widget to accept input.

- `void clear_visible ()`
  Hides the widget.

- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.

- `Fl_Color color () const`
  Gets the current color of the widget.
Gets the background color of the widget.

- **void color (Fl_Color bg)**
  - Sets the background color of the widget.
- **void color (Fl_Color bg, Fl_Color sel)**
  - Sets the background and selection color of the widget.
- **Fl_Color color2 () const**
  - For back compatibility only.
- **void color2 (unsigned a)**
  - For back compatibility only.
- **int contains (const Fl_Widget *w) const**
  - Checks if w is a child of this widget.
- **void copy_label (const char *new_label)**
  - Sets the current label.
- **void copy_tooltip (const char *text)**
  - Sets the current tooltip text.
- **uchar damage () const**
  - Returns non-zero if draw() needs to be called.
- **void damage (uchar c)**
  - Sets the damage bits for the widget.
- **void damage (uchar c, int x, int y, int w, int h)**
  - Sets the damage bits for an area inside the widget.
- **int damage_resize (int, int, int, int)**
  - Internal use only.
- **void deactivate ()**
  - Deactivates the widget.
- **Fl_Image * deimage ()**
  - Gets the image that is used as part of the widget label when in the inactive state.
- **const Fl_Image * deimage () const**
  - Gets the image that is used as part of the widget label when in the inactive state.
- **void deimage (Fl_Image &img)**
  - Sets the image to use as part of the widget label when in the inactive state.
- **void deimage (Fl_Image *img)**
  - Sets the image to use as part of the widget label when in the inactive state.
- **int deimage_bound () const**
  - Returns whether the inactive image is managed by the widget.
- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  - Calls the widget callback function with default arguments.
- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  - Calls the widget callback function with arbitrary arguments.
- **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  - Calls the widget callback function with arbitrary arguments.
- **void draw_label (int, int, int, int, Fl_Align) const**
  - Draws the label in an arbitrary bounding box with an arbitrary alignment.
- **int h () const**
  - Gets the widget height.
- **virtual void hide ()**
  - Makes a widget invisible.
- **Fl_Image * image ()**
  - Gets the image that is used as part of the widget label when in the active state.
- **const Fl_Image * image () const**
  - Gets the image that is used as part of the widget label when in the active state.
- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.
- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.
- **int image_bound () const**
  Returns whether the image is managed by the widget.
- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.
- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().
- **const char * label () const**
  Gets the current label text.
- **void label (const char *text)**
  Sets the current label pointer.
- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.
- **Fl_Color labelcolor () const**
  Gets the label color.
- **void labelcolor (Fl_Color c)**
  Sets the label color.
- **Fl_Font labelfont () const**
  Gets the font to use.
- **void labelfont (Fl_Font f)**
  Sets the font to use.
- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.
- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.
- **Fl_Labeltype labeltype () const**
  Gets the label type.
- **void labeltype (Fl_Labeltype a)**
  Sets the label type.
- **void measure_label (int &ww, int &hh) const**
  Sets width ww and height hh accordingly with the label size.
- **bool needs_keyboard () const**
  Returns whether this widget needs a keyboard.
- **void needs_keyboard (bool needs)**
  Sets whether this widget needs a keyboard.
- **unsigned int output () const**
  Returns if a widget is used for output only.
- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.
- **void parent (Fl_Group *p)**
  Internal use only - “for hacks only”.
- **void position (int X, int Y)**
  Repositions the window or widget.
- **void redraw ()**
  Schedules the drawing of the widget.
- **void redraw_label ()**
  Schedules the drawing of the label.
- **Fl_Color selection_color () const**
• **void** `selection_color (Fl_Color a)`
  
  Gets the selection color.

• **void** `set_active ()`
  
  Marks the widget as active without sending events or changing focus.

• **void** `set_changed ()`
  
  Marks the value of the widget as changed.

• **void** `set_output ()`
  
  Sets a widget to output only.

• **void** `set_visible ()`
  
  Makes the widget visible.

• **void** `set_visible_focus ()`
  
  Enables keyboard focus navigation with this widget.

• **int** `shortcut_label () const`
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

• **void** `shortcut_label (int value)`
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

• **virtual** **void** `show ()`
  
  Makes a widget visible.

• **void** `size (int W, int H)`
  
  Changes the size of the widget.

• **int** `take_focus ()`
  
  Gives the widget the keyboard focus.

• **unsigned int** `takesevents () const`
  
  Returns if the widget is able to take events.

• **int** `testShortcut ()`
  
  Returns true if the widget's label contains the entered 'x' shortcut.

• **const char** ∗`tooltip () const`
  
  Gets the current tooltip text.

• **void** `tooltip (const char ∗text)`
  
  Sets the current tooltip text.

• **Fl_Window** ∗`top_window () const`
  
  Returns a pointer to the top-level window for the widget.

• **Fl_Window** ∗`top_window_offset (int &xoff, int &yoff) const`
  
  Finds the x/y offset of the current widget relative to the top-level window.

• **uchar** `type () const`
  
  Gets the widget type.

• **void** `type (uchar t)`
  
  Sets the widget type.

• **int** `use_accents_menu ()`
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void** `*user_data () const`
  
  Gets the user data for this widget.

• **void** `user_data (Fl_Callback_User_Data ∗v, bool auto_free)`
  
  Sets the user data for this widget.

• **void** `user_data (void ∗v)`
  
  Sets the user data for this widget.

• **unsigned int** `visible () const`
  
  Returns whether a widget is visible.

• **unsigned int** `visible_focus () const`
  
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Static Public Attributes

• static const char * copy_menu_text = "Copy"
  [this text may be customized at run-time]
• static const char * cut_menu_text = "Cut"
  [this text may be customized at run-time]
• static const char * paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.
• int handle_key ()
  Handles a keystroke.
• int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input__

• int apply_undo ()
  Apply the current undo/redo operation.
• void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
• void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
• void handle_mouse (int, int, int, int, int keepmark=0)
  Handles mouse clicks and mouse moves.
• int handletext (int e, int, int, int)
  Handles all kinds of text field related events.
• int line_end (int i) const
  Finds the end of a line.
• int line_start (int i) const
Finds the start of a line.

- int linesPerPage ()
- void maybe_do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
- int up_down_position (int, int keepmark=0)

  Moves the cursor to the column given by up_down_pos.

- int word_end (int i) const

  Finds the end of a word.

- int word_start (int i) const

  Finds the start of a word.

- int xscroll () const
- int yscroll () const
- void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)

  Clears a flag in the flags mask.

- void draw_backdrop () const

  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const

  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const

  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const

  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const

  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int X, int Y , int W, int H) const

  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const

  Draws a focus box for the widget at the given position and size.

- void draw_label () const

  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const

  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)

  Creates a widget at the given position and size.

- unsigned int flags () const

  Gets the widget flags mask.

- void h (int v)

  Internal use only.

- void set_flag (unsigned int c)

  Sets a flag in the flags mask.

- void w (int v)

  Internal use only.

- void x (int v)

  Internal use only.

- void y (int v)

  Internal use only.
Friends

- class Fl_Cocoa_Screen_Driver
- class Fl_Screen_Driver

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don't set a callback.
- static unsigned int labelShortcut (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int testShortcut (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,

  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCEPTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }

flags possible values enumeration.

12.74.1 Detailed Description

This is the FLTK text input widget. It displays a single line of text and lets the user edit it. Normally it is drawn with an inset box and a white background. The text may contain any characters, and will correctly display any UTF text, using ^X notation for unprintable control characters. It assumes the font can draw any characters of the used scripts, which is true for standard fonts under Windows and Mac OS X. Characters can be input using the keyboard or the character palette/map. Character composition is done using dead keys and/or a compose key as defined by the operating system.

<table>
<thead>
<tr>
<th>Mouse button 1</th>
<th>Moves the cursor to this point. Drag selects characters. Double click selects words. Triple click selects all line. Shift+click extends the selection. When you select text it is automatically copied to the selection buffer.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mouse button 2</td>
<td>Insert the selection buffer at the point clicked. You can also select a region and replace it with the selection buffer by selecting the region with mouse button 2.</td>
</tr>
<tr>
<td>Mouse button 3</td>
<td>Currently acts like button 1.</td>
</tr>
<tr>
<td>Backspace</td>
<td>Deletes one character to the left, or deletes the selected region.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes one character to the right, or deletes the selected region. Combine with Shift for equivalent of ^X (copy+cut).</td>
</tr>
<tr>
<td>Enter</td>
<td>May cause the callback, see when().</td>
</tr>
</tbody>
</table>

Table 12.296 Keyboard and mouse bindings.

Table 12.297 Platform specific keyboard bindings.
<table>
<thead>
<tr>
<th>Windows/Linux</th>
<th>Mac</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>^A</td>
<td>Command-A</td>
<td>Selects all text in the widget.</td>
</tr>
<tr>
<td>^C</td>
<td>Command-C</td>
<td>Copy the current selection to the clipboard.</td>
</tr>
<tr>
<td>^I</td>
<td>^I</td>
<td>Insert a tab.</td>
</tr>
</tbody>
</table>
| ^J            | ^J           | Insert a Line Feed.  
(Similar to literal 'Enter' character) |
| ^L            | ^L           | Insert a Form Feed.                             |
| ^M            | ^M           | Insert a Carriage Return.                       |
| ^V, Shift-Insert | Command-V    | Paste the clipboard.  
(Macs keyboards don't have "Insert" keys, but if they did, Shift-Insert would work) |
| ^X, Shift-Delete | Command-X, Shift-Delete | Cut.  
Copy the selection to the clipboard and delete it. (If there's no selection, Shift-Delete acts like Delete) |
| ^Z            | Command-Z    | Undo.                                            
This is a single-level undo mechanism, but all adjacent deletions and insertions are concatenated into a single "undo". Often this will undo a lot more than you expected. |
| Shift-^Z      | Shift-Command-Z | Redo.  
Currently same behavior as ^Z. Reserved for future multilevel undo/redo. |
| Arrow Keys    | Arrow Keys   | Standard cursor movement.                      
Can be combined with Shift to extend selection. |
| Home          | Command-Up, Command-Left | Move to start of line.  
Can be combined with Shift to extend selection. |
| End           | Command-Down, Command-Right | Move to end of line.  
Can be combined with Shift to extend selection. |
| Ctrl-Home     | Command-Up, Command-PgUp, Ctrl-Left | Move to top of document/field.  
In single line input, moves to start of line. In multiline input, moves to start of top line. Can be combined with Shift to extend selection. |
| Ctrl-End      | Command-End, Command-PgDn, Ctrl-Right | Move to bottom of document/field.  
In single line input, moves to end of line. In multiline input, moves to end of last line. Can be combined with Shift to extend selection. |
| Ctrl-Left     | Alt-Left     | Word left.                                      
Can be combined with Shift to extend selection. |
| Ctrl-Right    | Alt-Right    | Word right.                                     
Can be combined with Shift to extend selection. |
| Ctrl-Backspace | Alt-Backspace | Delete word left.                            |
| Ctrl-Delete   | Alt-Delete   | Delete word right.                            |
12.74 Fl_Input Class Reference

12.74.2 Constructor & Destructor Documentation

12.74.2.1 Fl_Input()

Fl_Input::Fl_Input ( 
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0
) Creates a new Fl_Input widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

12.74.3 Member Function Documentation

12.74.3.1 draw()

void Fl_Input::draw ( ) [protected], [virtual] Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead. Override this function to draw your own widgets. If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Implements Fl_Widget.

12.74.3.2 handle()

int Fl_Input::handle ( 
    int event ) [virtual]
Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in | event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Widget.
Reimplemented in Fl_Spinner::Fl_Spinner_Input, and Fl_Secret_Input.
12.74.3.3 handle_key()

int Fl_Input::handle_key () [protected]
Handles a keystroke.
This protected method handles a keystroke in an Fl_Input or derived class. It handles compose key sequences and can also be used e.g. in Fl_Multiline_Input, Fl_Float_Input and several more derived classes. The details are way too complicated to be documented here and can be changed as required. If in doubt, please consult the source code.

Returns

1 if the keystroke is handled by us, 0 if not.

12.74.3.4 handle_rmb()

int Fl_Input::handle_rmb () [protected]
Handle right mouse button down events.

Returns

1

The documentation for this class was generated from the following files:

• Fl_Input.H
• Fl_Input.cxx

12.75 Fl_Input_ Class Reference

This class provides a low-overhead text input field.
#include <Fl_Input_.H>

```

Public Member Functions

• int append (const char *t, int l=0, char keep_selection=0)
  Append text at the end.
• bool can_redo () const
  Check if there is a redo action available.
• bool can_undo () const
  Check if the last operation can be undone.
• int copy (int clipboard)
  Put the current selection into the clipboard.
• int copy_cuts ()
  Copies the yank buffer to the clipboard.
• Fl_Color cursor_color () const
  Gets the color of the cursor.
• void cursor_color (Fl_Color n)
  Sets the color of the cursor.
• int cut ()
Deletes the current selection.
• int cut (int a, int b)
  Deletes all characters between index a and b.
• int cut (int n)
  Deletes the next n bytes rounded to characters before or after the cursor.
• double dvalue () const
  Returns the widget text interpreted as a floating point number.
• Fl_Input_ (int, int, int, int, const char ∗=0)
  Creates a new Fl_Input_ widget.
• unsigned int index (int i) const
  Returns the character at index i.
• int input_type () const
  Gets the input field type.
• void input_type (int t)
  Sets the input field type.
• int insert (const char ∗t, int l=0)
  Inserts text at the cursor position.
• int insert_position () const
  Gets the position of the text cursor.
• int insert_position (int p)
  Sets the cursor position and mark.
• int insert_position (int p, int m)
  Sets the index for the cursor and mark.
• int ivalue () const
  Returns the widget text interpreted as a signed integer.
• int mark () const
  Gets the current selection mark.
• int mark (int m)
  Sets the current selection mark.
• int maximum_size () const
  Gets the maximum length of the input field in characters.
• void maximum_size (int m)
  Sets the maximum length of the input field in characters.
• int position () const
• int position (int p)
• int position (int p, int m)
• int readonly () const
  Gets the read-only state of the input field.
• void readonly (int b)
  Sets the read-only state of the input field.
• int redo ()
  Redo previous undo operation.
• int replace (int b, int e, const char ∗text, int ilen=0)
  Deletes text from b to e and inserts the new string text.
• void resize (int, int, int, int) FL_OVERRIDE
  Changes the size of the widget.
• int shortcut () const
  Return the shortcut key associated with this widget.
• void shortcut (int s)
  Sets the shortcut key associated with this widget.
• int size () const
Returns the number of bytes in value().

- void size (int W, int H)
  Sets the width and height of this widget.
- int static_value (const char * )
  Changes the widget text.
- int static_value (const char *, int)
  Changes the widget text.
- int tab_nav () const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.
- void tab_nav (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.
- Fl_Color textcolor () const
  Gets the color of the text in the input field.
- void textcolor (Fl_Color n)
  Sets the color of the text in the input field.
- Fl_Font textfont () const
  Gets the font of the text in the input field.
- void textfont (Fl_Font s)
  Sets the font of the text in the input field.
- Fl_Fontsize textsize () const
  Gets the size of the text in the input field.
- void textsize (Fl_Fontsize s)
  Sets the size of the text in the input field.
- int undo ()
  Undoes previous changes to the text buffer.
- const char * value () const
  Returns the text displayed in the widget.
- int value (const char *)
  Changes the widget text.
- int value (const char *, int)
  Changes the widget text.
- int value (double value)
  Changes the widget text to a floating point number ("%g").
- int value (int value)
  Changes the widget text to a signed integer number.
- int wrap () const
  Gets the word wrapping state of the input field.
- void wrap (int b)
  Sets the word wrapping state of the input field.
- ~Fl_Input_ ()
  Destroys the widget.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- FL_Color color () const
  Gets the background color of the widget.

- void color (FL_Color bg)
  Sets the background color of the widget.

- void color (FL_Color bg, FL_Color sel)
  Sets the background and selection color of the widget.

- FL_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)
  Sets the current label.

- void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- FL_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const FL_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (FL_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (FL_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- void do_callback (Fl_Widget ∗widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void do_callback (Fl_Widget ∗widget, void ∗arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- virtual void draw ()=0
  Draws the widget.

- void draw_label (int, int, int, FL_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.

• virtual int handle (int event)
  Handles the specified event.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.

• Fl_Group * parent () const
Returns a pointer to the parent widget.

• void parent (Fl_Group *p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• Fl_Color selection_color () const
  Gets the selection color.

• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.

• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void *\texttt{user\_data} () const
  
  \textit{Gets the user data for this widget.}

• void \texttt{user\_data} (\texttt{Fl\_Callback\_User\_Data} *v, bool auto\_free)
  
  \textit{Sets the user data for this widget.}

• void \texttt{user\_data} (void *v)
  
  \textit{Sets the user data for this widget.}

• unsigned int \texttt{visible} () const
  
  \textit{Returns whether a widget is visible.}

• unsigned int \texttt{visible\_focus} () const
  
  \textit{Checks whether this widget has a visible focus.}

• void \texttt{visible\_focus} (int v)
  
  \textit{Modifies keyboard focus navigation.}

• int \texttt{visible\_r} () const
  
  \textit{Returns whether a widget and all its parents are visible.}

• int \texttt{w} () const
  
  \textit{Gets the widget width.}

• \texttt{Fl\_When} \texttt{when} () const
  
  \textit{Returns the conditions under which the callback is called.}

• void \texttt{when} (uchar i)
  
  \textit{Sets the flags used to decide when a callback is called.}

• \texttt{Fl\_Window} *\texttt{window} () const
  
  \textit{Returns a pointer to the nearest parent window up the widget hierarchy.}

• int \texttt{x} () const
  
  \textit{Gets the widget position in its window.}

• int \texttt{y} () const
  
  \textit{Gets the widget position in its window.}

• virtual ~\texttt{Fl\_Widget} ()
  
  \textit{Destroys the widget.}

\begin{description}
\item[Protected Member Functions]
• int \texttt{apply\_undo} ()
  
  \textit{Apply the current undo\/redo operation.}

• void \texttt{drawtext} (int, int, int, int)
  
  \textit{Draws the text in the passed bounding box.}

• void \texttt{drawtext} (int, int, int, bool draw\_active)
  
  \textit{Draws the text in the passed bounding box.}

• void \texttt{handle\_mouse} (int, int, int, int keepmark=0)
  
  \textit{Handles mouse clicks and mouse moves.}

• int \texttt{handle\_text} (int e, int, int, int)
  
  \textit{Handles all kinds of text field related events.}

• int \texttt{line\_end} (int i) const
  
  \textit{Finds the end of a line.}

• int \texttt{line\_start} (int i) const
  
  \textit{Finds the start of a line.}

• int \texttt{lines\_per\_page} ()
  
  \textit{Moves the cursor to the column given by \texttt{up\_down\_pos}.}

• int \texttt{word\_end} (int i) const
  
  \textit{Finds the end of a word.}
\end{description}
• int word_start (int i) const
  Finds the start of a word.
• int xscroll () const
• int yscroll () const
• void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget
• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget
• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char ∗, const bool require_alt=false)
  Returns true if the given text ∗t contains the entered '&x' shortcut.

### 12.75.1 Detailed Description

This class provides a low-overhead text input field. This is a virtual base class below Fl_Input. It has all the same interfaces, but lacks the handle() and draw() method. You may want to subclass it if you are one of those people who likes to change how the editing keys work. It may also be useful for adding scrollbars to the input field.

This can act like any of the subclasses of Fl_Input, by setting type() to one of the following values:

- `#define FL_NORMAL_INPUT 0`
- `#define FL_FLOAT_INPUT 1`
- `#define FL_INT_INPUT 2`
- `#define FL_MULTILINE_INPUT 4`
- `#define FL_SECRET_INPUT 5`
- `#define FL_INPUT_TYPE 7`
- `#define FL_INPUT_READONLY 8`
- `#define FL_NORMAL_OUTPUT (FL_NORMAL_INPUT | FL_INPUT_READONLY)`
- `#define FL_MULTILINE_OUTPUT (FL_MULTILINE_INPUT | FL_INPUT_READONLY)`
- `#define FL_INPUT_WRAP 16`
- `#define FL_MULTILINE_INPUT_WRAP (FL_MULTILINE_INPUT | FL_INPUT_READONLY | FL_INPUT_WRAP)`
- `#define FL_MULTILINE_OUTPUT_WRAP (FL_MULTILINE_INPUT | FL_INPUT_READONLY | FL_INPUT_WRAP)`

All variables that represent an index into a text buffer are byte-oriented, not character oriented, counting from 0 (at or before the first character) to size() (at the end of the buffer, after the last byte). Since UTF-8 characters can be up to six bytes long, simply incrementing such an index will not reliably advance to the next character in the text buffer. Indices and pointers into the text buffer should always point at a 7 bit ASCII character or the beginning of a UTF-8 character sequence. Behavior for false UTF-8 sequences and pointers into the middle of a sequence are undefined.

### 12.75.2 Constructor & Destructor Documentation

#### 12.75.2.1 Fl_Input()

`Fl_Input_::Fl_Input_ (int X, int Y, int W, int H, const char * l = 0)`

Creates a new Fl_Input_ widget.

This function creates a new Fl_Input_ widget and adds it to the current Fl_Group. The value() is set to NULL. The default boxtype is FL_DOWN_BOX.

**Parameters**

- **X, Y, W, H**: the dimensions of the new widget
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{l}</td>
<td>an optional label text</td>
</tr>
</tbody>
</table>

12.75.2.2 \texttt{\textasciitilde Fl\_Input\_()} \par
\texttt{Fl\_Input\_::\textasciitilde Fl\_Input\_ ( )}

Destroys the widget.
The destructor clears all allocated buffers and removes the widget from the parent \texttt{Fl\_Group}.

12.75.3 Member Function Documentation

12.75.3.1 append() \par
\texttt{int Fl\_Input\_::append ( const char * \textit{t}, int \textit{l} = 0, char keep\_selection = 0 )}

Append text at the end.
This function appends the string in \textit{t} to the end of the text. It does not moves the new position or mark.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{t}</td>
<td>text that will be appended</td>
</tr>
<tr>
<td>\textit{l}</td>
<td>length of text, or 0 if the string is terminated by nul.</td>
</tr>
<tr>
<td>\textit{keep_selection}</td>
<td>if this is 1, the current text selection will remain, if 0, the cursor will move to the end of the inserted text.</td>
</tr>
</tbody>
</table>

Returns

0 if no text was appended

12.75.3.2 apply\_undo() \par
\texttt{int Fl\_Input\_::apply\_undo ( ) [protected]}

Apply the current undo/redo operation.
It's up to \texttt{undo()} and \texttt{redo()} to push and pop actions to and from the lists.

Returns

1 if the current action changed any text.

See also

\texttt{undo()}, \texttt{redo()}

12.75.3.3 can\_redo() \par
\texttt{bool Fl\_Input\_::can\_redo ( ) const}

Check if there is a redo action available.

Returns

true if the widget can redo the last undo action
12.75.3.4 can_undo()

bool Fl_Input_::can_undo () const
Check if the last operation can be undone.

Returns
true if the widget can undo the last change

12.75.3.5 copy()

int Fl_Input_::copy ( int clipboard )
Put the current selection into the clipboard.
This function copies the current selection between mark() and position() into the specified clipboard. This does not replace the old clipboard contents if position() and mark() are equal. Clipboard 0 maps to the current text selection and clipboard 1 maps to the cut/paste clipboard.

Parameters

| clipboard | the clipboard destination 0 or 1 |

Returns
0 if no text is selected, 1 if the selection was copied

See also
Fl::copy(const char *, int, int)

12.75.3.6 copy_cuts()

int Fl_Input_::copy_cuts ( )
Copies the yank buffer to the clipboard.
This method copies all the previous contiguous cuts from the undo information to the clipboard. This function implements the ^K shortcut key.

Returns
0 if the operation did not change the clipboard

See also
copy(int), cut

12.75.3.7 cursor_color() [1/2]

Fl_Color Fl_Input_::cursor_color ( ) const [inline]
Gets the color of the cursor.

Returns
the current cursor color

12.75.3.8 cursor_color() [2/2]

void Fl_Input_::cursor_color ( Fl_Color n ) [inline]
Sets the color of the cursor.
The default color for the cursor is FL_BLACK.
Parameters

| in  | n | the new cursor color |

12.75.3.9  **cut()** [1/3]

```cpp
int Fl_Input_::cut ( ) [inline]
```

Deletes the current selection.
This function deletes the currently selected text *without* storing it in the clipboard. To use the clipboard, you may call `copy()` first or `copy_cuts()` after this call.

Returns

0 if no data was copied

12.75.3.10  **cut()** [2/3]

```cpp
int Fl_Input_::cut ( int a, int b ) [inline]
```

Deletes all characters between index a and b.
This function deletes the currently selected text *without* storing it in the clipboard. To use the clipboard, you may call `copy()` first or `copy_cuts()` after this call.

Parameters

| a,b | range of bytes rounded to full characters and clamped to the buffer |

Returns

0 if no data was copied

12.75.3.11  **cut()** [3/3]

```cpp
int Fl_Input_::cut ( int n ) [inline]
```

Deletes the next n bytes rounded to characters before or after the cursor.
This function deletes the currently selected text *without* storing it in the clipboard. To use the clipboard, you may call `copy()` first or `copy_cuts()` after this call.

Parameters

| n | number of bytes rounded to full characters and clamped to the buffer. A negative number will cut characters to the left of the cursor. |

Returns

0 if no data was copied

12.75.3.12  **drawtext()** [1/2]

```cpp
void Fl_Input_::drawtext ( int X, int Y, int W, int H ) [protected]
```

Generated by Doxygen
Draws the text in the passed bounding box. If `damage() & FL_DAMAGE_ALL` is true, this assumes the area has already been erased to `color()`. Otherwise it does minimal update and erases the area itself.

Parameters

| X, Y, W, H | area that must be redrawn |

12.75.3.13 `drawtext()` [2/2]

```cpp
void Fl_Input_::drawtext (int X, int Y, int W, int H, bool draw_active) [protected]
```

Draws the text in the passed bounding box. This version of `drawtext` allows the user to control whether the widget is drawn as active, i.e. with the text cursor, or inactive. This is useful for compound widgets where the input should be shown as active when actually the container widget is the active one.

A caller should not draw the widget with active set if another text widget may indeed be the active widget.

Parameters

| X, Y, W, H | area that must be redrawn |
| draw_active | if set, the cursor will be drawn, even if the widget is not active |

See also

`Fl_Input_::drawtext(int X, int Y, int W, int H)`

12.75.3.14 `dvalue()`

```cpp
double Fl_Input_::dvalue ( ) const
```

Returns the widget text interpreted as a floating point number.

Returns

double precision floating point value

See also

`Fl_Input_::ivalue()`
`Fl_Input_::value(double)`

12.75.3.15 `handle_mouse()`

```cpp
void Fl_Input_::handle_mouse (int X, int Y, int , int , int drag = 0) [protected]
```

Handles mouse clicks and mouse moves.

Todo Add comment and parameters
12.75.3.16 handletext()

```cpp
int Fl_Input_::handletext (  
    int event,  
    int X,  
    int Y,  
    int W,  
    int H ) [protected]
```

Handles all kinds of text field related events. This is called by derived classes.

**Todo** Add comment and parameters

12.75.3.17 index()

```cpp
unsigned int Fl_Input_::index (  
    int i ) const
```

Returns the character at index \( i \). This function returns the UTF-8 character at \( i \) as a ucs4 character code.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>i</th>
<th>index into the value field</th>
</tr>
</thead>
</table>

Returns

the character at index \( i \)

12.75.3.18 input_type() [1/2]

```cpp
int Fl_Input_::input_type ( ) const [inline]
```

Gets the input field type.

Returns

the current input type

12.75.3.19 input_type() [2/2]

```cpp
void Fl_Input_::input_type (  
    int t ) [inline]
```

Sets the input field type. A **redraw()** is required to reformat the input field.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>t</th>
<th>new input type</th>
</tr>
</thead>
</table>

12.75.3.20 insert()

```cpp
int Fl_Input_::insert (  
    const char * t,  
    int l = 0 ) [inline]
```

Inserts text at the cursor position. This function inserts the string in \( t \) at the cursor **position()** and moves the new position and mark to the end of the inserted text.
Parameters

<table>
<thead>
<tr>
<th>in  t</th>
<th>text that will be inserted</th>
</tr>
</thead>
<tbody>
<tr>
<td>in   l</td>
<td>length of text, or 0 if the string is terminated by nul.</td>
</tr>
</tbody>
</table>

Returns

0 if no text was inserted

12.75.3.21 insert_position() [1/3]

```cpp
int Fl_Input_::insert_position ( ) const [inline]
```

Gets the position of the text cursor.

**Returns**

the cursor position as an index in the range 0..size()

**See also**

insert_position(int, int)

12.75.3.22 insert_position() [2/3]

```cpp
int Fl_Input_::insert_position ( int p ) [inline]
```

Sets the cursor position and mark. position(n) is the same as position(n, n).

**Parameters**

| p   | new index for cursor and mark |

**Returns**

0 if no positions changed

**See also**

insert_position(int, int), insert_position(), mark(int)

12.75.3.23 insert_position() [3/3]

```cpp
int Fl_Input_::insert_position ( int p, int m )
```

Sets the index for the cursor and mark. The input widget maintains two pointers into the string. The position (p) is where the cursor is. The mark (m) is the other end of the selected text. If they are equal then there is no selection. Changing this does not affect the clipboard (use copy() to do that). Changing these values causes a redraw(). The new values are bounds checked.

**Parameters**

| p | index for the cursor position |
| m | index for the mark |
Returns
0 if no positions changed

See also
position(int), position(), mark(int)

12.75.3.24  ivalue()

int Fl_Input_::ivalue ( ) const
Returns the widget text interpreted as a signed integer.

Returns
signed integer value

See also
Fl_Input_::dvalue()
Fl_Input_::value(int)

12.75.3.25  line_end()

int Fl_Input_::line_end ( int i ) const [protected]
Finds the end of a line.
This call calculates the end of a line based on the given index i.

Parameters

| in | i | starting index for the search |

Returns
dead of the line

12.75.3.26  line_start()

int Fl_Input_::line_start ( int i ) const [protected]
Finds the start of a line.
This call calculates the start of a line based on the given index i.

Parameters

| in | i | starting index for the search |

Returns
start of the line

12.75.3.27  mark() [1/2]

int Fl_Input_::mark ( ) const [inline]
Gets the current selection mark.
12.75.3.28 \texttt{mark()} [2/2]

\begin{verbatim}
int Fl_Input_::mark (  
  int m ) [inline]
\end{verbatim}

Sets the current selection mark. \texttt{mark(n)} is the same as \texttt{insert_position(insert_position(),n)}.

Parameters

| \texttt{m} | new index of the mark |

Returns

0 if the mark did not change

See also

\texttt{insert_position()}, \texttt{insert_position(int, int)}

12.75.3.29 \texttt{maximum_size()} [1/2]

\begin{verbatim}
int Fl_Input_::maximum_size ( ) const [inline]
\end{verbatim}

Gets the maximum length of the input field in characters.

See also

\texttt{maximum_size(int)}.

12.75.3.30 \texttt{maximum_size()} [2/2]

\begin{verbatim}
void Fl_Input_::maximum_size (  
  int m ) [inline]
\end{verbatim}

Sets the maximum length of the input field in characters. This limits the number of characters that can be inserted in the widget. Since FLTK 1.3 this is different than the buffer size, since one character can be more than one byte in UTF-8 encoding. In FLTK 1.1 this was the same (one byte = one character).

12.75.3.31 \texttt{position()} [1/3]

\begin{verbatim}
int Fl_Input_::position ( ) const [inline]
\end{verbatim}

\textbf{Deprecated} “in 1.4.0 - use insert_position() instead”

12.75.3.32 \texttt{position()} [2/3]

\begin{verbatim}
int Fl_Input_::position (  
  int p ) [inline]
\end{verbatim}

\textbf{Deprecated} “in 1.4.0 - use insert_position(p) instead”
12.75.3.33  position() [3/3]

int Fl_Input_::position (  
    int p,  
    int m ) [inline]

Deprecated  "in 1.4.0 - use insert_position(p, m) or Fl_Widget::position(x, y) instead"

12.75.3.34  readonly() [1/2]

int Fl_Input_::readonly ( ) const [inline]

Gets the read-only state of the input field.

Returns

non-zero if this widget is read-only

12.75.3.35  readonly() [2/2]

void Fl_Input_::readonly (  
    int b ) [inline]

Sets the read-only state of the input field.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>if b is 0, the text in this widget can be edited by the user</td>
<td></td>
</tr>
</tbody>
</table>

12.75.3.36  redo()

int Fl_Input_::redo ( )

Redo previous undo operation.

This call reappplies previously executed undo operations.

Returns

non-zero if any change was made.

12.75.3.37  replace()

int Fl_Input_::replace (  
    int b,  
    int e,  
    const char * text,  
    int ilen = 0 )

Deletes text from b to e and inserts the new string text.

All changes to the text buffer go through this function. It deletes the region between b and e (either one may be less or equal to the other), and then inserts the string text at that point and moves the mark() and position() to the end of the insertion. Does the callback if when() & FL_WHEN_CHANGED and there is a change.

Set b and e equal to not delete anything. Set text to NULL to not insert anything.

ilen can be zero or strlen(text), which saves a tiny bit of time if you happen to already know the length of the insertion, or can be used to insert a portion of a string. If ilen is zero, strlen(text) is used instead. b and e are clamped to the 0..size() range, so it is safe to pass any values. b, e, and ilen are used as numbers of bytes (not characters), where b and e count from 0 to size() (end of buffer).

If b and/or e don't point to a valid UTF-8 character boundary, they are adjusted to the previous (b) or the next (e) valid UTF-8 character boundary, resp..

If the current number of characters in the buffer minus deleted characters plus inserted characters in text would overflow the number of allowed characters (maximum_size()), then only the first characters of the string are inserted, so that maximum_size() is not exceeded.
cut() and insert() are just inline functions that call replace().

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>in b</code></td>
<td>beginning index of text to be deleted</td>
</tr>
<tr>
<td><code>in e</code></td>
<td>ending index of text to be deleted and insertion position</td>
</tr>
<tr>
<td><code>in text</code></td>
<td>string that will be inserted</td>
</tr>
<tr>
<td><code>in ilen</code></td>
<td>length of text or 0 for null terminated strings</td>
</tr>
</tbody>
</table>

Returns
0 if nothing changed

Note
If `text` does not point to a valid UTF-8 character or includes invalid UTF-8 sequences, the text is inserted nevertheless (counting invalid UTF-8 bytes as one character each).

12.75.3.38 resize()

```cpp
void Fl_Input_::resize ( int X, int Y, int W, int H ) [virtual]
```

Changes the size of the widget.
This call updates the text layout so that the cursor is visible.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>in X,Y,W,H</code></td>
<td>new size of the widget</td>
</tr>
</tbody>
</table>

See also
Fl_Widget::resize(int, int, int)
Reimplemented from Fl_Widget.

12.75.3.39 shortcut() [1/2]

```cpp
int Fl_Input_::shortcut ( ) const [inline]
```

Return the shortcut key associated with this widget.

Returns
shortcut keystroke

See also
Fl_Button::shortcut()

12.75.3.40 shortcut() [2/2]

```cpp
void Fl_Input_::shortcut ( int s ) [inline]
```

Sets the shortcut key associated with this widget.
Pressing the shortcut key gives text editing focus to this widget.
Parameters

| in | s  | new shortcut keystroke |

See also

Fl_Button::shortcut()

12.75.3.41 size() [1/2]

int Fl_Input_::size () const [inline]

Returns the number of bytes in value().
This may be greater than strlen(value()) if there are null characters in the text.

Returns

number of bytes in the text

12.75.3.42 size() [2/2]

void Fl_Input_::size (  
  int W, 
  int H ) [inline]

Sets the width and height of this widget.

Parameters

| in | W, H | new width and height |

See also

Fl_Widget::size(int, int)

12.75.3.43 static_value() [1/2]

int Fl_Input_::static_value (  
  const char * str )

Changes the widget text.
This function changes the text and sets the mark and the point to the end of it. The string is not copied. If the user edits the string it is copied to the internal buffer then. This can save a great deal of time and memory if your program is rapidly changing the values of text fields, but this will only work if the passed string remains unchanged until either the Fl_Input is destroyed or value() is called again.

Parameters

| in | str | the new text |

Returns

non-zero if the new value is different than the current one

12.75.3.44 static_value() [2/2]

int Fl_Input_::static_value (  
  const char * str, 
  int len )
Changes the widget text. This function changes the text and sets the mark and the point to the end of it. The string is not copied. If the user edits the string it is copied to the internal buffer then. This can save a great deal of time and memory if your program is rapidly changing the values of text fields, but this will only work if the passed string remains unchanged until either the Fl_Input is destroyed or value() is called again. You can use the len parameter to directly set the length if you know it already or want to put null characters in the text.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>str</th>
<th>the new text</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>len</td>
<td>the length of the new text</td>
</tr>
</tbody>
</table>

Returns

non-zero if the new value is different than the current one

12.75.3.45 tab_nav() [1/2]

int Fl_Input_::tab_nav ( ) const [inline]
GETS WHETHER THE TAB KEY CAUSES FOCUS NAVIGATION IN MULTILINE INPUT FIELDS OR NOT. IF ENABLED (DEFAULT), HITTING TAB CAUSES FOCUS NAVIGATION TO THE NEXT Widget. IF DISABLED, HITTING TAB INSERTS A TAB CHARACTER INTO THE TEXT FIELD.

Returns

1 if Tab advances focus (default), 0 if Tab inserts tab characters.

See also

tab_nav(int), Fl::OPTION_ARROW_FOCUS.

12.75.3.46 tab_nav() [2/2]

void Fl_Input_::tab_nav ( int val ) [inline]

SETS WHETHER THE TAB KEY DOES FOCUS NAVIGATION, OR INSERTS TAB CHARACTERS INTO Fl_Multiline_Input. By default this flag is enabled to provide the 'normal' behavior most users expect; Tab navigates focus to the next widget. To inserting an actual Tab character, users can use Ctrl-I or copy/paste. Disabling this flag gives the old FLTK behavior where Tab inserts a tab character into the text field, in which case only the mouse can be used to navigate to the next field. History: This flag was provided for backwards support of FLTK's old 1.1.x behavior where Tab inserts a tab character instead of navigating focus to the next widget. This behavior was unique to Fl_Multiline_Input. With the advent of Fl_Text_Editor, this old behavior has been deprecated.

Parameters

| in   | val | If val is 1, Tab advances focus (default). If val is 0, Tab inserts a tab character (old FLTK behavior). |

See also

tab_nav(), Fl::OPTION_ARROW_FOCUS.

12.75.3.47 textcolor() [1/2]

Fl_Color Fl_Input_::textcolor ( ) const [inline]

GETS THE COLOR OF THE TEXT IN THE INPUT FIELD.
Returns

the text color

See also

textcolor(Fl_Color)

12.75.3.48 textcolor() [2/2]

void Fl_Input_::textcolor (  
    Fl_Color n ) [inline]

Sets the color of the text in the input field.
The text color defaults to FL_FOREGROUND_COLOR.

Parameters

| in | n | new text color |

See also

textcolor()

12.75.3.49 textfont() [1/2]

Fl_Font Fl_Input_::textfont ( ) const [inline]

Gets the font of the text in the input field.

Returns

the current Fl_Font index

12.75.3.50 textfont() [2/2]

void Fl_Input_::textfont (  
    Fl_Font s ) [inline]

Sets the font of the text in the input field.
The text font defaults to FL_HELVETICA.

Parameters

| in | s | the new text font |

12.75.3.51 textsize() [1/2]

Fl_Fontsize Fl_Input_::textsize ( ) const [inline]

 Gets the size of the text in the input field.

Returns

the text height in pixels

12.75.3.52 textsize() [2/2]

void Fl_Input_::textsize (  
    Fl_Fontsize s ) [inline]

Sets the size of the text in the input field.
The text height defaults to `FL_NORMAL_SIZE`. 

Parameters

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>the new font height in pixel units</th>
</tr>
</thead>
</table>

12.75.3.53  **undo()**

```cpp
int Fl_Input_::undo ( )
```

Undoes previous changes to the text buffer.
This call undoes a number of previous calls to `replace()`.

Returns

non-zero if any change was made.

12.75.3.54  **up_down_position()**

```cpp
int Fl_Input_::up_down_position ( int i,
int keepmark = 0 ) [protected]
```

Moves the cursor to the column given by `up_down_pos`.
This function is helpful when implementing up and down cursor movement. It moves the cursor from the beginning of a line to the column indicated by the global variable `up_down_pos` in pixel units.

Parameters

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>index into the beginning of a line of text</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>i</td>
<td></td>
</tr>
<tr>
<td></td>
<td>keepmark</td>
<td>if set, move only the cursor, but not the mark</td>
</tr>
</tbody>
</table>

Returns

index to new cursor position

12.75.3.55  **value()** [1/5]

```cpp
const char * Fl_Input_::value ( ) const [inline]
```

Returns the text displayed in the widget.
This function returns the current value, which is a pointer to the internal buffer and is valid only until the next event is handled.

Returns

pointer to an internal buffer - do not free() this

See also

`Fl_Input_::value(const char*)`

12.75.3.56  **value()** [2/5]

```cpp
int Fl_Input_::value ( const char * str )
```

Changes the widget text.
This function changes the text and sets the mark and the point to the end of it. The string is copied to the internal buffer. Passing NULL is the same as " ".

Generated by Doxygen
Parameters

| in  | str  | the new text |

Returns

non-zero if the new value is different than the current one

See also

Fl_Input_::value(const char * str, int len), Fl_Input_::value()

### 12.75.3.57 value() [3/5]

```c
int Fl_Input_::value (const char * str,
                       int len )
```

Changes the widget text. This function changes the text and sets the mark and the point to the end of it. The string is copied to the internal buffer. Passing NULL is the same as "". You can use the length parameter to directly set the length if you know it already or want to put null characters in the text.

Parameters

| in  | str  | the new text |

| in  | len  | the length of the new text |

Returns

non-zero if the new value is different than the current one

See also

Fl_Input_::value(const char * str), Fl_Input_::value()

### 12.75.3.58 value() [4/5]

```c
int Fl_Input_::value (double v )
```

Changes the widget text to a floating point number ("%g").

Parameters

| in  | v    | the new value |

Returns

non-zero if the new value is different than the current one

See also

Fl_Input_::value(const char * str), Fl_Input_::ivalue()

### 12.75.3.59 value() [5/5]

```c
int Fl_Input_::value (int v )
```
Changes the widget text to a signed integer number.

Parameters

\begin{verbatim}
in \texttt{v}
\end{verbatim}

the new value

Returns

non-zero if the new value is different than the current one

See also

\texttt{Fl_Input::value(const char* str)}, \texttt{Fl_Input::ivalue()}

\subsection{word_end()}

\begin{verbatim}
int Fl_Input::word_end ( int \texttt{i} ) const [protected]
\end{verbatim}

Finds the end of a word.

Returns the index after the last byte of a word. If the index is already at the end of a word, it will find the end of the following word, so if you call it repeatedly you will move forwards to the end of the text.

Note that this is inconsistent with line_end().

Parameters

\begin{verbatim}
in \texttt{i} starting index for the search
\end{verbatim}

Returns

end of the word

\subsection{word_start()}

\begin{verbatim}
int Fl_Input::word_start ( int \texttt{i} ) const [protected]
\end{verbatim}

Finds the start of a word.

Returns the index of the first byte of a word. If the index is already at the beginning of a word, it will find the beginning of the previous word, so if you call it repeatedly you will move backwards to the beginning of the text.

Note that this is inconsistent with line_start().

Parameters

\begin{verbatim}
in \texttt{i} starting index for the search
\end{verbatim}

Returns

start of the word, or previous word

\subsection{wrap() [1/2]}

\begin{verbatim}
int Fl_Input::wrap ( ) const [inline]
\end{verbatim}

Gets the word wrapping state of the input field.

Word wrap is only functional with multi-line input fields.

\subsection{wrap() [2/2]}

\begin{verbatim}
void Fl_Input::wrap ( 
\end{verbatim}
int b ) [inline]
Sets the word wrapping state of the input field.
Word wrap is only functional with multi-line input fields.
The documentation for this class was generated from the following files:

- Fl_Input_.H
- Fl_Input_.cxx

## 12.76 Fl_Input_Choice Class Reference

A combination of the input widget and a menu button.

Inheritance diagram for Fl_Input_Choice:

```
Fl_Widget
   ↓
Fl_Group
   ↓
Fl_Input_Choice
```

### Public Member Functions

- **void add (const char *s)**
  
  Adds an item to the menu.

- **int changed () const**
  
  Returns the combined `changed()` state of the input and menu button widget.

- **void clear ()**
  
  Removes all items from the menu.

- **void clear_changed ()**
  
  Clears the `changed()` state of both input and menu button widgets.

- **FL_Boxtype down_box () const**
  
  Gets the box type of the menu button.

- **void down_box (FL_Boxtype b)**
  
  Sets the box type of the menu button.

- **Fl_Input_Choice (int X, int Y, int W, int H, const char *L=0)**
  
  Creates a new Fl_Input_Choice widget using the given position, size, and label string.

- **Fl_Input * input ()**
  
  Returns a pointer to the internal Fl_Input widget.

- **const Fl_Menu_Item * menu ()**
  
  Gets the Fl_Menu_Item array used for the menu.

- **void menu (const Fl_Menu_Item *m)**
  
  Sets the Fl_Menu_Item array used for the menu.

- **Fl_Menu_Button * menubutton ()**
  
  Returns a pointer to the internal Fl_Menu_Button widget.

- **void resize (int X, int Y, int W, int H) FL_OVERRIDE**
  
  Resizes the Fl_Input_Choice widget.

- **void set_changed ()**
  
  Sets the `changed()` state of both input and menu button widgets to the specified value.

- **FL_Color textcolor () const**
  
  Gets the Fl_Input text field's text color.

- **void textcolor (FL_Color c)**
Sets the Fl_Input text field's text color to \texttt{c}.

\begin{itemize}
  \item \texttt{Fl_Font textfont () const}
    \hfill Gets the Fl_Input text field's font style.
  \item \texttt{void textfont (Fl_Font f)}
    \hfill Sets the Fl_Input text field's font style to \texttt{f}.
  \item \texttt{Fl_Fontsize textsize () const}
    \hfill Gets the Fl_Input text field's font size.
  \item \texttt{void textsize (Fl_Fontsize s)}
    \hfill Sets the Fl_Input text field's font size to \texttt{s}.
  \item \texttt{int update_menubutton ()}
    \hfill Updates the menubutton with the string value in Fl_Input.
  \item \texttt{const char * value () const}
    \hfill Returns the Fl_Input text field's current contents.
  \item \texttt{void value (const char * val)}
    \hfill Sets the Fl_Input text field's contents to \texttt{val}.
  \item \texttt{void value (int val)}
    \hfill Chooses item\# \texttt{val} in the menu, and sets the Fl_Input text field to that value.
\end{itemize}

Public Member Functions inherited from Fl_Group

\begin{itemize}
  \item \texttt{Fl_Widget * & _ddfdesign_kludge ()}
    \hfill This is for forms compatibility only.
  \item \texttt{void add (Fl_Widget &)}
    \hfill The widget is removed from its current group (if any) and then added to the end of this group.
  \item \texttt{void add (Fl_Widget * o)}
    \hfill See \texttt{void Fl_Group::add(Fl_Widget &w)}
  \item \texttt{void add_resizable (Fl_Widget &o)}
    \hfill Adds a widget to the group and makes it the resizable widget.
  \item \texttt{Fl_Widget *& array () const}
    \hfill Returns a pointer to the array of children.
  \item \texttt{Fl_Group const * as_group () const FL_OVERRIDE}
    \hfill \texttt{Fl_Group} pointer if this widget is an \texttt{Fl_Group}.
  \item \texttt{void begin ()}
    \hfill Sets the current group so you can build the widget tree by just constructing the widgets.
  \item \texttt{Fl_Widget * child (int n) const}
    \hfill Returns \texttt{array()[n]}.
  \item \texttt{int children () const}
    \hfill Returns how many child widgets the group has.
  \item \texttt{void clear ()}
    \hfill Deletes all child widgets from memory recursively.
  \item \texttt{unsigned int clip_children ()}
    \hfill Returns the current clipping mode.
  \item \texttt{void clip_children (int c)}
    \hfill Controls whether the group widget clips the drawing of child widgets to its bounding box.
  \item \texttt{virtual int delete_child (int n)}
    \hfill Removes the widget at \texttt{index} from the group and deletes it.
  \item \texttt{void end ()}
    \hfill Exactly the same as \texttt{current(this->parent())}.
  \item \texttt{int find (const Fl_Widget &o) const}
    \hfill See \texttt{int Fl_Group::find(const Fl_Widget *w) const}.
\end{itemize}
• int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.

• Fl_Group (int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.

• void focus (Fl_Widget *W)

• void forms_end ()
  This is for forms compatibility only.

• int handle (int) FL_OVERRIDE
  Handles the specified event.

• void init_sizes ()
  Resets the internal array of widget sizes and positions.

• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

• void insert (Fl_Widget &, Fl_Widget *before)
  This does insert(w, find(before)).

• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

• void remove (Fl_Widget *o)
  Removes the widget o from the group.

• void remove (int index)
  Removes the widget at index from the group but does not delete it.

• Fl_Widget * resizable () const
  Returns the group's resizable widget.

• void resizable (Fl_Widget &o)
  Sets the group's resizable widget.

• void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.

• unsigned int active () const
  Returns whether the widget is active.

• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`
  Gets the current label text.

- `void label (const char *text)`
  Sets the current label pointer.

- `void label (Fi_Labeltype a, const char *b)`
  
  Shortcut to set the label text and type in one call.

- `Fi_Color labelcolor () const`
  Gets the label color.

- `void labelcolor (Fi_Color c)`
  Sets the label color.

- `Fi_Font labelfont () const`
  Gets the font to use.

- `void labelfont (Fi_Font f)`
  Sets the font to use.

- `Fi_Fontsize labelsize () const`
  Gets the font size in pixels.

- `void labelsize (Fi_Fontsize pix)`
  Sets the font size in pixels.

- `Fi_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (Fi_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `Fi_Group * parent () const`
  
  Returns a pointer to the parent widget.

- `void parent (Fi_Group *p)`
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `Fi_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fi_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.
void set_visible()

Makes the widget visible.

void set_visible_focus()

Enables keyboard focus navigation with this widget.

int shortcut_label() const

Returns whether the widget's label uses '&' to indicate shortcuts.

void shortcut_label(int value)

Sets whether the widget's label uses '&' to indicate shortcuts.

virtual void show()

Makes a widget visible.

void size(int W, int H)

Changes the size of the widget.

int take_focus()

Gives the widget the keyboard focus.

unsigned int takesevents() const

Returns if the widget is able to take events.

int test_shortcut()

Returns true if the widget's label contains the entered '&x' shortcut.

const char* tooltip() const

Gets the current tooltip text.

void tooltip(const char* text)

Sets the current tooltip text.

Fl_Window* top_window()

Returns a pointer to the top-level window for the widget.

Fl_Window* top_window_offset(int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.

uchar type() const

Gets the widget type.

void type(uchar t)

Sets the widget type.

int use_accents_menu()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

void* user_data() const

Gets the user data for this widget.

void user_data(Fl_Callback_User_Data*v, bool auto_free)

Sets the user data for this widget.

void user_data(void*v)

Sets the user data for this widget.

unsigned int visible() const

Returns whether a widget is visible.

unsigned int visible_focus() const

Checks whether this widget has a visible focus.

void visible_focus(int v)

Modifies keyboard focus navigation.

int visible_r() const

Returns whether a widget and all its parents are visible.

int w() const

Gets the widget width.

Fl_When when() const

Returns the conditions under which the callback is called.

void when(uchar i)
Sets the flags used to decide when a callback is called.

- `FL_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x () const`
  Gets the widget position in its window.
- `int y () const`
  Gets the widget position in its window.
- `virtual ~FL_Widget ()`
  Destroys the widget.

Protected Member Functions

- `virtual int inp_h () const`
  See `inp_x()` for info.
- `virtual int inp_w () const`
  See `inp_x()` for info.
- `virtual int inp_x () const`
  The methods `inp_x()`, `inp_y()`, `inp_w()` and `inp_h()` return the desired position and size of the internal `Fl_Input` widget.
- `virtual int inp_y () const`
  See `inp_x()` for info.
- `virtual int menu_h () const`
  See `menu_x()` for info.
- `virtual int menu_w () const`
  See `menu_x()` for info.
- `virtual int menu_x () const`
  The methods `menu_x()`, `menu_y()`, `menu_w()` and `menu_h()` return the desired position and size of the internal `Fl_Menu_Button` widget.
- `virtual int menu_y () const`
  See `menu_x()` for info.

Protected Member Functions inherited from `Fl_Group`

- `Fl_Rect * bounds ()`
  Returns the internal array of widget sizes and positions.
- `void draw () FL_OVERRIDE`
  Draws the widget.
- `void draw_child (Fl_Widget &widget) const`
  Forces a child to redraw.
- `void draw_children ()`
  Draws all children of the group.
- `void draw_outside_label (const Fl_Widget &widget) const`
  Parents normally call this to draw outside labels of child widgets.
- `virtual int on_insert (Fl_Widget *, int)`
  Allow derived groups to act when a widget is added as a child.
- `virtual int on_move (int, int)`
  Allow derived groups to act when a widget is moved within the group.
- `virtual void on_remove (int)`
  Allow derived groups to act when a child widget is removed from the group.
- `int * sizes ()`
  Returns the internal array of widget sizes and positions.
- `void update_child (Fl_Widget &widget) const`
  Draws a child only if it needs it.
Protected Member Functions inherited from Fl_Widget

- void clear_flag(unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop() const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box() const
  Draws the widget box according its box style.
- void draw_box(Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus() const
  Draws a focus rectangle around the widget.
- void draw_focus(Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label() const
  Draws the widget's label at the defined label position.
- void draw_label(int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget(int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int flags() const
  Gets the widget flags mask.
- void h(int v)
  Internal use only.
- void set_flag(unsigned int c)
  Sets a flag in the flags mask.
- void w(int v)
  Internal use only.
- void x(int v)
  Internal use only.
- void y(int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group ∗current()
  Returns the currently active group.
- static void current(Fl_Group ∗g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback(Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut(const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut(const char ∗, const bool require_alt=false)
  Returns true if the given text ∗t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPY_LABEL = 1<<10, CLIPCHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  FULLSCREEN = 1<<16, COPY_TOOLTIP = 1<<17, MAC_USE_ACCENTS_MENU = 1<<18,
  NEEDS_KEYBOARD = 1<<19, IMAGE_BOUND = 1<<20, DEIMAGE_BOUND = 1<<21, AUTO_DELETE_USER_DATA = 1<<22,
  MAXIMIZED = 1<<23, USERFLAG3 = 1<<24, USERFLAG2 = 1<<25, USERFLAG1 = 1<<26
}
flags possible values enumeration.

12.76.1 Detailed Description

A combination of the input widget and a menu button.

The user can either type into the input area, or use the menu button chooser on the right to choose an item which loads the input area with the selected text.

The application can directly access both the internal Fl_Input and Fl_Menu_Button widgets respectively using the input() and menubutton() accessor methods.

The default behavior is to invoke the Fl_Input_Choice::callback() if the user changes the input field's contents, either by typing, pasting, or clicking a different item in the choice menu.

The callback can determine if an item was picked vs. typing into the input field by checking the value of menubutton()->changed(), which will be:

- 1: the user picked a different item in the choice menu
- 0: the user typed or pasted directly into the input field

Example Use of Fl_Input_Choice

```c
#include <stdio.h>
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Input_Choice.H>

// Fl_Input_Choice callback()
void choice_cb(Fl_Widget *w, void *userdata) {
  // Show info about the picked item
  Fl_Input_Choice *choice = (Fl_Input_Choice*)w;
  printf("*** Choice Callback:\n");
  printf(" widget's text value='%s', choice->value()\n", choice->value()); // normally all you need
  // Access the menu via menubutton().
  const Fl_Menu_Item *item = choice->menubutton()->mvalue();
  printf(" item label()='%s', choice->menubutton()->value()\n", item ? item->label() : "(No item)";
  printf(" input value()='%s', choice->input()->value()\n", item ? item->value() : "(No item)";
  printf(" The user %s\n", choice->menubutton()->changed() ? "picked a menu item" :
            "typed text");
}

int main() {
  Fl_Double_Window win(200,100,"Input Choice");
  win.begin();
  Fl_Input_Choice choice(10,10,100,30);
```
choice.callback(choice_cb, 0);
choice.add("Red");
choice.add("Orange");
choice.add("Yellow");
//choice.value("Red"); // uncomment to make "Red" default
win.end();
win.show();
return Fl::run();
}

Subclassing Example

One can subclass Fl_Input_Choice to override the virtual methods inp_x/y/w/h() and menu_x/y/w/h() to take
control of the internal Fl_Input and Fl_Menu_Button widget positioning. In this example, input and menubutton-
's positions are swapped:

```cpp
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Input_Choice.H>

class MyInputChoice : public Fl_Input_Choice {
protected:
  virtual int inp_x() const { return x() + Fl::box_dx(box()) + menu_w(); } // override to reposition
  virtual int menu_x() const { return x() + Fl::box_dx(box()); } // override to reposition
public:
  MyInputChoice(int X, int Y, int W, int H, const char*L=0) : Fl_Input_Choice(X,Y,W,H,L) {
    resize(X,Y,W,H); // necessary for ctor to trigger our overrides
  }
};

int main(int argc, char **argv) {
  Fl_Window *win = new Fl_Window(400,300);
  MyInputChoice *mychoice = new MyInputChoice(150,40,150,25,"Right Align Input");
  mychoice->add("Aaa");
  mychoice->add("Bbb");
  mychoice->add("Ccc");
  win->end();
  win->resizable(win);
  win->show();
  return Fl::run();
}
```

12.76.2 Constructor & Destructor Documentation

12.76.2.1 Fl_Input_Choice()

Fl_Input_Choice::Fl_Input_Choice {
  int X,
  int Y,
  int W,
  int H,
  const char * L = 0 )
Creates a new Fl_Input_Choice widget using the given position, size, and label string.
Inherited destructor destroys the widget and any values associated with it.

12.76.3 Member Function Documentation

12.76.3.1 add()  

```cpp
void Fl_Input_Choice::add ( 
  const char * s ) [inline]
```

Adds an item to the menu.
When any item is selected, the Fl_Input_Choice callback() is invoked, which can do something with the selected
item.
You can access the more complex Fl_Menu_Button::add() methods (setting item-specific callbacks, userdata, etc),
via menubutton(). Example:

```cpp
Fl_Input_Choice *choice = new Fl_Input_Choice(100,10,120,25,"Fonts");
Fl_Menu_Button *mb = choice->menubutton(); // use Fl_Input_Choice's Fl_Menu_Button
mb->add("Helvetica", 0, MyFont_CB, (void*)mydata); // use Fl_Menu_Button's add() methods
mb->add("Courier", 0, MyFont_CB, (void*)mydata);
mb->add("More..", 0, FontDialog_CB, (void*)mydata);
```
12.76.3.2 inp_x()

virtual int Fl_Input_Choice::inp_x() const [inline], [protected], [virtual]
The methods inp_x(), inp_y(), inp_w() and inp_h() return the desired position and size of the internal Fl_Input widget. These can be overridden by a subclass to redefine positioning. See code example in the Description for subclassing details.

12.76.3.3 input()

Fl_Input * Fl_Input_Choice::input() [inline]
Returns a pointer to the internal Fl_Input widget. This can be used to directly access all of the Fl_Input widget's methods.

12.76.3.4 menu_x()

virtual int Fl_Input_Choice::menu_x() const [inline], [protected], [virtual]
The methods menu_x(), menu_y(), menu_w() and menu_h() return the desired position and size of the internal Fl_Menu_Button widget. These can be overridden by a subclass to redefine positioning. See code example in the Description for subclassing details.

12.76.3.5 menubutton()

Fl_Menu_Button * Fl_Input_Choice::menubutton() [inline]
Returns a pointer to the internal Fl_Menu_Button widget. This can be used to access any of the methods of the menu button, e.g. Fl_Input_Choice * choice = new Fl_Input_Choice(100,10,120,25,"Choice:"); [...] // Print all the items in the choice menu for ( int t=0; t<choice->menubutton()->size(); t++ ) { const Fl_Menu_Item &item = choice->menubutton()->menu()[t]; printf("item %d -- label=%s\n", t, item.label() ? item.label() : "(Null)")); }

12.76.3.6 resize()

void Fl_Input_Choice::resize ( int X, int Y, int W, int H ) [virtual]
Resizes the Fl_Input_Choice widget. Reimplemented from Fl_Group.

12.76.3.7 update_menubutton()

int Fl_Input_Choice::update_menubutton() {}
Updates the menubutton with the string value in Fl_Input. If the string value currently in Fl_Input matches one of the menu items in menubutton(), that menu item will become the current item selected. Call this method after setting value(const char*) if you need the menubutton() to be synchronized with the Fl_Input field. // Add items choice->add(".25"); choice->add(".50"); choice->add("1.0"); choice->add("2.0"); choice->add("4.0"); choice->value("1.0"); // sets Fl_Input to "1.0" choice->update_menubutton(); // cause menubutton to reflect this value too // [returns 1 if match was found, 0 if not] // Verify menubutton()'s value.
printf("menu button choice index=%d, value=%s\n",
   choice->menubutton()->value(), // would be -1 if update not done
   choice->menubutton()->text()); // would be NULL if update not done

Generated by Doxygen
Returns

1 if a matching menuitem was found and value set, 0 if not.

Version

1.4.0

12.76.3.8 value() [1/2]

void Fl_Input_Choice::value (const char ∗val) [inline]

Sets the Fl_Input text field's contents to val.

Note it is possible to set the value() to one that is not in the menubutton's list of choices.

Setting the value() does NOT affect the menubutton's selection. If that's needed, call update_menubutton() after setting value().

See also

void value(int val), update_menubutton()

12.76.3.9 value() [2/2]

void Fl_Input_Choice::value (int val)

Chooses item# val in the menu, and sets the Fl_Input text field to that value.

Any previous text is cleared.

See also

void value(const char ∗val)

The documentation for this class was generated from the following files:

- Fl_Input_Choice.H
- Fl_Input_Choice.cxx

12.77 Fl_Int_Input Class Reference

The Fl_Int_Input class is a subclass of Fl_Input that only allows the user to type decimal digits (or hex numbers of the form 0xabcdef).

#include <Fl_Int_Input.H>

Inheritance diagram for Fl_Int_Input:

```

Public Member Functions

- Fl_Int_Input (int X, int Y, int W, int H, const char ∗l=0)

  Creates a new Fl_Int_Input widget using the given position, size, and label string.
Public Member Functions inherited from Fl_Input

- Fl_Input (int, int, int, int, const char ∗=0)
  Creates a new Fl_Input widget using the given position, size, and label string.
- int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Input_

- int append (const char ∗t, int l=0, char keep_selection=0)
  Append text at the end.
- bool can_redo () const
  Check if there is a redo action available.
- bool can_undo () const
  Check if the last operation can be undone.
- int copy (int clipboard)
  Put the current selection into the clipboard.
- int copy_cuts ()
  Copies the yank buffer to the clipboard.
- Fl_Color cursor_color () const
  Gets the color of the cursor.
- void cursor_color (Fl_Color n)
  Sets the color of the cursor.
- int cut ()
  Deletes the current selection.
- int cut (int a, int b)
  Deletes all characters between index \( a \) and \( b \).
- int cut (int n)
  Deletes the next \( n \) bytes rounded to characters before or after the cursor.
- double dvalue () const
  Returns the widget text interpreted as a floating point number.
- Fl_Input_ (int, int, int, int, const char ∗=0)
  Creates a new Fl_Input_ widget.
- unsigned int index (int i) const
  Returns the character at index \( i \).
- int input_type () const
  Gets the input field type.
- void input_type (int t)
  Sets the input field type.
- int insert (const char ∗t, int l=0)
  Inserts text at the cursor position.
- int insert_position () const
  Gets the position of the text cursor.
- int insert_position (int p)
  Sets the cursor position and mark.
- int insert_position (int p, int m)
  Sets the index for the cursor and mark.
- int ivalue () const
  Returns the widget text interpreted as a signed integer.
- int mark () const
  Gets the current selection mark.
- int mark (int m)
Sets the current selection mark.

- `int maximum_size () const`
  
  Gets the maximum length of the input field in characters.

- `void maximum_size (int m)`
  
  Sets the maximum length of the input field in characters.

- `int position () const`
- `int position (int p)`
- `int position (int p, int m)`
- `int readonly () const`
  
  Gets the read-only state of the input field.

- `void readonly (int b)`
  
  Sets the read-only state of the input field.

- `int redo ()`
  
  Redo previous undo operation.

- `int replace (int b, int e, const char ∗text, int ilen=0)`
  
  Deletes text from b to e and inserts the new string text.

- `void resize (int, int, int, int) FL_OVERRIDE`
  
  Changes the size of the widget.

- `int shortcut () const`
  
  Returns the shortcut key associated with this widget.

- `void shortcut (int s)`
  
  Sets the shortcut key associated with this widget.

- `int size () const`
  
  Returns the number of bytes in value().

- `void size (int W, int H)`
  
  Sets the width and height of this widget.

- `int static_value (const char ∗)`
  
  Changes the widget text.

- `int static_value (const char ∗, int)`
  
  Changes the widget text.

- `int tab_nav () const`
  
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

- `void tab_nav (int val)`
  
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

- `Fl_Color textcolor () const`
  
  Gets the color of the text in the input field.

- `void textcolor (Fl_Color n)`
  
  Sets the color of the text in the input field.

- `Fl_Font textfont () const`
  
  Gets the font of the text in the input field.

- `void textfont (Fl_Font s)`
  
  Sets the font of the text in the input field.

- `Fl_Fontsize textsize () const`
  
  Gets the size of the text in the input field.

- `void textsize (Fl_Fontsize s)`
  
  Sets the size of the text in the input field.

- `int undo ()`
  
  Undoes previous changes to the text buffer.

- `const char ∗value () const`
  
  Returns the text displayed in the widget.
Changes the widget text.
• int value (const char *, int)

Changes the widget text.
• int value (double value)

Changes the widget text to a floating point number ("%g").
• int value (int value)

Changes the widget text to a signed integer number.
• int wrap () const

Gets the word wrapping state of the input field.
• void wrap (int b)

Sets the word wrapping state of the input field.
• ~Fl_Input_ ()

Destroys the widget.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()

• void _set_fullscreen ()

• void activate ()

Activates the widget.
• unsigned int active () const

Returns whether the widget is active.
• int active_r () const

Returns whether the widget and all of its parents are active.
• Fl_Align align () const

Gets the label alignment.
• void align (Fl_Align alignment)

Sets the label alignment.
• long argument () const

Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)

Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()

Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const

• virtual Fl_Group * as_group ()

Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const

• virtual Fl_Window * as_window ()

Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const

• void bind_deimage (Fl_Image * img)

Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image * img)

Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const

Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.

• void callback (Fl_Callback ∗cb)
  
  Sets the current callback function for the widget.

• void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback ∗cb, void ∗p)
  
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 ∗cb)
  
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 ∗cb, long p=0)
  
  Sets the current callback function for the widget.

• unsigned int changed () const
  
  Checks if the widget value changed since the last callback.

• void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.

• void clear_output ()
  
  Sets a widget to accept input.

• void clear_visible ()
  
  Hides the widget.

• void clear_visible_focuss ()
  
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  
  Gets the background color of the widget.

• void color (Fl_Color bg)
  
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  
  For back compatibility only.

• void color2 (unsigned a)
  
  For back compatibility only.

• int contains (const Fl_Widget ∗w) const
  
  Checks if w is a child of this widget.

• void copy_label (const char ∗new_label)
  
  Sets the current label.

• void copy_tooltip (const char ∗text)
  
  Sets the current tooltip text.

• uchar damage () const
  
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image ∗ deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image ∗ deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image ∗img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget ∗wgt, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget ∗wgt, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **Fl_Image ∗ image ()**
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image ∗ image () const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image ∗img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget ∗wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

- **const char ∗ label () const**
  Gets the current label text.

- **void label (const char ∗text)**
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char ∗b)**
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  Sets the label color.

- **Fl_Font labelfont () const**
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group * p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- **const char * tooltip () const**
  
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  
  Gets the widget type.

- **void type (uchar t)**
  
  Sets the widget type.

- **int use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void * user_data () const**
  
  Gets the user data for this widget.

- **void user_data (Fl_Callback_User_Data *v, bool auto_free)**
  
  Sets the user data for this widget.

- **void user_data (void *v)**
  
  Sets the user data for this widget.

- **unsigned int visible () const**
  
  Returns whether a widget is visible.

- **unsigned int visible_focus () const**
  
  Checks whether this widget has a visible focus.

- **void visible_focus (int v)**
  
  Modifies keyboard focus navigation.

- **int visible_r () const**
  
  Returns whether a widget and all its parents are visible.

- **int w () const**
  
  Gets the widget width.

- **Fl_When when () const**
  
  Returns the conditions under which the callback is called.

- **void when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

- **Fl_Window * window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  
  Gets the widget position in its window.

- **int y () const**
  
  Gets the widget position in its window.

- **virtual ~Fl_Widget ()**
  
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int labelShortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int testShortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from Fl_Input

- static const char *copy_menu_text = "Copy"
  [this text may be customized at run-time]
- static const char *cut_menu_text = "Cut"
  [this text may be customized at run-time]
- static const char *paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
  }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Input

- void draw () FL_OVERRIDE
  Draws the widget.
- int handle_key ()
  Handles a keystroke.
- int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

- int apply_undo ()
  Apply the current undo/redo operation.
- void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
- void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
- void handle_mouse (int, int, int, int keepmark=0)
Handles mouse clicks and mouse moves.

- int **handle_text**(int e, int, int, int, int)

Handles all kinds of text field related events.

- int **line_end**(int i) const

  Finds the end of a line.

- int **line_start**(int i) const

  Finds the start of a line.

- int **linesPerPage**

- void **maybe_do_callback**(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

- int **up_down_position**(int, int keepmark=0)

  Moves the cursor to the column given by up_down_pos.

- int **word_end**(int i) const

  Finds the end of a word.

- int **word_start**(int i) const

  Finds the start of a word.

- int **xscroll**

- int **y_scroll**

- void **yscroll**(int yOffset)

Protected Member Functions inherited from Fl_Widget

- void **clear_flag**(unsigned int c)

  Clears a flag in the flags mask.

- void **draw_backdrop**(const)

  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box**(const)

  Draws the widget box according its box style.

- void **draw_box**(Fl_Boxtype t, Fl_Color c) const

  Draws a box of type t, of color c at the widget's position and size.

- void **draw_box**(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const

  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus**(const)

  Draws a focus rectangle around the widget.

- void **draw_focus**(Fl_Boxtype t, int X, int Y, int W, int H) const

  Draws a focus rectangle around the widget.

- void **draw_focus**(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const

  Draws a focus box for the widget at the given position and size.

- void **draw_label**(const)

  Draws the widget's label at the defined label position.

- void **draw_label**(int, int, int, int) const

  Draws the label in an arbitrary bounding box.

- Fl_Widget**(int x, int y, int w, int h, const char *label=0L)

  Creates a widget at the given position and size.

- unsigned int **flags**(const)

  Gets the widget flags mask.

- void **h**(int v)

  Internal use only.

- void **set_flag**(unsigned int c)

  Sets a flag in the flags mask.

- void **w**(int v)

  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

12.77.1 Detailed Description

The Fl_Int_Input class is a subclass of Fl_Input that only allows the user to type decimal digits (or hex numbers of the form 0xae).

12.77.2 Constructor & Destructor Documentation

12.77.2.1 Fl_Int_Input()

Fl_Int_Input::Fl_Int_Input (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char ∗ l = 0 )

Creates a new Fl_Int_Input widget using the given position, size, and label string.
The default boxtype is FL_DOWN_BOX.
Inherited destructor destroys the widget and any value associated with it.
The documentation for this class was generated from the following files:

• Fl_Int_Input.H
• Fl_Input.cxx

12.78 Fl_JPEG_Image Class Reference

The Fl_JPEG_Image class supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images.

#include <Fl_JPEG_Image.H>

Inheritance diagram for Fl_JPEG_Image:

Fl_JPEG_Image
Fl_RGB_Image
Fl_Image

Public Member Functions

• Fl_JPEG_Image (const char ∗filename)
  The constructor loads the JPEG image from the given jpeg filename.
• Fl_JPEG_Image (const char ∗name, const unsigned char ∗data, int data_length=-1)
  The constructor loads the JPEG image from memory.

Public Member Functions inherited from Fl_RGB_Image

• virtual Fl_SVG_Image ∗ as_svg_image ()

Generated by Doxygen
• void color_average (Fl_Color c, float i) FL_OVERRIDE
  The color_average() method averages the colors in the image with the provided FLTK color value.
• Fl_Image * copy () const
  Creates a resized copy of the image.
• void desaturate () FL_OVERRIDE
  The desaturate() method converts an image to grayscale.
• void draw (int X, int Y)
• void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  Draws the image to the current drawing surface with a bounding box.
• Fl_RGB_Image (const Fl_Pixmap * pxm, Fl_Color bg=FL_GRAY)
  The constructor creates a new RGBA image from the specified Fl_Pixmap.
• Fl_RGB_Image (const uchar * bits, int bits_length, int W, int H, int D, int LD)
  The constructor creates a new image from the specified data.
• Fl_RGB_Image (const uchar * bits, int W, int H, int D=3, int LD=0)
  The constructor creates a new image from the specified data.
• void label (Fl_Menu_Item * m) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a menu item.
• void label (Fl_Widget * w) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a widget or menu item.
• virtual void normalize ()
  Makes sure the object is fully initialized.
• void uncache () FL_OVERRIDE
  If the image has been cached for display, delete the cache data.
• ~Fl_RGB_Image () FL_OVERRIDE
  The destructor frees all memory and server resources that are used by the image.

Public Member Functions inherited from Fl_Image

• virtual class Fl_Shared_Image * as_shared_image ()
  Returns whether an image is an Fl_Shared_Image or not.
• Fl_Image * copy () const
  Creates a copy of the image in the same size.
• int count () const
  Returns the number of data values associated with the image.
• int d () const
  Returns the image depth.
• const char *const * data () const
  Returns a pointer to the current image data array.
• int data_h () const
  Returns the height of the image data.
• int data_w () const
  Returns the width of the image data.
• void draw (int X, int Y)
  Draws the image to the current drawing surface.
• int fail () const
  Returns a value that is not 0 if there is currently no image available.
• Fl_Image (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.
• int h () const
  Returns the current image drawing height in FLTK units.
• void **inactive** ()
  The **inactive()** method calls **color_average(FL_BACKGROUND_COLOR, 0.33f)** to produce an image that appears
grayed out.

• int **ld** () const
  Returns the current line data size in bytes.

• virtual void **release** ()
  Releases an **Fl_Image** - the same as 'delete this'.

• virtual void **scale** (int width, int height, int proportional=1, int can_expand=0)
  Sets the drawing size of the image.

• int **w** () const
  Returns the current image drawing width in FLTK units.

• virtual **~Fl_Image** ()
  The destructor is a virtual method that frees all memory used by the image.

Protected Member Functions

• void **load_jpg_** (const char *filename, const char *sharename, const unsigned char *data, int data_length=-1)

Protected Member Functions inherited from Fl_Image

• void **d** (int D)
  Sets the current image depth.

• void **data** (const char *const *p, int c)
  Sets the current data pointer and count of pointers in the array.

• void **draw_empty** (int X, int Y)
  The protected method **draw_empty()** draws a box with an X in it.

• int **draw_scaled** (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.

• void **h** (int H)
  Sets the height of the image data.

• void **Id** (int LD)
  Sets the current line data size in bytes.

• void **w** (int W)
  Sets the width of the image data.

Additional Inherited Members

Static Public Member Functions inherited from Fl_RGB_Image

• static size_t **max_size** ()
  Returns the maximum allowed image size in bytes when creating an **Fl_RGB_Image** object.

• static void **max_size** (size_t size)
  Sets the maximum allowed image size in bytes when creating an **Fl_RGB_Image** object.

Static Public Member Functions inherited from Fl_Image

• static **Fl_Labeltype** **define_FL_IMAGE_LABEL** ()
• static **Fl_RGB_Scaling** **RGB_scaling** ()
  Returns the currently used RGB image scaling method.

• static void **RGB_scaling** (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).

• static **Fl_RGB_Scaling** **scaling_algorithm** ()
  Gets what algorithm is used when resizing a source image to draw it.

• static void **scaling_algorithm** (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.
Public Attributes inherited from Fl_RGB_Image

- int alloc_array
  If non-zero, the object's data array is delete[]d when deleting the object.
- const uchar * array
  Points to the start of the object's data array.

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  True after fl_register_images() was called, false before.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

12.78.1 Detailed Description

The Fl_JPEG_Image class supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images. The class supports grayscale and color (RGB) JPEG image files.

12.78.2 Constructor & Destructor Documentation

12.78.2.1 Fl_JPEG_Image()

Fl_JPEG_Image::Fl_JPEG_Image (const char * filename )
const char * filename )
The constructor loads the JPEG image from the given jpeg filename.
The inherited destructor frees all memory and server resources that are used by the image.
Use Fl_Image::fail() to check if Fl_JPEG_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the JPEG format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason. If the image has loaded correctly, w(), h(), and d() should return values greater than zero.

Parameters

- filename [in] a full path and name pointing to a valid jpeg file.

See also

Fl_JPEG_Image::Fl_JPEG_Image(const char * imagename, const unsigned char * data)

12.78.2.2 Fl_JPEG_Image()

Fl_JPEG_Image::Fl_JPEG_Image (const char * name,
const unsigned char * data,
int data_length = -1 )
The constructor loads the JPEG image from memory.
Construct an image from a block of memory inside the application. Fluid offers "binary Data" chunks as a great way to add image data into the C++ source code. name_png can be NULL. If a name is given, the image is added to the list of shared images (see: Fl_Shared_Image) and will be available by that name.
The inherited destructor frees all memory and server resources that are used by the image. Use Fl_Image::fail() to check if Fl_JPEG_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the JPEG format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason. If the image has loaded correctly, w(), h(), and d() should return values greater than zero.

Parameters

<table>
<thead>
<tr>
<th>name</th>
<th>A unique name or NULL</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>A pointer to the memory location of the JPEG image</td>
</tr>
<tr>
<td>data_length</td>
<td>optional length of data. This will protect memory outside of the data array from illegal read operations</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_JPEG_Image.H
- Fl_JPEG_Image.cxx

12.79 Fl_Label Struct Reference

This struct stores all information for a text or mixed graphics label.

#include <Fl_Widget.H>

Public Member Functions

- void draw (int, int, int, int, Fl_Align) const

  Draws the label aligned to the given box.

- void measure (int &w, int &h) const

  Measures the size of the label.

Public Attributes

- Fl_Align align_

  alignment of label

- Fl_Color color

  text color

- Fl_Image *deimage

  optional image for a deactivated label

- Fl_Font font

  label font used in text

- Fl_Image *image

  optional image for an active label

- Fl_Fontsize size

  size of label font

- uchar type

  type of label.

- const char *value

  label text
12.79.1 Detailed Description
This struct stores all information for a text or mixed graphics label.

Todo There is an aspiration that the Fl_Label type will become a widget by itself. That way we will be avoiding a
lot of code duplication by handling labels in a similar fashion to widgets containing text. We also provide an
easy interface for very complex labels, containing html or vector graphics. However, this re-factoring is not in
place in this release.

12.79.2 Member Function Documentation
12.79.2.1 draw()

void Fl_Label::draw (  
    int X,  
    int Y,  
    int W,  
    int H,  
    Fl_Align align ) const

Draws the label aligned to the given box.
Draws a label with arbitrary alignment in an arbitrary box.

12.79.2.2 measure()

void Fl_Label::measure (  
    int & W,  
    int & H ) const

Measures the size of the label.

Parameters

| in, out | W,H | : this is the requested size for the label text plus image; on return, this will contain the size |
|---------|-----|: this is the requested size for the label text plus image; on return, this will contain the size |
|         |     | needed to fit the label |

12.79.3 Member Data Documentation
12.79.3.1 type

uchar Fl_Label::type

type of label.

12.80 Fl_Light_Button Class Reference

This subclass displays the "on" state by turning on a light, rather than drawing pushed in.

#include <Fl_Light_Button.H>

Inheritance diagram for Fl_Light_Button:
Public Member Functions

- **Fl_Light_Button (int x, int y, int w, int h, const char ∗=0)**
  
  Creates a new Fl_Light_Button widget using the given position, size, and label string.

- **int handle (int) FL_OVERRIDE**
  
  Handles the specified event.

Public Member Functions inherited from Fl_Button

- **int clear ()**
  
  Same as value(0).

- **uchar compact ()**
  
  Return true if buttons are rendered as compact buttons.

- **void compact (uchar v)**
  
  Decide if buttons should be rendered in compact mode.

- **Fl_Boxtype down_box () const**
  
  Returns the current down box type, which is drawn when value() is non-zero.

- **void down_box (Fl_Boxtype b)**
  
  Sets the down box type.

- **Fl_Color down_color () const**
  
  (for backwards compatibility)

- **void down_color (unsigned c)**
  
  (for backwards compatibility)

- **Fl_Button (int X, int Y, int W, int H, const char ∗L=0)**
  
  The constructor creates the button using the given position, size, and label.

- **int set ()**
  
  Same as value(1).

- **void setonly ()**
  
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).

- **int shortcut () const**
  
  Returns the current shortcut key for the button.

- **void shortcut (const char ∗s)**
  
  (for backwards compatibility)

- **void shortcut (int s)**
  
  Sets the shortcut key to s.

- **char value () const**
  
  Returns the current value of the button (0 or 1).

- **int value (int v)**
  
  Sets the current value of the button.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const ∗ as_group () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
Checks if the widget value changed since the last callback.

- **void clear_active ()**
  
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  
  Clears or sets the damage flags.

- **void clear_output ()**
  
  Sets a widget to accept input.

- **void clear_visible ()**
  
  Hides the widget.

- **void clear_visible_focus ()**
  
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  
  For back compatibility only.

- **void color2 (unsigned a)**
  
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  
  Sets the current label.

- **void copy_tooltip (const char *text)**
  
  Sets the current tooltip text.

- **uchar damage () const**
  
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  
  Internal use only.

- **void deactivate ()**
  
  Deactivates the widget.

- **Fl_Image * deimage ()**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image * deimage () const**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int int, int int, int int, Fl_Choice) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Label a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- unsigned int output() const
  Returns if a widget is used for output only.

- Fl_Group * parent() const
  Returns a pointer to the parent widget.

- void parent(Fl_Group *p)
  Internal use only - “for hacks only”.

- void position(int X, int Y)
  Repositions the window or widget.

- void redraw()
  Schedules the drawing of the widget.

- void redraw_label()
  Schedules the drawing of the label.

- virtual void resize(int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color() const
  Gets the selection color.

- void selection_color(Fl_Color a)
  Sets the selection color.

- void set_active()
  Marks the widget as active without sending events or changing focus.

- void set_changed()
  Marks the value of the widget as changed.

- void set_output()
  Sets a widget to output only.

- void set_visible()
  Makes the widget visible.

- void set_visible_focus()
  Enables keyboard focus navigation with this widget.

- int shortcut_label() const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label(int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void show()
  Makes a widget visible.

- void size(int W, int H)
  Changes the size of the widget.

- int take_focus()
  Gives the widget the keyboard focus.

- unsigned int takesevents() const
  Returns if the widget is able to take events.

- int testShortcut()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char * tooltip() const
  Gets the current tooltip text.

- void tooltip(const char *text)
  Sets the current tooltip text.

- Fl_Window * top_window()
  Returns a pointer to the top-level window for the widget.

- Fl_Window * top_window_offset(int &xoff, int &yoff)
  Finds the x/y offset of the current widget relative to the top-level window.
• **uchar type () const**
  
  Gets the widget type.

• **void type (uchar t)**
  
  Sets the widget type.

• **int use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void * user_data () const**
  
  Gets the user data for this widget.

• **void user_data (Fl_Callback_User_Data *v, bool auto_free)**
  
  Sets the user data for this widget.

• **void user_data (void *v)**
  
  Sets the user data for this widget.

• **unsigned int visible () const**
  
  Returns whether a widget is visible.

• **unsigned int visible_focus () const**
  
  Checks whether this widget has a visible focus.

• **void visible_focus (int v)**
  
  Modifies keyboard focus navigation.

• **int visible_r () const**
  
  Returns whether a widget and all its parents are visible.

• **int w () const**
  
  Gets the widget width.

• **FL_When when () const**
  
  Returns the conditions under which the callback is called.

• **void when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

• **FL_Window * window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int x () const**
  
  Gets the widget position in its window.

• **int y () const**
  
  Gets the widget position in its window.

• **virtual ~Fl_Widget ()**
  
  Destroys the widget.

**Protected Member Functions**

• **void draw () FL_OVERRIDE**
  
  Draws the widget.

**Protected Member Functions inherited from Fl_Button**

• **void simulate_key_action ()**

**Protected Member Functions inherited from Fl_Widget**

• **void clear_flag (unsigned int c)**
  
  Clears a flag in the flags mask.

• **void draw_backdrop () const**
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• **void draw_box () const**
  
  Draws the widget box according its box style.
• **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type `t`, of color `c` at the widget's position and size.

• **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  Draws a box of type `t`, of color `c` at the position `X,Y` and size `W,H`.

• **void draw_focus () const**
  Draws a focus rectangle around the widget.

• **void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const**
  Draws a focus box for the widget at the given position and size.

• **void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  Draws a focus box for the widget at the given position and size.

• **void draw_label () const**
  Draws the widget's label at the defined label position.

• **void draw_label (int, int, int, int) const**
  Draws the label in an arbitrary bounding box.

• **Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)**
  Creates a widget at the given position and size.

• **unsigned int flags () const**
  Gets the widget flags mask.

• **void h (int v)**
  Internal use only.

• **void set_flag (unsigned int c)**
  Sets a flag in the flags mask.

• **void w (int v)**
  Internal use only.

• **void x (int v)**
  Internal use only.

• **void y (int v)**
  Internal use only.

---

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

• **static void default_callback (Fl_Widget ∗widget, void ∗data)**
  The default callback for all widgets that don't set a callback.

• **static unsigned int label_shortcut (const char ∗t)**
  Returns the Unicode value of the '&x' shortcut in a given text.

• **static int test_shortcut (const char ∗t, const bool require_alt=false)**
  Returns true if the given text `t` contains the entered '&x' shortcut.

---

**Protected Types inherited from Fl_Widget**

• **enum {**
  \[ details of enum \]
  \}
  flags possible values enumeration.

12.80.1 Detailed Description

This subclass displays the "on" state by turning on a light, rather than drawing pushed in. The shape of the "light" is initially set to FL_DOWN_BOX. The color of the light when on is controlled with selection_color(), which defaults to FL_YELLOW.

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for type() and when().

![Image of Fl_Light_Button](image.png)

Figure 12.27 Fl_Light_Button

12.80.2 Constructor & Destructor Documentation

12.80.2.1 Fl_Light_Button()

Fl_Light_Button::Fl_Light_Button ( int X, int Y, int W, int H, const char * l = 0 )

Creates a new Fl_Light_Button widget using the given position, size, and label string. The default box type is FL_UP_BOX and the default down box type down_box() is FL_NO_BOX (0). The selection_color() sets the color of the "light". Default is FL_YELLOW.

The default label alignment is 'FL_ALIGN_LEFT|FL_ALIGN_INSIDE' so the label is drawn inside the button area right of the "light".

Note

Do not change the default box types of Fl_Light_Button. The box types determine how the button is drawn. If you change the down_box() type the drawing behavior is undefined.

12.80.3 Member Function Documentation

12.80.3.1 draw()

void Fl_Light_Button::draw ( ) [protected], [virtual]

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();
```

Reimplemented from Fl_Button.

12.80.3.2 handle()

int Fl_Light_Button::handle ( int event ) [virtual]
Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in   | event | the kind of event received |

Return values

| 0    | if the event was not used or understood |
| 1    | if the event was used and can be deleted |

- Fl_Light_Button.cxx

12.81 Fl_Line_Dial Class Reference

Inheritance diagram for Fl_Line_Dial:

```
Fl_Widget
   
Fl_Valuator
   
Fl_Dial
   
Fl_Line_Dial
```

Public Member Functions

- Fl_Line_Dial (int X, int Y, int W, int H, const char *L=0)

Public Member Functions inherited from Fl_Dial

- short angle1 () const
  
  Sets Or gets the angles used for the minimum and maximum values.

- void angle1 (short a)
See short `angle1() const`.

- short `angle2 () const`
  See short `angle1() const`.

- void `angle2 (short a)`
  See short `angle1() const`.

- void `angles (short a, short b)`
  See short `angle1() const`.

- `Fl_Dial (int x, int y, int w, int h, const char ∗l=0)`
  Creates a new `Fl_Dial` widget using the given position, size, and label string.

- int `handle (int)` FL_OVERRIDE
  Allow subclasses to handle event based on current position and size.

**Public Member Functions inherited from `Fl_Valuator`**

- void `bounds (double a, double b)`
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- double `clamp (double)`
  Clamps the passed value to the valuator range.

- virtual int `format (char ∗)`
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- double `increment (double, int)`
  Adds n times the step value to the passed value.

- double `maximum () const`
  Gets the maximum value for the valuator.

- void `maximum (double a)`
  Sets the maximum value for the valuator.

- double `minimum () const`
  Gets the minimum value for the valuator.

- void `minimum (double a)`
  Sets the minimum value for the valuator.

- void `precision (int digits)`
  Sets the step value to $1.0 / 10^{digits}$.

- void `range (double a, double b)`
  Sets the minimum and maximum values for the valuator.

- double `round (double)`
  Round the passed value to the nearest step increment.

- double `step () const`
  Gets or sets the step value.

- void `step (double a, int b)`
  See double `Fl_Valuator::step() const`

- void `step (double s)`
  See double `Fl_Valuator::step() const`.

- void `step (int a)`
  See double `Fl_Valuator::step() const`.

- double `value () const`
  Gets the floating point(double) value.

- int `value (double)`
  Sets the current value.
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• FL_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (FL_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (FL_Callback ∗ cb, FL_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (FL_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
• void callback (FL_Callback0 ∗ cb)
  Sets the current callback function for the widget.
• void callback (FL_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget * w) const
  Checks if w is a child of this widget.

- void copy_label (const char * new_label)
  Sets the current label.

- void copy_tooltip (const char * text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image & img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw()
  Schedules the drawing of the widget.

- void redraw_label()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active()
  Marks the widget as active without sending events or changing focus.

- void set_changed()
  Marks the value of the widget as changed.

- void set_output()
  Sets a widget to output only.

- void set_visible()
  Makes the widget visible.

- void set_visible_focus()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void show()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut()
  Returns true if the widget's label contains the entered 'x' shortcut.

- const char * tooltip () const
  Gets the current tooltip text.

- void tooltip (const char *text)
  Sets the current tooltip text.

- Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data +v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void +v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

```
enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 ,
  CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 ,
  CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 ,
  NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 ,
  MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 ,
  USERFLAG1 = 1<<31 }
```

flags possible values enumeration.

Protected Member Functions inherited from Fl_Dial

```
• void draw () FL_OVERRIDE
  Draws dial at current position and size.
• void draw (int X, int Y , int W, int H)
  Draws dial at given position and size.
• int handle (int event, int X, int Y , int W, int H)
  Allows subclasses to handle event based on given position and size.
```

Protected Member Functions inherited from Fl_Valuator

```
• Fl_Valuator (int X, int Y, int W, int H, const char ∗L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
• void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
• void handle_push ()
  Stores the current value in the previous value.
• void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
• int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
• double previous_value () const
  Gets the previous floating point value before an event changed it.
• void set_value (double v)
  Sets the current floating point value.
• double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.
• virtual void value_damage ()
  Asks for partial redraw.
```

Protected Member Functions inherited from Fl_Widget

```
• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
```

Generated by Doxygen
Draws the widget box according its box style.

- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
  Draws a focus rectangle around the widget.
- void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
  Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- FL_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int **flags** () const
  Gets the widget flags mask.
- void **h** (int v)
  Internal use only.
- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.
- void **w** (int v)
  Internal use only.
- void **x** (int v)
  Internal use only.
- void **y** (int v)
  Internal use only.

The documentation for this class was generated from the following files:

- Fl_Line_Dial.H
- Fl_Dial.cxx

### Fl_Mac_App_Menu Class Reference

#### Static Public Member Functions

- static void **custom_application_menu_items** (const Fl_Menu_Item ∗m)
  Adds custom menu item(s) to the application menu of the system menu bar.

#### Static Public Attributes

- static const char ∗**about**
  Localizable text for the "About xxx" application menu item.
- static const char ∗**hide**
  Localizable text for the "Hide xxx" application menu item.
- static const char ∗**hide_others**
  Localizable text for the "Hide Others" application menu item.
- static const char ∗**print**
  Localizable text for the "Print Front Window" application menu item.
- static const char ∗**print_no_titlebar**

Generated by Doxygen
Localizable text for the "Print Front Window" application menu item.

- static const char * quit
  Localizable text for the "Quit xxx" application menu item.
- static const char * services
  Localizable text for the "Services" application menu item.
- static const char * show
  Localizable text for the "Show All" application menu item.
- static const char * toggle_print_titlebar
  Localizable text for the "Toggle print titlebar" application menu item.

### 12.82.1 Member Function Documentation

#### 12.82.1.1 custom_application_menu_items()

static void Fl_Mac_App_Menu::custom_application_menu_items (const Fl_Menu_Item * m) [static]

Adds custom menu item(s) to the application menu of the system menu bar. They are positioned after the "Print Front Window / Toggle printing of titlebar" items, or at their place if they were removed with Fl_Mac_App_Menu::print = "".

**Parameters**

- `m` zero-ending array of Fl_Menu_Item's.

### 12.82.2 Member Data Documentation

#### 12.82.2.1 print

const char* Fl_Mac_App_Menu::print [static]

Localizable text for the "Print Front Window" application menu item.

This menu item and next one won't be displayed if Fl_Mac_App_Menu::print is set to an empty string.

The documentation for this class was generated from the following file:

- mac.H

### 12.83 Fl_Menu_ Class Reference

Base class of all widgets that have a menu in FLTK.

#include <Fl_Menu_.H>

Inheritance diagram for Fl_Menu_:

```
Fl_Widget
  Fl_Menu_
  Fl_Choice  Fl_Menu_Bar  Fl_Menu_Button
  Fl_Scheme_Choice  Fl_Sys_Menu_Bar
```

**Public Member Functions**

- int add (const char *)
This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with \'|\' separating the menu items, and tab separating the menu item names from an optional shortcut string.

- **int add (const char *, int shortcut, Fl_Callback *, void *=0, int=0)**
  Adds a new menu item.

- **int add (const char +a, const char +b, Fl_Callback +c, void +d=0, int e=0)**
  See int Fl_Menu_::add(const char label, int shortcut, Fl_Callback*, void +user_data=0, int flags=0)

- **void clear ()**
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

- **int clear_submenu (int index)**
  Clears the specified submenu pointed to by index of all menu items.

- **void copy (const Fl_Menu_Item *, void *user_data=0)**
  Sets the menu array pointer with a copy of m that will be automatically deleted.

- **Fl_Boxtype down_box () const**
  This box type is used to surround the currently-selected items in the menus.

- **void down_box (Fl_Boxtype b)**
  Sets the box type used to surround the currently-selected items in the menus.

- **Fl_Color down_color () const**
  For back compatibility, same as selection_color()

- **void down_color (unsigned c)**
  For back compatibility, same as selection_color()

- **int find_index (const char *name) const**
  Find the menu item index for a given menu pathname, such as "Edit/Copy".

- **int find_index (const Fl_Menu_Item *item) const**
  Find the index into the menu array for a given item.

- **int find_index (Fl_Callback *cb) const**
  Find the index into the menu array for a given callback cb.

- **const Fl_Menu_Item *find_item (const char *name)**
  Find the menu item for a given menu pathname, such as "Edit/Copy".

- **const Fl_Menu_Item *find_item (Fl_Callback *cb)**
  Find the menu item for the given callback cb.

- **const Fl_Menu_Item *find_item_with_argument (long)**
  Find the menu item for the given user argument v.

- **const Fl_Menu_Item *find_item_with_user_data (void *)**
  Find the menu item for the given user data v.

- **Fl_Menu_ (int, int, int, int, const char *0)**
  Creates a new Fl_Menu_ widget using the given position, size, and label string.

- **void global ()**
  Make the shortcuts for this menu work no matter what window has the focus when you type it.

- **int insert (int index, const char *, int shortcut, Fl_Callback *, void *=0, int=0)**
  Inserts a new menu item at the specified index position.

- **int insert (int index, const char +a, const char +b, Fl_Callback +c, void +d=0, int e=0)**
  See int Fl_Menu_::insert(const char label, int shortcut, Fl_Callback*, void +user_data=0, int flags=0)

- **int item_pathname (char *name, int namelen, const Fl_Menu_Item *finditem=0) const**
  Get the menu 'pathname' for the specified menuitem.

- **const Fl_Menu_Item *menu () const**
  Returns a pointer to the array of Fl_Menu_Items.

- **void menu (const Fl_Menu_Item +m)**
  Sets the menu array pointer directly.

- **Fl_Boxtype menu_box () const**
  Get the box type for the menu popup windows.

- **void menu_box (Fl_Boxtype b)**

Set the box type for the menu popup windows.

- **const Fl_Menu_Item** ∗ menu_end ()
  Finishes menu modifications and returns menu().

- **int** mode (int i) const
  Gets the flags of item i.

- **void** mode (int i, int fl)
  Sets the flags of item i.

- **const Fl_Menu_Item** ∗ mvalue () const
  Returns a pointer to the last menu item that was picked.

- **const Fl_Menu_Item** ∗ picked (const Fl_Menu_Item ∗)
  When user picks a menu item, call this.

- **const Fl_Menu_Item** ∗ prev_mvalue () const
  Returns a pointer to the menu item that was picked before the current one was picked.

- **void** remove (int)
  Deletes item i from the menu.

- **void** replace (int, const char ∗)
  Changes the text of item i.

- **void** setonly (Fl_Menu_Item ∗+item)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

- **void** shortcut (int i, int s)
  Changes the shortcut of item i to s.

- **int** size () const
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.

- **void** size (int W, int H)

- **const Fl_Menu_Item** ∗ test_shortcut ()
  Returns the menu item with the entered shortcut (key value).

- **const char** ∗ text () const
  Returns the title of the last item chosen.

- **const char** ∗ text (int i) const
  Returns the title of item i.

- **Fl_Color** textcolor () const
  Get the current color of menu item labels.

- **void** textcolor (Fl_Color c)
  Sets the current color of menu item labels.

- **Fl_Font** textfont () const
  Gets the current font of menu item labels.

- **void** textfont (Fl_Font c)
  Sets the current font of menu item labels.

- **Fl_Fontsize** textsize () const
  Gets the font size of menu item labels.

- **void** textsize (Fl_Fontsize c)
  Sets the font size of menu item labels.

- **int** value () const
  Returns the index into menu() of the last item chosen by the user.

- **int** value (const Fl_Menu_Item ∗)
  The value is the index into menu() of the last item chosen by the user.

- **int** value (int i)
  The value is the index into menu() of the last item chosen by the user.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const ∗ as_group () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
Checks if the widget value changed since the last callback.

- void clear_active()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed()
  Marks the value of the widget as unchanged.

- void clear_damage(uchar c=0)
  Clears or sets the damage flags.

- void clear_output()
  Sets a widget to accept input.

- void clear_visible()
  Hides the widget.

- void clear_visible_focus()
  Disables keyboard focus navigation with this widget.

- Fl_Color color() const
  Gets the background color of the widget.

- void color(Fl_Color bg)
  Sets the background color of the widget.

- void color(Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2() const
  For back compatibility only.

- void color2(unsigned a)
  For back compatibility only.

- int contains(const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label(const char *new_label)
  Sets the current label.

- void copy_tooltip(const char *text)
  Sets the current tooltip text.

- uchar damage() const
  Returns non-zero if draw() needs to be called.

- void damage(uchar c)
  Sets the damage bits for the widget.

- void damage(uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize(int, int, int, int)
  Internal use only.

- void deactivate()
  Deactivates the widget.

- Fl_Image *deimage()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image *deimage() const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage(Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage(Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound() const
  Returns whether the inactive image is managed by the widget.

- void do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• virtual void draw ()=0
  Draws the widget.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual int handle (int event)
  Handles the specified event.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image ∗ image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image ∗ image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char ∗ label () const
  Gets the current label text.

• void label (const char ∗text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
Sets width \( ww \) and height \( hh \) accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**

  Sets whether this widget needs a keyboard.

- **unsigned int output () const**

  Returns if a widget is used for output only.

- **Fl_Group *parent () const**

  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**

  Internal use only - “for hacks only”.

- **void position (int X, int Y)**

  Repositions the window or widget.

- **void redraw ()**

  Schedules the drawing of the widget.

- **void redraw_label ()**

  Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**

  Changes the size or position of the widget.

- **Fl_Color selection_color () const**

  Gets the selection color.

- **void selection_color (Fl_Color a)**

  Sets the selection color.

- **void set_active ()**

  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**

  Marks the value of the widget as changed.

- **void set_output ()**

  Sets a widget to output only.

- **void set_visible ()**

  Makes the widget visible.

- **void set_visible_focus ()**

  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**

  Returns whether the widget's label uses ‘&’ to indicate shortcuts.

- **void shortcut_label (int value)**

  Sets whether the widget's label uses ‘&’ to indicate shortcuts.

- **virtual void show ()**

  Makes a widget visible.

- **void size (int W, int H)**

  Changes the size of the widget.

- **int take_focus ()**

  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**

  Returns if the widget is able to take events.

- **int test_shortcut ()**

  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char * tooltip () const**

  Gets the current tooltip text.

- **void tooltip (const char *text)**

  Sets the current tooltip text.
- `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.

- `int use_accents_menu ()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void * user_data () const`
  Gets the user data for this widget.

- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
  Sets the user data for this widget.

- `void user_data (void *v)`
  Sets the user data for this widget.

- `unsigned int visible () const`
  Returns whether a widget is visible.

- `unsigned int visible_focus () const`
  Checks whether this widget has a visible focus.

- `void visible_focus (int v)`
  Modifies keyboard focus navigation.

- `int visible_r () const`
  Returns whether a widget and all its parents are visible.

- `int w () const`
  Gets the widget width.

- `Fl_When when () const`
  Returns the conditions under which the callback is called.

- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- `virtual ~Fl_Widget ()`
  Destroys the widget.

Protected Member Functions

- `int item_pathname_ (char *name, int namelen, const Fl_Menu_Item *finditem, const Fl_Menu_Item *menu=0) const`

Protected Member Functions inherited from Fl_Widget

- `void clear_flag (unsigned int c)`
  Clears a flag in the flags mask.

- `void draw_backdrop () const`
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- `void draw_box () const`
  Draws the widget box according its box style.
• **void** `draw_box` (**Fl_Boxtype** t, **Fl_Color** c) const  
  Draws a box of type t, of color c at the widget's position and size.

• **void** `draw_box` (**Fl_Boxtype** t, int x, int y, int w, int h, **Fl_Color** c) const  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• **void** `draw_focus` () const  
  Draws a focus rectangle around the widget.

• **void** `draw_focus` (**Fl_Boxtype** t, int X, int Y, int W, int H) const  
  Draws a focus rectangle around the widget.

• **void** `draw_focus` (**Fl_Boxtype** t, int x, int y, int w, int h, **Fl_Color** bg) const  
  Draws a focus box for the widget at the given position and size.

• **void** `draw_label` () const  
  Draws the widget's label at the defined label position.

• **void** `draw_label` (int, int, int, int) const  
  Draws the label in an arbitrary bounding box.

• **Fl_Widget** (int x, int y, int w, int h, const char ∗=0L)  
  Creates a widget at the given position and size.

• unsigned int `flags` () const  
  Gets the widget flags mask.

• **void** `h` (int v)  
  Internal use only.

• **void** `set_flag` (unsigned int c)  
  Sets a flag in the flags mask.

• **void** `w` (int v)  
  Internal use only.

• **void** `x` (int v)  
  Internal use only.

• **void** `y` (int v)  
  Internal use only.

### Protected Attributes

- uchar `alloc`
- uchar `down_box_`
- **Fl_Boxtype** `menu_box_`
- **Fl_Color** `textcolor_`
- **Fl_Font** `textfont_`
- **Fl_Fontsize** `textsize_`

### Additional Inherited Members

#### Static Public Member Functions inherited from **Fl_Widget**

- static **void** `default_callback` (**Fl_Widget** ∗=widget, void ∗=data)  
  The default callback for all widgets that don't set a callback.

- static unsigned int `label_shortcut` (const char ∗=t)  
  Returns the Unicode value of the 'x' shortcut in a given text.

- static int `test_shortcut` (const char ∗=t, const bool require_alt=false)  
  Returns true if the given text t contains the entered '+x' shortcut.
Protected Types inherited from **Fl_Widget**

```c
enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.
```

### 12.83.1 Detailed Description

Base class of all widgets that have a menu in FLTK.

Currently FLTK provides you with **Fl_Menu_Button**, **Fl_Menu_Bar**, and **Fl_Choice**.

The class contains a pointer to an array of structures of type **Fl_Menu_Item**. The array may either be supplied directly by the user program, or it may be "private": a dynamically allocated array managed by the **Fl_Menu_**.

When the user clicks a menu item, **value()** is set to that item and then:

- If the **Fl_Menu_Item** has a callback set, that callback is invoked with any userdata configured for it. (The **Fl_Menu_** widget's callback is NOT invoked.)
- For any **Fl_Menu_Items** that don't have a callback set, the **Fl_Menu_** widget's callback is invoked with any userdata configured for it. The callback can determine which item was picked using **value()**, **mvalue()**, **item_pathname()**, etc.

The line spacing between menu items can be controlled with the global setting **Fl::menu_linespacing()**.

See also

* **Fl_Widget::shortcut_label(int)**

### 12.83.2 Constructor & Destructor Documentation

#### 12.83.2.1 **Fl_Menu()**

```c
Fl_Menu_::Fl_Menu_ ( int X, int Y, int W, int H, const char ∗ l = 0 )
```

Creates a new **Fl_Menu_** widget using the given position, size, and label string. **menu()** is initialized to null.

### 12.83.3 Member Function Documentation

#### 12.83.3.1 **add()**

```c
int Fl_Menu_::add ( const char ∗ str )
```

This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string. The passed string is split at any '|' characters and then **add(s,0,0,0,0)** is done with each section. This is often useful if you are just using the value, and is compatible with Forms and other GL programs. The section strings use the same special characters as described for the long version of **add()**.

---

Generated by Doxygen
No items must be added to a menu during a callback to the same menu.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>str</code></td>
<td>string containing multiple menu labels as described above</td>
</tr>
</tbody>
</table>

Returns

the index into the menu() array, where the entry was added

12.83.3.2 add() [2/2]

```cpp
int Fl_Menu_::add (const char * label, int shortcut, Fl_Callback * callback, void * userdata = 0, int flags = 0)
```

Adds a new menu item.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>label</code></td>
<td>The text label for the menu item.</td>
</tr>
<tr>
<td><code>shortcut</code></td>
<td>Optional keyboard shortcut that can be an int or string: (FL_CTRL+'a') or &quot;^a&quot;. Default 0 if none.</td>
</tr>
<tr>
<td><code>callback</code></td>
<td>Optional callback invoked when user clicks the item. Default 0 if none.</td>
</tr>
<tr>
<td><code>userdata</code></td>
<td>Optional user data passed as an argument to the callback. Default 0 if none.</td>
</tr>
<tr>
<td><code>flags</code></td>
<td>Optional flags that control the type of menu item; see below. Default is 0 for none.</td>
</tr>
</tbody>
</table>

Returns

The index into the menu() array, where the entry was added.

Description

If the menu array was directly set with menu(x), then copy() is done to make a private array.

Since this method can change the internal menu array, any menu item pointers or indices the application may have cached can become stale, and should be recalculated/refreshed.

A menu item's callback must not add() items to its parent menu during the callback.

Due to backwards compatibility and historical restrictions we recommend to use either

- static menu arrays that are not extended during runtime or
- dynamic, extendable menu item arrays that are entirely created by using add() or insert().

This ensures that all menu arrays and strings are copied to internal storage and released when required.

Note

If you create menus from static Fl_Menu_Item arrays and add() or insert() more menu items later, then the menu array is copied to local storage but some local (static) strings may appear to "leak memory". This is a known issue and discouraged usage (see description above) but the impact on memory usage should typically be small.

Detailed Description of Parameters

---

Generated by Doxygen
label

The menu item's label. This argument is required and must not be NULL.

The characters "&", "/", "\", and "_" are treated as special characters in the label string. The "&" character specifies that the following character is an accelerator and will be underlined. The "\" character is used to escape the next character in the string. Labels starting with the "_" character cause a divider to be placed after that menu item.

A label of the form "File/Quit" will create the submenu "File" with a menu item called "Quit".

The label string is copied to new memory and can be freed. The other arguments (including the shortcut) are copied into the menu item unchanged.

If an item exists already with that name then it is replaced with this new one. Otherwise this new one is added to the end of the correct menu or submenu. The return value is the offset into the array that the new entry was placed at.

shortcut

The keyboard shortcut for this menu item.

This parameter is optional, and defaults to 0 to indicate no shortcut.

The shortcut can either be a raw integer value (eg. FL_CTRL+'A') or a string (eg. "^c" or "^97").

Raw integer shortcuts can be a combination of keyboard chars (eg. 'A') and optional keyboard modifiers (see Fl::event_state(), e.g. FL_SHIFT, etc). In addition, FL_COMMAND can be used to denote FL_META under Mac OS X and FL_CTRL under other platforms.

String shortcuts can be specified in one of two ways:

- \<ascii_value> e.g. "97", "^97", "+97", "#97"
- \<ascii_char> e.g. "a", "^a", "+a", "#a"

.. where \<ascii_value> is a decimal value representing an ASCII character (eg. 97 is the ascii code for 'a'), and the optional prefixes enhance the value that follows. Multiple prefixes must appear in the order below.

\# - Alt
+ - Shift
^ - Control

Internally, the text shortcuts are converted to integer values using Fl_old_shortcut(const char*).
callback

The callback to invoke when this menu item is selected.

This parameter is optional, and defaults to 0 for no callback.

userdata

The callback’s ‘user data’ that is passed to the callback.

This parameter is optional, and defaults to 0.

flags

These are bit flags to define what kind of menu item this is.

This parameter is optional, and defaults to 0 to define a ‘regular’ menu item.

These flags can be ‘OR’ed together:

- FL_MENU_INACTIVE // Deactivate menu item (gray out)
- FL_MENU_TOGGLE // Item is a checkbox toggle (shows checkbox for on/off state)
- FL_MENU_VALUE // The on/off state for checkbox/radio buttons (if set, state is ‘on’)
- FL_MENU_RADIO // Item is a radio button (one checkbox of many can be on)
- FL_MENU_INVISIBLE // Item will not show up (shortcut will work)
- FL_SUBMENU_POINTER // Indicates user_data() is a pointer to another menu array
- FL_SUBMENU // This item is a submenu to other items
- FL_MENU_DIVIDER // Creates divider line below this item. Also ends a group of radio buttons.

All other bits in ‘flags’ are reserved and must not be used.

If FL_SUBMENU is set in an item’s flags, then actually two items are added:

- the first item is the menu item (submenu title), as expected, and
- the second item is the submenu terminating item with the label and all other members set to 0.

If you add submenus with the ‘path’ technique, then the corresponding submenu terminators (maybe more than one) are added as well.

Todo Raw integer shortcut needs examples. Dependent on responses to https://www.fltk.org/newsgroups.php?g=ftlk.coredev+v:10086 and results of STR#2344

12.83.3.3 clear()

void Fl_Menu_::clear ( )

Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

Menus must not be cleared during a callback to the same menu.

12.83.3.4 clear_submenu()

int Fl_Menu_::clear_submenu ( int index )

Clears the specified submenu pointed to by index of all menu items.

This method is useful for clearing a submenu so that it can be re-populated with new items. Example: a "File/Recent Files/..." submenu that shows the last few files that have been opened.

The specified index must point to a submenu.

The submenu is cleared with remove(). If the menu array was directly set with menu(x), then copy() is done to make a private array.
Warning

Since this method can change the internal menu array, any menu item pointers or indices the application may have cached can become stale, and should be recalculated/refreshed.

Example:

```cpp
int index = menubar->find_index("File/Recent"); // get index of "File/Recent" submenu
if ( index != -1 ) menubar->clear_submenu(index); // clear the submenu
menubar->add("File/Recent/Aaa");
mubar->add("File/Recent/Bbb");
```

Parameters

| index | The index of the submenu to be cleared |

Returns

0 on success, -1 if the index is out of range or not a submenu

See also

remove(int)

12.83.3.5 copy()

```cpp
void Fl_Menu_::copy ( const Fl_Menu_Item ∗ m, void ∗ ud = 0 )
```

Sets the menu array pointer with a copy of m that will be automatically deleted. If userdata ud is not NULL, then all user data pointers are changed in the menus as well. See void Fl_Menu_::menu(const Fl_Menu_Item* m).

12.83.3.6 down_box() [1/2]

```cpp
Fl_Boxtype Fl_Menu_::down_box ( ) const [inline]
```

This box type is used to surround the currently-selected items in the menus. If this is FL_NO_BOX then it acts like FL_THIN_UP_BOX and selection_color() acts like FL_WHITE, for back compatibility.

12.83.3.7 down_box() [2/2]

```cpp
void Fl_Menu_::down_box ( Fl_Boxtype b ) [inline]
```

Sets the box type used to surround the currently-selected items in the menus.

12.83.3.8 find_index() [1/3]

```cpp
int Fl_Menu_::find_index ( const char ∗ pathname ) const
```

Find the menu item index for a given menu pathname, such as "Edit/Copy". This method finds a menu item's index position for the given menu pathname, also traversing submenus, but not submenu pointers (FL_SUBMENU_POINTER). To get the menu item pointer for a pathname, use find_item().

Parameters

| in | pathname | The path and name of the menu item to find |

Generated by Doxygen
Returns

The index of the matching item, or -1 if not found.

See also

item_pathname()

12.83.3.9  find_index() [2/3]

int Fl_Menu_::find_index ( const Fl_Menu_Item * item ) const

Find the index into the menu array for a given item. A way to convert a menu item pointer into an index.

A way to convert a menu item pointer into an index.

Does not handle items that are in submenu pointers (FL_SUBMENU_POINTER).

-1 is returned if the item is not in this menu or is part of an FL_SUBMENU_POINTER submenu.

Current implementation is fast and not expensive.

// Convert an index-to-item
int index = 12;
const Fl_Menu_Item *item = mymenu->menu() + index;

// Convert an item-to-index
int index = mymenu->find_index(item);
if ( index == -1 ) { ..error.. }

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>The item to be found</td>
</tr>
</tbody>
</table>

Returns

The index of the item, or -1 if not found.

See also

menu()

12.83.3.10  find_index() [3/3]

int Fl_Menu_::find_index ( Fl_Callback * cb ) const

Find the index into the menu array for a given callback cb.

This method finds a menu item's index position, also traversing submenus, but not submenu pointers (FL_SUBMENU_POINTER). This is useful if an application uses internationalisation and a menu item can not be found using its label. This search is also much faster.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>cb</td>
<td>Find the first item with this callback</td>
</tr>
</tbody>
</table>

Returns

The index of the item with the specific callback, or -1 if not found
12.83.3.11 find_item() [1/2]

const Fl_Menu_Item * Fl_Menu_::find_item (const char * pathname)

Find the menu item for a given menu pathname, such as “Edit/Copy”.
This method finds a menu item in the menu array, also traversing submenus, but not submenu pointers (FL_SUBMENU_POINTER).
To get the menu item’s index, use find_index(const char*)

Example:
Fl_Menu_Bar *menubar = new Fl_Menu_Bar(....);
menubar->add("File/&Open");
menubar->add("File/&Save");
menubar->add("Edit/&Copy");
// [...]
Fl_Menu_Item *item;
if ( ( item = (Fl_Menu_Item*)menubar->find_item("File/&Open") ) != NULL ) {
  item->labelcolor(FL_RED);
}
if ( ( item = (Fl_Menu_Item*)menubar->find_item("Edit/&Copy") ) != NULL ) {
  item->labelcolor(FL_GREEN);
}

Parameters

| pathname | The path and name of the menu item |

Returns

The item found, or NULL if not found

See also

find_index(const char*), find_item(Fl_Callback*), item_pathname()

12.83.3.12 find_item() [2/2]

const Fl_Menu_Item * Fl_Menu_::find_item (Fl_Callback * cb)

Find the menu item for the given callback cb.
This method finds a menu item in a menu array, also traversing submenus, but not submenu pointers. This is useful if an application uses internationalisation and a menu item can not be found using its label. This search is also much faster.

Parameters

| in cb | find the first item with this callback |

Returns

The item found, or NULL if not found

See also

find_item(const char*)

12.83.3.13 find_item_with_argument()

const Fl_Menu_Item * Fl_Menu_::find_item_with_argument (long v)

Generated by Doxygen
Find the menu item for the given user argument `v`.

Parameters

```
in  v  find the first item with this user argument
```

Returns

The item found, or NULL if not found

See also

`find_item(const char*)`

### 12.83.3.14 find_item_with_user_data()

```cpp
class Fl_Menu_Item * Fl_Menu_::find_item_with_user_data (void * v)
```

Find the menu item for the given user data `v`.

Parameters

```
in  v  find the first item with this user data
```

Returns

The item found, or NULL if not found

See also

`find_item(const char*)`

### 12.83.3.15 global()

```cpp
void Fl_Menu_::global ( )
```

Make the shortcuts for this menu work no matter what window has the focus when you type it. This is done by using `Fl::add_handler()`. This `Fl_Menu_` widget does not have to be visible (ie the window it is in can be hidden, or it does not have to be put in a window at all). Currently there can be only one `global()` menu. Setting a new one will replace the old one. There is no way to remove the `global()` setting (so don't destroy the widget!)

### 12.83.3.16 insert()

```cpp
int Fl_Menu_::insert (int index,
    const char * label,
    int shortcut,
    Fl_Callback * callback,
    void * userdata = 0,
    int flags = 0)
```

Inserts a new menu item at the specified `index` position. If `index` is -1, the menu item is appended; same behavior as `add()`. To properly insert a menu item, `label` must be the name of the item (eg. “Quit”), and not a ‘menu pathname’ (eg. “File/Quit”). If a menu pathname is specified, the value of `index` is ignored, the new item’s position defined by the pathname.

For more details, see `add()`. Except for the `index` parameter, `add()` has more detailed information on parameters and behavior, and is functionally equivalent.
Parameters

| in | index | The menu array’s index position where the new item is inserted. If -1, behavior is the same as add(). |
| in | label | The text label for the menu item. If the label is a menu pathname, index is ignored, and the pathname indicates the position of the new item. |
| in | shortcut | Optional keyboard shortcut. Can be an int (FL_CTRL+‘a’) or a string (“a”). Default is 0. |
| in | callback | Optional callback invoked when user clicks the item. Default 0 if none. |
| in | userdata | Optional user data passed as an argument to the callback. Default 0 if none. |
| in | flags | Optional flags that control the type of menu item; see add() for more info. Default is 0 for none. |

Returns

The index into the menu() array, where the entry was added.

See also

add()

12.83.3.17 item_pathname()

int Fl_Menu_::item_pathname ( 
    char * name, 
    int namelen, 
    const Fl_Menu_Item * finditem = 0 ) const

Get the menu ‘pathname’ for the specified menuitem. If finditem==NULL, mvalue() is used (the most recently picked menuitem).

Example:

```c
Fl_Menu_Bar *menubar = 0;
void my_menu_callback(Fl_Widget*,void*) {
    char name[80];
    if ( menubar->item_pathname(name, sizeof(name)-1) == 0 ) { // recently picked item
        if ( strcmp(name, "File/&Open") == 0 ) { .. } // open invoked
        if ( strcmp(name, "File/&Save") == 0 ) { .. } // save invoked
        if ( strcmp(name, "Edit/&Copy") == 0 ) { .. } // copy invoked
    }
}
int main() {
    ...
    menubar = new Fl_Menu_Bar(..);
    menubar->add("File/&Open", 0, my_menu_callback);
    menubar->add("File/&Save", 0, my_menu_callback);
    menubar->add("Edit/&Copy", 0, my_menu_callback);
    ...
}
```

Returns

- 0 : OK (name has menuitem’s pathname)
- -1 : item not found (name="")
- -2 : ‘name’ not large enough (name="")

See also

find_item()

12.83.3.18 menu() [1/2]

const Fl_Menu_Item * Fl_Menu_::menu ( ) const [inline]

Returns a pointer to the array of Fl_Menu_Items. This will either be the value passed to menu(value) or the private copy or an internal (temporary) location (see note below).

Generated by Doxygen
Note

_Implementation details - may be changed in the future._ All modifications of the menu array are done by copying the entire menu array to an internal storage for optimization of memory allocations, for instance when using `add()` or `insert()`. While this is done, `menu()` returns the pointer to this internal location. The entire menu will be copied back to private storage when needed, i.e. when another `Fl_Menu_` is modified. You can force this reallocation after you're done with all menu modifications by calling `Fl_Menu_::menu_end()` to make sure `menu()` returns a permanent pointer to private storage (until the menu is modified again). Note also that some menu methods (e.g. `Fl_Menu_Button::popup()`) call `menu_end()` internally to ensure a consistent menu array while the menu is open.

See also

- `size()` – returns the size of the `Fl_Menu_Item` array.
- `menu_end()` – finish menu modifications (optional)

**Example:** How to walk the array:

```c
for ( int t=0; t<menubar->size(); t++ ) { // walk array of items
    const Fl_Menu_Item &item = menubar->menu()[t]; // get each item
    fprintf(stderr, "item #%d -- label=%s, value=%s type=%s\n",
            t, item.label() ? item.label() : "(Null)", // menu terminators have NULL labels
            (item.flags & FL_MENU_VALUE) ? "set" : "clear", // value of toggle or radio items
            (item.flags & FL_SUBMENU) ? "Submenu" : "Item"); // see if item is a submenu or actual item
}
```

### 12.83.3.19 menu()

```c
void Fl_Menu_::menu (const Fl_Menu_Item *m)
```

Set the menu array pointer directly. If the old menu is private it is deleted. NULL is allowed and acts the same as a zero-length menu. If you try to modify the array (with `add()`, `replace()`, or `remove()`) a private copy is automatically done.

### 12.83.3.20 menu_box()

```c
Fl_Boxtype Fl_Menu_::menu_box ( ) const [inline]
```

Get the box type for the menu popup windows.

Returns

the box type, or FL_NO_BOX if `Fl_Menu_::box()` is to be used instead

### 12.83.3.21 menu_box()

```c
void Fl_Menu_::menu_box ( Fl_Boxtype b ) [inline]
```

Set the box type for the menu popup windows. If `menu_box` set to FL_NO_BOX, the menu window will use `Fl_Menu_::box()` instead.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>b</th>
<th>new box type or FL_NO_BOX</th>
</tr>
</thead>
</table>

### 12.83.3.22 menu_end()

```c
const Fl_Menu_Item * Fl_Menu_::menu_end ( )
```

Finishes menu modifications and returns `menu()`.

Call `menu_end()` after using `add()`, `insert()`, `remove()`, or any other methods that may change the menu array if you want to access the menu array anytime later with `menu()`. This should be called only once after the _last_ menu modification for performance reasons.
Does nothing if the menu array is already in a private location.
Some methods like Fl_Menu_Button::popup() call this method before their menu is opened.

Note
After menu changes like add(), insert(), etc. menu() would return a pointer to a temporary internal menu array
that may be relocated at unexpected times. This is due to performance considerations and may be changed
w/o further notice.

Since
1.4.0

Returns
New Fl_Menu_Item array pointer.

See also
Fl_Menu_::menu()

12.83.3.23 mode() [1/2]

int Fl_Menu_::mode (  
    int i ) const [inline]

Gets the flags of item i.
For a list of the flags, see Fl_Menu_Item.

12.83.3.24 mode() [2/2]

void Fl_Menu_::mode (  
    int i,  
    int f) [inline]

Sets the flags of item i.
For a list of the flags, see Fl_Menu_Item.

12.83.3.25 mvalue()

const Fl_Menu_Item ∗ Fl_Menu_::mvalue ( ) const [inline]

Returns a pointer to the last menu item that was picked.

12.83.3.26 picked()

const Fl_Menu_Item ∗ Fl_Menu_::picked (  
    const Fl_Menu_Item ∗ v )

When user picks a menu item, call this.
It will do the callback. Unfortunately this also casts away const for the checkboxes, but this was necessary so
non-checkbox menus can really be declared const...

12.83.3.27 prev_mvalue()

const Fl_Menu_Item ∗ Fl_Menu_::prev_mvalue ( ) const [inline]

Returns a pointer to the menu item that was picked before the current one was picked.
This call gives devs additional details how a user changed a choice in the Fl_Choice widget.
12.83.3.28  remove()

```cpp
void Fl_Menu_::remove ( int i )
```

Deletes item i from the menu.
If the menu array was directly set with menu(x) then copy() is done to make a private array.
No items must be removed from a menu during a callback to the same menu.

**Parameters**

- `i`: index into menu array

12.83.3.29  replace()

```cpp
void Fl_Menu_::replace ( int i, const char * str )
```

Changes the text of item i.
This is the only way to get slash into an add()'ed menu item. If the menu array was directly set with menu(x) then copy() is done to make a private array.

**Parameters**

- `i`: index into menu array
- `str`: new label for menu item at index i

12.83.3.30  size()

```cpp
int Fl_Menu_::size ( ) const
```

This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.
This includes the "terminator" item at the end. To copy a menu array you need to copy size()∗sizeof(Fl_Menu_Item) bytes. If the menu is NULL this returns zero (an empty menu will return 1).

12.83.3.31  test_shortcut()

```cpp
const Fl_Menu_Item * Fl_Menu_::test_shortcut ( ) [inline]
```

Returns the menu item with the entered shortcut (key value).
This searches the complete menu() for a shortcut that matches the entered key value. It must be called for a FL_KEYBOARD or FL_SHORTCUT event.
If a match is found, the menu’s callback will be called.

**Returns**

- matched Fl_Menu_Item or NULL.

12.83.3.32  text [1/2]

```cpp
const char * Fl_Menu_::text ( ) const [inline]
```

Returns the title of the last item chosen.

12.83.3.33  text [2/2]

```cpp
const char * Fl_Menu_::text ( int i ) const [inline]
```

Returns the title of item i.
12.83.3.34  textcolor()

Fl_Color Fl_Menu_::textcolor ( ) const  [inline]
Get the current color of menu item labels.

12.83.3.35  textfont() [1/2]

Fl_Font Fl_Menu_::textfont ( ) const  [inline]
Gets the current font of menu item labels.

12.83.3.36  textfont() [2/2]

void Fl_Menu_::textfont (     Fl_Font c )  [inline]
Sets the current font of menu item labels.

12.83.3.37  textsize() [1/2]

Fl_Fontsize Fl_Menu_::textsize ( ) const  [inline]
Gets the font size of menu item labels.

12.83.3.38  textsize() [2/2]

void Fl_Menu_::textsize (     Fl_Fontsize c )  [inline]
Sets the font size of menu item labels.

12.83.3.39  value() [1/3]

int Fl_Menu_::value ( ) const  [inline]
Returns the index into menu() of the last item chosen by the user.
It is zero initially.

12.83.3.40  value() [2/3]

int Fl_Menu_::value (     const Fl_Menu_Item * m )
The value is the index into menu() of the last item chosen by the user.
It is zero initially. You can set it as an integer, or set it with a pointer to a menu item. The set routines return non-zero
if the new value is different than the old one.

12.83.3.41  value() [3/3]

int Fl_Menu_::value (     int i )  [inline]
The value is the index into menu() of the last item chosen by the user.
It is zero initially. You can set it as an integer, or set it with a pointer to a menu item. The set routines return non-zero if the new value is different than the old one.

The documentation for this class was generated from the following files:

- Fl_Menu_.H
- Fl_Menu_.debug-disabled.cxx
- Fl_Menu_.delete-labels.cxx
- Fl_Menu_.cxx
- Fl_Menu_add.cxx
- Fl_Menu_global.cxx

12.84 Fl_Menu_Bar Class Reference

This widget provides a standard menubar interface.

```
#include <Fl_Menu_Bar.H>
```

Inheritance diagram for Fl_Menu_Bar:

```

       \|-- Fl_Menu_Bar
           \|-- Fl_Sys_Menu_Bar
```

Public Member Functions

- `Fl_Menu_Bar (int X, int Y, int W, int H, const char ∗l=0)`
  Creates a new Fl_Menu_Bar widget using the given position, size, and label string.

- `int handle (int) FL_OVERRIDE`
  Handles the specified event.

- `virtual void update ()`
  Updates the menu bar after any change to its items.

Public Member Functions inherited from Fl_Menu_

- `int add (const char ∗)`
  This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with ' ' separating the menu items, and tab separating the menu item names from an optional shortcut string.

- `int add (const char ∗, int shortcut, Fl_Callback ∗, void ∗=0, int=0)`
  Adds a new menu item.

- `int add (const char ∗a, const char ∗b, Fl_Callback ∗c, void ∗d=0, int e=0)`
  See int Fl_Menu_::add(const char∗ label, int shortcut, Fl_Callback∗, void ∗user_data=0, int flags=0)

- `void clear ()`
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

- `int clear_submenu (int index)`
  Clears the specified submenu pointed to by index of all menu items.

- `void copy (const Fl_Menu_Item ∗m, void ∗user_data=0)`
  Sets the menu array pointer with a copy of m that will be automatically deleted.

- `Fl_Boxtype down_box () const`
  This box type is used to surround the currently-selected items in the menus.
• void **down_box** (**Fl_Boxtype** b)
  
  Sets the box type used to surround the currently-selected items in the menus.

• **Fl_Color** **down_color** () const
  
  For back compatibility, same as **selection_color**()

• void **down_color**(unsigned c)
  
  For back compatibility, same as **selection_color**()

• int **find_index**(const char ∗name) const
  
  Find the menu item index for a given menu pathname, such as "Edit/Copy".

• int **find_index**(const **Fl_Menu_Item** ∗item) const
  
  Find the index into the menu array for a given item.

• int **find_index**(**Fl_Callback** ∗cb) const
  
  Find the index into the menu array for a given callback cb.

• const **Fl_Menu_Item** ∗**find_item**(const char ∗name)
  
  Find the menu item for a given menu pathname, such as "Edit/Copy".

• const **Fl_Menu_Item** ∗**find_item**(const **Fl_Callback** ∗cb)
  
  Find the menu item for the given callback cb.

• const **Fl_Menu_Item** ∗**find_item_with_argument**(long)
  
  Find the menu item for the given user argument v.

• const **Fl_Menu_Item** ∗**find_item_with_user_data**(void ∗)
  
  Find the menu item for the given user data v.

• **Fl_Menu_**(int, int, int, int, const char ∗=0)
  
  Creates a new **Fl_Menu_** widget using the given position, size, and label string.

• void **global** ()
  
  Make the shortcuts for this menu work no matter what window has the focus when you type it.

• int **insert**(int index, const char ∗, int shortcut, **Fl_Callback** ∗, void ∗=0, int=0)
  
  Inserts a new menu item at the specified index position.

• int **insert**(int index, const char ∗a, const char ∗b, **Fl_Callback** ∗c, void ∗d=0, int e=0)
  
  See int **Fl_Menu_::insert**(const char ∗label, int shortcut, **Fl_Callback** ∗, void ∗user_data=0, int flags=0)

• int **item_pathname**(char ∗name, int namelen, const **Fl_Menu_Item** ∗finditem=0) const
  
  Get the menu 'pathname' for the specified menuitem.

• const **Fl_Menu_Item** ∗**menu** () const
  
  Returns a pointer to the array of **Fl_Menu_Items**.

• void **menu**(const **Fl_Menu_Item** ∗m)
  
  Sets the menu array pointer directly.

• **Fl_Boxtype** **menu_box** () const
  
  Get the box type for the menu popup windows.

• void **menu_box**(**Fl_Boxtype** b)
  
  Set the box type for the menu popup windows.

• const **Fl_Menu_Item** ∗**menu_end** ()
  
  Finishes menu modifications and returns menu()(

• int **mode**(int i) const
  
  Gets the flags of item i.

• void **mode**(int i, int fl)
  
  Sets the flags of item i.

• const **Fl_Menu_Item** ∗**mvalue** () const
  
  Returns a pointer to the last menu item that was picked.

• const **Fl_Menu_Item** ∗**picked**(const **Fl_Menu_Item** ∗)
  
  When user picks a menu item, call this.

• const **Fl_Menu_Item** ∗**prev_mvalue** () const
  
  Returns a pointer to the menu item that was picked before the current one was picked.

• void **remove**(int)
Deletes item \( i \) from the menu.

- **void replace** (int, const char *)
  Changes the text of item \( i \).

- **void setonly** (Fl_Menu_Item *item)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

- **void shortcut** (int i, int s)
  Changes the shortcut of item \( i \) to \( s \).

- **int size () const**
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.

- **void size** (int W, int H)

- **const Fl_Menu_Item * test_shortcut ()**
  Returns the menu item with the entered shortcut (key value).

- **const char * text () const**
  Returns the title of the last item chosen.

- **const char * text (int i) const**
  Returns the title of item \( i \).

- **Fl_Color textcolor () const**
  Get the current color of menu item labels.

- **void textcolor** (Fl_Color c)
  Sets the current color of menu item labels.

- **Fl_Font textfont () const**
  Gets the current font of menu item labels.

- **void textfont** (Fl_Font c)
  Sets the current font of menu item labels.

- **Fl_Fontsize textsize () const**
  Gets the font size of menu item labels.

- **void textsize** (Fl_Fontsize c)
  Sets the font size of menu item labels.

- **int value () const**
  Returns the index into menu() of the last item chosen by the user.

- **int value (const Fl_Menu_Item *)**
  The value is the index into menu() of the last item chosen by the user.

- **int value (int i)**
  The value is the index into menu() of the last item chosen by the user.

**Public Member Functions inherited from Fl_Widget**

- **void _clear_fullscreen ()**
- **void _set_fullscreen ()**
- **void activate ()**
  Activates the widget.

- **unsigned int active () const**
  Returns whether the widget is active.

- **int active_r () const**
  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**
  Gets the label alignment.

- **void align** (Fl_Align alignment)
  Sets the label alignment.

- **long argument () const**
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**

  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const**

  Checks if this widget is a child of wgt.

- **int is_label_copied () const**

  Returns whether the current label was assigned with copy_label().

- **const char * label () const**

  Gets the current label text.

- **void label (const char *text)**

  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**

  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**

  Gets the label color.

- **void labelcolor (Fl_Color c)**

  Sets the label color.

- **Fl_Font labelfont () const**

  Gets the font to use.

- **void labelfont (Fl_Font f)**

  Sets the font to use.

- **Fl_Fontsize labelsize () const**

  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**

  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**

  Gets the label type.

- **void labeltype (Fl_Labeltype a)**

  Sets the label type.

- **void measure_label (int &ww, int &hh) const**

  Sets width ww and height hh accordingly with the label size.

- **bool needs_keyboard () const**

  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**

  Sets whether this widget needs a keyboard.

- **unsigned int output () const**

  Returns if a widget is used for output only.

- **Fl_Group * parent () const**

  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**

  Internal use only - "for hacks only".

- **void position (int X, int Y)**

  Repositions the window or widget.

- **void redraw ()**

  Schedules the drawing of the widget.

- **void redraw_label ()**

  Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**

  Changes the size or position of the widget.
- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char * tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.

- **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void * user_data () const**
  Gets the user data for this widget.

- **void user_data (Fl_Callback_User_Data *v, bool auto_free)**
  Sets the user data for this widget.

- **void user_data (void *v)**
  Sets the user data for this widget.

- **unsigned int visible () const**
  Returns whether a widget is visible.

- **unsigned int visible_focus () const**
  Returns whether a widget has keyboard focus.
Checks whether this widget has a visible focus.

- void **visible_focus** (int v)
  
  Modifies keyboard focus navigation.

- int **visible_r** () const
  
  Returns whether a widget and all its parents are visible.

- int **w** () const
  
  Gets the widget width.

- **Fl_When** when () const
  
  Returns the conditions under which the callback is called.

- void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

- **Fl_Window** ∗ window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int **x** () const
  
  Gets the widget position in its window.

- int **y** () const
  
  Gets the widget position in its window.

- virtual ~**Fl_Widget** ()
  
  Destroys the widget.

**Protected Member Functions**

- void draw () FL_OVERRIDE
  
  Draws the widget.

**Protected Member Functions inherited from Fl_Menu_Item**

- int item_pathname_ (char ∗name, int namelen, const Fl_Menu_Item ∗finditem, const Fl_Menu_Item ∗menu=0) const

**Protected Member Functions inherited from Fl_Widget**

- void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.

- void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const
  
  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int) const
  
  Draws the label in an arbitrary bounding box.
• **FL_Widget (int x, int y, int w, int h, const char *label=0L)**
  
  Creates a widget at the given position and size.

• unsigned int **flags () const**
  
  Gets the widget flags mask.

• void **h (int v)**
  
  Internal use only.

• void **set_flag (unsigned int c)**
  
  Sets a flag in the flags mask.

• void **w (int v)**
  
  Internal use only.

• void **x (int v)**
  
  Internal use only.

• void **y (int v)**
  
  Internal use only.

Friends

• class **Fl_Sys_Menu_Bar_Driver**

Additional Inherited Members

Static Public Member Functions inherited from **FL_Widget**

• static void **default_callback (Fl_Widget *widget, void *data)**
  
  The default callback for all widgets that don’t set a callback.

• static unsigned int **label_shortcut (const char *t)**
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int **test_shortcut (const char *, const bool require_alt=false)**
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from **FL_Widget**

• uchar down_box_

• Fl_Boxtype menu_box_

• Fl_Font textfont_

• Fl_Fontsize textsize_
12.84 Fl_Menu_Bar Class Reference

12.84.1 Detailed Description

This widget provides a standard menubar interface. Usually you will put this widget along the top edge of your window. The height of the widget should be 30 for the menu titles to draw correctly with the default font.

The items on the bar and the menus they bring up are defined by a single Fl_Menu_Item array. Because a Fl_Menu_Item array defines a hierarchy, the top level menu defines the items in the menubar, while the submenus define the pull-down menus. Sub-sub menus and lower pop up to the right of the submenus.

![Figure 12.28 menubar](image)

If there is an item in the top menu that is not a title of a submenu, then it acts like a "button" in the menubar. Clicking on it will pick it.

When the user clicks a menu item, value() is set to that item and then:

- The item's callback is done if one has been set; the Fl_Menu_Bar is passed as the Fl_Widget argument, along with any userdata configured for the callback.
- If the item does not have a callback, the Fl_Menu_Bar's callback is done instead, along with any userdata configured for the callback. The callback can determine which item was picked using value(), mvalue(), item_pathname(), etc.

Submenus will also pop up in response to shortcuts indicated by putting a '&' character in the name field of the menu item. If you put a '&' character in a top-level "button" then the shortcut picks it. The '&' character in submenus is ignored until the menu is popped up.

Typing the shortcut() of any of the menu items will cause callbacks exactly the same as when you pick the item with the mouse.

12.84.2 Constructor & Destructor Documentation

12.84.2.1 Fl_Menu_Bar()

Fl_Menu_Bar::Fl_Menu_Bar ( int X, int Y, int W, int H, const char * l = 0 )

Creates a new Fl_Menu_Bar widget using the given position, size, and label string. The default boxtype is FL_UP_BOX.

The constructor sets menu() to NULL. See Fl_Menu_ for the methods to set or change the menu.

labelsiz(), labelfont(), and labelcolor() are used to control how the menubar items are drawn. They are initialized from the Fl_Menu static variables, but you can change them if desired.

label() is ignored unless you change align() to put it outside the menubar.

The destructor removes the Fl_Menu_Bar widget and all of its menu items.

12.84.3 Member Function Documentation

12.84.3.1 draw()

void Fl_Menu_Bar::draw ( ) [protected], [virtual]

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

---

Generated by Doxygen
FL_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Implements Fl_Widget.
Reimplemented in Fl_Sys_Menu_Bar.

12.84.3.2 handle()

```cpp
int Fl_Menu_Bar::handle (int event) [virtual]
```

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

**Parameters**

| in event | the kind of event received |

**Return values**

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Widget.

12.84.3.3 update()

```cpp
virtual void Fl_Menu_Bar::update ( ) [inline], [virtual]
```

Updates the menu bar after any change to its items.
This is useful when the menu bar can be an Fl_Sys_Menu_Bar object.
Reimplemented in Fl_Sys_Menu_Bar.
The documentation for this class was generated from the following files:

- Fl_Menu_Bar.H
- Fl_Menu_Bar.cxx

12.85 Fl_Menu_Button Class Reference

This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of Fl_Menu_Item objects.
```cpp
#include <Fl_Menu_Button.H>
```
Inheritance diagram for Fl_Menu_Button:
Public Types

• enum popup_buttons {
   POPUP1, POPUP2, POPUP12, POPUP3,
   POPUP13, POPUP23, POPUP123 }

   indicate what mouse buttons pop up the menu.

Public Member Functions

• Fl_Menu_Button (int, int, int, int, const char ∗=0)
   Creates a new Fl_Menu_Button widget using the given position, size, and label string.

• int handle (int) FL_OVERRIDE
   Handles the specified event.

• const Fl_Menu_Item ∗ popup ()
   Act exactly as though the user clicked the button or typed the shortcut key.

Public Member Functions inherited from Fl_Menu_

• int add (const char ∗)
   This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|'
   separating the menu items, and tab separating the menu item names from an optional shortcut string.

• int add (const char ∗, int shortcut, Fl_Callback ∗, void ∗=0, int=0)
   Adds a new menu item.

• int add (const char ∗a, const char ∗b, Fl_Callback ∗c, void ∗d=0, int e=0)
   See int Fl_Menu_::add(const char∗ label, int shortcut, Fl_Callback∗, void∗ user_data=0, int flags=0)

• void clear ()
   Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

• int clear_submenu (int index)
   Clears the specified submenu pointed to by index of all menu items.

• void copy (const Fl_Menu_Item ∗m, void ∗user_data=0)
   Sets the menu array pointer with a copy of m that will be automatically deleted.

• Fl_Boxtype down_box () const
   This box type is used to surround the currently-selected items in the menus.

• void down_box (Fl_Boxtype b)
   Sets the box type used to surround the currently-selected items in the menus.

• Fl_Color down_color () const
   For back compatibility, same as selection_color()

• void down_color (unsigned c)
   For back compatibility, same as selection_color()

• int find_index (const char ∗name) const
   Find the menu item index for a given menu pathname, such as "Edit/Copy".

• int find_index (const Fl_Menu_Item ∗item) const
   Find the index into the menu array for a given item.

• int find_index (Fl_Callback ∗cb) const
   Find the index into the menu array for a given callback cb.
• const Fl_Menu_Item * find_item (const char *name)
  Find the menu item for a given menu pathname, such as "Edit/Copy".

• const Fl_Menu_Item * find_item (Fl_Callback *)
  Find the menu item for the given callback cb.

• const Fl_Menu_Item * find_item_with_argument (long)
  Find the menu item for the given user argument v.

• const Fl_Menu_Item * find_item_with_user_data (void *)
  Find the menu item for the given user data v.

• Fl_Menu_ (int, int, int, int, const char * = 0)
  Creates a new Fl_Menu_ widget using the given position, size, and label string.

• void global ()
  Make the shortcuts for this menu work no matter what window has the focus when you type it.

• int insert (int index, const char *a, int shortcut, Fl_Callback *, void * = 0, int = 0)
  Inserts a new menu item at the specified index position.

• int insert (int index, const char *a, const char *, Fl_Callback *, void * = 0, int = 0)
  See int Fl_Menu_::insert(const char *, int shortcut, Fl_Callback *, void *user_data=0, int flags=0)

• int item_pathname (char *, int namelen, const Fl_Menu_Item *) const
  Get the menu 'pathname' for the specified menuItem.

• const Fl_Menu_Item * menu () const
  Returns a pointer to the array of Fl_Menu_Items.

• void menu (const Fl_Menu_Item *m)
  Sets the menu array pointer directly.

• Fl_Boxtype menu_box () const
  Get the box type for the menu popup windows.

• void menu_box (Fl_Boxtype b)
  Set the box type for the menu popup windows.

• const Fl_Menu_Item * menu_end ()
  Finishes menu modifications and returns menu().

• int mode (int i) const
  Gets the flags of item i.

• void mode (int i, int fl)
  Sets the flags of item i.

• const Fl_Menu_Item * mvalue () const
  Returns a pointer to the last menu item that was picked.

• const Fl_Menu_Item * picked (const Fl_Menu_Item *)
  When user picks a menu item, call this.

• const Fl_Menu_Item * prev_mvalue () const
  Returns a pointer to the menu item that was picked before the current one was picked.

• void remove (int)
  Deletes item i from the menu.

• void replace (int, const char *)
  Changes the text of item i.

• void setonly (Fl_Menu_Item *)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

• void shortcut (int i, int s)
  Changes the shortcut of item i to s.

• int size () const
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.

• void size (int W, int H)

• const Fl_Menu_Item * test_shortcut ()
  Returns the menu item with the entered shortcut (key value).
• const char * text () const
  Returns the title of the last item chosen.
• const char * text (int i) const
  Returns the title of item i.
• Fl_Color textcolor () const
  Get the current color of menu item labels.
• void textcolor (Fl_Color c)
  Sets the current color of menu item labels.
• Fl_Font textfont () const
  Gets the current font of menu item labels.
• void textfont (Fl_Font c)
  Sets the current font of menu item labels.
• Fl_Fontsize textsize () const
  Gets the font size of menu item labels.
• void textsize (Fl_Fontsize c)
  Sets the font size of menu item labels.
• int value () const
  Returns the index into menu() of the last item chosen by the user.
• int value (const Fl_Menu_Item *)
  The value is the index into menu() of the last item chosen by the user.
• int value (int i)
  The value is the index into menu() of the last item chosen by the user.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image *img)
Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Imag* img)
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  Gets the current callback function for the widget.

- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void contains (unsigned a)
  For back compatibility only.

- int contains (const FL_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.
• void **copy_tooltip** (const char *text)
  
  *Sets the current tooltip text.*

• uchar **damage** () const
  
  *Returns non-zero if draw() needs to be called.*

• void **damage** (uchar c)
  
  *Sets the damage bits for the widget.*

• void **damage** (uchar c, int x, int y, int w, int h)
  
  *Sets the damage bits for an area inside the widget.*

• int **damage_resize** (int, int, int)
  
  *Internal use only.*

• void **deactivate** ()
  
  *Deactivates the widget.*

• Fl_IMAGE * **deimage** ()
  
  *Gets the image that is used as part of the widget label when in the inactive state.*

• const Fl_IMAGE * **deimage** () const
  
  *Gets the image that is used as part of the widget label when in the inactive state.*

• void **deimage** (Fl_IMAGE &img)
  
  *Sets the image to use as part of the widget label when in the inactive state.*

• void **deimage** (Fl_IMAGE * img)
  
  *Sets the image to use as part of the widget label when in the inactive state.*

• int **deimage_bound** () const
  
  *Returns whether the inactive image is managed by the widget.*

• void **do_callback** (Fl_Callback_REASON reason=FL_REASON_UNKNOWN)
  
  *Calls the widget callback function with default arguments.*

• void **do_callback** (Fl_Widget *widget, long arg, Fl_Callback_REASON reason=FL_REASON_UNKNOWN)
  
  *Calls the widget callback function with arbitrary arguments.*

• void **do_callback** (Fl_Widget *widget, void *arg=0, Fl_Callback_REASON reason=FL_REASON_UNKNOWN)
  
  *Calls the widget callback function with arbitrary arguments.*

• void **draw_label** (int, int, int, int, Fl_ALIGN) const
  
  *Draws the label in an arbitrary bounding box with an arbitrary alignment.*

• int **h** () const
  
  *Gets the widget height.*

• virtual void **hide** ()
  
  *Makes a widget invisible.*

• Fl_IMAGE * **image** ()
  
  *Gets the image that is used as part of the widget label when in the active state.*

• const Fl_IMAGE * **image** () const
  
  *Gets the image that is used as part of the widget label when in the active state.*

• void **image** (Fl_IMAGE &img)
  
  *Sets the image to use as part of the widget label when in the active state.*

• void **image** (Fl_IMAGE * img)
  
  *Sets the image to use as part of the widget label when in the active state.*

• int **image_bound** () const
  
  *Returns whether the image is managed by the widget.*

• int **inside** (const Fl_Widget *wgt) const
  
  *Checks if this widget is a child of wgt.*

• int **is_label_copied** () const
  
  *Returns whether the current label was assigned with copy_label().*

• const char * **label** () const
  
  *Gets the current label text.*

• void **label** (const char *text)
Sets the current label pointer.

- void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

- Fl_Color labelcolor () const
  Gets the label color.

- void labelcolor (Fl_Color c)
  Sets the label color.

- Fl_Font labelfont () const
  Gets the font to use.

- void labelfont (Fl_Font f)
  Sets the font to use.

- Fl_Fontsize labelsize () const
  Gets the font size in pixels.

- void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

- Fl_Labeltype labeltype () const
  Gets the label type.

- void labeltype (Fl_Labeltype a)
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  
  Gets the widget position in its window.

- **int y () const**
  
  Gets the widget position in its window.

- **virtual ~Fl_Widget ()**
  
  Destroys the widget.

Protected Member Functions

- **void draw () FL_OVERRIDE**
  
  Draws the widget.

Protected Member Functions inherited from Fl_Menu_

- **int item_pathname_ (char *name, int namelen, const Fl_Menu_Item *finditem, const Fl_Menu_Item *menu=0) const**

Protected Member Functions inherited from Fl_Widget

- **void clear_flag (unsigned int c)**
  
  Clears a flag in the flags mask.

- **void draw_backdrop () const**
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box () const**
  
  Draws the widget box according its box style.

- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus () const**
  
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const**
  
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  
  Draws a focus box for the widget at the given position and size.

- **void draw_label () const**
  
  Draws the widget's label at the defined label position.

- **void draw_label (int, int, int, int) const**
  
  Draws the label in an arbitrary bounding box.

- **Fl_Widget (int x, int y, int w, int h, const char *label=0L)**
  
  Creates a widget at the given position and size.

- **unsigned int flags () const**
  
  Gets the widget flags mask.

- **void h (int v)**
  
  Internal use only.

- **void set_flag (unsigned int c)**
  
  Sets a flag in the flags mask.

- **void w (int v)**
  
  Internal use only.

- **void x (int v)**
  
  Internal use only.

- **void y (int v)**
  
  Internal use only.
Static Protected Attributes

- static Fl_Menu_Button* pressed_menu_button_ = NULL

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget* widget, void* data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char* t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
- static int test_shortcut (const char* t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLtip_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
flags possible values enumeration.

Protected Attributes inherited from Fl_Menu_

- uchar alloc
- uchar down_box_
- Fl_Boxtype menu_box_
- Fl_Color textcolor_
- Fl_Font textfont_
- Fl_Fontsize textsize_

12.85.1 Detailed Description

This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of Fl_Menu_Item objects.
Normally any mouse button will pop up a menu and it is lined up below the button as shown in the picture. However an Fl_Menu_Button may also control a pop-up menu. This is done by setting the type(). If type() is zero a normal menu button is produced. If it is nonzero then this is a pop-up menu. The bits in type() indicate what mouse buttons pop up the menu (see Fl_Menu_Button::popup_buttons).

The menu will also pop up in response to shortcuts indicated by putting a ‘&’ character in the label(). Typing the shortcut() of any of the menu items will cause callbacks exactly the same as when you pick the item with the mouse. The ‘&’ character in menu item names are only looked at when the menu is popped up, however.

When the user clicks a menu item, value() is set to that item and then:

- The item’s callback is done if one has been set; the Fl_Menu_Button is passed as the Fl_Widget+ argument, along with any userdata configured for the callback.
- If the item does not have a callback, the Fl_Menu_Button’s callback is done instead, along with any userdata configured for it. The callback can determine which item was picked using value(), mvalue(), item_pathname(), etc.

### 12.85.2 Member Enumeration Documentation

#### 12.85.2.1 popup_buttons

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>POPUP1</td>
<td>pops up with the mouse 1st button.</td>
</tr>
<tr>
<td>POPUP2</td>
<td>pops up with the mouse 2nd button.</td>
</tr>
<tr>
<td>POPUP12</td>
<td>pops up with the mouse 1st or 2nd buttons.</td>
</tr>
<tr>
<td>POPUP3</td>
<td>pops up with the mouse 3rd button.</td>
</tr>
<tr>
<td>POPUP13</td>
<td>pops up with the mouse 1st or 3rd buttons.</td>
</tr>
<tr>
<td>POPUP23</td>
<td>pops up with the mouse 2nd or 3rd buttons.</td>
</tr>
<tr>
<td>POPUP123</td>
<td>pops up with any mouse button.</td>
</tr>
</tbody>
</table>

Values for type() used to indicate what mouse buttons pop up the menu. Fl_Menu_Button::POPUP3 is usually what you want.

Generated by Doxygen
12.85.3 Constructor & Destructor Documentation

12.85.3.1 Fl_Menu_Button()

Fl_Menu_Button::Fl_Menu_Button (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ l = 0 )

Creates a new Fl_Menu_Button widget using the given position, size, and label string. The default boxtype is FL_UP_BOX. The constructor sets menu() to NULL. See Fl_Menu_ for the methods to set or change the menu.

12.85.4 Member Function Documentation

12.85.4.1 draw()

void Fl_Menu_Button::draw ( ) [protected], [virtual]

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead. Override this function to draw your own widgets. If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

Fl_Widget ∗s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Implements Fl_Widget.

12.85.4.2 handle()

int Fl_Menu_Button::handle (  
    int event ) [virtual]

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

- **event**: the kind of event received

Return values

- 0 if the event was not used or understood
- 1 if the event was used and can be deleted

See also

- Fl_Event

Reimplemented from Fl_Widget.
12.85.4.3 popup()

const Fl_Menu_Item * Fl_Menu_Button::popup ( )

Act exactly as though the user clicked the button or typed the shortcut key.
The menu appears, it waits for the user to pick an item, and if they pick one it sets value() and does the callback or sets changed() as described above. The menu item is returned or NULL if the user dismisses the menu.

Note

Since FLTK 1.4.0 Fl_Menu_::menu_end() is called before the menu pops up to make sure the menu array is located in private storage.

See also

Fl_Menu_::menu_end()

The documentation for this class was generated from the following files:

- Fl_Menu_Button.H
- Fl_Menu_Button.cxx

12.86 Fl_Menu_Item Struct Reference

The Fl_Menu_Item structure defines a single menu item that is used by the Fl_Menu_ class.

#include <Fl_Menu_Item.H>

Public Member Functions

- void activate ()
  Allows a menu item to be picked.
- int active () const
  Gets whether or not the item can be picked.
- int activevisible () const
  Returns non 0 if FL_INACTIVE and FL_INVISIBLE are cleared, 0 otherwise.
- int add (const char *, int shortcut, Fl_Callback *, void *, int=0)
  Adds a menu item.
- int add (const char *, const char *, Fl_Callback *, void *, int e=0)
  See int add(const char *, int shortcut, Fl_Callback *, void *, int)
- long argument () const
  Gets the user_data() argument that is sent to the callback function.
- void argument (long v)
  Sets the user_data() argument that is sent to the callback function.
- Fl_Callback_p callback () const
  Returns the callback function that is set for the menu item.
- void callback (Fl_Callback *c)
  Sets the menu item’s callback function.
- void callback (Fl_Callback *c, void *p)
  Sets the menu item’s callback function and userdata() argument.
- void callback (Fl_Callback0 *c)
  Sets the menu item’s callback function.
- void callback (Fl_Callback1 *c, long p=0)
  Sets the menu item’s callback function and userdata() argument.
- void check ()
  Back compatibility only.
- int checkbox () const
  Returns true if a checkbox will be drawn next to this item.
• int **checked () const**
  Back compatibility only.
• void **clear ()**
  Turns the check or radio item "off" for the menu item.
• void **deactivate ()**
  Prevents a menu item from being picked.
• void **do_callback (Fl_Widget∗ o) const**
  Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.
• void **do_callback (Fl_Widget∗ o, long arg) const**
  Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.
• void **do_callback (Fl_Widget∗ o, void∗ arg) const**
  Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.
• void **draw (int x, int y, int w, int h, const Fl_Menu_Item∗, int t=0) const**
  Draws the menu item in bounding box x,y,w,h, optionally selects the item.
• const Fl_Menu_Item∗ **find_shortcut (int∗ ip=0, const bool require_alt=false) const**
  Search only the top level menu for a shortcut.
• Fl_Menu_Item∗ **first ()**
  Returns the first menu item, same as next(0).
• const Fl_Menu_Item∗ **first () const**
  Returns the first menu item, same as next(0).
• void **hide ()**
  Hides an item in the menu.
• void **image (Fl_Image &image)**
  Compatibility API for FLUID, same as image.label(this).
• void **image (Fl_Image∗ image)**
  Compatibility API for FLUID, same as image->label(this).
• void **image_label (const Fl_Image∗ image)**
  Sets the title (label()) to an icon or image.
• int **insert (int, const char∗, int, Fl_Callback∗, void∗ =0, int t=0)**
  Inserts an item at position index.
• const char∗ **label () const**
  Returns the title (label) of the menu item.
• void **label (const char∗ a)**
  Sets the title (label) of the menu item.
• void **label (Fl_Labeltype a, const char∗ b)**
  Sets the title (label) and the label type of the menu item.
• Fl_Color **labelcolor () const**
  Gets the menu item's label color.
• void **labelcolor (Fl_Color a)**
  Sets the menu item's label color.
• Fl_Font **labelfont () const**
  Gets the menu item's label font.
• void **labelfont (Fl_Font a)**
  Sets the menu item's label font.
• Fl_Fontsize **labelsizesize () const**
  Gets the label font pixel size/height.
• void **labelsizesize (Fl_Fontsize a)**
  Sets the label font pixel size/height.
• Fl_Labeltype **labeltype () const**
  Returns the menu item's labeltype.
• void **labeltype (Fl_Labeltype a)**
Sets the menu item's labeltype.

- **int measure (int h, const Fl_Menu_Item *) const**
  Measures width of label, including effect of & characters.

- **void multi_label (const Fl_Multi_Label *ml)**
  Sets the title (label()) and labeltype() to an Fl_Multi_Label.

- **Fl_Menu_Item * next (int i=1)**
  Advances a pointer by n items through a menu array, skipping the contents of submenus and invisible items.

- **const Fl_Menu_Item * next (int=1) const**
  Advance a pointer by n items through a menu array, skipping the contents of submenus and invisible items.

- **const Fl_Menu_Item * popup (int X, int Y, const char *title=0, const Fl_Menu_Item *picked=0, const Fl_Menu_Item *title=0, const Fl_Menu_Item *menubar=0) const**
  This method is called by widgets that want to display menus.

- **const Fl_Menu_Item * pulldown (int X, int Y, int W, int H, const Fl_Menu_Item *picked=0, const Fl_Menu_Item *title=0, int menubar=0) const**
  Pulldown() is similar to popup(), but a rectangle is provided to position the menu.

- **int radio () const**
  Returns true if this item is a radio item.

- **void set ()**
  Turns the check or radio item "on" for the menu item.

- **void setonly (Fl_Menu_Item const *first=NULL)**
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items set.

- **int shortcut () const**
  Gets what key combination shortcut will trigger the menu item.

- **void shortcut (int s)**
  Sets exactly what key combination will trigger the menu item.

- **void show ()**
  Makes an item visible in the menu.

- **int size () const**
  Size of the menu starting from this menu item.

- **int submenu () const**
  Returns true if either FL_SUBMENU or FL_SUBMENU_POINTER is on in the flags.

- **const Fl_Menu_Item * test_shortcut () const**
  This is designed to be called by a widgets handle() method in response to a FL_SHORTCUT event.

- **void uncheck ()**
  Back compatibility only.

- **void * user_data () const**
  Gets the user_data() argument that is sent to the callback function.

- **void user_data (void *v)**
  Sets the user_data() argument that is sent to the callback function.

- **int value () const**
  Returns the current value of the check or radio item.

- **void value (int v)**
  Sets the current value of the check or radio item.

- **int visible () const**
  Gets the visibility of an item.
Public Attributes

- **Fl_Callback * callback_
  
  menu item callback

- **int flags
  
  menu item flags like FL_MENU_TOGGLE, FL_MENU_RADIO

- **Fl_Color labelcolor_
  
  menu item text color

- **Fl_Font labelfont_
  
  which font for this menu item text

- **Fl_Fontsize labelsize_
  
  size of menu item text

- **uchar labeltype_
  
  how the menu item text looks like

- **int shortcut_
  
  menu item shortcut

- **const char * text
  
  menu item text, returned by label()

- **void * user_data_
  
  menu item user_data for the menu's callback

12.86.1 Detailed Description

The Fl_Menu_Item structure defines a single menu item that is used by the Fl_Menu_ class.

```c
struct Fl_Menu_Item {
    const char* text; // label()
    int shortcut_;    // Item is a checkbox toggle (shows checkbox for on/off state)
    Fl_Callback* callback_; // The on/off state for checkbox/radio buttons (if set, state is 'on')
    Fl_Font labelfont_; // Item is a radio button (one checkbox of many can be on)
    Fl_Fontsize labelsize_; // Item will not show up (shortcut will work)
    Fl_Callback* submenu_; // Indicates user_data() is a pointer to another menu array
    Fl_Menu_Item* context_; // This item is a submenu to other items
    Fl_Menu_Item* parent_;  // Creates divider line below this item. Also ends a group of radio
    Fl_Menu_Item* sibling_; // buttons.
    Fl_Menu_Item* anchor_;  // FL_MENU_HORIZONTAL = 0x100, // ??? -- reserved, internal (do not use)
    Fl_Menu_Item* next_;    // FL_MENU_RESERVED = 0xffffffff // These bits are reserved for internal or future usage (do not use)
    Fl_Menu_Item* previous_;
}
```

Typically menu items are statically defined; for example:

```c
Fl_Menu_Item popup[] = {
    {"alpha", FL_ALT+'a', the_cb, (void*)1},
    {"beta", FL_ALT+'b', the_cb, (void*)2},
    {"gamma", FL_ALT+'c', the_cb, (void*)3, FL_MENU_DIVIDER},
    {"strange", 0, strange_cb},
    {"charm", 0, charm_cb},
    {"truth", 0, truth_cb},
    {"beauty", 0, beauty_cb},
    {"submenu", 0, 0, 0, FL_SUBMENU},
    {"one"},
    {"two"},
    {"three"},
    {0},
    {"inactive", FL_ALT+'i', 0, 0, FL_MENU_INACTIVE|FL_MENU_DIVIDER},
    {"invisible", FL_ALT+'i', 0, 0, FL_MENU_INVISIBLE},
    {"check", FL_ALT+'c', 0, 0, FL_MENU_TOGGLE|FL_MENU_VALUE},
    {"box", FL_ALT+'b', 0, 0, FL_MENU_TOGGLE},
    {0}};
```
A submenu title is identified by the bit FL_SUBMENU in the flags field, and ends with a label() that is NULL. You can nest menus to any depth. A pointer to the first item in the submenu can be treated as an Fl_Menu array itself. It is also possible to make separate submenu arrays with FL_SUBMENU_POINTER flags.

You should use the method functions to access structure members and not access them directly to avoid compatibility problems with future releases of FLTK.

Note

Adding menu items with insert(), add(), or any of its overloaded variants copies the entire menu to internal storage. Using the memory of a static menu array after that would access unused (but not released) memory and thus have no effect.

12.86.2 Member Function Documentation

12.86.2.1 add()

```
int Fl_Menu_Item::add (const char * mytext,
                      int sc,
                      Fl_Callback * cb,
                      void * data = 0,
                      int myflags = 0 )
```

Adds a menu item.

The text is split at '/' characters to automatically produce submenus (actually a totally unnecessary feature as you can now add submenu titles directly by setting FL_SUBMENU in the flags).

Returns

the index into the menu() array, where the entry was added
See also

Fl_Menu_Item::insert(int, const char*, int, Fl_Callback*, void*, int)

12.86.2.2 argument() [1/2]

long Fl_Menu_Item::argument() const [inline]

Gets the user_data() argument that is sent to the callback function.
For convenience you can also define the callback as taking a long argument. This method casts the stored user-
data() argument to long and returns it as a long value.

12.86.2.3 argument() [2/2]

void Fl_Menu_Item::argument (long v) [inline]

Sets the user_data() argument that is sent to the callback function.
For convenience you can also define the callback as taking a long argument. This method casts the given argument
v to void* and stores it in the menu item's userdata() member. This may not be portable to some machines.

12.86.2.4 callback() [1/5]

Fl_Callback_p Fl_Menu_Item::callback() const [inline]

Returns the callback function that is set for the menu item.
Each item has space for a callback function and an argument for that function. Due to back compatibility, the
Fl_Menu_Item itself is not passed to the callback, instead you have to get it by calling ((Fl_Menu_*w)->mvalue()
where w is the widget argument.

12.86.2.5 callback() [2/5]

void Fl_Menu_Item::callback (Fl_Callback * c) [inline]

Sets the menu item's callback function.
This method does not set the userdata() argument.
See also

Fl_Callback_p Fl_MenuItem::callback() const

12.86.2.6 callback() [3/5]

void Fl_Menu_Item::callback (Fl_Callback * c, void * p) [inline]

Sets the menu item's callback function and userdata() argument.
See also

Fl_Callback_p Fl_MenuItem::callback() const

12.86.2.7 callback() [4/5]

void Fl_Menu_Item::callback (Fl_Callback0 * c) [inline]

Sets the menu item's callback function.
This method does not set the userdata() argument.
See also

Fl_Callback_p Fl_MenuItem::callback() const
12.86.2.8 callback() [5/5]

void Fl_Menu_Item::callback (  
    Fl_Callback1 ∗ c,  
    long p = 0 ) [inline]
Sets the menu item's callback function and userdata() argument.  
The argument is cast to void* and stored as the userdata() for the menu item's callback function.

See also
    Fl_Callback_p Fl_MenuItem::callback() const

12.86.2.9 check()

void Fl_Menu_Item::check ( ) [inline]
Back compatibility only.

Deprecated Please use Fl_Menu_Item::set() instead. This method will be removed in FLTK 1.5.0 or later.

See also
    set()

12.86.2.10 checkbox()

int Fl_Menu_Item::checkbox ( ) const [inline]
Returns true if a checkbox will be drawn next to this item.  
This is true if FL_MENU_TOGGLE or FL_MENU_RADIO is set in the flags.

12.86.2.11 checked()

int Fl_Menu_Item::checked ( ) const [inline]
Back compatibility only.

Deprecated Please use Fl_Menu_Item::value() instead. This method will be removed in FLTK 1.5.0 or later.

See also
    value()

12.86.2.12 deactivate()

void Fl_Menu_Item::deactivate ( ) [inline]
Prevents a menu item from being picked.
Note that this will also cause the menu item to appear grayed-out.

12.86.2.13 do_callback() [1/3]

void Fl_Menu_Item::do_callback (  
    Fl_Widget ∗ o ) const [inline]
Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.  
The callback is called with the stored user_data() as its second argument. You must first check that callback() is non-zero before calling this.

12.86.2.14 do_callback() [2/3]

void Fl_Menu_Item::do_callback (  
    Fl_Widget ∗ o,  
    long arg ) const [inline]
Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument.  
This call overrides the callback's second argument with the given value arg. long arg is cast to void* when calling the callback. You must first check that callback() is non-zero before calling this.
12.86.2.15 do_callback() [3/3]

```c
void Fl_Menu_Item::do_callback ( 
    Fl_Widget * o, 
    void * arg ) const [inline]
```

Calls the Fl_Menu_Item item's callback, and provides the Fl_Widget argument. This call overrides the callback's second argument with the given value arg. You must first check that callback() is non-zero before calling this.

12.86.2.16 find_shortcut() const

```c
const Fl_Menu_Item * Fl_Menu_Item::find_shortcut ( 
    int * ip = 0, 
    const bool require_alt = false ) const
```

Search only the top level menu for a shortcut. Either &x in the label or the shortcut fields are used. This tests the current event, which must be an FL_KEYBOARD or FL_SHORTCUT, against a shortcut value.

**Parameters**

| ip | returns the index of the item, if ip is not NULL. |
| require_alt | if true: match only if Alt key is pressed. |

**Returns**

found Fl_Menu_Item or NULL

12.86.2.17 image() [1/2]

```c
void Fl_Menu_Item::image ( 
    Fl_Image & image ) [inline]
```

Compatibility API for FLUID, same as image.label(this).

**Note**

This method is intended for internal use by fluid and may not do what you expect.

12.86.2.18 image() [2/2]

```c
void Fl_Menu_Item::image ( 
    Fl_Image * image ) [inline]
```

Compatibility API for FLUID, same as image->label(this).

**Note**

This method is intended for internal use by fluid and may not do what you expect.

12.86.2.19 image_label()

```c
void Fl_Menu_Item::image_label ( 
    const Fl_Image * image ) [inline]
```

Sets the title (label()) to an icon or image. This sets the labeltype() to _FL_IMAGE_LABEL (note the leading underscore).

**See also**

const char* Fl_Menu_Item::label() const

**Since**

1.4.0
12.86.2.20  insert()

```cpp
int Fl_Menu_Item::insert (  
  int index,  
  const char * mytext,  
  int sc,  
  Fl_Callback * cb,  
  void * data = 0,  
  int myflags = 0)
```

Inserts an item at position `index`. If `index` is -1, the item is added the same way as `Fl_Menu_Item::add()`. If 'mytext' contains any un-escaped front slashes (/), it's assumed a menu pathname is being specified, and the value of `index` will be ignored. In all other aspects, the behavior of `insert()` is the same as `add()`.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>index</code></td>
<td>insert new items here</td>
</tr>
<tr>
<td><code>mytext</code></td>
<td>new label string, details see above</td>
</tr>
<tr>
<td><code>sc</code></td>
<td>keyboard shortcut for new item</td>
</tr>
<tr>
<td><code>cb</code></td>
<td>callback function for new item</td>
</tr>
<tr>
<td><code>data</code></td>
<td>user data for new item</td>
</tr>
<tr>
<td><code>myflags</code></td>
<td>menu flags as described in <code>Fl_Menu_Item</code></td>
</tr>
</tbody>
</table>

**Returns**

the index into the menu() array, where the entry was added

12.86.2.21  label() [1/3]

```cpp
const char * Fl_Menu_Item::label ( ) const [inline]
```

Returns the title (label) of the menu item. A NULL here indicates the end of the menu (or of a submenu). A '&' in the item will print an underscore under the next letter, and if the menu is popped up that letter will be a "shortcut" to pick that item. To get a real '&' put two in a row.

The returned value depends on the `labeltype()` that has been used to store the label.

**Returns**

A pointer to the label cast to (const char *)

**Return values**

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a)</td>
<td>A pointer to text (const char *)</td>
</tr>
<tr>
<td>(b)</td>
<td>A pointer to an image (Fl_Image *)</td>
</tr>
<tr>
<td>(c)</td>
<td>A pointer to a &quot;multi label&quot; (Fl_Multi_Label *)</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td>End of menu or submenu</td>
</tr>
</tbody>
</table>

**See also**

- `Fl_Menu_Item::label(const char *)`
- `Fl_Menu_Item::label(Fl_Labeltype, const char *)`
- `Fl_Menu_Item::image_label(const Fl_Image *)`
- `Fl_Menu_Item::multi_label(const Fl_Multi_Label *)`
- `Fl_Multi_Label::label(Fl_Menu_Item *)`
12.86.22 label() [2/3]

```cpp
void Fl_Menu_Item::label (const char * a) [inline]
```

Sets the title (label) of the menu item.

**Note**

This does **not** change the `labeltype()` for backwards compatibility. Take care to assign the correct `labeltype()` if you assign different label types to the same menu item sequentially.

The default `labeltype()` is `FL_NORMAL_LABEL`.

See also

```cpp
label(Fl_Labeltype, const char*)
```

12.86.23 label() [3/3]

```cpp
void Fl_Menu_Item::label (Fl_Labeltype a, const char * b) [inline]
```

Sets the title (label) and the label type of the menu item.

The default `Fl_Labeltype` when using `Fl_Menu_Item::label(const char * a)` is `FL_NORMAL_LABEL` but you can set any other label type, for instance `FL_EMBOSSED_LABEL`.

Special labeltypes are:

- `FL_ICON_LABEL`: draws the icon (`Fl_Image`) associated with the text
- `FL_IMAGE_LABEL`: draws the image (`Fl_Image`) associated with the text
- `FL_MULTI_LABEL`: draws multiple parts side by side, see `Fl_Multi_Label`

See also

```cpp
const char* Fl_Menu_Item::label() const
```

12.86.24 labelcolor() [1/2]

```cpp
Fl_Color Fl_Menu_Item::labelcolor () const [inline]
```

Gets the menu item's label color.

This color is passed to the labeltype routine, and is typically the color of the label text. This defaults to `FL_BLACK`. If this color is not black fltk will **not** use overlay bitplanes to draw the menu - this is so that images put in the menu draw correctly.

12.86.25 labelcolor() [2/2]

```cpp
void Fl_Menu_Item::labelcolor (Fl_Color a) [inline]
```

Sets the menu item's label color.

See also

```cpp
Fl_Color Fl_Menu_Item::labelcolor() const
```

12.86.26 labelfont() [1/2]

```cpp
Fl_Font Fl_Menu_Item::labelfont () const [inline]
```

Gets the menu item's label font.

Fonts are identified by small 8-bit indexes into a table. See the enumeration list for predefined fonts. The default value is a Helvetica font. The function `Fl::set_font()` can define new fonts.
12.86.27  labelfont() [2/2]

void Fl_Menu_Item::labelfont (  
    Fl_Font a ) [inline]

Sets the menu item's label font.
Fonts are identified by small 8-bit indexes into a table. See the enumeration list for predefined fonts. The default value is a Helvetica font. The function Fl::set_font() can define new fonts.

12.86.28  labeltype() [1/2]

Fl_Labeltype Fl_Menu_Item::labeltype ( ) const [inline]

Returns the menu item's labeltype.
A labeltype identifies a routine that draws the label of the widget. This can be used for special effects such as emboss, or to use the label() pointer as another form of data such as a bitmap. The value FL_NORMAL_LABEL prints the label as text.

12.86.29  labeltype() [2/2]

void Fl_Menu_Item::labeltype (  
    Fl_Labeltype a ) [inline]

Sets the menu item's labeltype.
A labeltype identifies a routine that draws the label of the widget. This can be used for special effects such as emboss, or to use the label() pointer as another form of data such as a bitmap. The value FL_NORMAL_LABEL prints the label as text.

12.86.30  measure()

int Fl_Menu_Item::measure (  
    int * hp,  
    const Fl_Menu_ * m ) const

Measures width of label, including effect of & characters. Optionally, can get height if hp is not NULL.

12.86.31  multi_label()

void Fl_Menu_Item::multi_label (  
    const Fl_Multi_Label * ml ) [inline]

Sets the title (label()) and labeltype() to an Fl_Multi_Label.
This sets the labeltype() to _FL_MULTI_LABEL (note the leading underscore).
See also  

const char* Fl_Menu_Item::label() const

Since

1.4.0

12.86.32  next() [1/2]

Fl_Menu_Item * Fl_Menu_Item::next (  
    int i = 1 ) [inline]

Advances a pointer by n items through a menu array, skipping the contents of submenus and invisible items. There are two calls so that you can advance through const and non-const data.

12.86.33  next() [2/2]

const Fl_Menu_Item * Fl_MENU::next (  
    int n = 1 ) const

Advance a pointer by n items through a menu array, skipping the contents of submenus and invisible items. There are two calls so that you can advance through const and non-const data.
12.86.2.34 popup()

const Fl_Menu_Item * Fl_Menu_Item::popup (  
    int X,  
    int Y,  
    const char * title = 0,  
    const Fl_Menu_Item * picked = 0,  
    const Fl_Menu_Item * menu_button = 0 ) const

This method is called by widgets that want to display menus. The menu stays up until the user picks an item or dismisses it. The selected item (or NULL if none) is returned. This does not do the callbacks or change the state of check or radio items. The menu is positioned so the cursor is centered over the item picked. This will work even if picked is in a submenu. If picked is zero or not in the menu item table the menu is positioned with the cursor in the top-left corner.

Parameters

| in | X,Y | the position of the mouse cursor, relative to the window that got the most recent event (usually you can pass Fl::event_x() and Fl::event_y() unchanged here). |
| in | title | a character string title for the menu. If non-zero a small box appears above the menu with the title in it. |
| in | picked | if this pointer is not NULL, the popup menu will appear so that the picked menu is under the mouse pointer. |
| in | menu_button | is a pointer to an Fl_Menu_ from which the color and boxtypes for the menu are pulled. If NULL then defaults are used. |

Returns

a pointer to the menu item selected by the user, or NULL

12.86.2.35 pulldown()

const Fl_Menu_Item * Fl_Menu_Item::pulldown (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const Fl_Menu_Item * initial_item = 0,  
    const Fl_Menu_Item * pbutton = 0,  
    const Fl_Menu_Item * title = 0,  
    int menubar = 0 ) const

Pulldown() is similar to popup(), but a rectangle is provided to position the menu. The menu is made at least W wide, and the picked item initial_item is centered over the rectangle (like Fl_Choice uses). If initial_item is NULL or not found, the menu is aligned just below the rectangle (like a pulldown menu). The title and menubar arguments are used internally by the Fl_Menu_Bar widget.

12.86.2.36 radio()

int Fl_Menu_Item::radio ( ) const [inline]

Returns true if this item is a radio item. When a radio button is selected all "adjacent" radio buttons are turned off. A set of radio items is delimited by an item that has radio() false, or by an item with FL_MENU_DIVIDER turned on.

12.86.2.37 set()

void Fl_Menu_Item::set ( ) [inline]

Turns the check or radio item "on" for the menu item. Note that this does not turn off any adjacent radio items like setonly() does.
12.86.2.38  setonly()

```cpp
void Fl_Menu_Item::setonly(
    Fl_Menu_Item const * first = NULL)
```

Turns the radio item "on" for the menu item and turns "off" adjacent radio items set.

**Note**
This method is dangerous if radio items are first in the menu. Make sure that `first` is set correctly or use `Fl_Menu_::setonly(Fl_Menu_Item*)` instead.

**Parameters**
- `in first` start of menu array or NULL (default) if the radio group is not the first item

12.86.2.39  shortcut()

```cpp
void Fl_Menu_Item::shortcut (int s) [inline]
```

Sets exactly what key combination will trigger the menu item. The value is a logical 'or' of a key and a set of shift flags, for instance FL_ALT+'a' or FL_ALT+FL_F+10 or just 'a'. A value of zero disables the shortcut. The key can be any value returned by `Fl::event_key()`, but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down. The shift flags can be any set of values accepted by `Fl::event_state()`. If the bit is on that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

12.86.2.40  size()

```cpp
int Fl_Menu_Item::size ( ) const
```

Size of the menu starting from this menu item. This method counts all menu items starting with this menu item, including all menu items in the same (sub)menu level, all nested submenus, and the terminating empty (0) menu item. It does not count menu items referred to by `FL_SUBMENU_POINTER` menu items (except the single menu item with `FL_SUBMENU_POINTER`). All menu items counted are consecutive in memory (one array).

**Example:**
```cpp
schemechoice = new Fl_Choice(X+125,Y,140,25,"FLTK Scheme");
schemechoice->add("none");
schemechoice->add("plastic");
schemechoice->add("gtk+");
printf("schemechoice->menu()->size() = %d\n", schemechoice->menu()->size());
```

Output:
```
schemechoice->menu()->size() = 5
```

12.86.2.41  submenu()

```cpp
int Fl_Menu_Item::submenu ( ) const [inline]
```

Returns true if either `FL_SUBMENU` or `FL_SUBMENU_POINTER` is on in the flags. `FL_SUBMENU` indicates an embedded submenu that goes from the next item through the next one with a NULL label(). `FL_SUBMENU_POINTER` indicates that `user_data()` is a pointer to another menu array.

12.86.2.42  test_shortcut()

```cpp
const Fl_Menu_Item * Fl_Menu_Item::test_shortcut ( ) const
```

This is designed to be called by a widgets handle() method in response to a FL_SHORTCUT event. If the current event matches one of the items shortcut, that item is returned. If the keystroke does not match any shortcuts then NULL is returned. This only matches the `shortcut()` fields, not the letters in the title preceeded by `'}'

---

Generated by Doxygen
12.86.2.43 uncheck()

void Fl_Menu_Item::uncheck () [inline]
Back compatibility only.

Deprecated Please use Fl_Menu_Item::clear() instead. This method will be removed in FLTK 1.5.0 or later.

See also
clear()

12.86.2.44 value()

int Fl_Menu_Item::value () const [inline]
Returns the current value of the check or radio item.
This is zero (0) if the menu item is not checked and non-zero otherwise.
Since

1.4.0 this method returns 1 if the item is checked but you should not rely on a particular value, only zero or non-zero.

Note
The returned value for a checked menu item was FL_MENU_VALUE (4) before FLTK 1.4.0.

The documentation for this struct was generated from the following files:
- Fl_Menu_Item.H
- Fl_Menu.cxx
- Fl_Menu-debug-disabled.cxx
- Fl_Menu-delete-labels.cxx
- Fl_Menu.cxx
- Fl_Menu_add.cxx

12.87 Fl_Menu_Window Class Reference

The Fl_Menu_Window widget is a window type used for menus.
#include <Fl_Menu_Window.H>
Inheritance diagram for Fl_Menu_Window:

public Member Functions

- Fl_Menu_Window (int W, int H, const char *l=0)
  Creates a new Fl_Menu_Window widget using the given size, and label string.
- Fl_Menu_Window (int X, int Y, int W, int H, const char *l=0)
  Creates a new Fl_Menu_Window widget using the given position, size, and label string.
- ~Fl_Menu_Window ()
  Destroys the window and all of its children.
Public Member Functions inherited from Fl_Single_Window

• **Fl_Single_Window** (int W, int H, const char ∗l=0)
  
  Creates a new Fl_Single_Window widget using the given size, and label (title) string.

• **Fl_Single_Window** (int X, int Y, int W, int H, const char ∗l=0)
  
  Creates a new Fl_Single_Window widget using the given position, size, and label (title) string.

• void show () FL_OVERRIDE
  
  Makes a widget visible.

• void show (int a, char ∗∗b)
  
  Same as Fl_Window::show(int a, char ∗∗b)

Public Member Functions inherited from Fl_Window

• virtual class Fl_Double_Window ∗ as_double_window ()
  
  Return non-null if this is an Fl_Double_Window object.

• virtual class Fl_Overlay_Window ∗ as_overlay_window ()
  
  Return non-null if this is an Fl_Overlay_Window object.

• Fl_Window const ∗ as_window () const FL_OVERRIDE

• Fl_Window ∗ as_window () FL_OVERRIDE
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• unsigned int border () const
  
  Returns whether the window possesses a border.

• void border (int b)
  
  Sets whether or not the window manager border is around the window.

• void clear_border ()
  
  Fast inline function to turn the window manager border off.

• void clear_modal_states ()
  
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

• void copy_label (const char ∗a)
  
  Sets the window titlebar label to a copy of a character string.

• void cursor (const Fl_RGB_Image ∗, int, int)
  
  Changes the cursor for this window using the provided image as cursor's shape.

• void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.

• void cursor (Fl_Cursor)
  
  Changes the cursor for this window.

• int decorated_h () const
  
  Returns the window height including any window title bar and any frame added by the window manager.

• int decorated_w () const
  
  Returns the window width including any frame added by the window manager.

• void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.

• void default_cursor (Fl_Cursor)
  
  Sets the default window cursor.

• void draw_backdrop ()
  
  Draw the background image if one is set and is aligned inside.

• Fl_Window (int w, int h, const char ∗title=0)
  
  Creates a window from the given width w, height h, and title.

• Fl_Window (int x, int y, int w, int h, const char ∗title=0)
  
  Creates a window from the given position (x, y), size (w, h) and title.

• void free_position ()
Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.

- **void fullscreen()**
  Makes the window completely fill one or more screens, without any window manager border visible.

- **unsigned int fullscreen_active() const**
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.

- **void fullscreen_off()**
  Turns off any side effects of fullscreen()

- **void fullscreen_off(int X, int Y, int W, int H)**
  Turns off any side effects of fullscreen() and does resize(x,y,w,h).

- **void fullscreen_screens(int top, int bottom, int left, int right)**
  Sets which screens should be used when this window is in fullscreen mode.

- **int handle(int) FL_OVERRIDE**
  Handles the specified event.

- **void hide() FL_OVERRIDE**
  Removes the window from the screen.

- **void hotspot(const Fl_Widget &p, int offscreen=0)**
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot(const Fl_Widget *, int offscreen=0)**
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot(int x, int y, int offscreen=0)**
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- **const void *icon() const**
  Gets the current icon window target dependent data.

- **void icon(const Fl_RGB_Image *)**
  Sets or resets a single window icon.

- **void icon(const void *ic)**
  Platform-specific method to set the window icon usable on Windows and X11 only.

- **void iconize()**
  Iconifies the window.

- **const char *iconlabel() const**
  See void Fl_Window::iconlabel(const char *)

- **void iconlabel(const char *)**
  Sets the icon label.

- **void icons(const Fl_RGB_Image *[])**, int
  Sets the window icons.

- **void icons(HICON big_icon, HICON small_icon)**
  Sets the window icons using HICON handles (Windows platform only).

- **const char *label() const**
  See void Fl_Window::label(const char *)

- **void label(const char *)**
  Sets the window title bar label.

- **void label(const char *label, const char *iconlabel)**
  Sets the icon label.

- **void make_current()**
  Sets things up so that the drawing functions in <FL/fl_draw.H> will go into this window.

- **void maximize()**
  Maximizes a top-level window to its current screen.
• unsigned int maximize_active () const
  Returns whether the window is currently maximized.

• unsigned int menu_window () const
  Returns true if this window is a menu window.

• unsigned int modal () const
  Returns true if this window is modal.

• unsigned int non_modal () const
  Returns true if this window is modal or non-modal.

• fl_uintptr_t os_id ()
  Returns a platform-specific identification of a shown window, or 0 if not shown.

• unsigned int override () const
  Returns non zero if OVERRIDE flag is set, 0 otherwise.

• void resize (int X, int Y , int W, int H) FL_OVERRIDE
  Changes the size and position of the window.

• int screen_num ()
  The number of the screen containing the mapped window.

• void screen_num (int screen_num)
  Set the number of the screen where to map the window.

• void set_menu_window ()
  Marks the window as a menu window.

• void set_modal ()
  A "modal" window, when shown(), will prevent any events from being delivered to other windows in the same program,
  and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

• void set_non_modal ()
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a modal() one in that it remains on
  top, but it has no effect on event delivery.

• void set_override ()
  Activates the flags NOBORDER|OVERRIDE.

• void set_tooltip_window ()
  Marks the window as a tooltip window.

• const Fl_Ima χ∗ shape ()
  Returns the image controlling the window shape or NULL.

• void shape (const Fl_Ima χ &b)
  Set the window's shape with an Fl_Ima χ.

• void shape (const Fl_Ima χ *img)
  Assigns a non-rectangular shape to the window.

• void show () FL_OVERRIDE
  Puts the window on the screen.

• void show (int argc, char ∗ ∗argv)
  Puts the window on the screen with show() and parses command-line arguments.

• int shown ()
  Returns non-zero if show() has been called (but not hide()).

• void size_range (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
  Sets the allowable range the user can resize this window to.

• unsigned int tooltip_window () const
  Returns true if this window is a tooltip window.

• void un_maximize ()
  Returns a previously maximized top-level window to its previous size.

• void wait_for_expose ()
  Waits for the window to be displayed after calling show().

• int x_root () const
Gets the x position of the window on the screen.

- const char * xclass () const
  Returns the xclass for this window, or a default.

- void xclass (const char *c)
  Sets the xclass for this window.

- int y_root () const
  Gets the y position of the window on the screen.

- virtual ~FL_Window ()
  The destructor also deletes all the children.

Public Member Functions inherited from FL_Group

- FL_Widget *& _ddfdesign_kludge ()
  This is for forms compatibility only.

- void add (FL_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

- void add (FL_Widget *o)
  See void FL_Group::add(FL_Widget &w)

- void addResizable (FL_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

- FL_Widget *const * array () const
  Returns a pointer to the array of children.

- Fl_Group const * as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

- FL_Widget * child (int n) const
  Returns array()[n].

- int children () const
  Returns how many child widgets the group has.

- void clear ()
  Deletes all child widgets from memory recursively.

- unsigned int clip_children ()
  Returns the current clipping mode.

- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

- void end ()
  Exactly the same as current(this->parent()).

- int find (const FL_Widget &o) const
  See int FL_Group::find(const FL_Widget *w) const.

- int find (const FL_Widget *) const
  Searches the child array for the widget and returns the index.

- FL_Group (int, int, int, int, const char * = 0)
  Creates a new FL_Group widget using the given position, size, and label string.

- void focus (FL_Widget *W)

- void forms_end ()
  This is for forms compatibility only.

- void init_sizes ()

Generated by Doxygen
Resets the internal array of widget sizes and positions.

- **void** `insert(Fl_Widget &, int i)`
  The widget is removed from its current group (if any) and then inserted into this group.

- **void** `insert(Fl_Widget &, Fl_Widget *)before`
  This does `insert(w, find(before))`.

- **void** `remove(Fl_Widget &)`
  Removes a widget from the group but does not delete it.

- **void** `remove(Fl_Widget *o)`
  Removes the widget `o` from the group.

- **void** `remove(int index)`
  Removes the widget at `index` from the group but does not delete it.

- **Fl_Widget **`resizable()` const
  Returns the group’s resizable widget.

- **void** `resizable(Fl_Widget &o)`
  Sets the group’s resizable widget.

- **void** `resizable(Fl_Widget *o)`
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual** `~Fl_Group ()`
  The destructor also deletes all the children.

**Public Member Functions inherited from Fl_Widget**

- **void** `_clear_fullscreen ()`
- **void** `_set_fullscreen ()`
- **void** `activate ()`
  Activates the widget.

- **unsigned int** `active () const`
  Returns whether the widget is active.

- **int** `active_r () const`
  Returns whether the widget and all of its parents are active.

- **Fl_Align** `align () const`
  Gets the label alignment.

- **void** `align(Fl_Align alignment)`
  Sets the label alignment.

- **long** `argument () const`
  Gets the current user data (long) argument that is passed to the callback function.

- **void** `argument (long v)`
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window **`as_gl_window ()`
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const **`as_gl_window () const`

- **void** `bind_deimage (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the inactive state.

- **void** `bind_deimage (int f)`
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void** `bind_image (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the active state.

- **void** `bind_image (int f)`
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype** `box () const`
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback +cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback +cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback +cb, void *p)
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 +cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 +cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

• void copy_label (const char *new_label)
  Sets the current label.

• void copy_tooltip (const char *text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image * deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image * deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **Fl_Image * image ()**
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image * image () const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

- **const char * label () const**
  Gets the current label text.

- **void label (const char *text)**
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

- **FL_Color labelcolor () const**
  Gets the label color.

- **void labelcolor (FL_Color c)**
  Sets the label color.

- **FL_Font labelfont () const**
  Gets the font to use.

- **void labelfont (FL_Font f)**
  Sets the font to use.
• `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

• `void labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

• `Fl_Labeltype labeltype () const`
  Gets the label type.

• `void labeltype (Fl_Labeltype a)`
  Sets the label type.

• `void measure_label (int &ww, int &hh) const`
  Sets width ww and height hh accordingly with the label size.

• `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

• `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

• `unsigned int output () const`
  Returns if a widget is used for output only.

• `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

• `void parent (Fl_Group * p)`
  Internal use only - “for hacks only”.

• `void position (int X, int Y)`
  Repositions the window or widget.

• `void redraw ()`
  Schedules the drawing of the widget.

• `void redraw_label ()`
  Schedules the drawing of the label.

• `Fl_Color selection_color () const`
  Gets the selection color.

• `void selection_color (Fl_Color a)`
  Sets the selection color.

• `void set_active ()`
  Marks the widget as active without sending events or changing focus.

• `void set_changed ()`
  Marks the value of the widget as changed.

• `void set_output ()`
  Sets a widget to output only.

• `void set_visible ()`
  Makes the widget visible.

• `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

• `int shortcut_label () const`
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

• `void shortcut_label (int value)`
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

• `void size (int W, int H)`
  Changes the size of the widget.

• `int take_focus ()`
  Gives the widget the keyboard focus.

• `unsigned int takesevents () const`
  Returns if the widget is able to take events.

• `int testShortcut ()`
Returns true if the widget's label contains the entered '\&x' shortcut.

- **const char * tooltip () const**
  
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  
  Sets the current tooltip text.

- **FL_Window * top_window () const**
  
  Returns a pointer to the top-level window for the widget.

- **FL_Window * top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  
  Gets the widget type.

- **void type (uchar t)**
  
  Sets the widget type.

- **int use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void * user_data () const**
  
  Gets the user data for this widget.

- **void user_data (FL_Callback_User_Data *v, bool auto_free)**
  
  Sets the user data for this widget.

- **void user_data (void *v)**
  
  Sets the user data for this widget.

- **unsigned int visible () const**
  
  Returns whether a widget is visible.

- **unsigned int visible_focus () const**
  
  Checks whether this widget has a visible focus.

- **void visible_focus (int v)**
  
  Modifies keyboard focus navigation.

- **int visible_r () const**
  
  Returns whether a widget and all its parents are visible.

- **int w () const**
  
  Gets the widget width.

- **FL_When when () const**
  
  Returns the conditions under which the callback is called.

- **void when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

- **FL_Window * window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  
  Gets the widget position in its window.

- **int y () const**
  
  Gets the widget position in its window.

- **virtual ~FL_Widget ()**
  
  Destroys the widget.

**Additional Inherited Members**

**Public Types inherited from FL_Window**

- **typedef struct HICON__ * HICON**
Static Public Member Functions inherited from Fl_Window

- static Fl_Window * current ()
  Returns the last window that was made current.
- static void default_callback (Fl_Window *, void *)
  Back compatibility: Sets the default callback v for win to call on close event.
- static void default_icon (const Fl_RGB_Image *)
  Sets a single default window icon.
- static void default_icons (const Fl_RGB_Image [ ], int)
  Sets the default window icons.
- static void default_icons (HICON big_icon, HICON small_icon)
  Sets the default window icons (Windows platform only).
- static const char * default_xclass ()
  Returns the default xclass.
- static void default_xclass (const char *)
  Sets the default window xclass.
- static bool is_a_rescale ()
  Returns true when a window is being rescaled.
- static char show_next_window_iconic ()
  Returns the static flag whether the next window should be opened iconified.
- static void show_next_window_iconic (char stat)
  Sets a static flag whether the next window should be opened iconified.

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *, void *)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered 'x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , Copied_Tooltip = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.
Protected Member Functions inherited from Fl_Window

- void default_size_range ()
  Protected method to calculate the default size range of a window.
- void draw () FL_OVERRIDE
  Draws the widget.
- virtual void flush ()
  Forces the window to be drawn, this window is also made current and calls draw().
- int force_position () const
  Returns the internal state of the window's FORCE_POSITION flag.
- void force_position (int force)
  Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void free_icons ()
  Deletes all icons previously attached to the window.
- int is_resizable ()
  Protected method to determine whether a window is resizable.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
12.88 Fl_Multi_Browser Class Reference

- void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
  Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
- unsigned int **flags** () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

**Static Protected Attributes inherited from Fl_Window**

- static Fl_Widget ∗current_
  Stores the last window that was made current.

12.87.1 Detailed Description

The **Fl_Menu_Window** widget is a window type used for menus. By default the window is drawn in the hardware overlay planes if they are available so that the menu don't force the rest of the window to redraw.

The documentation for this class was generated from the following files:
- Fl_Menu_Window.H
- Fl_Menu_Window.cxx

12.88 Fl_Multi_Browser Class Reference

The **Fl_Multi_Browser** class is a subclass of Fl_Browser which lets the user select any set of the lines.

#include <Fl_Multi_Browser.H>

Inheritance diagram for Fl_Multi_Browser:

Fl_Multi_Browser
```
Public Member Functions

• **Fl_Multi_Browser** (int X, int Y, int W, int H, const char ∗L=0)
  
  Creates a new Fl_Multi_Browser widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Browser

• void **add** (const char ∗newtext, void ∗d=0)
  
  Adds a new line to the end of the browser.

• void **bottomline** (int line)
  
  Scrolls the browser so the bottom item in the browser is showing the specified line.

• void **clear** ()
  
  Removes all the lines in the browser.

• char **column_char** () const
  
  Gets the current column separator character.

• void **column_char** (char c)
  
  Sets the column separator to c.

• const int ∗**column_widths** () const
  
  Gets the current column width array.

• void **column_widths** (const int ∗arr)
  
  Sets the current array to arr.

• void ∗**data** (int line) const
  
  Returns the user data() for specified line.

• void **data** (int line, void ∗d)
  
  Sets the user data for specified line to d.

• void **display** (int line, int val=1)
  
  For back compatibility.

• int **displayed** (int line) const
  
  Returns non-zero if line has been scrolled to a position where it is being displayed.

• **Fl_Browser** (int X, int Y, int W, int H, const char ∗L=0)
  
  The constructor makes an empty browser.

• char **format_char** () const
  
  Gets the current format code prefix character, which by default is '@'.

• void **format_char** (char c)
  
  Sets the current format code prefix character to c.

• void **hide** () FL_OVERRIDE
  
  Hides the entire Fl_Browser widget – opposite of show().

• void **hide** (int line)
  
  Make the item at the specified line invisible, preventing selection by the user.

• **Fl_Image** ∗**icon** (int line) const
  
  Returns the icon currently defined for line.

• void **icon** (int line, Fl_Image ∗icon)
  
  Set the image icon for line to the value icon.

• void **insert** (int line, const char ∗newtext, void ∗d=0)
  
  Insert a new entry whose label is newtext above given line, optional data d.

• void **lineposition** (int line, Fl_Line_Position pos)
  
  Updates the browser so that line is shown at position pos.

• int **load** (const char ∗filename)
  
  Clears the browser and reads the file, adding each line from the file to the browser.

• void **make_visible** (int line)
  
  Make the item at the specified line visible().

• void **middleline** (int line)
Scrolls the browser so the middle item in the browser is showing the specified line.

- **void move**(int to, int from)
  
  Line from is removed and reinserted at to.

- **void remove**(int line)
  
  Remove entry for given line number, making the browser one line shorter.

- **void remove_icon**(int line)
  
  Removes the icon for line.

- **void replace**(int a, const char ∗b)
  
  For back compatibility only.

- **int select**(int line, int val=1)
  
  Sets the selection state of the item at line to the value val.

- **int selected**(int line) const
  
  Returns 1 if specified line is selected, 0 if not.

- **void show ()** FL_OVERRIDE
  
  Shows the entire Fl_Browser widget – opposite of hide().

- **void show**(int line)
  
  Makes line visible, and available for selection by user.

- **int size ()** const
  
  Returns how many lines are in the browser.

- **void size**(int W, int H)

- **void swap**(int a, int b)
  
  Swaps two browser lines a and b.

- **const char ∗text**(int line) const
  
  Returns the label text for the specified line.

- **void text**(int line, const char ∗newtext)
  
  Sets the text for the specified line to newtext.

- **Fl_Fontsize textsize ()** const
  
  Gets the default text size (in pixels) for the lines in the browser.

- **void textsize**(Fl_Fontsize newSize)
  
  Sets the default text size (in pixels) for the lines in the browser to newSize.

- **int topline ()** const
  
  Returns the line that is currently visible at the top of the browser.

- **void topline**(int line)
  
  Scrolls the browser so the top item in the browser is showing the specified line.

- **int value ()** const
  
  Returns the line number of the currently selected line, or 0 if none selected.

- **void value**(int line)
  
  Sets the browser’s value(), which selects the specified line.

- **int visible**(int line) const
  
  Returns non-zero if the specified line is visible, 0 if hidden.

- **~Fl_Browser ()**
  
  The destructor deletes all list items and destroys the browser.

Public Member Functions inherited from Fl_Browser_

- **int deselect**(int docallbacks=0)
  
  Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

- **void display**(void ∗item)
  
  Displays the item, scrolling the list as necessary.

- **int handle**(int event) FL_OVERRIDE
  
  Handles the event within the normal widget bounding box.
• uchar **has_scrollbar () const**
  
  Returns the current scrollbar mode, see Fl_Browser_::has_scrollbar(uchar)

• void **has_scrollbar (uchar mode)**
  
  Sets whether the widget should have scrollbars or not (default Fl_Browser_::BOTH).

• int **hposition () const**
  
  Gets the horizontal scroll position of the list as a pixel position pos.

• void **hposition (int)**
  
  Sets the horizontal scroll position of the list to pixel position pos.

• int **linespacing () const**
  
  Return the height of additional spacing between browser lines.

• void **linespacing (int pixels)**
  
  Add some space between browser lines.

• int **position () const**
  
  • void position (int pos)
  
  • void position (int x, int y)

• void **resize (int X, int Y, int W, int H) FL_OVERRIDE**
  
  Repositions and/or resizes the browser.

• void **scrollbar_left ()**
  
  Moves the vertical scrollbar to the lefthand side of the list.

• void **scrollbar_right ()**
  
  Moves the vertical scrollbar to the righthand side of the list.

• int **scrollbar_size () const**
  
  Gets the current size of the scrollbars' troughs, in pixels.

• void **scrollbar_size (int newSize)**
  
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

• int **scrollbar_width () const**
  
  Returns the global value Fl::scrollbar_size().

• void **scrollbar_width (int width)**
  
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

• int **select (void ∗item, int val=1, int docallbacks=0)**
  
  Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.

• int **select_only (void ∗item, int docallbacks=0)**
  
  Selects item and returns 1 if the state changed or 0 if it did not.

• void **sort (int flags=0)**
  
  Sort the items in the browser based on flags.

• Fl_Color **textcolor () const**
  
  Gets the default text color for the lines in the browser.

• void **textcolor (Fl_Color col)**
  
  Sets the default text color for the lines in the browser to color col.

• Fl_Font **textfont () const**
  
  Gets the default text font for the lines in the browser.

• void **textfont (Fl_Font font)**
  
  Sets the default text font for the lines in the browser to font.

• Fl_Fontsize **textsize () const**
  
  Gets the default text size (in pixels) for the lines in the browser.

• void **textsize (Fl_Fontsize newSize)**
  
  Sets the default text size (in pixels) for the lines in the browser to size.

• int **vposition () const**
  
  Gets the vertical scroll position of the list as a pixel position pos.

• void **vposition (int pos)**
  
  Sets the vertical scroll position of the list to pixel position pos.
Public Member Functions inherited from Fl_Group

- `Fl_Widget * & ddfdesign_kludge ()`
  
  This is for forms compatibility only.

- `void add (Fl_Widget &)`

  The widget is removed from its current group (if any) and then added to the end of this group.

- `void add (Fl_Widget *o)`

  See void Fl_Group::add(Fl_Widget &w)

- `void add_resizable (Fl_Widget &o)`

  Adds a widget to the group and makes it the resizable widget.

- `Fl_Widget * const * array () const`

  Returns a pointer to the array of children.

- `Fl_Group const * as_group () const FL_OVERRIDE`

  Returns an Fl_Group pointer if this widget is an Fl_Group.

- `void begin ()`

  Sets the current group so you can build the widget tree by just constructing the widgets.

- `Fl_Widget * child (int n) const`

  Returns array()[n].

- `int children () const`

  Returns how many child widgets the group has.

- `void clear ()`

  Deletes all child widgets from memory recursively.

- `unsigned int clip_children ()`

  Returns the current clipping mode.

- `void clip_children (int c)`

  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- `virtual int delete_child (int n)`

  Removes the widget at index from the group and deletes it.

- `void end ()`

  Exactly the same as current(this->parent()).

- `int find (const Fl_Widget &o) const`

  See int Fl_Group::find(const Fl_Widget *w) const.

- `int find (const Fl_Widget *) const`

  Searches the child array for the widget and returns the index.

- `Fl_Group (int, int, int, int, const char * = 0)`

  Creates a new Fl_Group widget using the given position, size, and label string.

- `void focus (Fl_Widget *)`

- `void forms_end ()`

  This is for forms compatibility only.

- `int handle (int) FL_OVERRIDE`

  Handles the specified event.

- `void init_sizes ()`

  Resets the internal array of widget sizes and positions.

- `void insert (Fl_Widget &, int i)`

  The widget is removed from its current group (if any) and then inserted into this group.

- `void insert (Fl_Widget &o, Fl_Widget *before)`

  This does insert(w, find(before)).

- `void remove (Fl_Widget &)`

  Removes a widget from the group but does not delete it.

- `void remove (Fl_Widget *o)`
Removes the widget \( o \) from the group.

- **void** remove (int index)
  
  Removes the widget at index from the group but does not delete it.

- **Fl_Widget** ∗ resizable () const
  
  Returns the group's resizable widget.

- **void** resizable (Fl_Widget &o)
  
  Sets the group's resizable widget.

- **void** resizable (Fl_Widget ∗o)
  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **void** resize (int, int, int, int) FL_OVERRIDE
  
  Resizes the Fl_Group widget and all of its children.

- **virtual ~Fl_Group ()**
  
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- **void** _clear_fullscreen ()
- **void** _set_fullscreen ()
- **void** activate ()
  
  Activates the widget.

- **unsigned int** active () const
  
  Returns whether the widget is active.

- **int** active_r () const
  
  Returns whether the widget and all of its parents are active.

- **Fl_Align** align () const
  
  Gets the label alignment.

- **void** align (Fl_Align alignment)
  
  Sets the label alignment.

- **long** argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- **void** argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window ∗ as_gl_window ()**
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const ∗ as_gl_window () const**

- **virtual Fl_Window ∗ as_window ()**
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **virtual Fl_Window const ∗ as_window () const**

- **void** bind_deimage (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void** bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void** bind_image (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the active state.

- **void** bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype** box () const
  
  Gets the box type of the widget.

- **void** box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.

- **Fl_Callback_p** callback () const
Gets the current callback function for the widget.

- **void callback (Fl_Callback cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback cb, Fl_Callback_User_Data *p, bool auto_free)**
  Sets the current callback function and managed user data for the widget.

- **void callback (Fl_Callback cb, void *p)**
  Sets the current callback function and data for the widget.

- **void callback (Fl_Callback0 cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback1 cb, long p=0)**
  Sets the current callback function for the widget.

- **unsigned int changed () const**
  Checks if the widget value changed since the last callback.

- **void clear_active ()**
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output ()**
  Sets a widget to accept input.

- **void clear_visible ()**
  Hides the widget.

- **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.
• FL_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const FL_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (FL_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (FL_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• FL_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const FL_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (FL_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (FL_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• FL_Color labelcolor () const
  Gets the label color.
• void labelcolor (FL_Color c)
  Sets the label color.
• FL_Font labelfont () const
  Gets the font to use.
• void labelfont (FL_Font f)
  Sets the font to use.
• FL_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (FL_Fontsize pix)
Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.

- `void set_visible ()`
  Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  Returns whether the widget's label uses '&' to indicate shortcuts.

- `void shortcut_label (int value)`
  Sets whether the widget's label uses '&' to indicate shortcuts.

- `void size (int W, int H)`
  Changes the size of the widget.

- `int take_focus ()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.

- `int testShortcut ()`
  Returns true if the widget's label contains the entered '&' shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.
• **void tooltip (const char ∗text)**
  
  Sets the current tooltip text.

• **Fl_Window ∗ top_window () const**
  
  Returns a pointer to the top-level window for the widget.

• **Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

• **uchar type () const**
  
  Gets the widget type.

• **void type (uchar t)**
  
  Sets the widget type.

• **int use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void ∗ user_data () const**
  
  Gets the user data for this widget.

• **void user_data (Fl_Callback_User_Data ∗v, bool auto_free)**
  
  Sets the user data for this widget.

• **void user_data (void ∗v)**
  
  Sets the user data for this widget.

• **unsigned int visible () const**
  
  Returns whether a widget is visible.

• **unsigned int visible_focus () const**
  
  Checks whether this widget has a visible focus.

• **void visible_focus (int v)**
  
  Modifies keyboard focus navigation.

• **int visible_r () const**
  
  Returns whether a widget and all its parents are visible.

• **int w () const**
  
  Gets the widget width.

• **Fl_When when () const**
  
  Returns the conditions under which the callback is called.

• **void when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

• **Fl_Window ∗ window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int x () const**
  
  Gets the widget position in its window.

• **int y () const**
  
  Gets the widget position in its window.

• **virtual ∼Fl_Widget ()**
  
  Destroys the widget.

---

**Additional Inherited Members**

**Public Types inherited from Fl_Browser**

• enum **Fl_Line_Position { TOP, BOTTOM, MIDDLE }**
  
  For internal use only?

**Public Types inherited from Fl_Browser_**

• enum {

  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7
}

  Values for has_scrollbar().

---

Generated by Doxygen
Static Public Member Functions inherited from Fl_Group

• static Fl_Group * current ()
  Returns the currently active group.
• static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Public Attributes inherited from Fl_Browser_

• Fl_Scrollbar hscrollbar
  Horizontal scrollbar.
• Fl_Scrollbar scrollbar
  Vertical scrollbar.

Protected Types inherited from Fl_Widget

} flags possible values enumeration.

Protected Member Functions inherited from Fl_Browser

• FL_BLINE * _remove (int line)
  Removes the item at the specified line.
• FL_BLINE * find_line (int line) const
  Returns the item for specified line.
• int full_height () const FL_OVERRIDE
  The height of the entire list of all visible() items in pixels.
• int incr_height () const FL_OVERRIDE
  The default 'average' item height (including inter-item spacing) in pixels.
• void insert (int line, FL_BLINE *item)
• void *item_at (int line) const FL_OVERRIDE
  Return the item at specified line.
• void item_draw (void *item, int X, int Y, int W, int H) const FL_OVERRIDE
Draws item at the position specified by X Y W H.

- **void** item_first () const FL_OVERRIDE
  Returns the very first item in the list.

- **int** item_height (void *item) const FL_OVERRIDE
  Returns height of item in pixels.

- **void** item_last () const FL_OVERRIDE
  Returns the very last item in the list.

- **void** item_next (void *item) const FL_OVERRIDE
  Returns the next item after item.

- **void** item_prev (void *item) const FL_OVERRIDE
  Returns the previous item before item.

- **void** item_select (void *item, int val) FL_OVERRIDE
  Change the selection state of item to the value val.

- **int** item_selected (void *item) const FL_OVERRIDE
  See if item is selected.

- **void** item_swap (void *a, void *b) FL_OVERRIDE
  Swap the items a and b.

- **const char** *item_text (void *item) const FL_OVERRIDE
  Returns the label text for item.

- **int** item_width (void *item) const FL_OVERRIDE
  Returns width of item in pixels.

- **int** lineno (void *item) const
  Returns line number corresponding to item, or zero if not found.

- **void** swap (FL_BLINE *a, FL_BLINE *b)
  Swap the two items a and b.

---

**Protected Member Functions inherited from Fl_Browser_**

- **void** bbox (int &X, int &Y, int &W, int &H) const
  Returns the bounding box for the interior of the list's display window, inside the scrollbars.

- **void** deleting (void *item)
  This method should be used when item is being deleted from the list.

- **int** displayed (void *item) const
  Returns non-zero if item has been scrolled to a position where it is being displayed.

- **void** draw () FL_OVERRIDE
  Draws the list within the normal widget bounding box.

- **void** *find_item (int ypos)
  Returns the item under mouse y position ypos.

- **Fl_Browser_** (int X, int Y, int W, int H, const char *L=0)
  The constructor makes an empty browser.

- **virtual int** full_width () const
  This method may be provided by the subclass to indicate the full width of the item list, in pixels.

- **void** inserting (void *a, void *b)
  This method should be used when an item is in the process of being inserted into the list.

- **virtual int** item_quick_height (void *item) const
  This method may be provided by the subclass to return the height of the item, in pixels.

- **int** leftedge () const
  This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

- **void** new_list ()
  This method should be called when the list data is completely replaced or cleared.

- **void** redraw_line (void *item)
This method should be called when the contents of item has changed, but not its height.

- void redraw_lines ()
  This method will cause the entire list to be redrawn.
- void replacing (void ∗a, void ∗b)
  This method should be used when item a is being replaced by item b.
- void ∗selection () const
  Returns the item currently selected, or NULL if there is no selection.
- void swapping (void ∗a, void ∗b)
  This method should be used when two items a and b are being swapped.
- void ∗top () const
  Returns the item that appears at the top of the list.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw () FL_OVERRIDE
  Draws the widget.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget ∗, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
- int ∗sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget’s position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
Draws a focus box for the widget at the given position and size.

- void draw_label() const
  Draws the widget's label at the defined label position.
- void draw_label(int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget(int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int flags() const
  Gets the widget flags mask.
- void h(int v)
  Internal use only.
- void set_flag(unsigned int c)
  Sets a flag in the flags mask.
- void w(int v)
  Internal use only.
- void x(int v)
  Internal use only.
- void y(int v)
  Internal use only.

### 12.88.1 Detailed Description

The Fl_Multi_Browser class is a subclass of Fl_Browser which lets the user select any set of the lines.

![Fl_Multi_Browser](image)

Figure 12.31 Fl_Multi_Browser

The user interface is Macintosh style: clicking an item turns off all the others and selects that one, dragging selects all the items the mouse moves over, and ctrl + click (Cmd+click on the Mac OS platform) toggles the items. Shift + click extends the selection until the clicked item. This is different from how forms did it. Normally the callback is done when the user releases the mouse, but you can change this with when(). See Fl_Browser for methods to add and remove lines from the browser.

### 12.88.2 Constructor & Destructor Documentation

#### 12.88.2.1 Fl_Multi_Browser()

Fl_Multi_Browser::Fl_Multi_Browser(int X, int Y, int W, int H, const char *L = 0L)

Creates a new Fl_Multi_Browser widget using the given position, size, and label string.

The default boxtype is FL_DOWN_BOX. The constructor specializes Fl_Browser() by setting the type to FL←MULTI_BROWSER. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- Fl_Multi_Browser.H
- Fl_Browser.cxx
**12.89 Fl_Multi_Label Struct Reference**

Allows a mixed text and/or graphics label to be applied to an `Fl_Menu_Item` or `Fl_Widget`.

```c
#include <Fl_Multi_Label.H>
```

**Public Member Functions**

- `void label(Fl_Menu_Item *)`
  
  Associate an `Fl_Multi_Label` with an `Fl_Menu_Item`.

- `void label(Fl_Widget *)`
  
  Associate an `Fl_Multi_Label` with an `Fl_Widget`.

**Public Attributes**

- `const char * labela`
  
  Holds the "leftmost" of the two elements in the composite label.

- `const char * labelb`
  
  Holds the "rightmost" of the two elements in the composite label.

- `uchar typea`
  
  Holds the "type" of labela.

- `uchar typeb`
  
  Holds the "type" of labelb.

**12.89.1 Detailed Description**

Allows a mixed text and/or graphics label to be applied to an `Fl_Menu_Item` or `Fl_Widget`. Most regular FLTK widgets now support the ability to associate both images and text with a label but some special cases, notably the non-widget `Fl_Menu_Item` objects, do not. `Fl_Multi_Label` may be used to create menu items that have an icon and text, which would not normally be possible for an `Fl_Menu_Item`. For example, `Fl_Multi_Label` is used in the New->Code submenu in fluid, and others.

![Menu items with icons using Fl_Multi_Label](image)

Each `Fl_Multi_Label` holds two elements, `labela` and `labelb`; each may hold either a text label (const char*) or an image (Fl_Image*). When displayed, `labela` is drawn first and `labelb` is drawn immediately to its right.

More complex labels can be constructed by setting `labelb` as another `Fl_Multi_Label` and thus chaining up a series of label elements.

When assigning a label element to one of `labela` or `labelb`, they should be explicitly cast to (const char*) if they are not of that type already.

**Note**

An `Fl_Multi_Label` object and all its components (label text, images, chained `Fl_Multi_Label`'s and their linked objects) must exist during the lifetime of the widget or menu item they are assigned to. It is the responsibility of the user's code to release these linked objects if necessary after the widget or menu is deleted.

**Example Use: Fl_Menu_Bar**

```c
Fl_Pixmap *image = new Fl_Pixmap(..); // image for menu item; any Fl_Image based widget
Fl_Menu_Bar *menu = new Fl_Menu_Bar(..); // can be any Fl_Menu_ oriented widget (Fl_Choice, Fl_Menu_Button..)

// Create a menu item
```

Generated by Doxygen
```c
int i = menu->add("File/New", ..);
Fl_Menu_Item *item = (Fl_Menu_Item*)(menu->menu()[i]);
// Create a multi label, assign it an image + text
Fl_Multi_Label *ml = new Fl_Multi_Label;
// Left side of label is an image
ml->typea = FL_IMAGE_LABEL;
ml->labela = (const char*)image; // any Fl_Image widget: Fl_Fixmap, Fl_PNG_Image, etc..
// Right side of label is label text
ml->typeb = FL_NORMAL_LABEL;
ml->labelb = item->label();
// Assign the multilabel to the menu item
// ml->label(item); // deprecated since 1.4.0; backwards compatible with 1.3.x
item->label(ml); // new method since 1.4.0
```

Fl_Label and Fl_Labeltype and examples/howto-menu-with-images.cxx

### 12.89.2 Member Function Documentation

#### 12.89.2.1 `label()` [1/2]

```c
void Fl_Multi_Label::label (Fl_Menu_Item *o)
```

Associate an Fl_Multi_Label with an Fl_Menu_Item.

This uses Fl_Menu_Item::label(Fl_Labeltype a, const char *b) internally to set the label and the label type of the menu item, i.e. it stores a pointer to the Fl_Multi_Label object (this). An existing label (pointer) will be overwritten. This sets the type of the menu item's label to _FL_MULTI_LABEL - note the leading underscore ('_').

There is no way to use a method like Fl_Widget::copy_label() that transfers ownership of the Fl_Multi_Label and its linked objects (images, text, and chained Fl_Multi_Labels) to the menu item. The Fl_Multi_Label and all linked images, text labels, or chained Fl_Multi_Label objects must exist during the lifetime of the menu and will not be released when the menu item is destroyed.

Note

The user's code is responsible for releasing the Fl_Multi_Label and all linked objects (images, text, chained Fl_Multi_Label's) after the menu has been deleted. This may cause memory leaks if Fl_Multi_Label is used and reassigned w/o releasing the objects assigned to it.

**Deprecated** since 1.4.0: please use Fl_Menu_Item::label(Fl_Multi_Label *)

See also

Fl_Menu_Item::label(Fl_Multi_Label *)

#### 12.89.2.2 `label()` [2/2]

```c
void Fl_Multi_Label::label (Fl_Widget *o)
```

Associate an Fl_Multi_Label with an Fl_Widget.

This method uses Fl_Widget::label(Fl_Labeltype, const char *) internally to set the label of the widget, i.e. it stores a pointer to the Fl_Multi_Label object (this). An existing label that has been set using Fl_Widget::copy_label() will be released prior to the assignment of the new label.

This sets the type of the widget's label to _FL_MULTI_LABEL - note the leading underscore ('_').

There is no way to use a method like Fl_Widget::copy_label() that transfers ownership of the Fl_Multi_Label and its linked objects (images, text, and chained Fl_Multi_Labels) to the widget. The Fl_Multi_Label and all linked images, text labels, or chained Fl_Multi_Label objects must exist during the lifetime of the widget and will not be released when the widget is destroyed.

Note

The user's code is responsible for releasing the Fl_Multi_Label and all linked objects (images, text, chained Fl_Multi_Label's) after the widget has been deleted. This may cause memory leaks if Fl_Multi_Label is used and reassigned w/o releasing the objects assigned to it.
12.89.3 Member Data Documentation

12.89.3.1 labela

const char* Fl_Multi_Label::labela
Holds the "leftmost" of the two elements in the composite label.
Typically this would be assigned either a text string (const char*), a (Fl_Image*) or a (Fl_Multi_Label*).

12.89.3.2 labelb

const char* Fl_Multi_Label::labelb
Holds the "rightmost" of the two elements in the composite label.
Typically this would be assigned either a text string (const char*), a (Fl_Image*) or a (Fl_Multi_Label*).

12.89.3.3 typea

uchar Fl_Multi_Label::typea
Holds the "type" of labela.
Typically this is set to FL_NORMAL_LABEL for a text label, FL_IMAGE_LABEL for an image (based on Fl_image)
or FL_MULTI_LABEL if "chaining" multiple Fl_Multi_Label elements together.

12.89.3.4 typeb

uchar Fl_Multi_Label::typeb
Holds the "type" of labelb.
Typically this is set to FL_NORMAL_LABEL for a text label, FL_IMAGE_LABEL for an image (based on Fl_image)
or FL_MULTI_LABEL if "chaining" multiple Fl_Multi_Label elements together.
The documentation for this struct was generated from the following files:

• Fl_Multi_Label.H
• Fl_Multi_Label.cxx

12.90 Fl_Multiline_Input Class Reference

This input field displays 'n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down arrow keys.

#include <Fl_Multiline_Input.H>

Inheritance diagram for Fl_Multiline_Input:

Fl_Widget

Fl_Input_

Fl_Input

Fl_Multiline_Input

Public Member Functions

• Fl_Multiline_Input (int X, int Y, int W, int H, const char *=0)

  Creates a new Fl_Multiline_Input widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Input

• Fl_Input (int, int, int, int, const char *=0)
1118 Class Documentation

Creates a new Fl Input widget using the given position, size, and label string.

- **int handle (int) FL_OVERRIDE**
  Handles the specified event.

### Public Member Functions inherited from Fl_Input_

- **int append (const char *t, int l=0, char keep_selection=0)**
  Append text at the end.
- **bool can_redo () const**
  Check if there is a redo action available.
- **bool can_undo () const**
  Check if the last operation can be undone.
- **int copy (int clipboard)**
  Put the current selection into the clipboard.
- **int copy_cuts ()**
  Copies the yank buffer to the clipboard.
- **Fl_Color cursor_color () const**
  Gets the color of the cursor.
- **void cursor_color (Fl_Color n)**
  Sets the color of the cursor.
- **int cut ()**
  Deletes the current selection.
- **int cut (int a, int b)**
  Deletes all characters between index a and b.
- **int cut (int n)**
  Deletes the next n bytes rounded to characters before or after the cursor.
- **double dvalue () const**
  Returns the widget text interpreted as a floating point number.
- **Fl_Input_ (int, int, int, int, const char *=0)**
  Creates a new Fl_Input_ widget.
- **unsigned int index (int i) const**
  Returns the character at index i.
- **int input_type () const**
  Gets the input field type.
- **void input_type (int t)**
  Sets the input field type.
- **int insert (const char *t, int l=0)**
  Inserts text at the cursor position.
- **int insert_position () const**
  Gets the position of the text cursor.
- **int insert_position (int p)**
  Sets the cursor position and mark.
- **int insert_position (int p, int m)**
  Sets the index for the cursor and mark.
- **int ivalue () const**
  Returns the widget text interpreted as a signed integer.
- **int mark () const**
  Gets the current selection mark.
- **int mark (int m)**
  Sets the current selection mark.
- **int maximum_size () const**

Generated by Doxygen
Gets the maximum length of the input field in characters.

- void maximum_size (int m)
  Sets the maximum length of the input field in characters.

- int position () const
- int position (int p)
- int position (int p, int m)
- int readonly () const
  Gets the read-only state of the input field.

- void readonly (int b)
  Sets the read-only state of the input field.

- int redo ()
  Redo previous undo operation.

- int replace (int b, int e, const char *text, int ilen=0)
  Deletes text from b to e and inserts the new string text.

- void resize (int, int, int, int) FL_OVERRIDE
  Changes the size of the widget.

- int shortcut () const
  Return the shortcut key associated with this widget.

- void shortcut (int s)
  Sets the shortcut key associated with this widget.

- int size () const
  Returns the number of bytes in value().

- void size (int W, int H)
  Sets the width and height of this widget.

- int static_value (const char *)
  Changes the widget text.

- int static_value (const char *, int)
  Changes the widget text.

- int tab_nav () const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

- void tab_nav (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

- Fl_Color textcolor () const
  Gets the color of the text in the input field.

- void textcolor (Fl_Color n)
  Sets the color of the text in the input field.

- Fl_Font textfont () const
  Gets the font of the text in the input field.

- void textfont (Fl_Font s)
  Sets the font of the text in the input field.

- Fl_Fontsize textsize () const
  Gets the size of the text in the input field.

- void textsize (Fl_Fontsize s)
  Sets the size of the text in the input field.

- int undo ()
  Undoes previous changes to the text buffer.

- const char * value () const
  Returns the text displayed in the widget.

- int value (const char *)
  Changes the widget text.

- int value (const char *, int)
Changes the widget text.

- **int value (double value)**
  Changes the widget text to a floating point number ("%g").
- **int value (int value)**
  Changes the widget text to a signed integer number.
- **int wrap () const**
  Gets the word wrapping state of the input field.
- **void wrap (int b)**
  Sets the word wrapping state of the input field.
- **`Fl_Input_()`**
  Destroys the widget.

**Public Member Functions inherited from Fl_Widget**

- **void _clear_fullscreen ()**
- **void _set_fullscreen ()**
- **void activate ()**
  Activates the widget.
- **unsigned int active () const**
  Returns whether the widget is active.
- **int active_r () const**
  Returns whether the widget and all of its parents are active.
- **Fl_Align align () const**
  Gets the label alignment.
- **void align (Fl_Align alignment)**
  Sets the label alignment.
- **long argument () const**
  Gets the current user data (long) argument that is passed to the callback function.
- **void argument (long v)**
  Sets the current user data (long) argument that is passed to the callback function.
- **virtual class Fl_Gl_Window * as_gl_window ()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- **virtual class Fl_Gl_Window const * as_gl_window () const**
- **virtual Fl_Group * as_group ()**
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- **virtual Fl_Group const * as_group () const**
- **virtual Fl_Window * as_window ()**
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- **virtual Fl_Window const * as_window () const**
- **void bind_deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.
- **void bind_deimage (int f)**
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- **void bind_image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.
- **void bind_image (int f)**
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- **Fl_Boxtype box () const**
  Gets the box type of the widget.
- **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
  Sets the current label.
• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
Deactivates the widget.

- **Fl_Image** * deimage ()
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image** * deimage () const
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const
  
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const
  
  Gets the widget height.

- **virtual void hide ()
  
  Makes a widget invisible.

- **Fl_Image** * image ()
  
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image** * image () const
  
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const
  
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const
  
  Checks if this widget is a child of \textit{wgt}.

- **int is_label_copied () const
  
  Returns whether the current label was assigned with \textit{copy_label}().

- **const char * label () const
  
  Gets the current label text.

- **void label (const char *text)
  
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const
  
  Gets the label color.

- **void labelcolor (Fl_Color c)
  
  Sets the label color.

- **Fl_Font labelfont () const
  
  Gets the font to use.

- **void labelfont (Fl_Font f)
  
  Sets the font to use.
• `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

• void `labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

• `Fl_Labeltype labeltype () const`
  Gets the label type.

• void `labeltype (Fl_Labeltype a)`
  Sets the label type.

• void `measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

• bool `needs_keyboard () const`
  Returns whether this widget needs a keyboard.

• void `needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

• unsigned int `output () const`
  Returns if a widget is used for output only.

• `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

• void `parent (Fl_Group * p)`
  Internal use only - “for hacks only”.

• void `position (int X, int Y)`
  Repositions the window or widget.

• void `redraw ()`
  Schedules the drawing of the widget.

• void `redraw_label ()`
  Schedules the drawing of the label.

• `Fl_Color selection_color () const`
  Gets the selection color.

• void `selection_color (Fl_Color a)`
  Sets the selection color.

• void `set_active ()`
  Marks the widget as active without sending events or changing focus.

• void `set_changed ()`
  Marks the value of the widget as changed.

• void `set_output ()`
  Sets a widget to output only.

• void `set_visible ()`
  Makes the widget visible.

• void `set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

• int `shortcut_label () const`
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

• void `shortcut_label (int value)`
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

• virtual void `show ()`
  Makes a widget visible.

• void `size (int W, int H)`
  Changes the size of the widget.

• int `take_focus ()`
  Gives the widget the keyboard focus.

• unsigned int `takesevents () const`
• int test_shortcut ()
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback (Fl_Widget *widget, void *data)`
  *The default callback for all widgets that don’t set a callback.*

- static unsigned int `label_shortcut (const char *t)`
  *Returns the Unicode value of the ‘&x’ shortcut in a given text.*

- static int `test_shortcut (const char *t, const bool require_alt=false)`
  *Returns true if the given text t contains the entered ‘&x’ shortcut.*

Static Public Attributes inherited from `Fl_Input`

- static const char * `copy_menu_text` = "Copy"
  *[this text may be customized at run-time]*

- static const char * `cut_menu_text` = "Cut"
  *[this text may be customized at run-time]*

- static const char * `paste_menu_text` = "Paste"
  *[this text may be customized at run-time]*

  *flags possible values enumeration.*

Protected Member Functions inherited from `Fl_Input`

- void `draw () FL_OVERRIDE`
  *Draws the widget.*

- int `handle_key ()`
  *Handles a keystroke.*

- int `handle_rmb ()`
  *Handle right mouse button down events.*

Protected Member Functions inherited from `Fl_Input_`

- int `apply_undo ()`
  *Apply the current undo/redo operation.*

- void `drawtext (int, int, int, int)`
  *Draws the text in the passed bounding box.*

- void `drawtext (int, int, int, int, bool draw_active)`
  *Draws the text in the passed bounding box.*

- void `handle_mouse (int, int, int, int keepmark=0)`
Handles mouse clicks and mouse moves.

- int handletext (int e, int, int, int, int)
  Handles all kinds of text field related events.

- int line_end (int i) const
  Finds the end of a line.

- int line_start (int i) const
  Finds the start of a line.

- int linesPerPage ()
- void maybe_do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Moves the cursor to the column given by up_down_pos.

- int word_end (int i) const
  Finds the end of a word.

- int word_start (int i) const
  Finds the start of a word.

- int xscroll () const
- int yscroll () const
- void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const
  Draws the widget box according its box style.

- void draw_box (FL_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (FL_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  Draws a focus rectangle around the widget.

- void draw_focus (FL_Boxtype t, int X, int Y , int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (FL_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.
12.90.1 Detailed Description

This input field displays 'n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down arrow keys.
This is for editing multiline text.
This is far from the nirvana of text editors, and is probably only good for small bits of text, 10 lines at most. Note that this widget does not support scrollbars or per-character color control.
If you are presenting large amounts of text and need scrollbars or full color control of characters, you probably want Fl_Text_Editor instead.
In FLTK 1.3.x, the default behavior of the 'Tab' key was changed to support consistent focus navigation. To get the older FLTK 1.1.x behavior, set Fl_Input_::tab_nav() to 0. Newer programs should consider using Fl_Text_Editor.

12.90.2 Constructor & Destructor Documentation

12.90.2.1 Fl_Multiline_Input()

Fl_Multiline_Input::Fl_Multiline_Input (int X, int Y , int W, int H, const char ∗l=0 )

Creates a new Fl_Multiline_Input widget using the given position, size, and label string.
The default boxtype is FL_DOWN_BOX.
Inherited destructor destroys the widget and any value associated with it.
The documentation for this class was generated from the following files:
  • Fl_Multiline_Input.H
  • Fl_Input.cxx

12.91 Fl_Multiline_Output Class Reference

This widget is a subclass of Fl_Output that displays multiple lines of text.
#include <Fl_Multiline_Output.H>
Inheritance diagram for Fl_Multiline_Output:

Public Member Functions

  • Fl_Multiline_Output (int X, int Y, int W, int H, const char ∗l=0)
    Creates a new Fl_Multiline_Output widget using the given position, size, and label string.
Public Member Functions inherited from Fl_Output

- Fl_Output (int X, int Y, int W, int H, const char *l=0)
  Creates a new Fl_Output widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Input

- Fl_Input (int, int, int, int, const char *l=0)
  Creates a new Fl_Input widget using the given position, size, and label string.

- int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Input_

- int append (const char *t, int l=0, char keep_selection=0)
  Append text at the end.

- bool can_redo () const
  Check if there is a redo action available.

- bool can_undo () const
  Check if the last operation can be undone.

- int copy (int clipboard)
  Put the current selection into the clipboard.

- int copy_cuts ()
  Copies the yank buffer to the clipboard.

- Fl_Color cursor_color () const
  Gets the color of the cursor.

- void cursor_color (Fl_Color n)
  Sets the color of the cursor.

- int cut ()
  Deletes the current selection.

- int cut (int a, int b)
  Deletes all characters between index a and b.

- int cut (int n)
  Deletes the next n bytes rounded to characters before or after the cursor.

- double dvalue () const
  Returns the widget text interpreted as a floating point number.

- Fl_Input_ (int, int, int, int, const char *l=0)
  Creates a new Fl_Input_ widget.

- unsigned int index (int i) const
  Returns the character at index i.

- int input_type () const
  Gets the input field type.

- void input_type (int t)
  Sets the input field type.

- int insert (const char *t, int l=0)
  Inserts text at the cursor position.

- int insert_position () const
  Gets the position of the text cursor.

- int insert_position (int p)
  Sets the cursor position and mark.

- int insert_position (int p, int m)
  Sets the index for the cursor and mark.
• int ivalue () const
  Returns the widget text interpreted as a signed integer.

• int mark () const
  Gets the current selection mark.

• int mark (int m)
  Sets the current selection mark.

• int maximum_size () const
  Gets the maximum length of the input field in characters.

• void maximum_size (int m)
  Sets the maximum length of the input field in characters.

• int position () const
• int position (int p)
• int position (int p, int m)
  Gets the read-only state of the input field.

• void readonly (int b)
  Sets the read-only state of the input field.

• int redo ()
  Redo previous undo operation.

• int replace (int b, int e, const char ∗text, int ilen=0)
  Deletes text from b to e and inserts the new string text.

• void resize (int, int, int, int) FL_OVERRIDE
  Changes the size of the widget.

• int shortcut () const
  Return the shortcut key associated with this widget.

• void shortcut (int s)
  Sets the shortcut key associated with this widget.

• int size () const
  Returns the number of bytes in value().

• void size (int W, int H)
  Sets the width and height of this widget.

• int static_value (const char ∗)
  Changes the widget text.

• int static_value (const char ∗, int)
  Changes the widget text.

• int tab_nav () const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

• void tab_nav (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

• FL_COLOR textcolor () const
  Gets the color of the text in the input field.

• void textcolor (FL_COLOR n)
  Sets the color of the text in the input field.

• FL_FONT textfont () const
  Gets the font of the text in the input field.

• void textfont (FL_FONT s)
  Sets the font of the text in the input field.

• FL_FONTSIZE textsize () const
  Gets the size of the text in the input field.

• void textsize (FL_FONTSIZE s)
  Sets the size of the text in the input field.
• int undo ()
  Undoes previous changes to the text buffer.
• const char * value () const
  Returns the text displayed in the widget.
• int value (const char *)
  Changes the widget text.
• int value (const char *, int)
  Changes the widget text.
• int value (double value)
  Changes the widget text to a floating point number ("%g").
• int value (int value)
  Changes the widget text to a signed integer number.
• int wrap () const
  Gets the word wrapping state of the input field.
• void wrap (int b)
  Sets the word wrapping state of the input field.
• ~Fl_Input ()
  Destroys the widget.

Public Member Functions inherited from Fl_Widget
• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image * img)
Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  
  Gets the current callback function for the widget.

- **void callback (Fl_Callback *cb)**
  
  Sets the current callback function for the widget.

- **void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**
  
  Sets the current callback function and managed user data for the widget.

- **void callback (Fl_Callback *cb, void *p)**
  
  Sets the current callback function and data for the widget.

- **void callback (Fl_Callback0 *cb)**
  
  Sets the current callback function for the widget.

- **void callback (Fl_Callback1 *cb, long p=0)**
  
  Sets the current callback function for the widget.

- **unsigned int changed () const**
  
  Checks if the widget value changed since the last callback.

- **void clear_active ()**
  
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  
  Clears or sets the damage flags.

- **void clear_output ()**
  
  Sets a widget to accept input.

- **void clear_visible ()**
  
  Hides the widget.

- **void clear_visible_focus ()**
  
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  
  For back compatibility only.

- **void color2 (unsigned a)**
  
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  
  Sets the current label.

- **void copy_tooltip (const char *text)**
  
  Sets the current tooltip text.

- **uchar damage () const**
  
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image ∗ deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗ widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗ widget, void ∗ arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗ image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗ image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗ wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗ label () const
  Gets the current label text.
• void label (const char ∗ text)
  Sets the current label text.
• Fl_Color labelcolor () const
  Shortcut to set the label text and type in one call.
Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.

• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - “for hacks only”.

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.

• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.
• virtual void show ()
   
   Makes a widget visible.
• void size (int W, int H)
   
   Changes the size of the widget.
• int take_focus ()
   
   Gives the widget the keyboard focus.
• unsigned int takeevents () const
   
   Returns if the widget is able to take events.
• int test_shortcut ()
   
   Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
   
   Gets the current tooltip text.
• void tooltip (const char *text)
   
   Sets the current tooltip text.
• Fl_Window * top_window () const
   
   Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
   
   Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
   
   Gets the widget type.
• void type (uchar t)
   
   Sets the widget type.
• int use_accents_menu ()
   
   Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
   
   Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
   
   Sets the user data for this widget.
• void user_data (void *v)
   
   Sets the user data for this widget.
• unsigned int visible () const
   
   Returns whether a widget is visible.
• unsigned int visible_focus () const
   
   Checks whether this widget has a visible focus.
• void visible_focus (int v)
   
   Modifies keyboard focus navigation.
• int visible_r () const
   
   Returns whether a widget and all its parents are visible.
• int w () const
   
   Gets the widget width.
• Fl_When when () const
   
   Returns the conditions under which the callback is called.
• void when (uchar i)
   
   Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
   
   Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
   
   Gets the widget position in its window.
• int y () const
   
   Gets the widget position in its window.
• virtual ~Fl_Widget ()
   
   Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from Fl_Input

- static const char ∗copy_menu_text = "Copy"
  [this text may be customized at run-time]
- static const char ∗cut_menu_text = "Cut"
  [this text may be customized at run-time]
- static const char ∗paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLBOX_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLBOX = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Input

- void draw () FL_OVERRIDE
  Draws the widget.
- int handle_key ()
  Handles a keystroke.
- int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

- int apply_undo ()
  Apply the current undo/redo operation.
- void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
- void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
- void handle_mouse (int, int, int, int keepmark=0)

Generated by Doxygen
Handles mouse clicks and mouse moves.

- int handleText (int e, int, int, int, int)
  Handles all kinds of text field related events.

- int line_end (int i) const
  Finds the end of a line.

- int line_start (int i) const
  Finds the start of a line.

- int linesPerPage ()

- void maybe_do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Moves the cursor to the column given by up_down_pos.

- int word_end (int i) const
  Finds the end of a word.

- int word_start (int i) const
  Finds the start of a word.

- int xscroll () const
- int yscroll () const
- void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- void draw_backdrop () const
  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.
12.91.1 Detailed Description

This widget is a subclass of Fl_Output that displays multiple lines of text. It also displays tab characters as whitespace to the next column. Note that this widget does not support scrollbars, or per-character color control. If you are presenting large amounts of read-only text and need scrollbars, or full color control of characters, then use Fl_Text_Display. If you want to display HTML text, use Fl_Help_View.

A caret cursor (\textasciitilde) shows the keyboard navigation mark for keyboard selection of the output text, e.g. Arrow Keys to move the cursor, Shift + Arrow Keys to create a text selection, and \textasciitilde' to copy the selected text to the paste buffer. The caret cursor can be disabled by disabling the widget’s “visible focus” using clear_visible_focus(), inherited from the Fl_Widget base class. Doing this also disables the widget’s keyboard navigation.

12.91.2 Constructor & Destructor Documentation

12.91.2.1 Fl_Multiline_Output()

Fl_Multiline_Output::Fl_Multiline_Output (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char ∗ l = 0 )

Creates a new Fl_Multiline_Output widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- Fl_Multiline_Output.H
- Fl_Multiline_Outputxx

12.92 Fl_Native_File_Chooser Class Reference

This class lets an FLTK application easily and consistently access the operating system's native file chooser.

\#include <Fl_Native_File_Chooser.H>

Public Types

- enum Option {
  NO_OPTIONS = 0x0000 , SAVEAS_CONFIRM = 0x0001 , NEW_FOLDER = 0x0002 , PREVIEW = 0x0004 ,
  USE_FILTER_EXT = 0x0008 }
- enum Type {
  BROWSE_FILE = 0 , BROWSE_DIRECTORY , BROWSE_MULTI_FILE , BROWSE_MULTI_DIRECTORY ,
  BROWSE_SAVE_FILE , BROWSE_SAVE_DIRECTORY }

Public Member Functions

- int count () const
  
  Returns the number of filenames (or directory names) the user selected.

- const char ∗ directory () const
  
  Returns the current preset directory() value.

- void directory (const char ∗val)
  
  Preset the directory the browser will show when opened.
• const char * errmsg () const
  
  *Returns a system dependent error message for the last method that failed.*

• const char * filename () const

  *Return the filename the user chose.*

• const char * filename (int i) const

  *Return one of the filenames the user selected.*

• const char * filter () const

  *Returns the filter string last set.*

• void filter (const char * f)

  *Sets the filename filters used for browsing.*

• int filter_value () const

  *Returns which filter value was last selected by the user.*

• void filter_value (int i)

  *Sets which filter will be initially selected.*

• int filters () const

  *Gets how many filters were available, not including "All Files".*

• Fl_Native_File_Chooser (int val=BROWSE_FILE)

  *The constructor.*

• int options () const

  *Gets the platform specific Fl_Native_File_Chooser::Option flags.*

• void options (int o)

  *Sets the platform specific chooser options to val.*

• const char * preset_file () const

  *Get the preset filename.*

• void preset_file (const char * f)

  *Sets the default filename for the chooser.*

• int show ()

  *Post the chooser's dialog.*

• const char * title () const

  *Get the title of the file chooser's dialog window.*

• void title (const char * t)

  *Set the title of the file chooser's dialog window.*

• int type () const

  *Gets the current Fl_Native_File_Chooser::Type of browser.*

• void type (int t)

  *Sets the current Fl_Native_File_Chooser::Type of browser.*

• ~Fl_Native_File_Chooser ()

  *Destructor.*

**Static Public Attributes**

• static const char * file_exists_message = "File exists. Are you sure you want to overwrite?"

  *Localizable message.*
12.92 Fl_Native_File_Chooser Class Reference

12.92.1 Detailed Description

This class lets an FLTK application easily and consistently access the operating system's native file chooser. Some operating systems have very complex and specific file choosers that many users want access to specifically, instead of FLTK's default file chooser(s).

In cases where there is no native file browser, FLTK's own file browser is used instead.

To use this widget, use the following include in your code:

```
#include <FL/Fl_Native_File_Chooser.H>
```

The following example shows how to pick a single file:

```
// Create and post the local native file chooser
#include <FL/Fl_Native_File_Chooser.H>
[..]
Fl_Native_File_Chooser fnfc;
fnfc.title("Pick a file");
fnfc.type(Fl_Native_File_Chooser::BROWSE_FILE);
fnfc.filter("Text\n*.txt\n";  
"C Files\t*.cxx,h,c");
fnfc.directory("/var/tmp"); // default directory to use
// Show native chooser
switch ( fnfc.show() ) {  
  case -1: printf("ERROR: %s\n", fnfc.errmsg()); break; // ERROR
  case 1: printf("CANCEL\n"); break; // CANCEL
  default: printf("PICKED: %s\n", fnfc.filename()); break; // FILE CHOSEN
}
```

The `Fl_Native_File_Chooser` widget transmits UTF-8 encoded filenames to its user. It is recommended to open files that may have non-ASCII names with the `fl_fopen()` or `fl_open()` utility functions that handle these names in a cross-platform way (whereas the standard fopen()/open() functions fail on the Windows platform to open files with a non-ASCII name).

Platform Specific Caveats

- Under X11/Wayland the dialog is chosen as follows:
  1. If command `zenity` is available at run-time and if Fl::option(OPTION_FNFCUSES_ZENITY) is not turned off, the zenity -based dialog opens. This is expected to be more appropriate than other dialog forms for sandboxed apps.
  2. Else if the app runs under the KDE desktop and if command `kdialog` is available at run-time and if the library was not built with `cmake -DOPTION_USE_KDIALOG=Off`, the `kdialog` -based dialog opens.
  3. Else if the GTK library is available at run-time on the computer and if Fl::option(OPTION_FNFCUSES_GTK) is not turned off, the GTK-styled dialog opens. Call `fl_register_images()` to add a "Preview" button to this dialog. Use the static public attributes of class `Fl_File_Chooser` to localize the browser.
  4. Otherwise, FLTK's own dialog produced by the `Fl_File_Chooser` class opens. Call `fl_register_images()` to add a "Preview" button to it. It's best if you also call `Fl_File_Icon::load_system_icons()` at the start of `main()`, to enable the nicer looking file browser widgets. Use the static public attributes of class `Fl_File_Chooser` to localize the browser.

Todo Improve documentation about selection of native file choosers on X11/Wayland.

- Some operating systems support certain OS specific options; see `Fl_Native_File_Chooser::options()` for a list.
12.92.2 Member Enumeration Documentation

12.92.2.1 Option

```cpp
enum Fl_Native_File_Chooser::Option
```

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_OPTIONS</td>
<td>no options enabled</td>
</tr>
<tr>
<td>SAVEAS_CONFIRM</td>
<td>Show native 'Save As' overwrite confirm dialog.</td>
</tr>
<tr>
<td>NEW_FOLDER</td>
<td>Show 'New Folder' icon (if supported)</td>
</tr>
<tr>
<td>PREVIEW</td>
<td>enable preview mode (if supported)</td>
</tr>
<tr>
<td>USE_FILTER_EXT</td>
<td>Chooser filter presets the output file extension (if supported)</td>
</tr>
</tbody>
</table>

12.92.2.2 Type

```cpp
enum Fl_Native_File_Chooser::Type
```

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BROWSE_FILE</td>
<td>browse files (lets user choose one file)</td>
</tr>
<tr>
<td>BROWSE_DIRECTORY</td>
<td>browse directories (lets user choose one directory)</td>
</tr>
<tr>
<td>BROWSE_MULTI_FILE</td>
<td>browse files (lets user choose multiple files)</td>
</tr>
<tr>
<td>BROWSE_MULTI_DIRECTORY</td>
<td>browse directories (lets user choose multiple directories)</td>
</tr>
<tr>
<td>BROWSE_SAVE_FILE</td>
<td>browse to save a file</td>
</tr>
<tr>
<td>BROWSE_SAVE_DIRECTORY</td>
<td>browse to save a directory</td>
</tr>
</tbody>
</table>
12.92.3 Constructor & Destructor Documentation

12.92.3.1 Fl_Native_File_Chooser()

Fl_Native_File_Chooser::Fl_Native_File_Chooser (  
    int val = BROWSE_FILE  )

The constructor.
Internally allocates the native widgets. Optional \texttt{val} presets the type of browser this will be, which can also be changed with \texttt{type()}.

12.92.3.2 \texttt{\sim \ }Fl_Native_File_Chooser()

Fl_Native_File_Chooser::\texttt{\sim \ }Fl_Native/File_Chooser ( )
Destructor.
Deallocates any resources allocated to this widget.

12.92.4 Member Function Documentation

12.92.4.1 count()

\begin{verbatim}
int Fl_Native_File_Chooser::count ( ) const
\end{verbatim}

Returns the number of filenames (or directory names) the user selected.
Example:
\begin{verbatim}
if ( fnfc->show() == 0 ) {  
    // Print all filenames user selected  
    for (int n=0; n<fnfc->count(); n++) {  
        printf("%d) '%s'
", n, fnfc->filename(n));  
    }  
}
\end{verbatim}

12.92.4.2 directory()

\begin{verbatim}
void Fl_Native_File_Chooser::directory (  
    const char * val  )
\end{verbatim}

Preset the directory the browser will show when opened.
If \texttt{val} is \texttt{NULL}, or no directory is specified, the chooser will attempt to use the last non-cancelled folder.

12.92.4.3 errmsg()

\begin{verbatim}
const char * Fl_Native/File_Chooser::errmsg ( ) const
\end{verbatim}

Returns a system dependent error message for the last method that failed.
This message should at least be flagged to the user in a dialog box, or to some kind of error log. Contents will be valid only for methods that document \texttt{errmsg()} will have info on failures.

12.92.4.4 filename() [1/2]

\begin{verbatim}
const char * Fl_Native_File_Chooser::filename ( ) const
\end{verbatim}

Return the filename the user chose.
Use this if only expecting a single filename. If more than one filename is expected, use \texttt{filename(int)} instead. Return value may be "" if no filename was chosen (eg. user cancelled).

12.92.4.5 filename() [2/2]

\begin{verbatim}
const char * Fl_Native_File_Chooser::filename (  
    int i  ) const
\end{verbatim}

Return one of the filenames the user selected.
Use \texttt{count()} to determine how many filenames the user selected.
Example:
\begin{verbatim}
if ( fnfc->show() == 0 ) {  
    // Print all filenames user selected  
    for (int n=0; n<fnfc->count(); n++) {  
        printf("%d) '%s'
", n, fnfc->filename(n));  
    }  
}
\end{verbatim}
12.92.4.6  filter() [1/2]

const char * Fl_Native_File_Chooser::filter ( ) const
Returns the filter string last set.
Can be NULL if no filter was set.

12.92.4.7  filter() [2/2]

void Fl_Native_File_Chooser::filter ( const char * f )
Sets the filename filters used for browsing.
The default is NULL, which browses all files.
The filter string can be any of:

• A single wildcard (eg. "*.txt")
• Multiple wildcards (eg. "*.cxx,h,H")
• A descriptive name followed by a "t" and a wildcard (eg. "Text Files\t.txt")
• A list of separate wildcards with a "n" between each (eg. "*.cxx,h,H\n*.txt")
• A list of descriptive names and wildcards (eg. "C++ Files\t*.cxx,h,H\nTxt Files\t*.txt")

The format of each filter is a wildcard, or an optional user description followed by 't' and the wildcard.

12.92.4.8  filter_value() [1/2]

int Fl_Native_File_Chooser::filter_value ( ) const
Returns which filter value was last selected by the user.
This is only valid if the chooser returns success and if the particular file chooser supports it. Otherwise the value is not changed.
Some "native" file choosers don't support returning the filter selection by the user, particularly the system dialog based browsers:

• kdialog (KDE system dialog)
• zenity (another system dialog based chooser).

Note: this list may not be complete.
These system file chooser dialogs don't return the filter value chosen by the user.
See also

filter(const char *f)

12.92.4.9  filter_value() [2/2]

void Fl_Native_File_Chooser::filter_value ( int i )
Sets which filter will be initially selected.
The first filter is indexed as 0. If filter_value() == filters(), then "All Files" was chosen. If filter_value() > filters(), then a custom filter was set.
Some “native” file choosers don't support this way to set the initial filter type, particularly the system dialog based browsers:

• kdialog (KDE system dialog)
• zenity (another system dialog based chooser).

Note: this list may not be complete.
As far as we know these dialogs use the first item in the list of filter values as the initial filter presented to the user.
12.92 Fl_Native_File_Chooser Class Reference

See also

```
filter(const char *f)
```

### 12.92.4.10 options()

```cpp
void Fl_Native_File_Chooser::options (int o)
```

Sets the platform specific chooser options to `val`. `val` is expected to be one or more `Fl_Native_File_Chooser::Option` flags ORed together. Some platforms have OS-specific functions that can be enabled/disabled via this method.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
<th>Win</th>
<th>Mac</th>
<th>Other</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW_FOLDER</td>
<td>Shows the 'New Folder' button.</td>
<td>Ignored</td>
<td>Used</td>
<td>Used</td>
</tr>
<tr>
<td>PREVIEW</td>
<td>Enables the 'Preview' mode by default.</td>
<td>Ignored</td>
<td>Ignored</td>
<td>Used</td>
</tr>
<tr>
<td>SAVESAS_CONFIRM</td>
<td>Confirm dialog if BROWSE_SAVE_FILE file exists.</td>
<td>Used</td>
<td>Used</td>
<td>Used</td>
</tr>
<tr>
<td>USE_FILTER_EXT</td>
<td>Chooser filter presets the output file extension.</td>
<td>Ignored</td>
<td>Used (GTK)</td>
<td></td>
</tr>
</tbody>
</table>

### 12.92.4.11 preset_file()

```cpp
void Fl_Native_File_Chooser::preset_file (const char *f)
```

Sets the default filename for the chooser. Use `directory()` to set the default directory. Mainly used to preset the filename for save dialogs, and on most platforms can be used for opening files as well.

### 12.92.4.12 show()

```cpp
int Fl_Native_File_Chooser::show ()
```

Post the chooser's dialog. Blocks until dialog has been completed or cancelled.

Returns

- 0 – user picked a file
- 1 – user cancelled
- -1 – failed; errmsg() has reason

### 12.92.4.13 title() [1/2]

```cpp
const char * Fl_Native_File_Chooser::title ( ) const
```

Get the title of the file chooser's dialog window. Return value may be NULL if no title was set.

### 12.92.4.14 title() [2/2]

```cpp
void Fl_Native_File_Chooser::title (const char * t)
```

Set the title of the file chooser's dialog window. Can be NULL if no title desired. The default title varies according to the platform, so you are advised to set the title explicitly.

The documentation for this class was generated from the following files:

- `Fl_Native_File_Chooser.H`
- `Fl_Native_File_Chooser.cxx`
- `Fl_Native_File_Chooser_GTK.cxx`
12.93 **Fl_Nice_Slider Class Reference**

Inheritance diagram for Fl_Nice_Slider:

```
Fl_Widget
   ↓
Fl_Valuator
   ↓
Fl_Slider
   ↓
Fl_Nice_Slider
```

**Public Member Functions**

- **Fl_Nice_Slider** (int X, int Y, int W, int H, const char ∗L=0)

**Public Member Functions inherited from Fl_Slider**

- void *bounds* (double a, double b)
  
  _Sets the minimum (a) and maximum (b) values for the valuator widget._

- **Fl_Slider** (int X, int Y, int W, int H, const char ∗L=0)
  
  _Creates a new Fl_Slider widget using the given position, size, and label string._

- **Fl_Slider** (uchar t, int X, int Y, int W, int H, const char ∗L)
  
  _Creates a new Fl_Slider widget using the given type, position, size, and label string._

- int *handle* (int) FL_OVERRIDE
  
  _Handles the specified event._

- int *scrollvalue* (int pos, int size, int first, int total)
  
  _Sets the size and position of the sliding knob in the box._

- **Fl_Boxtype slider() const**
  
  _Gets the slider box type._

- void *slider* (Fl_Boxtype c)
  
  _Sets the slider box type._

- float *slider_size() const
  
  _Get the dimensions of the moving piece of slider._

- void *slider_size* (double v)
  
  _Set the dimensions of the moving piece of slider._

**Public Member Functions inherited from Fl_Valuator**

- void *bounds* (double a, double b)
  
  _Sets the minimum (a) and maximum (b) values for the valuator widget._

- double *clamp* (double)
  
  _Clamps the passed value to the valuator range._

- virtual int *format* (char ∗)
  
  _Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter._

- double *increment* (double, int)
  
  _Adds n times the step value to the passed value._

- double *maximum* () const
  
  _Gets the maximum value for the valuator._

- void *maximum* (double a)
Sets the maximum value for the valuator.

- double minimum() const
  
  Gets the minimum value for the valuator.

- void minimum(double a)
  
  Sets the minimum value for the valuator.

- void precision(int digits)
  
  Sets the step value to \(1.0 / 10^{\text{digits}}\).

- void range(double a, double b)
  
  Sets the minimum and maximum values for the valuator.

- double round(double)
  
  Round the passed value to the nearest step increment.

- double step() const
  
  Gets or sets the step value.

- void step(double a, int b)
  
  See double Fl_Valuator::step() const

- void step(double s)
  
  See double Fl_Valuator::step() const.

- void step(int a)
  
  See double Fl_Valuator::step() const

- double value() const
  
  Gets the floating point(double) value.

- int value(double)
  
  Sets the current value.

### Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen()
- void _set_fullscreen()
- void activate()

  Activates the widget.

- unsigned int active() const
  
  Returns whether the widget is active.

- int active_r() const
  
  Returns whether the widget and all of its parents are active.

- Fl_Align align() const
  
  Gets the label alignment.

- void align(Fl_Align alignment)
  
  Sets the label alignment.

- long argument() const
  
  Gets the current user data (long) argument that is passed to the callback function.

- void argument(long v)

  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window as_gl_window()

  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const as_gl_window() const

- virtual Fl_Group as_group()

  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const as_group() const

- virtual Fl_Window as_window()

  Returns an Fl_Window pointer if this widget is an Fl_Window.
virtual Fl_Window const * as_window () const

Sets the image to use as part of the widget label when in the inactive state.

void bind_deimage (Fl_Image *img)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

void bind_image (int f)

Sets the image to use as part of the widget label when in the active state.

void bind_image (Fl_Image *img)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

Fl_Boxtype box () const

Gets the box type of the widget.

void box (Fl_Boxtype new_box)

Sets the box type for the widget.

Fl_Callback_p callback () const

Gets the current callback function for the widget.

void callback (Fl_Callback *cb)

Sets the current callback function for the widget.

void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)

Sets the current callback function and managed user data for the widget.

void callback (Fl_Callback *cb, void *p)

Sets the current callback function and data for the widget.

void callback (Fl_Callback0 *cb)

Sets the current callback function for the widget.

void callback (Fl_Callback1 *cb, long p=0)

Sets the current callback function for the widget.

unsigned int changed () const

Checks if the widget value changed since the last callback.

void clear_active ()

Marks the widget as inactive without sending events or changing focus.

void clear_changed ()

Marks the value of the widget as unchanged.

void clear_damage (uchar c=0)

Clears or sets the damage flags.

void clear_output ()

Sets a widget to accept input.

void clear_visible ()

Hides the widget.

void clear_visible_focus ()

Disables keyboard focus navigation with this widget.

Fl_Color color () const

Gets the background color of the widget.

void color (Fl_Color bg)

Sets the background color of the widget.

void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.

Fl_Color color2 () const

For back compatibility only.

void color2 (unsigned a)

For back compatibility only.

int contains (const Fl_Widget *w) const

Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
Gets the current label text.

- **void label (const char *text)**
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

**Fl_Color labelcolor () const**

- Gets the label color.

**void labelcolor (Fl_Color c)**

- Sets the label color.

**Fl_Font labelfont () const**

- Gets the font to use.

**void labelfont (Fl_Font f)**

- Sets the font to use.

**Fl_Fontsize labelsize () const**

- Gets the font size in pixels.

**void labelsize (Fl_Fontsize pix)**

- Sets the font size in pixels.

**Fl_Labeltype labeltype () const**

- Gets the label type.

**void labeltype (Fl_Labeltype a)**

- Sets the label type.

**void measure_label (int &ww, int &hh) const**

- Sets width ww and height hh accordingly with the label size.

**bool needs_keyboard () const**

- Returns whether this widget needs a keyboard.

**void needs_keyboard (bool needs)**

- Sets whether this widget needs a keyboard.

**unsigned int output () const**

- Returns if a widget is used for output only.

**Fl_Group *parent () const**

- Returns a pointer to the parent widget.

**void parent (Fl_Group *p)**

- Internal use only - "for hacks only".

**void position (int X, int Y)**

- Repositions the window or widget.

**void redraw ()**

- Schedules the drawing of the widget.

**void redraw_label ()**

- Schedules the drawing of the label.

**virtual void resize (int x, int y, int w, int h)**

- Changes the size or position of the widget.

**Fl_Color selection_color () const**

- Gets the selection color.

**void selection_color (Fl_Color a)**

- Sets the selection color.

**void set_active ()**

- Marks the widget as active without sending events or changing focus.

**void set_changed ()**

- Marks the value of the widget as changed.

**void set_output ()**

- Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses ' & ' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses ' & ' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered ' & x ' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
Sets the flags used to decide when a callback is called.

- **FL_Window** + window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x () const
  
  Gets the widget position in its window.

- int y () const
  
  Gets the widget position in its window.

- virtual ~Fl_Widget ()
  
  Destroys the widget.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

- static void default_callback (Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char *, const bool require_alt=false)
  
  Returns true if the given text *t* contains the entered '&x' shortcut.

**Protected Types inherited from Fl_Widget**

- enum {

  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7
  ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11
  ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15
  ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31
  }

  flags possible values enumeration.

**Protected Member Functions inherited from Fl_Slider**

- void draw () FL_OVERRIDE
  
  Draws the widget.

- void draw (int, int, int, int)

- int handle (int, int, int, int)

**Protected Member Functions inherited from Fl_Valuator**

- **Fl_Valuator** (int X, int Y , int W, int H, const char *L)
  
  Creates a new Fl_Valuator widget using the given position, size, and label string.

- void handle_drag (double newvalue)
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- void handle_push ()
  
  Stores the current value in the previous value.

- void handle_release ()
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.
• int horizontal() const
  Tells if the valuator is an FL_HORIZONTAL one.
• double previous_value() const
  Gets the previous floating point value before an event changed it.
• void set_value(double v)
  Sets the current floating point value.
• double softclamp(double)
  Clamps the value, but accepts v if the previous value is not already out of range.
• virtual void value_damage()
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

• void clear_flag(unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop() const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box() const
  Draws the widget box according its box style.
• void draw_box(Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus() const
  Draws a focus rectangle around the widget.
• void draw_focus(Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label() const
  Draws the widget's label at the defined label position.
• void draw_label(int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget(int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
• unsigned int flags() const
  Gets the widget flags mask.
• void h(int v)
  Internal use only.
• void set_flag(unsigned int c)
  Sets a flag in the flags mask.
• void w(int v)
  Internal use only.
• void x(int v)
  Internal use only.
• void y(int v)
  Internal use only.

The documentation for this class was generated from the following files:

• Fl_Nice_Slider.H
• Fl_Slider.cxx

Generated by Doxygen
12.94  Fl_Output Class Reference

This widget displays a piece of text.

```cpp
#include <Fl_Output.H>
```

Inheritance diagram for Fl_Output:

![Inheritance Diagram]

Public Member Functions

- **Fl_Output** (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new Fl_Output widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Input

- **Fl_Input** (int, int, int, int, const char *l=0)
  
  Creates a new Fl_Input widget using the given position, size, and label string.

- int **handle** (int) FL_OVERRIDE
  
  Handles the specified event.

Public Member Functions inherited from Fl_Input_

- int **append** (const char *t, int l=0, char keep_selection=0)
  
  Append text at the end.

- bool **can_redo** () const
  
  Check if there is a redo action available.

- bool **can_undo** () const
  
  Check if the last operation can be undone.

- int **copy** (int clipboard)
  
  Put the current selection into the clipboard.

- int **copy_cuts** ()
  
  Copies the yank buffer to the clipboard.

- Fl_Color **cursor_color** () const
  
  Gets the color of the cursor.

- void **cursor_color** (Fl_Color n)
  
  Sets the color of the cursor.

- int **cut** ()
  
  Deletes the current selection.

- int **cut** (int a, int b)
  
  Deletes all characters between index a and b.

- int **cut** (int n)
  
  Deletes the next n bytes rounded to characters before or after the cursor.

- double **dvalue** () const
Returns the widget text interpreted as a floating point number.

• **Fl_Input_** (int, int, int, int, const char *=0)

  Creates a new Fl_Input_ widget.

• unsigned int **index** (int i) const

  Returns the character at index i.

• int **input_type** () const

  Gets the input field type.

• void **input_type** (int t)

  Sets the input field type.

• int **insert** (const char *=t, int l=0)

  Inserts text at the cursor position.

• int **insert_position** () const

  Gets the position of the text cursor.

• int **insert_position** (int p)

  Sets the cursor position and mark.

• int **insert_position** (int p, int m)

  Sets the index for the cursor and mark.

• int **ivalue** () const

  Returns the widget text interpreted as a signed integer.

• int **mark** () const

  Gets the current selection mark.

• int **mark** (int m)

  Sets the current selection mark.

• int **maximum_size** () const

  Gets the maximum length of the input field in characters.

• void **maximum_size** (int m)

  Sets the maximum length of the input field in characters.

• int **position** () const

• int **position** (int p)

• int **position** (int p, int m)

• int **readonly** () const

  Gets the read-only state of the input field.

• void **readonly** (int b)

  Sets the read-only state of the input field.

• int **redo** ()

  Redo previous undo operation.

• int **replace** (int b, int e, const char *=text, int ilen=0)

  Deletes text from b to e and inserts the new string text.

• void **resize** (int, int, int, int) FL_OVERRIDE

  Changes the size of the widget.

• int **shortcut** () const

  Return the shortcut key associated with this widget.

• void **shortcut** (int s)

  Sets the shortcut key associated with this widget.

• int **size** () const

  Returns the number of bytes in value().

• void **size** (int W, int H)

  Sets the width and height of this widget.

• int **static_value** (const char *=)

  Changes the widget text.

• int **static_value** (const char *=, int)
Changes the widget text.

• int tab_nav () const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

• void tab_nav (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

• Fl_Color textcolor () const
  Gets the color of the text in the input field.

• void textcolor (Fl_Color n)
  Sets the color of the text in the input field.

• Fl_Font textfont () const
  Gets the font of the text in the input field.

• void textfont (Fl_Font s)
  Sets the font of the text in the input field.

• Fl_Fontsize textsize () const
  Gets the size of the text in the input field.

• void textsize (Fl_Fontsize s)
  Sets the size of the text in the input field.

• int undo ()
  Undoes previous changes to the text buffer.

• const char * value () const
  Returns the text displayed in the widget.

• int value (const char * value)
  Changes the widget text.

• int value (const char *, int)
  Changes the widget text.

• int value (double value)
  Changes the widget text to a floating point number ("%g").

• int value (int value)
  Changes the widget text to a signed integer number.

• int wrap () const
  Gets the word wrapping state of the input field.

• void wrap (int b)
  Sets the word wrapping state of the input field.

• ~Fl_Input_ ()
  Destroys the widget.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.

• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * as_gl_window () const

• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const * as_group () const

• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * as_window () const

• void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Returns the color of the widget.
Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_CbReason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- void do_callback (Fl_Widget *witness, long arg, Fl_CbReason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void do_callback (Fl_Widget *witness, void *arg=0, Fl_CbReason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void draw_label (int, int, int, int, Fl_Align)
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int h () const
  Gets the widget height.

- virtual void hide ()
  Makes a widget invisible.

- Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.

- const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

• **void image (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the active state.

• **int image_bound () const**

  Returns whether the image is managed by the widget.

• **int inside (const Fl_Widget *wgt) const**

  Checks if this widget is a child of wgt.

• **int is_label_copied () const**

  Returns whether the current label was assigned with copy_label().

• **const char * label () const**

  Gets the current label text.

• **void label (const char *text)**

  Sets the current label pointer.

• **void label (Fl_Labeltype a, const char *b)**

  Shortcut to set the label text and type in one call.

• **Fl_Color labelcolor () const**

  Gets the label color.

• **void labelcolor (Fl_Color c)**

  Sets the label color.

• **Fl_Font labelfont () const**

  Gets the font to use.

• **void labelfont (Fl_Font f)**

  Sets the font to use.

• **Fl_Fontsize labelsize () const**

  Gets the font size in pixels.

• **void labelsize (Fl_Fontsize pix)**

  Sets the font size in pixels.

• **Fl_Labeltype labeltype () const**

  Gets the label type.

• **void labeltype (Fl_Labeltype a)**

  Sets the label type.

• **void measure_label (int &ww, int &hh) const**

  Sets width ww and height hh accordingly with the label size.

• **bool needs_keyboard () const**

  Returns whether this widget needs a keyboard.

• **void needs_keyboard (bool needs)**

  Sets whether this widget needs a keyboard.

• **unsigned int output () const**

  Returns if a widget is used for output only.

• **Fl_Group * parent () const**

  Returns a pointer to the parent widget.

• **void parent (Fl_Group *p)**

  Internal use only - “for hacks only”.

• **void position (int X, int Y)**

  Repositions the window or widget.

• **void redraw ()**

  Schedules the drawing of the widget.

• **void redraw_label ()**

  Schedules the drawing of the label.

• **Fl_Color selection_color () const**

  Returns the color used for selection.
• void \texttt{selection\_color (Fl\_Color a)}
  
  \textit{Sets the selection color.}

• void \texttt{set\_active ()}
  
  \textit{Marks the widget as active without sending events or changing focus.}

• void \texttt{set\_changed ()}
  
  \textit{Marks the value of the widget as changed.}

• void \texttt{set\_output ()}
  
  \textit{Sets a widget to output only.}

• void \texttt{set\_visible ()}
  
  \textit{Makes the widget visible.}

• void \texttt{set\_visible\_focus ()}
  \begin{quote}
  \textit{Enables keyboard focus navigation with this widget.}
  \end{quote}

• int \texttt{shortcut\_label () const}
  
  \textit{Returns whether the widget's label uses ' & ' to indicate shortcuts.}

• void \texttt{shortcut\_label (int value)}
  
  \textit{Sets whether the widget's label uses ' & ' to indicate shortcuts.}

• virtual void \texttt{show ()}
  
  \textit{Makes a widget visible.}

• void \texttt{size (int W, int H)}
  
  \textit{Changes the size of the widget.}

• int \texttt{take\_focus ()}
  
  \textit{Gives the widget the keyboard focus.}

• unsigned int \texttt{take\_events () const}
  
  \textit{Returns if the widget is able to take events.}

• int \texttt{test\_shortcut ()}
  
  \textit{Returns true if the widget's label contains the entered ' & x ' shortcut.}

• const char * \texttt{tooltip () const}
  
  \textit{Gets the current tooltip text.}

• void \texttt{tooltip (const char *text)}
  
  \textit{Sets the current tooltip text.}

• \texttt{Fl\_Window * top\_window () const}
  
  \textit{Returns a pointer to the top-level window for the widget.}

• \texttt{Fl\_Window * top\_window\_offset (int &xoff, int &yoff) const}
  
  \textit{Finds the x/y offset of the current widget relative to the top-level window.}

• uchar \texttt{type () const}
  
  \textit{Gets the widget type.}

• void \texttt{type (uchar t)}
  
  \textit{Sets the widget type.}

• int \texttt{use\_accents\_menu ()}
  
  \textit{Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.}

• void * \texttt{user\_data () const}
  
  \textit{Gets the user data for this widget.}

• void \texttt{user\_data (Fl\_Callback\_User\_Data *v, bool auto\_free)}
  
  \textit{Sets the user data for this widget.}

• void \texttt{user\_data (void *v)}
  
  \textit{Sets the user data for this widget.}

• unsigned int \texttt{visible () const}
  
  \textit{Returns whether a widget is visible.}

• unsigned int \texttt{visible\_focus () const}
  
  \textit{Checks whether this widget has a visible focus.}
- void visible_focus (int v)
  Modifies keyboard focus navigation.
- int visible_r () const
  Returns whether a widget and all its parents are visible.
- int w () const
  Gets the widget width.
- Fl_When when () const
  Returns the conditions under which the callback is called.
- void when (uchar i)
  Sets the flags used to decide when a callback is called.
- Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- int x () const
  Gets the widget position in its window.
- int y () const
  Gets the widget position in its window.
- virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from Fl_Input

- static const char * copy_menu_text = "Copy"
  [this text may be customized at run-time]
- static const char * cut_menu_text = "Cut"
  [this text may be customized at run-time]
- static const char * paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.
Protected Member Functions inherited from Fl_Input

• void draw () FL_OVERRIDE
  Draws the widget.
• int handle_key ()
  Handles a keystroke.
• int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

• int apply_undo ()
  Apply the current undo/redo operation.
• void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
• void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
• void handle_mouse (int, int, int, int keepmark=0)
  Handles mouse clicks and mouse moves.
• int handletext (int e, int, int, int, int)
  Handles all kinds of text field related events.
• int line_end (int i) const
  Finds the end of a line.
• int line_start (int i) const
  Finds the start of a line.
• int linesPerPage ()
• void maybe_do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
• int up_down_position (int, int keepmark=0)
  Moves the cursor to the column given by up_down_pos.
• int word_end (int i) const
  Finds the end of a word.
• int word_start (int i) const
  Finds the start of a word.
• int xscroll () const
• int yscroll () const
• void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

### 12.94.1 Detailed Description

This widget displays a piece of text. When you set the value(), Fl_Output does a strcpy() to its own storage, which is useful for program-generated values. The user may select portions of the text using the mouse and paste the contents into other fields or programs.

![Fl_Output Example](image)

There is a single subclass, Fl_Multiline_Output, which allows you to display multiple lines of text. Fl_Multiline_Output does not provide scroll bars. If a more complete text editing widget is needed, use Fl_Text_Display instead.

The text may contain any characters except \0, and will correctly display anything, using \^X notation for unprintable control characters and \nnn notation for unprintable characters with the high bit set. It assumes the font can draw any characters in the ISO-Latin1 character set.
12.94.2 Constructor & Destructor Documentation

12.94.2.1 Fl_Output()

Fl_Output::Fl_Output (int X, int Y, int W, int H, const char ∗l = 0)

Creates a new Fl_Output widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX. Inherited destructor destroys the widget and any value associated with it. The documentation for this class was generated from the following files:

• Fl_Output.H
• Fl_Input.cxx

12.95 Fl_Overlay_Window Class Reference

This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image.

#include <Fl_Overlay_Window.H>

Inheritance diagram for Fl_Overlay_Window:

```
Fl_Widget
  Fl_Group
  Fl_Window
  Fl_Double_Window
  Fl_Overlay_Window
```

Public Member Functions

• Fl_Overlay_Window ∗ as_overlay_window () FL_OVERRIDE
  Return non-null if this is an Fl_Overlay_Window object.

• int can_do_overlay ()
  Returns non-zero if there's hardware overlay support.

• virtual void draw_overlay ()=0
  You must subclass Fl_Overlay_Window and provide this method.

• void flush () FL_OVERRIDE
  Forces the window to be drawn, this window is also made current and calls draw().

• void hide () FL_OVERRID
  Makes a widget invisible.

• void redraw_overlay ()
  Call this to indicate that the overlay data has changed and needs to be redrawn.

• void resize (int, int, int, int) FL_OVERRID
  Changes the size or position of the widget.

• void show () FL_OVERRID
  Makes a widget visible.
• void **show** (int a, char ∗∗b)
  
  Same as *Fl_Window::show(int a, char ∗∗b)*

• **~Fl_Overlay_Window**
  
  Destroys the window and all child widgets.

### Public Member Functions inherited from Fl_Double_Window

• Fl_Double_Window *as_double_window () FL_OVERRIDE
  
  Return non-null if this is an Fl_Overlay_Window object.

• Fl_Double_Window (int W, int H, const char ∗=0)
  
  Creates a new Fl_Double_Window widget using the given position, size, and label (title) string.

• Fl_Double_Window (int X, int Y, int W, int H, const char ∗=0)
  
  See *Fl_Double_Window::Fl_Double_Window(int w, int h, const char ∗label = 0)*

• void **show** (int a, char ∗∗b)
  
  Same as *Fl_Window::show(int a, char ∗∗b)*

• **~Fl_Double_Window**
  
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Window

• Fl_Window const *as_window () const FL_OVERRIDE

• Fl_Window ∗as_window () FL_OVERRIDE
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• unsigned int **border** () const
  
  Returns whether the window possesses a border.

• void **border** (int b)
  
  Sets whether or not the window manager border is around the window.

• void **clear_border** ()
  
  Fast inline function to turn the window manager border off.

• void **clear_modal_states** ()
  
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

• void **copy_label** (const char ∗a)
  
  Sets the window titlebar label to a copy of a character string.

• void **cursor** (const Fl_RGB_Image ∗, int, int)
  
  Changes the cursor for this window using the provided image as cursor's shape.

• void **cursor** (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.

• void **cursor** (Fl_Cursor)
  
  Changes the cursor for this window.

• int **decorated_h** () const
  
  Returns the window height including any window title bar and any frame added by the window manager.

• int **decorated_w** () const
  
  Returns the window width including any frame added by the window manager.

• void **default_cursor** (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.

• void **default_cursor** (Fl_Cursor)
  
  Sets the default window cursor.

• void **draw_backdrop** ()
  
  Draw the background image if one is set and is aligned inside.

• Fl_Window (int w, int h, const char ∗title=0)
  
  Creates a window from the given width w, height h, and title.

• Fl_Window (int x, int y, int w, int h, const char ∗title=0)
Creates a window from the given position (x, y), size (w, h) and title.

- **void free_position ()**
  
  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.

- **void fullscreen ()**
  
  Makes the window completely fill one or more screens, without any window manager border visible.

- **unsigned int fullscreen_active () const**
  
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.

- **void fullscreen_off ()**
  
  Turns off any side effects of fullscreen()

- **void fullscreen_off (int X, int Y, int W, int H)**
  
  Turns off any side effects of fullscreen() and does resize(x,y,w,h).

- **void fullscreen_screens (int top, int bottom, int left, int right)**
  
  Sets which screens should be used when this window is in fullscreen mode.

- **int handle (int) FL_OVERRIDE**
  
  Handles the specified event.

- **void hide () FL_OVERRIDE**
  
  Removes the window from the screen.

- **void hotspot (const Fl_Widget &p, int offscreen=0)**
  
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot (const Fl_Widget *, int offscreen=0)**
  
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot (int x, int y, int offscreen=0)**
  
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- **const void * icon () const**
  
  Gets the current icon window target dependent data.

- **void icon (const Fl_RGB_Image *)**
  
  Sets or resets a single window icon.

- **void icon (const void *ic)**
  
  Platform-specific method to set the window icon usable on Windows and X11 only.

- **void iconize ()**
  
  Iconifies the window.

- **const char * iconlabel () const**
  
  See void Fl_Window::iconlabel(const char *)

- **void iconlabel (const char *)**
  
  Sets the icon label.

- **void icons (const Fl_RGB_Image *[])**, int)
  
  Sets the window icons.

- **void icons (HICON big_icon, HICON small_icon)**
  
  Sets the window icons using HICON handles (Windows platform only).

- **const char * label () const**
  
  See void Fl_Window::label(const char *)

- **void label (const char *)**
  
  Sets the window title bar label.

- **void label (const char *label, const char *iconlabel)**
  
  Sets the icon label.

- **void make_current ()**
  
  Sets things up so that the drawing functions in <FL/fl_draw.H> will go into this window.
• void maximize ()
  Maximizes a top-level window to its current screen.
• unsigned int maximize_active () const
  Returns whether the window is currently maximized.
• unsigned int menu_window () const
  Returns true if this window is a menu window.
• unsigned int modal () const
  Returns true if this window is modal.
• unsigned int non_modal () const
  Returns true if this window is modal or non-modal.
• fl_uintptr_t os_id ()
  Returns a platform-specific identification of a shown window, or 0 if not shown.
• unsigned int override () const
  Returns non zero if OVERRIDE flag is set, 0 otherwise.
• void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Changes the size and position of the window.
• int screen_num ()
  The number of the screen containing the mapped window.
• void screen_num (int screen_num)
  Set the number of the screen where to map the window.
• void set_menu_window ()
  Marks the window as a menu window.
• void set_modal ()
  A "modal" window, when shown(), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).
• void set_non_modal ()
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a modal() one in that it remains on top, but it has no effect on event delivery.
• void set_override ()
  Activates the flags NOBORDER/OVERRIDE.
• void set_tooltip_window ()
  Marks the window as a tooltip window.
• const Fl_Image * shape ()
  Returns the image controlling the window shape or NULL.
• void shape (const Fl_Image &b)
  Set the window's shape with an Fl_Image.
• void shape (const Fl_Image *img)
  Assigns a non-rectangular shape to the window.
• void show () FL_OVERRIDE
  Puts the window on the screen.
• void show (int argc, char **argv)
  Puts the window on the screen with show() and parses command-line arguments.
• int shown ()
  Returns non-zero if show() has been called (but not hide() ).
• void size_range (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
  Sets the allowable range the user can resize this window to.
• unsigned int tooltip_window () const
  Returns true if this window is a tooltip window.
• void un_maximize ()
  Returns a previously maximized top-level window to its previous size.
• void wait_for_expose ()
Waits for the window to be displayed after calling show().

- **int x_root () const**
  
  Gets the x position of the window on the screen.

- **const char * xclass () const**
  
  Returns the xclass for this window, or a default.

- **void xclass (const char * c)**
  
  Sets the xclass for this window.

- **int y_root () const**
  
  Gets the y position of the window on the screen.

- **virtual ~Fl_Window ()**
  
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Group

- **Fl_Widget *& _ddfdesign_kludge ()**
  
  This is for forms compatibility only.

- **void add (Fl_Widget &)**
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void add (Fl_Widget *o)**
  
  See void Fl_Group::add(Fl_Widget &w)

- **void add_resizable (Fl_Widget &o)**
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget *const * array () const**
  
  Returns a pointer to the array of children.

- **Fl_Group const * as_group () const FL_OVERRIDE**

- **Fl_Group * as_group () FL_OVERRIDE**

  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin ()**
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget * child (int n) const**
  
  Returns array()[n].

- **int children () const**
  
  Returns how many child widgets the group has.

- **void clear ()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()**
  
  Returns the current clipping mode.

- **void clip_children (int c)**
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child (int n)**
  
  Removes the widget at index from the group and deletes it.

- **void end ()**
  
  Exactly the same as current(this->parent()).

- **int find (const Fl_Widget &o) const**
  
  See int Fl_Group::find(const Fl_Widget *w) const.

- **int find (const Fl_Widget *) const**
  
  Searches the child array for the widget and returns the index.

- **Fl_Group (int, int, int, int, const char * =0)**
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus (Fl_Widget *)**

- **void forms_end ()**
This is for forms compatibility only.

- void init_sizes()
  Resets the internal array of widget sizes and positions.
- void insert(Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert(Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove(Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove(Fl_Widget *o)
  Removes the widget o from the group.
- void remove(int index)
  Removes the widget at index from the group but does not delete it.
- Fl_Widget *resizable() const
  Returns the group's resizable widget.
- void resizable(Fl_Widget &o)
  Sets the group's resizable widget.
- void resizable(Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- virtual ~Fl_Group()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen()
- void _set_fullscreen()
- void activate()
  Activates the widget.
- unsigned int active() const
  Returns whether the widget is active.
- int active_r() const
  Returns whether the widget and all of its parents are active.
- Fl_Align align() const
  Gets the label alignment.
- void align(Fl_Align alignment)
  Sets the label alignment.
- long argument() const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument(long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window *as_gl_window()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const *as_gl_window() const
- void bind_deimage(Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage(int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image(Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image(int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• **Fl_Boxtype box () const**
  
  Gets the box type of the widget.

• **void box (Fl_Boxtype new_box)**
  
  Sets the box type for the widget.

• **Fl_Callback_p callback () const**
  
  Gets the current callback function for the widget.

• **void callback (Fl_Callback +cb)**
  
  Sets the current callback function for the widget.

• **void callback (Fl_Callback +cb, Fl_Callback_User_Data +p, bool auto_free)**
  
  Sets the current callback function and managed user data for the widget.

• **void callback (Fl_Callback +cb, void +p)**
  
  Sets the current callback function and data for the widget.

• **void callback (Fl_Callback0 +cb)**
  
  Sets the current callback function for the widget.

• **void callback (Fl_Callback1 +cb, long p=0)**
  
  Sets the current callback function for the widget.

• **unsigned int changed () const**
  
  Checks if the widget value changed since the last callback.

• **void clear_active ()**
  
  Marks the widget as inactive without sending events or changing focus.

• **void clear_changed ()**
  
  Marks the value of the widget as unchanged.

• **void clear_damage (uchar c=0)**
  
  Clears or sets the damage flags.

• **void clear_output ()**
  
  Sets a widget to accept input.

• **void clear_visible ()**
  
  Hides the widget.

• **void clear_visible_focus ()**
  
  Disables keyboard focus navigation with this widget.

• **Fl_Color color () const**
  
  Gets the background color of the widget.

• **void color (Fl_Color bg)**
  
  Sets the background color of the widget.

• **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

• **Fl_Color color2 () const**
  
  For back compatibility only.

• **void color2 (unsigned a)**
  
  For back compatibility only.

• **int contains (const Fl_Widget +w) const**
  
  Checks if w is a child of this widget.

• **void copy_label (const char +new_label)**
  
  Sets the current label.

• **void copy_tooltip (const char +text)**
  
  Sets the current tooltip text.

• **uchar damage () const**
  
  Returns non-zero if draw() needs to be called.

• **void damage (uchar c)**
  
  Sets the damage bits for the widget.

• **void damage (uchar c, int x, int y, int w, int h)**
Sets the damage bits for an area inside the widget.

- `int damage_resize(int, int, int, int)`  
  Internal use only.

- `void deactivate()`  
  Deactivates the widget.

- `FL_Image * deimage()`  
  Gets the image that is used as part of the widget label when in the inactive state.

- `const FL_Image * deimage()` const  
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage(FL_Image &img)`  
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage(FL_Image *img)`  
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound()` const  
  Returns whether the inactive image is managed by the widget.

- `void do_callback(FL_Callback_Reason reason=FL_REASON_UNKNOWN)`  
  Calls the widget callback function with default arguments.

- `void do_callback(FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`  
  Calls the widget callback function with arbitrary arguments.

- `void do_callback(FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`  
  Calls the widget callback function with arbitrary arguments.

- `void draw_label(int, int, int, int, Fl_Align) const`  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h()` const  
  Gets the widget height.

- `FL_Image * image()`  
  Gets the image that is used as part of the widget label when in the active state.

- `const FL_Image * image()` const  
  Gets the image that is used as part of the widget label when in the active state.

- `void image(FL_Image &img)`  
  Sets the image to use as part of the widget label when in the active state.

- `void image(FL_Image *img)`  
  Sets the image to use as part of the widget label when in the active state.

- `int image_bound()` const  
  Returns whether the image is managed by the widget.

- `int inside(const FL_Widget *wgt)` const  
  Checks if this widget is a child of `wgt`.

- `int is_label_copied()` const  
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label()` const  
  Gets the current label text.

- `void label(const char *text)`  
  Sets the current label pointer.

- `void label(FL_Labeltype a, const char *b)`  
  Shortcut to set the label text and type in one call.

- `FL_Color labelcolor()` const  
  Gets the label color.

- `void labelcolor(FL_Color c)`  
  Sets the label color.

- `FL_Font labelfont()` const  
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
Returns if the widget is able to take events.

- int testShortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char * tooltip () const
  Gets the current tooltip text.

- void tooltip (const char *text)
  Sets the current tooltip text.

- Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.

- void type (uchar t)
  Sets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void * user_data () const
  Gets the user data for this widget.

- void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

- void user_data (void *v)
  Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  Modifies keyboard focus navigation.

- int visible_r () const
  Returns whether a widget and all its parents are visible.

- int w () const
  Gets the widget width.

- Fl_When when () const
  Returns the conditions under which the callback is called.

- void when (uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x () const
  Gets the widget position in its window.

- int y () const
  Gets the widget position in its window.

- virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

- Fl_Overlay_Window (int W, int H, const char *l=0)
  See Fl_Overlay_Window::Fl_Overlay_Window(int X, int Y, int W, int H, const char *l=0)

- Fl_Overlay_Window (int X, int Y, int W, int H, const char *l=0)
  Creates a new Fl_Overlay_Window widget using the given position, size, and label (title) string.
Protected Member Functions inherited from Fl_Window

- void default_size_range ()
  Protected method to calculate the default size range of a window.
- void draw () FL_OVERRIDE
  Draws the widget.
- int force_position () const
  Returns the internal state of the window's FORCE_POSITION flag.
- void force_position (int force)
  Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void free_icons ()
  Deletes all icons previously attached to the window.
- int is_resizable ()
  Protected method to determine whether a window is resizable.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget’s position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void **draw_focus** (**Fl_Boxtype** t, int x, int y, int w, int h, **Fl_Color** bg) const
  
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const

  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const

  Draws the label in an arbitrary bounding box.

• **Fl_Widget**(int x, int y, int w, int h, const char ∗ label=0L)

  Creates a widget at the given position and size.

• unsigned int **flags** () const

  Gets the widget flags mask.

• void **h**(int v)

  Internal use only.

• void **set_flag**(unsigned int c)

  Sets a flag in the flags mask.

• void **w**(int v)

  Internal use only.

• void **x**(int v)

  Internal use only.

• void **y**(int v)

  Internal use only.

**Additional Inherited Members**

**Public Types inherited from Fl_Window**

• typedef struct HICON__ ∗ HICON

**Static Public Member Functions inherited from Fl_Window**

• static Fl_Window ∗ **current** ()

  Returns the last window that was made current.

• static void **default_callback**(Fl_Window ∗, void ∗v)

  Back compatibility: Sets the default callback v for win to call on close event.

• static void **default_icon**(const Fl_RGB_Image ∗)

  Sets a single default window icon.

• static void **default_icons**(const Fl_RGB_Image ∗[], int)

  Sets the default window icons.

• static void **default_icons**(HICON big_icon, HICON small_icon)

  Sets the default window icons (Windows platform only).

• static const char ∗ **default_xclass** ()

  Returns the default xclass.

• static void **default_xclass**(const char ∗)

  Sets the default window xclass.

• static bool **is_a_rescale** ()

  Returns true when a window is being rescaled.

• static char **show_next_window_iconic** ()

  Returns the static flag whether the next window should be opened iconified.

• static void **show_next_window_iconic**(char stat)

  Sets a static flag whether the next window should be opened iconified.
Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACENTS_MENU
  = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
flags possible values enumeration.

Static Protected Attributes inherited from Fl_Window

- static Fl_Window * current_
  Stores the last window that was made current.

12.95.1 Detailed Description

This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image.
The overlay is designed to be a rapidly-changing but simple graphic such as a mouse selection box. Fl_Overlay_Window uses the overlay planes provided by your graphics hardware if they are available.
If no hardware support is found the overlay is simulated by drawing directly into the on-screen copy of the double-buffered window, and "erased" by copying the backbuffer over it again. This means the overlay will blink if you change the image in the window.

12.95.2 Constructor & Destructor Documentation

12.95.2.1 Fl_Overlay_Window()

Fl_Overlay_Window::Fl_Overlay_Window ( int X, int Y, int W, )
Generated by Doxygen
int H,
const char * l = 0 ) [protected]
Creates a new Fl_Overlay_Window widget using the given position, size, and label (title) string.
If the positions (x,y) are not given, then the window manager will choose them.

12.95.3 Member Function Documentation

12.95.3.1 as_overlay_window()

Fl_Overlay_Window * Fl_Overlay_Window::as_overlay_window ( ) [inline], [virtual]
Return non-null if this is an Fl_Overlay_Window object.
Reimplemented from Fl_Window.

12.95.3.2 draw_overlay()

virtual void Fl_Overlay_Window::draw_overlay ( ) [pure virtual]
You must subclass Fl_Overlay_Window and provide this method.
It is just like a draw() method, except it draws the overlay. The overlay will have already been "cleared" when this is
called. You can use any of the routines described in <FL/fl_draw.H>.

12.95.3.3 flush()

void Fl_Overlay_Window::flush ( ) [virtual]
Forces the window to be drawn, this window is also made current and calls draw().
Reimplemented from Fl_Double_Window.

12.95.3.4 hide()

void Fl_Overlay_Window::hide ( ) [virtual]
Makes a widget invisible.
See also
    show(), visible(), visible_r()
Reimplemented from Fl_Double_Window.

12.95.3.5 redraw_overlay()

void Fl_Overlay_Window::redraw_overlay ( )
Call this to indicate that the overlay data has changed and needs to be redrawn.
The overlay will be clear until the first time this is called, so if you want an initial display you must call this after calling
show().

12.95.3.6 resize()

void Fl_Overlay_Window::resize ( int x, int y, int w, int h ) [virtual]
Changes the size or position of the widget.
This is a virtual function so that the widget may implement its own handling of resizing. The default version does
not call the redraw() method, but instead relies on the parent widget to do so because the parent may know a faster
way to update the display, such as scrolling from the old position.
Some window managers under X11 call resize() a lot more often than needed. Please verify that the position or
size of a widget did actually change before doing any extensive calculations.
position(X, Y) is a shortcut for resize(X, Y, w(), h()), and size(W, H) is a shortcut for resize(x(), y(), W, H).

Generated by Doxygen
Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x,y</td>
</tr>
<tr>
<td>in</td>
<td>w,h</td>
</tr>
</tbody>
</table>

See also

position(int,int), size(int,int)

Reimplemented from Fl_Double_Window.

12.95.3.7 show()

```cpp
def Fl_Overlay_Window::show () [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL_SHOW.

The `visible()` method returns true if the widget is set to be visible. The `visible_r()` method returns true if the widget and all of its parents are visible. A widget is only visible if `visible()` is true on it and all of its parents.

Changing it will send FL_SHOW or FL_HIDE events to the widget. Do not change it if the parent is not visible, as this will send false FL_SHOW or FL_HIDE events to the widget. `redraw()` is called if necessary on this or the parent.

See also

hide(), visible(), visible_r() 

Reimplemented from Fl_Double_Window.

The documentation for this class was generated from the following files:

- Fl_Overlay_Window.H
- Fl_Overlay_Window.cxx

12.96 Fl_Pack Class Reference

This widget was designed to add the functionality of compressing and aligning widgets.

```cpp
#include <Fl_Pack.H>
```

Inheritance diagram for Fl_Pack:

```
Fl_Widget
  ↓
Fl_Group
  ↓
Fl_Pack
```

Public Types

- enum { VERTICAL = 0, HORIZONTAL = 1 }

Public Member Functions

- `Fl_Pack (int X, int Y, int W, int H, const char ∗L=0)`
  
  Creates a new Fl_Pack widget using the given position, size, and label string.

- `uchar horizontal () const`

  Returns non-zero if Fl_Pack alignment is horizontal.

- `void resize (int X, int Y, int W, int H)` FL_OVERRIDE

Generated by Doxygen
Override Fl_Group resize behavior.

- **int spacing()** const
  
  Gets the number of extra pixels of blank space that are added between the children.

- **void spacing(int i)**
  
  Sets the number of extra pixels of blank space that are added between the children.

### Public Member Functions inherited from Fl_Group

- **Fl_Widget *& _ddfdesign_kludge()**
  
  This is for forms compatibility only.

- **void add(Fl_Widget &)**
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void add(Fl_Widget +o)**
  
  See void Fl_Group::add(Fl_Widget +w)

- **void add_resizable(Fl_Widget +o)**
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget *const + array()** const
  
  Returns a pointer to the array of children.

- **Fl_Group const + as_group()** const FL_OVERRIDE
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin()**
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget + child(int n) const**
  
  Returns array()[n].

- **int children()** const
  
  Returns how many child widgets the group has.

- **void clear()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children()**
  
  Returns the current clipping mode.

- **void clip_children(int c)**
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child(int n)**
  
  Removes the widget at index from the group and deletes it.

- **void end()**
  
  Exactly the same as current(this->parent()).

- **int find(const Fl_Widget &o)** const
  
  See int Fl_Group::find(const Fl_Widget +w) const.

- **int find(const Fl_Widget +) const**
  
  Searches the child array for the widget and returns the index.

- **Fl_Group (int, int, int, int, const char *)=0**
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus(Fl_Widget +W)**

- **void forms_end()**
  
  This is for forms compatibility only.

- **int handle(int) FL_OVERRIDE**
  
  Handles the specified event.

- **void init_sizes()**
  
  Resets the internal array of widget sizes and positions.

- **void insert(Fl_Widget &, int i)**
The widget is removed from its current group (if any) and then inserted into this group.

- void insert (Fl_Widget &, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
  Removes the widget at index from the group but does not delete it.
- Fl_Widget * resizable () const
  Returns the group's resizable widget.
- void resizable (Fl_Widget &o)
  Sets the group's resizable widget.
- void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- virtual ~Fl_Group ()
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
• void box (Fl_Boxtype new_box)
  
  Gets the box type of the widget.
• Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  
  Sets the current callback function for the widget.
• unsigned int changed () const
  
  Checks if the widget value changed since the last callback.
• void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.
• void clear_output ()
  
  Sets a widget to accept input.
• void clear_visible ()
  
  Hides the widget.
• void clear_visible_focus ()
  
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  
  Gets the background color of the widget.
• void color (Fl_Color bg)
  
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  
  For back compatibility only.
• void color2 (unsigned a)
  
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  
  Sets the current label.
• void copy_tooltip (const char *text)
  
  Sets the current tooltip text.
• uchar damage () const
  
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.
• **int damage_resize**(int, int, int, int)
  *Internal use only.*

• **void deactivate**()
  *Deactivates the widget.*

• **Fl_Image * deimage ()**
  *Gets the image that is used as part of the widget label when in the inactive state.*

• **const Fl_Image * deimage () const**
  *Gets the image that is used as part of the widget label when in the inactive state.*

• **void deimage(Fl_Image &img)**
  *Sets the image to use as part of the widget label when in the inactive state.*

• **void deimage(Fl_Image *img)**
  *Sets the image to use as part of the widget label when in the inactive state.*

• **int deimage_bound () const**
  *Returns whether the inactive image is managed by the widget.*

• **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  *Calls the widget callback function with default arguments.*

• **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  *Calls the widget callback function with arbitrary arguments.*

• **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  *Calls the widget callback function with arbitrary arguments.*

• **void draw_label (int, int, int, int, Fl_Align) const**
  *Draws the label in an arbitrary bounding box with an arbitrary alignment.*

• **int h () const**
  *Gets the widget height.*

• **virtual void hide ()**
  *Makes a widget invisible.*

• **Fl_Image * image ()**
  *Gets the image that is used as part of the widget label when in the active state.*

• **const Fl_Image * image () const**
  *Gets the image that is used as part of the widget label when in the active state.*

• **void image (Fl_Image &img)**
  *Sets the image to use as part of the widget label when in the active state.*

• **void image (Fl_Image *img)**
  *Sets the image to use as part of the widget label when in the active state.*

• **int image_bound () const**
  *Returns whether the image is managed by the widget.*

• **int inside (const Fl_Widget *wgt) const**
  *Checks if this widget is a child of wgt.*

• **int is_label_copied () const**
  *Returns whether the current label was assigned with copy_label().*

• **const char * label () const**
  *Gets the current label text.*

• **void label (const char *text)**
  *Sets the current label pointer.*

• **void label (Fl_Labeltype a, const char *b)**
  *Shortcut to set the label text and type in one call.*

• **Fl_Color labelcolor () const**
  *Gets the label color.*

• **void labelcolor (Fl_Color c)**
  *Sets the label color.*

• **Fl_Font labelfont () const**
- Gets the font to use.
  - void labelfont (Fl_Font f)
    Sets the font to use.
- Fl_Fontsize labelsize () const
  Gets the font size in pixels.
- void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
- Fl_Labeltype labeltype () const
  Gets the label type.
- void labeltype (Fl_Labeltype a)
  Sets the label type.
- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
- unsigned int output () const
  Returns if a widget is used for output only.
- Fl_Group * parent () const
  Returns a pointer to the parent widget.
- void parent (Fl_Group *p)
  Internal use only - "for hacks only".
- void position (int X, int Y)
  Repositions the window or widget.
- void redraw ()
  Schedules the drawing of the widget.
- void redraw_label ()
  Schedules the drawing of the label.
- Fl_Color selection_color () const
  Gets the selection color.
- void selection_color (Fl_Color a)
  Sets the selection color.
- void set_active ()
  Marks the widget as active without sending events or changing focus.
- void set_changed ()
  Marks the value of the widget as changed.
- void set_output ()
  Sets a widget to output only.
- void set_visible ()
  Makes the widget visible.
- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
- int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
- void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void show ()
  Makes a widget visible.
- void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Protected Member Functions

- void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)  
  *Internal use only.*
• void set_flag (unsigned int c)  
  *Sets a flag in the flags mask.*
• void w (int v)  
  *Internal use only.*
• void x (int v)  
  *Internal use only.*
• void y (int v)  
  *Internal use only.*

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Group**

• static Fl_Group ∗ current ()  
  *Returns the currently active group.*
• static void current (Fl_Group ∗ g)  
  *Sets the current group.*

**Static Public Member Functions inherited from Fl_Widget**

• static void default_callback (Fl_Widget ∗ widget, void ∗ data)  
  *The default callback for all widgets that don’t set a callback.*
• static unsigned int label_shortcut (const char ∗ t)  
  *Returns the Unicode value of the ‘&x’ shortcut in a given text.*
• static int test_shortcut (const char ∗ t, const bool require_alt=false)  
  *Returns true if the given text t contains the entered ‘&x’ shortcut.*

*flags possible values enumeration.*

### 12.96.1 Detailed Description

This widget was designed to add the functionality of compressing and aligning widgets. If `type()` is `Fl_Pack::HORIZONTAL` all the children are resized to the height of the Fl_Pack, and are moved next to each other horizontally. If `type()` is not `Fl_Pack::HORIZONTAL` then the children are resized to the width and are stacked below each other. Then the Fl_Pack resizes itself to surround the child widgets. You may want to put the Fl_Pack inside an Fl_Scroll.

The ‘resizable()’ for Fl_Pack is set to NULL by default. Its behavior is slightly different than in a normal Fl_Group widget: only if the resizable() widget is the last widget in the group it is extended to take the full available width or height, respectively, of the Fl_Pack group.
Note

You can nest Fl_Pack widgets or put them inside Fl_Scroll widgets or inside other group widgets but their behavior can sometimes be "surprising". This is partly due to the fact that Fl_Pack widgets resize themselves during their draw() operation, trying to react on their child widgets resizing themselves during their draw() operations which can be confusing. If you want to achieve special resize behavior of nested group widgets it can sometimes be easier to derive your own specialized group widget than to try to make nested Fl_Pack widgets behave as expected.

See also

Fl_Group::resizable()

12.96.2 Constructor & Destructor Documentation

12.96.2.1 Fl_Pack()

Fl_Pack::Fl_Pack (int X, int Y, int W, int H, const char * L = 0)

Creates a new Fl_Pack widget using the given position, size, and label string.
The default boxtype is FL_NO_BOX.
The default type() is Fl_Pack::VERTICAL.
The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the Fl_Pack and all of its children can be automatic (local) variables, but you must declare the Fl_Pack first, so that it is destroyed last.

Parameters

- in X,Y X and Y coordinates (position)
- in W,H width and height, respectively
- in L label (optional)

12.96.3 Member Function Documentation

12.96.3.1 draw()

void Fl_Pack::draw ( ) [protected], [virtual]

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget * s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Reimplemented from Fl_Group.

12.96.3.2 horizontal()

uchar Fl_Pack::horizontal ( ) const [inline]

Returns non-zero if Fl_Pack alignment is horizontal.

Returns

- non-zero if Fl_Pack alignment is horizontal (Fl_Pack::HORIZONTAL)
Note

Currently the return value is the same as Fl_Group::type(), but this may change in the future. Do not set any other values than the following with Fl_Pack::type():

- Fl_Pack::VERTICAL (Default)
- Fl_Pack::HORIZONTAL

See class Fl_Pack documentation for details.

12.96.3.3 resize()

void Fl_Pack::resize (int X, int Y, int W, int H) [virtual]

Override Fl_Group resize behavior.
Resizing an Fl_Pack will not resize any of its children, but trigger a redraw, which in turn recalculates the dimensions of all children.

Parameters

| in   | X, Y, W, H | new position and size of the Fl_Pack widget |

Reimplemented from Fl_Group.
The documentation for this class was generated from the following files:

- Fl_Pack.H
- Fl_Pack.cxx

12.97 Fl_Paged_Device Class Reference

Represents page-structured drawing surfaces.
#include <Fl_Paged_Device.H>

Inheritance diagram for Fl_Paged_Device:

```

Classes

- struct page_format
  width, height and name of a page format

Public Types

- enum Page_Format {
  A0 = 0, A1, A2, A3,
  A4, A5, A6, A7,
**A8, A9, B0, B1, B2, B3, B4, B5, B6, B7, B8, B9, B10, CSE, DLE, EXECUTIVE, FOLIO, LEDGER, LEGAL, LETTER, TABLOID, ENVELOPE, MEDIA = 0x1000**

Possible page formats.

- **enum Page_Layout { PORTRAIT = 0, LANDSCAPE = 0x100, REVERSED = 0x200, ORIENTATION = 0x300 }**

Possible page layouts.

**Public Member Functions**

- **virtual int begin_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL)**
  - Begins a print job.

- **virtual int begin_page (void)**
  - Begins a new printed page.

- **virtual void end_job (void)**
  - To be called at the end of a print job.

- **virtual int end_page (void)**
  - To be called at the end of each page.

- **virtual void margins (int *left, int *top, int *right, int *bottom)**
  - Computes the dimensions of margins that lie between the printable page area and the full page.

- **void print_widget (Fl_Widget *widget, int delta_x=0, int delta_y=0)**
  - Synonym of draw(Fl_Widget*, int, int)

- **void print_window (Fl_Window *win, int x_offset=0, int y_offset=0)**
  - Synonym of draw_decorated_window(Fl_Window*, int, int)

- **virtual void rotate (float angle)**
  - Rotates the graphics operations relatively to paper.

- **virtual void scale (float scale_x, float scale_y=0.)**
  - Changes the scaling of page coordinates.

- **int start_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL)**
  - Synonym of begin_job(int pagecount, int *frompage, int *topage, char **perr_message).

- **int start_page ()**
  - Synonym of begin_page().

- **virtual ~Fl_Paged_Device ()**
  - The destructor.

**Public Member Functions inherited from Fl_Widget_Surface**

- **void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)**
  - Draws the widget on the drawing surface.

- **void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)**
  - Draws a window with its title bar and frame if any.

- **virtual void origin (int *x, int *y)**
  - Computes the coordinates of the current origin of graphics functions.

- **virtual void origin (int x, int y)**
  - Sets the position of the origin of graphics in the drawable part of the drawing surface.

- **void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)**
  - Draws a rectangular part of an on-screen window.

- **virtual int printable_rect (int *w, int *h)**
Computes the width and height of the drawable area of the drawing surface.

- virtual void translate (int x, int y)
  Translates the current graphics origin accounting for the current rotation.
- virtual void untranslate ()
  Undoes the effect of a previous translate() call.

Public Member Functions inherited from Fl_Surface_Device

- Fl/Graphics_Driver * driver ()
  Returns the graphics driver of this drawing surface.
- virtual bool is_current ()
  Is this surface the current drawing surface?
- virtual void set_current (void)
  Make this surface the current drawing surface.
- virtual ~Fl_Surface_Device ()
  The destructor.

Static Public Attributes

- static const page_format page_formats [NO_PAGE_FORMATS]
  width, height and name of all elements of the enum Page_Format.

Protected Member Functions

- Fl_Paged_Device ()
  The constructor.

Protected Member Functions inherited from Fl_Widget_Surface

- Fl_Widget_Surface (Fl_Graphics_Driver * d)
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

- void driver (Fl_Graphics_Driver * graphics_driver)
  Sets the graphics driver of this drawing surface.
- virtual void end_current ()
  FLTK calls this each time a surface ceases to be the current drawing surface.
- Fl_Surface_Device (Fl_Graphics_Driver * graphics_driver)
  Constructor that sets the graphics driver to use for the created surface.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * pop_current ()
  Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void push_current (Fl_Surface_Device * new_current)
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static Fl_Surface_Device * surface ()
  The current drawing surface.
Protected Attributes inherited from Fl_Widget_Surface

- int x_offset
  
  horizontal offset to the origin of graphics coordinates

- int y_offset
  
  vertical offset to the origin of graphics coordinates

12.97.1 Detailed Description

Represents page-structured drawing surfaces.
This class has no public constructor: don't instantiate it; use Fl_Printer or Fl_PostScript_File_Device instead.

12.97.2 Member Enumeration Documentation

12.97.2.1 Page_Format

defined in Fl_Paged_Device.h

Possible page formats.
All paper formats with pre-defined width and height. The Fl_Paged_Device::page_formats array gives these widths and heights.

12.97.2.2 Page_Layout

defined in Fl_Paged_Device.h

Generated by Doxygen
Possible page layouts.

Enumerator

| PORTRAIT | Portrait orientation. |
| LANDSCAPE | Landscape orientation. |
| REVERSED | Reversed orientation. |
| ORIENTATION | orientation |

12.97.3 Member Function Documentation

12.97.3.1 begin_job()

```cpp
int Fl_Paged_Device::begin_job (  
    int pagecount = 0,
    int * frompage = NULL,
    int * topage = NULL,
    char ** perr_message = NULL ) [virtual]
```

Begins a print job.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>pagecount</th>
<th>the total number of pages of the job (or 0 if you don’t know the number of pages)</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>frompage</td>
<td>if non-null, *frompage is set to the first page the user wants printed</td>
</tr>
<tr>
<td>out</td>
<td>topage</td>
<td>if non-null, *topage is set to the last page the user wants printed</td>
</tr>
<tr>
<td>out</td>
<td>perr_message</td>
<td>if non-null and if the returned value is 2, *perr_message is set to a string describing the error. That string can be delete[]’d after use.</td>
</tr>
</tbody>
</table>

Returns

0 if OK, 1 if user cancelled the job, 2 if any error.

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.

12.97.3.2 begin_page()

```cpp
int Fl_Paged_Device::begin_page (  
    void ) [virtual]
```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area. This function also makes this surface the current drawing surface with Fl_Surface_Device::push_current().

Note

begin_page() calls Fl_Surface_Device::push_current() and leaves this device as the active surface. If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current(), or the content of the dialog box will be rendered to the printer instead of the screen.

Returns

0 if OK, non-zero if any error

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.
12.97.3.3  
end_job()

```cpp
void Fl_Paged_Device::end_job (  
    void ) [virtual]
```

To be called at the end of a print job.
Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.

12.97.3.4  
end_page()

```cpp
int Fl_Paged_Device::end_page (  
    void ) [virtual]
```

To be called at the end of each page.
This function also stops this surface from being the current drawing surface with Fl_Surface_Device::pop_current().

**Note**

end_page() calls Fl_Surface_Device::pop_current(). If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current().

**Returns**

0 if OK, non-zero if any error.

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.

12.97.3.5  margins()

```cpp
void Fl_Paged_Device::margins (  
    int * left,  
    int * top,  
    int * right,  
    int * bottom ) [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page.
Values are in the same unit as that used by FLTK drawing functions. They are changed by scale() calls.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>out left</code></td>
<td>If non-null, <code>*left</code> is set to the left margin size.</td>
</tr>
<tr>
<td><code>out top</code></td>
<td>If non-null, <code>*top</code> is set to the top margin size.</td>
</tr>
<tr>
<td><code>out right</code></td>
<td>If non-null, <code>*right</code> is set to the right margin size.</td>
</tr>
<tr>
<td><code>out bottom</code></td>
<td>If non-null, <code>*bottom</code> is set to the bottom margin size.</td>
</tr>
</tbody>
</table>

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.

12.97.3.6  rotate()

```cpp
void Fl_Paged_Device::rotate (  
    float angle ) [virtual]
```

Rotates the graphics operations relatively to paper.
The rotation is centered on the current graphics origin. Successive rotate() calls don’t combine their effects.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>angle</code></td>
<td>Rotation angle in counter-clockwise degrees.</td>
</tr>
</tbody>
</table>

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.
12.97.3.7 scale()

void Fl_Paged_Device::scale ( 
    float scale_x, 
    float scale_y = 0. ) [virtual]

Changes the scaling of page coordinates.
This function also resets the origin of graphics functions at top left of printable page area. After a scale() call, do a printable_rect() call to get the new dimensions of the printable page area. Successive scale() calls don't combine their effects.

Parameters

| scale←-_x | Horizontal dimensions of plot are multiplied by this quantity. |
| scale←-_y | Same as above, vertically. The value 0. is equivalent to setting scale_y = scale_x. Thus, scale(factor); is equivalent to scale(factor, factor); |

Reimplemented in Fl_PostScript_File_Device, and Fl_Printer.

12.97.3.8 start_job()

int Fl_Paged_Device::start_job ( 
    int pagecount = 0, 
    int * frompage = NULL, 
    int * topage = NULL, 
    char ** perr_message = NULL ) [inline]

Synonym of begin_job(int pagecount, int *frompage, int *topage, char **perr_message).
For API compatibility with FLTK 1.3.x

12.97.3.9 start_page()

int Fl_Paged_Device::start_page () [inline]
Synonym of begin_page().
For API compatibility with FLTK 1.3.x

The documentation for this class was generated from the following files:

- Fl_Paged_Device.H
- Fl_Paged_Device.cxx

12.98 Fl_Pixmap Class Reference

The Fl_Pixmap class supports caching and drawing of colormap ( pixmap) images, including transparency.
#include <Fl_Pixmap.H>

Inheritance diagram for Fl_Pixmap:

```
  Fl_Image
   |
   v
  Fl_Pixmap
     |
     v
  Fl_GIF_Image Fl_XPM_Image
     |
     v
Fl_Anim_GIF_Image
```
Public Member Functions

- int cache_h ()
- int cache_w ()
- void color_average (FL_Color c, float i) FL_OVERRIDE
  
  The color_average() method averages the colors in the image with the provided FLTK color value.
- Fl_Image * copy () const
- Fl_Image * copy (int W, int H) const FL_OVERRIDE

  Creates a resized copy of the image.
- void desaturate () FL_OVERRIDE

  The desaturate() method converts an image to grayscale.
- void draw (int X, int Y)
- void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  
  Draws the image to the current drawing surface with a bounding box.
- Fl_Pixmap (char *const *D)

  The constructors create a new pixmap from the specified XPM data.
- Fl_Pixmap (const char *const *D)

  The constructors create a new pixmap from the specified XPM data.
- Fl_Pixmap (const uchar *const *D)

  The constructors create a new pixmap from the specified XPM data.
- Fl_Pixmap (uchar *const *D)

  The constructors create a new pixmap from the specified XPM data.
- void label (Fl_Menu_Item *m) FL_OVERRIDE

  This method is an obsolete way to set the image attribute of a menu item.
- void label (Fl_Widget *w) FL_OVERRIDE

  This method is an obsolete way to set the image attribute of a widget or menu item.
- void uncache () FL_OVERRIDE

  If the image has been cached for display, delete the cache data.
- virtual ~Fl_Pixmap ()

  The destructor frees all memory and server resources that are used by the pixmap.

Public Member Functions inherited from Fl_Image

- virtual class Fl_Shared_Image * as_shared_image ()

  Returns whether an image is an Fl_Shared_Image or not.
- Fl_Image * copy () const

  Creates a copy of the image in the same size.
- int count () const

  Returns the number of data values associated with the image.
- int d () const

  Returns the image depth.
- const char *const * data () const

  Returns a pointer to the current image data array.
- int data_h () const

  Returns the height of the image data.
- int data_w () const

  Returns the width of the image data.
- void draw (int X, int Y)

  Draws the image to the current drawing surface.
- int fail () const

  Returns a value that is not 0 if there is currently no image available.
- Fl_Image (int W, int H, int D)
The constructor creates an empty image with the specified width, height, and depth.

- `int h () const`
  Returns the current image drawing height in FLTK units.

- `void inactive ()`
  The inactive() method calls `color_average(FL_BACKGROUND_COLOR, 0.33)` to produce an image that appears grayed out.

- `int ld () const`
  Returns the current line data size in bytes.

- `virtual void release ()`
  Releases an `Fl_Image` - the same as 'delete this'.

- `virtual void scale (int width, int height, int proportional=1, int can_expand=0)`
  Sets the drawing size of the image.

- `int w () const`
  Returns the current image drawing width in FLTK units.

- `virtual ~Fl_Image ()`
  The destructor is a virtual method that frees all memory used by the image.

Public Attributes

- `int alloc_data`

Protected Member Functions

- `void measure ()`

Protected Member Functions inherited from `Fl_Image`

- `void d (int D)`
  Sets the current image depth.

- `void data (const char *const *p, int c)`
  Sets the current data pointer and count of pointers in the array.

- `void draw_empty (int X, int Y)`
  The protected method draw_empty() draws a box with an X in it.

- `int draw_scaled (int X, int Y, int W, int H)`
  Draw the image to the current drawing surface rescaled to a given width and height.

- `void h (int H)`
  Sets the height of the image data.

- `void ld (int LD)`
  Sets the current line data size in bytes.

- `void w (int W)`
  Sets the width of the image data.

Friends

- `class Fl_Graphics_Driver`

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Image`

- `static Fl_Labeltype define_FL_IMAGE_LABEL ()`

- `static Fl_RGB_Scaling RGB_scaling ()`
  Returns the currently used RGB image scaling method.

- `static void RGB_scaling (Fl_RGB_Scaling)`

Generated by Doxygen
Sets the RGB image scaling method used for copy(int, int).

- static Fl_RGB_Scaling scaling_algorithm ()

    Gets what algorithm is used when resizing a source image to draw it.
- static void scaling_algorithm (Fl_RGB_Scaling algorithm)

    Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false

    True after fl_register_images() was called, false before.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label ∗lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label ∗lo, int &lw, int &lh)

12.98.1 Detailed Description

The Fl_Pixmap class supports caching and drawing of colormap ( pixmap) images, including transparency.

12.98.2 Constructor & Destructor Documentation

12.98.2.1 Fl_Pixmap() [1/4]

Fl_Pixmap::Fl_Pixmap ( char ∗const ∗D ) [inline], [explicit]

The constructors create a new pixmap from the specified XPM data.

12.98.2.2 Fl_Pixmap() [2/4]

Fl_Pixmap::Fl_Pixmap ( uchar ∗const ∗D ) [inline], [explicit]

The constructors create a new pixmap from the specified XPM data.

12.98.2.3 Fl_Pixmap() [3/4]

Fl_Pixmap::Fl_Pixmap ( const char ∗const ∗D ) [inline], [explicit]

The constructors create a new pixmap from the specified XPM data.

12.98.2.4 Fl_Pixmap() [4/4]

Fl_Pixmap::Fl_Pixmap ( const uchar ∗const ∗D ) [inline], [explicit]

The constructors create a new pixmap from the specified XPM data.
12.98.3 Member Function Documentation

12.98.3.1 color_average()

```cpp
void Fl_Pixmap::color_average ( Fl_Color c, float i ) [virtual]
```

The `color_average()` method averages the colors in the image with the provided FLTK color value. The first argument specifies the FLTK color to be used. The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory. Reimplemented from `Fl_Image`.

12.98.3.2 copy()

```cpp
Fl_Image * Fl_Pixmap::copy ( int W, int H ) const [virtual]
```

Creates a resized copy of the image. The new image should be released when you are done with it. Note: since FLTK 1.4.0 you can use `Fl_Image::release()` for all types of images (i.e. all subclasses of `Fl_Image`) instead of `operator delete` for `Fl_Image`s and `Fl_Image::release()` for `Fl_Shared_Image`'s. The new image data will be converted to the requested size. RGB images are resized using the algorithm set by `Fl_Image::RGB_scaling()`.

For the new image the following equations are true:

- \( w() = \text{data}_w() = W \)
- \( h() = \text{data}_h() = H \)

**Parameters**

| in | W/H | Requested width and height of the new image |

**Note**

The returned image can be safely cast to the same image type as that of the source image provided this type is one of `Fl_RGB_Image`, `Fl_SVG_Image`, `Fl_Pixmap`, `Fl_Bitmap`, `Fl_Tiled_Image`, `Fl_Anim_GIF_Image` and `Fl_Shared_Image`. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an `Fl_RGB_Image` is an object of class `Fl_Pixmap`.

Since FLTK 1.4.0 this method is `const`. If you derive your own class from `Fl_Image` or any subclass your overridden methods of `Fl_Image::copy() const` and `Fl_Image::copy(int, int) const` **must** also be `const` for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been `const`.

Reimplemented from `Fl_Image`.

12.98.3.3 desaturate()

```cpp
void Fl_Pixmap::desaturate ( ) [virtual]
```

The `desaturate()` method converts an image to grayscale. If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory. Reimplemented from `Fl_Image`.
12.98.3.4 draw()

```cpp
void Fl_Pixmap::draw (  
    int X,  
    int Y,  
    int W,  
    int H,  
    int cx = 0,  
    int cy = 0 ) [virtual]
```

Draws the image to the current drawing surface with a bounding box. Arguments X, Y, W, H specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the cx and cy arguments. In other words: `fl_push_clip(X,Y,W,H)` is applied, the image is drawn with its upper-left corner at X-cx,Y-cy and its own width and height, `fl_pop_clip()` is applied. Reimplemented from Fl_Image.

12.98.3.5 label() [1/2]

```cpp
void Fl_Pixmap::label (  
    Fl_Menu_Item * m ) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item. **Deprecated** Please use `Fl_Menu_Item::image()` instead.

Reimplemented from Fl_Image.

12.98.3.6 label() [2/2]

```cpp
void Fl_Pixmap::label (  
    Fl_Widget * widget ) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item. **Deprecated** Please use `Fl_Widget::image()` or `Fl_Widget::deimage()` instead.

Reimplemented from Fl_Image.

12.98.3.7 uncache()

```cpp
void Fl_Pixmap::uncache ( ) [virtual]
```

If the image has been cached for display, delete the cache data. This allows you to change the data used for the image and then redraw it without recreating an image object. Reimplemented from Fl_Image.

The documentation for this class was generated from the following files:

- Fl_Pixmap.H
- Fl_Pixmap.cxx

12.99 Fl_Plugin Class Reference

**Fl_Plugin** allows link-time and run-time integration of binary modules.

```cpp
#include <Fl_Plugin.H>
```

Inheritance diagram for Fl_Plugin:

```
Fl_Plugin
```

```
Fl_Device_Plugin
```

Generated by Doxygen
Public Member Functions

- Fl_Plugin (const char *klass, const char *name)
  Create a plugin.
- virtual ~Fl_Plugin ()
  Clear the plugin and remove it from the database.

12.99.1 Detailed Description

Fl_Plugin allows link-time and run-time integration of binary modules.
Fl_Plugin and Fl_Plugin_Manager provide a small and simple solution for linking C++ classes at run-time, or optionally linking modules at compile time without the need to change the main application.
Fl_Plugin_Manager uses static initialization to create the plugin interface early during startup. Plugins are stored in a temporary database, organized in classes.
Plugins should derive a new class from Fl_Plugin as a base:

```cpp
class My_Plugin : public Fl_Plugin {
public:
  My_Plugin() : Fl_Plugin("effects", "blur") { }
  void do_something(...);
};
My_Plugin blur_plugin();
```

Plugins can be put into modules and either linked before distribution, or loaded from dynamically linkable files. An Fl_Plugin_Manager is used to list and access all currently loaded plugins.

```cpp
Fl_Plugin_Manager mgr("effects");
int i, n = mgr.plugins();
for (i=0; i<n; i++) {
  My_Plugin *pin = (My_Plugin*)mgr.plugin(i);
  pin->do_something();
}
```

12.99.2 Constructor & Destructor Documentation

12.99.2.1 Fl_Plugin()

Fl_Plugin::Fl_Plugin (const char * klass, const char * name )

Create a plugin.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>klass</th>
<th>plugins are grouped in classes</th>
</tr>
</thead>
<tbody>
<tr>

12.100 Fl_Plugin_Manager Class Reference

Fl_Plugin_Manager manages link-time and run-time plugin binaries.

```cpp
#include "Fl_Plugin.H"
```
Inheritance diagram for Fl_Plugin_Manager:

```
FlPreferences

Fl_Plugin_Manager
```
Public Member Functions

- **Fl_Preferences::ID addPlugin (const char *name, Fl_Plugin *plugin)**
  
  This function adds a new plugin to the database.

- **Fl_Plugin_Manager (const char *klass)**
  
  Manage all plugins belonging to one class.

- **Fl_Plugin * plugin (const char *name)**
  
  Return the address of a plugin by name.

- **Fl_Plugin * plugin (int index)**
  
  Return the address of a plugin by index.

- **int plugins ()**
  
  Return the number of plugins in the klass.

- **~Fl_Plugin_Manager ()**
  
  Remove the plugin manager.

Public Member Functions inherited from Fl_Preferences

- **char clear ()**
  
  Delete all groups and all entries.

- **char delete_all_entries ()**
  
  Delete all entries.

- **char delete_all_groups ()**
  
  Delete all groups.

- **char delete_entry (const char *entry)**
  
  Deletes a single name/value pair.

- **char delete_group (const char *group)**
  
  Deletes a group.

- **int dirty ()**
  
  Check if there were changes to the database that need to be written to disk.

- **int entries ()**
  
  Returns the number of entries (name/value pairs) in a group.

- **const char * entry (int index)**
  
  Returns the name of an entry.

- **char entry_exists (const char *key)**
  
  Returns non-zero if an entry with this name exists.

- **Root filename (char *buffer, size_t buffer_size)**
  
  Return the file name and path to the preference file.

- **Fl_Preferences (const char *path, const char *vendor, const char *application)**
  
  Deprecated: Use this constructor to create or read a preference file at an arbitrary position in the file system.

- **Fl_Preferences (const char *path, const char *vendor, const char *application, Root flags)**
  
  Use this constructor to create or read a preference file at an arbitrary position in the file system.

- **Fl_Preferences (const Fl_Preferences &)**
  
  Create another reference to a Preferences group.

- **Fl_Preferences (Fl_Preferences &parent, const char *group)**
  
  Generate or read a new group of entries within another group.

- **Fl_Preferences (Fl_Preferences &parent, int groupIndex)**
  
  Open a child group using a given index.

- **Fl_Preferences (Fl_Preferences *parent, const char *group)**
  
  Create or access a group of preferences using a name.

- **Fl_Preferences (Fl_Preferences *parent, int groupIndex)**

- **Fl_Preferences (ID id)**
  
  Create a new dataset access point using a dataset ID.
• **FL_Preferences (Root root, const char *vendor, const char *application)**

  The constructor creates a group that manages key/value pairs and child groups.

• **int flush ()**

  Writes preferences to disk if they were modified.

• **char get (const char *entry, char *value, const char *defaultValue)**

  Reads an entry from the group.

• **char get (const char *entry, char *value, const char *defaultValue, int maxSize)**

  Reads an entry from the group.

• **char get (const char *entry, double &value, double defaultValue)**

  Reads an entry from the group.

• **char get (const char *entry, float &value, float defaultValue)**

  Reads an entry from the group.

• **char get (const char *entry, int &value, int defaultValue)**

  Reads an entry from the group.

• **char get (const char *entry, void *value, const void *defaultValue, int defaultSize)**

  Reads an entry from the group.

• **char get (const char *entry, void *value, const void *defaultValue, int defaultSize, int *size)**

  Reads a binary entry from the group, encoded in hexadecimal blocks.

• **char get_userdata_path (char *path, int pathlen)**

  Creates a path that is related to the preference file and that is usable for additional application data.

• **const char * group (int num_group)**

  Returns the name of the Nth (num_group) group.

• **char group_exists (const char *key)**

  Returns non-zero if a group with this name exists.

• **int groups ()**

  Returns the number of groups that are contained within a group.

• **ID id ()**

  Return an ID that can later be reused to open more references to this dataset.

• **const char * name ()**

  Return the name of this entry.

• **const char * path ()**

  Return the full path to this entry.

• **char set (const char *entry, const char *value)**

  Sets an entry (name/value pair).

• **char set (const char *entry, const void *value, int size)**

  Sets an entry (name/value pair).

• **char set (const char *entry, double value)**

  Sets an entry (name/value pair).

• **char set (const char *entry, double value, int precision)**

  Sets an entry (name/value pair).

• **char set (const char *entry, float value)**

  Sets an entry (name/value pair).

• **char set (const char *entry, float value, int precision)**

  Sets an entry (name/value pair).

• **char set (const char *entry, int value)**

  Sets an entry (name/value pair).

• **int size (const char *entry)**

  Returns the size of the value part of an entry.

• **virtual ~FL_Preferences ()**

  The destructor removes allocated resources.
Static Public Member Functions

- static int load (const char *filename)
  Load a module from disk.
- static int loadAll (const char *dirpath, const char *pattern=0)
  Use this function to load a whole directory full of modules.
- static void removePlugin (Fl_Preferences::ID id)
  Remove any plugin.

Static Public Member Functions inherited from Fl_Preferences

- static unsigned int file_access ()
  Return the current file access permissions for the FLTK preferences system.
- static void file_access (unsigned int flags)
  Tell the FLTK preferences system which files in the file system it may read, create, or write.
- static Root filename (char *buffer, size_t buffer_size, Root root, const char *vendor, const char *application)
  Determine the file name and path to preferences that would be opened with these parameters.
- static const char *new_UUID ()
  Returns a UUID as generated by the system.
- static char remove (ID id_)
  Remove the group with this ID from a database.

Additional Inherited Members

Public Types inherited from Fl_Preferences

- typedef void *ID
  Every Fl_Preferences-Group has a unique ID.
- enum Root {
  UNKNOWN_ROOT_TYPE = -1 , SYSTEM = 0 , USER , MEMORY ,
  ROOT_MASK = 0x00FF , CORE = 0x0100 , C_LOCALE = 0x1000 , CLEAR = 0x2000 ,
  SYSTEM_L = SYSTEM | C_LOCALE , USER_L = USER | C_LOCALE , CORE_SYSTEM_L = CORE |
  SYSTEM_L , CORE_USER_L = CORE | USER ,
  CORE_SYSTEM = CORE | SYSTEM , CORE_USER = CORE | USER }
  Define the scope of the preferences.

Static Public Attributes inherited from Fl_Preferences

- static const unsigned int ALL = ALL_READ_OK | ALL_WRITE_OK
  Set this to give FLTK and applications permission to read, write, and create preference files.
- static const unsigned int ALL_READ_OK = USER_READ_OK | SYSTEM_READ_OK | CORE_READ_OK
  Set this to allow FLTK and applications to read preference files.
- static const unsigned int ALL_WRITE_OK = USER_WRITE_OK | SYSTEM_WRITE_OK | CORE_WRITE_OK
  Set this to allow FLTK and applications to create and write preference files.
- static const unsigned int APP_OK = SYSTEM_OK | USER_OK
  Set this if it is OK for applications to read, create, and write any kind of preference files.
- static const unsigned int CORE_OK = CORE_READ_OK | CORE_WRITE_OK
  Set this if it is OK for FLTK to read, create, or write preference files.
- static const unsigned int CORE_READ_OK = 0x0010
  Set this if it is OK for FLTK to read preference files.
- static const unsigned int CORE_WRITE_OK = 0x0020
  Set this if it is OK for FLTK to create or write preference files.
- static const unsigned int NONE = 0x0000
  Set this if no call to Fl_Preferences shall access the file system.
• static const unsigned int SYSTEM_OK = SYSTEM_READ_OK | SYSTEM_WRITE_OK
  Set this if it is OK for applications to read, create, and write system wide preference files.
• static const unsigned int SYSTEM_READ_OK = 0x0004
  Set this if it is OK for applications to read system wide preference files.
• static const unsigned int SYSTEM_WRITE_OK = 0x0008
  Set this if it is OK for applications to create and write system wide preference files.
• static const unsigned int USER_OK = USER_READ_OK | USER_WRITE_OK
  Set this if it is OK for applications to read, create, and write user preference files.
• static const unsigned int USER_READ_OK = 0x0001
  Set this if it is OK for applications to read user preference files.
• static const unsigned int USER_WRITE_OK = 0x0002
  Set this if it is OK for applications to create and write user preference files.

Protected Attributes inherited from Fl_Preferences

• Node * node
• RootNode * rootNode

12.100.1 Detailed Description

Fl_Plugin_Manager manages link-time and run-time plugin binaries.

See also

Fl_Plugin

12.100.2 Constructor & Destructor Documentation

12.100.2.1 ~Fl_Plugin_Manager()

Fl_Plugin_Manager::~Fl_Plugin_Manager ( )
Remove the plugin manager.
Calling this does not remove the database itself or any plugins. It just removes the reference to the database.

12.100.3 Member Function Documentation

12.100.3.1 addPlugin()

Fl_Preferences::ID Fl_Plugin_Manager::addPlugin ( const char * name,
             Fl_Plugin * plugin )
This function adds a new plugin to the database.
There is no need to call this function explicitly. Every Fl_Plugin constructor will call this function at initialization time.

12.100.3.2 load()

int Fl_Plugin_Manager::load ( const char * filename ) [static]
Load a module from disk.
A module must be a dynamically linkable file for the given operating system. When loading a module, its init function will be called which in turn calls the constructor of all statically initialized Fl_Plugin classes and adds them to the database.
12.100.3.3 loadAll()

```cpp
int Fl_Plugin_Manager::loadAll (  
    const char * dirpath,
    const char * pattern = 0 ) [static]
```

Use this function to load a whole directory full of modules.
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>dirpath</strong></td>
<td>Pathname of a directory. It <strong>must</strong> end with the platform's directory separator character (i.e., '\' under Windows, '/' otherwise).</td>
</tr>
<tr>
<td><strong>pattern</strong></td>
<td>A filename pattern to catch all modules of interest in the targeted directory (e.g., &quot;*.so,*.dll,*.dylib&quot;), or NULL to catch all files in the directory.</td>
</tr>
</tbody>
</table>

## 12.100.3.4 removePlugin()

```cpp
def Fl_Plugin_Manager::removePlugin (Fl_Preferences::ID id) [static]
```

Remove any plugin.

There is no need to call this function explicitly. Every Fl_Plugin destructor will call this function at destruction time.

The documentation for this class was generated from the following files:
- Fl_Plugin.H
- Fl_Preferences.cxx

## 12.101 Fl_PNG_Image Class Reference

The Fl_PNG_Image class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files.

```cpp
#include <Fl_PNG_Image.H>
```

Inheritance diagram for Fl_PNG_Image:

```
Fl_PNG_Image
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Fl_RGB_Image</td>
</tr>
<tr>
<td>----------------</td>
</tr>
<tr>
<td>Fl_Image</td>
</tr>
</tbody>
</table>
```

### Public Member Functions

- **Fl_PNG_Image (const char *filename)**
  
  *The constructor loads the named PNG image from the given png filename.*

- **Fl_PNG_Image (const char *name_png, const unsigned char *buffer, int datasize)**

  *Constructor that reads a PNG image from memory.*

### Public Member Functions inherited from Fl_RGB_Image

- virtual **Fl_SVG_Image * as_svg_image ()**
  
  *Returns whether an image is an Fl_SVG_Image or not.*

- int **cache_h ()**

- int **cache_w ()**

- void **color_average (Fl_Color c, float i) FL_OVERRIDE**
  
  *The color_average() method averages the colors in the image with the provided FLTK color value.*

- **Fl_Image * copy () const**

- **Fl_Image * copy (int W, int H) const FL_OVERRIDE**
  
  *Creates a resized copy of the image.*

- void **desaturate () FL_OVERRIDE**
  
  *The desaturate() method converts an image to grayscale.*

- void **draw (int X, int Y)**
• void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  Draws the image to the current drawing surface with a bounding box.

• Fl_RGB_Image (const Fl_Pixmap *pxm, Fl_Color bg=FL_GRAY)
  The constructor creates a new RGBA image from the specified Fl_Pixmap.

• Fl_RGB_Image (const uchar *bits, int bits_length, int W, int H, int D, int LD)
  The constructor creates a new image from the specified data.

• Fl_RGB_Image (const uchar *bits, int W, int H, int D=3, int LD=0)
  The constructor creates a new image from the specified data.

• void label (Fl_Menu_Item *m) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a menu item.

• void label (Fl_Widget *w) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a widget or menu item.

• virtual void normalize ()
  Makes sure the object is fully initialized.

• void uncache () FL_OVERRIDE
  If the image has been cached for display, delete the cache data.

• ~Fl_RGB_Image () FL_OVERRIDE
  The destructor frees all memory and server resources that are used by the image.

Public Member Functions inherited from Fl_Image

• virtual class Fl_Shared_Image * as_shared_image ()
  Returns whether an image is an Fl_Shared_Image or not.

• Fl_Image * copy () const
  Creates a copy of the image in the same size.

• int count () const
  Returns the number of data values associated with the image.

• int d () const
  Returns the image depth.

• const char *const * data () const
  Returns a pointer to the current image data array.

• int data_h () const
  Returns the height of the image data.

• int data_w () const
  Returns the width of the image data.

• void draw (int X, int Y)
  Draws the image to the current drawing surface.

• int fail () const
  Returns a value that is not 0 if there is currently no image available.

• Fl_Image (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.

• int h () const
  Returns the current image drawing height in FLTK units.

• void inactive ()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

• int id () const
  Returns the current line data size in bytes.

• virtual void release ()
  Releases an Fl_Image - the same as 'delete this'.

• virtual void scale (int width, int height, int proportional=1, int can_expand=0)
Sets the drawing size of the image.

- `int w () const`
  Returns the current image drawing width in FLTK units.

- `virtual ~Fl_Image ()`
  The destructor is a virtual method that frees all memory used by the image.

Friends

- class `Fl_ICO_Image`

Additional Inherited Members

Static Public Member Functions inherited from `Fl_RGB_Image`

- `static size_t max_size ()`
  Returns the maximum allowed image size in bytes when creating an `Fl_RGB_Image` object.

- `static void max_size (size_t size)`
  Sets the maximum allowed image size in bytes when creating an `Fl_RGB_Image` object.

Static Public Member Functions inherited from `Fl_Image`

- `static Fl_Labeltype define_FL_IMAGE_LABEL ()`
  Returns the currently used RGB image scaling method.

- `static Fl_RGB_Scaling RGB_scaling ()`
  Sets the RGB image scaling method used for `copy(int, int)`.

- `static Fl_RGB_Scaling scaling_algorithm ()`
  Gets what algorithm is used when resizing a source image to draw it.

- `static void scaling_algorithm (Fl_RGB_Scaling algorithm)`
  Sets what algorithm is used when resizing a source image to draw it.

Public Attributes inherited from `Fl_RGB_Image`

- `int alloc_array`
  If non-zero, the object’s data array is `delete[]`d when deleting the object.

- `const uchar * array`
  Points to the start of the object’s data array.

Static Public Attributes inherited from `Fl_Image`

- `static const int ERR_FILE_ACCESS = -2`
- `static const int ERR_FORMAT = -3`
- `static const int ERR_MEMORY_ACCESS = -4`
- `static const int ERR_NO_IMAGE = -1`
- `static bool register_images_done = false`
  True after `fl_register_images()` was called, false before.

Protected Member Functions inherited from `Fl_Image`

- `void d (int D)`
  Sets the current image depth.

- `void data (const char *const *p, int c)`
  Sets the current data pointer and count of pointers in the array.

- `void draw_empty (int X, int Y)`
The protected method `draw_empty()` draws a box with an X in it.

- `int draw_scaled(int X, int Y, int W, int H)`
  Draw the image to the current drawing surface rescaled to a given width and height.
- `void h(int H)`
  Sets the height of the image data.
- `void ld(int LD)`
  Sets the current line data size in bytes.
- `void w(int W)`
  Sets the width of the image data.

### Static Protected Member Functions inherited from Fl_Image

- `static void labeltype(const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)`
- `static void measure(const Fl_Label *lo, int &lw, int &lh)`

#### 12.101.1 Detailed Description

The `Fl_PNG_Image` class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files. The class loads color-mapped and full-color images and handles color- and alpha-based transparency.

#### 12.101.2 Constructor & Destructor Documentation

**12.101.2.1 Fl_PNG_Image()** [1/2]

```cpp
Fl_PNG_Image::Fl_PNG_Image (const char *filename)
```

The constructor loads the named PNG image from the given png filename. The destructor frees all memory and server resources that are used by the image. Use `Fl_PNG_Image::fail()` to check if `Fl_PNG_Image` failed to load. `fail()` returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the PNG format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filename</code></td>
<td>Name of PNG file to read</td>
</tr>
</tbody>
</table>

**12.101.2.2 Fl_PNG_Image()** [2/2]

```cpp
Fl_PNG_Image::Fl_PNG_Image (const char *name_png, const unsigned char *buffer, int maxsize)
```

Constructor that reads a PNG image from memory. Construct an image from a block of memory inside the application. Fluid offers "binary Data" chunks as a great way to add image data into the C++ source code. `name_png` can be NULL. If a name is given, the image is added to the list of shared images (see: `Fl_Shared_Image`) and will be available by that name.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name_png</code></td>
<td>A name given to this image or NULL</td>
</tr>
<tr>
<td><code>buffer</code></td>
<td>Pointer to the start of the PNG image in memory</td>
</tr>
<tr>
<td><code>maxsize</code></td>
<td>Size in bytes of the memory buffer containing the PNG image</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- `Fl_PNG_Image.H`
12.102  **Fl_PNM_Image** Class Reference

The **Fl_PNM_Image** class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files.

```cpp
#include <Fl_PNM_Image.H>
```

Inheritance diagram for Fl_PNM_Image:

```
Fl_PNM_Image -> Fl_RGB_Image -> Fl_Image
```

**Public Member Functions**

- **Fl_PNM_Image** (const char ∗filename)
  
  The constructor loads the named PNM image.

**Public Member Functions inherited from Fl_RGB_Image**

- virtual **Fl_SVG_Image** ∗as_svg_image ()
  
  Returns whether an image is an Fl_SVG_Image or not.

- int cache_h ()

- int cache_w ()

- void color_average (Fl_Color c, float i) FL_OVERRIDE
  
  The color_average() method averages the colors in the image with the provided FLTK color value.

- **Fl_Image** ∗copy () const

- **Fl_Image** ∗copy (int W, int H) const FL_OVERRIDE
  
  Creates a resized copy of the image.

- void desaturate () FL_OVERRIDE
  
  The desaturate() method converts an image to grayscale.

- void draw (int X, int Y)

- void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  
  Draws the image to the current drawing surface with a bounding box.

- **Fl_RGB_Image** (const Fl_Pixmap ∗pxm, Fl_Color bg=FL_GRAY)
  
  The constructor creates a new RGBA image from the specified Fl_Pixmap.

- **Fl_RGB_Image** (const uchar ∗bits, int bits_length, int W, int H, int D, int LD)

- **Fl_RGB_Image** (const uchar ∗bits, int W, int H, int D=3, int LD=0)

- void label (Fl_Menu_Item ∗m) FL_OVERRIDE
  
  This method is an obsolete way to set the image attribute of a menu item.

- void label (Fl_Widget ∗w) FL_OVERRIDE
  
  This method is an obsolete way to set the image attribute of a widget or menu item.

- virtual void normalize ()

  Makes sure the object is fully initialized.

- void uncache () FL_OVERRIDE
  
  If the image has been cached for display, delete the cache data.

- ~**Fl_RGB_Image** () FL_OVERRIDE

  The destructor frees all memory and server resources that are used by the image.
Public Member Functions inherited from Fl_Image

- virtual class Fl_Shared_Image ∗ as_shared_image ()
  Returns whether an image is an Fl_Shared_Image or not.
- Fl_Image ∗ copy () const
  Creates a copy of the image in the same size.
- int count () const
  Returns the number of data values associated with the image.
- int d () const
  Returns the image depth.
- const char ∗ const ∗ data () const
  Returns a pointer to the current image data array.
- int data_h () const
  Returns the height of the image data.
- int data_w () const
  Returns the width of the image data.
- void draw (int X, int Y)
  Draws the image to the current drawing surface.
- int fail () const
  Returns a value that is not 0 if there is currently no image available.
- Fl_Image (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.
- int h () const
  Returns the current image drawing height in FLTK units.
- void inactive ()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.
- int ld () const
  Returns the current line data size in bytes.
- virtual void release ()
  Releases an Fl_Image - the same as 'delete this'.
- virtual void scale (int width, int height, int proportional=1, int can_expand=0)
  Sets the drawing size of the image.
- int w () const
  Returns the current image drawing width in FLTK units.
- virtual ~Fl_Image ()
  The destructor is a virtual method that frees all memory used by the image.

Additional Inherited Members

Static Public Member Functions inherited from Fl_RGB_Image

- static size_t max_size ()
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
- static void max_size (size_t size)
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
Static Public Member Functions inherited from Fl_Image

- static Fl_Labeltype define_FL_IMAGE_LABEL ()
- static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
- static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
- static Fl_RGB_Scaling scaling_algorithm ()
  Gets what algorithm is used when resizing a source image to draw it.
- static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.

Public Attributes inherited from Fl_RGB_Image

- int alloc_array
  If non-zero, the object’s data array is delete[]’d when deleting the object.
- const uchar * array
  Points to the start of the object’s data array.

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  True after fl_register_images() was called, false before.

Protected Member Functions inherited from Fl_Image

- void d (int D)
  Sets the current image depth.
- void data (const char *const *p, int c)
  Sets the current data pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h (int H)
  Sets the height of the image data.
- void ld (int LD)
  Sets the current line data size in bytes.
- void w (int W)
  Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

12.102.1 Detailed Description

The Fl_PNM_Image class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files.
The class loads bitmap, grayscale, and full-color images in both ASCII and binary formats.
12.102.2 Constructor & Destructor Documentation

12.102.2.1 Fl_PNM_Image()

Fl_PNM_Image::Fl_PNM_Image (const char * filename )

The constructor loads the named PNM image. The destructor frees all memory and server resources that are used by the image. Use Fl_Image::fail() to check if Fl_PNM_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the PNM format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason.

Parameters

**in** filename a full path and name pointing to a valid jpeg file.

The documentation for this class was generated from the following files:

- Fl_PNM_Image.H
- Fl_PNM_Image.cxx

12.103 Fl_Positioner Class Reference

This class is provided for Forms compatibility.

```
#include <Fl_Positioner.H>
```

Inheritance diagram for Fl_Positioner:

```
Fl_Widget
    ▼
     ▼
Fl_Positioner
```

Public Member Functions

- **Fl_Positioner** (int x, int y, int w, int h, const char *l=0)
  
  Creates a new Fl_Positioner widget using the given position, size, and label string.

- int handle (int) FL_OVERRIDE
  
  Handles the specified event.

- int value (double, double)
  
  Returns the current position in x and y.

- void xbounds (double, double)
  
  Sets the X axis bounds.

- double xmaximum () const
  
  Gets the X axis maximum.

- void xmaximum (double a)
  
  Same as xbounds(xminimum(), a)

- double xminimum () const
  
  Gets the X axis minimum.

- void xminimum (double a)
  
  Same as xbounds(a, xmaximum())

- void xstep (double a)
  
  Sets the stepping value for the X axis.

- double xvalue () const
  
  Gets the X axis coordinate.
• int \texttt{xvalue} (double)
  
  \textit{Sets the X axis coordinate.}

• void \texttt{ybounds} (double, double)
  
  \textit{Sets the Y axis bounds.}

• double \texttt{ymaximum} () const
  
  \textit{Gets the Y axis maximum.}

• void \texttt{ymaximum} (double a)
  
  \textit{Same as ybounds(\texttt{yminimum}(), a)}

• double \texttt{yminimum} () const
  
  \textit{Gets the Y axis minimum.}

• void \texttt{yminimum} (double a)
  
  \textit{Same as ybounds(a, \texttt{ymaximum}())}

• void \texttt{ystep} (double a)
  
  \textit{Sets the stepping value for the Y axis.}

• double \texttt{yvalue} () const
  
  \textit{Gets the Y axis coordinate.}

• int \texttt{yvalue} (double)
  
  \textit{Sets the Y axis coordinate.}

\textbf{Public Member Functions inherited from Fl_Widget}

• void \texttt{_clear_fullscreen} ()

• void \texttt{_set_fullscreen} ()

• void \texttt{activate} ()
  
  \textit{Activates the widget.}

• unsigned int \texttt{active} () const
  
  \textit{Returns whether the widget is active.}

• int \texttt{active_r} () const
  
  \textit{Returns whether the widget and all of its parents are active.}

• \texttt{Fl_Align} \texttt{align} () const
  
  \textit{Gets the label alignment.}

• void \texttt{align} (\texttt{Fl_Align} alignment)
  
  \textit{Sets the label alignment.}

• long \texttt{argument} () const
  
  \textit{Gets the current user data (long) argument that is passed to the callback function.}

• void \texttt{argument} (long v)
  
  \textit{Sets the current user data (long) argument that is passed to the callback function.}

• virtual class \texttt{Fl_Gl_Window \* as_gl_window} ()
  
  \textit{Returns an \texttt{Fl_Gl_Window} pointer if this widget is an \texttt{Fl_Gl_Window}.}

• virtual class \texttt{Fl_Gl_Window const \* as_gl_window} () const
  
  \textit{Returns an \texttt{Fl_Gl_Window} pointer if this widget is an \texttt{Fl_Gl_Window}.}

• virtual \texttt{Fl_Group \* as_group} ()
  
  \textit{Returns an \texttt{Fl_Group} pointer if this widget is an \texttt{Fl_Group}.}

• virtual \texttt{Fl_Group const \* as_group} () const
  
  \textit{Returns an \texttt{Fl_Group} pointer if this widget is an \texttt{Fl_Group}.}

• virtual \texttt{Fl_Window \* as_window} ()
  
  \textit{Returns an \texttt{Fl_Window} pointer if this widget is an \texttt{Fl_Window}.}

• virtual \texttt{Fl_Window const \* as_window} () const
  
  \textit{Returns an \texttt{Fl_Window} pointer if this widget is an \texttt{Fl_Window}.}

• void \texttt{bind_deimage} (\texttt{Fl_Image \*img})
  
  \textit{Sets the image to use as part of the widget label when in the inactive state.}

• void \texttt{bind_deimage} (int f)
  
  \textit{Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.}

• void \texttt{bind_image} (\texttt{Fl_Image \*img})
Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  Gets the current callback function for the widget.

- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.
• void **damage (uchar c)**
  
  **Sets the damage bits for the widget.**

• void **damage (uchar c, int x, int y, int w, int h)**
  
  **Sets the damage bits for an area inside the widget.**

• int **damage_resize** (int, int, int, int)
  
  **Internal use only.**

• void **deactivate ()**
  
  **Deactivates the widget.**

• Fl_Image ∗ **deimage ()**
  
  **Gets the image that is used as part of the widget label when in the inactive state.**

• const Fl_Image ∗ **deimage () const**
  
  **Gets the image that is used as part of the widget label when in the inactive state.**

• void **deimage (Fl_Image &img)**
  
  **Sets the image to use as part of the widget label when in the inactive state.**

• void **deimage (Fl_Image ∗ img)**
  
  **Sets the image to use as part of the widget label when in the inactive state.**

• int **deimage_bound () const**
  
  **Returns whether the inactive image is managed by the widget.**

• void **do_callback (Fl_Callback_Reas on=FL_REASON_UNKNOWN)**
  
  **Calls the widget callback function with default arguments.**

• void **do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reas on=FL_REASON_UNKNOWN)**
  
  **Calls the widget callback function with arbitrary arguments.**

• void **do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reas on=FL_REASON_UNKNOWN)**
  
  **Calls the widget callback function with arbitrary arguments.**

• void **draw_label (int, int, int, int, Fl_Align) const**
  
  **Draws the label in an arbitrary bounding box with an arbitrary alignment.**

• int **h () const**
  
  **Gets the widget height.**

• virtual void **hide ()**
  
  **Makes a widget invisible.**

• Fl_Image ∗ **image ()**
  
  **Gets the image that is used as part of the widget label when in the active state.**

• const Fl_Image ∗ **image () const**
  
  **Gets the image that is used as part of the widget label when in the active state.**

• void **image (Fl_Image &img)**
  
  **Sets the image to use as part of the widget label when in the active state.**

• void **image (Fl_Image ∗ img)**
  
  **Sets the image to use as part of the widget label when in the active state.**

• int **image_bound () const**
  
  **Returns whether the image is managed by the widget.**

• int **inside (const Fl_Widget ∗wgt) const**
  
  **Checks if this widget is a child of wgt.**

• int **is_label_copied () const**
  
  **Returns whether the current label was assigned with copy_label().**

• const char ∗ **label () const**
  
  **Gets the current label text.**

• void **label (const char ∗text)**
  
  **Sets the current label pointer.**

• void **label (Fl_Labeltype a, const char ∗b)**
  
  **Shortcut to set the label text and type in one call.**

• Fl_Color **labelcolor () const**
• void labelcolor (Fl_Color c)
  Gets the label color.
• Fl_Font labelfont () const
  Sets the font to use.
• void labelfont (Fl_Font f)
  Gets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group * p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses ' & ' to indicate shortcuts.
• void shortcut_label (int value)
  
  Sets whether the widget’s label uses ’&’ to indicate shortcuts.
• virtual void show ()
  
  Makes a widget visible.
• void size (int W, int H)
  
  Changes the size of the widget.
• int take_focus ()
  
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  
  Returns if the widget is able to take events.
• int test_shortcut ()
  
  Returns true if the widget’s label contains the entered ’&x’ shortcut.
• const char ∗ tooltip () const
  
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  
  Gets the widget type.
• void type (uchar t)
  
  Sets the widget type.
• int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  
  Sets the user data for this widget.
• void user_data (void ∗v)
  
  Sets the user data for this widget.
• unsigned int visible () const
  
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  
  Modifies keyboard focus navigation.
• int visible_r () const
  
  Returns whether a widget and all its parents are visible.
• int w () const
  
  Gets the widget width.
• Fl_When when () const
  
  Returns the conditions under which the callback is called.
• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.
• Fl_Window ∗ window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  
  Gets the widget position in its window.
• int y () const
  
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  
  Destroys the widget.
Protected Member Functions

- void `draw () FL_OVERRIDE`
  Draws the widget.
- void `draw (int, int, int, int)`
- int `handle (int, int, int, int)`

Protected Member Functions inherited from Fl_Widget

- void `clear_flag (unsigned int c)`
  Clears a flag in the flags mask.
- void `draw_backdrop () const`
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void `draw_box () const`
  Draws the widget box according its box style.
- void `draw_box (Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget's position and size.
- void `draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void `draw_focus () const`
  Draws a focus rectangle around the widget.
- void `draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const`
  Draws a focus rectangle around the widget.
- void `draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  Draws a focus box for the widget at the given position and size.
- void `draw_label () const`
  Draws the widget's label at the defined label position.
- void `draw_label (int, int, int, int) const`
  Draws the label in an arbitrary bounding box.
- void `Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)`
  Creates a widget at the given position and size.
- unsigned int `flags () const`
  Gets the widget flags mask.
- void `h (int v)`
  Internal use only.
- void `set_flag (unsigned int c)`
  Sets a flag in the flags mask.
- void `w (int v)`
  Internal use only.
- void `x (int v)`
  Internal use only.
- void `y (int v)`
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void `default_callback (Fl_Widget ∗widget, void ∗data)`
  The default callback for all widgets that don’t set a callback.
- static unsigned int `label_shortcut (const char ∗t)`
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut (const char ∗t, const bool require_alt=false)`
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,

}

flags possible values enumeration.

12.103.1 Detailed Description

This class is provided for Forms compatibility. It provides 2D input. It would be useful if this could be put atop another widget so that the crosshairs are on top, but this is not implemented. The color of the crosshairs is selection_color().

![Figure 12.35 Fl_Positioner](image)

12.103.2 Constructor & Destructor Documentation

12.103.2.1 Fl_Positioner()

Fl_Positioner::Fl_Positioner (int X, int Y, int W, int H, const char * l = 0)

Creates a new Fl_Positioner widget using the given position, size, and label string. The default boxtype is FL_NO_BOX.

12.103.3 Member Function Documentation

12.103.3.1 draw()

void Fl_Positioner::draw () [protected], [virtual]

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets. If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```c
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.
12.103.3.2 handle()

```cpp
int Fl_Positioner::handle (  
    int event ) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn’t do anything with it.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>the kind of event received</td>
</tr>
</tbody>
</table>

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the event was not used or understood</td>
</tr>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

- Fl_Positioner.cxx

12.104 Fl_PostScript_File_Device Class Reference

To send graphical output to a PostScript file.

```cpp
#include <Fl_PostScript.H>
```

Inheritance diagram for Fl_PostScript_File_Device:

```
Fl_Surface_Device
  
Fl_Widget_Surface
  
Fl_Paged_Device
  
Fl_PostScript_File_Device
```

Public Member Functions

- int begin_job (FILE *ps_output, int pageCount=0, enum Fl_Paged_Device::Page_Format format=Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout=Fl_Paged_Device::PORTRAIT)
Begins the session where all graphics requests will go to FILE pointer.

- int \texttt{begin\_job} (int pagecount, int *from, int *to, char **perr\_message) \texttt{FL\_OVERRIDE}
  
  Don't use with this class.

- int \texttt{begin\_job} (int pagecount=0, enum \texttt{Fl\_Paged\_Device::Page\_Format} format=\texttt{Fl\_Paged\_Device::A4}, enum \texttt{Fl\_Paged\_Device::Page\_Layout} layout=\texttt{Fl\_Paged\_Device::PORTRAIT})

  Begins the session where all graphics requests will go to a local PostScript file.

- int \texttt{begin\_page} (void) \texttt{FL\_OVERRIDE}

  Begins a new printed page.

- void \texttt{close\_command} (\texttt{Fl\_PostScript\_Close\_Command} cmd)

  Sets the function \texttt{end\_job()} calls to close the file()

- void \texttt{end\_current} () \texttt{FL\_OVERRIDE}

  FLTKit calls this each time a surface ceases to be the current drawing surface.

- void \texttt{end\_job} (void) \texttt{FL\_OVERRIDE}

  Completes all PostScript output.

- int \texttt{end\_page} (void) \texttt{FL\_OVERRIDE}

  To be called at the end of each page.

- FILE \* \texttt{file} ()

  Returns the underlying FILE\* receiving all PostScript data.

- \texttt{Fl\_PostScript\_File\_Device} ()

  The constructor.

- void \texttt{margins} (int *left, int *top, int *right, int *bottom) \texttt{FL\_OVERRIDE}

  Computes the dimensions of margins that lie between the printable page area and the full page.

- void \texttt{origin} (int *x, int *y) \texttt{FL\_OVERRIDE}

  Computes the coordinates of the current origin of graphics functions.

- void \texttt{origin} (int x, int y) \texttt{FL\_OVERRIDE}

  Sets the position of the origin of graphics in the drawable part of the drawing surface.

- int \texttt{printable\_rect} (int *w, int *h) \texttt{FL\_OVERRIDE}

  Computes the width and height of the drawable area of the drawing surface.

- void \texttt{rotate} (float angle) \texttt{FL\_OVERRIDE}

  Rotates the graphics operations relatively to paper.

- void \texttt{scale} (float scale\_x, float scale\_y=0.) \texttt{FL\_OVERRIDE}

  Changes the scaling of page coordinates.

- void \texttt{set\_current} () \texttt{FL\_OVERRIDE}

  Make this surface the current drawing surface.

- int \texttt{start\_job} (FILE \*ps\_output, int pagecount=0, enum \texttt{Fl\_Paged\_Device::Page\_Format} format=\texttt{Fl\_Paged\_Device::A4}, enum \texttt{Fl\_Paged\_Device::Page\_Layout} layout=\texttt{Fl\_Paged\_Device::PORTRAIT})

  Synonym of \texttt{begin\_job()}.

- int \texttt{start\_job} (int pagecount=0, enum \texttt{Fl\_Paged\_Device::Page\_Format} format=\texttt{Fl\_Paged\_Device::A4}, enum \texttt{Fl\_Paged\_Device::Page\_Layout} layout=\texttt{Fl\_Paged\_Device::PORTRAIT})

  Synonym of \texttt{begin\_job()}.

- void \texttt{translate} (int x, int y) \texttt{FL\_OVERRIDE}

  Translates the current graphics origin accounting for the current rotation.

- void \texttt{untranslate} (void) \texttt{FL\_OVERRIDE}

  Undoes the effect of a previous \texttt{translate()} call.

- \texttt{\sim\_Fl\_PostScript\_File\_Device} ()

  The destructor.
Public Member Functions inherited from Fl_Paged_Device

• void print_widget (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Synonym of draw(Fl_Widget*, int, int)

• void print_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Synonym of draw_decorated_window(Fl_Window*, int, int)

• int start_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL)
  
  Synonym of begin_job(int pagecount, int *frompage, int *topage, char **perr_message).

• int start_page ()
  
  Synonym of begin_page().

• virtual ~Fl_Paged_Device ()
  
  The destructor.

Public Member Functions inherited from Fl_Widget_Surface

• void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Draws the widget on the drawing surface.

• void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Draws a window with its title bar and frame if any.

• void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  
  Draws a rectangular part of an on-screen window.

Public Member Functions inherited from Fl_Surface_Device

• Fl_Graphics_Driver * driver ()
  
  Returns the graphics driver of this drawing surface.

• virtual bool is_current ()
  
  Is this surface the current drawing surface?

• virtual ~Fl_Surface_Device ()
  
  The destructor.

Static Public Attributes

• static const char * file_chooser_title
  
  Label of the PostScript file chooser window.

Static Public Attributes inherited from Fl_Paged_Device

• static const page_format page_formats [NO_PAGE_FORMATS]
  
  width, height and name of all elements of the enum Page_Format.

Protected Member Functions

• Fl_PostScript_Graphics_Driver * driver ()
  
  Returns the PostScript driver of this drawing surface.

Protected Member Functions inherited from Fl_Paged_Device

• Fl_Paged_Device ()
  
  The constructor.

Protected Member Functions inherited from Fl_Widget_Surface

• Fl_Widget_Surface (Fl_Graphics_Driver *d)
  
  The constructor.
Protected Member Functions inherited from Fl_Surface_Device

- void driver (Fl_Graphics_Driver *graphics_driver)
  
  Sets the graphics driver of this drawing surface.

- Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)
  
  Constructor that sets the graphics driver to use for the created surface.

Additional Inherited Members

Public Types inherited from Fl_Paged_Device

- enum Page_Format { A0 = 0 , A1 , A2 , A3 , A4 , A5 , A6 , A7 , A8 , A9 , B0 , B1 , B2 , B3 , B4 , B5 , B6 , B7 , B8 , B9 , B10 , C5E , DLE , EXECUTIVE , FOLIO , LEDGER , LEGAL , LETTER , TABLOID , ENVELOPE , MEDIA = 0x1000 }  
  
  Possible page formats.

- enum Page_Layout { PORTRAIT = 0 , LANDSCAPE = 0x100 , REVERSED = 0x200 , ORIENTATION = 0x300 }
  
  Possible page layouts.

Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * pop_current ()
  
  Removes the top element from the current drawing surface stack, and makes the new top element current.

- static void push_current (Fl_Surface_Device *new_current)
  
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.

- static Fl_Surface_Device * surface ()
  
  The current drawing surface.

Protected Attributes inherited from Fl_Widget_Surface

- int x_offset  
  
  Horizontal offset to the origin of graphics coordinates.

- int y_offset  
  
  Vertical offset to the origin of graphics coordinates.

12.104.1 Detailed Description

To send graphical output to a PostScript file.
This class is used exactly as the Fl_Printer class except for the begin_job() call, two variants of which are usable and allow to specify what page format and layout are desired.

Processing of text: Text uses vectorial fonts under the X11 + Pango and the Wayland platforms. With other platforms, only text restricted to the Latin alphabet (and a few other characters listed in the table below) and to FLTK standard fonts is vectorized. All other unicode characters or all other fonts (FL_FREE_FONT and above) are output as a bitmap. FLTK standard fonts are output using the corresponding PostScript standard fonts. The latin alphabet means all unicode characters between U+0020 and U+017F, or, in other words, the ASCII, Latin-1 Supplement and Latin Extended-A charts.
12.104 Fl_PostScript_File_Device Class Reference

12.104.2 Member Function Documentation

12.104.2.1 begin_job() [1/3]

```c
int Fl_PostScript_File_Device::begin_job ( 
    FILE * ps_output, 
    int pagecount = 0, 
    enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4, 
    enum Fl_Paged_Device::Page_Layer layout = Fl_Paged_Device::PORTRAIT )
```

Begins the session where all graphics requests will go to FILE pointer.
This member function prevents `end_job()` from closing `ps_output`, so the user can check with `ferror(ps_←output)` for output errors.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ps_output</code></td>
<td>A writable FILE pointer that will receive PostScript output and that should not be closed until after <code>end_job()</code> has been called.</td>
</tr>
<tr>
<td><code>pagecount</code></td>
<td>The total number of pages to be created. Use 0 if this number is unknown when this function is called.</td>
</tr>
<tr>
<td><code>format</code></td>
<td>Desired page format.</td>
</tr>
<tr>
<td><code>layout</code></td>
<td>Desired page layout.</td>
</tr>
</tbody>
</table>

Returns

always 0.

12.104.2.2 begin_job() [2/3]

```c
int Fl_PostScript_File_Device::begin_job ( 
    int pagecount, 
    int * from,
```

Figure 12.36 Extra characters supported by standard PostScript fonts

Processing of transparent Fl_RGB_Image objects: Under the X11 + Pango and the Wayland platforms, these objects are output with their exact transparency. With other platforms, these objects are drawn blended to white color. Class Fl_EPS_File_Surface’s constructor allows to set another background color for blending.

</table>
int * to,
char ** perr_message ) [virtual]

Don't use with this class.
Reimplemented from Fl_Paged_Device.

12.104.2.3 begin_job() [3/3]

int Fl_PostScript_File_Device::begin_job (  
    int pagecount = 0,
    enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
    enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT )

Begins the session where all graphics requests will go to a local PostScript file.
Opens a file dialog to select an output PostScript file. This member function makes end_job() close the resulting
PostScript file and display an alert message with fl_alert() in case of any output error.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pagecount</td>
<td>The total number of pages to be created. Use 0 if this number is unknown when this function is called.</td>
</tr>
<tr>
<td>format</td>
<td>Desired page format.</td>
</tr>
<tr>
<td>layout</td>
<td>Desired page layout.</td>
</tr>
</tbody>
</table>

Returns

0 if OK, 1 if user cancelled the file dialog, 2 if fopen failed on user-selected output file.

12.104.2.4 begin_page()

int Fl_PostScript_File_Device::begin_page (  
    void ) [virtual]

Begins a new printed page.
The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area.
This function also makes this surface the current drawing surface with Fl_Surface_Device::push_current().

Note

begin_page() calls Fl_Surface_Device::push_current() and leaves this device as the active surface. If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current(), or the content of the dialog box will be rendered to the printer instead of the screen.

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

12.104.2.5 end_current()

void Fl_PostScript_File_Device::end_current ( ) [virtual]

FLTK calls this each time a surface ceases to be the current drawing surface.
This member function is mostly of interest to developers of new Fl_Surface_Device derived classes. It allows to perform surface-specific operations necessary when this surface ceases to be current. Each implementation should end with a call to Fl_Surface_Device::end_current().
Reimplemented from Fl_Surface_Device.
12.104.2.6 end_job()

```cpp
void Fl_PostScript_File_Device::end_job {
  void ) [virtual]
}
```

Completes all PostScript output.
This also closes with fclose() the underlying file() unless close_command() was used to set another function.
Reimplemented from Fl_Paged_Device.

12.104.2.7 end_page()

```cpp
int Fl_PostScript_File_Device::end_page {
  void ) [virtual]
}
```

To be called at the end of each page.
This function also stops this surface from being the current drawing surface with Fl_Surface_Device::pop_current().

Note

end_page() calls Fl_Surface_Device::pop_current(). If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to
Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current().

Returns

0 if OK, non-zero if any error.
Reimplemented from Fl_Paged_Device.

12.104.2.8 margins()

```cpp
void Fl_PostScript_File_Device::margins {
  int * left,
  int * top,
  int * right,
  int * bottom ) [virtual]
}
```

Computes the dimensions of margins that lie between the printable page area and the full page.
Values are in the same unit as that used by FLTK drawing functions. They are changed by scale() calls.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>out left</code></td>
<td>If non-null, <code>*left</code> is set to the left margin size.</td>
</tr>
<tr>
<td><code>out top</code></td>
<td>If non-null, <code>*top</code> is set to the top margin size.</td>
</tr>
<tr>
<td><code>out right</code></td>
<td>If non-null, <code>*right</code> is set to the right margin size.</td>
</tr>
<tr>
<td><code>out bottom</code></td>
<td>If non-null, <code>*bottom</code> is set to the bottom margin size.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

12.104.2.9 origin() [1/2]

```cpp
void Fl_PostScript_File_Device::origin {
  int * x,
  int * y ) [virtual]
}
```

Computes the coordinates of the current origin of graphics functions.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>out x,y</code></td>
<td>If non-null, <code>*x</code> and <code>*y</code> are set to the horizontal and vertical coordinates of the graphics origin.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Widget_Surface.
12.104.2.10 origin() [2/2]

```cpp
void Fl_PostScript_File_Device::origin ( 
    int x, 
    int y ) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface. Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive `origin()` calls don't combine their effects. `Origin()` calls are not affected by `rotate()` calls (for classes derived from `Fl_Paged_Device`).

**Parameters**

| in | x, y | Horizontal and vertical positions in the drawing surface of the desired origin of graphics. |

Reimplemented from `Fl_Widget_Surface`.

12.104.2.11 printable_rect()

```cpp
int Fl_PostScript_File_Device::printable_rect ( 
    int * w, 
    int * h ) [virtual]
```

Computes the width and height of the drawable area of the drawing surface. Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to `origin()`. If the object is derived from class `Fl_Paged_Device`, values account for the user-selected paper type and print orientation and are changed by `scale()` calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented from `Fl_Widget_Surface`.

12.104.2.12 rotate()

```cpp
void Fl_PostScript_File_Device::rotate ( 
    float angle ) [virtual]
```

Rotates the graphics operations relatively to paper. The rotation is centered on the current graphics origin. Successive `rotate()` calls don't combine their effects.

**Parameters**

| angle | Rotation angle in counter-clockwise degrees. |

Reimplemented from `Fl_Paged_Device`.

12.104.2.13 scale()

```cpp
void Fl_PostScript_File_Device::scale ( 
    float scale_x, 
    float scale_y = 0. ) [virtual]
```

Changes the scaling of page coordinates. This function also resets the origin of graphics functions at top left of printable page area. After a `scale()` call, do a `printable_rect()` call to get the new dimensions of the printable page area. Successive `scale()` calls don't combine their effects.

**Parameters**

| scale←_x | Horizontal dimensions of plot are multiplied by this quantity. |
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>scale_y</em></td>
<td>Same as above, vertically. The value 0. is equivalent to setting scale_y = scale_x. Thus, scale(factor); is equivalent to scale(factor, factor);</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Paged_Device.

12.104.2.14 set_current()

```cpp
void Fl_PostScript_File_Device::set_current ( ) [virtual]
```

Make this surface the current drawing surface. This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().

**Note**

It's recommended to use this function only as follows:

- The current drawing surface is the display;
- make current another surface, e.g., an Fl_Printer or an Fl_Image_Surface object, calling set_current() on this object;
- draw to that surface;
- make the display current again with Fl_Display_Device::display_device()->set_current();. Don't do any other call to set_current() before this one.

Other scenarios of drawing surface changes should be performed via Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().

Reimplemented from Fl_Surface_Device.

12.104.2.15 start_job() [1/2]

```cpp
int Fl_PostScript_File_Device::start_job ( FILE * ps_output, int pagecount = 0, enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT ) [inline]
```

Synonym of begin_job().

For API compatibility with FLTK 1.3.x

12.104.2.16 start_job() [2/2]

```cpp
int Fl_PostScript_File_Device::start_job ( int pagecount = 0, enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4, enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT ) [inline]
```

Synonym of begin_job().

For API compatibility with FLTK 1.3.x

12.104.2.17 translate()

```cpp
void Fl_PostScript_File_Device::translate ( int x, int y ) [virtual]
```

Translates the current graphics origin accounting for the current rotation. Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects. Reimplemented from Fl_Widget_Surface.
12.104.2.18 untranslate()

`void Fl_PostScript_File_Device::untranslate ( void )` [virtual]

Undoes the effect of a previous `translate()` call.

Reimplemented from `Fl_Widget_Surface`.

The documentation for this class was generated from the following file:

- `Fl_PostScript.H`

12.105 Fl_Preferences Class Reference

`Fl_Preferences` store user settings between application starts.

```cpp
#include <Fl_Preferences.H>
```

Inheritance diagram for `Fl_Preferences`:

```
    Fl_Preferences
    |   
    |   Fl_Plugin_Manager
```

Classes

- struct Entry
- class Name

  'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.

- class Node
- class RootNode

Public Types

- typedef void * ID

  Every `Fl_Preferences`-Group has a unique ID.

- enum Root {
  UNKNOWN_ROOT_TYPE = -1 , SYSTEM = 0 , USER , MEMORY ,
  ROOT_MASK = 0x00FF , CORE = 0x0100 , C_LOCALE = 0x1000 , CLEAR = 0x2000 ,
  SYSTEM_L = SYSTEM | C_LOCALE , USER_L = USER | C_LOCALE , CORE_SYSTEM_L = CORE | SYSTEM_L , CORE_USER_L = CORE | USER_L ,
  CORE_SYSTEM = CORE | SYSTEM , CORE_USER = CORE | USER }

  Define the scope of the preferences.

Public Member Functions

- char `clear ()`

  Delete all groups and all entries.

- char `delete_all_entries ()`

  Delete all entries.

- char `delete_all_groups ()`

  Delete all groups.

- char `delete_entry (const char *entry)`

  Deletes a single name/value pair.

- char `delete_group (const char *group)`

  Deletes a group.

- int `dirty ()`
Check if there were changes to the database that need to be written to disk.

- int entries()
  Returns the number of entries (name/value pairs) in a group.
- const char * entry (int index)
  Returns the name of an entry.
- char entry_exists (const char *key)
  Returns non-zero if an entry with this name exists.
- Root filename (char *buffer, size_t buffer_size)
  Return the file name and path to the preference file.
- Fl_Preferences (const char *path, const char *vendor, const char *application)
  Deprecated: Use this constructor to create or read a preference file at an arbitrary position in the file system.
- Fl_Preferences (const char *path, const char *vendor, const char *application, Root flags)
  Use this constructor to create or read a preference file at an arbitrary position in the file system.
- Fl_Preferences (const Fl_Preferences &)
  Create another reference to a Preferences group.
- Fl_Preferences (Fl_Preferences &parent, const char *group)
  Generate or read a new group of entries within another group.
- Fl_Preferences (Fl_Preferences &parent, int groupIndex)
  Open a child group using a given index.
- Fl_Preferences (Fl_Preferences *parent, const char *group)
  Create or access a group of preferences using a name.
- Fl_Preferences (Fl_Preferences *parent, int groupIndex)
- Fl_Preferences (ID id)
  Create a new dataset access point using a dataset ID.
- Fl_Preferences (Root root, const char *vendor, const char *application)
  The constructor creates a group that manages key/value pairs and child groups.
- int flush()
  Writes preferences to disk if they were modified.
- char get (const char *entry, char *&value, const char *defaultValue)
  Reads an entry from the group.
- char get (const char *entry, char *value, const char *defaultValue, int maxSize)
  Reads an entry from the group.
- char get (const char *entry, double &value, double defaultValue)
  Reads an entry from the group.
- char get (const char *entry, float &value, float defaultValue)
  Reads an entry from the group.
- char get (const char *entry, int &value, int defaultValue)
  Reads an entry from the group.
- char get (const char *entry, void *&value, const void *defaultValue, int defaultSize)
  Reads an entry from the group.
- char get (const char *entry, void *value, const void *defaultValue, int defaultSize, int *size)
  Reads a binary entry from the group, encoded in hexadecimal blocks.
- char get (const char *entry, void *value, const void *defaultValue, int defaultSize, int maxSize)
  Reads a binary entry from the group, encoded in hexadecimal blocks.
- char get_userdata_path (char *path, int pathlen)
  Creates a path that is related to the preference file and that is usable for additional application data.
- const char * group (int num_group)
  Returns the name of the Nth (num_group) group.
- char group_exists (const char *key)
  Returns non-zero if a group with this name exists.
- int groups ()
Returns the number of groups that are contained within a group.

- **ID id ()**
  Return an ID that can later be reused to open more references to this dataset.

- **const char * name ()**
  Return the name of this entry.

- **const char * path ()**
  Return the full path to this entry.

- **char set (const char * entry, const char *value)**
  Sets an entry (name/value pair).

- **char set (const char * entry, const void *value, int size)**
  Sets an entry (name/value pair).

- **char set (const char * entry, double value)**
  Sets an entry (name/value pair).

- **char set (const char * entry, double value, int precision)**
  Sets an entry (name/value pair).

- **char set (const char * entry, float value)**
  Sets an entry (name/value pair).

- **char set (const char * entry, float value, int precision)**
  Sets an entry (name/value pair).

- **char set (const char * entry, int value)**
  Sets an entry (name/value pair).

- **int size (const char *entry)**
  Returns the size of the value part of an entry.

- **virtual ~FL_Preferences ()**
  The destructor removes allocated resources.

### Static Public Member Functions

- **static unsigned int file_access ()**
  Return the current file access permissions for the FLTK preferences system.

- **static void file_access (unsigned int flags)**
  Tell the FLTK preferences system which files in the file system it may read, create, or write.

- **static Root filename (char *buffer, size_t buffer_size, Root root, const char *vendor, const char *application)**
  Determine the file name and path to preferences that would be opened with these parameters.

- **static const char *new_UUID ()**
  Returns a UUID as generated by the system.

- **static char remove (ID id_)**
  Remove the group with this ID from a database.

### Static Public Attributes

- **static const unsigned int ALL = ALL_READ_OK | ALL_WRITE_OK**
  Set this to give FLTK and applications permission to read, write, and create preference files.

- **static const unsigned int ALL_READ_OK = USER_READ_OK | SYSTEM_READ_OK | CORE_READ_OK**
  Set this to allow FLTK and applications to read preference files.

- **static const unsigned int ALL_WRITE_OK = USER_WRITE_OK | SYSTEM_WRITE_OK | CORE_WRITE_OK**
  Set this to allow FLTK and applications to create and write preference files.

- **static const unsigned int APP_OK = SYSTEM_OK | USER_OK**
  Set this if it is OK for applications to read, create, and write any kind of preference files.

- **static const unsigned int CORE_OK = CORE_READ_OK | CORE_WRITE_OK**
  Set this if it is OK for FLTK to read, create, or write preference files.

- **static const unsigned int CORE_READ_OK = 0x0010**
Set this if it is OK for FLTK to read preference files.
- static const unsigned int CORE_WRITE_OK = 0x0020
  Set this if it is OK for FLTK to create or write preference files.
- static const unsigned int NONE = 0x0000
  Set this if no call to Fl_Preferences shall access the file system.
- static const unsigned int SYSTEM_OK = SYSTEM_READ_OK | SYSTEM_WRITE_OK
  Set this if it is OK for applications to read, create, and write system wide preference files.
- static const unsigned int SYSTEM_READ_OK = 0x0004
  Set this if it is OK for applications to read system wide preference files.
- static const unsigned int SYSTEM_WRITE_OK = 0x0008
  Set this if it is OK for applications to create and write system wide preference files.
- static const unsigned int USER_OK = USER_READ_OK | USER_WRITE_OK
  Set this if it is OK for applications to read, create, and write user preference files.
- static const unsigned int USER_READ_OK = 0x0001
  Set this if it is OK for applications to read user preference files.
- static const unsigned int USER_WRITE_OK = 0x0002
  Set this if it is OK for applications to create and write user preference files.

12.105.1 Detailed Description

Fl_Preferences store user settings between application starts. Fl_Preferences are similar to the Registry on Windows and Preferences on MacOS, providing a simple method to store customizable user settings between app launches, for instance the previous window position or a history of previously used documents.

Preferences are organized in a hierarchy of groups. Every group can contain more groups and any number of key/value pairs. Keys can be text strings containing ASCII letters, digits, periods, and underscores. Forward slashes in a key name are treated as subgroups, i.e. the key 'window/width' would actually refer to the key 'width' inside the group 'window'.

Keys usually have a unique name within their group. Duplicate keys are possible though and can be accessed using the index based functions.

A value can be an UTF-8 string. Control characters and UTF-8 sequences are stored as octal values. Long strings are wrapped at the line ending and will be reassembled when reading the file back.

Several methods allow setting and getting numerical values and binary data.

Preferences are stored in text files that can be edited manually if needed. The file format is easy to read and relatively forgiving. Preference files are the same on all platforms. User comments in preference files are preserved. Filenames are unique for each application by using a vendor/application naming scheme. The user must provide default values for all entries to ensure proper operation should preferences be corrupted or not yet exist.

FLTK preferences are not meant to replace a fully features database. No merging of data takes place. If several instances of an app access the same database at the same time, only the most recent changes will persist.

Preferences should not be used to store document data. The .prefs file should be kept small for performance reasons. One application can have multiple preference files. Extensive binary data however should be stored in separate files: see Fl_Preferences::get_userdata_path().

Fl_Preferences are not thread-safe. They can temporarily change the locale on some platforms during read and write access, which also changes it temporarily in other threads of the same app.

Typically a preferences database is read at startup, and then reopened and written at app shutdown.
int appWindowWidth, appWindowHeight;

void launch() {
    FL_Preferences app(FL_PREFERENCES::USER_L, "matthiasm.com", "hello");
    // 'app' constructor will be called, reading data from .prefs file
    FL_PREFERENCES window(app, "window");
    window.get("width", appWindowWidth, 800);
    window.get("height", appWindowHeight, 600);
    // 'app' destructor will be called. This will write data to the
    // .prefs file if any preferences were changed or added
}

void quit() {
    FL_PREFERENCES app(FL_PREFERENCES::USER_L, "matthiasm.com", "hello");
    FL_PREFERENCES window(app, "window");
    window.set("width", appWindowWidth);
    window.set("height", appWindowHeight);
}

See also

    FL_PREFERENCES::FL_PREFERENCES(Root root, const char ∗vendor, const char ∗application)

As a special case, FL_PREFERENCES can be memory mapped and not be associated with a file on disk.

See also

    FL_PREFERENCES::FL_PREFERENCES(FL_PREFERENCES ∗parent, const char ∗group) for more details on memory
    mapped preferences.

Note

Starting with FLTK 1.3, preference databases are expected to be in UTF-8 encoding. Previous databases
were stored in the current character set or code page which renders them incompatible for text entries using
international characters.

Starting with FLTK 1.4, searching a valid path to store the preference files has changed slightly. Please see
FL_PREFERENCES::FL_PREFERENCES(Root, const char ∗, const char ∗) for details.

Starting with FLTK 1.4, preference files should be created with SYSTEM_L or USER_L to be interchangeable
between computers with differing locale settings. The legacy modes, LOCAL and SYSTEM, will read and
write floating point values using the decimal point of the current locale. As a result, a fp-value would be written
‘3,1415’ on a German machine, and would be read back as ‘3.0’ on a US machine because the comma would
not be recognized as an alternative decimal point.

12.105.2 Member Typedef Documentation

12.105.2.1 ID

typedef void ∗FL_PREFERENCES::ID

Every FL_PREFERENCES-Group has a unique ID. ID's can be retrieved from an FL_PREFERENCES-Group and can then be used to create more FL_Preference references
to the same data set, as long as the database remains open.

12.105.3 Member Enumeration Documentation

12.105.3.1 Root

enum FL_PREFERENCES::Root

Define the scope of the preferences.

Enumerator

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>

12.105.4 Constructor & Destructor Documentation

12.105.4.1 Fl_Preferences() [1/8]

Fl_Preferences::Fl_Preferences ( 
    Root root, 
    const char * vendor, 
    const char * application )  

The constructor creates a group that manages key/value pairs and child groups. Preferences can be stored per user using the root type Fl_Preferences::USER_L, or stored system-wide using Fl_Preferences::SYSTEM_L.

Groups and key/value pairs can be read and written randomly. Reading undefined values will return the default value. Writing undefined values will create all required groups and key/value pairs.

This constructor creates the base instance for all following entries and reads the database from disk into memory if it exists. The vendor argument is a unique text string identifying the development team or vendor of an application. A domain name or an EMail address (replacing the '@' with a '.') are great unique names, e.g. "research.matthiasm.com" or "fluid.fltk.org". The application argument can be the working title or final name of your application. Both vendor and application must be valid UNIX path segments as they become parts of the preference file path and may contain forward slashes to create deeper file structures.

Note

On Windows, the directory is constructed by querying the Common AppData or AppData key of the Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders registry entry. The filename and path is then constructed as $(query)/$(vendor)/$(application).prefs. If the query call fails, data will be stored in RAM only. It will be lost when the app exits.

In FLTK versions before 1.4.0, if querying the registry failed, preferences would be written to C:\FLTK\$(vendor)\$(application).prefs.

Note

On Linux, the USER directory is constructed by reading $HOME. If $HOME is not set or not pointing to an existing directory, FLTK will check the path member of the passwd struct returned by getpwuid(getuid()) . If all attempts fail, data will be stored in RAM only and be lost when the app exits.

The SYSTEM preference filename is hardcoded as /etc/fltk/$(vendor)/$(application).prefs. For backward compatibility, the old USER.prefs file naming scheme $(directory)/.fltk/$(vendor)/$(application).prefs is checked first. If that file does not exist, the environment variable $XDG_CONFIG_HOME is read as a base directory. If $XDG_CONFIG_HOME is not set, the base directory defaults to $HOME/.config/. The user preferences will be stored in $(directory)/$(vendor)/$(application).prefs. The user data path will be $(directory)/$(vendor)/$(application)/. In FLTK versions before 1.4.0, if $HOME was not set, the USER path would be empty, generating $(vendor)/$(application).prefs, which was used relative to the current working directory.
Note

On macOS, the USER directory is constructed by reading $HOME. If $HOME is not set or not pointing to an existing directory, we check the path returned by NSHomeDirectory, and finally checking the path member of the passwd struct returned by getpwuid(getuid). If all attempts fail, data will be stored in RAM only and be lost when the app exits. The filename and path is then constructed as $(directory)/~Library/Preferences/${vendor}/$(application).prefs. The SYSTEM directory is hard-coded as /Library/Preferences/${vendor}/$(application).prefs.

In FLTK versions before 1.4.0, if $HOME was not set, the USER path would be NULL, generating <null>/Library/Preferences/${vendor}/$(application).prefs, which would silently fail to create a preference file.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>root</td>
<td>can be USER_L or SYSTEM_L for user specific or system wide preferences, add the CLEAR flag to start with a clean set of preferences instead of reading them from a preexisting database</td>
</tr>
<tr>
<td>vendor</td>
<td>unique text describing the company or author of this file, must be a valid filepath segment</td>
</tr>
<tr>
<td>application</td>
<td>unique text describing the application, must be a valid filepath segment</td>
</tr>
</tbody>
</table>

See also

Fl_Preferences(Fl_Preferences *parent, const char *group) with parent set to NULL

12.105.4.2 Fl_Preferences() [2/8]

Fl_Preferences::Fl_Preferences (  
const char * path,  
const char * vendor,  
const char * application,  
Root flags )  

Use this constructor to create or read a preference file at an arbitrary position in the file system. The file name is generated in the form $(path)/$(application).prefs. If application is NULL, path is taken literally as the file path and name.

// Example: read from an existing database and write modifications when flushed
Fl_Preferences database("/user/matt/test.prefs", "org.fltk.test", NULL, Fl_Preferences::C_LOCALE);

// Example: create a new preferences file with an empty data set
Fl_Preferences database("/user/matt/test.prefs", "org.fltk.test", NULL, Fl_Preferences::Root)(Fl_Preferences::C_LOCALE|Fl_Preferences::CLEAR));

Note

the C_LOCALE flag is is not set by default for backward compatibility, but it is highly recommended to set it when opening a database.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>path to the directory that contains the preference file</td>
</tr>
<tr>
<td>vendor</td>
<td>unique text describing the company or author of this file, must be a valid file path segment</td>
</tr>
<tr>
<td>application</td>
<td>unique text describing the application, must be a valid filename or NULL</td>
</tr>
<tr>
<td>flags</td>
<td>C_LOCALE to make the preferences file independent of the current locale, add the CLEAR flag to start with a clean set of preferences instead of reading from the database</td>
</tr>
</tbody>
</table>
12.105.3 Fl_Preferences() [3/8]

FL_PREFERENCES:

| Fl_Preferences & parent, |
| const char * group |

Generate or read a new group of entries within another group. Use the `group` argument to name the group that you would like to access. Group can also contain a path to a group further down the hierarchy by separating group names with a forward slash '/'.

Parameters

| in parent |
| reference object for the new group |
| in group |
| name of the group to access (may contain '/'s) |

12.105.4 Fl_Preferences() [4/8]

FL_PREFERENCES:

| Fl_Preferences & parent, |
| const char * group |

Create or access a group of preferences using a name. Parent should point to a previously created parent preferences group to create a preferences hierarchy. If `parent` is set to NULL, an unnamed database will be accessed that exists only in local memory and is not associated with a file on disk. The root type of this database is set to `Fl_Preferences::MEMORY`.

- the memory database is not shared among multiple instances of the same app
- memory databases are not thread safe
- all data will be lost when the app quits

```cpp
void some_function() {
    Fl_Preferences guide( NULL, "Guide" );
    guide.set("answer", 42);
}
void other_function() {
    int x;
    Fl_Preferences guide( NULL, "Guide" );
    guide.get("answer", x, -1);
}
```

FLTK uses the memory database to manage plugins. See `Fl_Plugin`.

Parameters

| in parent |
| the parameter parent is a pointer to the parent group. If parent is NULL, the new preferences item refers to an application internal database ("runtime prefs") which exists only once, and remains in RAM only until the application quits. This database is used to manage plugins and other data indexes by strings. Runtime prefs are not thread-safe. |
| in group |
| a group name that is used as a key into the database |

See also

`. Fl_Preferences( Fl_Preferences&, const char *group )`

12.105.5 Fl_Preferences() [5/8]

FL_PREFERENCES:

| Fl_Preferences & parent, |
| int groupIndex |

Open a child group using a given index. Use the `groupIndex` argument to find the group that you would like to access. If the given index is invalid (negative or too high), a new group is created with a UUID as a name.
The index needs to be fixed. It is currently backward. Index 0 points to the last member in the 'list' of preferences.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>in</strong></td>
<td><strong>parent</strong></td>
</tr>
<tr>
<td><strong>in</strong></td>
<td><strong>groupIndex</strong></td>
</tr>
</tbody>
</table>

### 12.105.4.6 Fl_Preferences() [6/8]

```c
Fl_Preferences::Fl_Preferences ( 
    Fl_Preferences * parent, 
    int groupIndex )
```

See also

```c
Fl_Preferences( Fl_Preferences&, int groupIndex )
```

### 12.105.4.7 Fl_Preferences() [7/8]

```c
Fl_Preferences::Fl_Preferences ( Fl_Preferences::ID id )
```

Create a new dataset access point using a dataset ID. ID's are a great way to remember shortcuts to database entries that are deeply nested in a preferences database, as long as the database root is not deleted. An ID can be retrieved from any Fl_Preferences dataset, and can then be used to create multiple new references to the same dataset. ID's can be very helpful when put into the user_data() field of widget callbacks.

### 12.105.4.8 ~Fl_Preferences()

```c
Fl_Preferences::~Fl_Preferences ( ) [virtual]
```

The destructor removes allocated resources. When used on the base preferences group, the destructor flushes all changes to the preference file and deletes all internal databases. The destructor does not remove any data from the database. It merely deletes your reference to the database.

### 12.105.4.9 Fl_Preferences() [8/8]

```c
Fl_Preferences::Fl_Preferences ( 
    const char * path, 
    const char * vendor, 
    const char * application )
```

Deprecated: Use this constructor to create or read a preference file at an arbitrary position in the file system.

**Deprecated** "in 1.4.0 - use Fl_Preferences(path, vendor, application, flags) instead"

This constructor should no longer be used because the generated database uses the current locale, making it impossible to exchange floating point settings between machines with different language settings. Use Fl_Preferences(path, vendor, application, Fl_Preferences::C_LOCALE) in new projects and Fl_Preferences(path, vendor, application, 0) if you must keep backward compatibility.

See also

```c
Fl_Preferences( const char *path, const char *vendor, const char *application, Root flags )
```
12.105.5 Member Function Documentation

12.105.5.1 delete_entry()

```
char Fl_Preferences::delete_entry (const char * key )
```

Deletes a single name/value pair.
This function removes the entry `key` from the database.

**Parameters**

- `key` name of entry to delete

**Returns**

- `0` if deleting the entry failed

12.105.5.2 delete_group()

```
char Fl_Preferences::delete_group (const char * group )
```

Deletes a group.
Removes a group and all keys and groups within that group from the database.

**Parameters**

- `group` name of the group to delete

**Returns**

- `0` if call failed

12.105.5.3 dirty()

```
int Fl_Preferences::dirty ( )
```

Check if there were changes to the database that need to be written to disk.

**Returns**

- `1` if the database will be written to disk by `flush` or destructor.
- `0` if the database is unchanged since the last write operation.
- `-1` if there is an internal database error.

12.105.5.4 entries()

```
int Fl_Preferences::entries ( )
```

Returns the number of entries (name/value pairs) in a group.

**Returns**

- number of entries

12.105.5.5 entry()

```
const char * Fl_Preferences::entry (int index )
```

Returns the name of an entry.
There is no guaranteed order of entry names. The index must be within the range given by `entries()`.
### 12.105.5.6 entry_exists()

```cpp
cchar Fl_Preferences::entry_exists (const char * key)
```

Retruns non-zero if an entry with this name exists.

**Parameters**

- **in key** name of entry that is searched for

**Returns**

- 0 if entry was not found

### 12.105.5.7 file_access() [1/2]

```cpp
unsigned int Fl_Preferences::file_access ( ) [static]
```

Return the current file access permissions for the FLTK preferences system.

See also

- Fl_Preferences::file_access(unsigned int)

### 12.105.5.8 file_access() [2/2]

```cpp
void Fl_Preferences::file_access ( unsigned int flags ) [static]
```

Tell the FLTK preferences system which files in the file system it may read, create, or write.

The FLTK core library will try to read or even create or write preference files when calling Fl::option(), Fl_File_Chooser, the printing panel, and possibly some other internal functions. If your application wants to keep FLTK from touching the file system, call this function before making any other FLTK calls:

```cpp
// neither FLTK nor the app may read, create, or write preference files
Fl_Preferences::file_access( Fl_Preferences::NONE);
```

Or

```cpp
// FLTK may not read, create, or write preference files, but the application may
Fl_Preferences::file_access( Fl_Preferences::APP_OK);
```

All flags can be combined using an OR operator. If flags are not set, that specific access to the file system will not be allowed. By default, all access is granted. To clear one or more flags from the default setting, use:

```cpp
Fl_Preferences::file_access( Fl_Preferences::file_access() &~ Fl_Preferences::SYSTEM_WRITE);
```

If preferences are created using a filename (instead of Fl_Preferences::USER or Fl_Preferences::SYSTEM), file access is handled as if the Fl_Preferences::USER flag was set.

See also

- Fl_Preferences::NONE and others for a list of flags.
- Fl_Preferences::file_access()
12.105.5.9  filename() [1/2]

```
Fl_Preferences::Root Fl_Preferences::filename {
    char * buffer,
    size_t buffer_size
}
```

Return the file name and path to the preference file.
If the preferences have not changed or have not been flushed, the file or directory may not have been created yet.

**Parameters**

| out buffer | write the resulting path into this buffer |
| in buffer_size | size of the buffer in bytes |

**Returns**

the root type at creation type, or MEMORY for runtime prefs, it does not return CORE or LOCALE flags.

12.105.5.10  filename() [2/2]

```
Fl_Preferences::Root Fl_Preferences::filename {
    char * buffer,
    size_t buffer_size,
    Root root,
    const char * vendor,
    const char * application } [static]
```

Determine the file name and path to preferences that would be openend with these parameters.
Find the possible location of a preference file on disk without touching any of the pathname components. This can be used to check if a preference file already exists.

**Parameters**

| out buffer | write the resulting path into this buffer |
| in buffer_size | size of the buffer in bytes |
| in root | can be USER_L or SYSTEM_L for user specific or system wide preferences |
| in vendor | unique text describing the company or author of this file, must be a valid filepath segment |
| in application | unique text describing the application, must be a valid filepath segment |

**Returns**

the input root value, or Fl_Preferences::UNKNOWN_ROOT_TYPE if the path could not be determined.

**See also**

Fl_Preferences( Root root, const char *vendor, const char *application )

12.105.5.11  flush()

```
int Fl_Preferences::flush ( )
```

Writes preferences to disk if they were modified.
This method can be used to verify that writing a preference file went well. Deleting the base preferences object will also write the contents of the database to disk.

**Returns**

-1 if anything went wrong, i.e. file could not be opened, permissions blocked writing, etc.
0 if the file was written to disk. This does not check if the disk ran out of space and the file is truncated.
1 if no data was written to the database and no write attempt to disk was made.
12.105.5.12  get() [1/8]

char Fl_Preferences::get (  
  const char * key,  
  char * & text,  
  const char * defaultValue )

Reads an entry from the group.  
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).  
get() allocates memory of sufficient size to hold the value. The buffer must be free'd by the developer using 'free(value)'.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>text</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

12.105.5.13  get() [2/8]

char Fl_Preferences::get (  
  const char * key,  
  char * text,  
  const char * defaultValue,  
  int maxSize )

Reads an entry from the group.  
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).  
'maxSize' is the maximum length of text that will be read. The text buffer must allow for one additional byte for a trailing zero.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>text</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
<tr>
<td>in</td>
<td>maxSize</td>
<td>maximum length of value plus one byte for a trailing zero</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

12.105.5.14  get() [3/8]

char Fl_Preferences::get (  
  const char * key,  
  double & value,  
  double defaultValue )

Reads an entry from the group.  
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>value</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

12.105.15  get() [4/8]

```cpp
char Fl_Preferences::get (const char * key, float & value, float defaultValue )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>value</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

12.105.16  get() [5/8]

```cpp
char Fl_Preferences::get (const char * key, int & value, int defaultValue )
```

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>value</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

12.105.17  get() [6/8]

```cpp
char Fl_Preferences::get (const char * key, 
```
void *data,
const void *defaultValue,
int defaultSize)

Reads an entry from the group.
A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was
used (0). get() allocates memory of sufficient size to hold the value. The buffer must be free’d by the developer
using 'free(value)'.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>data</td>
<td>returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultSize</td>
<td>size of default value array</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

12.105.5.18 get() [7/8]

char Fl_Preferences::get (  
    const char * key,
    void * data,
    const void * defaultValue,
    int defaultSize,
    int * maxSize )

Reads a binary entry from the group, encoded in hexadecimal blocks.
A binary (not hex) default value can be supplied. The return value indicates if the value was available (non-zero) or
the default was used (0). maxSize is the maximum length of text that will be read and returns the actual number
of bytes read.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>data</td>
<td>value returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value to be used if no preference was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultSize</td>
<td>size of default value array</td>
</tr>
<tr>
<td>in,out</td>
<td>maxSize</td>
<td>maximum length of value and actual number of bytes set</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

12.105.5.19 get() [8/8]

char Fl_Preferences::get (  
    const char * key,
    void * data,
    const void * defaultValue,
    int defaultSize,
    int maxSize )

Reads a binary entry from the group, encoded in hexadecimal blocks.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>data</td>
<td>value returned from preferences or default value if none was set</td>
</tr>
<tr>
<td>in</td>
<td>defaultValue</td>
<td>default value</td>
</tr>
<tr>
<td>in</td>
<td>defaultSize</td>
<td>size of default value array</td>
</tr>
<tr>
<td>in</td>
<td>maxSize</td>
<td>maximum length of value, to receive the number of bytes read, use the function below instead.</td>
</tr>
</tbody>
</table>

Returns

0 if the default value was used

See also

Fl_Preferences::get(const char *key, void *data, const void *defaultValue, int defaultSize, int *maxSize)

12.105.5.20 get_userdata_path()

char Fl_Preferences::get_userdata_path (char *path, int pathlen)

Creates a path that is related to the preference file and that is usable for additional application data. This function creates a directory that is named after the preferences database without the .prefs extension and located in the same directory. It then fills the given buffer with the complete path name.

There is no way to verify that the path name fit into the buffer. If the name is too long, it will be clipped. This function can be used with direct paths that don't end in .prefs. getUserDataPath() will remove any extension and end the path with a /. If the file name has no extension, getUserDataPath() will append .data/ to the path name.

Example:

Fl_Preferences prefs( USER, "matthiasm.com", "test" );
char path[FL_PATH_MAX];
prefs.getUserdataPath( path, FL_PATH_MAX );

creates the preferences database in the directory (User 'matt' on Linux):

/Users/matt/.fltk/matthiasm.com/test.prefs

...and returns the userdata path:

/Users/matt/.fltk/matthiasm.com/test/

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>path</th>
<th>buffer for user data path</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>pathlen</td>
<td>size of path buffer (should be at least FL_PATH_MAX)</td>
</tr>
</tbody>
</table>

Returns

1 if there is no filename (path will be unmodified)
1 if pathlen is 0 (path will be unmodified)
1 if a path was created successfully, path will contain the path name ending in a '/'
0 if path was not created for some reason; path will contain the pathname that could not be created

See also

Fl_Preferences::Fl_Preferences(Root, const char*, const char*)

12.105.5.21 group()

const char * Fl_Preferences::group (int num_group)
Returns the name of the Nth \texttt{(num\_group)} group.
There is no guaranteed order of group names. The index must be within the range given by \texttt{groups()}.

**Parameters**

| in | num\_group | number indexing the requested group |

**Returns**

'C' string pointer to the group name

\subsection{group\_exists()}

\begin{verbatim}
char Fl_Preferences::group_exists (const char * key )
\end{verbatim}

Returns non-zero if a group with this name exists.
Group names are relative to the Fl\_Preferences node and can contain a path. '.' describes the current node, '.../' describes the topmost node. By preceding a group name with a '.../' its path becomes relative to the topmost node.

**Parameters**

| in | key | name of group that is searched for |

**Returns**

0 if no group by that name was found

\subsection{groups()}

\begin{verbatim}
int Fl_Preferences::groups ( )
\end{verbatim}

Returns the number of groups that are contained within a group.

**Returns**

0 for no groups at all

\subsection{new\_UUID()}

\begin{verbatim}
const char * Fl_Preferences::new\_UUID ( ) [static]
\end{verbatim}

Returns a UUID as generated by the system.
A UUID is a "universally unique identifier" which is commonly used in configuration files to create identities. A UUID in ASCII looks like this: 937C4900-51AA-4C11-8DD3-7AB59944F03E. It has always 36 bytes plus a trailing zero.

**Returns**

a pointer to a static buffer containing the new UUID in ASCII format. The buffer is overwritten during every call to this function!

\subsection{set() [1/7]}

\begin{verbatim}
char Fl_Preferences::set (const char * key,
                        const char * text )
\end{verbatim}

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>text</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

12.105.5.26  set() [2/7]

```
cchar Fl_Preferences::set (  
    const char * key,  
    const void * data,  
    int dsize )  
```

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>data</td>
<td>set this entry to value</td>
</tr>
<tr>
<td>in</td>
<td>dsize</td>
<td>size of data array</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

12.105.5.27  set() [3/7]

```
cchar Fl_Preferences::set (  
    const char * key,  
    double value )  
```

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

12.105.5.28  set() [4/7]

```
cchar Fl_PREFERENCES::set (  
    const char * key,  
    double value,  
    int precision )  
```

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
<tr>
<td>in</td>
<td>precision</td>
<td>number of decimal digits to represent value</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

12.105.5.29 set() [5/7]

```cpp
char Fl_Preferences::set (const char * key, float value )
```

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

12.105.5.30 set() [6/7]

```cpp
char Fl_Preferences::set (const char * key, float value, int precision )
```

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
<tr>
<td>in</td>
<td>precision</td>
<td>number of decimal digits to represent value</td>
</tr>
</tbody>
</table>

Returns

0 if setting the value failed

12.105.5.31 set() [7/7]

```cpp
char Fl_Preferences::set (const char * key, int value )
```

Sets an entry (name/value pair).
The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>set this entry to value</td>
</tr>
</tbody>
</table>

**Returns**

0 if setting the value failed

### 12.105.32 size()

```c++
int Fl_Preferences::size (const char * key )
```

Returns the size of the value part of an entry.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>key</th>
<th>name of entry</th>
</tr>
</thead>
</table>

**Returns**

size of value

### 12.105.6 Member Data Documentation

#### 12.105.6.1 CORE_READ_OK

```c++
const unsigned int Fl_Preferences::CORE_READ_OK = 0x0010 [static]
```

Set this if it is OK for FLTK to read preference files. USER_READ_OK and/or SYSTEM_READ_OK must also be set.

#### 12.105.6.2 CORE_WRITE_OK

```c++
const unsigned int Fl_Preferences::CORE_WRITE_OK = 0x0020 [static]
```

Set this if it is OK for FLTK to create or write preference files. USER_WRITE_OK and/or SYSTEM_WRITE_OK must also be set.

#### 12.105.6.3 NONE

```c++
const unsigned int Fl_Preferences::NONE = 0x0000 [static]
```

Set this if no call to Fl_Preferences shall access the file system.

See also

- Fl_Preferences::file_access(unsigned int)
- Fl_Preferences::file_access()

The documentation for this class was generated from the following files:

- Fl_Preferences.H
- Fl_Preferences.cxx

### 12.106 Fl_Printer Class Reference

OS-independent print support.
#include <Fl_Printer.H>

Inheritance diagram for Fl_Printer:

```
Fl_Surface_Device
    Fl_Paged_Device
        Fl_Widget_Surface
            Fl_Printer
```

## Public Member Functions

- `int begin_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL)` FL_OVERRIDE
  
  Begins a print job.

- `int begin_page (void)` FL_OVERRIDE
  
  Begins a new printed page.

- `void end_job (void)` FL_OVERRIDE
  
  To be called at the end of a print job.

- `int end_page (void)` FL_OVERRIDE
  
  To be called at the end of each page.

- `Fl_Printer (void)`
  
  The constructor.

- `bool is_current ()` FL_OVERRIDE
  
  Is this surface the current drawing surface?

- `void margins (int *left, int *top, int *right, int *bottom)` FL_OVERRIDE
  
  Computes the dimensions of margins that lie between the printable page area and the full page.

- `void origin (int *x, int *y)` FL_OVERRIDE
  
  Computes the coordinates of the current origin of graphics functions.

- `void origin (int x, int y)` FL_OVERRIDE
  
  Sets the position of the origin of graphics in the drawable part of the drawing surface.

- `int printable_rect (int *w, int *h)` FL_OVERRIDE
  
  Computes the width and height of the drawable area of the drawing surface.

- `void rotate (float angle)` FL_OVERRIDE
  
  Rotates the graphics operations relatively to paper.

- `void scale (float scale_x, float scale_y=0.)` FL_OVERRIDE
  
  Changes the scaling of page coordinates.

- `void set_current (void)` FL_OVERRIDE
  
  Make this surface the current drawing surface.

- `void translate (int x, int y)` FL_OVERRIDE
  
  Translates the current graphics origin accounting for the current rotation.

- `void untranslate (void)` FL_OVERRIDE
  
  Undoes the effect of a previous translate() call.

- `~Fl_Printer (void)`
  
  The destructor.
Public Member Functions inherited from Fl_Paged_Device

- void print_widget (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Synonym of draw(Fl_Widget*, int, int)

- void print_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Synonym of draw_decorated_window(Fl_Window*, int, int)

- int start_job (int pagecount=0, int *frompage=NULL, int *topage=NULL, char **perr_message=NULL)
  
  Synonym of begin_job(int pagecount, int *frompage, int *topage, char **perr_message).

- int start_page ()
  
  Synonym of begin_page().

- virtual ~Fl_Paged_Device ()
  
  The destructor.

Public Member Functions inherited from Fl_Widget_Surface

- void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  
  Draws the widget on the drawing surface.

- void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  
  Draws a window with its title bar and frame if any.

- void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  
  Draws a rectangular part of an on-screen window.

Public Member Functions inherited from Fl_Surface_Device

- Fl_Graphics_Driver * driver ()
  
  Returns the graphics driver of this drawing surface.

- virtual ~Fl_Surface_Device ()
  
  The destructor.

Static Public Attributes

These attributes are useful for the Linux/Unix platform only.

- static const char * dialog_title = "Print"
  
  [this text may be customized at run-time]

• static const char ∗ property_cancel = "Cancel"
  [this text may be customized at run-time]

Static Public Attributes inherited from Fl_Paged_Device

• static const page_format page_formats [NO_PAGE_FORMATS]
  width, height and name of all elements of the enum Page_Format.

Additional Inherited Members

Public Types inherited from Fl_Paged_Device

• enum Page_Format {
   A0 = 0 , A1 , A2 , A3 ,
   A4 , A5 , A6 , A7 ,
   A8 , A9 , B0 , B1 ,
   B2 , B3 , B4 , B5 ,
   B6 , B7 , B8 , B9 ,
   B10 , C5E , DLE , EXECUTIVE ,
   FOLIO , LEDGER , LEGAL , LETTER ,
   TABLOID , ENVELOPE , MEDIA = 0x1000 }
   Possible page formats.
• enum Page_Layout { PORTRAIT = 0 , LANDSCAPE = 0x100 , REVERSED = 0x200 , ORIENTATION = 0x300 }
   Possible page layouts.

Static Public Member Functions inherited from Fl_Surface_Device

• static Fl_Surface_Device ∗ pop_current ()
  Removes the top element from the current drawing surface stack, and makes
  the new top element current.
• static void push_current (Fl_Surface_Device ∗ new_current)
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
• static Fl_Surface_Device ∗ surface ()
  The current drawing surface.

Protected Member Functions inherited from Fl_Paged_Device

• Fl_Paged_Device ()
  The constructor.

Protected Member Functions inherited from Fl_Widget_Surface

• Fl_Widget_Surface (Fl_Graphics_Driver ∗d)
  The constructor.
Protected Member Functions inherited from Fl_Surface_Device

- void driver (Fl_Graphics_Driver *graphics_driver)
  
  Sets the graphics driver of this drawing surface.

- virtual void end_current ()
  
  FLTK calls this each time a surface ceases to be the current drawing surface.

- Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)
  
  Constructor that sets the graphics driver to use for the created surface.

Protected Attributes inherited from Fl_Widget_Surface

- int x_offset
  
  horizontal offset to the origin of graphics coordinates

- int y_offset
  
  vertical offset to the origin of graphics coordinates

12.106.1 Detailed Description

OS-independent print support.

Fl_Printer allows to use all drawing, color, text, image, and clip FLTK functions, and to have them operate on printed page(s). There are two main, non exclusive, ways to use it.

- Print any widget (standard, custom, Fl_Window, Fl_Gl_Window) as it appears on screen, with optional translation, scaling and rotation. This is done by calling print_widget(), print_window() or print_window_part().

- Use a series of FLTK graphics commands (e.g., font, text, lines, colors, clip, image) to compose a page appropriately shaped for printing.

In both cases, begin by begin_job(), begin_page(), printable_rect() and origin() calls and finish by end_page() and end_job() calls.

Example of use: print a widget centered in a page

```c
#include <FL/Fl_Printer.H>
#include <FL/fl_draw.H>

int width, height;
Fl_Widget *widget = ... // a widget we want printed
Fl_Printer *printer = new Fl_Printer();
if (printer->begin_job(1) == 0) {
    printer->begin_page();
    printer->printable_rect(&width, &height);
    fl_color(FL_BLACK);
    fl_line_style(FL_SOLID, 2);
    fl_rect(0, 0, width, height);
    fl_font(FL_COURIER, 12);
    time_t now; time(&now); fl_draw(ctime(&now), 0, fl_height());
    printer->origin(width/2, height/2);
    printer->print_widget(widget, -widget->w()/2, -widget->h()/2);
    printer->end_page();
    printer->end_job();
}
delete printer;
```

Recommended method to refresh GUI while printing:

```c
printer->begin_job(0);

......
Fl_Surface_Device::push_current(Fl_Display_Device::display_device());
Fl::check(); // or any operation that draws to display
Fl_Surface_Device::pop_current();

......
printer->end_job();
```

Platform specifics

- X11 and Wayland platforms:
  - FLTK expresses all graphics data using (Level 2) PostScript and sends that to the selected printer. See class Fl_PostScript_File_Device for a description of how text and transparent images appear in print.
  - If the GTK library is available at run-time, class Fl_Printer runs GTK’s printer dialog which allows to set printer, paper size and orientation.
– Under the KDE desktop, Fl_Printer runs the kdialog command to create KDE-styled file dialogs if that command is available at run-time, unless FLTK was built with CMake and option OPTION_USE_KDIALOG turned off. In that case, Fl_Printer attempts to run the GTK dialog.

– If the GTK library is not available, or if Fl::option(Fl::OPTION_PRINTER_USES_GTK) has been turned off, class Fl_Printer runs FLTK’s print dialog.

• Unless it has been previously changed, the default paper size is A4. To change that, press the "Properties" button of the "Print" dialog window opened by an Fl_Printer::begin_job() call. This opens a "Printer Properties" window where it’s possible to select the adequate paper size. Finally press the "Save" button therein to assign the chosen paper size to the chosen printer for this and all further print operations.

• Use the static public attributes of this class to set the print dialog to other languages than English. For example, the “Printer:” dialog item Fl_Printer::dialog_printer can be set to French with:
  Fl_Printer::dialog_printer = "Imprimante:"

  before creation of the Fl_Printer object.

• Use Fl_PostScript_File_Device::file_chooser_title to customize the title of the file chooser dialog that opens when using the "Print To File" option of the print dialog.

• Windows platform: Transparent Fl_RGB_Images don’t print with exact transparency on most printers (a workaround is to use print_window_part()). Fl_RGB_Images don’t rotate() well.

• Mac OS X platform: all graphics requests print as on display and accept rotation and scaling.

12.106.2 Member Function Documentation

12.106.2.1 begin_job()

```cpp
int Fl_Printer::begin_job ( 
    int pagecount = 0, 
    int * frompage = NULL, 
    int * topage = NULL, 
    char ** perr_message = NULL ) [virtual]
```

Begins a print job.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pagecount</td>
<td>the total number of pages of the job (or 0 if you don’t know the number of pages)</td>
</tr>
<tr>
<td>frompage</td>
<td>if non-null, +frompage is set to the first page the user wants printed</td>
</tr>
<tr>
<td>topage</td>
<td>if non-null, +topage is set to the last page the user wants printed</td>
</tr>
<tr>
<td>perr_message</td>
<td>if non-null and if the returned value is 2, +perr_message is set to a string describing the error. That string can be delete[]d after use.</td>
</tr>
</tbody>
</table>

Returns

0 if OK, 1 if user cancelled the job, 2 if any error.

Reimplemented from Fl_Paged_Device.

12.106.2.2 begin_page()

```cpp
int Fl_Printer::begin_page ( 
    void ) [virtual]
```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area. This function also makes this surface the current drawing surface with Fl_Surface_Device::push_current().
begin_page() calls Fl_Surface_Device::push_current() and leaves this device as the active surface. If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current(), or the content of the dialog box will be rendered to the printer instead of the screen.

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Paged_Device.

12.106.2.3 end_job()

void Fl_Printer::end_job (
    void ) [virtual]

To be called at the end of a print job.
Reimplemented from Fl_Paged_Device.

12.106.2.4 end_page()

int Fl_Printer::end_page (
    void ) [virtual]

To be called at the end of each page.
This function also stops this surface from being the current drawing surface with Fl_Surface_Device::pop_current().

Note

end_page() calls Fl_Surface_Device::pop_current(). If any calls between begin_page() and end_page() open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to Fl_Surface_Device::pop_current() and a call to Fl_Surface_Device::push_current().

Returns

0 if OK, non-zero if any error.

Reimplemented from Fl_Paged_Device.

12.106.2.5 is_current()

bool Fl_Printer::is_current ( ) [virtual]

Is this surface the current drawing surface?
Reimplemented from Fl_Surface_Device.

12.106.2.6 margins()

void Fl_Printer::margins (  
    int * left,    
    int * top,    
    int * right,  
    int * bottom ) [virtual]

Computes the dimensions of margins that lie between the printable page area and the full page. Values are in the same unit as that used by FLTK drawing functions. They are changed by scale() calls.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>left</td>
<td>If non-null, *left is set to the left margin size.</td>
</tr>
<tr>
<td>top</td>
<td>If non-null, *top is set to the top margin size.</td>
</tr>
<tr>
<td>right</td>
<td>If non-null, *right is set to the right margin size.</td>
</tr>
<tr>
<td>bottom</td>
<td>If non-null, *bottom is set to the bottom margin size.</td>
</tr>
</tbody>
</table>
origin() [1/2]

```cpp
void Fl_Printer::origin (  
    int * x,  
    int * y ) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**
- `out x,y` If non-null, `*x` and `*y` are set to the horizontal and vertical coordinates of the graphics origin.

origin() [2/2]

```cpp
void Fl_Printer::origin (  
    int x,  
    int y ) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive `origin()` calls don't combine their effects. `Origin()` calls are not affected by `rotate()` calls (for classes derived from `Fl_Paged_Device`).

**Parameters**
- `in x,y` Horizontal and vertical positions in the drawing surface of the desired origin of graphics.

printable_rect()

```cpp
int Fl_Printer::printable_rect (  
    int * w,  
    int * h ) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to `origin()`. If the object is derived from class `Fl_Paged_Device`, values account for the user-selected paper type and print orientation and are changed by `scale()` calls.

**Returns**
- 0 if OK, non-zero if any error

rotate()

```cpp
void Fl_Printer::rotate (  
    float angle ) [virtual]
```

Rotates the graphics operations relatively to paper.

The rotation is centered on the current graphics origin. Successive `rotate()` calls don't combine their effects.

**Parameters**
- `angle` Rotation angle in counter-clockwise degrees.
The documentation for this class was generated from the following files:

Reimplemented from `Fl_Paged_Device`.

### 12.106.2.11 scale()

```cpp
void Fl_Printer::scale ( 
    float scale_x, 
    float scale_y = 0. ) [virtual]
```

Changes the scaling of page coordinates. This function also resets the origin of graphics functions at top left of printable page area. After a `scale()` call, do a `printable_rect()` call to get the new dimensions of the printable page area. Successive `scale()` calls don’t combine their effects.

#### Parameters

| scale← _x | Horizontal dimensions of plot are multiplied by this quantity. |
| scale← _y | Same as above, vertically. The value 0. is equivalent to setting scale_y = scale_x. Thus, scale(factor); is equivalent to scale(factor, factor); |

Reimplemented from `Fl_Paged_Device`.

### 12.106.2.12 set_current()

```cpp
void Fl_Printer::set_current ( 
    void ) [virtual]
```

Make this surface the current drawing surface. This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is `Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current()`.

#### Note

It’s recommended to use this function only as follows:

- The current drawing surface is the display;
- make current another surface, e.g., an `Fl_Printer` or an `Fl_Image_Surface` object, calling `set_current()` on this object;
- draw to that surface;
- make the display current again with `Fl_Display_Device::display_device()->set_current();`. Don’t do any other call to `set_current()` before this one.

Other scenarios of drawing surface changes should be performed via `Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current()`.

Reimplemented from `Fl_Surface_Device`.

### 12.106.2.13 translate()

```cpp
void Fl_Printer::translate ( 
    int x, 
    int y ) [virtual]
```

Translates the current graphics origin accounting for the current rotation. Each `translate()` call must be matched by an `untranslate()` call. Successive `translate()` calls add up their effects.

Reimplemented from `Fl_Widget_Surface`.

### 12.106.2.14 untranslate()

```cpp
void Fl_Printer::untranslate ( 
    void ) [virtual]
```

Undoes the effect of a previous `translate()` call.

Reimplemented from `Fl_Widget_Surface`.

The documentation for this class was generated from the following files:
Fl_Progress Class Reference

Displays a progress bar for the user.

```c
#include <Fl_Progress.H>
```

Inheritance diagram for Fl_Progress:

```
Fl_Widget

| Fl_Progress
```

Public Member Functions

- **Fl_Progress** (int x, int y, int w, int h, const char *l=0)
  
  The constructor creates the progress bar using the position, size, and label.

- float maximum () const
  
  Gets the maximum value in the progress widget.

- void maximum (float v)
  
  Sets the maximum value in the progress widget.

- float minimum () const
  
  Gets the minimum value in the progress widget.

- void minimum (float v)
  
  Sets the minimum value in the progress widget.

- float value () const
  
  Gets the current value in the progress widget.

- void value (float v)
  
  Sets the current value in the progress widget.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  
  Activates the widget.

- unsigned int active () const
  
  Returns whether the widget is active.

- int active_r () const
  
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  
  Gets the label alignment.

- void align (Fl_Align alignment)
  
  Sets the label alignment.

- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window * as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const
• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window () const
• void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• `Fl_Color color2 () const`
  For back compatibility only.
• `void color2 (unsigned a)`
  For back compatibility only.
• `int contains (const Fl_Widget *w) const`
  Checks if `w` is a child of this widget.
• `void copy_label (const char *new_label)`
  Sets the current label.
• `void copy_tooltip (const char *text)`
  Sets the current tooltip text.
• `uchar damage () const`
  Returns non-zero if `draw()` needs to be called.
• `void damage (uchar c)`
  Sets the damage bits for the widget.
• `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.
• `int damage_resize (int, int, int, int)`
  Internal use only.
• `void deactivate ()`
  Deactivates the widget.
• `Fl_Image *deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.
• `const Fl_Image *deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.
• `void deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.
• `void deimage (Fl_Image *img)`
• `int deimage_bound () const`
  Returns whether the inactive image is managed by the widget.
• `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.
• `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
• `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
• `void draw_label (int, int, int, int, Fl_Align) const`
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• `int h () const`
  Gets the widget height.
• `virtual int handle (int event)`
  Handles the specified event.
• `virtual void hide ()`
  Makes a widget invisible.
• `Fl_Image *image ()`
  Gets the image that is used as part of the widget label when in the active state.
• `const Fl_Image *image () const`
  Gets the image that is used as part of the widget label when in the active state.
• `void image (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the active state.
• `void image (Fl_Image *img)`
Sets the image to use as part of the widget label when in the active state.

- `int image_bound() const`
  Returns whether the image is managed by the widget.

- `int inside(const Fl_Widget *wgt) const`
  Checks if this widget is a child of `wgt`.

- `int is_label_copied() const`
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label() const`
  Gets the current label text.

- `void label(const char *text)`
  Sets the current label pointer.

- `void label(Fl_Labeltype a, const char *b)`
  Shortcut to set the label text and type in one call.

- `FL_Color labelcolor() const`
  Gets the label color.

- `void labelcolor(FL_Color c)`
  Sets the label color.

- `FL_Font labelfont() const`
  Gets the font to use.

- `void labelfont(FL_Font f)`
  Sets the font to use.

- `FL_Fontsize labelsize() const`
  Gets the font size in pixels.

- `void labelsize(FL_Fontsize pix)`
  Sets the font size in pixels.

- `FL_Labeltype labeltype() const`
  Gets the label type.

- `void labeltype(FL_Labeltype a)`
  Sets the label type.

- `void measure_label(int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard() const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard(bool needs)`
  Sets whether this widget needs a keyboard.

- `unsigned int output() const`
  Returns if a widget is used for output only.

- `FL_Group *parent() const`
  Returns a pointer to the parent widget.

- `void parent(FL_Group *p)`
  Internal use only - “for hacks only”.

- `void position(int X, int Y)`
  Repositions the window or widget.

- `void redraw()`
  Schedules the drawing of the widget.

- `void redraw_label()`
  Schedules the drawing of the label.

- `virtual void resize(int x, int y, int w, int h)`
  Changes the size or position of the widget.

- `FL_Color selection_color() const`
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char∗ text)
  Sets the current tooltip text.
• Fl_Window∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (FI_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
Modifies keyboard focus navigation.

- int `visible_r` () const
  Returns whether a widget and all its parents are visible.

- int `w` () const
  Gets the widget width.

- `FL_When` `when` () const
  Returns the conditions under which the callback is called.

- void `when` (uchar i)
  Sets the flags used to decide when a callback is called.

- `Fl_Window` ∗ `window` () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int `x` () const
  Gets the widget position in its window.

- int `y` () const
  Gets the widget position in its window.

- virtual `~Fl_Widget` ()
  Destroys the widget.

Protected Member Functions

- void `draw` () `FL_OVERRIDE`
  Draws the progress bar.

Protected Member Functions inherited from `Fl_Widget`

- void `clear_flag` (unsigned int c)
  Clears a flag in the flags mask.

- void `draw_backdrop` () const
  If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.

- void `draw_box` () const
  Draws the widget box according its box style.

- void `draw_box` (`Fl_Boxtype` t, `Fl_Color` c) const
  Draws a box of type t, of color c at the widget's position and size.

- void `draw_box` (`Fl_Boxtype` t, int x, int y, int w, int h, `Fl_Color` c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void `draw_focus` () const
  Draws a focus rectangle around the widget.

- void `draw_focus` (`Fl_Boxtype` t, int x, int y, int w, int h, `Fl_Color` bg) const
  Draws a focus box for the widget at the given position and size.

- void `draw_label` () const
  Draws the widget's label at the defined label position.

- void `draw_label` (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- `Fl_Widget` (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

- unsigned int `flags` () const
  Gets the widget flags mask.

- void `h` (int v)
  Internal use only.

- void `set_flag` (unsigned int c)
Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the ’&x’ shortcut in a given text.
• static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered ’&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,

12.107.1 Detailed Description

Displays a progress bar for the user.

12.107.2 Constructor & Destructor Documentation

12.107.2.1 Fl_Progress()

Fl_Progress::Fl_Progress ( 
  int X,
  int Y,
  int W,
  int H,
  const char * L = 0 )

The constructor creates the progress bar using the position, size, and label.
You can set the background color with color() and the progress bar color with selection_color(), or you can set both colors together with color(unsigned bg, unsigned sel).
The default colors are FL_BACKGROUND2_COLOR and FL_YELLOW, resp.
12.107.3 Member Function Documentation

12.107.3.1 draw()

```c
void Fl_Progress::draw {
    void ) [protected], [virtual]
```

Draws the progress bar.
Implements Fl_Widget.

12.107.3.2 maximum() [1/2]

```c
float Fl_Progress::maximum ( ) const [inline]
```

Gets the maximum value in the progress widget.

12.107.3.3 maximum() [2/2]

```c
void Fl_Progress::maximum ( float v ) [inline]
```

Sets the maximum value in the progress widget.

12.107.3.4 minimum() [1/2]

```c
float Fl_Progress::minimum ( ) const [inline]
```

Gets the minimum value in the progress widget.

12.107.3.5 minimum() [2/2]

```c
void Fl_Progress::minimum ( float v ) [inline]
```

Sets the minimum value in the progress widget.

12.107.3.6 value() [1/2]

```c
float Fl_Progress::value ( ) const [inline]
```

Gets the current value in the progress widget.

12.107.3.7 value() [2/2]

```c
void Fl_Progress::value ( float v ) [inline]
```

Sets the current value in the progress widget.

The documentation for this class was generated from the following files:

- Fl_Progress.H
- Fl_Progress.hxx
12.108 Fl_Radio_Button Class Reference

Inheritance diagram for Fl_Radio_Button:

```

Public Member Functions

- **Fl_Radio_Button** (int X, int Y, int W, int H, const char *L=0)
  
  The constructor creates the button using the given position, size, and label.

Public Member Functions inherited from Fl_Button

- int **clear** ()
  
  Same as value(0).
- uchar **compact** ()
  
  Return true if buttons are rendered as compact buttons.
- void **compact** (uchar v)
  
  Decide if buttons should be rendered in compact mode.
- Fl_Boxtype **down_box** () const
  
  Returns the current down box type, which is drawn when value() is non-zero.
- void **down_box** (Fl_Boxtype b)
  
  Sets the down box type.
- Fl_Color **down_color** () const
  
  (for backwards compatibility)
- void **down_color** (unsigned c)
  
  (for backwards compatibility)
- **Fl_Button** (int X, int Y, int W, int H, const char *L=0)
  
  The constructor creates the button using the given position, size, and label.
- int **handle** (int) FL_OVERRIDE
  
  Handles the specified event.
- int **set** ()
  
  Same as value(1).
- void **setonly** ()
  
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).
- int **shortcut** () const
  
  Returns the current shortcut key for the button.
- void **shortcut** (const char *s)
  
  (for backwards compatibility)
- void **shortcut** (int s)
  
  Sets the shortcut key to s.
- char **value** () const
  
  Returns the current value of the button (0 or 1).
- int **value** (int v)
  
  Sets the current value of the button.
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- FI_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const FI_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (FI_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (FI_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- unsigned int `output () const`
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- void `parent (Fl_Group *p)`
  Internal use only - "for hacks only".

- void `position (int X, int Y)`
  Repositions the window or widget.

- void `redraw ()`
  Schedules the drawing of the widget.

- void `redraw_label ()`
  Schedules the drawing of the label.

- virtual void `resize (int x, int y, int w, int h)`
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  Gets the selection color.

- void `selection_color (Fl_Color a)`
  Sets the selection color.

- void `set_active ()`
  Marks the widget as active without sending events or changing focus.

- void `set_changed ()`
  Marks the value of the widget as changed.

- void `set_output ()`
  Sets a widget to output only.

- void `set_visible ()`
  Makes the widget visible.

- void `set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- int `shortcut_label () const`
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void `shortcut_label (int value)`
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void `show ()`
  Makes a widget visible.

- void `size (int W, int H)`
  Changes the size of the widget.

- int `take_focus ()`
  Gives the widget the keyboard focus.

- unsigned int `takesevents () const`
  Returns if the widget is able to take events.

- int `test_shortcut ()`
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char * `tooltip () const`
  Gets the current tooltip text.

- void `tooltip (const char *text)`
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  
  Gets the widget type.

• void type (uchar t)
  
  Sets the widget type.

• int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  
  Sets the user data for this widget.

• void user_data (void *v)
  
  Sets the user data for this widget.

• unsigned int visible () const
  
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  
  Modifies keyboard focus navigation.

• int visible_r () const
  
  Returns whether a widget and all its parents are visible.

• int w () const
  
  Gets the widget width.

• Fl_When when () const
  
  Returns the conditions under which the callback is called.

• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don’t set a callback.

• static unsigned int labelShortcut (const char *t)
  
  Returns the Unicode value of the \'&x\' shortcut in a given text.

• static int testShortcut (const char *, const bool require_alt=false)
  
  Returns true if the given text contains the entered \'&x\' shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7
  , OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11
  , MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15
  , GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
    = 1<<19, NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
flags possible values enumeration.

Protected Member Functions inherited from Fl/Button

- void draw () FL_OVERRIDE
  Draws the widget.

- void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const
  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

12.108.1 Constructor & Destructor Documentation

12.108.1.1 Fl_Radio_Button()

Fl_Radio_Button::Fl_Radio_Button (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char * L = 0)

The constructor creates the button using the given position, size, and label.  
The Button type() is set to FL_RADIO_BUTTON.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X,Y,W,H</td>
</tr>
<tr>
<td>in</td>
<td>L</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:
• Fl_Radio_Button.H
• Fl_Button.cxx

12.109 Fl_Radio_Light_Button Class Reference

Public Member Functions

• Fl_Radio_Light_Button (int X, int Y, int W, int H, const char *=l=0)
Public Member Functions inherited from Fl_Light_Button

• Fl_Light_Button (int x, int y, int w, int h, const char ∗l=0)
  Creates a new Fl_Light_Button widget using the given position, size, and label string.
• int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Button

• int clear ()
  Same as value(0).
• uchar compact ()
  Return true if buttons are rendered as compact buttons.
• void compact (uchar v)
  Decide if buttons should be rendered in compact mode.
• Fl_Boxtype down_box () const
  Returns the current down box type, which is drawn when value() is non-zero.
• void down_box (Fl_Boxtype b)
  Sets the down box type.
• Fl_Color down_color () const
  (for backwards compatibility)
• void down_color (unsigned c)
  (for backwards compatibility)
• Fl_Button (int X, int Y , int W, int H, const char ∗L=0)
  The constructor creates the button using the given position, size, and label.
• int set ()
  Same as value(1).
• void setonly ()
  Turns on this button and turns off all other radio buttons in the group. (calling value(1) or set() does not do this).
• int shortcut () const
  Returns the current shortcut key for the button.
• void shortcut (const char ∗s)
  (for backwards compatibility)
• void shortcut (int s)
  Sets the shortcut key to s.
• char value () const
  Returns the current value of the button (0 or 1).
• int value (int v)
  Sets the current value of the button.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void **align**(Fl_Align alignment)
  
  Sets the label alignment.

• long **argument** () const
  
  Gets the current user data (long) argument that is passed to the callback function.

• void **argument**(long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window ∗ **as_gl_window** ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const ∗ **as_gl_window** () const

• virtual Fl_Group ∗ **as_group** ()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const ∗ **as_group** () const

• virtual Fl_Window ∗ **as_window** ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const ∗ **as_window** () const

• void **bind_deimage**(Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• void **bind_deimage**(int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void **bind_image**(Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the active state.

• void **bind_image**(int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype **box** () const
  
  Gets the box type of the widget.

• void **box**(Fl_Boxtype new_box)
  
  Sets the box type for the widget.

• Fl_Callback_p **callback** () const
  
  Gets the current callback function for the widget.

• void **callback**(Fl_Callback ∗ cb)
  
  Sets the current callback function for the widget.

• void **callback**(Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.

• void **callback**(Fl_Callback ∗ cb, void ∗ p)
  
  Sets the current callback function and data for the widget.

• void **callback**(Fl_Callback0 ∗ cb)
  
  Sets the current callback function for the widget.

• void **callback**(Fl_Callback1 ∗ cb, long p=0)
  
  Sets the current callback function for the widget.

• unsigned int **changed** () const
  
  Checks if the widget value changed since the last callback.

• void **clear_active** ()
  
  Marks the widget as inactive without sending events or changing focus.

• void **clear_changed** ()
  
  Marks the value of the widget as unchanged.

• void **clear_damage**(uchar c=0)
  
  Clears or sets the damage flags.

• void **clear_output** ()
  
  Sets a widget to accept input.

• void **clear_visible** ()
  
  Hides the widget.
• void clear_visible_focus ()
  *Disables keyboard focus navigation with this widget.*

• Fl_Color color () const
  *Gets the background color of the widget.*

• void color (Fl_Color bg)
  *Sets the background color of the widget.*

• void color (Fl_Color bg, Fl_Color sel)
  *Sets the background and selection color of the widget.*

• Fl_Color color2 () const
  *For back compatibility only.*

• void color2 (unsigned a)
  *For back compatibility only.*

• int contains (const Fl_Widget ∗w) const
  *Checks if w is a child of this widget.*

• void copy_label (const char ∗new_label)
  *Sets the current label.*

• void copy_tooltip (const char ∗text)
  *Sets the current tooltip text.*

• uchar damage () const
  *Returns non-zero if draw() needs to be called.*

• void damage (uchar c)
  *Sets the damage bits for the widget.*

• void damage (uchar c, int x, int y, int w, int h)
  *Sets the damage bits for an area inside the widget.*

• int damage_resize (int, int, int, int)
  *Internal use only.*

• void deactivate ()
  *Deactivates the widget.*

• Fl_Image ∗deimage ()
  *Gets the image that is used as part of the widget label when in the inactive state.*

• const Fl_Image ∗deimage () const
  *Gets the image that is used as part of the widget label when in the inactive state.*

• void deimage (Fl_Image &img)
  *Sets the image to use as part of the widget label when in the inactive state.*

• void deimage (Fl_Image ∗img)
  *Sets the image to use as part of the widget label when in the inactive state.*

• int deimage_bound () const
  *Returns whether the inactive image is managed by the widget.*

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  *Calls the widget callback function with default arguments.*

• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  *Calls the widget callback function with arbitrary arguments.*

• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  *Calls the widget callback function with arbitrary arguments.*

• void draw_label (int, int, int, int, Fl_Align) const
  *Draws the label in an arbitrary bounding box with an arbitrary alignment.*

• int h () const
  *Gets the widget height.*

• virtual void hide ()
  *Makes a widget invisible.*

• Fl Image ∗image ()
Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image** ∗ image () const
  
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image ∗img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget ∗wgt) const**
  
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  
  Returns whether the current label was assigned with copy_label().

- **const char ∗ label () const**
  
  Gets the current label text.

- **void label (const char ∗text)**
  
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char ∗b)**
  
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  
  Sets the label color.

- **Fl_Font labelfont () const**
  
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width ww and height hh accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group ∗ parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group ∗p)**
  
  Internal use only - “for hacks only”.

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.
• void **redraw_label** ()
  Schedules the drawing of the label.
• virtual void **resize** (int x, int y, int w, int h)
  Changes the size or position of the widget.
• **Fl_Color selection_color** () const
  Gets the selection color.
• void **selection_color** (Fl_Color a)
  Sets the selection color.
• void **set_active** ()
  Marks the widget as active without sending events or changing focus.
• void **set_changed** ()
  Marks the value of the widget as changed.
• void **set_output** ()
  Sets a widget to output only.
• void **set_visible** ()
  Makes the widget visible.
• void **set_visible_focus** ()
  Enables keyboard focus navigation with this widget.
• int **shortcut_label** () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void **shortcut_label** (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void **show** ()
  Makes a widget visible.
• void **size** (int W, int H)
  Changes the size of the widget.
• int **take_focus** ()
  Gives the widget the keyboard focus.
• unsigned int **takesevents** () const
  Returns if the widget is able to take events.
• int **test_shortcut** ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char ∗ **tooltip** () const
  Gets the current tooltip text.
• void **tooltip** (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ **top_window** () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar **type** () const
  Gets the widget type.
• void **type** (uchar t)
  Sets the widget type.
• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ **user_data** () const
  Gets the user data for this widget.
• void **user_data** (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void **user_data** (void ∗v)
Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  Modifies keyboard focus navigation.

- int visible_r () const
  Returns whether a widget and all its parents are visible.

- int w () const
  Gets the widget width.

- Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x () const
  Gets the widget position in its window.

- int y () const
  Gets the widget position in its window.

- virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum
  
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,

  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31

  flags possible values enumeration.
Protected Member Functions inherited from \texttt{Fl\_Light\_Button}

- \texttt{void draw () FL\_OVERRIDE}
  
  Draws the widget.

Protected Member Functions inherited from \texttt{Fl\_Button}

- \texttt{void simulate\_key\_action ()}

Protected Member Functions inherited from \texttt{Fl\_Widget}

- \texttt{void clear\_flag (unsigned int c)}
  
  Clears a flag in the flags mask.
- \texttt{void draw\_backdrop () const}
  
  If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.
- \texttt{void draw\_box () const}
  
  Draws the widget box according its box style.
- \texttt{void draw\_box (Fl\_Boxtype t, Fl\_Color c) const}
  
  Draws a box of type \texttt{t}, of color \texttt{c} at the widget's position and size.
- \texttt{void draw\_box (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color c) const}
  
  Draws a box of type \texttt{t}, of color \texttt{c} at the position \texttt{X,Y} and size \texttt{W,H}.
- \texttt{void draw\_focus () const}
  
  Draws a focus rectangle around the widget.
- \texttt{void draw\_focus (Fl\_Boxtype t, int X, int Y, int W, int H) const}
  
  Draws a focus rectangle around the widget.
- \texttt{void draw\_focus (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color bg) const}
  
  Draws a focus box for the widget at the given position and size.
- \texttt{void draw\_label () const}
  
  Draws the widget's label at the defined label position.
- \texttt{void draw\_label (int, int, int, int) const}
  
  Draws the label in an arbitrary bounding box.
- \texttt{Fl\_Widget (int x, int y, int w, int h, const char \texttt{+label} = 0L)}
  
  Creates a widget at the given position and size.
- \texttt{unsigned int flags () const}
  
  Gets the widget flags mask.
- \texttt{void h (int v)}
  
  \textit{Internal use only.}
- \texttt{void set\_flag (unsigned int c)}
  
  Sets a flag in the flags mask.
- \texttt{void w (int v)}
  
  \textit{Internal use only.}
- \texttt{void x (int v)}
  
  \textit{Internal use only.}
- \texttt{void y (int v)}
  
  \textit{Internal use only.}

- \texttt{static void key\_release\_timeout (void *)}
Static Protected Attributes inherited from Fl_Button

- static Fl_Widget_Tracker * key_release_tracker = 0

The documentation for this class was generated from the following files:

- Fl_Radio_Light_Button.H
- Fl_Light_Button.cxx

12.110 Fl_Radio_Round_Button Class Reference

Inheritance diagram for Fl_Radio_Round_Button:

```
Fl_Widget
   Fl_Button
      Fl_Light_Button
         Fl_Round_Button
            Fl_Radio_Round_Button
```

Public Member Functions

- Fl_Radio_Round_Button (int X, int Y, int W, int H, const char *L=0)
  "Creates a new Fl_Radio_Button widget using the given position, size, and label string."

Public Member Functions inherited from Fl_Round_Button

- Fl_Round_Button (int x, int y, int w, int h, const char *l=0)
  "Creates a new Fl_Round_Button widget using the given position, size, and label string."

Public Member Functions inherited from Fl_Light_Button

- Fl_Light_Button (int x, int y, int w, int h, const char *l=0)
  "Creates a new Fl_Light_Button widget using the given position, size, and label string."

- int handle (int) FL_OVERRIDE
  "Handles the specified event."

Public Member Functions inherited from Fl_Button

- int clear ()
  "Same as value(0)."

- uchar compact ()
  "Return true if buttons are rendered as compact buttons."

- void compact (uchar v)
  "Decide if buttons should be rendered in compact mode."

- Fl_Boxtype down_box () const
  "Returns the current down box type, which is drawn when value() is non-zero."

- void down_box (Fl_Boxtype b)
  "Sets the down box type."
• **FL_Color** `down_color()` const
  (for backwards compatibility)

• void `down_color`(unsigned c)
  (for backwards compatibility)

• **Fl_Button**(int X, int Y, int W, int H, const char ∗L=0)
  
  The constructor creates the button using the given position, size, and label.

• int `set()`
  
  Same as `value(1)`.

• void `setonly()`
  
  Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).

• int `shortcut()` const
  
  Returns the current shortcut key for the button.

• void `shortcut`(const char ∗s)
  
  (for backwards compatibility)

• void `shortcut`(int s)
  
  Sets the shortcut key to s.

• char `value()` const
  
  Returns the current value of the button (0 or 1).

• int `value`(int v)
  
  Sets the current value of the button.

### Public Member Functions inherited from **Fl_Widget**

• void `_clear_fullscreen()`

• void `_set_fullscreen()`

• void `activate()`
  
  Activates the widget.

• unsigned int `active()` const
  
  Returns whether the widget is active.

• int `active_r()` const
  
  Returns whether the widget and all of its parents are active.

• **Fl_Align** `align()` const
  
  Gets the label alignment.

• void `align`(Fl_Align alignment)
  
  Sets the label alignment.

• long `argument()` const
  
  Gets the current user data (long) argument that is passed to the callback function.

• void `argument`(long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window ∗ `as_gl_window()`
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const ∗ `as_gl_window()` const

• virtual Fl_Group ∗ `as_group()`
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const ∗ `as_group()` const

• virtual Fl_Window ∗ `as_window()`
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const ∗ `as_window()` const

• void `bind_deimage`(Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• void `bind_deimage`(int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void** **bind_image (Fl_Image ∗img)**  
  Sets the image to use as part of the widget label when in the active state.

- **void** **bind_image (int f)**  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**  
  Gets the box type of the widget.

- **void** **box (Fl_Boxtype new_box)**  
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**  
  Gets the current callback function for the widget.

- **void** **callback (Fl_Callback ∗cb)**  
  Sets the current callback function for the widget.

- **void** **callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)**  
  Sets the current callback function and managed user data for the widget.

- **void** **callback (Fl_Callback ∗cb, void ∗p)**  
  Sets the current callback function and data for the widget.

- **void** **callback (Fl_Callback0 ∗cb)**  
  Sets the current callback function for the widget.

- **void** **callback (Fl_Callback1 ∗cb, long p=0)**  
  Sets the current callback function for the widget.

- **unsigned int changed () const**  
  Checks if the widget value changed since the last callback.

- **void** **clear_active ()**  
  Marks the widget as inactive without sending events or changing focus.

- **void** **clear_changed ()**  
  Marks the value of the widget as unchanged.

- **void** **clear_damage (uchar c=0)**  
  Clears or sets the damage flags.

- **void** **clear_output ()**  
  Sets a widget to accept input.

- **void** **clear_visible ()**  
  Hides the widget.

- **void** **clear_visible_focus ()**  
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**  
  Gets the background color of the widget.

- **void** **color (Fl_Color bg)**  
  Sets the background color of the widget.

- **void** **color (Fl_Color bg, Fl_Color sel)**  
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**  
  For back compatibility only.

- **void** **color2 (unsigned a)**  
  For back compatibility only.

- **int** **contains (const Fl_Widget ∗w) const**  
  Checks if w is a child of this widget.

- **void** **copy_label (const char ∗new_label)**  
  Sets the current label.

- **void** **copy_tooltip (const char ∗text)**  
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image ∗ deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗ widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗ widget, void ∗ arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗ image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗ image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗ wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗ label () const
  Gets the current label text.
• void label (const char ∗ text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗ b)
Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  
  Gets the label color.

- `void labelcolor (Fl_Color c)`
  
  Sets the label color.

- `Fl_Font labelfont () const`
  
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  
  Sets the font to use.

- `Fl_Fontsize labelsizelabelsize () const`
  
  Gets the font size in pixels.

- `void labelsizelabelsize (Fl_Fontsize pix)`
  
  Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  
  Sets width ww and height hh accordingly with the label size.

- `bool needs_keyboard () const`
  
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  
  Returns if a widget is used for output only.

- `Fl_Group *parent () const`
  
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  
  Repositions the window or widget.

- `void redraw ()`
  
  Schedules the drawing of the widget.

- `void redraw_label ()`
  
  Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  
  Sets the selection color.

- `void set_active ()`
  
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  
  Marks the value of the widget as changed.

- `void set_output ()`
  
  Sets a widget to output only.

- `void set_visible ()`
  
  Makes the widget visible.

- `void set_visible_focus ()`
  
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses ' &' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses ' &' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered ' &x' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
Gets the widget position in its window.

- int y () const

  Gets the widget position in its window.

- virtual ~Fl_Widget ()

  Destroys the widget.

### Additional Inherited Members

#### Static Public Member Functions Inherited from `Fl_Widget`

- static void default_callback (Fl_Widget *widget, void *data)

  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char *t)

  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char *, const bool require_alt=false)

  Returns true if the given text t contains the entered '&x' shortcut.

#### Protected Types Inherited from `Fl_Widget`

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP.Relative = 1<<16, COPIED.TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.

#### Protected Member Functions Inherited from `Fl_Light_Button`

- void draw () FL_OVERRIDE

  Draws the widget.

#### Protected Member Functions Inherited from `Fl_Button`

- void simulate_key_action ()

#### Protected Member Functions Inherited from `Fl_Widget`

- void clear_flag (unsigned int c)

  Clears a flag in the flags mask.

- void draw_backdrop () const

  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const

  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const

  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const

  Draws a box of type t, of color c at the position X,Y and size W,H.
• void **draw_focus** () const
  Draws a focus rectangle around the widget.
• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void **draw_label** () const
  Draws the widget's label at the defined label position.
• void **draw_label** (int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char * = "0")
  Creates a widget at the given position and size.
• unsigned int **flags** () const
  Gets the widget flags mask.
• void **h** (int v)
  Internal use only.
• void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.
• void **w** (int v)
  Internal use only.
• void **x** (int v)
  Internal use only.
• void **y** (int v)
  Internal use only.

Static Protected Member Functions inherited from Fl_Button

• static void **key_release_timeout** (void *)

Static Protected Attributes inherited from Fl_Button

• static Fl_Widget_Tracker * **key_release_tracker** = 0

12.110.1 Constructor & Destructor Documentation

12.110.1.1 Fl_Radio_Round_Button()

Fl_Radio_Round_Button::Fl_Radio_Round_Button (int X, int Y, int W, int H, const char * = "0")
Creates a new Fl_Radio_Button widget using the given position, size, and label string.
The button type() is set to FL_RADIO_BUTTON.

Parameters

| in | X, Y, W, H | position and size of the widget |
| in | L | widget label, default is no label |

The documentation for this class was generated from the following files:

• Fl_Radio_Round_Button.H
• Fl_Round_Button.cxx
12.111 Fl_Rect Class Reference

Rectangle with standard FLTK coordinates (X, Y, W, H).

```cpp
#include <Fl_Rect.H>
```

Public Member Functions

- **int b () const**
  gets the bottom edge (y + h).
- **void b (int B)**
  sets the height based on B and y
- **Fl_Rect ()**
  The default constructor creates an empty rectangle (x = y = w = h = 0).
- **Fl_Rect (const Fl_Widget &widget)**
  This constructor creates a rectangle based on a widget's position and size.
- **Fl_Rect (const Fl_Widget &const widget)**
  This constructor creates a rectangle based on a widget's position and size.
- **Fl_Rect (int W, int H)**
  This constructor creates a rectangle with x = y = 0 and the given width and height.
- **Fl_Rect (int X, int Y, int W, int H)**
  This constructor creates a rectangle with the given x,y coordinates and the given width and height.
- **Fl_Rect (int X, int Y, int W, int H, Fl_Boxtype bt)**
  This constructor creates a rectangle with the given x,y coordinates and the given width and height reduced by the box frame size.
- **int h () const**
  gets the height
- **void h (int H)**
  sets the height
- **void inset (Fl_Boxtype bt)**
  Move all edges in by the frame size of box type bt.
- **void inset (int d)**
  Move all edges in by d.
- **void inset (int left, int top, int right, int bottom)**
  Move all edges in by left, top, right, bottom.
- **int r () const**
  gets the right edge (x + w).
- **void r (int R)**
  sets the width based on R and x
- **int w () const**
  gets the width
- **void w (int W)**
  sets the width
- **int x () const**
  gets the x coordinate (left edge)
- **void x (int X)**
  sets the x coordinate (left edge)
- **int y () const**
  gets the y coordinate (top edge)
- **void y (int Y)**
  sets the y coordinate (top edge)
Friends

- bool operator!=(const Fl_Rect &lhs, const Fl_Rect &rhs)
- bool operator==(const Fl_Rect &lhs, const Fl_Rect &rhs)

12.111.1 Detailed Description

Rectangle with standard FLTK coordinates (X, Y, W, H).
This may be used internally, for overloaded widget constructors and other overloaded methods like \texttt{fl\_measure()}, \texttt{fl\_text\_extents()}, \texttt{fl\_rect()}, \texttt{fl\_rectf()}, and maybe more.

12.111.2 Constructor & Destructor Documentation

12.111.2.1 Fl_Rect()

\texttt{Fl\_Rect::Fl\_Rect (}
\begin{verbatim}
int X,
int Y,
int W,
int H,
Fl\_Boxtype bt ) [inline]
\end{verbatim}

This constructor creates a rectangle with the given x,y coordinates and the given width and height reduced by the box frame size.
This is the same as using the constructor w/o \texttt{bt} and subsequently calling inset(\texttt{bt}).

12.111.3 Member Function Documentation

12.111.3.1 b()

\texttt{int Fl\_Rect::b ( ) const [inline]}

gets the bottom edge (y + h).

Note

\texttt{r()} and \texttt{b()} are coordinates outside the area of the rectangle.

12.111.3.2 inset() [1/3]

\texttt{void Fl\_Rect::inset (}
\begin{verbatim}
Fl\_Boxtype bt ) [inline]
\end{verbatim}

Move all edges in by the frame size of box type \texttt{bt}.
Shrinks the rectangle at all sides by the frame width or height of the given box type \texttt{bt}.
This method uses the frame sizes given by the box type \texttt{bt} using

- Fl::box\_dx(bt)
- Fl::box\_dy(bt)
- Fl::box\_dw(bt)
- Fl::box\_dh(bt)

If the rectangle is smaller than the frame sizes the result is undefined, i.e. an invalid or empty rectangle.

12.111.3.3 inset() [2/3]

\texttt{void Fl\_Rect::inset (}
\begin{verbatim}
int d ) [inline]
\end{verbatim}

Move all edges in by \texttt{d}.
Shrinks the rectangle by \texttt{d} at all sides keeping the center of the rectangle at the same spot.
If \texttt{d} is negative, the rectangle is enlarged.
If \texttt{d} >= \texttt{w()} or \texttt{h()} the result is undefined, i.e. an invalid or empty rectangle.
12.111.3.4 inset() [3/3]

```cpp
void Fl_Rect::inset (  
    int left,  
    int top,  
    int right,  
    int bottom ) [inline]
```

Move all edges in by `left`, `top`, `right`, `bottom`.
Shrinks the rectangle on all sides keeping the center of the rectangle at the same spot.
If any value is negative, the rectangle is enlarged.
Values are not range checked; it is possible to create an invalid or empty rectangle.

12.111.3.5 r()

```cpp
int Fl_Rect::r ( ) const [inline]
```
gets the right edge `(x + w)`.

Note

`r()` and `b()` are coordinates **outside** the area of the rectangle.

The documentation for this class was generated from the following file:

- Fl_Rect.H

### 12.112 Fl_Scroll::Fl_Region_LRTB Struct Reference

A local struct to manage a region defined by left/right/top/bottom.

```cpp
#include <Fl_Scroll.H>
```

**Public Attributes**

- int b
  - (b)ottom "y" position, aka `y2`
- int l
  - (l)eft "x" position, aka `x1`
- int r
  - (r)ight "x" position, aka `x2`
- int t
  - (t)op "y" position, aka `y1`

### 12.112.1 Detailed Description

A local struct to manage a region defined by left/right/top/bottom.
The documentation for this struct was generated from the following file:

- Fl_Scroll.H

### 12.113 Fl_Scroll::Fl_Region_XYWH Struct Reference

A local struct to manage a region defined by xywh.

```cpp
#include <Fl_Scroll.H>
```

**Public Attributes**

- int h
- int w
- int x
- int y
12.114 Fl_Repeat_Button Class Reference

The Fl_Repeat_Button is a subclass of Fl_Button that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down.

#include <Fl_Repeat_Button.H>

Inheritance diagram for Fl_Repeat_Button:

```
Fl_Widget
   v
Fl_Button
   v
Fl_Repeat_Button
```

Public Member Functions

- void deactivate ()
- Fl_Repeat_Button (int X, int Y, int W, int H, const char *l=0)
  Creates a new Fl_Repeat_Button widget using the given position, size, and label string.
- int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Button

- int clear ()
  Same as value(0).
- uchar compact ()
  Return true if buttons are rendered as compact buttons.
- void compact (uchar v)
  Decide if buttons should be rendered in compact mode.
- Fl_Boxtype down_box () const
  Returns the current down box type, which is drawn when value() is non-zero.
- void down_box (Fl_Boxtype b)
  Sets the down box type.
- Fl_Color down_color () const
  (for backwards compatibility)
- void down_color (unsigned c)
  (for backwards compatibility)
- Fl_Button (int X, int Y, int W, int H, const char *L=0)
  The constructor creates the button using the given position, size, and label.
- int set ()
  Same as value(1).
- void setonly ()
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).
- int shortcut () const
Returns the current shortcut key for the button.

- void **shortcut** (const char ∗s)  
  (for backwards compatibility)
- void **shortcut** (int s)  
  Sets the shortcut key to s.
- char **value** () const  
  Returns the current value of the button (0 or 1).
- int **value** (int v)  
  Sets the current value of the button.

Public Member Functions inherited from Fl_Widget

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()  
  Activates the widget.
- unsigned int **active** () const  
  Returns whether the widget is active.
- int **active_r** () const  
  Returns whether the widget and all of its parents are active.
- **Fl_Align align** () const  
  Gets the label alignment.
- void **align** (Fl_Align alignment)  
  Sets the label alignment.
- long **argument** () const  
  Gets the current user data (long) argument that is passed to the callback function.
- void **argument** (long v)  
  Sets the current user data (long) argument that is passed to the callback function.
- virtual **class Fl_Gl_Window** ∗**as_gl_window** ()  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual **class Fl_Gl_Window** const ∗**as_gl_window** () const  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual **class Fl_Group** ∗**as_group** ()  
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual **class Fl_Group** const ∗**as_group** () const  
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual **class Fl_Window** ∗**as_window** ()  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual **class Fl_Window** const ∗**as_window** () const  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- void **bind_deimage** (Fl_Image ∗img)  
  Sets the image to use as part of the widget label when in the inactive state.
- void **bind_deimage** (int f)  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void **bind_image** (Fl_Image ∗img)  
  Sets the image to use as part of the widget label when in the active state.
- void **bind_image** (int f)  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- **Fl_Boxtype box** () const  
  Gets the box type of the widget.
- void **box** (Fl_Boxtype new_box)  
  Sets the box type for the widget.
- **Fl_Callback_p** callback () const  
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Gets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

• void copy_label (const char *new_label)
  Sets the current label.

• void copy_tooltip (const char *text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.

• Fl_Image *deimage ()
Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image * deimage () const`
  
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage (Fl_Image &img)`
  
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage (Fl_Image *img)`
  
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound () const`
  
  Returns whether the inactive image is managed by the widget.

- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with default arguments.

- `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with arbitrary arguments.

- `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with arbitrary arguments.

- `void draw_label (int, int, int, int, Fl_Align) const`
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h () const`
  
  Gets the widget height.

- `virtual void hide ()`
  
  Makes a widget invisible.

- `Fl_Image * image ()`
  
  Gets the image that is used as part of the widget label when in the active state.

- `const Fl_Image * image () const`
  
  Gets the image that is used as part of the widget label when in the active state.

- `void image (Fl_Image &img)`
  
  Sets the image to use as part of the widget label when in the active state.

- `void image (Fl_Image *img)`
  
  Sets the image to use as part of the widget label when in the active state.

- `int image_bound () const`
  
  Returns whether the image is managed by the widget.

- `int inside (const Fl_Widget *wgt) const`
  
  Checks if this widget is a child of wgt.

- `int is_label_copied () const`
  
  Returns whether the current label was assigned with copy_label().

- `const char * label () const`
  
  Gets the current label text.

- `void label (const char *text)`
  
  Sets the current label pointer.

- `void label (Fl_Labeltype a, const char *b)`
  
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  
  Gets the label color.

- `void labelcolor (Fl_Color c)`
  
  Sets the label color.

- `Fl_Font labelfont () const`
  
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
  
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.

• Fl_Group * parent () const
  Returns a pointer to the parent widget.

• void parent (Fl_Group *p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  Gets the selection color.

• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.

• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
Returns if the widget is able to take events.

- int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char * tooltip () const
  Gets the current tooltip text.

- void tooltip (const char *text)
  Sets the current tooltip text.

- Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.

- void type (uchar t)
  Sets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void * user_data () const
  Gets the user data for this widget.

- void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

- void user_data (void *v)
  Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  Modifies keyboard focus navigation.

- int visible_r () const
  Returns whether a widget and all its parents are visible.

- int w () const
  Gets the widget width.

- Fl_When when () const
  Returns the conditions under which the callback is called.

- void when (uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x () const
  Gets the widget position in its window.

- int y () const
  Gets the widget position in its window.

- virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback(Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don't set a callback.

- static unsigned int labelShortcut(const char *t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int testShortcut(const char *t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,

}

flags possible values enumeration.

Protected Member Functions inherited from Fl_Button

- void draw() FL_OVERRIDE
  
  Draws the widget.

- void simulate_key_action()
Draws the label in an arbitrary bounding box.

- **Fl_Widget** (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

- unsigned int flags () const
  
  Gets the widget flags mask.

- void h (int v)
  
  Internal use only.

- void set_flag (unsigned int c)
  
  Sets a flag in the flags mask.

- void w (int v)
  
  Internal use only.

- void x (int v)
  
  Internal use only.

- void y (int v)
  
  Internal use only.

**Static Protected Member Functions inherited from Fl_Button**

- static void key_release_timeout (void ∗)

**Static Protected Attributes inherited from Fl_Button**

- static Fl_Widget_Tracker ∗key_release_tracker = 0

### Detailed Description

The Fl_REPEAT_Button is a subclass of Fl_Button that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down. The speed of the repeat is fixed and depends on the implementation.

### Constructor & Destructor Documentation

#### Fl_REPEAT_Button()

Fl_REPEAT_Button::Fl_REPEAT_Button {  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char ∗l = 0  
}  

Creates a new Fl_REPEAT_Button widget using the given position, size, and label string. The default boxtype is FL_UP_BOX. Deletes the button.

### Member Function Documentation

#### handle()

int Fl_REPEAT_Button::handle {  
  int event  
} [virtual]

Handles the specified event. You normally don’t call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don’t short-circuit events that you don’t handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

### 12.115 Fl_Return_Button Class Reference

The Fl_Return_Button is a subclass of Fl_Button that generates a callback when it is pressed or when the user presses the Enter key.

```
#include <Fl_Return_Button.H>
```

Inheritance diagram for Fl_Return_Button:

```
Fl_Widget
  Fl_Button
  Fl_Return_Button
```

**Public Member Functions**

- `Fl_Return_Button(int X, int Y, int W, int H, const char *l=0)`
  
  Creates a new Fl_Return_Button widget using the given position, size, and label string.

- `int handle(int)` FL_OVERRIDE
  
  Handles the specified event.

**Public Member Functions inherited from Fl_Button**

- `int clear()` 
  
  Same as value(0).

- `uchar compact()` 
  
  Return true if buttons are rendered as compact buttons.

- `void compact(uchar v)`
Decide if buttons should be rendered in compact mode.

- **Fl_Boxtype down_box () const**
  Returns the current down box type, which is drawn when value() is non-zero.

- **void down_box (Fl_Boxtype b)**
  Sets the down box type.

- **Fl_Color down_color () const**
  (for backwards compatibility)

- **void down_color (unsigned c)**
  (for backwards compatibility)

- **Fl_Button (int X, int Y , int W, int H, const char ∗L=0)**
  The constructor creates the button using the given position, size, and label.

- **int set ()**
  Same as value(1).

- **void setonly ()**
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).

- **int shortcut () const**
  Returns the current shortcut key for the button.

- **void shortcut (const char ∗s)**
  (for backwards compatibility)

- **void shortcut (int s)**
  Sets the shortcut key to s.

- **char value () const**
  Returns the current value of the button (0 or 1).

- **int value (int v)**
  Sets the current value of the button.

**Public Member Functions inherited from Fl_Widget**

- **void _clear_fullscreen ()**

- **void _set_fullscreen ()**

- **void activate ()**
  Activates the widget.

- **unsigned int active () const**
  Returns whether the widget is active.

- **int active_r () const**
  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**
  Gets the label alignment.

- **void align (Fl_Align alignment)**
  Sets the label alignment.

- **long argument () const**
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window ∗ as_gl_window ()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const ∗ as_gl_window () const**

- **virtual Fl_Group ∗ as_group ()**
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **virtual Fl_Group const ∗ as_group () const**

- **virtual Fl_Window ∗ as_window ()**

Generated by Doxygen
Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const * as_window () const
  
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (Fl_Image *img)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_deimage (int f)
  
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
  
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.

- Fl_Callback * callback () const
  
  Gets the current callback function for the widget.

- void callback (Fl_Callback cb)
  
  Sets the current callback function for the widget.

- void callback (Fl_Callback cb, Fl_Callback_User_Data *p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback cb, void *p)
  
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 cb)
  
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 cb, long p=0)
  
  Sets the current callback function for the widget.

- unsigned int changed () const
  
  Checks if the widget value changed since the last callback.

- void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.

- void clear_output ()
  
  Sets a widget to accept input.

- void clear_visible ()
  
  Hides the widget.

- void clear_visible_focus ()
  
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  
  Gets the background color of the widget.

- void color (Fl_Color bg)
  
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  
  For back compatibility only.

- void color2 (unsigned a)
  
  For back compatibility only.

- int contains (const Fl_Widget *w) const
Checks if \( w \) is a child of this widget.

- **void copy_label** (const char *new_label)
  Sets the current label.

- **void copy_tooltip** (const char *text)
  Sets the current tooltip text.

- **uchar damage** () const
  Returns non-zero if draw() needs to be called.

- **void damage** (uchar c)
  Sets the damage bits for the widget.

- **void damage** (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- **int damage_resize**(int, int, int, int)
  Internal use only.

- **void deactivate** ()
  Deactivates the widget.

- **Fl_Image * deimage** ()
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image * deimage** () const
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage** (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage** (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound** () const
  Returns whether the inactive image is managed by the widget.

- **void do_callback** (Fl_Callback_REASON reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- **void do_callback** (Fl_Widget *widget, long arg, Fl_Callback_REASON reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- **void do_callback** (Fl_Widget *widget, void *arg=0, Fl_Callback_REASON reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- **void draw_label** (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h** () const
  Gets the widget height.

- virtual **void hide** ()
  Makes a widget invisible.

- **Fl_Image * image** ()
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image * image** () const
  Gets the image that is used as part of the widget label when in the active state.

- **void image** (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

- **void image** (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound** () const
  Returns whether the image is managed by the widget.

- **int inside** (const Fl_Widget *wgt) const
  Checks if this widget is a child of \( wgt \).

- **int is_label_copied** () const
  Returns whether the current label was assigned with copy_label().
• `const char * label () const`
  
  Gets the current label text.

• `void label (const char *text)`
  
  Sets the current label pointer.

• `void label (Fl_Labeltype a, const char *b)`

  Shortcut to set the label text and type in one call.

• `Fl_Color labelcolor () const`

  Gets the label color.

• `void labelcolor (Fl_Color c)`

  Sets the label color.

• `Fl_Font labelfont () const`

  Gets the font to use.

• `void labelfont (Fl_Font f)`

  Sets the font to use.

• `Fl_Fontsize labelsize () const`

  Gets the font size in pixels.

• `void labelsize (Fl_Fontsize pix)`

  Sets the font size in pixels.

• `Fl_Labeltype labelttype () const`

  Gets the label type.

• `void labelttype (Fl_Labeltype a)`

  Sets the label type.

• `void measure_label (int &ww, int &hh) const`

  Sets width `ww` and height `hh` accordingly with the label size.

• `bool needs_keyboard () const`

  Returns whether this widget needs a keyboard.

• `void needs_keyboard (bool needs)`

  Sets whether this widget needs a keyboard.

• `unsigned int output () const`

  Returns if a widget is used for output only.

• `Fl_Group * parent () const`

  Returns a pointer to the parent widget.

• `void parent (Fl_Group *p)`

  Internal use only - “for hacks only”.

• `void position (int X, int Y)`

  Repositions the window or widget.

• `void redraw ()`

  Schedules the drawing of the widget.

• `void redraw_label ()`

  Schedules the drawing of the label.

• `virtual void resize (int x, int y, int w, int h)`

  Changes the size or position of the widget.

• `Fl_Color selection_color () const`

  Gets the selection color.

• `void selection_color (Fl_Color a)`

  Sets the selection color.

• `void set_active ()`

  Marks the widget as active without sending events or changing focus.

• `void set_changed ()`

  Marks the value of the widget as changed.

• `void set_output ()`
Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget's label uses ' & ' to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget's label uses ' & ' to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int testShortcut ()
  Returns true if the widget's label contains the entered ' & X ' shortcut.

- const char *tooltip () const
  Gets the current tooltip text.

- void tooltip (const char *text)
  Sets the current tooltip text.

- Fl_Window *top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window *top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.

- void type (uchar t)
  Sets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void *user_data () const
  Gets the user data for this widget.

- void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

- void user_data (void *v)
  Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  Modifies keyboard focus navigation.

- int visible_r () const
  Returns whether a widget and all its parents are visible.

- int w () const
  Gets the widget width.

- Fl_When when () const
  Returns the conditions under which the callback is called.
• void \texttt{when} (uchar \texttt{i})
  \textit{Sets the flags used to decide when a callback is called.}

• \texttt{Fl\_Window * window () const}
  \textit{Returns a pointer to the nearest parent window up the widget hierarchy.}

• \texttt{int x () const}
  \textit{Gets the widget position in its window.}

• \texttt{int y () const}
  \textit{Gets the widget position in its window.}

• virtual \texttt{~Fl\_Widget ()}
  \textit{Destroys the widget.}

\textbf{Protected Member Functions}

• void \texttt{draw () FL\_OVERRIDE}
  \textit{Draws the widget.}

\textbf{Protected Member Functions inherited from Fl\_Button}

• void \texttt{simulate\_key\_action ()}

\textbf{Protected Member Functions inherited from Fl\_Widget}

• void \texttt{clear\_flag} (unsigned int \texttt{c})
  \textit{Clears a flag in the flags mask.}

• void \texttt{draw\_backdrop () const}
  \textit{If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.}

• void \texttt{draw\_box () const}
  \textit{Draws the widget box according its box style.}

• void \texttt{draw\_box (Fl\_Boxtype t, Fl\_Color c) const}
  \textit{Draws a box of type t, of color c at the widget's position and size.}

• void \texttt{draw\_box (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color c) const}
  \textit{Draws a box of type t, of color c at the position X,Y and size W,H.}

• void \texttt{draw\_focus () const}
  \textit{Draws a focus rectangle around the widget.}

• void \texttt{draw\_focus (Fl\_Boxtype t, int X, int Y, int W, int H) const}
  \textit{Draws a focus rectangle around the widget.}

• void \texttt{draw\_focus (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color bg) const}
  \textit{Draws a focus box for the widget at the given position and size.}

• void \texttt{draw\_label () const}
  \textit{Draws the widget's label at the defined label position.}

• void \texttt{draw\_label (int, int, int, int) const}
  \textit{Draws the label in an arbitrary bounding box.}

• \texttt{Fl\_Widget (int x, int y, int w, int h, const char *label=0L)}
  \textit{Creates a widget at the given position and size.}

• unsigned int \texttt{flags () const}
  \textit{Gets the widget flags mask.}

• void \texttt{h (int v)}
  \textit{Internal use only.}

• void \texttt{set\_flag} (unsigned int \texttt{c})
  \textit{Sets a flag in the flags mask.}

• void \texttt{w (int v)}
  \textit{Internal use only.}
• void x (int v)
  *Internal use only.*
• void y (int v)
  *Internal use only.*

### Additional Inherited Members

#### Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  *The default callback for all widgets that don't set a callback.*
• static unsigned int label_shortcut (const char ∗t)
  *Returns the Unicode value of the 'x' shortcut in a given text.*
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  *Returns true if the given text t contains the entered 'x' shortcut.*

### Protected Types inherited from Fl_Widget

```cpp
enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
    = 1<<19, NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
};
```

*flags possible values enumeration.*

### 12.115.1 Detailed Description

The Fl_Return_Button is a subclass of Fl_Button that generates a callback when it is pressed or when the user presses the Enter key.

A carriage-return symbol is drawn next to the button label.

![Fl_Return_Button](image)

*Figure 12.37 Fl_Return_Button*

### 12.115.2 Constructor & Destructor Documentation

#### 12.115.2.1 Fl_Return_Button()

```cpp
Fl_Return_Button::Fl_Return_Button (int X, ...
```
int Y,
int W,
int H,
const char * l = 0)

Creates a new Fl_Return_Button widget using the given position, size, and label string.
The default boxtype is FL_UP_BOX.
The inherited destructor deletes the button.

12.115.3 Member Function Documentation

12.115.3.1 draw()

void Fl_Return_Button::draw ( ) [protected], [virtual]

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
Reimplemented from Fl_Button.

12.115.3.2 handle()

int Fl_Return_Button::handle ( 
    int event ) [virtual]

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-
circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The
effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses)
in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In
such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by
returning 1 even if you didn't do anything with it.

Parameters

|  in  | event | the kind of event received |

Return values

| 0  | if the event was not used or understood |
| 1  | if the event was used and can be deleted |

Fl_Event

Reimplemented from Fl_Button.
The documentation for this class was generated from the following files:

- Fl_Return_Button.H
- Fl_Return_Button.cxx

Generated by Doxygen
12.116 FL_RGB_Image Class Reference

The **FL_RGB_Image** class supports caching and drawing of full-color images with 1 to 4 channels of color information.

```c
#include <FL/Image.H>
```

Inheritance diagram for FL_RGB_Image:

```
Fl_RGB_Image
  └ Fl_Image
    └ Fl_BMP_Image
        └ Fl_JPEG_Image
        └ Fl_PNG_Image
        └ Fl_PNM_Image
        └ Fl_SVG_Image
```

### Public Member Functions

- `virtual Fl_SVG_Image* as_svg_image()`  
  Returns whether an image is an **Fl_SVG_Image** or not.
- `int cache_h()`  
- `int cache_w()`  
- `void color_average(Fl_Color c, float i) FL_OVERRIDE`
  The `color_average()` method averages the colors in the image with the provided FLTK color value.
- `Fl_Image* copy()` const  
- `Fl_Image* copy(int W, int H) const FL_OVERRIDE`
  Creates a resized copy of the image.
- `void desaturate() FL_OVERRIDE`
  The `desaturate()` method converts an image to grayscale.
- `void draw(int X, int Y)`  
- `void draw(int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE`
  Draws the image to the current drawing surface with a bounding box.
- `Fl_RGB_Image(const Fl_Pixmap* pxm, Fl_Color bg=FL_GRAY)`  
  The constructor creates a new RGBA image from the specified **Fl_Pixmap**.
- `Fl_RGB_Image(const uchar* bits, int bits_length, int W, int H, int D, int LD)`  
  The constructor creates a new image from the specified data.
- `Fl_RGB_Image(const uchar* bits, int W, int H, int D=3, int LD=0)`  
  The constructor creates a new image from the specified data.
- `void label(Fl_Menu_Item* m) FL_OVERRIDE`
  This method is an obsolete way to set the image attribute of a menu item.
- `void label(Fl_Widget* w) FL_OVERRIDE`
  This method is an obsolete way to set the image attribute of a widget or menu item.
- `virtual void normalize()`  
  Makes sure the object is fully initialized.
- `void uncache() FL_OVERRIDE`
  If the image has been cached for display, delete the cache data.
- `~FL_RGB_Image() FL_OVERRIDE`
  The destructor frees all memory and server resources that are used by the image.
Public Member Functions inherited from Fl_Image

- virtual class Fl_Shared_Image ∗ as_shared_image ()
  Returns whether an image is an Fl_Shared_Image or not.
- Fl_image ∗ copy () const
  Creates a copy of the image in the same size.
- int count () const
  Returns the number of data values associated with the image.
- int d () const
  Returns the image depth.
- const char ∗ ∗ data () const
  Returns a pointer to the current image data array.
- int data_h () const
  Returns the height of the image data.
- int data_w () const
  Returns the width of the image data.
- void draw (int X, int Y)
  Draws the image to the current drawing surface.
- int fail () const
  Returns a value that is not 0 if there is currently no image available.
- Fl_image (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.
- int h () const
  Returns the current image drawing height in FLTK units.
- void inactive ()
  The inactive() method calls color_average(FL_BACKGROUNDCOLOR, 0.33f) to produce an image that appears grayed out.
- int ld () const
  Returns the current line data size in bytes.
- virtual void release ()
  Releases an Fl_image - the same as 'delete this'.
- virtual void scale (int width, int height, int proportional=1, int can_expand=0)
  Sets the drawing size of the image.
- int w () const
  Returns the current image drawing width in FLTK units.
- virtual ∼Fl_image ()
  The destructor is a virtual method that frees all memory used by the image.

Static Public Member Functions

- static size_t max_size ()
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_image object.
- static void max_size (size_t size)
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_image object.

Static Public Member Functions inherited from Fl_Image

- static Fl_Labeltype define_FL_IMAGE_LABEL ()
- static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
- static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
- static Fl_RGB_Scaling scaling_algorithm ()
Gets what algorithm is used when resizing a source image to draw it.
• static void scaling_algorithm (FL_RGB_Scaling algorithm)

Sets what algorithm is used when resizing a source image to draw it.

Public Attributes
• int alloc_array
  If non-zero, the object's data array is delete[]d when deleting the object.
• const uchar * array
  Points to the start of the object's data array.

Friends
• class Fl_Graphics_Driver

Additional Inherited Members

Static Public Attributes inherited from Fl_Image
• static const int ERR_FILE_ACCESS = -2
• static const int ERR_FORMAT = -3
• static const int ERR_MEMORY_ACCESS = -4
• static const int ERR_NO_IMAGE = -1
• static bool register_images_done = false
  True after fl_register_images() was called, false before.

Protected Member Functions inherited from Fl_Image
• void d (int D)
  Sets the current image depth.
• void data (const char * const * p, int c)
  Sets the current data pointer and count of pointers in the array.
• void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
• int draw_scaled (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
• void h (int H)
  Sets the height of the image data.
• void ld (int LD)
  Sets the current line data size in bytes.
• void w (int W)
  Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image
• static void labeltype (const Fl_Label * lo, int lx, int ly, int lw, int lh, Fl_Align la)
• static void measure (const Fl_Label * lo, int & lw, int & lh)

12.116.1 Detailed Description
The Fl_RGB_Image class supports caching and drawing of full-color images with 1 to 4 channels of color information.
Images with an even number of channels are assumed to contain alpha information, which is used to blend the image with the contents of the screen.
Fl_RGB_Image is defined in <FL/Fl_Image.H>, however for compatibility reasons <FL/FL_RGB_Image.H> should be included.
12.116.2 Constructor & Destructor Documentation

12.116.2.1 Fl_RGB_Image() [1/3]

The constructor creates a new image from the specified data.
The data array `bits` must contain sufficient data to provide `W * H * D` image bytes and optional line padding, see `LD`.
`W` and `H` are the width and height of the image in pixels, resp.
`D` is the image depth and can be:

- D=1: each uchar in `bits[]` is a grayscale pixel value
- D=2: each uchar pair in `bits[]` is a grayscale + alpha pixel value
- D=3: each uchar triplet in `bits[]` is an R/G/B pixel value
- D=4: each uchar quad in `bits[]` is an R/G/B/A pixel value

`LD` specifies the line data size of the array, see Fl_Image::ld(int). If `LD` is zero, then `W * D` is assumed, otherwise `LD` must be greater than or equal to `W * D` to account for (unused) extra data per line (padding).
The caller is responsible that the image data array `bits` persists as long as the image is used.
This constructor sets Fl_RGB_Image::alloc_array to 0. To have the image object control the deallocation of the data array `bits`, set alloc_array to non-zero after construction.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>bits</th>
<th>The image data array.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>W</td>
<td>The width of the image in pixels.</td>
</tr>
<tr>
<td>in</td>
<td>H</td>
<td>The height of the image in pixels.</td>
</tr>
<tr>
<td>in</td>
<td>D</td>
<td>The image depth, or 'number of channels' (default=3).</td>
</tr>
<tr>
<td>in</td>
<td>LD</td>
<td>Line data size (default=0).</td>
</tr>
</tbody>
</table>

See also

Fl_Image::data(), Fl_Image::w(), Fl_Image::h(), Fl_Image::d(), Fl_Image::ld(int)

12.116.2.2 Fl_RGB_Image() [2/3]

The constructor creates a new image from the specified data.
If the provided array is too small to contain all the image data, the constructor will not generate the image to avoid illegal memory read access and instead set data to NULL and ld to ERR_MEMORY_ACCESS.

Parameters

<table>
<thead>
<tr>
<th>bits</th>
<th>image data</th>
</tr>
</thead>
<tbody>
<tr>
<td>bits_length</td>
<td>length of the bits array in bytes</td>
</tr>
</tbody>
</table>

Generated by Doxygen
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( W )</td>
<td>image width in pixels</td>
</tr>
<tr>
<td>( H )</td>
<td>image height in pixels</td>
</tr>
<tr>
<td>( D )</td>
<td>image depth in bytes, 1 for gray scale, 2 for gray with alpha, 3 for RGB, and 4 for RGB plus alpha</td>
</tr>
<tr>
<td>( LD )</td>
<td>line length in bytes, or 0 to use ( W \times D ).</td>
</tr>
</tbody>
</table>

See also

\texttt{Fl_RGB\_Image(const \texttt{uchar} * \texttt{bits}, int \( W \), int \( H \), int \( D \), int \( LD \))}

12.116.2.3 \texttt{Fl\_RGB\_Image()} [3/3]

\texttt{Fl\_RGB\_Image::Fl\_RGB\_Image (}
  \texttt{const Fl\_Pixmap *} \texttt{pxm},
  \texttt{Fl\_Color bg = FL\_GRAY})

The constructor creates a new RGBA image from the specified \texttt{Fl\_Pixmap}.
The RGBA image is built fully opaque except for the transparent area of the pixmap that is assigned the \texttt{bg} color with full transparency.
This constructor creates a new internal data array and sets \texttt{Fl\_RGB\_Image::alloc\_array} to 1 so the data array is deleted when the image is destroyed.

12.116.3 Member Function Documentation

12.116.3.1 \texttt{as\_svg\_image()}

\texttt{virtual Fl\_SVG\_Image *} \texttt{Fl\_RGB\_Image::as\_svg\_image ( ) [inline], [virtual]}

Returns whether an image is an \texttt{Fl\_SVG\_Image} or not.
This virtual method returns a pointer to the \texttt{Fl\_SVG\_Image} if this object is an instance of \texttt{Fl\_SVG\_Image} or NULL if not.
Reimplemented in \texttt{Fl\_SVG\_Image}.

12.116.3.2 \texttt{color\_average()}

\texttt{void Fl\_RGB\_Image::color\_average (}
  \texttt{Fl\_Color c,}
  \texttt{float \( i \) [virtual]}

The \texttt{color\_average()} method averages the colors in the image with the provided FLTK color value.
The first argument specifies the FLTK color to be used.
The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.
An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.
Reimplemented from \texttt{Fl\_Image}.
Reimplemented in \texttt{Fl\_SVG\_Image}.

12.116.3.3 \texttt{copy()}

\texttt{Fl\_Image *} \texttt{Fl\_RGB\_Image::copy (}
  \texttt{int \( W \),}
  \texttt{int \( H \) const [virtual]}

Creates a resized copy of the image.
The new image should be released when you are done with it.
Note: since FLTK 1.4.0 you can use \texttt{Fl\_Image::release()} for all types of images (i.e. all subclasses of \texttt{Fl\_Image}) instead of operator \texttt{delete} for \texttt{Fl\_Image\'s} and \texttt{Fl\_Image::release()} for \texttt{Fl\_Shared\_Image\'s}.
The new image data will be converted to the requested size. RGB images are resized using the algorithm set by \texttt{Fl\_Image::RGB\_scaling()}. For the new image the following equations are true:
\section*{12.116 Fl_RGB_Image Class Reference}

- \texttt{w()} == \texttt{data_w()} == W
- \texttt{h()} == \texttt{data_h()} == H

\textbf{Parameters}

\begin{tabular}{ll}
\hline
\texttt{in} & \texttt{W,H} \texttt{Requested width and height of the new image} \\
\hline
\end{tabular}

\textbf{Note}

The returned image can be safely cast to the same image type as that of the source image provided this type is one of \texttt{Fl_RGB_Image}, \texttt{Fl_SVG_Image}, \texttt{Fl_Pixmap}, \texttt{Fl_Bitmap}, \texttt{Fl_Tiled_Image}, \texttt{Fl_Anim_GIF_Image} and \texttt{Fl_Shared_Image}. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an \texttt{Fl_GIF_Image} is an object of class \texttt{Fl_Pixmap}.

Since FLTK 1.4.0 this method is \texttt{const}. If you derive your own class from \texttt{Fl_Image} or any subclass your overridden methods of \texttt{`Fl_Image::copy() const'} and \texttt{`Fl_Image::copy(int, int) const'} must also be \texttt{`const'} for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been \texttt{`const'}.

Reimplemented from \texttt{Fl_Image}.

Reimplemented in \texttt{Fl_SVG_Image}.

\subsection*{12.116.3.4 desaturate()}

\begin{verbatim}
void Fl_RGB_Image::desaturate ( ) [virtual]
The \texttt{desaturate()} method converts an image to grayscale. If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.
\end{verbatim}

Reimplemented from \texttt{Fl_Image}.

Reimplemented in \texttt{Fl_SVG_Image}.

\subsection*{12.116.3.5 draw()}

\begin{verbatim}
void Fl_RGB_Image::draw ( int X, int Y, int W, int H, int cx = 0, int cy = 0 ) [virtual]
Draws the image to the current drawing surface with a bounding box. Arguments \texttt{X,Y,W,H} specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the \texttt{cx} and \texttt{cy} arguments. In other words: \texttt{fl_push_clip(X,Y,W,H)} is applied, the image is drawn with its upper-left corner at \texttt{X-cx,Y-cy} and its own width and height, \texttt{fl_pop_clip()} is applied.
\end{verbatim}

Reimplemented from \texttt{Fl_Image}.

Reimplemented in \texttt{Fl_SVG_Image}.

\subsection*{12.116.3.6 label() [1/2]}

\begin{verbatim}
void Fl_RGB_Image::label ( Fl_Menu_Item * m ) [virtual]
This method is an obsolete way to set the image attribute of a menu item. \textbf{Deprecated} Please use \texttt{Fl_Menu_Item::image()} instead.
\end{verbatim}

Reimplemented from \texttt{Fl_Image}.

\texttt{Generated by Doxygen}
12.116.3.7 label() [2/2]

void Fl_RGB_Image::label ( 
    Fl_Widget ∗ widget ) [virtual]

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use Fl_Widget::image() or Fl_Widget::deimage() instead.

Reimplemented from Fl_Image.

12.116.3.8 max_size() [1/2]

static size_t Fl_RGB_Image::max_size ( ) [inline], [static]

Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

See also

    void Fl_RGB_Image::max_size(size_t)

12.116.3.9 max_size() [2/2]

static void Fl_RGB_Image::max_size ( 
    size_t size ) [inline], [static]

Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
The image size in bytes of an Fl_RGB_Image object is the value of the product w() ∗ h() ∗ d(). If this product exceeds size, the created object of a derived class of Fl_RGB_Image won’t be loaded with the image data. This does not apply to direct RGB image creation with Fl_RGB_Image::Fl_RGB_Image(const uchar ∗ bits, int W, int H, int D, int LD).
The default max_size() value is essentially infinite.

12.116.3.10 normalize()

virtual void Fl_RGB_Image::normalize ( ) [inline], [virtual]

Makes sure the object is fully initialized.
In particular, makes sure member variable array is non-null.
Reimplemented in Fl_SVG_Image.

12.116.3.11 uncache()

void Fl_RGB_Image::uncache ( ) [virtual]

If the image has been cached for display, delete the cache data.
This allows you to change the data used for the image and then redraw it without recreating an image object.
Reimplemented from Fl_Image.

12.116.4 Member Data Documentation

12.116.4.1 array

const uchar* Fl_RGB_Image::array

Points to the start of the object's data array.

See also

    class Fl_SVG_Image which delays initialization of this member variable.

The documentation for this class was generated from the following files:

- Fl_IMAGE.H
- Fl_IMAGE.cxx
The `Fl_Roller` widget is a "dolly" control commonly used to move 3D objects.

```cpp
#include <Fl_Roller.H>
```

Inheritance diagram for `Fl_Roller`:

```
Fl_Widget
|     |
|     |
Fl_Valuator
|     |
Fl_Roller
```

### Public Member Functions

- **`Fl_Roller (int X, int Y, int W, int H, const char ∗L=0)`**
  - Creates a new `Fl_Roller` widget using the given position, size, and label string.

- **`int handle (int)` FL_OVERRIDE**
  - Handles the specified event.

### Public Member Functions inherited from `Fl_Valuator`

- **`void bounds (double a, double b)`**
  - Sets the minimum (a) and maximum (b) values for the valuator widget.

- **`double clamp (double)`**
  - Clamps the passed value to the valuator range.

- **`virtual int format (char ∗)`**
  - Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **`double increment (double, int)`**
  - Adds n times the step value to the passed value.

- **`double maximum () const`**
  - Gets the maximum value for the valuator.

- **`void maximum (double a)`**
  - Sets the maximum value for the valuator.

- **`double minimum () const`**
  - Gets the minimum value for the valuator.

- **`void minimum (double a)`**
  - Sets the minimum value for the valuator.

- **`void precision (int digits)`**
  - Sets the step value to $1.0 / 10^{digits}$.

- **`void range (double a, double b)`**
  - Sets the minimum and maximum values for the valuator.

- **`double round (double)`**
  - Round the passed value to the nearest step increment.

- **`double step () const`**
  - Gets or sets the step value.

- **`void step (double a, int b)`**
  - See `double Fl_Valuator::step() const`

- **`void step (double s)`**
  - See `double Fl_Valuator::step() const`.

- **`void step (int a)`**
See double Fl_Valuator::step() const

- double value () const
  Gets the floating point(double) value.
- int value (double)
  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group () const
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
Sets the image to use as part of the widget label when in the inactive state.

- **void deimage(Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound() const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback(Fl_Widget *widget, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback(Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label(int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h() const**
  Gets the widget height.

- **virtual void hide()**
  Makes a widget invisible.

- **Fl_Image * image()**
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image * image() const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image(Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image(Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound() const**
  Returns whether the image is managed by the widget.

- **int inside(const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied() const**
  Returns whether the current label was assigned with copy_label().

- **const char * label() const**
  Gets the current label text.

- **void label(const char *text)**
  Sets the current label pointer.

- **void label(Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor() const**
  Gets the label color.

- **void labelcolor(Fl_Color c)**
  Sets the label color.

- **Fl_Font labelfont() const**
  Gets the font to use.

- **void labelfont(Fl_Font f)**
  Sets the font to use.

- **Fl_Fontsize labelsize() const**
  Gets the font size in pixels.

- **void labelsize(Fl_Fontsize pix)**
  Sets the font size in pixels.

- **Fl_Labeltype labeltype() const**
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takeevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window *top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window *top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void *user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window *window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.
Protected Member Functions inherited from \texttt{Fl\_Valuator}

- \texttt{Fl\_Valuator} (int X, int Y, int W, int H, const char *L)
  
  Creates a new \texttt{Fl\_Valuator} widget using the given position, size, and label string.
- void \texttt{handle\_drag} (double newvalue)
  
  Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.
- void \texttt{handle\_push} ()
  
  Stores the current value in the previous value.
- void \texttt{handle\_release} ()
  
  Called after an FL\_WHEN\_RELEASE event is received and before the callback.
- int \texttt{horizontal} () const
  
  Tells if the valuator is an FL\_HORIZONTAL one.
- double \texttt{previous\_value} () const
  
  Gets the previous floating point value before an event changed it.
- void \texttt{set\_value} (double v)
  
  Sets the current floating point value.
- double \texttt{softclamp} (double)
  
  Clamps the value, but accepts \( v \) if the previous value is not already out of range.
- virtual void \texttt{value\_damage} ()
  
  Asks for partial redraw.

Protected Member Functions inherited from \texttt{Fl\_Widget}

- void \texttt{clear\_flag} (unsigned int c)
  
  Clears a flag in the flags mask.
- void \texttt{draw\_backdrop} () const
  
  If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.
- void \texttt{draw\_box} () const
  
  Draws the widget box according its box style.
- void \texttt{draw\_box} (Fl\_Boxtype t, Fl\_Color c) const
  
  Draws a box of type \( t \), of color \( c \) at the widget's position and size.
- void \texttt{draw\_box} (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color c) const
  
  Draws a box of type \( t \), of color \( c \) at the position \( X,Y \) and size \( W,H \).
- void \texttt{draw\_focus} () const
  
  Draws a focus rectangle around the widget.
- void \texttt{draw\_focus} (Fl\_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.
- void \texttt{draw\_focus} (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color bg) const
  
  Draws a focus box for the widget at the given position and size.
- void \texttt{draw\_label} () const
  
  Draws the widget's label at the defined label position.
- void \texttt{draw\_label} (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.
- \texttt{Fl\_Widget} (int x, int y, int w, int h, const char *=label*=0L)
  
  Creates a widget at the given position and size.
- unsigned int \texttt{flags} () const
  
  Gets the widget flags mask.
- void \texttt{h} (int v)
  
  \textit{Internal use only}.
- void \texttt{set\_flag} (unsigned int c)
  
  Sets a flag in the flags mask.
- void \texttt{w} (int v)
1322 Class Documentation

Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget
• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&'x' shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget
• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,

} flags possible values enumeration.

12.117.1 Detailed Description

The Fl_Roller widget is a "dolly" control commonly used to move 3D objects.
The roller can be controlled by clicking and dragging the mouse, by the corresponding arrow keys when the roller
has the keyboard focus, or by the mouse wheels when the mouse pointer is positioned over the roller widget.

![Fl_Roller](image)

Figure 12.38 Fl_Roller

12.117.2 Constructor & Destructor Documentation

12.117.2.1 Fl_Roller()

Fl_Roller::Fl_Roller ( int X,
  int Y,
int W,  
int H,  
const char ∗L = 0 )

Creates a new Fl_Roller widget using the given position, size, and label string.  
The default boxtype is FL_NO_BOX.  
Inherited destructor destroys the valuator.

12.117.3 Member Function Documentation

12.117.3.1 draw()    
void Fl_Roller::draw ( ) [protected], [virtual]  
Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as 
soon as possible, call redraw() instead.  
Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded 
scrollbar, you can do it (because draw() is virtual) like this:  
Fl_Widget ∗s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar  
s->draw(); // calls Fl_Scrollbar::draw()  

Implements Fl_Widget.

12.117.3.2 handle()  
int Fl_Roller::handle (    
    int event ) [virtual]

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-
circuit events that you don't handle. In this last case you should return the callee retval.  
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.

This requires knowledge of the details of the inherited class.  
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The 
effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in 
a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In 
such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by 
returning 1 even if you didn't do anything with it.

Parameters

| in | event  | the kind of event received |

Return values

| 0  | if the event was not used or understood |
| 1  | if the event was used and can be deleted |

   Fl_Button
   |
   Fl_Light_Button
   |
   Fl_Round_Button
   |
Fl_Radio_Round_Button
```

Public Member Functions

```
• Fl_Round_Button (int x, int y, int w, int h, const char *l=0)
  Creates a new Fl_Round_Button widget using the given position, size, and label string.
```

Public Member Functions inherited from Fl_Light_Button

```
• Fl_Light_Button (int x, int y, int w, int h, const char *l=0)
  Creates a new Fl_Light_Button widget using the given position, size, and label string.

• int handle (int) FL_OVERRIDE
  Handles the specified event.
```

Public Member Functions inherited from Fl_Button

```
• int clear ()
  Same as value(0).

• uchar compact ()
  Return true if buttons are rendered as compact buttons.

• void compact (uchar v)
  Decide if buttons should be rendered in compact mode.

• Fl_Boxtype down_box () const
  Returns the current down box type, which is drawn when value() is non-zero.

• void down_box (Fl_Boxtype b)
  Sets the down box type.

• Fl_Color down_color () const
  (for backwards compatibility)

• void down_color (unsigned c)
  (for backwards compatibility)

• Fl_Button (int X, int Y, int W, int H, const char *L=0)
  The constructor creates the button using the given position, size, and label.

• int set ()
  Same as value(1).

• void setonly ()
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set() does not do this).

• int shortcut () const
  ```
  ```
```
Returns the current shortcut key for the button.

* void **shortcut** (const char ∗s)
  (for backwards compatibility)
* void **shortcut** (int s)
  Sets the shortcut key to s.

* char **value** () const
  Returns the current value of the button (0 or 1).
* int **value** (int v)
  Sets the current value of the button.

Public Member Functions inherited from Fl_Widget

* void **_clear_fullscreen** ()
  * void **_set_fullscreen** ()
  * void **activate** ()
    Activates the widget.
* unsigned int **active** () const
  Returns whether the widget is active.
* int **active_r** () const
  Returns whether the widget and all of its parents are active.
* **Fl_Align** **align** () const
  Gets the label alignment.
  * void **align** (**Fl_Align** alignment)
    Sets the label alignment.
  * long **argument** () const
    Gets the current user data (long) argument that is passed to the callback function.
  * void **argument** (long v)
    Sets the current user data (long) argument that is passed to the callback function.
* virtual class **Fl_Gl_Window** ∗ **as_gl_window** ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
* virtual class **Fl_Gl_Window** const ∗ **as_gl_window** () const
* virtual class **Fl_Group** ∗ **as_group** ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
  * void **bind_deimage** (**Fl_Image** ∗img)
    Sets the image to use as part of the widget label when in the inactive state.
  * void **bind_deimage** (int f)
    Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
  * void **bind_image** (**Fl_Image** ∗img)
    Sets the image to use as part of the widget label when in the active state.
  * void **bind_image** (int f)
    Bind the image to the widget, so the widget will delete the image when it is no longer needed.
* **Fl_Boxtype** **box** () const
  Gets the box type of the widget.
  * void **box** (**Fl_Boxtype** new_box)
    Sets the box type for the widget.
* **Fl_Callback_p** **callback** () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
Gets the image that is used as part of the widget label when in the inactive state.

- 

\begin{verbatim}
• const Fl_Image * deimage () const

Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)

Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image *img)

Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const

Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *wgt, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *wgt, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const

Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const

Gets the widget height.

• virtual void hide ()

Makes a widget invisible.

• Fl_Image * image ()

Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const

Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)

Sets the image to use as part of the widget label when in the active state.

• void image (FlImageButton img)

Sets the image to use as part of the widget label when in the active state.

• int image_bound () const

Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const

Checks if this widget is a child of wgt.

• int is_label_copied () const

Returns whether the current label was assigned with copy_label().

• const char * label () const

Gets the current label text.

• void label (const char *text)

Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)

Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const

Gets the label color.

• void labelcolor (Fl_Color c)

Sets the label color.

• Fl_Font labelfont () const

Gets the font to use.

• void labelfont (Fl_Font f)

Sets the font to use.

• Fl_Fontsize labelsize () const

Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
   Sets the font size in pixels.

• Fl_Labeltype labeltype () const
   Gets the label type.

• void labeltype (Fl_Labeltype a)
   Sets the label type.

• void measure_label (int &ww, int &hh) const
   Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
   Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
   Sets whether this widget needs a keyboard.

• unsigned int output () const
   Returns if a widget is used for output only.

• Fl_Group * parent () const
   Returns a pointer to the parent widget.

• void parent (Fl_Group *p)
   Internal use only - "for hacks only".

• void position (int X, int Y)
   Repositions the window or widget.

• void redraw ()
   Schedules the drawing of the widget.

• void redraw_label ()
   Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
   Changes the size or position of the widget.

• Fl_Color selection_color () const
   Gets the selection color.

• void selection_color (Fl_Color a)
   Sets the selection color.

• void set_active ()
   Marks the widget as active without sending events or changing focus.

• void set_changed ()
   Marks the value of the widget as changed.

• void set_output ()
   Sets a widget to output only.

• void set_visible ()
   Makes the widget visible.

• void set_visible_focus ()
   Enables keyboard focus navigation with this widget.

• int shortcut_label () const
   Returns whether the widget's label uses '&' to indicate shortcuts.

• void shortcut_label (int value)
   Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
   Makes a widget visible.

• void size (int W, int H)
   Changes the size of the widget.

• int take_focus ()
   Gives the widget the keyboard focus.

• unsigned int takesevents () const

Generated by Doxygen
Returns if the widget is able to take events.

- `int test_shortcut()`
  Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip()`
  Gets the current tooltip text.

- `void tooltip(const char *text)`
  Sets the current tooltip text.

- `Fl_Window * top_window()`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset(int &xoff, int &yoff)`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type()`
  Gets the widget type.

- `void type(uchar t)`
  Sets the widget type.

- `int use_accents_menu()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void * user_data()`
  Gets the user data for this widget.

- `void user_data(Fl_Callback_User_Data *v, bool auto_free)`
  Sets the user data for this widget.

- `void user_data(void *v)`
  Sets the user data for this widget.

- `unsigned int visible()`
  Returns whether a widget is visible.

- `unsigned int visible_focus()`
  Checks whether this widget has a visible focus.

- `void visible_focus(int v)`
  Modifies keyboard focus navigation.

- `int visible_r()`
  Returns whether a widget and all its parents are visible.

- `int w()`
  Gets the widget width.

- `Fl_When when()`
  Returns the conditions under which the callback is called.

- `void when(uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window * window()`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x()`
  Gets the widget position in its window.

- `int y()`
  Gets the widget position in its window.

- `virtual ~Fl_Widget()`
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.

• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,

Protected Member Functions inherited from Fl_Light_Button

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Button

• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
12.118 Fl_Round_Button Class Reference

- **void draw_label()** const
  
  Draws the widget's label at the defined label position.

- **void draw_label(int, int, int, int)** const
  
  Draws the label in an arbitrary bounding box.

- **Fl_Widget(int x, int y, int w, int h, const char *label=0L)**
  
  Creates a widget at the given position and size.

- **unsigned int flags()** const
  
  Gets the widget flags mask.

- **void h(int v)**
  
  Internal use only.

- **void set_flag(unsigned int c)**
  
  Sets a flag in the flags mask.

- **void w(int v)**
  
  Internal use only.

- **void x(int v)**
  
  Internal use only.

- **void y(int v)**
  
  Internal use only.

- **static Fl_Widget_Tracker* key_release_tracker = 0**

12.118.1 Detailed Description

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for **type()** and **when()**.

The **Fl_Round_Button** subclass displays the "on" state by turning on a light, rather than drawing pushed in. The shape of the "light" is initially set to **FL_ROUND_DOWN_BOX**. The color of the light when on is controlled with **selection_color()**, which defaults to **FL_FOREGROUND_COLOR**.

12.118.2 Constructor & Destructor Documentation

12.118.2.1 **Fl_Round_Button()**

**Fl_Round_Button::Fl_Round_Button (**

  int X,
  int Y,
  int W,
  int H,
  const char * L = 0)

Creates a new **Fl_Round_Button** widget using the given position, size, and label string.
The Fl_Round_Button subclass displays the "ON" state by turning on a light, rather than drawing pushed in. The default box type is FL_NO_BOX, which draws the label w/o a box right of the checkmark. The shape of the "light" is set with down_box() and its default value is FL_ROUND_DOWN_BOX. The color of the light when on is controlled with selection_color(), which defaults to FL_FOREGROUND_COLOR (usually black).

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X,Y,W,H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Round_Button.H
- Fl_Round_Button.cxx

### 12.119 Fl_Round_Clock Class Reference

A clock widget of type FL_ROUND_CLOCK.

```c
#include <Fl_Round_Clock.H>
```

Inheritance diagram for Fl_Round_Clock:

```
Fl_Widget
 |   |
|   | Fl_Clock_Output
|   |
|   | Fl_Clock
|   |
|   | Fl_Round_Clock
```

**Public Member Functions**

- `Fl_Round_Clock (int X, int Y, int W, int H, const char *L=0)`
  
  Creates the clock widget, setting his type and box.

**Public Member Functions inherited from Fl_Clock**

- `Fl_Clock (int X, int Y, int W, int H, const char *L=0)`
  
  Create an Fl_Clock widget using the given position, size, and label string.

- `Fl_Clock (uchar t, int X, int Y, int W, int H, const char *L)`
  
  Create an Fl_Clock widget using the given clock type t, position, size, and label string.

- `int handle (int) FL_OVERRIDE`
  
  Handles the specified event.

- `~Fl_Clock ()`
  
  The destructor removes the clock.

**Public Member Functions inherited from Fl_Clock_Output**

- `Fl_Clock_Output (int X, int Y, int W, int H, const char *L=0)`
  
  Create a new Fl_Clock_Output widget with the given position, size and label.

- `int hour () const`
  
  Returns the displayed hour (0 to 23).
12.119 Fl_Round_Clock Class Reference

- **int minute () const**
  Returns the displayed minute (0 to 59).

- **int second () const**
  Returns the displayed second (0 to 60, 60=leap second).

- **int shadow () const**
  Returns the shadow drawing mode of the hands.

- **void shadow (int mode)**
  Sets the shadow drawing mode of the hands.

- **ulong value () const**
  Returns the displayed time.

- **void value (int H, int m, int s)**
  Set the displayed time.

- **void value (ulong v)**
  Set the displayed time.

Public Member Functions inherited from Fl_Widget

- **void _clear_fullscreen ()**
- **void _set_fullscreen ()**
- **void activate ()**
  Activates the widget.

- **unsigned int active () const**
  Returns whether the widget is active.

- **int active_r () const**
  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**
  Gets the label alignment.

- **void align (Fl_Align alignment)**
  Sets the label alignment.

- **long argument () const**
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window * as_gl_window ()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const * as_gl_window () const**

- **virtual Fl_Group * as_group ()**
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **virtual Fl_Group const * as_group () const**

- **virtual Fl_Window * as_window ()**
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **virtual Fl_Window const * as_window () const**

- **void bind_deimage (Fl_Image * img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void bind_deimage (int f)**
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
Gets the box type of the widget.

- **void** box (**Fl_Boxtype** new_box)
  
  Sets the box type for the widget.

- **void** callback (**Fl_Callback** *cb)
  
  Sets the current callback function for the widget.

- **void** callback (**Fl_Callback** *cb, **Fl_Callback_User_Data** *p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.

- **void** callback (**Fl_Callback** *cb, **void** *p)
  
  Sets the current callback function and data for the widget.

- **void** callback (**Fl_Callback0** *cb)
  
  Sets the current callback function for the widget.

- **void** callback (**Fl_Callback1** *cb, long p=0)
  
  Sets the current callback function for the widget.

- **unsigned int** changed ()
  
  Checks if the widget value changed since the last callback.

- **void** clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.

- **void** clear_changed ()
  
  Marks the value of the widget as unchanged.

- **void** clear_damage (uchar c=0)
  
  Clears or sets the damage flags.

- **void** clear_output ()
  
  Sets a widget to accept input.

- **void** clear_visible ()
  
  Hides the widget.

- **void** clear_visible_focus ()
  
  Disables keyboard focus navigation with this widget.

- **Fl_Color** color ()
  
  Gets the background color of the widget.

- **void** color (**Fl_Color** bg)
  
  Sets the background color of the widget.

- **void** color (**Fl_Color** bg, **Fl_Color** sel)
  
  Sets the background and selection color of the widget.

- **Fl_Color** color2 ()
  
  For back compatibility only.

- **void** color2 (unsigned a)
  
  For back compatibility only.

- **int** contains (const **Fl_Widget** *w) const
  
  Checks if w is a child of this widget.

- **void** copy_label (const char *new_label)
  
  Sets the current label.

- **void** copy_tooltip (const char *text)
  
  Sets the current tooltip text.

- **uchar** damage ()
  
  Returns non-zero if draw() needs to be called.

- **void** damage (uchar c)
  
  Sets the damage bits for the widget.

- **void** damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.
• int **damage_resize** (int, int, int, int)
  
  Internal use only.

• void **deactivate** ()
  
  Deactivates the widget.

• Fl_Image **deimage** ()
  
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image **deimage** () const
  
  Gets the image that is used as part of the widget label when in the inactive state.

• void **deimage** (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• void **deimage** (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• int **deimage_bound** () const
  
  Returns whether the inactive image is managed by the widget.

• void **do_callback** (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.

• void **do_callback** (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **do_callback** (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **draw_label** (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int **h** () const
  
  Gets the widget height.

• virtual void **hide** ()
  
  Makes a widget invisible.

• Fl_Image **image** ()
  
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image **image** () const
  
  Gets the image that is used as part of the widget label when in the active state.

• void **image** (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

• void **image** (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.

• int **image_bound** () const
  
  Returns whether the image is managed by the widget.

• int **inside** (const Fl_Widget *wgt) const
  
  Checks if this widget is a child of wgt.

• int **is_label_copied** () const
  
  Returns whether the current label was assigned with copy_label().

• const char **label** () const
  
  Gets the current label text.

• void **label** (const char *text)
  
  Sets the current label pointer.

• void **label** (Fl_Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color **labelcolor** () const
  
  Gets the label color.

• void **labelcolor** (Fl_Color c)
  
  Sets the label color.

• Fl_Font **labelfont** () const
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void \texttt{size} (int W, int H)
  \textit{Changes the size of the widget.}

• int \texttt{take\_focus} ()
  \textit{Gives the widget the keyboard focus.}

• unsigned int \texttt{take\_events} () const
  \textit{Returns if the widget is able to take events.}

• int \texttt{test\_shortcut} ()
  \textit{Returns true if the widget's label contains the entered 'x' shortcut.}

• const char \* \texttt{tooltip} () const
  \textit{Gets the current tooltip text.}

• void \texttt{tooltip} (const char \*text)
  \textit{Sets the current tooltip text.}

  \texttt{FI\_Window} \* \texttt{top\_window} () const
  \textit{Returns a pointer to the top-level window for the widget.}

  \texttt{FI\_Window} \* \texttt{top\_window\_offset} (int \&xoff, int \&yoff) const
  \textit{Finds the x/y offset of the current widget relative to the top-level window.}

• uchar \texttt{type} () const
  \textit{Gets the widget type.}

• void \texttt{type} (uchar t)
  \textit{Sets the widget type.}

• int \texttt{use\_accents\_menu} ()
  \textit{Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.}

• void \texttt{user\_data} () const
  \textit{Gets the user data for this widget.}

• void \texttt{user\_data} (FI\_Callback\_User\_Data \*v, bool auto\_free)
  \textit{Sets the user data for this widget.}

• void \texttt{user\_data} (void \*v)
  \textit{Sets the user data for this widget.}

• unsigned int \texttt{visible} () const
  \textit{Returns whether a widget is visible.}

• unsigned int \texttt{visible\_focus} () const
  \textit{Checks whether this widget has a visible focus.}

• void \texttt{visible\_focus} (int v)
  \textit{Modifies keyboard focus navigation.}

• int \texttt{visible\_r} () const
  \textit{Returns whether a widget and all its parents are visible.}

• int \texttt{w} () const
  \textit{Gets the widget width.}

• \texttt{FI\_When\_when} () const
  \textit{Returns the conditions under which the callback is called.}

• void \texttt{when} (uchar i)
  \textit{Sets the flags used to decide when a callback is called.}

• \texttt{FI\_Window} \* \texttt{window} () const
  \textit{Returns a pointer to the nearest parent window up the widget hierarchy.}

• int \texttt{x} () const
  \textit{Gets the widget position in its window.}

• int \texttt{y} () const
  \textit{Gets the widget position in its window.}

• virtual \texttt{~FI\_Widget} ()
  \textit{Destroys the widget.}
### Additional Inherited Members

#### Static Public Member Functions inherited from Fl_Widget

- `static void default_callback (Fl_Widget *widget, void *data)`
  *The default callback for all widgets that don’t set a callback.*

- `static unsigned int label_shortcut (const char *t)`
  *Returns the Unicode value of the ‘&x’ shortcut in a given text.*

- `static int test_shortcut (const char *t, const bool require_alt=false)`
  *Returns true if the given text t contains the entered ‘&x’ shortcut.*

#### Protected Types inherited from Fl_Widget

- `enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7
  , OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11
  , MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15
  , GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 , NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 , MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

#### Protected Member Functions inherited from Fl_Clock_Output

- `void draw () FL_OVERRIDE`
  *Draw clock with current position and size.*

- `void draw (int X, int Y, int W, int H)`
  *Draw clock with the given position and size.*

#### Protected Member Functions inherited from Fl_Widget

- `void clear_flag (unsigned int c)`
  *Clears a flag in the flags mask.*

- `void draw_backdrop () const`
  *If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.*

- `void draw_box () const`
  *Draws the widget box according its box style.*

- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  *Draws a box of type t, of color c at the widget’s position and size.*

- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  *Draws a box of type t, of color c at the position X,Y and size W,H.*

- `void draw_focus () const`
  *Draws a focus rectangle around the widget.*

- `void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const`
  *Draws a focus rectangle around the widget.*

- `void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  *Draws a focus box for the widget at the given position and size.*

- `void draw_label () const`
  *Draws the widget’s label at the defined label position.*
12.120 Fl_Scheme Class Reference

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

12.119.1 Detailed Description

A clock widget of type FL_ROUND_CLOCK.
Has no box.

12.119.2 Constructor & Destructor Documentation

12.119.2.1 Fl_Round_Clock()

Fl_Round_Clock::Fl_Round_Clock (int X, int Y, int W, int H, const char *L = 0L)

Creates the clock widget, setting his type and box.
Create an Fl_Round_Clock widget using the given position, size, and label string.
The clock type is FL_ROUND_CLOCK and the boxtype is FL_NO_BOX.
This constructor is the same as Fl_Clock(FL_ROUND_CLOCK, X, Y, W, H, L).

See also

Fl_Clock(uchar, int, int, int, int, const char *)

Parameters

| in | X,Y,W,H | position and size of the widget |
| in | L | widget label, default is no label |

The documentation for this class was generated from the following files:

- Fl_Round_Clock.H
- Fl_Clock.cxx

12.120 Fl_Scheme Class Reference

Static Public Member Functions

- static int add_scheme_name (const char *name)
Add a scheme name to the list of known schemes.

• static const char ** names ()

  Return a list of all known scheme names.

• static int num_schemes ()

  Return the number of currently registered schemes.

### 12.120.1 Member Function Documentation

#### 12.120.1.1 add_scheme_name()

```cpp
int Fl_Scheme::add_scheme_name (  
  const char * name ) [static]
```

Add a scheme name to the list of known schemes.

This method is public in FLTK 1.4.0 because derived classes of `Fl_Scheme` are not yet implemented. Thus, users implementing their own schemes can use this method to add the scheme name to the list of known schemes which is for instance used in `Fl_Scheme::names()`.

**Note**

**Attention!** In a future version, when subclasses of `Fl_Scheme` will be implemented, this method will either be replaced by another protected method or it will no longer do anything (kept only for ABI reasons).

The new scheme name must consist of valid ASCII characters as described below:

- lowercase letters 'a'-'z'
- numbers '0'-'9'
- any character in "$+_." (w/o the quotes).

The name must not be longer than 12 ASCII characters (bytes). The new scheme name is added to the end of the unordered list.

**Note**

Call this method only once for each scheme name. If the returned value is \(\leq 0\) you should check the scheme name.

The given scheme name is copied and may be freed directly after the call to `add_scheme_name()`.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>name</th>
<th>New scheme name</th>
</tr>
</thead>
</table>

**Returns**

The new number of schemes if the name was successfully added. This is the same as the index of the scheme + 1.

**Return values**

<table>
<thead>
<tr>
<th>0</th>
<th>Scheme name already exists</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
<td>Invalid character(s) in name</td>
</tr>
<tr>
<td>-2</td>
<td>The name is too long</td>
</tr>
</tbody>
</table>

Generated by Doxygen
Since 1.4.0

12.120.1.2 names()

const char ** Fl_Scheme::names ( ) [static]

Return a list of all known scheme names. This list is only valid until a new scheme is added or one is removed. It is possible that scheme names are appended to the list during the runtime of the program but schemes can’t be removed.

Getting the list of known schemes can be useful to populate a menu of scheme choices to let the user select a scheme. You should process the names immediately and you should never store a pointer to the list or any individual name for later reference because the location of the list can be changed (reallocated) when schemes are added.

The list of scheme names is null-terminated.

Note

Currently (in FLTK 1.4.0) schemes can only be added to the list and not removed from the list. This may change in a later version.

Returns

List of currently known scheme names.

12.120.1.3 num_schemes()

static int Fl_Scheme::num_schemes ( ) [inline], [static]

Return the number of currently registered schemes.

Returns

Number of registered schemes.

The documentation for this class was generated from the following files:

• Fl_Scheme.H
• Fl_Scheme.cxx

12.121 Fl_Scheme_Choice Class Reference

Inheritance diagram for Fl_Scheme_Choice:

Public Member Functions

• Fl_Scheme_Choice (int X, int Y, int W, int H, const char *L=0)
  
The constructor initializes the Fl_Scheme_Choice object with all known schemes.

• int handle (int event) FL_OVERRIDE
  
Handle FLTK events.

• virtual void init_value ()
  
Public method to initialize the value of the Fl_Scheme_Choice widget.
Public Member Functions inherited from Fl_Choice

- **Fl_Choice** (int X, int Y, int W, int H, const char ∗L=0)
  
  Create a new Fl_Choice widget using the given position, size and label string.

- int **value** () const
  
  Gets the index of the last item chosen by the user.

- int **value** (const Fl_Menu_Item ∗v)
  
  Sets the currently selected value using a pointer to menu item.

- int **value** (int v)
  
  Sets the currently selected value using the index into the menu item array.

Public Member Functions inherited from Fl_Menu_

- int **add** (const char ∗)
  
  This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with ↑ separating the menu items, and tab separating the menu item names from an optional shortcut string.

- int **add** (const char ∗, int shortcut, Fl_Callback ∗c, void ∗d=0, int e=0)
  
  Adds a new menu item.

- void **clear** ()
  
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

- int **clear_submenu** (int index)
  
  Clears the specified submenu pointed to by index of all menu items.

- void **copy** (const Fl_Menu_Item ∗m, void ∗user_data=0)
  
  Sets the menu array pointer with a copy of m that will be automatically deleted.

- Fl_Boxtype **down_box** () const
  
  This box type is used to surround the currently-selected items in the menus.

- void **down_box** (Fl_Boxtype b)
  
  Sets the box type used to surround the currently-selected items in the menus.

- Fl_Color **down_color** () const
  
  For back compatibility, same as selection_color()

- void **down_color** (unsigned c)
  
  For back compatibility, same as selection_color()

- int **find_index** (const char ∗name) const
  
  Find the menu item index for a given menu pathname, such as "Edit/Copy".

- int **find_index** (const Fl_Menu_Item ∗item) const
  
  Find the index into the menu array for a given item.

- int **find_index** (Fl_Callback ∗cb) const
  
  Find the index into the menu array for a given callback cb.

- const Fl_Menu_Item ∗**find_item** (const char ∗name)
  
  Find the menu item for a given menu pathname, such as "Edit/Copy".

- const Fl_Menu_Item ∗**find_item** (Fl_Callback ∗cb)
  
  Find the menu item for the given callback cb.

- const Fl_Menu_Item ∗**find_item_with_argument** (long v)
  
  Find the menu item for the given user argument v.

- const Fl_Menu_Item ∗**find_item_with_user_data** (void ∗)
  
  Find the menu item for the given user data v.

- Fl_Menu_ (int, int, int, int, const char ∗L=0)
  
  Creates a new Fl_Menu_ widget using the given position, size, and label string.

- void **global** ()
  
  Make the shortcuts for this menu work no matter what window has the focus when you type it.
• int insert (int index, const char *, int shortcut, Fl_Callback *, void *=0, int e=0)
  Inserts a new menu item at the specified index position.

• int insert (int index, const char *a, const char *b, Fl_Callback *c, void *=0, int e=0)
  See int Fl_Menu_::insert(const char* label, int shortcut, Fl_Callback*, void *=user_data=0, int flags=0)

• int item_pathname (char *name, int namelen, const Fl_Menu_Item *finditem=0) const
  Get the menu 'pathname' for the specified menuitem.

• const Fl_Menu_Item * menu () const
  Returns a pointer to the array of Fl_Menu_Items.

• void menu (const Fl_Menu_Item *m)
  Sets the menu array pointer directly.

• Fl_Boxtype menu_box () const
  Get the box type for the menu popup windows.

• void menu_box (Fl_Boxtype b)
  Set the box type for the menu popup windows.

• const Fl_Menu_Item * menu_end ()
  Finishes menu modifications and returns menu().

• int mode (int i) const
  Gets the flags of item i.

• void mode (int i, int fl)
  Sets the flags of item i.

• const Fl_Menu_Item * mvalue () const
  Returns a pointer to the last menu item that was picked.

• const Fl_Menu_Item * picked (const Fl_Menu_Item *)
  When user picks a menu item, call this.

• const Fl_Menu_Item * prev_mvalue () const
  Returns a pointer to the menu item that was picked before the current one was picked.

• void remove (int)
  Deletes item i from the menu.

• void replace (int, const char *)
  Changes the text of item i.

• void setonly (Fl_Menu_Item *item)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

• void shortcut (int i, int s)
  Changes the shortcut of item i to s.

• int size () const
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.

• void size (int W, int H)
  Returns the menu item with the entered shortcut (key value).

• const char * text () const
  Returns the title of the last item chosen.

• const char * text (int i) const
  Returns the title of item i.

• Fl_Color textcolor () const
  Get the current color of menu item labels.

• void textcolor (Fl_Color c)
  Sets the current color of menu item labels.

• Fl_Font textfont () const
  Gets the current font of menu item labels.

• void textfont (Fl_Font c)
  Sets the current font of menu item labels.
• **Fl_Fontsize** **textsize** () const
  
  Gets the font size of menu item labels.

• void **textsize** (Fl_Fontsize c)

  Sets the font size of menu item labels.

• int **value** () const

  Returns the index into menu() of the last item chosen by the user.

• int **value** (const Fl_Menu_Item *)

  The value is the index into menu() of the last item chosen by the user.

• int **value** (int i)

  The value is the index into menu() of the last item chosen by the user.

### Public Member Functions inherited from Fl_Widget

• void **_clear_fullscreen** ()

• void **_set_fullscreen** ()

  Activates the widget.

• unsigned int **active** () const

  Returns whether the widget is active.

• int **active_r** () const

  Returns whether the widget and all of its parents are active.

• Fl_Align **align** () const

  Gets the label alignment.

• void **align** (Fl_Align alignment)

  Sets the label alignment.

• long **argument** () const

  Gets the current user data (long) argument that is passed to the callback function.

• void **argument** (long v)

  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * **as_gl_window** ()

  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * **as_gl_window** () const

• virtual Fl_Group * **as_group** ()

  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const * **as_group** () const

• virtual Fl_Window * **as_window** ()

  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * **as_window** () const

• void **bind_deimage** (Fl_Image * img)

  Sets the image to use as part of the widget label when in the inactive state.

• void **bind_deimage** (int f)

  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void **bind_image** (Fl_Image * img)

  Sets the image to use as part of the widget label when in the active state.

• void **bind_image** (int f)

  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype **box** () const

  Gets the box type of the widget.

• void **box** (Fl_Boxtype new_box)

  Sets the box type for the widget.

• Fl_Callback **callback** () const
Gets the current callback function for the widget.
• void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.

Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)

Sets the current callback function for the widget.
• void callback (Fl_Callback ∗cb, void ∗p)

Sets the current callback function for the widget.
• void callback (Fl_Callback0 ∗cb)

Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗cb, long p=0)

Checks if the widget value changed since the last callback.
• unsigned int changed () const
  Marks the widget as inactive without sending events or changing focus.
• void clear_active ()

Marks the value of the widget as unchanged.
• void clear_changed ()
  Clears or sets the damage flags.
• void clear_damage (uchar c=0)
  Sets a widget to accept input.
• void clear_input ()

Hides the widget.
• void clear_visible ()
  Disables keyboard focus navigation with this widget.
• void clear_visible_focus ()
• Fl_Color color () const
  Gets the background color of the widget.
• Fl_Color color (Fl_Color bg)
  Sets the background color of the widget.
• Fl_Color color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
  Sets the current label.
• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• **FL_Image * deimage ()**
  
  Gets the image that is used as part of the widget label when in the inactive state.

• **const FL_Image * deimage () const**

  Gets the image that is used as part of the widget label when in the inactive state.

• **void deimage (FL_Image &img)**

  Sets the image to use as part of the widget label when in the inactive state.

• **void deimage (FL_Image *img)**

  Sets the image to use as part of the widget label when in the inactive state.

• **int deimage_bound () const**

  Returns whether the inactive image is managed by the widget.

• **void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**

  Calls the widget callback function with default arguments.

• **void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**

  Calls the widget callback function with arbitrary arguments.

• **void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**

  Calls the widget callback function with arbitrary arguments.

• **void draw_label (int, int, int, int, Fl_Align) const**

  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• **int h () const**

  Gets the widget height.

• **virtual void hide ()**

  Makes a widget invisible.

• **FL_Image * image ()**

  Gets the image that is used as part of the widget label when in the active state.

• **const FL_Image * image () const**

  Gets the image that is used as part of the widget label when in the active state.

• **void image (FL_Image &img)**

  Sets the image to use as part of the widget label when in the active state.

• **void image (FL_Image *img)**

  Sets the image to use as part of the widget label when in the active state.

• **int image_bound () const**

  Returns whether the image is managed by the widget.

• **int inside (const FL_Widget *wgt) const**

  Checks if this widget is a child of wgt.

• **int is_label_copied () const**

  Returns whether the current label was assigned with copy_label().

• **const char * label () const**

  Gets the current label text.

• **void label (const char *text)**

  Sets the current label pointer.

• **void label (FL_Labeltype a, const char *b)**

  Shortcut to set the label text and type in one call.

• **FL_Color labelcolor () const**

  Gets the label color.

• **void labelcolor (FL_Color c)**

  Sets the label color.

• **FL_Font labelfont () const**

  Gets the font to use.

• **void labelfont (FL_Font f)**

  Sets the font to use.

• **FL_Fontsize labelsize () const**
Gets the font size in pixels.

- void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

- Fl_Labeltype labeltype () const
  Gets the label type.

- void labeltype (Fl_Labeltype a)
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - “for hacks only”.

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget's label uses '&’ to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takeevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Static Protected Member Functions
• static void scheme_cb_ (Fl_Widget *w, void *)
  Internal Fl_Scheme_Choice callback function (protected).
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void **default_callback**( Fl_Widget *widget, void *data)  
  The default callback for all widgets that don't set a callback.
- static unsigned int **labelShortcut**( const char *t)  
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int **testShortcut**( const char *t, const bool require_alt=false)  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,  
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,  
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPY_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,  
  MENU_WINDOW = 1<<12, TOOLBOX_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,  
  GROUP_RELATIVE = 1<<16, COPY_TOOTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,  
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,

  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31  
} flags possible values enumeration.

Protected Member Functions inherited from Fl_Choice

- void **draw** FL_OVERRIDE  
  Draws the widget.

Protected Member Functions inherited from Fl_Menu_

- int **itemGetName**( char *name, int namelen, const Fl_Menu_Item *findItem, const Fl_Menu_Item *menu=0) const

Protected Member Functions inherited from Fl_Widget

- void **clearFlag**( unsigned int c)  
  Clears a flag in the flags mask.
- void **drawBackdrop**() const  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **drawBox**() const  
  Draws the widget box according its box style.
- void **drawBox**( Fl_Boxtype t, Fl_Color c) const  
  Draws a box of type t, of color c at the widget’s position and size.
- void **drawBox**( Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const  
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void **drawFocus**() const  
  Draws a focus rectangle around the widget.
- void **drawFocus**( Fl_Boxtype t, int X, int Y, int W, int H) const  
  Draws a focus rectangle around the widget.
- void **drawFocus**( Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
Draws a focus box for the widget at the given position and size.

- void `draw_label()` const
  Draws the widget's label at the defined label position.

- void `draw_label(int, int, int, int)` const
  Draws the label in an arbitrary bounding box.

- `Fl_Widget(int x, int y, int w, int h, const char *label=0L)`
  Creates a widget at the given position and size.

- unsigned int `flags()` const
  Gets the widget flags mask.

- void `h(int v)`
  Internal use only.

- void `set_flag(unsigned int c)`
  Sets a flag in the flags mask.

- void `w(int v)`
  Internal use only.

- void `x(int v)`
  Internal use only.

- void `y(int v)`
  Internal use only.

Protected Attributes inherited from `Fl_Menu`

- uchar `alloc`
- uchar `down_box_`
- `Fl_Boxtype menu_box_`
- `Fl_Color textcolor_`
- `Fl_Font textfont_`
- `Fl_Fontsize textsize_`

12.121.1 Constructor & Destructor Documentation

12.121.1.1 `Fl_Scheme_Choice()`

`Fl_Scheme_Choice::Fl_Scheme_Choice(int X, int Y, int W, int H, const char *L=0L)`
The constructor initializes the `Fl_Scheme_Choice` object with all known schemes.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int <code>X,Y</code></td>
<td>Widget coordinates</td>
</tr>
<tr>
<td>int <code>W,H</code></td>
<td>Widget size (width, height)</td>
</tr>
<tr>
<td><code>L</code></td>
<td>Widget label (default: NULL, no label)</td>
</tr>
</tbody>
</table>

12.121.2 Member Function Documentation

12.121.2.1 `handle()`

`int Fl_Scheme_Choice::handle(int event)` [virtual]
Handle FLTK events.
This widget uses FL_SHOW and some other events to initialize its `value()` according to the current scheme. All events are also handled by the base class `Fl_Choice`.

**Parameters**

| in | event |

**Returns**

1 if the event was used, 0 otherwise

Reimplemented from `Fl_Choice`.

### 12.121.2.2 init_value()

```cpp
void Fl_Scheme_Choice::init_value ( ) [virtual]
```

Public method to initialize the value of the `Fl_Scheme_Choice` widget. Normally you don't need to call this unless you change the current scheme by calling `Fl::scheme(const char *)`. The `Fl_Scheme_Choice` widget does this automatically when the widget is shown (when receiving the FL_SHOW event) which should always be after `Fl_Window::show(argc, argv)` which may set the current scheme by interpreting the commandline.

Since 1.4.0

### 12.121.2.3 scheme_cb()

```cpp
void Fl_Scheme_Choice::scheme_cb_ ( Fl_Widget * w, void * ) [static], [protected]
```

Internal `Fl_Scheme_Choice` callback function (protected). You don't need to set a callback for this widget. The default callback changes the scheme (`Fl::scheme()`) and redraws all open windows. You may override the callback if changing the scheme shall redraw other windows or don't redraw the window at all.

**Parameters**

| in | w | The Fl_Scheme_Choice widget |

The documentation for this class was generated from the following files:

- `Fl_Scheme_Choice.H`
- `Fl_Scheme_Choice.cxx`

### 12.122 Fl_Scroll Class Reference

This container widget lets you maneuver around a set of widgets much larger than your window.

```cpp
#include <Fl_Scroll.H>
```

Inheritance diagram for `Fl_Scroll`:

```
Fl_Widget
   /|
  / Fl_Group
 /|
Fl_Scroll
```
Classes

- **struct Fl_Region_LRTB**
  A local struct to manage a region defined by left/right/top/bottom.
- **struct Fl_Region_XYWH**
  A local struct to manage a region defined by xywh.
- **struct Fl_Scrollbar_Data**
  A local struct to manage a scrollbar’s xywh region and tab values.
- **struct ScrollInfo**
  Structure to manage scrollbar and widget interior sizes.

Public Types

- enum {
  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7
}

Public Member Functions

- **void clear ()**
  Clear all but the scrollbars...
- **int delete_child (int n) FL_OVERRIDE**
  Removes the widget at index from the group and deletes it.
- **Fl_Scroll (int X, int Y, int W, int H, const char ∗L=0)**
  Creates a new Fl_Scroll widget using the given position, size, and label string.
- **int handle (int) FL_OVERRIDE**
  Handles the specified event.
- **void resize (int X, int Y, int W, int H) FL_OVERRIDE**
  Resizes the Fl_Scroll widget and moves its children if necessary.
- **void scroll_to (int, int)**
  Moves the contents of the scroll group to a new position.
- **int scrollbar_size () const**
  Gets the current size of the scrollbars’ troughs, in pixels.
- **void scrollbar_size (int newSize)**
  Sets the pixel size of the scrollbars’ troughs to newSize, in pixels.
- **int xposition () const**
  Gets the current horizontal scrolling position.
- **int yposition () const**
  Gets the current vertical scrolling position.
- **virtual ∼Fl_Scroll ()**
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Group

- **Fl_Widget ∗& _ddfdesign_kludge ()**
  This is for forms compatibility only.
- **void add (Fl_Widget &)**
  The widget is removed from its current group (if any) and then added to the end of this group.
- **void add (Fl_Widget ∗o)**
  See void Fl_Group::add(Fl_Widget &w)
- **void add_resizable (Fl_Widget &o)**
  Adds a widget to the group and makes it the resizable widget.
- **Fl_Widget ∗const ∗ array () const**
Returns a pointer to the array of children.

- `Fl_Group const * as_group () const FL_OVERRIDE`  
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

- `void begin ()`  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- `Fl_Widget * child (int n) const`  
  Returns `array()[n]`.

- `int children () const`  
  Returns how many child widgets the group has.

- `void clear ()`  
  Deletes all child widgets from memory recursively.

- `unsigned int clip_children ()`  
  Returns the current clipping mode.

- `void clip_children (int c)`  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- `void end ()`  
  Exactly the same as `current(this->parent())`.

- `int find (const Fl_Widget &o) const`  
  See `int Fl_Group::find(const Fl_Widget *w) const`.

- `int find (const Fl_Widget *) const`  
  Searches the child array for the widget and returns the index.

- `Fl_Group (int, int, int, int, const char *)=0)`  
  Creates a new `Fl_Group` widget using the given position, size, and label string.

- `void focus (Fl_Widget *W)`

- `void forms_end ()`  
  This is for forms compatibility only.

- `void init_sizes ()`  
  Resets the internal array of widget sizes and positions.

- `void insert (Fl_Widget &, int i)`  
  The widget is removed from its current group (if any) and then inserted into this group.

- `void insert (Fl_Widget &o, Fl_Widget *before)`  
  This does `insert(w, find(before))`.

- `void remove (Fl_Widget &)`  
  Removes a widget from the group but does not delete it.

- `void remove (Fl_Widget *=o)`  
  Removes the widget `o` from the group.

- `void remove (int index)`  
  Removes the widget at index from the group but does not delete it.

- `Fl_Widget * resizable () const`  
  Returns the group's resizable widget.

- `void resizable (Fl_Widget &o)`  
  Sets the group's resizable widget.

- `void resizable (Fl_Widget *=o)`  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- `virtual ~Fl_Group ()`  
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- void **clear_changed** ()
  Marks the value of the widget as unchanged.

- void **clear_damage** (uchar c=0)
  Clears or sets the damage flags.

- void **clear_output** ()
  Sets a widget to accept input.

- void **clear_visible** ()
  Hides the widget.

- void **clear_visible_focus** ()
  Disables keyboard focus navigation with this widget.

- **Fl_Color** **color** () const
  Gets the background color of the widget.

- void **color** (**Fl_Color** bg)
  Sets the background color of the widget.

- void **color** (**Fl_Color** bg, **Fl_Color** sel)
  Sets the background and selection color of the widget.

- **Fl_Color** **color2** () const
  For back compatibility only.

- void **color2** (unsigned a)
  For back compatibility only.

- int **contains** (**const Fl_Widget** *w) const
  Checks if *w* is a child of this widget.

- void **copy_label** (**const char** *new_label)
  Sets the current label.

- void **copy_tooltip** (**const char** *text)
  Sets the current tooltip text.

- uchar **damage** () const
  Returns non-zero if **draw()** needs to be called.

- void **damage** (uchar c)
  Sets the damage bits for the widget.

- void **damage** (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int **damage_resize** (int, int, int, int)
  Internal use only.

- void **deactivate** ()
  Deactivates the widget.

- **Fl_Image** * **deimage** ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const **Fl_Image** * **deimage** () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void **deimage** (**Fl_Image** &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void **deimage** (**Fl_Image** *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int **deimage_bound** () const
  Returns whether the inactive image is managed by the widget.

- void **do_callback** (**Fl_Callback_Reas**on reason=**FL_REASON_UNKNOWN**)
  Calls the widget callback function with default arguments.

- void **do_callback** (**Fl_Widget** *widget, long arg, **Fl_Callback_Reas**on reason=**FL_REASON_UNKNOWN**)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
Returns if a widget is used for output only.

- **Fl_Group** ∗ **parent ()** const
  
  Returns a pointer to the parent widget.

- **void** **parent (Fl_Group ∗p)**
  
  Internal use only - “for hacks only”.

- **void** **position (int X, int Y)**
  
  Repositions the window or widget.

- **void** **redraw ()**
  
  Schedules the drawing of the widget.

- **void** **redraw_label ()**
  
  Schedules the drawing of the label.

- **Fl_Color** **selection_color ()** const
  
  Gets the selection color.

- **void** **selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void** **set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void** **set_changed ()**
  
  Marks the value of the widget as changed.

- **void** **set_output ()**
  
  Sets a widget to output only.

- **void** **set_visible ()**
  
  Makes the widget visible.

- **void** **set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int** **shortcut_label ()** const
  
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- **void** **shortcut_label (int value)**
  
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- **virtual** **void** **show ()**
  
  Makes a widget visible.

- **void** **size (int W, int H)**
  
  Changes the size of the widget.

- **int** **take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int** **takesevents ()** const
  
  Returns if the widget is able to take events.

- **int** **testShortcut ()**
  
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- **const char ∗** **tooltip ()** const
  
  Gets the current tooltip text.

- **void** **tooltip (const char ∗text)**
  
  Sets the current tooltip text.

- **Fl_Window ∗** **top_window ()** const
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window ∗** **top_window_offset (int &xoff, int &yoff)** const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar** **type ()** const
  
  Gets the widget type.

- **void** **type (uchar t)**
  
  Sets the widget type.
• int \texttt{use\_accents\_menu} ()

  Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.

• void \ast \texttt{user\_data} () const

  Gets the user data for this widget.

• void \texttt{user\_data} (FL Callback User Data \ast v, bool auto\_free)

  Sets the user data for this widget.

• void \texttt{user\_data} (void \ast v)

  Sets the user data for this widget.

• unsigned int \texttt{visible} () const

  Returns whether a widget is visible.

• unsigned int \texttt{visible\_focus} () const

  Checks whether this widget has a visible focus.

• void \texttt{visible\_focus} (int v)

  Modifies keyboard focus navigation.

• int \texttt{visible\_r} () const

  Returns whether a widget and all its parents are visible.

• int \texttt{w} () const

  Gets the widget width.

• FL\_When \texttt{when} () const

  Returns the conditions under which the callback is called.

• void \texttt{when} (uchar i)

  Sets the flags used to decide when a callback is called.

• FL\_Window \ast \texttt{window} () const

  Returns a pointer to the nearest parent window up the widget hierarchy.

• int \texttt{x} () const

  Gets the widget position in its window.

• int \texttt{y} () const

  Gets the widget position in its window.

• virtual \texttt{~FL\_Widget} ()

  Destroys the widget.

\textbf{Public Attributes}

• \texttt{FL\_Scrollbar hscrollbar}

• \texttt{FL\_Scrollbar scrollbar}

\textbf{Protected Member Functions}

• void \texttt{bbox} (int \&, int \&, int \&, int \&) const

  Returns the bounding box for the interior of the scrolling area, inside the scrollbars.

• void \texttt{draw} () \texttt{FL\_OVERRIDE}

  Draws the widget.

• void \texttt{fix\_scrollbar\_order} ()

  Ensure the scrollbars are the last children.

• int \texttt{on\_insert} (FL\_Widget \ast, int) \texttt{FL\_OVERRIDE}

  Change insert position of a child before it is added.

• int \texttt{on\_move} (int, int) \texttt{FL\_OVERRIDE}

  Change new position of a child before it is moved.

• void \texttt{recalc\_scrollbars} (ScrollInfo \&si) const

  Calculate visibility/size/position of scrollbars, find children's bounding box.
Protected Member Functions inherited from Fl_Group

- **Fl_Rect ∗ bounds ()**
  Returns the internal array of widget sizes and positions.

- **void draw_child (Fl_Widget &widget) const**
  Forces a child to redraw.

- **void draw_children ()**
  Draws all children of the group.

- **void draw_outside_label (const Fl_Widget &widget) const**
  Parents normally call this to draw outside labels of child widgets.

- **virtual void on_remove (int)**
  Allow derived groups to act when a child widget is removed from the group.

- **int ∗ sizes ()**
  Returns the internal array of widget sizes and positions.

- **void update_child (Fl_Widget &widget) const**
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

- **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box () const**
  Draws the widget box according its box style.

- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus () const**
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const**
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  Draws a focus box for the widget at the given position and size.

- **void draw_label () const**
  Draws the widget's label at the defined label position.

- **void draw_label (int, int, int, int) const**
  Draws the label in an arbitrary bounding box.

- **Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)**
  Creates a widget at the given position and size.

- **unsigned int flags () const**
  Gets the widget flags mask.

- **void h (int v)**
  Internal use only.

- **void set_flag (unsigned int c)**
  Sets a flag in the flags mask.

- **void w (int v)**
  Internal use only.

- **void x (int v)**
  Internal use only.

- **void y (int v)**
  Internal use only.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

flags possible values enumeration.

12.122.1 Detailed Description

This container widget lets you maneuver around a set of widgets much larger than your window. If the child widgets are larger than the size of this object then scrollbars will appear so that you can scroll over to them:

![Figure 12.41 Fl_Scroll](image)

If all of the child widgets are packed together into a solid rectangle then you want to set box() to FL_NO_BOX or one of the _FRAME types. This will result in the best output. However, if the child widgets are a sparse arrangement you must set box() to a real _BOX type. This can result in some blinking during redrawing, but that can be solved by using a Fl_Double_Window.

The Fl_Scroll widget calculates the bounding box of all its children by using their widget positions and sizes (x, y, w, h). Outside labels are not considered. If you need outside labels of any widgets or free space outside of this bounding box you can add a tiny invisible Fl_Box at the relevant corner(s) of the Fl_Scroll widget, for instance:
By default you can scroll in both directions, and the scrollbars disappear if the data will fit in the area of the scroll. Use `Fl_Scroll::type()` to change this as follows:

- **0** - No scrollbars
- **Fl_Scroll::HORIZONTAL** - Only a horizontal scrollbar.
- **Fl_Scroll::VERTICAL** - Only a vertical scrollbar.
- **Fl_Scroll::BOTH** - The default is both scrollbars.
- **Fl_Scroll::HORIZONTAL_ALWAYS** - Horizontal scrollbar always on, vertical always off.
- **Fl_Scroll::VERTICAL_ALWAYS** - Vertical scrollbar always on, horizontal always off.
- **Fl_Scroll::BOTH_ALWAYS** - Both always on.

Use `scrollbar.align(int)` (see `void Fl_Widget::align(Fl_Align)`): to change what side the scrollbars are drawn on.

If the FL_ALIGN_LEFT bit is on, the vertical scrollbar is on the left. If the FL_ALIGN_TOP bit is on, the horizontal scrollbar is on the top. Note that only the alignment flags in scrollbar are considered. The flags in hscrollbar however are ignored.

This widget can also be used to pan around a single child widget "canvas". This child widget should be of your own class, with a `draw()` method that draws the contents. The scrolling is done by changing the x() and y() of the widget, so this child must use the x() and y() to position its drawing. To speed up drawing it should test `fl_not_clipped(int x, int y, int w, int h)` to find out if a particular area of the widget must be drawn.

Another very useful child is a single `Fl_Pack`, which is itself a group that packs its children together and changes size to surround them. Filling the `Fl_Pack` with `Fl_Tabs` groups (and then putting normal widgets inside those) gives you a very powerful scrolling list of individually-openable panels.

Fluid lets you create these, but you can only lay out objects that fit inside the `Fl_Scroll` without scrolling. Be sure to leave space for the scrollbars, as Fluid won’t show these either.

You cannot use `Fl_Window` as a child of this since the clipping is not conveyed to it when drawn, and it will draw over the scrollbars and neighboring objects.

### 12.122.2 Constructor & Destructor Documentation

#### 12.122.2.1 `Fl_Scroll()`

```cpp
Fl_Scroll::Fl_Scroll ( int X, int Y, int W, int H, const char ∗L = 0 )
```

Creates a new `Fl_Scroll` widget using the given position, size, and label string.

The default boxtype is FL_NO_BOX.

The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the `Fl_Scroll` and all of its children can be automatic (local) variables, but you must declare the `Fl_Scroll` first, so that it is destroyed last.

#### 12.122.2.2 `~Fl_Scroll()`

```cpp
Fl_Scroll::~Fl_Scroll ( ) [virtual]
```

The destructor also deletes all the children.

See also

```cpp
Fl_Group::~Fl_Group()
```
12.122.3 Member Function Documentation

12.122.3.1 bbox()

```c++
void Fl_Scroll::bbox (
    int & X,
    int & Y,
    int & W,
    int & H ) const [protected]
```

Returns the bounding box for the interior of the scrolling area, inside the scrollbars.
This method does not change the scrollbars or their visibility. First the scrollbar positions and visibility are calculated
as they should be, according to the positions and sizes of the children. Then the bounding box is calculated.
You may need to call `redraw()` to make sure the widget gets updated.

See also

recalc_scrollbars()

12.122.3.2 delete_child()

```c++
int Fl_Scroll::delete_child ( int index ) [virtual]
```

Removes the widget at `index` from the group and deletes it.
This method does nothing if `index` is out of bounds or if `Fl_Group::child(index)` is one of the scrollbars.

Parameters

<table>
<thead>
<tr>
<th>index</th>
</tr>
</thead>
<tbody>
<tr>
<td>index of child to be removed</td>
</tr>
</tbody>
</table>

Returns

success (0) or error code

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>success</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>index out of range</td>
</tr>
<tr>
<td>2</td>
<td>widget not allowed to be removed (see note)</td>
</tr>
</tbody>
</table>

See also

`Fl_Group::delete_child(int index)`

Since

FLTK 1.4.0

Reimplemented from `Fl_Group`.

12.122.3.3 draw()

```c++
void Fl_Scroll::draw ( ) [protected], [virtual]
```

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call `redraw()` instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded
scrollbar, you can do it (because `draw()` is virtual) like this:

```c++
Fl_Widget *s = scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from `Fl_Group`. 

Generated by Doxygen
12.122.3.4 **fix_scrollbar_order()**

```c
void Fl_Scroll::fix_scrollbar_order ( ) [protected]
```

Ensure the scrollbars are the last children. When `Fl_Scroll` is instantiated the first child of the `Fl_Group` is the vertical scrollbar `scrollbar` and the second child is the horizontal scrollbar `hscrollbar`. These two widgets must always be the last two widgets and in this order to guarantee the correct drawing order and event delivery. Since FLTK 1.4.0 the new method `on_insert()` modifies the insert position of other children if it would be after the scrollbars.

12.122.3.5 **handle()**

```c
int Fl_Scroll::handle ( int event ) [virtual]
```

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

**Parameters**

| in  | event | the kind of event received |

**Return values**

- 0 if the event was not used or understood
- 1 if the event was used and can be deleted

**See also**

`Fl_Event`

Reimplemented from `Fl_Group`.

12.122.3.6 **on_insert()**

```c
int Fl_Scroll::on_insert ( Fl_Widget * candidate, int index ) [protected], [virtual]
```

Change insert position of a child before it is added. Fix insert position if the new child is planned to be inserted after the scrollbars. We can assume that the scrollbars are always the last two children! `Fl_Group` calls this when a new widget is added. We return the new index if the new widget would be added after the scrollbars.

**Parameters**

| in  | candidate | the candidate will be added to the child array_ after this method returns. |
| in  | index     | add the child at this position in the array_ |

Generated by Doxygen
Returns

- index to position the child as planned
- a new index to force the child to a different position
-1 to keep the group from adding the candidate

Version

1.4.0

See also

Fl_Group::on_insert(Fl_Widget *candidate, int index)

Reimplemented from Fl_Group.

12.122.3.7 on_move()

```c
int Fl_Scroll::on_move (int old_index, int new_index) [protected], [virtual]
```

Change new position of a child before it is moved.
Fix new position if the new child is planned to be moved after the scrollbars. We can assume that the scrollbars are always the last two children!
Fl_Group calls this when a widget is moved within the list of children. We return a new index if the widget would be moved after the scrollbars.

Parameters

<table>
<thead>
<tr>
<th>old_index</th>
<th>the current index of the child that will be moved</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_index</td>
<td>the new index of the child</td>
</tr>
</tbody>
</table>

Returns

new index, possibly corrected to avoid last two scrollbar entries

Reimplemented from Fl_Group.

12.122.3.8 recalc_scrollbars()

```c
void Fl_Scroll::recalc_scrollbars (ScrollInfo & si) const [protected]
```

Calculate visibility/size/position of scrollbars, find children's bounding box.
The `si` parameter will be filled with data from the calculations. Derived classes can make use of this call to figure out the scrolling area eg. during resize() handling.
This method does not change the scrollbars or their visibility. It calculates the scrollbar positions and visibility as they should be, according to the positions and sizes of the children.
You may need to call `redraw()` to make sure the widget gets updated.

Parameters

| in,out | si | - ScrollInfo structure, filled with data |

Generated by Doxygen
12.122.3.9 resize()

void Fl_Scroll::resize {
    int X,
    int Y,
    int W,
    int H ) [virtual]
Resizes the Fl_Scroll widget and moves its children if necessary.
The Fl_Scroll widget first resizes itself, and then it moves all its children if (and only if) the Fl_Scroll widget has been
moved. The children are moved by the same amount as the Fl_Scroll widget has been moved, hence all children
keep their relative positions.

Note
Fl_Scroll::resize() does not call Fl_Group::resize(), and child widgets are not resized.
Since children of an Fl_Scroll are not resized, the resizable() widget is ignored (if it is set).
The scrollbars are moved to their proper positions, as given by Fl_Scroll::scrollbar.align(), and switched on or off as
necessary.

Note
Due to current (FLTK 1.3.x) implementation constraints some of this may effectively be postponed until the
Fl_Scroll is drawn the next time. This may change in a future release.

See also
Fl_Group::resizable()
Fl_Widget::resize(int,int,int,int)
Reimplemented from Fl_Group.

12.122.3.10 scroll_to()

void Fl_Scroll::scroll_to {
    int X,
    int Y )
Moves the contents of the scroll group to a new position.
This is like moving the scrollbars of the Fl_Scroll around. For instance:
Fl_Scroll scroll (10,10,200,200);
Fl_Box b1 ( 10, 10,50,50,"b1"); // relative (x,y) = (0,0)
Fl_Box b2 ( 60, 60,50,50,"b2"); // relative (x,y) = (50,50)
Fl_Box b3 (60,110,50,50,"b3"); // relative (x,y) = (50,100)
// populate scroll with more children ...
scroll.end();
scroll.scroll_to(50,100);
will move the logical origin of the internal scroll area to (-50,-100) relative to the origin of the Fl_Scroll (10,10), i.e.
Fl_Box b3 will be visible in the top left corner of the scroll area.

12.122.3.11 scrollbar_size() [1/2]

int Fl_Scroll::scrollbar_size ( ) const [inline]
Gets the current size of the scrollbars' troughs, in pixels.
If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.

Returns
Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also
Fl::scrollbar_size(int)
scrollbar_size() [2/2]

```cpp
void Fl_Scroll::scrollbar_size (  
    int newSize ) [inline]
```

Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.

Normally you should not need this method, and should use `Fl::scrollbar_size(int)` instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.

Setting `newSize` to the special value of 0 causes the widget to track the global `Fl::scrollbar_size()`, which is the default.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>newSize</th>
<th>Sets the scrollbar size in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If 0 (default), scrollbar size tracks the global <code>Fl::scrollbar_size()</code></td>
</tr>
</tbody>
</table>

**See also**

`Fl::scrollbar_size()`

12.122.3.13 xposition()

```cpp
int Fl_Scroll::xposition ( ) const [inline]
```

Gets the current horizontal scrolling position.

12.122.3.14 yposition()

```cpp
int Fl_Scroll::yposition ( ) const [inline]
```

Gets the current vertical scrolling position.

The documentation for this class was generated from the following files:

- Fl_Scroll.H
- Fl_Scroll.cxx

12.123 Fl_Scrollbar Class Reference

The `Fl_Scrollbar` widget displays a slider with arrow buttons at the ends of the scrollbar.

```cpp
#include <Fl_Scrollbar.H>
```

Inheritance diagram for `Fl_Scrollbar`:

```
Fl_Widget
   \--- Fl_Valuator
       \--- Fl_Slider
           \--- Fl_Scrollbar
```
Public Member Functions

- **Fl_Scrollbar** (int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Scrollbar widget with given position, size, and label.

- **int handle**(int) FL_OVERRIDE
  
  Handles the specified event.

- **int linesize**(int i) const
  
  Get the size of step, in lines, that the arrow keys move.

- **void linesize**(int i)
  
  This number controls how big the steps are that the arrow keys do.

- **int value**(int) const
  
  Gets the integer value (position) of the slider in the scrollbar.

- **int value**(int p)
  
  Sets the value (position) of the slider in the scrollbar.

- **int value**(int pos, int windowSize, int first_line, int total_lines)
  
  Sets the position, size and range of the slider in the scrollbar.

- **~Fl_Scrollbar**()
  
  Destroys the Scrollbar.

Public Member Functions inherited from Fl_Slider

- **void bounds**(double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **Fl_Slider**(int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Slider widget using the given position, size, and label string.

- **Fl_Slider**(uchar t, int X, int Y, int W, int H, const char *L)
  
  Creates a new Fl_Slider widget using the given type, position, size, and label string.

- **int handle**(int) FL_OVERRIDE
  
  Handles the specified event.

- **int scrollvalue**(int pos, int size, int first, int total)
  
  Sets the size and position of the sliding knob in the box.

- **Fl_Boxtype slider**(int) const
  
  Gets the slider box type.

- **void slider**(Fl_Boxtype c)
  
  Sets the slider box type.

- **float slider_size**(int) const
  
  Get the dimensions of the moving piece of slider.

- **void slider_size**(double v)
  
  Set the dimensions of the moving piece of slider.

Public Member Functions inherited from Fl_Valuator

- **void bounds**(double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp**(double)
  
  Clamps the passed value to the valuator range.

- **virtual int format**(char *)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment**(double, int)
  
  Adds n times the step value to the passed value.

- **double maximum**(int) const
  
  Gets the maximum value for the valuator.
• void maximum (double a)
  *Sets the maximum value for the valuator.*

• double minimum () const
  *Gets the minimum value for the valuator.*

• void minimum (double a)
  *Sets the minimum value for the valuator.*

• void precision (int digits)
  *Sets the step value to 1.0 / 10^digits.*

• void range (double a, double b)
  *Sets the minimum and maximum values for the valuator.*

• double round (double)
  *Round the passed value to the nearest step increment.*

• double step () const
  *Gets or sets the step value.*

• void step (double a, int b)
  *See double Fl_Valuator::step() const*

• void step (double s)
  *See double Fl_Valuator::step() const.*

• void step (int a)
  *See double Fl_Valuator::step() const*

• double value () const
  *Gets the floating point(double) value.*

• int value (double)
  *Sets the current value.*

### Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()

• void _set_fullscreen ()

• void activate ()
  *Activates the widget.*

• unsigned int active () const
  *Returns whether the widget is active.*

• int active_r () const
  *Returns whether the widget and all of its parents are active.*

• Fl_Align align () const
  *Gets the label alignment.*

• void align (Fl_Align alignment)
  *Sets the label alignment.*

• long argument () const
  *Gets the current user data (long) argument that is passed to the callback function.*

• void argument (long v)
  *Sets the current user data (long) argument that is passed to the callback function.*

• virtual class Fl_Gl_Window * as_gl_window ()
  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

• virtual class Fl_Gl_Window const * as_gl_window () const

• virtual Fl_Group * as_group ()
  *Returns an Fl_Group pointer if this widget is an Fl_Group.*

• virtual Fl_Group const * as_group () const

• virtual Fl_Window * as_window ()

• virtual Fl_Window const * as_window () const
Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.

- virtual `Fl_Window` const * as_window () const

Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (Fl_Image *img)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image *img)

Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- `Fl_Boxtype` box () const

Gets the box type of the widget.

- void box (Fl_Boxtype new_box)

Sets the box type for the widget.

- `Fl_Callback_p` callback () const

Gets the current callback function for the widget.

- void callback (Fl_Callback *cb)

Sets the current callback function for the widget.

- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)

Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, void *p)

Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 *cb)

Sets the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)

Sets the current callback function for the widget.

- unsigned int changed () const

Checks if the widget value changed since the last callback.

- void clear_active ()

Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()

Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)

Clears or sets the damage flags.

- void clear_output ()

Sets a widget to accept input.

- void clear_visible ()

Hides the widget.

- void clear_visible_focus ()

Disables keyboard focus navigation with this widget.

- `Fl_Color` color () const

Gets the background color of the widget.

- void color (Fl_Color bg)

Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.

- `Fl_Color` color2 () const

For back compatibility only.

- void color2 (unsigned a)

For back compatibility only.

- int contains (const Fl_Widget *w) const
Checks if w is a child of this widget.

- **void copy_label (const char ∗new_label)**
  Sets the current label.

- **void copy_tooltip (const char ∗text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **FL_Image ∗deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const FL_Image ∗deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (FL_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (FL_Image ∗img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (FL_Widget ∗widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (FL_Widget ∗widget, void ∗arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **FL_Image ∗image ()**
  Gets the image that is used as part of the widget label when in the active state.

- **const FL_Image ∗image () const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image (FL_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image (FL_Image ∗img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const FL_Widget ∗wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().
- `const char∗ label () const`
  
  Gets the current label text.

- `void label (const char∗ text)`
  
  Sets the current label pointer.

- `void label (FL_Labeltype a, const char ∗b)`
  
  Shortcut to set the label text and type in one call.

- `FL_Color labelcolor () const`
  
  Gets the label color.

- `void labelcolor (FL_Color c)`
  
  Sets the label color.

- `FL_Font labelfont () const`
  
  Gets the font to use.

- `void labelfont (FL_Font f)`
  
  Sets the font to use.

- `FL_Fontsize labelsize () const`
  
  Gets the font size in pixels.

- `void labelsize (FL_Fontsize pix)`
  
  Sets the font size in pixels.

- `FL_Labeltype labelfontype () const`
  
  Gets the label type.

- `void labelfontype (FL_Labeltype a)`
  
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  
  Sets width ww and height hh accordingly with the label size.

- `bool needs_keyboard () const`
  
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  
  Returns if a widget is used for output only.

- `FL_Group ∗ parent () const`
  
  Returns a pointer to the parent widget.

- `void parent (FL_Group ∗p)`
  
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  
  Repositions the window or widget.

- `void redraw ()`
  
  Schedules the drawing of the widget.

- `void redraw_label ()`
  
  Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  
  Changes the size or position of the widget.

- `FL_Color selection_color () const`
  
  Gets the selection color.

- `void selection_color (FL_Color a)`
  
  Sets the selection color.

- `void set_active ()`
  
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  
  Marks the value of the widget as changed.

- `void set_output ()`
  
  Marks the widget as output.
Sets a widget to output only.

- void set_visible ()
  
  *Makes the widget visible.*

- void set_visible_focus ()
  
  *Enables keyboard focus navigation with this widget.*

- int shortcut_label () const
  
  *Returns whether the widget's label uses '§' to indicate shortcuts.*

- void shortcut_label (int value)
  
  *Sets whether the widget's label uses '§' to indicate shortcuts.*

- virtual void show ()
  
  *Makes a widget visible.*

- void size (int W, int H)
  
  *Changes the size of the widget.*

- int take_focus ()
  
  *Gives the widget the keyboard focus.*

- unsigned int takesevents () const
  
  *Returns if the widget is able to take events.*

- int test_shortcut ()
  
  *Returns true if the widget's label contains the entered '§x' shortcut.*

- const char * tooltip () const
  
  *Gets the current tooltip text.*

- void tooltip (const char *text)
  
  *Sets the current tooltip text.*

- Fl_Window * top_window () const
  
  *Returns a pointer to the top-level window for the widget.*

- Fl_Window * top_window_offset (int &xoff, int &yoff) const
  
  *Finds the x/y offset of the current widget relative to the top-level window.*

- uchar type () const
  
  *Gets the widget type.*

- void type (uchar t)
  
  *Sets the widget type.*

- int use_accents_menu ()
  
  *Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.*

- void * user_data () const
  
  *Gets the user data for this widget.*

- void user_data (Fl_Callback_User_Data *v, bool auto_free)
  
  *Sets the user data for this widget.*

- void user_data (void *v)
  
  *Sets the user data for this widget.*

- unsigned int visible () const
  
  *Returns whether a widget is visible.*

- unsigned int visible_focus () const
  
  *Checks whether this widget has a visible focus.*

- void visible_focus (int v)
  
  *Modifies keyboard focus navigation.*

- int visible_r () const
  
  *Returns whether a widget and all its parents are visible.*

- int w () const
  
  *Gets the widget width.*

- Fl_When when () const
  
  *Returns the conditions under which the callback is called.*
• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  
  Gets the widget position in its window.
• int y () const
  
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  
  Draws the widget.

Protected Member Functions inherited from Fl_Slider

• void draw () FL_OVERRIDE
  
  Draws the widget.
• void draw (int, int, int, int)
• int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char * L)
  
  Creates a new Fl_Valuator widget using the given position, size, and label string.
• void handle_drag (double newvalue)
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
• void handle_push ()
  
  Stores the current value in the previous value.
• void handle_release ()
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.
• int horizontal () const
  
  Tells if the valuator is an FL_HORIZONTAL one.
• double previous_value () const
  
  Gets the previous floating point value before an event changed it.
• void set_value (double v)
  
  Sets the current floating point value.
• double softclamp (double)
  
  Clamps the value, but accepts v if the previous value is not already out of range.
• virtual void value_damage ()
  
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.
• void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  
  Draws the widget box according its box style.
• void draw_box (FL_Boxtyle t, FL_Color c) const
Draws a box of type \texttt{t}, of color \texttt{c} at the widget's position and size.

- \textbf{void} \texttt{draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const}
  
  Draws a box of type \texttt{t}, of color \texttt{c} at the position \texttt{X,Y} and size \texttt{W,H}.

- \textbf{void} \texttt{draw_focus () const}
  
  Draws a focus rectangle around the widget.

- \textbf{void} \texttt{draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const}
  
  Draws a focus rectangle around the widget.

- \textbf{void} \texttt{draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const}
  
  Draws a focus box for the widget at the given position and size.

- \textbf{void} \texttt{draw_label () const}
  
  Draws the widget's label at the defined label position.

- \textbf{void} \texttt{draw_label (int, int, int, int) const}
  
  Draws the label in an arbitrary bounding box.

- \textbf{Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)}
  
  Creates a widget at the given position and size.

- \textbf{unsigned int flags () const}
  
  Gets the widget flags mask.

- \textbf{void} \texttt{h (int v)}
  
  Internal use only.

- \textbf{void} \texttt{set_flag (unsigned int c)}
  
  Sets a flag in the flags mask.

- \textbf{void} \texttt{w (int v)}
  
  Internal use only.

- \textbf{void} \texttt{x (int v)}
  
  Internal use only.

- \textbf{void} \texttt{y (int v)}
  
  Internal use only.

### Additional Inherited Members

#### Static Public Member Functions inherited from \texttt{Fl_Widget}

- \textbf{static void} \texttt{default_callback (Fl_Widget ∗widget, void ∗data)}
  
  The default callback for all widgets that don't set a callback.

- \textbf{static unsigned int} \texttt{label_shortcut (const char ∗t)}
  
  Returns the Unicode value of the \texttt{&x} shortcut in a given text.

- \textbf{static int} \texttt{test_shortcut (const char ∗, const bool require_alt=false)}
  
  Returns true if the given text \texttt{t} contains the entered \texttt{&x} shortcut.

#### Protected Types inherited from \texttt{Fl_Widget}

- \textbf{enum} {\n  \texttt{INACTIVE = 1}<0, \texttt{INVISIBLE = 1}<1, \texttt{OUTPUT = 1}<2, \texttt{NOBORDER = 1}<3, \texttt{FORCE_POSITION = 1}<4, \texttt{NON_MODAL = 1}<5, \texttt{SHORTCUT_LABEL = 1}<6, \texttt{CHANGED = 1}<7, \texttt{OVERRIDE = 1}<8, \texttt{VISIBLE_FOCUS = 1}<9, \texttt{COPIED_LABEL = 1}<10, \texttt{CLIP_CHILDREN = 1}<11, \texttt{MENU_WINDOW = 1}<12, \texttt{TOOLTIP_WINDOW = 1}<13, \texttt{MODAL = 1}<14, \texttt{NO_OVERLAY = 1}<15, \texttt{GROUP_RELATIVE = 1}<16, \texttt{COPIED_TOOLTIP = 1}<17, \texttt{FULLSCREEN = 1}<18, \texttt{MAC_USE_ACCENTS_MENU = 1}<19, \texttt{NEEDS_KEYBOARD = 1}<20, \texttt{IMAGE_BOUND = 1}<21, \texttt{DEIMAGE_BOUND = 1}<22, \texttt{AUTO_DELETE_USER_DATA = 1}<23, \texttt{MAXIMIZED = 1}<24, \texttt{USERFLAG3 = 1}<29, \texttt{USERFLAG2 = 1}<30, \texttt{USERFLAG1 = 1}<31}\n  \}

  flags possible values enumeration.
12.123.1 Detailed Description

The Fl_Scrollbar widget displays a slider with arrow buttons at the ends of the scrollbar. Clicking on the arrows move up/left and down/right by linesize(). Scrollbars also accept FL_SHORTCUT events: the arrows move by linesize(), and vertical scrollbars take Page Up/Down (they move by the page size minus linesize()) and Home/End (they jump to the top or bottom). Scrollbars have step(1) preset (they always return integers). If desired you can set the step() to non-integer values. You will then have to use casts to get at the floating-point versions of value() from Fl_Slider.

![Fl_Scrollbar](image)

Figure 12.42 Fl_Scrollbar

12.123.2 Constructor & Destructor Documentation

12.123.2.1 Fl_Scrollbar()

```cpp
Fl_Scrollbar::Fl_Scrollbar ( 
    int X, 
    int Y, 
    int W, 
    int H, 
    const char ∗L = 0 )
```

Creates a new Fl_Scrollbar widget with given position, size, and label. You need to do type(FL_HORIZONTAL) if you want a horizontal scrollbar.

12.123.3 Member Function Documentation

12.123.3.1 draw()

```cpp
void Fl_Scrollbar::draw ( ) [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```cpp
FL_Widget ∗s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.

12.123.3.2 handle()

```cpp
int Fl_Scrollbar::handle ( 
    int event ) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also

FL_Event

Reimplemented from Fl_Widget.

12.123.3.3 linesize()

void Fl_Scrollbar::linesize (int i) [inline]

This number controls how big the steps are that the arrow keys do. In addition page up/down move by the size last sent to value() minus one linesize(). The default is 16.

12.123.3.4 value() [1/3]

int Fl_Scrollbar::value ( ) const [inline]

Gets the integer value (position) of the slider in the scrollbar. You can get the floating point value with Fl_Slider::value().

See also

Fl_Scrollbar::value(int p)
Fl_Scrollbar::value(int pos, int size, int first, int total)

12.123.3.5 value() [2/3]

int Fl_Scrollbar::value (int p) [inline]

Sets the value (position) of the slider in the scrollbar.

See also

Fl_Scrollbar::value()
Fl_Scrollbar::value(int pos, int size, int first, int total)

12.123.3.6 value() [3/3]

int Fl_Scrollbar::value (int p, int windowSize, int first_line, int total_lines) [inline]

Sets the position, size and range of the slider in the scrollbar.
You should call this every time your window changes size, your data changes size, or your scroll position changes (even if in response to a callback from this scrollbar). All necessary calls to `redraw()` are done. Calls `Fl_Slider::scrollvalue(int pos, int size, int first, int total)`.

The documentation for this class was generated from the following files:

- Fl_Scrollbar.H
- Fl_Scrollbar.cxx

### 12.124 FI_Scroll::FI_Scrollbar_Data Struct Reference

A local struct to manage a scrollbar's xywh region and tab values.

```cpp
#include <Fl_Scroll.H>
```

#### Public Attributes

- int **first**
  scrollbar tab's "number of first line"
- int **h**
- int **pos**
  scrollbar tab's "position of first line displayed"
- int **size**
  scrollbar tab's "size of window in lines"
- int **total**
  scrollbar tab's "total number of lines"
- int **w**
- int **x**
- int **y**

### 12.124.1 Detailed Description

A local struct to manage a scrollbar's xywh region and tab values.

The documentation for this struct was generated from the following file:

- Fl_Scroll.H

### 12.125 FI_Secret_Input Class Reference

The **FI_Secret_Input** class is a subclass of **FI_Input** that displays its input as a string of placeholders.

```cpp
#include <FI_Secret_Input.H>
```

Inheritance diagram for **FI_Secret_Input**:
Public Member Functions

- **Fl_Secret_Input** (int X, int Y, int W, int H, const char *l=0)
  Creates a new Fl_Secret_Input widget using the given position, size, and label string.

- **int handle** (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Input

- **Fl_Input** (int, int, int, int, const char * =0)
  Creates a new Fl_Input widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Input_

- **int append** (const char *t, int l=0, char keep_selection=0)
  Append text at the end.

- **bool can_redo** () const
  Check if there is a redo action available.

- **bool can_undo** () const
  Check if the last operation can be undone.

- **int copy** (int clipboard)
  Put the current selection into the clipboard.

- **int copy_cuts** ()
  Copies the yank buffer to the clipboard.

- **Fl_Color cursor_color** () const
  Gets the color of the cursor.

- **void cursor_color** (Fl_Color n)
  Sets the color of the cursor.

- **int cut** ()
  Deletes the current selection.

- **int cut** (int a, int b)
  Deletes all characters between index a and b.

- **int cut** (int n)
  Deletes the next n bytes rounded to characters before or after the cursor.

- **double dvalue** () const
  Returns the widget text interpreted as a floating point number.

- **Fl_Input_** (int, int, int, int, const char *=0)
  Creates a new Fl_Input_ widget.

- **unsigned int index** (int i) const
  Returns the character at index i.

- **int input_type** () const
  Gets the input field type.
• **void input_type** (int t)
  Sets the input field type.

• **int insert** (const char *t, int l=0)
  Inserts text at the cursor position.

• **int insert_position** () const
  Gets the position of the text cursor.

• **int insert_position** (int p)
  Sets the cursor position and mark.

• **int insert_position** (int p, int m)
  Sets the index for the cursor and mark.

• **int ivalue** () const
  Returns the widget text interpreted as a signed integer.

• **int mark** () const
  Gets the current selection mark.

• **int mark** (int m)
  Sets the current selection mark.

• **int maximum_size** () const
  Gets the maximum length of the input field in characters.

• **void maximum_size** (int m)
  Sets the maximum length of the input field in characters.

• **int position** () const

• **int position** (int p)

• **int position** (int p, int m)
  Gets the read-only state of the input field.

• **void readonly** (int b)
  Sets the read-only state of the input field.

• **int readonly** () const
  Gets the read-only state of the input field.

• **int redo** ()
  Redo previous undo operation.

• **int replace** (int b, int e, const char *text, int ilen=0)
  Deletes text from b to e and inserts the new string text.

• **void resize** (int, int, int, int) FL_OVERRIDE
  Changes the size of the widget.

• **int shortcut** () const
  Return the shortcut key associated with this widget.

• **void shortcut** (int s)
  Sets the shortcut key associated with this widget.

• **int size** () const
  Returns the number of bytes in value().

• **void size** (int W, int H)
  Sets the width and height of this widget.

• **int static_value** (const char *)
  Changes the widget text.

• **int static_value** (const char *, int)
  Changes the widget text.

• **int tab_nav** () const
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

• **void tab_nav** (int val)
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

• **Fl_Color textcolor** () const
  Gets the color of the text in the input field.
• **void textcolor (Fl_Color n)**
  Sets the color of the text in the input field.

• **Fl_Font textfont () const**
  Gets the font of the text in the input field.

• **void textfont (Fl_Font s)**
  Sets the font of the text in the input field.

• **Fl_Fontsize textsize () const**
  Gets the size of the text in the input field.

• **void textsize (Fl_Fontsize s)**
  Sets the size of the text in the input field.

• **int undo ()**
  Undoes previous changes to the text buffer.

• **const char * value () const**
  Returns the text displayed in the widget.

• **int value (const char * s)**
  Changes the widget text.

• **int value (const char * s, int i)**
  Changes the widget text.

• **int value (double value)**
  Changes the widget text to a floating point number ("%g").

• **int value (int value)**
  Changes the widget text to a signed integer number.

• **int wrap () const**
  Gets the word wrapping state of the input field.

• **void wrap (int b)**
  Sets the word wrapping state of the input field.

• **~Fl_Input ()**
  Destroys the widget.

**Public Member Functions inherited from Fl_Widget**

• **void _clear_fullscreen ()**

• **void _set_fullscreen ()**

• **void activate ()**
  Activates the widget.

• **unsigned int active () const**
  Returns whether the widget is active.

• **int active_r () const**
  Returns whether the widget and all of its parents are active.

• **Fl_Align align () const**
  Gets the label alignment.

• **void align (Fl_Align alignment)**
  Sets the label alignment.

• **long argument () const**
  Gets the current user data (long) argument that is passed to the callback function.

• **void argument (long v)**
  Sets the current user data (long) argument that is passed to the callback function.

• **virtual class Fl_Gl_Window * as_gl_window ()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• **virtual class Fl_Gl_Window const * as_gl_window () const**

• **virtual Fl_Group * as_group ()**
Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const *as_group() const
- virtual Fl_Window *as_window()

Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const *as_window() const
- void bind_deimage(Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage(int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image(Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image(int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box() const
  Gets the box type of the widget.
- void box(Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback() const
  Gets the current callback function for the widget.
- void callback(Fl_Callback *cb)
  Sets the current callback function for the widget.
- void callback(Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback(Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
- void callback(Fl_Callback0 *cb)
- void callback(Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed() const
  Checks if the widget value changed since the last callback.
- void clear_active()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed()
  Marks the value of the widget as unchanged.
- void clear_damage(uchar c=0)
  Clears or sets the damage flags.
- void clear_output()
  Sets a widget to accept input.
- void clear_visible()
  Hides the widget.
- void clear_visible_focus()
  Disables keyboard focus navigation with this widget.
- Fl_Color color() const
  Gets the background color of the widget.
- void color(Fl_Color bg)
  Sets the background color of the widget.
- void color(Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2() const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
Checks if this widget is a child of `wgt`.

- `int is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`
  Gets the current label text.

- `void label (const char *text)`
  Sets the current label pointer.

- `void label (Fl_Labeltype a, const char *b)`
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  Gets the label color.

- `void labelcolor (Fl_Color c)`
  Sets the label color.

- `Fl_Font labelfont () const`
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

- `void labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.
• void `set_output()`
  Sets a widget to output only.
• void `set_visible()`
  Makes the widget visible.
• void `set_visible_focus()`
  Enables keyboard focus navigation with this widget.
• int `shortcut_label()` const
  Returns whether the widget's label uses `&` to indicate shortcuts.
• void `shortcut_label(int value)`
  Sets whether the widget's label uses `&` to indicate shortcuts.
• virtual void `show()`
  Makes a widget visible.
• void `size(int W, int H)`
  Changes the size of the widget.
• int `take_focus()`
  Gives the widget the keyboard focus.
• unsigned int `takesevents()` const
  Returns if the widget is able to take events.
• int `testShortcut()`
  Returns true if the widget's label contains the entered `&x` shortcut.
• const char * `tooltip()` const
  Gets the current tooltip text.
• void `tooltip(const char *text)`
  Sets the current tooltip text.
• Fl_Window * `top_window()` const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * `top_window_offset(int &xoff, int &yoff)` const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar `type()` const
  Gets the widget type.
• void `type(uchar t)`
  Sets the widget type.
• int `use_accents_menu()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * `user_data()` const
  Gets the user data for this widget.
• void `user_data(Fl_Callback_User_Data *v, bool auto_free)`
  Sets the user data for this widget.
• void `user_data(void *v)`
  Sets the user data for this widget.
• unsigned int `visible()` const
  Returns whether a widget is visible.
• unsigned int `visible_focus()` const
  Checks whether this widget has a visible focus.
• void `visible_focus(int v)`
  Modifies keyboard focus navigation.
• int `visible_r()` const
  Returns whether a widget and all its parents are visible.
• int `w()` const
  Gets the widget width.
Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget * widget, void * data)
  The default callback for all widgets that don't set a callback.

• static unsigned int label_shortcut (const char * t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char * t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from Fl_Input

• static const char * copy_menu_text = "Copy"
  [this text may be customized at run-time]

• static const char * cut_menu_text = "Cut"
  [this text may be customized at run-time]

• static const char * paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19, NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31}

  flags possible values enumeration.

Protected Member Functions inherited from Fl_Input

• void draw () FL_OVERRIDE
  Draws the widget.

• int handle_key ()
  Handles a keystroke.
- **int handle_rmb ()**
  Handle right mouse button down events.

**Protected Member Functions inherited from Fl_Input_**

- **int apply_undo ()**
  Apply the current undo/redo operation.
- **void drawtext (int, int, int, int)**
  Draws the text in the passed bounding box.
- **void drawtext (int, int, int, int, bool draw_active)**
  Draws the text in the passed bounding box.
- **void handle_mouse (int, int, int, int, int keepmark=0)**
  Handles mouse clicks and mouse moves.
- **int handletext (int, int, int, int)**
  Handles all kinds of text field related events.
- **int line_end (int i) const**
  Finds the end of a line.
- **int line_start (int i) const**
  Finds the start of a line.
- **int linesPerPage ()**
  **void maybe_do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  **int up_down_position (int, int, int keepmark=0)**
  Moves the cursor to the column given by up_down_pos.
- **int word_end (int i) const**
  Finds the end of a word.
- **int word_start (int i) const**
  Finds the start of a word.
- **int xscroll () const**
- **int yscroll () const**
- **void yscroll (int yOffset)**

**Protected Member Functions inherited from Fl_Widget**

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.
- **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- **void draw_box () const**
  Draws the widget box according its box style.
- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.
- **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  Draws a box of type t, of color c at the position X,Y and size W,H.
- **void draw_focus () const**
  Draws a focus rectangle around the widget.
- **void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const**
  Draws a focus rectangle around the widget.
- **void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  Draws a focus box for the widget at the given position and size.
- **void draw_label () const**
  Draws the widget's label at the defined label position.
- **void draw_label (int, int, int, int) const**
12.125.1 Detailed Description

The Fl_Secret_Input class is a subclass of Fl_Input that displays its input as a string of placeholders. Depending on the platform this placeholder is either the asterisk ('\*') or the Unicode bullet character (U+2022). This subclass is usually used to receive passwords and other "secret" information.

12.125.2 Constructor & Destructor Documentation

12.125.2.1 Fl_Secret_Input()

Fl_Secret_Input::Fl_Secret_Input (int X, int Y, int W, int H, const char *l = 0L)

Creates a new Fl_Secret_Input widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

Inherited destructor destroys the widget and any value associated with it.

12.125.3 Member Function Documentation

12.125.3.1 handle()

int Fl_Secret_Input::handle (int event) [virtual]

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in event | the kind of event received |

Generated by Doxygen
Return values

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

Fl_Event

Reimplemented from Fl_Input.

The documentation for this class was generated from the following files:

- Fl_Secret_Input.H
- Fl_Input.cxx

12.126 Fl_Select_Browser Class Reference

The class is a subclass of Fl_Browser which lets the user select a single item, or no items by clicking on the empty space.

```
#include <Fl_Select_Browser.H>
```

```

Public Member Functions

- Fl_Select_Browser (int X, int Y, int W, int H, const char ∗L=0)
  Creates a new Fl_Select_Browser widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Browser

- void add (const char ∗newtext, void ∗d=0)
  Adds a new line to the end of the browser.
- void bottomline (int line)
  Scrolls the browser so the bottom item in the browser is showing the specified line.
- void clear ()
  Removes all the lines in the browser.
- char column_char () const
  Gets the current column separator character.
- void column_char (char c)
  Sets the column separator to c.
- const int ∗ column_widths () const
  Gets the current column width array.
- void column_widths (const int ∗arr)
Sets the current array to `arr`.

- `void * data (int line) const`
  Returns the user data() for specified line.

- `void data (int line, void *d)`
  Sets the user data for specified line to `d`.

- `void display (int line, int val=1)`
  For back compatibility.

- `int displayed (int line) const`
  Returns non-zero if line has been scrolled to a position where it is being displayed.

- `Fl_Browser (int X, int Y, int W, int H, const char *L=0)`
  The constructor makes an empty browser.

- `char format_char () const`
  Gets the current format code prefix character, which by default is '@'.

- `void format_char (char c)`
  Sets the current format code prefix character to `c`.

- `void hide () FL_OVERRIDE`
  Hides the entire Fl_Browser widget – opposite of show().

- `void hide (int line)`
  Makes line invisible, preventing selection by the user.

- `Fl_Image * icon (int line) const`
  Returns the icon currently defined for line.

- `void icon (int line, Fl_Image *icon)`
  Set the image icon for line to the value icon.

- `void insert (int line, const char *newtext, void *d=0)`
  Insert a new entry whose label is newtext above given line, optional data d.

- `void lineposition (int line, Fl_Line_Position pos)`
  Updates the browser so that line is shown at position pos.

- `int load (const char *filename)`
  Clear the browser and reads the file, adding each line from the file to the browser.

- `void make_visible (int line)`
  Make the item at the specified line visible().

- `void middleline (int line)`
  Scrolls the browser so the middle item in the browser is showing the specified line.

- `void move (int to, int from)`
  Line from is removed and reinserted at to.

- `void remove (int line)`
  Remove entry for given line number, making the browser one line shorter.

- `void remove_icon (int line)`
  Removes the icon for line.

- `void replace (int a, const char *b)`
  For back compatibility only.

- `int select (int line, int val=1)`
  Sets the selection state of the item at line to the value val.

- `int selected (int line) const`
  Returns 1 if specified line is selected, 0 if not.

- `void show () FL_OVERRIDE`
  Shows the entire Fl_Browser widget – opposite of hide().

- `void show (int line)`
  Makes line visible, and available for selection by user.

- `int size () const`
  Returns how many lines are in the browser.
• **void** *size*(int W, int H)
  
  Swaps two browser lines a and b.

• **void** *swap*(int a, int b)
  
  Swaps two browser lines a and b.

• **const char** ∗ *text*(int line) const
  
  Returns the label text for the specified line.

• **void** *text*(int line, const char ∗ newtext)
  
  Sets the text for the specified line to newtext.

• **FL_Fontsize** *textsize*() const
  
  Gets the default text size (in pixels) for the lines in the browser.

• **void** *textsize*(FL_Fontsize newSize)
  
  Sets the default text size (in pixels) for the lines in the browser to newSize.

• **int** *topline*(int line)
  
  Scrolls the browser so the top item in the browser is showing the specified line.

• **int** *value*(int line)
  
  Returns non-zero if the specified line is visible, 0 if hidden.

• **∼Fl_Browser**()
  
  The destructor deletes all list items and destroys the browser.

### Public Member Functions inherited from Fl_Browser_

• **int** *deselect*(int docallbacks=0)
  
  Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

• **void** *display*(void ∗ item)
  
  Displays the item, scrolling the list as necessary.

• **int** *handle*(int event) FL_OVERRIDE
  
  Handles the event within the normal widget bounding box.

• **uchar** *has_scrollbar*(uchar) const
  
  Returns the current scrollbar mode, see Fl_Browser_::has_scrollbar(uchar)

• **void** *has_scrollbar*(uchar mode)
  
  Sets whether the widget should have scrollbars or not (default Fl_Browser_::BOTH).

• **int** *hposition*(int)
  
  Gets the horizontal scroll position of the list as a pixel position pos.

• **void** *hposition*(int)
  
  Sets the horizontal scroll position of the list to pixel position pos.

• **int** *linespacing*(int pixels)
  
  Add some space between browser lines.

• **int** *position*(int pos)
  
  Repositions and/or resizes the browser.

• **void** *scrollbar_left*( )
  
  Moves the vertical scrollbar to the lefthand side of the list.
• void scrollbar_right ()

Moves the vertical scrollbar to the right hand side of the list.

• int scrollbar_size () const

Gets the current size of the scrollbars' troughs, in pixels.

• void scrollbar_size (int newSize)

Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

• int scrollbar_width () const

Returns the global value Fl::scrollbar_size().

• void scrollbar_width (int width)

Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

• int select (void ∗item, int val=1, int docallbacks=0)

Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.

• int select_only (void ∗item, int docallbacks=0)

Selects item and returns 1 if the state changed or 0 if it did not.

• void sort (int flags=0)

Sort the items in the browser based on flags.

• Fl_Color textcolor () const

Gets the default text color for the lines in the browser.

• void textcolor (Fl_Color col)

Sets the default text color for the lines in the browser to color col.

• Fl_Font textfont () const

Gets the default text font for the lines in the browser.

• void textfont (Fl_Font font)

Sets the default text font for the lines in the browser to font.

• Fl_Fontsize textsize () const

Gets the default text size (in pixels) for the lines in the browser.

• void textsize (Fl_Fontsize newSize)

Sets the default text size (in pixels) for the lines in the browser to size.

• int vposition () const

Gets the vertical scroll position of the list as a pixel position pos.

• void vposition (int pos)

Sets the vertical scroll position of the list to pixel position pos.

Public Member Functions inherited from Fl_Group

• Fl_Widget ∗ & _ddfdesign_kludge ()

This is for forms compatibility only.

• void add (Fl_Widget ∗&)

The widget is removed from its current group (if any) and then added to the end of this group.

• void add (Fl_Widget &)

See void Fl_Group::add(Fl_Widget &w)

• void add_resizable (Fl_Widget ∗&)

Adds a widget to the group and makes it the resizable widget.

• Fl_Widget ∗const ∗ array () const

Returns a pointer to the array of children.

• Fl_Group ∗ as_group () const FL_OVERRIDE

Returns an Fl_Group pointer if this widget is an Fl_Group.

• void begin ()

Sets the current group so you can build the widget tree by just constructing the widgets.

• Fl_Widget ∗ child (int n) const
Returns array()[n].

- **int children()** const
  
  Returns how many child widgets the group has.

- **void clear()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children()**
  
  Returns the current clipping mode.

- **void clip_children(int c)**
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child(int n)**
  
  Removes the widget at index from the group and deletes it.

- **void end()**
  
  Exactly the same as current(this->parent()).

- **int find(const Fl_Widget &w) const**
  
  See int Fl_Group::find(const Fl_Widget *w) const.

- **int find(const Fl_Widget *) const**
  
  Searches the child array for the widget and returns the index.

- **Fl_Group(int, int, int, int, const char *)=0**
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus(Fl_Widget *)**

- **void forms_end()**
  
  This is for forms compatibility only.

- **int handle(int) FL_OVERRIDE**
  
  Handles the specified event.

- **void init_sizes()**
  
  Resets the internal array of widget sizes and positions.

- **void insert(Fl_Widget &, int i)**
  
  The widget is removed from its current group (if any) and then inserted into this group.

- **void insert(Fl_Widget &, Fl_Widget *) before**
  
  This does insert(w, find(before)).

- **void remove(Fl_Widget &)**
  
  Removes a widget from the group but does not delete it.

- **void remove(Fl_Widget *o)**
  
  Removes the widget o from the group.

- **void remove(int index)**
  
  Removes the widget at index from the group but does not delete it.

- **Fl_Widget *resizable()** const
  
  Returns the group's resizable widget.

- **void resizable(Fl_Widget &o)**
  
  Sets the group's resizable widget.

- **void resizable(Fl_Widget *) o**
  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **void resize(int, int, int, int) FL_OVERRIDE**
  
  Resizes the Fl_Group widget and all of its children.

- **virtual ~Fl_Group()**
  
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

• void copy_label (const char *new_label)
  Sets the current label.

• void copy_tooltip (const char *text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.

• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
- `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  
  Calls the widget callback function with arbitrary arguments.

- `void draw_label (int, int, int, int, Fl_Align) const`
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h () const`
  
  Gets the widget height.

- `Fl_Image * image ()`
  
  Gets the image that is used as part of the widget label when in the active state.

- `const Fl_Image * image () const`
  
  Gets the image that is used as part of the widget label when in the active state.

- `void image (Fl_Image &img)`
  
  Sets the image to use as part of the widget label when in the active state.

- `void image (Fl_Image *img)`
  
  Sets the image to use as part of the widget label when in the active state.

- `int image_bound () const`
  
  Returns whether the image is managed by the widget.

- `int inside (const Fl_Widget *wgt) const`
  
  Checks if this widget is a child of `wgt`.

- `int is_label_copied () const`
  
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`
  
  Gets the current label text.

- `void label (const char *text)`
  
  Sets the current label pointer.

- `void label (Fl_Labeltype a, const char *b)`
  
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  
  Gets the label color.

- `void labelcolor (Fl_Color c)`
  
  Sets the label color.

- `Fl_Font labelfont () const`
  
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
  
  Gets the font size in pixels.

- `void labelsize (Fl_Fontsize pix)`
  
  Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
Returns a pointer to the parent widget.

- void parent (Fl_Group ∗p)
  
  Internal use only - "for hacks only".

- void position (int X, int Y)
  
  Repositions the window or widget.

- void redraw ()
  
  Schedules the drawing of the widget.

- void redraw_label ()
  
  Schedules the drawing of the label.

- Fl_Color selection_color () const
  
  Gets the selection color.

- void selection_color (Fl_Color a)
  
  Sets the selection color.

- void set_active ()
  
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  
  Marks the value of the widget as changed.

- void set_output ()
  
  Sets a widget to output only.

- void set_visible ()
  
  Makes the widget visible.

- void set_visible_focus ()
  
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  
  Returns whether the widget's label uses ' & ' to indicate shortcuts.

- void shortcut_label (int value)
  
  Sets whether the widget's label uses ' & ' to indicate shortcuts.

- void size (int W, int H)
  
  Changes the size of the widget.

- int take_focus ()
  
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  
  Returns if the widget is able to take events.

- int test_shortcut ()
  
  Returns true if the widget's label contains the entered ' & x ' shortcut.

- const char ∗tooltip () const
  
  Gets the current tooltip text.

- void tooltip (const char ∗text)
  
  Sets the current tooltip text.

- Fl_Window ∗top_window () const
  
  Returns a pointer to the top-level window for the widget.

- Fl_Window ∗top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  
  Gets the widget type.

- void type (uchar t)
  
  Sets the widget type.

- int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void ∗user_data () const
  
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window ∗window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ∼Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Public Types inherited from Fl_Browser

• enum Fl_Line_Position { TOP, BOTTOM, MIDDLE }
  For internal use only?

Public Types inherited from Fl_Browser_

• enum {  
  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,  
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7 }
  Values for has_scrollbar().

Static Public Member Functions inherited from Fl_Group

• static Fl_Group ∗current ()
  Returns the currently active group.
• static void current (Fl_Group ∗g)
  Sets the current group.
Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
- static unsigned int labelShortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int testShortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Public Attributes inherited from Fl_Browser_

- Fl_Scrollbar hscrollbar
  Horizontal scrollbar.
- Fl_Scrollbar scrollbar
  Vertical scrollbar.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19, NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
flags possible values enumeration.

Protected Member Functions inherited from Fl_Browser

- FL_BLINE ∗_remove (int line)
  Removes the item at the specified line.
- FL_BLINE ∗find_line (int line) const
  Returns the item for specified line.
- int full_height () const FL_OVERRIDE
  The height of the entire list of all visible() items in pixels.
- int incr_height () const FL_OVERRIDE
  The default 'average' item height (including inter-item spacing) in pixels.
- void insert (int line, FL_BLINE ∗item)
  Insert specified item above line.
- void ∗item_at (int line) const FL_OVERRIDE
  Return the item at specified line.
- void item_draw (void ∗item, int X, int Y, int W, int H) const FL_OVERRIDE
  Draws item at the position specified by X Y WH.
- void ∗item_first () const FL_OVERRIDE
  Returns the very first item in the list.
- int item_height (void ∗item) const FL_OVERRIDE
  Returns height of item in pixels.
- void ∗item_last () const FL_OVERRIDE

Returns the very last item in the list.

• void ∗ item_next (void ∗item) const FL_OVERRIDE
  Returns the next item after item.

• void ∗ item_prev (void ∗item) const FL_OVERRIDE
  Returns the previous item before item.

• void item_select (void ∗item, int val) FL_OVERRIDE
  Change the selection state of item to the value val.

• int item_selected (void ∗item) const FL_OVERRIDE
  See if item is selected.

• void item_swap (void ∗a, void ∗b) FL_OVERRIDE
  Swap the items a and b.

• const char ∗ item_text (void ∗item) const FL_OVERRIDE
  Returns the label text for item.

• int item_width (void ∗item) const FL_OVERRIDE
  Returns width of item in pixels.

• int lineno (void ∗item) const
  Returns line number corresponding to item, or zero if not found.

• void swap (FL_BLINE ∗a, FL_BLINE ∗b)
  Swap the two items a and b.

Protected Member Functions inherited from Fl_Browser_

• void bbox (int &X, int &Y, int &W, int &H) const
  Returns the bounding box for the interior of the list’s display window, inside the scrollbars.

• void deleting (void ∗item)
  This method should be used when item is being deleted from the list.

• int displayed (void ∗item) const
  Returns non-zero if item has been scrolled to a position where it is being displayed.

• void draw () FL_OVERRIDE
  Draws the list within the normal widget bounding box.

• void ∗ find_item (int ypos)
  This method returns the item under mouse y position ypos.

• Fl_Browser_ (int X, int Y, int W, int H, const char ∗L=0)
  The constructor makes an empty browser.

• virtual int full_width () const
  This method may be provided by the subclass to indicate the full width of the item list, in pixels.

• void inserting (void ∗a, void ∗b)
  This method should be used when an item is in the process of being inserted into the list.

• virtual int item_quick_height (void ∗item) const
  This method may be provided by the subclass to return the height of the item, in pixels.

• int leftedge () const
  This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

• void new_list ()
  This method should be called when the list data is completely replaced or cleared.

• void redraw_line (void ∗item)
  This method should be called when the contents of item has changed, but not its height.

• void redraw_lines ()
  This method will cause the entire list to be redrawn.

• void replacing (void ∗a, void ∗b)
  This method should be used when item a is being replaced by item b.

• void ∗ selection () const
Returns the item currently selected, or NULL if there is no selection.

- **void swapping (void ∗a, void ∗b)**
  This method should be used when two items a and b are being swapped.

- **void ∗top () const**
  Returns the item that appears at the top of the list.

### Protected Member Functions inherited from Fl_Group

- **Fl_Rect ∗bounds ()**
  Returns the internal array of widget sizes and positions.

- **void draw () FL_OVERRIDE**
  Draws the widget.

- **void draw_child (Fl_Widget &widget) const**
  Forces a child to redraw.

- **void draw_children ()**
  Draws all children of the group.

- **void draw_outside_label (const Fl_Widget &widget) const**
  Parents normally call this to draw outside labels of child widgets.

- **virtual int on_insert (Fl_Widget ∗, int)**
  Allow derived groups to act when a widget is added as a child.

- **virtual int on_move (int, int)**
  Allow derived groups to act when a widget is moved within the group.

- **virtual void on_remove (int)**
  Allow derived groups to act when a child widget is removed from the group.

- **int ∗sizes ()**
  Returns the internal array of widget sizes and positions.

- **void update_child (Fl_Widget &widget) const**
  Draws a child only if it needs it.

### Protected Member Functions inherited from Fl_Widget

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

- **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box () const**
  Draws the widget box according its box style.

- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus () const**
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const**
  Draws a focus rectangle around the widget.

- **void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const**
  Draws a focus box for the widget at the given position and size.

- **void draw_label () const**
  Draws the widget's label at the defined label position.

- **void draw_label (int, int, int, int) const**
  Draws the label in an arbitrary bounding box.

- **Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)**
12.127 Fl_Shared_Image Class Reference

This class supports caching, loading, and drawing of image files.

#include <Fl_Shared_Image.H>

Inheritance diagram for Fl_Shared_Image:

```
   Fl_Image
     ▼
      Fl_Shared_Image
```

Generated by Doxygen
Public Member Functions

- **Fl_Shared_Image** ∗ as_shared_image () FL_OVERRIDE
  
  Returns whether an image is an Fl_Shared_Image or not.

- **void** color_average (Fl_Color c, float i) FL_OVERRIDE
  
  Averages the colors in the image with the provided FLTK color value.

- **Fl_Image** ∗ copy ()
  
  Increments the reference counter and returns a pointer to itself.

- **Fl_Image** ∗ copy () const

- **Fl_Image** ∗ copy (int W, int H) const FL_OVERRIDE
  
  Return a shared image of this image with the requested size.

- **void** desaturate () FL_OVERRIDE
  
  Convert the image to gray scale.

- **void** draw (int X, int Y)

- **void** draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  
  Draw this image to the current graphics context.

- **const Fl_Image** ∗ image () const
  
  Returns a pointer to the internal Fl_Image object.

- **const char** ∗ name ()
  
  Returns the filename of the shared image.

- **int** original ()
  
  Returns whether this is an original image.

- **int** refcount ()
  
  Returns the number of references of this shared image.

- **void** release () FL_OVERRIDE
  
  Releases and possibly destroys (if refcount <= 0) a shared image.

- **virtual void** reload ()
  
  Reloads the shared image from disk.

- **void** uncache () FL_OVERRIDE
  
  Remove the cached device specific image data.

Public Member Functions inherited from Fl_Image

- **Fl_Image** ∗ copy () const
  
  Creates a copy of the image in the same size.

- **int** count () const
  
  Returns the number of data values associated with the image.

- **int** d () const
  
  Returns the image depth.

- **const char** ∗ const ∗ data () const
  
  Returns a pointer to the current image data array.

- **int** data_h () const
  
  Returns the height of the image data.

- **int** data_w () const
  
  Returns the width of the image data.

- **void** draw (int X, int Y)
  
  Draws the image to the current drawing surface.

- **int** fail () const
  
  Returns a value that is not 0 if there is currently no image available.

- **Fl_Image** (int W, int H, int D)
  
  The constructor creates an empty image with the specified width, height, and depth.

- **int** h () const

Generated by Doxygen
Returns the current image drawing height in FLTK units.

- void **inactive ()**
  
  The **inactive()** method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

- virtual void **label (Fl_Menu_Item ∗m)**
  
  This method is an obsolete way to set the image attribute of a menu item.

- virtual void **label (Fl_Widget ∗w)**
  
  This method is an obsolete way to set the image attribute of a widget or menu item.

- int **ld () const**
  
  Returns the current line data size in bytes.

- virtual void **scale (int width, int height, int proportional=1, int can_expand=0)**
  
  Sets the drawing size of the image.

- int **w () const**
  
  Returns the current image drawing width in FLTK units.

- virtual **~Fl_Image ()**
  
  The destructor is a virtual method that frees all memory used by the image.

**Static Public Member Functions**

- static void **add_handler (Fl_Shared_Handler f)**
  
  Adds a shared image handler, which is basically a test function for adding new image formats.

- static Fl_Shared_Imagex **find (const char ∗name, int W=0, int H=0)**
  
  Finds a shared image from its name and size specifications.

- static Fl_Shared_Imagex **get (const char ∗name, int W=0, int H=0)**
  
  Find or load an image that can be shared by multiple widgets.

- static Fl_Shared_Imagex **get (Fl_RGB_Imagex ∗rgb, int own_it=1)**
  
  Builds a shared image from a pre-existing Fl_RGB_Imagex.

- static Fl_Shared_Imagex **∗∗images ()**
  
  Returns the Fl_Shared_Imagex array.

- static int **num_images ()**
  
  Number of shared images in their various cached sizes.

- static void **remove_handler (Fl_Shared_Handler f)**
  
  Removes a shared image handler.

**Static Public Member Functions inherited from Fl_Image**

- static Fl_Labeltype **define_FL_IMAGE_LABEL ()**

- static Fl_RGB_Scaling **RGB_scaling ()**
  
  Returns the currently used RGB image scaling method.

- static void **RGB_scaling (Fl_RGB_Scaling)**
  
  Sets the RGB image scaling method used for copy(int, int).

- static Fl_RGB_Scaling **scaling_algorithm ()**
  
  Gets what algorithm is used when resizing a source image to draw it.

- static void **scaling_algorithm (Fl_RGB_Scaling algorithm)**
  
  Sets what algorithm is used when resizing a source image to draw it.
Protected Member Functions

• void add()
  Adds a shared image to the image pool.

• Fl_Shared_Image * copy_(int W, int H) const
  Create a resized copy of the image and wrap it into the share image class.

• Fl_Shared_Image()
  Creates an empty shared image.

• Fl_Shared_Image(const char *n, Fl_Image *img=0)
  Creates a shared image from its filename and its corresponding Fl_Image* img.

• void update()
  Update the dimensions of the shared images.

• virtual ~Fl_Shared_Image()
  The destructor frees all memory and server resources that are used by the image.

Protected Member Functions inherited from Fl_Image

• void d(int D)
  Sets the current image depth.

• void data(const char *const *p, int c)
  Sets the current data pointer and count of pointers in the array.

• void draw_empty(int X, int Y)
  The protected method draw_empty() draws a box with an X in it.

• int draw_scaled(int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.

• void h(int H)
  Sets the height of the image data.

• void ld(int LD)
  Sets the current line data size in bytes.

• void w(int W)
  Sets the width of the image data.

Static Protected Member Functions

• static int compare(Fl_Shared_Image **i0, Fl_Shared_Image **i1)
  Compares two shared images.

Static Protected Member Functions inherited from Fl_Image

• static void labeltype(const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)

• static void measure(const Fl_Label *lo, int &lw, int &lh)

Protected Attributes

• int alloc_image_
• Fl_Image * image_
• const char * name_
• int original_
• int refcount_
Static Protected Attributes

- static int alloc_handlers_ = 0
- static int alloc_images_ = 0
- static Fl_Shared_Handler * handlers_ = 0
- static Fl_Shared_Image ** images_ = 0
- static int num_handlers_ = 0
- static int num_images_ = 0

Additional Inherited Members

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false

True after fl_register_images() was called, false before.

12.127.1 Detailed Description

This class supports caching, loading, and drawing of image files. Most applications will also want to link against the fltk_images library and call the fl_register_images() function to support standard image formats such as BMP, GIF, JPEG, PNG, and SVG (unless the library was built with the option removing SVG support).

Images can be requested (loaded) with Fl_Shared_Image::get(), find(), and some other methods. All images are cached in an internal list of shared images and should be released when they are no longer needed. A refcount is used to determine if a released image is to be destroyed with delete.

Fl_Shared_Image::find()
Fl_Shared_Image::release()

12.127.2 Constructor & Destructor Documentation

12.127.2.1 Fl_Shared_Image() [1/2]

Fl_Shared_Image::Fl_Shared_Image ( ) [protected]
Creates an empty shared image.
The constructors create a new shared image record in the image cache.
The constructors are protected and cannot be used directly from a program. Use the get() method instead.

12.127.2.2  Fl_Shared_Image()  [2/2]

Fl_Shared_Image::Fl_Shared_Image (  
    const char ∗ n,  
    Fl_Image ∗ img = 0 )  [protected]

Creates a shared image from its filename and its corresponding Fl_Image* img.  
The constructors create a new shared image record in the image cache.  
The constructors are protected and cannot be used directly from a program. Use the get() method instead.  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>filename or pool name of the image, must be unique among shared images</td>
</tr>
<tr>
<td>img</td>
<td>the image that is made available using the name</td>
</tr>
</tbody>
</table>

12.127.3  ~Fl_Shared_Image()

Fl_Shared_Image::~Fl_Shared_Image ( )  [protected], [virtual]

The destructor frees all memory and server resources that are used by the image.  
The destructor is protected and cannot be used directly from a program. Use the Fl_Shared_Image::release() method instead.  

12.127.3  Member Function Documentation

12.127.3.1  add()

void Fl_Shared_Image::add ( )  [protected]

Adds a shared image to the image pool.  
This protected method adds an image to the pool, an ordered list of shared images. The pool is searched for a matching image whenever one is requested, for instance with Fl_Shared_Image::get() or Fl_Shared_Image::find().  
This method does not increase or decrease reference counts!  

12.127.3.2  add_handler()

void Fl_Shared_Image::add_handler (  
    Fl_Shared_Handler f )  [static]

Adds a shared image handler, which is basically a test function for adding new image formats.  
This function will be called when an Fl_Shared_Image is to be loaded (for instance with Fl_Shared_Image::get()) and the image type is not known to FLTK.  
All registered image handlers will be called in the order of registration. You should always call fl_register_images() before adding your own handlers - unless you need to override a known image file type which should be rare.  
See also  
Fl_Shared_Handler for more information of the function you need to define.  

12.127.3.3  as_shared_image()

Fl_Shared_Image ∗ Fl_Shared_Image::as_shared_image ( )  [inline], [virtual]

Returns whether an image is an Fl_Shared_Image or not.  
This virtual method returns a pointer to an Fl_Shared_Image if this object is an instance of Fl_Shared_Image or NULL if not. This can be used to detect if a given Fl_Image object is a shared image, i.e. derived from Fl_Shared_Image.  
Since  
1.4.0  

Reimplemented from Fl_Image.
12.127.3.4 color_average()

```cpp
void Fl_Shared_Image::color_average ( 
    Fl_Color c, 
    float i ) [virtual]
```

Averages the colors in the image with the provided FLTK color value. This method changes the pixel data of this specific image.

**Note**

It does not change any of the resized copies of this image, nor does it necessarily apply the color changes if this image is resized later.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>c</th>
<th>blend with this color</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>i</td>
<td>blend fraction</td>
</tr>
</tbody>
</table>

See also

`Fl_Image::color_average(Fl_Color c, float i)`

Reimplemented from `Fl_Image`.

12.127.3.5 compare()

```cpp
int Fl_Shared_Image::compare ( 
    Fl_Shared_Image ** i0, 
    Fl_Shared_Image ** i1 ) [static], [protected]
```

Compares two shared images. The order of comparison is:

1. Image name, usually the filename used to load it
2. Image width
3. Image height

Binary search in a sorted array works only if we search for the same parameters that were also used for sorting. No special cases are possible here. `Fl_Shared_Image::find()` requires a search for an element with a matching name and the original_ flags set. This is not implemented via binary search, but by a simple run of the array inside `Fl_Shared_Image::find()`.

**Parameters**

| in | i0,i1 | image pointer pointer for sorting |

**Returns**

Whether the images match or their relative sort order (see text).

**Return values**

| 0  | the images match |
| <0 | Image i0 is less than image i1 |
| >0 | Image i0 is greater than image i1 |
12.127.3.6 copy() [1/2]

Fl_Image * Fl_Shared_Image::copy ()
Increments the reference counter and returns a pointer to itself.
When the image is no longer used, call Fl_Shared_Image::release().
To get a copy of the image data, call this->image()->copy() instead.

Returns
pointer to an Fl_Shared_Image that can be safely cast

12.127.3.7 copy() [2/2]

Fl_Image * Fl_Shared_Image::copy ( 
    int W,
    int H ) const [virtual]
Return a shared image of this image with the requested size.
This is the same as calling Fl_Shared_Image::get(this->name(), W, H).
If a shared image of the desired size already exists in the shared image pool, the existing image is returned
and no copy is made. But the reference counter is incremented. When the image is no longer used, call
Fl_Shared_Image::release().
To get a copy of the image data, call this->image()->copy(W, H) instead.

Parameters

| in  | W/H  | size of requested image |

Returns
pointer to an Fl_Shared_Image that can be safely cast, or NULL if the image can't be found and can't be
created.
Reimplemented from Fl_Image.

12.127.3.8 copy_()

Fl_Shared_Image * Fl_Shared_Image::copy_ ( 
    int W,
    int H ) const [protected]
Create a resized copy of the image and wrap it into the share image class.
This function is usually followed by a call to returned_image->add() to add the image to the
pool, andthis->refcounter_++ to make sure that the original shared image keeps a reference to the copy. Don't
call this function if an image of the given size is already in the pool.

Parameters

| in  | W/H  | new image size |

Returns
a new shared image pointer that is not yet in the pool

12.127.3.9 desaturate()

void Fl_Shared_Image::desaturate ( ) [virtual]
Convert the image to gray scale.
This method changes the pixel data of this specific image.
Note

It does not change any of the resized copies of this image, nor does it necessarily apply the color changes if this image is resized later.

See also

Fl_Image::desaturate()

Reimplemented from Fl_Image.

### 12.127.3.10 draw()

```cpp
def draw (int X, int Y, int W, int H, int cx = 0, int cy = 0)
```

Draw this image to the current graphics context.

**Parameters**

- **in X, Y, W, H**: draw at this position and size
- **in cx, cy**: image origin

Reimplemented from Fl_Image.

### 12.127.3.11 find()

```cpp
Fl_Shared_Image * find (const char * name, int W = 0, int H = 0)
```

Finds a shared image from its name and size specifications. This uses a binary search in the image cache.

If the image `name` exists with the exact width `W` and height `H`, then it is returned.

If `W == 0` and the image `name` exists with another size, then the original image with that `name` is returned.

In either case the refcount of the returned image is increased. The found image should be released with Fl_Shared_Image::release() when no longer needed.

An image is marked original if it was directly loaded from a file or from memory as opposed to copied and resized images.

This comparison is used in Fl_Shared_Image::find() to find an image that matches the requested one or to find the position where a new image should be entered into the sorted list of shared images.

It is used in two steps by Fl_Shared_Image::add():

1. search with exact width and height
2. if not found, search again with width = 0 (and height = 0)

The first step will only return a match if the image exists with the same width and height. The second step will match if there is an image marked original with the same name, regardless of width and height.

### 12.127.3.12 get() [1/2]

```cpp
Fl_Shared_Image * get (const char * name, int W = 0, int H = 0)
```

Generated by Doxygen
Find or load an image that can be shared by multiple widgets.
If the image exists with the requested size, this image will be returned.
If the image exists, but only with another size, then a new copy with the requested size (width \(W\) and height \(H\)) will be created as a resized copy of the original image. The new image is added to the internal list of shared images.
If the image does not yet exist, then a new image of the proper dimension is created from the filename \(name\). The original image from filename \(name\) is always added to the list of shared images in its original size. If the requested size differs, then the resized copy with width \(W\) and height \(H\) is also added to the list of shared images.

**Note**
If the sizes differ, then two images are created as mentioned above. This is intentional so the original image is cached and preserved. If you request the same image with another size later, then the original image will be found, copied, resized, and returned.

Shared JPEG and PNG images can also be created from memory by using their named memory access constructor. You should release() the image when you’re done with it.

**Parameters**

<table>
<thead>
<tr>
<th>name</th>
<th>name of the image</th>
</tr>
</thead>
<tbody>
<tr>
<td>(W,H)</td>
<td>desired size</td>
</tr>
</tbody>
</table>

**Returns**
the image at the requested size, or NULL if the image could not be found or generated

**See also**

- Fl_Shared_Image::find(const char *name, int \(W\), int \(H\))
- Fl_Shared_Image::release()
- Fl_JPEG_Image::Fl_JPEG_Image(const char *name, const unsigned char *data)
- Fl_PNG_Image::Fl_PNG_Image (const char *name_png, const unsigned char *buffer, int maxsize)

**12.127.3.13 get()**

\[
\text{Fl\_Shared\_Image} * \text{Fl\_Shared\_Image}::\text{get} ( \\
\quad \text{Fl\_RGB\_Image} * \text{rgb}, \\
\quad \text{int own\_it} = 1) \] [static]

Builds a shared image from a pre-existing Fl_RGB_Image.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>(rgb)</th>
<th>an Fl_RGB_Image used to build a new shared image.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\text{inown_it})</td>
<td>1 if the shared image should delete (rgb) when it is itself deleted, 0 otherwise</td>
<td></td>
</tr>
</tbody>
</table>

**Version**

1.3.4

**12.127.3.14 image()**

\[
\text{const Fl\_Image} * \text{Fl\_Shared\_Image}::\text{image} () \text{ const } [\text{inline}] 
\]

Returns a pointer to the internal Fl_IMAGE object.
The output is a pointer to the internal image (Fl_IMAGE or subclass) which can be used to inspect or copy the image.
Do not try to modify the image! You can copy the image though if you want or need to change any attributes, size etc. If all you need to do is to resize the image you should use Fl_Shared_Image::copy(int, int) instead.

Note
The internal image (pointer) is protected for good reasons, e.g. to prevent access to the image so it can't be modified by user code. DO NOT cast away the ‘const’ attribute to modify the image.

User code should rarely need this method. Use with caution.

Returns
const Fl_Image* image, the internal Fl_Image

Since
1.4.0

12.127.3.15 images()
Fl_Shared_Image ** Fl_Shared_Image::images ( ) [static]
Returns the Fl_Shared_Image* array.

Returns
a pointer to an array of shared image pointers, sorted by name and size

See also
Fl_Shared_Image::num_images()

12.127.3.16 num_images()
int Fl_Shared_Image::num_images ( ) [static]
Number of shared images in their various cached sizes.

Returns
number of entries in the array

See also
Fl_Shared_Image::images()

12.127.3.17 original()
int Fl_Shared_Image::original ( ) [inline]
Returns whether this is an original image.
Images loaded from a file or from memory are marked original as opposed to images created as a copy of another image with different size (width or height).

Note
This is useful for debugging (rarely used in user code).

Since
FLTK 1.4.0
12.127.3.18 refcount()

```cpp
int Fl_Shared_Image::refcount () [inline]
```

Returns the number of references of this shared image. When reference is below 1, the image is deleted.

12.127.3.19 release()

```cpp
void Fl_Shared_Image::release () [virtual]
```

Releases and possibly destroys (if refcount <= 0) a shared image. In the latter case, it will reorganize the shared image array so that no hole will occur. Reimplemented from Fl_Image.

12.127.3.20 uncache()

```cpp
void Fl_Shared_Image::uncache () [virtual]
```

Remove the cached device specific image data.

See also

Fl_Image::uncache()

Reimplemented from Fl_Image.

12.127.3.21 update()

```cpp
void Fl_Shared_Image::update () [protected]
```

Update the dimensions of the shared images. Internal method to synchronize shared image data with the actual image data.

The documentation for this class was generated from the following files:

- Fl_Shared_Image.H
- Fl_Shared_Image.cxx

12.128 Fl_Shortcut_Button Class Reference

A button that allows the user to type a key combination to create shortcuts.

Inheritance diagram for Fl_Shortcut_Button:

```
Fl_Widget
    ^
  |   
Fl_Button
    ^
  |   
Fl_Shortcut_Button
```

Public Member Functions

- **Fl_Shortcut_Button** (int X, int Y, int W, int H, const char *l=0)

  *Construct a shortcut button.*

- **Fl_Shortcut value ()**

  *Return the user selected shortcut.*

- **void value (Fl_Shortcut shortcut)**

  *Set the displayed shortcut.*
Public Member Functions inherited from **Fl_Button**

- `int clear ()`
  
  *Same as `value(0)`.*

- `uchar compact ()`
  
  *Return true if buttons are rendered as compact buttons.*

- `void compact (uchar v)`
  
  *Decide if buttons should be rendered in compact mode.*

- `Fl_Boxtype down_box () const`
  
  *Returns the current down box type, which is drawn when `value() is non-zero.*

- `void down_box (Fl_Boxtype b)`
  
  *Sets the down box type.*

- `Fl_Color down_color () const`
  
  *(for backwards compatibility)*

- `void down_color (unsigned c)`
  
  *(for backwards compatibility)*

- `Fl_Button (int X, int Y, int W, int H, const char ∗L=0)`
  
  *The constructor creates the button using the given position, size, and label.*

- `int set ()`
  
  *Same as `value(1)`.*

- `void setonly ()`
  
  *Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).*

- `int shortcut () const`
  
  *Returns the current shortcut key for the button.*

- `void shortcut (const char ∗s)`
  
  *(for backwards compatibility)*

- `void shortcut (int s)`
  
  *Sets the shortcut key to s.*

- `char value () const`
  
  *Returns the current value of the button (0 or 1).*

- `int value (int v)`
  
  *Sets the current value of the button.*

Public Member Functions inherited from **Fl_Widget**

- `void _clear_fullscreen ()`

- `void _set_fullscreen ()`

- `void activate ()`
  
  *Activates the widget.*

- `unsigned int active () const`
  
  *Returns whether the widget is active.*

- `int active_r () const`
  
  *Returns whether the widget and all of its parents are active.*

- `Fl_Align align () const`
  
  *Gets the label alignment.*

- `void align (Fl_Align alignment)`
  
  *Sets the label alignment.*

- `long argument () const`
  
  *Gets the current user data (long) argument that is passed to the callback function.*

- `void argument (long v)`
  
  *Sets the current user data (long) argument that is passed to the callback function.*

- `virtual class Fl_Gl_Window ∗ as_gl_window ()`
Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window () const

Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group () const
• virtual Fl_Window * as_window ()

Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (Fl_Image * img)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_deimage (int f)

Sets the image to use as part of the widget label when in the active state.
• void bind_image (Fl_Image * img)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (int f)

Gets the box type of the widget.
• Fl_Boxtype box () const

Sets the box type for the widget.
• void box (Fl_Boxtype new_box)

Gets the current callback function for the widget.
• Fl_Callback_p callback () const

Sets the current callback function for the widget.
• void callback (Fl_Callback * cb)

Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)

Sets the current callback function and data for the widget.
• void callback (Fl_Callback * cb, void * p)

Sets the current callback function for the widget.
• void callback (Fl_Callback0 * cb)

Sets the current callback function for the widget.
• void callback (Fl_Callback1 * cb, long p=0)

Checks if the widget value changed since the last callback.
• unsigned int changed () const

Marks the widget as inactive without sending events or changing focus.
• void clear_active ()

Marks the value of the widget as unchanged.
• void clear_changed ()

Clears or sets the damage flags.
• void clear_damage (uchar c=0)

Sets a widget to accept input.
• void clear_output ()

Hides the widget.
• void clear_visible ()

Disables keyboard focus navigation with this widget.
• void clear_visible_focus ()

Gets the background color of the widget.
• Fl_Color color () const

Sets the background color of the widget.
• void color (Fl_Color bg)

Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
Sets the background and selection color of the widget.

- **FL_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const FL_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **FL_Image * deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const FL_Image * deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (FL_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (FL_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, FL_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **virtual void hide ()**
  Makes a widget invisible.

- **FL_Image * image ()**
  Gets the image that is used as part of the widget label when in the active state.

- **const FL_Image * image () const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image (FL_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image (FL_Image *img)**
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗ label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group ∗ parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group ∗p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget's label uses ' & ' to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget's label uses ' & ' to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut ()
  Returns true if the widget's label contains the entered ' & x ' shortcut.

- const char ∗ tooltip () const
  Gets the current tooltip text.

- void tooltip (const char ∗ text)
  Sets the current tooltip text.

- Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.

- void type (uchar t)
  Sets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void ∗ user_data () const
  Gets the user data for this widget.

- void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

- void user_data (void ∗v)
  Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void do_end_hot_callback ()
  Call the callback if the user is interested.

• void draw () FL_OVERRIDE
  Draw the textual representation of the shortcut button.

• int handle (int) FL_OVERRIDE
  Handle keystrokes to catch the user's shortcut.

Protected Member Functions inherited from Fl_Button

• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget's label at the defined label position.

• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• `Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)`
  
  Creates a widget at the given position and size.

• unsigned int flags () const

  Gets the widget flags mask.

• void h (int v)

  Internal use only.

• void set_flag (unsigned int c)

  Sets a flag in the flags mask.

• void w (int v)

  Internal use only.

• void x (int v)

  Internal use only.

• void y (int v)

  Internal use only.

Protected Attributes

• `Fl_Shortcut shortcut_value`

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Widget`

• static void default_callback (Fl_Widget ∗widget, void ∗data)

  The default callback for all widgets that don’t set a callback.

• static unsigned int label_shortcut (const char ∗t)

  Returns the Unicode value of the '&x' shortcut in a given text.

• static int test_shortcut (const char ∗t, const bool require_alt=false)

  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from `Fl_Widget`

• enum {

  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,

• static void key_release_timeout (void ∗)

Static Protected Attributes inherited from `Fl_Button`

• static Fl_Widget_Tracker ∗key_release_tracker = 0

Generated by Doxygen
12.128.1 Detailed Description

A button that allows the user to type a key combination to create shortcuts. After clicked once, the button catches the following keyboard events and records the pressed keys and all modifiers. It draws a text representation of the shortcut. The backspace key deletes the current shortcut. A second click on the button or moving focus makes the last shortcut permanent.

The Shortcut button calls the user callback after every change if FL_WHEN_CHANGED is set, and when the button is no longer recording shortcuts if FL_WHEN_RELEASE is set.

12.128.2 Constructor & Destructor Documentation

12.128.2.1 Fl_Shortcut_Button()

```cpp
Fl_Shortcut_Button::Fl_Shortcut_Button ( 
    int X, 
    int Y, 
    int W, 
    int H, 
    const char * l = 0 )
```

Construct a shortcut button.

**Parameters**

<table>
<thead>
<tr>
<th>X, Y, W, H</th>
<th>position and size of the button</th>
</tr>
</thead>
<tbody>
<tr>
<td>l</td>
<td>label text when no shortcut is set</td>
</tr>
</tbody>
</table>

12.128.3 Member Function Documentation

12.128.3.1 draw()

```cpp
void Fl_Shortcut_Button::draw ( 
    void ) [protected], [virtual]
```

Draw the textual representation of the shortcut button. When the button can receive shortcut key events, it's "hot". A hot button is drawn in selection color. A cold button is drawn as a regular text box containing a human readable version of the shortcut key. Reimplemented from Fl_Button.

12.128.3.2 handle()

```cpp
int Fl_Shortcut_Button::handle ( 
    int e ) [protected], [virtual]
```

Handle keystrokes to catch the user's shortcut. Reimplemented from Fl_Button.

12.128.3.3 value() [1/2]

```cpp
Fl_Shortcut Fl_Shortcut_Button::value ( )
```

Return the user selected shortcut. Returns

**shortcut encoded as key and modifier**

12.128.3.4 value() [2/2]

```cpp
void Fl_Shortcut_Button::value ( 
    Fl_Shortcut shortcut )
```

Set the displayed shortcut.
Parameters

| in | shortcut | encoded as key and modifier |

The documentation for this class was generated from the following files:

- Fl_Shortcut_Button.H
- Fl_Shortcut_Button.cxx

### 12.129 Fl_Simple_Counter Class Reference

This widget creates a counter with only 2 arrow buttons.

```cpp
#include <Fl_Simple_Counter.H>
```

Inheritance diagram for Fl_Simple_Counter:

```
Fl_Widget
   
Fl_Valuator
   
Fl_Counter
   
Fl_Simple_Counter
```

#### Public Member Functions

- `Fl_Simple_Counter(int X, int Y, int W, int H, const char *L=0)`

#### Public Member Functions inherited from Fl_Counter

- `Fl_Counter(int X, int Y, int W, int H, const char *L=0)`
  - Creates a new Fl_Counter widget using the given position, size, and label string.
- `int handle(int) FL_OVERRIDE`
  - Handles the specified event.
- `void lstep(double a)`
  - Sets the increment for the large step buttons.
- `double step() const`
  - Returns the increment for normal step buttons.
- `void step(double a)`
  - Sets the increment for the normal step buttons.
- `void step(double a, double b)`
  - Sets the increments for the normal and large step buttons.
- `Fl_Color textcolor() const`
  - Gets the font color.
- `void textcolor(Fl_Color s)`
  - Sets the font color to s.
- `Fl_Font textfont() const`
  - Gets the text font.
- `void textfont(Fl_Font s)`
  - Sets the text font to s.
- `Fl_Fontsize textsize() const`
  - Gets the font size.
• void `textsize` (Fl_Fontsize s)
  Sets the font size to s.
• `~Fl_Counter` ()
  Destroys the valuator.

Public Member Functions inherited from `Fl_Valuator`

• void `bounds` (double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.
• double `clamp` (double)
  Clamps the passed value to the valuator range.
• virtual int `format` (char *)
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
• double `increment` (double, int)
  Adds n times the step value to the passed value.
• double `maximum` () const
  Gets the maximum value for the valuator.
• void `maximum` (double a)
  Sets the maximum value for the valuator.
• double `minimum` () const
  Gets the minimum value for the valuator.
• void `minimum` (double a)
  Sets the minimum value for the valuator.
• void `precision` (int digits)
  Sets the step value to 1.0 / 10^digits.
• void `range` (double a, double b)
  Sets the minimum and maximum values for the valuator.
• double `round` (double)
  Round the passed value to the nearest step increment.
• double `step` () const
  Gets or sets the step value.
• void `step` (double a, int b)
  See double `Fl_Valuator::step()` const
• void `step` (double s)
  See double `Fl_Valuator::step()` const.
• void `step` (int a)
  See double `Fl_Valuator::step()` const
• double `value` () const
  Gets the floating point(double) value.
• int `value` (double)
  Sets the current value.

Public Member Functions inherited from `Fl_Widget`

• void `_clear_fullscreen` ()
• void `_set_fullscreen` ()
• void `activate` ()
  Activates the widget.
• unsigned int `active` () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * as_gl_window () const
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const * as_group () const
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * as_window () const
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗ w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗ new_label)
  Sets the current label.
• void copy_tooltip (const char ∗ text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image ∗ deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image & img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗ widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗ widget, void ∗ arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only.".
• void **position** (int X, int Y)
  Repositions the window or widget.

• void **redraw** ()
  Schedules the drawing of the widget.

• void **redraw_label** ()
  Schedules the drawing of the label.

• virtual void **resize** (int x, int y, int w, int h)
  Changes the size or position of the widget.

• Fl_Color **selection_color** () const
  Gets the selection color.

• void **selection_color** (Fl_Color a)
  Sets the selection color.

• void **set_active** ()
  Marks the widget as active without sending events or changing focus.

• void **set_changed** ()
  Marks the value of the widget as changed.

• void **set_output** ()
  Sets a widget to output only.

• void **set_visible** ()
  Makes the widget visible.

• void **set_visible_focus** ()
  Enables keyboard focus navigation with this widget.

• int **shortcut_label** () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void **shortcut_label** (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void **show** ()
  Makes a widget visible.

• void **size** (int W, int H)
  Changes the size of the widget.

• int **take_focus** ()
  Gives the widget the keyboard focus.

• unsigned int **takesevents** () const
  Returns if the widget is able to take events.

• int **test_shortcut** ()
  Returns true if the widget's label contains the entered 'x' shortcut.

• const char * **tooltip** () const
  Gets the current tooltip text.

• void **tooltip** (const char *text)
  Sets the current tooltip text.

• Fl_Window * **top_window** () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar **type** () const
  Gets the widget type.

• void **type** (uchar t)
  Sets the widget type.

• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * **user_data** () const
Gets the user data for this widget.

- `void user_data (Fl_Callback_User_Data ∗v, bool auto_free)`
  Sets the user data for this widget.

- `void user_data (void ∗v)`
  Sets the user data for this widget.

- `unsigned int visible () const`
  Returns whether a widget is visible.

- `unsigned int visible_focus () const`
  Checks whether this widget has a visible focus.

- `void visible_focus (int v)`
  Modifies keyboard focus navigation.

- `int visible_r () const`
  Returns whether a widget and all its parents are visible.

- `int w () const`
  Gets the widget width.

- `Fl_When when () const`
  Returns the conditions under which the callback is called.

- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window ∗window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- `virtual ~Fl_Widget ()`
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- `static void default_callback (Fl_Widget ∗widget, void ∗data)`
  The default callback for all widgets that don't set a callback.

- `static unsigned int label_shortcut (const char ∗t)`
  Returns the Unicode value of the '&x' shortcut in a given text.

- `static int test_shortcut (const char ∗t, const bool require_alt=false)`
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- `enum { INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3, FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7, OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11, MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15, GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19, NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }
  flags possible values enumeration.
Protected Member Functions inherited from Fl_Counter

• void arrow_widths (int &w1, int &w2)
  Compute sizes (widths) of arrow boxes.

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char ∗L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.

• void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

• void handle_push ()
  Stores the current value in the previous value.

• void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.

• int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.

• double previous_value () const
  Gets the previous floating point value before an event changed it.

• void set_value (double v)
  Sets the current floating point value.

• double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.

• virtual void value_damage ()
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget's label at the defined label position.

• void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
12.130 Fl_Single_Window Class Reference

- **unsigned int flags () const**
  
  *Gets the widget flags mask.*

- **void h (int v)**
  
  *Internal use only.*

- **void set_flag (unsigned int c)**
  
  *Sets a flag in the flags mask.*

- **void w (int v)**
  
  *Internal use only.*

- **void x (int v)**
  
  *Internal use only.*

- **void y (int v)**
  
  *Internal use only.*

### 12.129.1 Detailed Description

This widget creates a counter with only 2 arrow buttons.

![Fl_Simple_Counter](image)

*Figure 12.43 Fl_Simple_Counter*

The documentation for this class was generated from the following files:

- Fl_Simple_Counter.H
- Fl_Counter.cxx

### 12.130 Fl_Single_Window Class Reference

This is the same as Fl_Window.

```c
#include <Fl_Single_Window.H>
```

Inheritance diagram for Fl_Single_Window:

```
Fl_Widget
   ↓
Fl_Group
   ↓
Fl_Window
   ↓
Fl_Single_Window
   ↓
Fl_Menu_Window
```

**Public Member Functions**

- **Fl_Single_Window (int W, int H, const char *l=0)**
  
  *Creates a new Fl_Single_Window widget using the given size, and label (title) string.*

- **Fl_Single_Window (int X, int Y, int W, int H, const char *l=0)**
  
  *Creates a new Fl_Single_Window widget using the given position, size, and label (title) string.*
• void show () FL_OVERRIDE
  Makes a widget visible.
• void show (int a, char **b)
  Same as Fl_Window::show(int a, char **b)

Public Member Functions inherited from Fl_Window

• virtual class Fl_Double_Window * as_double_window ()
  Return non-null if this is an Fl_Double_Window object.
• virtual class Fl_Overlay_Window * as_overlay_window ()
  Return non-null if this is an Fl_Overlay_Window object.
• Fl_Window const * as_window () const FL_OVERRIDE
• Fl_Window * as_window () FL_OVERRIDE
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• unsigned int border () const
  Returns whether the window possesses a border.
• void border (int b)
  Sets whether or not the window manager border is around the window.
• void clear_border ()
  Fast inline function to turn the window manager border off.
• void clear_modal_states ()
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
• void copy_label (const char * a)
  Sets the window titlebar label to a copy of a character string.
• void cursor (const Fl_RGB_Image *, int, int)
  Changes the cursor for this window using the provided image as cursor's shape.
• void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  For back compatibility only.
• void cursor (Fl_Cursor)
  Changes the cursor for this window.
• int decorated_h () const
  Returns the window height including any window title bar and any frame added by the window manager.
• int decorated_w () const
  Returns the window width including any frame added by the window manager.
• void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  For back compatibility only.
• void default_cursor (Fl_Cursor)
  Sets the default window cursor.
• void draw_backdrop ()
  Draw the background image if one is set and is aligned inside.
• Fl_Window (int w, int h, const char * title=0)
  Creates a window from the given width w, height h, and title.
• Fl_Window (int x, int y, int w, int h, const char *title=0)
  Creates a window from the given position (x, y), size (w, h) and title.
• void free_position ()
  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free
to position the window.
• void fullscreen ()
  Makes the window completely fill one or more screens, without any window manager border visible.
• unsigned int fullscreen_active () const
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.
• void **fullscreen_off** ()
  Turns off any side effects of **fullscreen()**

• void **fullscreen_off** (int X, int Y, int W, int H)
  Turns off any side effects of **fullscreen()** and does **resize(x,y,w,h)**.

• void **fullscreen_screens** (int top, int bottom, int left, int right)
  Sets which screens should be used when this window is in fullscreen mode.

• int **handle** (int) FL_OVERRIDE
  Handles the specified event.

• void **hide** () FL_OVERRIDE
  Removes the window from the screen.

• void **hotspot** (const Fl_Widget &p, int offscreen=0)
  See void Fl_Window::**hotspot**(int x, int y, int offscreen = 0)

• void **hotspot** (const Fl_Widget *p, int offscreen=0)
  See void Fl_Window::**hotspot**(int x, int y, int offscreen = 0)

• void **hotspot** (int x, int y, int offscreen=0)
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

• const void * **icon** () const
  Gets the current icon window target dependent data.

• void **icon** (const Fl_RGB_Image *)
  Sets or resets a single window icon.

• void **icon** (const void *ic)
  Platform-specific method to set the window icon usable on Windows and X11 only.

• void **iconize** ()
  Iconifies the window.

• const char * **iconlabel** () const
  See void Fl_Window::**iconlabel**(const char *)

• void **iconlabel** (const char *)
  Sets the icon label.

• void **icons** (const Fl_RGB_Image *[], int)
  Sets the window icons.

• void **icons** (HICON big_icon, HICON small_icon)
  Sets the window icons using HICON handles (Windows platform only).

• const char * **label** () const
  See void Fl_Window::**label**(const char *)

• void **label** (const char *)
  Sets the window title bar label.

• void **label** (const char *label, const char *iconlabel)
  Sets the icon label.

• void **make_current** ()
  Sets things up so that the drawing functions in `<FL/fl_draw.H>` will go into this window.

• void **maximize** ()
  Maximizes a top-level window to its current screen.

• unsigned int **maximize_active** () const
  Returns whether the window is currently maximized.

• unsigned int **menu_window** () const
  Returns true if this window is a menu window.

• unsigned int **modal** () const
  Returns true if this window is modal.
• unsigned int **non_modal** () const
  
  Returns true if this window is modal or non-modal.

• **fl_uintptr_t os_id** ()
  
  Returns a platform-specific identification of a shown window, or 0 if not shown.

• unsigned int **override** () const
  
  Returns non zero if OVERRIDE flag is set, 0 otherwise.

• void **resize** (int X, int Y, int W, int H) **FL_OVERRIDE**
  
  Changes the size and position of the window.

• int **screen_num** ()
  
  The number of the screen containing the mapped window.

• void **screen_num** (int screen_num)
  
  Set the number of the screen where to map the window.

• void **set_menu_window** ()
  
  Marks the window as a menu window.

• void **set_modal** ()
  
  A "modal" window, when shown(), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

• void **set_non_modal** ()
  
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a modal() one in that it remains on top, but it has no effect on event delivery.

• void **set_override** ()
  
  Activates the flags NOBORDER, OVERRIDE.

• void **set_tooltip_window** ()
  
  Marks the window as a tooltip window.

• const Fl_Image * **shape** ()
  
  Returns the image controlling the window shape or NULL.

• void **shape** (const Fl_Image &b)
  
  Set the window’s shape with an Fl_Image.

• void **shape** (const Fl_Image *img)
  
  Assigns a non-rectangular shape to the window.

• void **show** () **FL_OVERRIDE**
  
  Puts the window on the screen.

• void **show** (int argc, char **argv)
  
  Puts the window on the screen with show() and parses command-line arguments.

• int **shown** ()
  
  Returns non-zero if shown() has been called (but not hide() ).

• void **size_range** (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
  
  Sets the allowable range the user can resize this window to.

• unsigned int **tooltip_window** () const
  
  Returns true if this window is a tooltip window.

• void **un_maximize** ()
  
  Returns a previously maximized top-level window to its previous size.

• void **wait_for_expose** ()
  
  Waits for the window to be displayed after calling show().

• int **x_root** () const
  
  Gets the x position of the window on the screen.

• const char * **xclass** () const
  
  Returns the xclass for this window, or a default.

• void **xclass** (const char *c)
  
  Sets the xclass for this window.

• int **y_root** () const
  
  Gets the y position of the window on the screen.

• virtual ~Fl_Window ()
  
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Group

- `Fl_Widget * _ddfdesign_kludge ()`
  - This is for forms compatibility only.
- `void add (Fl_Widget &)`
  - The widget is removed from its current group (if any) and then added to the end of this group.
- `void add (Fl_Widget *)`
  - See void Fl_Group::add(Fl_Widget &w)
- `void add_resizable (Fl_Widget &o)`
  - Adds a widget to the group and makes it the resizable widget.
- `Fl_Widget * const * array () const`
  - Returns a pointer to the array of children.
- `Fl_Group * as_group () const FL_OVERRIDE`
  - Returns an Fl_Group pointer if this widget is an Fl_Group.
- `void begin ()`
  - Sets the current group so you can build the widget tree by just constructing the widgets.
- `Fl_Widget * child (int n) const`
  - Returns array()[n].
- `int children () const`
  - Returns how many child widgets the group has.
- `void clear ()`
  - Deletes all child widgets from memory recursively.
- `unsigned int clip_children ()`
  - Returns the current clipping mode.
- `void clip_children (int c)`
  - Controls whether the group widget clips the drawing of child widgets to its bounding box.
- `virtual int delete_child (int n)`
  - Removes the widget at index from the group and deletes it.
- `void end ()`
  - Exactly the same as current(this->parent()).
- `int find (const Fl_Widget &o) const`
  - See int Fl_Group::find(const Fl_Widget *w) const.
- `int find (const Fl_Widget *) const`
  - Searches the child array for the widget and returns the index.
- `Fl_Group (int, int, int, int, const char * = 0)`
  - Creates a new Fl_Group widget using the given position, size, and label string.
- `void focus (Fl_Widget *)`
- `void forms_end ()`
  - This is for forms compatibility only.
- `void init_sizes ()`
  - Resets the internal array of widget sizes and positions.
- `void insert (Fl_Widget &, int i)`
  - The widget is removed from its current group (if any) and then inserted into this group.
- `void insert (Fl_Widget &, Fl_Widget *)`
  - This does insert(w, find(before)).
- `void remove (Fl_Widget &)`
  - Removes a widget from the group but does not delete it.
- `void remove (Fl_Widget *)`
  - Removes the widget o from the group.
- `void remove (int index)`
Removes the widget at index from the group but does not delete it.

- **Fl_Widget** + resizable () const
  Returns the group's resizable widget.

- **void** resizable (Fl_Widget &o)
  Sets the group's resizable widget.

- **void** resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual** ~Fl_Group ()
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- **void** _clear_fullscreen ()
  Activates the widget.

- **void** _set_fullscreen ()
  Activates the widget.

- **unsigned int** active () const
  Returns whether the widget is active.

- **int** active_r () const
  Returns whether the widget and all of its parents are active.

- **Fl_Align** align () const
  Gets the label alignment.

- **void** align (Fl_Align alignment)
  Sets the label alignment.

- **long** argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- **void** argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window** + as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const** + as_gl_window () const

- **void** bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- **void** bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void** bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

- **void** bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype** box () const
  Gets the box type of the widget.

- **void** box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- **Fl_Callback_p** callback () const
  Gets the current callback function for the widget.

- **void** callback (Fl_Callback *cb)
  Sets the current callback function for the widget.

- **void** callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- **void** callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
- void copy_label (const char *new_label)
  Sets the current label.
- void copy_tooltip (const char *text)
  Sets the current tooltip text.
- uchar damage () const
  Returns non-zero if draw() needs to be called.
- void damage (uchar c)
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
- int damage_resize (int, int, int, int)
  Internal use only.
- void deactivate ()
  Deactivates the widget.
- Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
- const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
- void deimage (Fl_Image *img)
Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  
  Returns whether the inactive image is managed by the widget.

- **void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with default arguments.

- **void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, FL_Align) const**
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  
  Gets the widget height.

- **FL_Image * image ()**
  
  Gets the image that is used as part of the widget label when in the active state.

- **const FL_Image * image () const**
  
  Gets the image that is used as part of the widget label when in the active state.

- **void image (FL_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **void image (FL_Image *img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  
  Returns whether the image is managed by the widget.

- **int inside (const FL_Widget *wgt) const**
  
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  
  Returns whether the current label was assigned with copy_label().

- **const char * label () const**
  
  Gets the current label text.

- **void label (const char *text)**
  
  Sets the current label pointer.

- **void label (FL_Labeltype a, const char *b)**
  
  Shortcut to set the label text and type in one call.

- **FL_Color labelcolor () const**
  
  Gets the label color.

- **void labelcolor (FL_Color c)**
  
  Sets the label color.

- **FL_Font labelfont () const**
  
  Gets the font to use.

- **void labelfont (FL_Font f)**
  
  Sets the font to use.

- **FL_Fontsize labelsize () const**
  
  Gets the font size in pixels.

- **void labelsize (FL_Fontsize pix)**
  
  Sets the font size in pixels.

- **FL_Labeltype labeltype () const**
  
  Gets the label type.

- **void labeltype (FL_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group ∗ parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group ∗ p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗ text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Checks whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Public Types inherited from Fl_Window

  • typedef struct HICON__ * HICON

Static Public Member Functions inherited from Fl_Window

  • static Fl_Window * current ()
    Returns the last window that was made current.
  • static void default_callback (Fl_Window *, void *v)
    Back compatibility: Sets the default callback v for win to call on close event.
  • static void default_icon (const Fl_RGB_Image *)
    Sets a single default window icon.
  • static void default_icons (const Fl_RGB_Image *[], int)
    Sets the default window icons.
  • static void default_icons (HICON big_icon, HICON small_icon)
    Sets the default window icons (Windows platform only).
**static const char ∗ default_xclass ()**  
Returns the default xclass.

**static void default_xclass (const char ∗)  
Sets the default window xclass.**

**static bool is_a_rescale ()**  
Returns true when a window is being rescaled.

**static char show_next_window_iconic ()**  
Returns the static flag whether the next window should be opened iconified.

**static void show_next_window_iconic (char stat)**  
Sets a static flag whether the next window should be opened iconified.

### Static Public Member Functions inherited from Fl_Group

- **static Fl_Group ∗ current ()**  
  Returns the currently active group.

- **static void current (Fl_Group ∗g)**  
  Sets the current group.

### Static Public Member Functions inherited from Fl_Widget

- **static void default_callback (Fl_Widget ∗widget, void ∗data)**  
The default callback for all widgets that don’t set a callback.

- **static unsigned int label_shortcut (const char ∗t)**  
  Returns the Unicode value of the '&x' shortcut in a given text.

- **static int test_shortcut (const char ∗, const bool require_alt=false)**  
  Returns true if the given text t contains the entered '&x' shortcut.

### Protected Types inherited from Fl_Widget

- **enum {**
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 }**
  flags possible values enumeration.

### Protected Member Functions inherited from Fl_Window

- **void default_size_range ()**  
  Protected method to calculate the default size range of a window.

- **void draw () FL_OVERRIDE**  
  Draws the widget.

- **virtual void flush ()**  
  Forces the window to be drawn, this window is also made current and calls draw().

- **int force_position () const**  
  Returns the internal state of the window's FORCE_POSITION flag.
• void force_position (int force)
  Sets an internal flag that tells FLTK and the window manager to honor position requests.

• void free_icons ()
  Deletes all icons previously attached to the window.

• int is_resizable ()
  Protected method to determine whether a window is resizable.

Protected Member Functions inherited from Fl_Group

• Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.

• void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.

• void draw_children ()
  Draws all children of the group.

• void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.

• virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.

• virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.

• virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.

• int * sizes ()
  Returns the internal array of widget sizes and positions.

• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget's label at the defined label position.

• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Static Protected Attributes inherited from Fl_Window

- static Fl_Window *current_
  Stores the last window that was made current.

12.130.1 Detailed Description

This is the same as Fl_Window. However, it is possible that some implementations will provide double-buffered windows by default. This subclass can be used to force single-buffering. This may be useful for modifying existing programs that use incremental update, or for some types of image data, such as a movie flipbook.

12.130.2 Member Function Documentation

12.130.2.1 show()

void Fl_Single_Window::show ( ) [virtual]

Makes a widget visible.
An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL_SHOW.
The visible() method returns true if the widget is set to be visible. The visible_r() method returns true if the widget and all of its parents are visible. A widget is only visible if visible() is true on it and all of its parents.
Changing it will send FL_SHOW or FL_HIDE events to the widget. Do not change it if the parent is not visible, as this will send false FL_SHOW or FL_HIDE events to the widget. redraw() is called if necessary on this or the parent.

See also

hide(), visible(), visible_r()

Reimplemented from Fl_Widget.
The documentation for this class was generated from the following files:

- Fl_Single_Window.H
- Fl_Single_Window.cxx

12.131 Fl_Slider Class Reference

The Fl_Slider widget contains a sliding knob inside a box.
#include <Fl_Slider.H>

Inheritance diagram for Fl_Slider:
Public Member Functions

- void **bounds** (double a, double b)
  
  *Sets the minimum (a) and maximum (b) values for the valuator widget.*

- **FL_Slider** (int X, int Y, int W, int H, const char ∗L=0)
  
  *Creates a new Fl_Slider widget using the given position, size, and label string.*

- **FL_Slider** (uchar t, int X, int Y, int W, int H, const char ∗L)
  
  *Creates a new Fl_Slider widget using the given type, position, size, and label string.*

- int **handle** (int) FL_OVERRIDE
  
  *Handles the specified event.*

- int **scrollvalue** (int pos, int size, int first, int total)
  
  *Sets the size and position of the sliding knob in the box.*

- **FL_Boxtype** **slider** () const
  
  *Gets the slider box type.*

- void **slider** (FL_Boxtype c)
  
  *Sets the slider box type.*

- float **slider_size** () const
  
  *Get the dimensions of the moving piece of slider.*

- void **slider_size** (double v)
  
  *Set the dimensions of the moving piece of slider.*

Public Member Functions inherited from **FL_Valuator**

- void **bounds** (double a, double b)
  
  *Sets the minimum (a) and maximum (b) values for the valuator widget.*

- double **clamp** (double)
  
  *Clamps the passed value to the valuator range.*

- virtual int **format** (char ∗)
  
  *Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*

- double **increment** (double, int)
  
  *Adds n times the step value to the passed value.*

- double **maximum** () const
  
  *Gets the maximum value for the valuator.*

- void **maximum** (double a)
  
  *Sets the maximum value for the valuator.*

- double **minimum** () const
  
  *Gets the minimum value for the valuator.*

- void **minimum** (double a)
  
  *Sets the minimum value for the valuator.*

- void **precision** (int digits)
  
  *Sets the step value to 1.0 / 10^{digits}.*

- void **range** (double a, double b)
  
  *Sets the minimum and maximum values for the valuator.*

- double **round** (double)
Round the passed value to the nearest step increment.

- double step() const
  Gets or sets the step value.

- void step(double a, int b)
  See double Fl_Valuator::step() const

- void step(double s)
  See double Fl_Valuator::step() const.

- void step(int a)
  See double Fl_Valuator::step() const

- double value() const
  Gets the floating point(double) value.

- int value(double)
  Sets the current value.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen()
- void _set_fullscreen()
- void activate()
  Activates the widget.
- unsigned int active() const
  Returns whether the widget is active.
- int active_r() const
  Returns whether the widget and all of its parents are active.
- Fl_Align align() const
  Gets the label alignment.
- void align(Fl_Align alignment)
  Sets the label alignment.
- long argument() const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument(long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window() const
- virtual Fl_Group * as_group()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group() const
- virtual Fl_Window * as_window()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window() const
- void bind_deimage(Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage(int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image(Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image(int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box() const
Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback +cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback +cb, Fl_Callback_User_Data +p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback +cb, void +p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 +cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 +cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- int contains (const Fl_Widget +w) const
  Checks if w is a child of this widget.
- void copy_label (const char +new_label)
  Sets the current label.
- void copy_tooltip (const char +text)
  Sets the current tooltip text.
- uchar damage () const
  Returns non-zero if draw() needs to be called.
- void damage (uchar c)
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int **damage_resize**(int, int, int, int)
  
  **Internal use only.**

• void **deactivate**()
  
  Deactivates the widget.

• Fl_Img**age** **+** deimage()
  
  **Gets the image that is used as part of the widget label when in the inactive state.**

• const Fl_Img**age** **+** deimage() const
  
  **Gets the image that is used as part of the widget label when in the inactive state.**

• void **deimage**(Fl_Img**age** &img)
  
  **Sets the image to use as part of the widget label when in the inactive state.**

• void **deimage**(Fl_Img**age** *img)
  
  **Sets the image to use as part of the widget label when in the inactive state.**

• int **deimage_bound**() const
  
  **Returns whether the inactive image is managed by the widget.**

• void **do_callback**(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.

• void **do_callback**(Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **do_callback**(Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void **draw_label**(int, int, int, int, Fl_Align) const
  
  **Draws the label in an arbitrary bounding box with an arbitrary alignment.**

• int **h**() const
  
  **Gets the widget height.**

• virtual void **hide**()
  
  **Makes a widget invisible.**

• Fl_Img**age** **+** image()
  
  **Gets the image that is used as part of the widget label when in the active state.**

• const Fl_Img**age** **+** image() const
  
  **Gets the image that is used as part of the widget label when in the active state.**

• void **image**(Fl_Img**age** &img)
  
  **Sets the image to use as part of the widget label when in the active state.**

• void **image**(Fl_Img**age** *img)
  
  **Sets the image to use as part of the widget label when in the active state.**

• int **image_bound**() const
  
  **Returns whether the image is managed by the widget.**

• int **inside**(const Fl_Widget *wgt) const
  
  **Checks if this widget is a child of wgt.**

• int **is_label_copied**() const
  
  **Returns whether the current label was assigned with copy_label().**

• const char **+** label() const
  
  **Gets the current label text.**

• void **label**(const char **+**text)
  
  **Sets the current label pointer.**

• void **label**(Fl_Labeltype a, const char **+**b)
  
  **Shortcut to set the label text and type in one call.**

• Fl_Color **labelcolor**() const
  
  **Gets the label color.**

• void **labelcolor**(Fl_Color c)
  
  **Sets the label color.**

• Fl_Font **labelfont**() const
Gets the font to use.

- void `labelfont (Fl_Font f)`
  
  Sets the font to use.

- `Fl_Fontsize` `labelfsize` () const
  
  Gets the font size in pixels.

- void `labelfsize (Fl_Fontsize pix)`
  
  Sets the font size in pixels.

- `Fl_Labeltype` `labelftype` () const
  
  Gets the label type.

- void `labelftype (Fl_Labeltype a)`
  
  Sets the label type.

- void `measure_label (int &ww, int &hh)` const
  
  Sets width `ww` and height `hh` accordingly with the label size.

- bool `needs_keyboard` () const
  
  Returns whether this widget needs a keyboard.

- void `needs_keyboard (bool needs)`
  
  Sets whether this widget needs a keyboard.

- unsigned int `output` () const
  
  Returns if a widget is used for output only.

- `Fl_Group` * `parent` () const
  
  Returns a pointer to the parent widget.

- void `parent (Fl_Group *p)`
  
  Internal use only - "for hacks only".

- void `position (int X, int Y)`
  
  Repositions the window or widget.

- void `redraw ()`
  
  Schedules the drawing of the widget.

- void `redraw_label ()`
  
  Schedules the drawing of the label.

- virtual void `resize (int x, int y, int w, int h)`
  
  Changes the size or position of the widget.

- `Fl_Color` `selection_color` () const
  
  Gets the selection color.

- void `selection_color (Fl_Color a)`
  
  Sets the selection color.

- void `set_active ()`
  
  Marks the widget as active without sending events or changing focus.

- void `set_changed ()`
  
  Marks the value of the widget as changed.

- void `set_output ()`
  
  Sets a widget to output only.

- void `set_visible ()`
  
  Makes the widget visible.

- void `set_visible_focus ()`
  
  Enables keyboard focus navigation with this widget.

- int `shortcut_label` () const
  
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- void `shortcut_label (int value)`
  
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- virtual void `show ()`
  
  Makes a widget visible.
• void **size** (int W, int H)
  Changes the size of the widget.

• int **take_focus** ()
  Gives the widget the keyboard focus.

• unsigned int **takeevents** () const
  Returns if the widget is able to take events.

• int **test_shortcut** ()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char ∗ **tooltip** () const
  Gets the current tooltip text.

• void **tooltip** (const char ∗text)
  Sets the current tooltip text.

• **Fl_Window** ∗ **top_window** () const
  Returns a pointer to the top-level window for the widget.

• **Fl_Window** ∗ **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar **type** () const
  Gets the widget type.

• void **type** (uchar t)
  Sets the widget type.

• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void ∗ **user_data** () const
  Gets the user data for this widget.

• void **user_data** (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

• void **user_data** (void ∗v)
  Sets the user data for this widget.

• unsigned int **visible** () const
  Returns whether a widget is visible.

• unsigned int **visible_focus** () const
  Checks whether this widget has a visible focus.

• void **visible_focus** (int v)
  Modifies keyboard focus navigation.

• int **visible_r** () const
  Returns whether a widget and all its parents are visible.

• int **w** () const
  Gets the widget width.

• **Fl_When** **when** () const
  Returns the conditions under which the callback is called.

• void **when** (uchar i)
  Sets the flags used to decide when a callback is called.

• **Fl_Window** ∗ **window** () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int **x** () const
  Gets the widget position in its window.

• int **y** () const
  Gets the widget position in its window.

• virtual ∼Fl_Widget ()
  Destroys the widget.
Protected Member Functions

- void **draw () **FL_OVERRIDE
  Draws the widget.
- void **draw**(int, int, int, int)
- int **handle**(int, int, int, int)

Protected Member Functions inherited from **Fl_Valuator**

- **Fl_Valuator**(int X, int Y, int W, int H, const char ∗L)
  Creates a new **Fl_Valuator** widget using the given position, size, and label string.
- void **handle_drag**(double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void **handle_push()**
  Stores the current value in the previous value.
- void **handle_release()**
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int **horizontal ()** const
  Tells if the valuator is an FL_HORIZONTAL one.
- double **previous_value ()** const
  Gets the previous floating point value before an event changed it.
- void **set_value**(double v)
  Sets the current floating point value.
- double **softclamp**(double)
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void **value_damage ()**
  Asks for partial redraw.

Protected Member Functions inherited from **Fl_Widget**

- void **clear_flag**(unsigned int c)
  Clears a flag in the flags mask.
- void **draw_backdrop ()** const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box ()** const
  Draws the widget box according its box style.
- void **draw_box**(Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void **draw_box**(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus ()** const
  Draws a focus rectangle around the widget.
- void **draw_focus**(Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void **draw_focus**(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void **draw_label ()** const
  Draws the widget's label at the defined label position.
- void **draw_label**(int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- **Fl_Widget**(int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int **flags** () const
  
  *Gets the widget flags mask.*

• void **h** (int v)
  
  *Internal use only.*

• void **set_flag** (unsigned int c)
  
  *Sets a flag in the flags mask.*

• void **w** (int v)
  
  *Internal use only.*

• void **x** (int v)
  
  *Internal use only.*

• void **y** (int v)
  
  *Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from Fl_Widget

• static void **default_callback** (Fl_Widget *widget, void *data)
  
  *The default callback for all widgets that don't set a callback.*

• static unsigned int **label_shortcut** (const char *t)
  
  *Returns the Unicode value of the '&x' shortcut in a given text.*

• static int **test_shortcut** (const char *t, const bool require_alt=false)
  
  *Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from Fl_Widget

  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }

  *flags possible values enumeration.*

### Detailed Description

The Fl_Slider widget contains a sliding knob inside a box. It is often used as a scrollbar. Moving the box all the way to the top/left sets it to the minimum(), and to the bottom/right to the maximum(). The minimum() may be greater than the maximum() to reverse the slider direction. Use void Fl_Widget::type(int) to set how the slider is drawn, which can be one of the following:

• FL_VERTICAL - Draws a vertical slider (this is the default).

• FL_HORIZONTAL - Draws a horizontal slider.

• FL_VERT_FILL_SLIDER - Draws a filled vertical slider, useful as a progress or value meter.

• FL_HOR_FILL_SLIDER - Draws a filled horizontal slider, useful as a progress or value meter.

• FL_VERT_NICE_SLIDER - Draws a vertical slider with a nice looking control knob.
• FL_HOR_NICE_SLIDER - Draws a horizontal slider with a nice looking control knob.

### 12.131.2 Constructor & Destructor Documentation

#### 12.131.2.1 Fl_Slider()

```cpp
Fl_Slider::Fl_Slider ( 
    int X,
    int Y,
    int W,
    int H,
    const char ∗ L = 0 )
```

Creates a new Fl_Slider widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

### 12.131.3 Member Function Documentation

#### 12.131.3.1 bounds()

```cpp
void Fl_Slider::bounds ( 
    double a,
    double b )
```

Sets the minimum (a) and maximum (b) values for the valuator widget. If at least one of the values is changed, a partial redraw is asked.

#### 12.131.3.2 draw()

```cpp
void Fl_Slider::draw ( ) [protected], [virtual]
```

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead. Override this function to draw your own widgets. If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget ∗ s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget. Reimplemented in Fl_Value_Slider.

#### 12.131.3.3 handle()

```cpp
int Fl_Slider::handle ( 
    int event ) [virtual]
```

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in  | event | the kind of event received |

Return values

| 0   | if the event was not used or understood |
| 1   | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Widget.
Reimplemented in Fl_Value_Slider.

12.131.3.4 scrollvalue()

int Fl_Slider::scrollvalue (int pos, int size, int first, int total)

Sets the size and position of the sliding knob in the box.

Parameters

| in  | pos | position of first line displayed |
| in  | size | size of window in lines |
| in  | first | number of first line |
| in  | total | total number of lines Returns Fl_Valuator::value(p) |

12.131.3.5 slider_size()

void Fl_Slider::slider_size (double v)

Set the dimensions of the moving piece of slider.
This is the fraction of the size of the entire widget. If you set this to 1 then the slider cannot move. The default value is .08.
For the "fill" sliders this is the size of the area around the end that causes a drag effect rather than causing the slider to jump to the mouse.
The documentation for this class was generated from the following files:

- Fl_Slider.H
- Fl_Slider.cxx

12.132 Fl_Spinner Class Reference

This widget is a combination of a numerical input widget and repeat buttons.
#include <Fl_Spinner.H>

Inheritance diagram for Fl_Spinner:

```
Fl_Widget
   |
   v
Fl_Group
   |
   v
Fl_Spinner
```

Classes

- class Fl_Spinner_Input

Public Member Functions

- Fl_Color color() const
  Returns the background color of the spinner widget's input field.

- void color(Fl_Color v)
  Sets the background color of the spinner widget's input field.

- Fl_Spinner(int X, int Y, int W, int H, const char *L=0)
  Creates a new Fl_Spinner widget using the given position, size, and label string.

- const char * format() const
  Returns the format string for the value.

- void format(const char *f)
  Sets the format string for the value.

- int handle(int event) FL_OVERRIDE
  Handles the specified event.

- double maximum() const
  Gets the maximum value of the widget.

- void maximum(double m)
  Sets the maximum value of the widget.

- int maximum_size() const
  Returns the maximum width of the input field.

- void maximum_size(int m)
  Sets the maximum width of the input field.

- double minimum() const
  Gets the minimum value of the widget.

- void minimum(double m)
  Sets the minimum value of the widget.

- void range(double a, double b)
  Sets the minimum and maximum values for the widget.

- void resize(int X, int Y, int W, int H) FL_OVERRIDE
  Resizes the Fl_Group widget and all of its children.

- Fl_Color selection_color() const
  Returns the selection color of the spinner widget's input field.

- void selection_color(Fl_Color val)
  Sets the selection color of the spinner widget's input field.

- double step() const
  Gets the amount to change the value when the user clicks a button.

- void step(double s)
Sets or returns the amount to change the value when the user clicks a button.

* `Fl_Color textcolor() const`
  Gets the color of the text in the input field.

* `void textcolor(Fl_Color c)`
  Sets the color of the text in the input field.

* `Fl_Font textfont() const`
  Gets the font of the text in the input field.

* `void textfont(Fl_Font f)`
  Sets the font of the text in the input field.

* `Fl_Fontsize textsize() const`
  Gets the size of the text in the input field.

* `void textsize(Fl_Fontsize s)`
  Sets the size of the text in the input field.

* `uchar type() const`
  Gets the numeric representation in the input field.

* `void type(uchar v)`
  Sets the numeric representation in the input field.

* `double value() const`
  Gets the current value of the widget.

* `void value(double v)`
  Sets the current value of the input widget.

* `int wrap() const`
  Gets the wrap mode of the `Fl_Spinner` widget.

* `void wrap(int set)`
  Sets whether the spinner wraps around at upper and lower bounds.

### Public Member Functions inherited from `Fl_Group`

* `FL_Widget *&_ddfdesign_kludge()`
  This is for forms compatibility only.

* `void add(Fl_Widget &)`
  The widget is removed from its current group (if any) and then added to the end of this group.

* `void add(Fl_Widget *o)`
  See void `Fl_Group::add(Fl_Widget &w)`

* `void add_resizable(Fl_Widget &o)`
  Adds a widget to the group and makes it the resizable widget.

* `FL_Widget *const * array()` const
  Returns a pointer to the array of children.

* `Fl_Group const * as_group() const FL_OVERRIDE`
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

* `void begin()`
  Sets the current group so you can build the widget tree by just constructing the widgets.

* `FL_Widget * child(int n)` const
  Returns `array()[n]`.

* `int children()` const
  Returns how many child widgets the group has.

* `void clear()`
  Deletes all child widgets from memory recursively.

* `unsigned int clip_children()`
  Returns the current clipping mode.
• void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

• void end ()
  Exactly the same as current(this->parent());

• int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.

• int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.

• Fl_Group (int, int, int, int, const char *)=0
  Creates a new Fl_Group widget using the given position, size, and label string.

• void focus (Fl_Widget *)

• void forms_end ()
  This is for forms compatibility only.

• void init_sizes ()
  Resets the internal array of widget sizes and positions.

• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

• void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).

• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

• void remove (Fl_Widget *o)
  Removes the widget o from the group.

• void remove (int index)
  Removes the widget at index from the group but does not delete it.

• Fl_Widget *resizable () const
  Returns the group's resizable widget.

• void resizable (Fl_Widget &o)
  Sets the group's resizable widget.

• void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()

• void _set_fullscreen ()

• void activate ()
  Activates the widget.

• unsigned int active () const
  Returns whether the widget is active.

• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const

Generated by Doxygen
Gets the current user data (long) argument that is passed to the callback function.

- **void argument** (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window** ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const ∗ as_gl_window ()** const
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual Fl_Window** ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **virtual Fl_Window const ∗ as_window ()** const
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **void bind_deimage (Fl_Image ∗ img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void bind_deimage (int f)**
  
  Sets the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image (Fl_Image ∗ img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  
  Sets the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  
  Gets the current callback function for the widget.

- **void callback (Fl_Callback ∗ cb)**
  
  Sets the current callback function for the widget.

- **void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)**
  
  Sets the current callback function and managed user data for the widget.

- **void callback (Fl_Callback ∗ cb, void ∗ p)**
  
  Sets the current callback function and data for the widget.

- **void callback (Fl_Callback0 ∗ cb)**
  
  Sets the current callback function for the widget.

- **void callback (Fl_Callback1 ∗ cb, long p=0)**
  
  Sets the current callback function for the widget.

- **unsigned int changed () const**
  
  Checks if the widget value changed since the last callback.

- **void clear_active ()**
  
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  
  Clears or sets the damage flags.

- **void clear_output ()**
  
  Sets a widget to accept input.

- **void clear_visible ()**
  
  Hides the widget.

- **void clear_visible_focus ()**
  
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

• void copy_label (const char *new_label)
  Sets the current label.

• void copy_tooltip (const char *text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.

• Fl_IMAGE = deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_IMAGE = deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_IMAGE &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_IMAGE *img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_IMAGE = image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_IMAGE = image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_IMAGE &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_IMAGE *img)
Sets the image to use as part of the widget label when in the active state.

- `int image_bound () const`
  Returns whether the image is managed by the widget.

- `int inside (const Fl_Widget *wgt) const`
  Checks if this widget is a child of `wgt`.

- `int is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`
  Gets the current label text.

- `void label (const char *text)`
  Sets the current label pointer.

- `void label (Fl_Labeltype a, const char *b)`
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  Gets the label color.

- `void labelcolor (Fl_Color c)`
  Sets the label color.

- `Fl_Font labelfont () const`
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

- `void labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  Internal use only - “for hacks only”.

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.
• const char ∗ tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗ user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
Returns whether a widget and all its parents are visible.

- **int w () const**
  Gets the widget width.

- **Fl_When when () const**
  Returns the conditions under which the callback is called.

- **void when (uchar i)**
  Sets the flags used to decide when a callback is called.

- **Fl_Window * window () const**
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  Gets the widget position in its window.

- **int y () const**
  Gets the widget position in its window.

- **virtual ~Fl_Widget ()**
  Destroys the widget.

### Protected Member Functions

- **void draw () FL_OVERRIDE**
  Draws the widget.

### Protected Member Functions inherited from Fl_Group

- **Fl_Rect * bounds ()**
  Returns the internal array of widget sizes and positions.

- **void draw_child (Fl_Widget &widget) const**
  Forces a child to redraw.

- **void draw_children ()**
  Draws all children of the group.

- **void draw_outside_label (const Fl_Widget &widget) const**
  Parents normally call this to draw outside labels of child widgets.

- **virtual int on_insert (Fl_Widget *, int)**
  Allow derived groups to act when a widget is added as a child.

- **virtual int on_move (int, int)**
  Allow derived groups to act when a widget is moved within the group.

- **virtual void on_remove (int)**
  Allow derived groups to act when a child widget is removed from the group.

- **int * sizes ()**
  Returns the internal array of widget sizes and positions.

- **void update_child (Fl_Widget &widget) const**
  Draws a child only if it needs it.

### Protected Member Functions inherited from Fl_Widget

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

- **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box () const**
  Draws the widget box according its box style.

- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.
• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const
  
  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• **Fl_Widget** (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

• unsigned int **flags** () const
  
  Gets the widget flags mask.

• void **h** (int v)
  
  Internal use only.

• void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

• void **w** (int v)
  
  Internal use only.

• void **x** (int v)
  
  Internal use only.

• void **y** (int v)
  
  Internal use only.

**Protected Attributes**

  • Fl_Repeat_Button down_button_

  • Fl_Spinner_Input input_

  • Fl_Repeat_Button up_button_

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Group**

  • static Fl_Group ∗current ()
    
    Returns the currently active group.

  • static void current (Fl_Group ∗g)
    
    Sets the current group.

**Static Public Member Functions inherited from Fl_Widget**

  • static void default_callback (Fl_Widget ∗widget, void ∗data)
    
    The default callback for all widgets that don't set a callback.

  • static unsigned int label_shortcut (const char ∗t)
    
    Returns the Unicode value of the '&x' shortcut in a given text.

  • static int test_shortcut (const char ∗t, const bool require_alt=false)
    
    Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

} flags possible values enumeration.

12.132.1 Detailed Description

This widget is a combination of a numerical input widget and repeat buttons.
The user can either type into the input area or use the buttons to change the value.

![Figure 12.45 Fl_Spinner widget](image)

12.132.2 Constructor & Destructor Documentation

12.132.2.1 Fl_Spinner()

Fl_Spinner::Fl_Spinner ( int X, int Y, int W, int H, const char ∗ L = 0 )

Creates a new Fl_Spinner widget using the given position, size, and label string.
The inherited destructor destroys the widget and any value associated with it.

12.132.3 Member Function Documentation

12.132.3.1 draw()

void Fl_Spinner::draw ( ) [protected], [virtual]

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:

```c++
Fl_Widget ∗ s = ∗ scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from Fl_Group.

Generated by Doxygen
12.132.3.2 handle()

```cpp
int Fl_Spinner::handle (int event) [virtual]
```
Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also

- `Fl_Event`

Reimplemented from `Fl_Group`.

12.132.3.3 resize()

```cpp
void Fl_Spinner::resize (int X, int Y, int W, int H) [virtual]
```
Resizes the Fl_Group widget and all of its children.
The Fl_Group widget first resizes itself, and then it moves and resizes all its children according to the rules documented for Fl_Group::resizable(Fl_Widget*)

See also

- `Fl_Group::resizable(Fl_Widget*)`
- `Fl_Group::resizable()`
- `Fl_Widget::resize(int,int,int,int)`

Reimplemented from `Fl_Group`.

12.132.3.4 step()[1/2]

```cpp
double Fl_Spinner::step () const [inline]
```
Gets the amount to change the value when the user clicks a button.

See also

- `Fl_Spinner::step(double)`
12.132.3.5 step() [2/2]

void Fl_Spinner::step (double s)

Sets or returns the amount to change the value when the user clicks a button. Before setting step to a non-integer value, the spinner type() should be changed to floating point.

See also

double Fl_Spinner::step() const

12.132.3.6 type() [1/2]

uchar Fl_Spinner::type () const [inline]

Gets the numeric representation in the input field.

See also

Fl_Spinner::type(uchar)

12.132.3.7 type() [2/2]

void Fl_Spinner::type (uchar v)

Sets the numeric representation in the input field. Valid values are FL_INT_INPUT and FL_FLOAT_INPUT. Also changes the format() template. Setting a new spinner type via a superclass pointer will not work.

Note

type() is not a virtual function.

12.132.3.8 value()

void Fl_Spinner::value (double v) [inline]

Sets the current value of the input widget. Before setting value to a non-integer value, the spinner type() should be changed to floating point.

12.132.3.9 wrap() [1/2]

int Fl_Spinner::wrap ( ) const [inline]

Gets the wrap mode of the Fl_Spinner widget.

See also

void wrap(int)

Since

1.4.0

12.132.3.10 wrap() [2/2]

void Fl_Spinner::wrap (int set) [inline]

Sets whether the spinner wraps around at upper and lower bounds. If wrap mode is on the spinner value is set to the minimum() or maximum() if the value exceeds the upper or lower bounds, resp., if it was changed by one of the buttons or the FL_Up or FL_Down keys. The spinner stops at the upper and lower bounds if wrap mode is off. The default wrap mode is on for backwards compatibility with FLTK 1.3.x and older versions.
Note

Wrap mode does not apply to the input field if the input value is edited directly as a number. The input value is always clipped to the allowed range as if wrap mode was off when the input field is left (i.e. loses focus).

See also

minimum(), maximum()

Parameters

```
in  set  non-zero sets wrap mode, zero resets wrap mode
```

Since

1.4.0

The documentation for this class was generated from the following files:

- Fl_Spinner.H
- Fl_Spinner.cxx

### 12.133 Fl_Spinner::Fl_Spinner_Input Class Reference

Inheritance diagram for Fl_Spinner::Fl_Spinner_Input:

```
Fl_Widget
  |

Fl_Input_
  |
  |
Fl_Input
  |
  |
Fl_Spinner::Fl_Spinner_INPUT
```

**Public Member Functions**

- **Fl_Spinner_Input** (int X, int Y, int W, int H)
- **int handle** (int event) FL_OVERRIDE
  
  Handles events of Fl_Spinner’s embedded input widget.

**Public Member Functions inherited from Fl_Input**

- **Fl_Input** (int, int, int, int, const char ∗=0)
  
  Creates a new Fl_Input widget using the given position, size, and label string.

**Public Member Functions inherited from Fl_Input_**

- **int append** (const char ∗t, int l=0, char keep_selection=0)
  
  Append text at the end.
- **bool can_redo** () const
  
  Check if there is a redo action available.
- **bool can_undo** () const
  
  Check if the last operation can be undone.
• int **copy** (int clipboard)
  
  *Put the current selection into the clipboard.*

• int **copy_cuts** ()
  
  *Copies the yank buffer to the clipboard.*

• **Fl_Color cursor_color** () const
  
  *Gets the color of the cursor.*

• void **cursor_color** (Fl_Color n)
  
  *Sets the color of the cursor.*

• int **cut** ()
  
  *Deletes the current selection.*

• int **cut** (int a, int b)
  
  *Deletes all characters between index a and b.*

• int **cut** (int n)
  
  *Deletes the next n bytes rounded to characters before or after the cursor.*

• double **dvalue** () const
  
  *Returns the widget text interpreted as a floating point number.*

• Fl_Input_ (int, int, int, const char ∗=0)
  
  *Creates a new Fl_Input_ widget.*

• unsigned int **index** (int i) const
  
  *Returns the character at index i.*

• int **input_type** () const
  
  *Gets the input field type.*

• void **input_type** (int t)
  
  *Sets the input field type.*

• int **insert** (const char ∗t, int l=0)
  
  *Inserts text at the cursor position.*

• int **insert_position** () const
  
  *Gets the position of the text cursor.*

• int **insert_position** (int p)
  
  *Sets the cursor position and mark.*

• int **insert_position** (int p, int m)
  
  *Sets the index for the cursor and mark.*

• int **ivalue** () const
  
  *Returns the widget text interpreted as a signed integer.*

• int **mark** () const
  
  *Gets the current selection mark.*

• int **mark** (int m)
  
  *Sets the current selection mark.*

• int **maximum_size** () const
  
  *Gets the maximum length of the input field in characters.*

• void **maximum_size** (int m)
  
  *Sets the maximum length of the input field in characters.*

• int **position** () const
  
  *Gets the read-only state of the input field.*

• void **readonly** (int b)
  
  *Sets the read-only state of the input field.*

• int **redo** ()
  
  *Redo previous undo operation.*

- **int replace**(int b, int e, const char *text, int ilen=0)
  
  Deletes text from b to e and inserts the new string text.

- **void resize**(int, int, int, int) FL_OVERRIDE
  
  Changes the size of the widget.

- **int shortcut**( ) const
  
  Return the shortcut key associated with this widget.

- **void shortcut**(int s)
  
  Sets the shortcut key associated with this widget.

- **int size**( ) const
  
  Returns the number of bytes in value().

- **void size**(int W, int H)
  
  Sets the width and height of this widget.

- **int static_value**(const char *)
  
  Changes the widget text.

- **int static_value**(const char *, int)
  
  Changes the widget text.

- **int tab_nav**( ) const
  
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

- **void tab_nav**(int val)
  
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.

- **Fl_Color textcolor**( ) const
  
  Gets the color of the text in the input field.

- **void textcolor**(Fl_Color n)
  
  Sets the color of the text in the input field.

- **Fl_Font textfont**( ) const
  
  Gets the font of the text in the input field.

- **void textfont**(Fl_Font s)
  
  Sets the font of the text in the input field.

- **Fl_Fontsize textsize**( ) const
  
  Gets the size of the text in the input field.

- **void textsize**(Fl_Fontsize s)
  
  Sets the size of the text in the input field.

- **int undo**( )
  
  Undoes previous changes to the text buffer.

- **const char * value**( ) const
  
  Returns the text displayed in the widget.

- **int value**(const char *)
  
  Changes the widget text.

- **int value**(const char *, int)
  
  Changes the widget text.

- **int value**(double value)
  
  Changes the widget text to a floating point number ("%g").

- **int value**(int value)
  
  Changes the widget text to a signed integer number.

- **int wrap**( ) const
  
  Gets the word wrapping state of the input field.

- **void wrap**(int b)
  
  Sets the word wrapping state of the input field.

- **~Fl_Input**( )
  
  Destroys the widget.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const ∗ as_group () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
Checks if the widget value changed since the last callback.

- **void clear_active()**
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed()**
  Marks the value of the widget as unchanged.

- **void clear_damage(uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output()**
  Sets a widget to accept input.

- **void clear_visible()**
  Hides the widget.

- **void clear_visible_focus()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color() const**
  Gets the background color of the widget.

- **void color(Fl_Color bg)**
  Sets the background color of the widget.

- **void color(Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

- **Fl_Color color2() const**
  For back compatibility only.

- **void color2(unsigned a)**
  For back compatibility only.

- **int contains(const Fl_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label(const char *new_label)**
  Sets the current label.

- **void copy_tooltip(const char *text)**
  Sets the current tooltip text.

- **uchar damage() const**
  Returns non-zero if draw() needs to be called.

- **void damage(uchar c)**
  Sets the damage bits for the widget.

- **void damage(uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize(int, int, int, int)**
  Internal use only.

- **void deactivate()**
  Deactivates the widget.

- **Fl_Image *deimage()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image *deimage() const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage(Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage(Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound() const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char *label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.
• unsigned int `output () const`
  Returns if a widget is used for output only.
• `Fl_Group * parent () const`
  Returns a pointer to the parent widget.
• void `parent (Fl_Group *p)`
  Internal use only - "for hacks only".
• void `position (int X, int Y)`
  Repositions the window or widget.
• void `re redraw ()`
  Schedules the drawing of the widget.
• void `re redraw_label ()`
  Schedules the drawing of the label.
• `Fl_Color selection_color () const`
  Gets the selection color.
• void `selection_color (Fl_Color a)`
  Sets the selection color.
• void `set_active ()`
  Marks the widget as active without sending events or changing focus.
• void `set_changed ()`
  Marks the value of the widget as changed.
• void `set_output ()`
  Sets a widget to output only.
• void `set_visible ()`
  Makes the widget visible.
• void `set_visible_focus ()`
  Enables keyboard focus navigation with this widget.
• int `shortcut_label () const`
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void `shortcut_label (int value)`
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void `show ()`
  Makes a widget visible.
• void `size (int W, int H)`
  Changes the size of the widget.
• int `take_focus ()`
  Gives the widget the keyboard focus.
• unsigned int `takeevents () const`
  Returns if the widget is able to take events.
• int `test_shortcut ()`
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * `tooltip () const`
  Gets the current tooltip text.
• void `tooltip (const char *text)`
  Sets the current tooltip text.
• `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.
• `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar `type () const`
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from Fl_Input

• static const char * copy_menu_text = "Copy"
  [this text may be customized at run-time]
• static const char * cut_menu_text = "Cut"
  [this text may be customized at run-time]
• static const char * paste_menu_text = "Paste"
  [this text may be customized at run-time]
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,

} flags possible values enumeration.

Protected Member Functions inherited from Fl_Input

- void draw () FL_OVERRIDE
  Draws the widget.
- int handle_key ()
  Handles a keystroke.
- int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

- int apply_undo ()
  Apply the current undo/redo operation.
- void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
- void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
- void handle_mouse (int, int, int, int, int keepmark=0)
  Handles mouse clicks and mouse moves.
- int handletext (int e, int, int, int)
  Handles all kinds of text field related events.
- int line_end (int i) const
  Finds the end of a line.
- int line_start (int i) const
  Finds the start of a line.
- int linesPerPage ()
  Returns the number of lines per page.
- void maybe_do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
- int up_down_position (int, int keepmark=0)
  Moves the cursor to the column given by up_down_pos.
- int word_end (int i) const
  Finds the end of a word.
- int word_start (int i) const
  Finds the start of a word.
- int xscroll () const
- int yscroll () const
- void yscroll (int yOffset)
Protected Member Functions inherited from Fl_Widget

- void **clear_flag** (unsigned int c)
  Clears a flag in the flags mask.

- void **draw_backdrop** () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box** () const
  Draws the widget box according its box style.

- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus** () const
  Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  Draws the widget's label at the defined label position.

- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int **flags** () const
  Gets the widget flags mask.

- void **h** (int v)
  Internal use only.

- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.

- void **w** (int v)
  Internal use only.

- void **x** (int v)
  Internal use only.

- void **y** (int v)
  Internal use only.

### 12.133.1 Member Function Documentation

#### 12.133.1.1 handle()

```cpp
int Fl_Spinner::Fl_Spinner_Input::handle (int event) [virtual]
```

Handles events of Fl_Spinner's embedded input widget.
Works like Fl_Input::handle() but ignores FL_Up and FL_Down keys so they can be handled by the parent widget (Fl_Spinner).
Reimplemented from Fl_Input.
The documentation for this class was generated from the following files:

- Fl_Spinner.H
- Fl_Spinner.cxx
12.134  Fl_Surface_Device Class Reference

A drawing surface that’s susceptible to receive graphical output.
#include <Fl_Device.H>

Inheritance diagram for Fl_Surface_Device:

```
Fl_Surface_Device
   Fl_Display_Device Fl_Widget_Surface
   Fl_Copy_Surface Fl_EPS_File_Surface Fl_Image_Surface Fl_Paged_Device Fl_SVG_File_Surface
   Fl_PostScript_File_Device Fl_Printer
```

Public Member Functions

- `Fl_Graphics_Driver * driver()`
  Returns the graphics driver of this drawing surface.
- `virtual bool is_current()`
  Is this surface the current drawing surface?
- `virtual void set_current(void)`
  Make this surface the current drawing surface.
- `virtual ~Fl_Surface_Device()`
  The destructor.

Static Public Member Functions

- `static Fl_Surface_Device * pop_current()`
  Removes the top element from the current drawing surface stack, and makes the new top element current.
- `static void push_current(Fl_Surface_Device *new_current)`
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- `static Fl_Surface_Device * surface()`
  The current drawing surface.

Protected Member Functions

- `void driver(Fl_Graphics_Driver *graphics_driver)`
  Sets the graphics driver of this drawing surface.
- `virtual void end_current()`
  FLTK calls this each time a surface ceases to be the current drawing surface.
- `Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)`
  Constructor that sets the graphics driver to use for the created surface.

12.134.1  Detailed Description

A drawing surface that’s susceptible to receive graphical output.

Any FLTK application has at any time a current drawing surface to which all drawing requests are directed. The
current surface is given by Fl_Surface_Device::surface(). When main() begins running, the current drawing surface
has been set to the computer’s display, an instance of the Fl_Display_Device class.

A drawing surface other than the computer’s display, is typically used as follows:

1. Create `surface`, an object from a particular Fl_Surface_Device derived class (e.g., Fl_Copy_Surface,
Fl_Printer).
2. Call `Fl_Surface_Device::push_current(surface);` to redirect all graphics requests to
   `surface` which becomes the new current drawing surface (not necessary with classes Fl_Printer /
   Fl_PostScript_File_Device because it is done by Fl_Paged_Device::begin_page()).

Generated by Doxygen
3. At this point all of the Drawing functions (e.g., \texttt{fl_rect()}) or the Color & Font functions or Drawing Images functions (e.g., \texttt{fl_draw_image()}, \texttt{Fl_Image::draw()}) operate on the new current drawing surface. Drawing surfaces from \texttt{Fl_Widget_Surface} derived classes allow additional ways to draw to them (e.g., \texttt{Fl_Printer::print_widget()}, \texttt{Fl_Image_Surface::draw()}).

4. After all drawing requests have been performed, redirect graphics requests back to their previous destination with \texttt{Fl_Surface_Device::pop_current();} (not necessary with classes \texttt{Fl_Printer} / \texttt{Fl_PostScript_File_Device}).

5. Delete surface.

For back-compatibility, it is also possible to use the \texttt{Fl_Surface_Device::set_current()} member function to change the current drawing surface, once to the new surface, once to the previous one.

Class \texttt{Fl_Surface_Device} can also be derived to define new kinds of graphical output usable with FLTK drawing functions. An example would be to draw to a PDF file. This would require to create a new class, say PDF\_File Surface, derived from class \texttt{Fl_Surface_Device}, and another new class, say PDF\_Graphics\_Driver, derived from class Fl\_Graphics\_Driver. Class PDF\_Graphics\_Driver should implement all virtual methods of the Fl\_Graphics\_Driver class to support all FLTK drawing functions and have them draw into PDF files. Alternatively, class PDF\_Graphics\_Driver could implement only some virtual methods, and only part of the FLTK drawing API would be usable when drawing to PDF files.

### 12.134.2 Member Function Documentation

#### 12.134.2.1 \texttt{end_current()} 

virtual void \texttt{Fl_Surface_Device::end_current()} [inline], [protected], [virtual]

FLTK calls this each time a surface ceases to be the current drawing surface.

This member function is mostly of interest to developers of new Fl\_Surface\_Device derived classes. It allows to perform surface-specific operations necessary when this surface ceases to be current. Each implementation should end with a call to \texttt{Fl_Surface_Device::end_current()}.

Reimplemented in \texttt{Fl_PostScript_File_Device}.

#### 12.134.2.2 \texttt{is_current()} 

bool \texttt{Fl_Surface_Device::is_current()} [virtual]

Is this surface the current drawing surface?

Reimplemented in \texttt{Fl_Copy_Surface, Fl_Image_Surface, and Fl_Printer}.

#### 12.134.2.3 \texttt{pop_current()} 

\texttt{Fl_Surface_Device \* Fl_Surface_Device::pop_current()} [static]

Removes the top element from the current drawing surface stack, and makes the new top element current.

Returns

A pointer to the new current drawing surface.

See also

\texttt{Fl_Surface_Device::push_current(Fl_Surface_Device \*)}

Version

1.4.0

#### 12.134.2.4 \texttt{push_current()} 

void \texttt{Fl_Surface_Device::push_current} ( 

\texttt{Fl_Surface_Device \* new_current} ) [static]

Pushes \texttt{new_current} on top of the stack of current drawing surfaces, and makes it current.

\texttt{new_current} will receive all future graphics requests.

Any call to \texttt{push_current()} must be matched by a subsequent call to \texttt{Fl_Surface_Device::pop_current()}. The max height of this stack is 16.
12.134.2.5 set_current()

```cpp
void Fl_Surface_Device::set_current ( void ) [virtual]
```

Make this surface the current drawing surface. This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is `Fl_Surface_Device::push_current( ) / Fl_Surface_Device::pop_current()`.

**Note**

It's recommended to use this function only as follows:

- The current drawing surface is the display;
- make current another surface, e.g., an `Fl_Printer` or an `Fl_Image_Surface` object, calling `set_current()` on this object;
- draw to that surface;
- make the display current again with `Fl_Display_Device::display_device()->set_current()`. Don't do any other call to `set_current()` before this one.

Other scenarios of drawing surface changes should be performed via `Fl_Surface_Device::push_current( ) / Fl_Surface_Device::pop_current()`.

Reimplemented in `Fl_Copy_Surface`, `Fl_Image_Surface`, `Fl_PostScript_File_Device`, and `Fl_Printer`.

12.134.2.6 surface()

```cpp
static Fl_Surface_Device * Fl_Surface_Device::surface ( ) [inline], [static]
```

The current drawing surface. In other words, the `Fl_Surface_Device` object that currently receives all graphics requests.

**Note**

It's possible to transiently remove the GUI scaling factor in place in the current drawing surface with `fl_override_scale()`.

The documentation for this class was generated from the following files:

- `Fl_Device.H`
- `Fl_Device.cxx`

# 12.135 Fl_SVG_File_Surface Class Reference

A drawing surface producing a Scalable Vector Graphics (SVG) file.

```cpp
#include <Fl_SVG_File_Surface.H>
```

Inheritance diagram for `Fl_SVG_File_Surface`:

```
Fl_Surface_Device
   |
   V
Fl_Widget_Surface
   |
   V
Fl_SVG_File_Surface
```
Public Member Functions

- `int close ()`
  Closes the FILE pointer where SVG data is output.

- `FILE * file ()`
  Returns the underlying FILE pointer.

- `Fl_SVG_File_Surface (int width, int height, FILE *svg, int(*closef)(FILE *))=NULL`
  Constructor of the SVG drawing surface.

- `void origin (int *x, int *y) FL_OVERRIDE`
  Computes the coordinates of the current origin of graphics functions.

- `void origin (int x, int y) FL_OVERRIDE`
  Sets the position of the origin of graphics in the drawable part of the drawing surface.

- `int printable_rect (int *w, int *h) FL_OVERRIDE`
  Computes the width and height of the drawable area of the drawing surface.

- `void translate (int x, int y) FL_OVERRIDE`
  Translates the current graphics origin accounting for the current rotation.

- `void untranslate () FL_OVERRIDE`
  Undoes the effect of a previous translate() call.

- `~Fl_SVG_File_Surface ()`
  Destructor.

Public Member Functions inherited from Fl_Widget_Surface

- `void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)`
  Draws the widget on the drawing surface.

- `void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)`
  Draws a window with its title bar and frame if any.

- `void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)`
  Draws a rectangular part of an on-screen window.

Public Member Functions inherited from Fl_Surface_Device

- `Fl_Graphics_Driver * driver ()`
  Returns the graphics driver of this drawing surface.

- `virtual bool is_current ()`
  Is this surface the current drawing surface?

- `virtual void set_current (void)`
  Make this surface the current drawing surface.

- `virtual ~Fl_Surface_Device ()`
  The destructor.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Surface_Device

- `static Fl_Surface_Device * pop_current ()`
  Removes the top element from the current drawing surface stack, and makes the new top element current.

- `static void push_current (Fl_Surface_Device *new_current)`
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.

- `static Fl_Surface_Device * surface ()`
  The current drawing surface.
Protected Member Functions inherited from Fl_Widget_Surface

• **Fl_Widget_Surface** (Fl_Graphics_Driver *d)
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

• **void driver** (Fl_Graphics_Driver *graphics_driver)
  Sets the graphics driver of this drawing surface.

• virtual **void end_current ()**
  FLTK calls this each time a surface ceases to be the current drawing surface.

• **Fl_Surface_Device** (Fl_Graphics_Driver *graphics_driver)
  Constructor that sets the graphics driver to use for the created surface.

Protected Attributes inherited from Fl_Widget_Surface

• **int x_offset**
  horizontal offset to the origin of graphics coordinates

• **int y_offset**
  vertical offset to the origin of graphics coordinates

12.135.1 Detailed Description

A drawing surface producing a Scalable Vector Graphics (SVG) file.
This drawing surface allows to store any FLTK graphics in vectorial form in a “Scalable Vector Graphics” file.
Usage example:

```cpp
Fl_Window *win = ... // Window to draw to a .svg file
int ww = win->decorated_w();
int wh = win->decorated_h();
FILE *svg = fl_fopen("/path/to/mywindow.svg", "w");
if (svg) {
  Fl_SVG_File_Surface *surface = new Fl_SVG_File_Surface(ww, wh, svg);
  Fl_Surface_Device::push_current(surface);
  fl_color(FL_WHITE);
  fl_rectf(0, 0, ww, wh);
  surface->draw_decorated_window(win);
  Fl_Surface_Device::pop_current();
  delete surface; // the .svg file is not complete until the destructor was run
  fclose(svg);
}
```

Note
FLTK uses the PNG and JPEG libraries to encode images to the SVG format. For this reason, class Fl_SVG_File_Surface is placed in the fltk_images library. If JPEG is not available at application build time, PNG is enough (but produces a quite larger output). If PNG isn't available either, images don't appear in the SVG output.

12.135.2 Constructor & Destructor Documentation

12.135.2.1 **Fl_SVG_File_Surface()**

Fl_SVG_File_Surface::Fl_SVG_File_Surface (  
  int width,  
  int height,  
  FILE * svg,  
  int(*)(FILE *) closef = NULL  )

Constructor of the SVG drawing surface.

Parameters

| width, height | Width and height of the graphics area in FLTK drawing units |

Generated by Doxygen
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>svg</code></td>
<td>A writable FILE pointer where the SVG data are to be sent. The resulting SVG data are not complete until after destruction of the Fl_SVG_File_Surface object or after calling close().</td>
</tr>
<tr>
<td><code>closef</code></td>
<td>If not NULL, the destructor and close() will call closef(svg) after all SVG data has been sent. If NULL, fclose(svg) is called instead. This allows to close the FILE pointer by, e.g., pclose, or, using a function such as &quot;int keep_open(FILE *){return 0;}&quot;, to keep it open after completion of all output to svg. Function closef should return non zero to indicate an error.</td>
</tr>
</tbody>
</table>

#### 12.135.2.2 ~Fl_SVG_File_Surface()

Fl_SVG_File_Surface::~Fl_SVG_File_Surface ( )

Destructor.
The underlying FILE pointer is processed as by close().

#### 12.135.3 Member Function Documentation

##### 12.135.3.1 close()

```c
int Fl_SVG_File_Surface::close ( )
```

Closes the FILE pointer where SVG data is output.
The underlying FILE is closed by function fclose() unless another function was set at object’s construction time. The only operation possible after this on the Fl_SVG_File_Surface object is its destruction.

**Returns**
The value returned by the closing function call.

##### 12.135.3.2 origin() [1/2]

```c
void Fl_SVG_File_Surface::origin ( int * x, int * y ) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>out x,y</code></td>
<td>If non-null, +x and +y are set to the horizontal and vertical coordinates of the graphics origin.</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Widget_Surface.

##### 12.135.3.3 origin() [2/2]

```c
void Fl_SVG_File_Surface::origin ( int x, int y ) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface. Arguments should be expressed relatively to the result of a previous printable_rect() call. That is, printable_rect(&w, &h); origin(w/2, 0); sets the graphics origin at the top center of the drawable area. Successive origin() calls don’t combine their effects. Origin() calls are not affected by rotate() calls (for classes derived from Fl_Paged_Device).

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>in x,y</code></td>
<td>Horizontal and vertical positions in the drawing surface of the desired origin of graphics.</td>
</tr>
</tbody>
</table>
Reimplemented from Fl_Widget_Surface.

12.135.3.4 printable_rect()

```cpp
int Fl_SVG_File_Surface::printable_rect (int * w, int * h) [virtual]
```
Computes the width and height of the drawable area of the drawing surface. Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to origin(). If the object is derived from class Fl_Paged_Device, values account for the user-selected paper type and print orientation and are changed by scale() calls.

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Widget_Surface.

12.135.3.5 translate()

```cpp
void Fl_SVG_File_Surface::translate (int x, int y) [virtual]
```
Translates the current graphics origin accounting for the current rotation. Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects.

Reimplemented from Fl_Widget_Surface.

12.135.3.6 untranslate()

```cpp
void Fl_SVG_File_Surface::untranslate (void ) [virtual]
```
Undoes the effect of a previous translate() call.

Reimplemented from Fl_Widget_Surface.

The documentation for this class was generated from the following file:

- Fl_SVG_File_Surface.H

12.136 Fl_SVG_Image Class Reference

The Fl_SVG_Image class supports loading, caching and drawing of scalable vector graphics (SVG) images.

```
#include <Fl_SVG_Image.H>
```

Inheritance diagram for Fl_SVG_Image:

```
  Fl_SVG_Image
    |      |
    Fl_RGB_Image
      |      |
      Fl_SVG_Image
```

Public Member Functions

- `Fl_SVG_Image * as_svg_image () FL_OVERRIDE`
  Returns whether an image is an Fl_SVG_Image or not.
- `void color_average (Fl_Color c, float i) FL_OVERRIDE`
  The color_average() method averages the colors in the image with the provided FLTK color value.
- `Fl_Image * copy () const`
• **FL_Image** » **copy** (int W, int H) const **FL_OVERRIDE**
  Creates a resized copy of the image.
• void **desaturate** () **FL_OVERRIDE**
  The **desaturate**() method converts an image to grayscale.
• void **draw** (int X, int Y)
• void **draw** (int X, int Y, int W, int H, int cx=0, int cy=0) **FL_OVERRIDE**
  Draws the image to the current drawing surface with a bounding box.
• **FL_SVG_Image** (const char ∗filename)
  Load an SVG image from a file.
• **FL_SVG_Image** (const char ∗sharedname, const char ∗svg_data)
  Load an SVG image from memory.
• **FL_SVG_Image** (const char ∗sharedname, const unsigned char ∗svg_data, size_t length)
  Load an SVG image from memory.
• void **normalize** () **FL_OVERRIDE**
  Makes sure the object is fully initialized.
• void **resize** (int width, int height)
  Have the svg data (re-)rasterized using the given width and height values.
• virtual ~**FL_SVG_Image** ()
  The destructor frees all memory and server resources that are used by the SVG image.

**Public Member Functions inherited from FL_RGB_Image**

• int **cache_h** ()
• int **cache_w** ()
• **FL_Image** » **copy** () const
• void **draw** (int X, int Y)
• **FL_RGB_Image** (const Fl_Pixmap ∗pxm, Fl_Color bg=FL_GRAY)
  The constructor creates a new RGBA image from the specified Fl_Pixmap.
• **FL_RGB_Image** (const uchar ∗bits, int bits_length, int W, int H, int D, int LD)
  The constructor creates a new image from the specified data.
• **FL_RGB_Image** (const uchar ∗bits, int W, int H, int D=3, int LD=0)
  The constructor creates a new image from the specified data.
• void **label** (Fl_Menu_Item ∗m) **FL_OVERRIDE**
  This method is an obsolete way to set the image attribute of a menu item.
• void **label** (Fl_Widget ∗w) **FL_OVERRIDE**
  This method is an obsolete way to set the image attribute of a widget or menu item.
• void **uncache** () **FL_OVERRIDE**
  If the image has been cached for display, delete the cache data.
• ~**FL_RGB_Image** () **FL_OVERRIDE**
  The destructor frees all memory and server resources that are used by the image.

**Public Member Functions inherited from FL_Image**

• virtual class Fl_Shared_Image ∗ **as_shared_image** ()
  Returns whether an image is an Fl_Shared_Image or not.
• **FL_Image** » **copy** () const
  Creates a copy of the image in the same size.
• int **count** () const
  Returns the number of data values associated with the image.
• int **d** () const
  Returns the image depth.
• const char ∗const + **data** () const
Returns a pointer to the current image data array.

- **int data_h ()** const
  Returns the height of the image data.

- **int data_w ()** const
  Returns the width of the image data.

- **void draw (int X, int Y)**
  Draws the image to the current drawing surface.

- **int fail ()** const
  Returns a value that is not 0 if there is currently no image available.

- **Fl_Image (int W, int H, int D)**
  The constructor creates an empty image with the specified width, height, and depth.

- **int h ()** const
  Returns the current image drawing height in FLTK units.

- **void inactive ()**
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

- **int ld ()** const
  Returns the current line data size in bytes.

- **virtual void release ()**
  Releases an Fl_Image - the same as 'delete this'.

- **virtual void scale (int width, int height, int proportional=1, int can_expand=0)**
  Sets the drawing size of the image.

- **int w ()** const
  Returns the current image drawing width in FLTK units.

- **virtual ~Fl_Image ()**
  The destructor is a virtual method that frees all memory used by the image.

**Public Attributes**

- **bool proportional**
  Set this to false to allow image re-scaling that alters the image aspect ratio.

**Public Attributes inherited from Fl_RGB_Image**

- **int alloc_array**
  If non-zero, the object's data array is delete[]d when deleting the object.

- **const uchar * array**
  Points to the start of the object's data array.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_RGB_Image**

- **static size_t max_size ()**
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

- **static void max_size (size_t size)**
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
12.136 Fl_SVG_Image Class Reference

Static Public Member Functions inherited from Fl_Image

- static Fl_Labeltype define_FL_IMAGE_LABEL()
- static Fl_RGB_Scaling RGB_scaling()
  
  Returns the currently used RGB image scaling method.
- static void RGB_scaling(Fl_RGB_Scaling)
  
  Sets the RGB image scaling method used for copy(int, int).
- static Fl_RGB_Scaling scaling_algorithm()
  
  Gets what algorithm is used when resizing a source image to draw it.
- static void scaling_algorithm(Fl_RGB_Scaling algorithm)
  
  Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  
  True after fl_register_images() was called, false before.

Protected Member Functions inherited from Fl_Image

- void d(int D)
  
  Sets the current image depth.
- void data(const char *const *p, int c)
  
  Sets the current data pointer and count of pointers in the array.
- void draw_empty(int X, int Y)
  
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled(int X, int Y, int W, int H)
  
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h(int H)
  
  Sets the height of the image data.
- void ld(int LD)
  
  Sets the current line data size in bytes.
- void w(int W)
  
  Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype(const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure(const Fl_Label *lo, int &lw, int &lh)

12.136.1 Detailed Description

The Fl_SVG_Image class supports loading, caching and drawing of scalable vector graphics (SVG) images. The FLTK library performs parsing and rasterization of SVG data using a modified version of the nanosvg software ([https://github.com/memononen/nanosvg](https://github.com/memononen/nanosvg)). The software modification allows the option to change the image ratio while performing rasterization.

Use Fl_Image::fail() to check if the Fl_SVG_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, and ERR_FORMAT if the SVG format could not be decoded. If the image has loaded correctly, w(), h(), and d() should return values greater than zero.

Rasterization is not done until the image is first drawn or resize() or normalize() is called. Therefore, array is NULL until then. The delayed rasterization ensures an Fl_SVG_Image is always rasterized to the exact screen resolution at which it is drawn.

The Fl_SVG_Image class draws images computed by nanosvg with the following known limitations.
The FLTK library can optionally be built without SVG support; in that case, class Fl_SVG_Image is unavailable.

Example of displaying a hard-coded svg file:

```c
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_SVG_Image.H>

// A black rotated rectangle
const char *svg_data = "<svg viewBox="0 0 200 200" version = "1.1" xmlns="http://www.w3.org/2000/svg">
  
  <rect x="25" y="50" width="150" height="100" fill="black" transform="rotate(45 100 100)" />
</svg>";

int main(int argc, char **argv) {
    Fl_SVG_Image *svg = new Fl_SVG_Image(0, svg_data); // create SVG object
    Fl_Window *win = new Fl_Window(720, 486, "svg test");
    Fl_Box *box = new Fl_Box(0, 0, win->w(), win->h());
    box->image(svg); // assign svg object to Fl_Box
    win->end();
    win->show(argc,argv);
    return(Fl::run());
}
```

Example of displaying an svg image from a file:

```c
#include <errno.h> // errno
#include <string.h> // strerror
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_SVG_Image.H>
#include <FL/fl_message.H>

int main(int argc, char **argv) {
    Fl_Window *win = new Fl_Window(720, 486, "svg test");
    Fl_Box *box = new Fl_Box(0, 0, win->w(), win->h());
    const char *svgpath = "/var/tmp/simple.svg";
    Fl_SVG_Image *svg = new Fl_SVG_Image(svgpath); // load SVG object from disk
    switch (svg->fail()) { // File couldn't load? show path + os error to user
        case Fl_Image::ERR_FILE_ACCESS:
            // File couldn't load? show path + os error to user
            fl_alert("%s: %s", svgpath, strerror(errno));
            return 1;
        case Fl_Image::ERR_FORMAT:
            // Parsing error
            fl_alert("%s: couldn't decode image", svgpath);
            return 1;
    }
    box->image(svg); // assign svg object to box
    win->end();
    win->show(argc,argv);
    return(Fl::run());
}
```

Example of fitting an svg image to a resizable Fl_Box:

```c
#include <FL/Fl_Window.H>
#include <FL/Fl_SVG_Image.H>
#include <FL/Fl_Box.H>

class resizable_box : public Fl_Box {
public:
    resizable_box(int w, int h) : Fl_Box(0, 0, w, h, NULL) {}  
    virtual void resize(int x, int y, int w, int h) { 
        image()->scale(w, h, 1, 1); // p3 = proportional, p4 = can expand
        Fl_Box::resize(x, y, w, h);
    }
};

int main(int argc, char **argv) {
    Fl_Window *win = new Fl_Window(130, 130);
    resizable_box *box = new resizable_box(win->w(), win->h());
    Fl_SVG_Image *svg = new Fl_SVG_Image("/path/to/image.svg");
    box->image(svg);
    svg->scale(box->w(), box->h());
    win->end();
    win->resizable(win);
    win->show(argc, argv);
    return Fl::run();
}
```
12.136.2 Constructor & Destructor Documentation

12.136.2.1 Fl_SVG_Image() [1/3]

Fl_SVG_Image::Fl_SVG_Image (const char ∗filename)

Load an SVG image from a file.
This constructor loads the SVG image from a .svg or .svgz file. The reader recognizes if the data is compressed, and decompresses it if zlib is available (HAVE_LIBZ).

Parameters

- **filename** the filename for a .svg or .svgz file

12.136.2.2 Fl_SVG_Image() [2/3]

Fl_SVG_Image::Fl_SVG_Image (const char ∗sharedname, const char ∗svg_data)

Load an SVG image from memory.
This constructor loads the SVG image from a block of memory. This version is commonly used for uncompressed text data, but the reader recognizes if the data is compressed, and decompresses it if zlib is available (HAVE_LIBZ).

Parameters

- **sharedname** if not NULL, a shared image will be generated with this name
- **svg_data** a pointer to the memory location of the SVG image data

Note

In-memory SVG data is parsed by the object constructor and is no longer needed after construction.

12.136.2.3 Fl_SVG_Image() [3/3]

Fl_SVG_Image::Fl_SVG_Image (const char ∗name, const unsigned char ∗svg_data, size_t length)

Load an SVG image from memory.
This constructor loads the SVG image from a block of memory. This version is commonly used for compressed binary data, but the reader recognizes if the data is uncompressed, and reads it as a text block.

Parameters

- **name** if not NULL, a shared image will be generated with this name
- **svg_data** a pointer to the memory location of the SVG image data
- **length** of svg_data or 0 if the length is unknown. This will protect memory outside of the svg_data array from illegal read operations for compressed SVG data.
Note

In-memory SVG data is parsed by the object constructor and is no longer needed after construction.

12.136.3 Member Function Documentation

12.136.3.1 as_svg_image()

Fl_SVG_Image ∗ Fl_SVG_Image::as_svg_image ( ) [inline], [virtual]

Returns whether an image is an Fl_SVG_Image or not.
This virtual method returns a pointer to the Fl_SVG_Image if this object is an instance of Fl_SVG_Image or NULL if not.
Reimplemented from Fl_RGB_Image.

12.136.3.2 color_average()

void Fl_SVG_Image::color_average ( Fl_Color c,
   float i ) [virtual]

The color_average() method averages the colors in the image with the provided FLTK color value.
The first argument specifies the FLTK color to be used.
The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results
in no color blend, and a value of 0.0 results in a constant image of the specified color.
An internal copy is made of the original image data before changes are applied, to avoid modifying the original
image data in memory.
Reimplemented from Fl_RGB_Image.

12.136.3.3 copy()

Fl_Image ∗ Fl_SVG_Image::copy ( int W,
   int H ) const [virtual]

Creates a resized copy of the image.
The new image should be released when you are done with it.
Note: since FLTK 1.4.0 you can use Fl_Image::release() for all types of images (i.e. all subclasses of Fl_Image)
instead of operator delete for Fl_Image's and Fl_Image::release() for Fl_Shared_Image's.
The new image data will be converted to the requested size. RGB images are resized using the algorithm set by
Fl_Image::RGB_scaling().
For the new image the following equations are true:

\[ w() == \text{data}_w() == W \]
\[ h() == \text{data}_h() == H \]

Parameters

| in | W/H | Requested width and height of the new image |

Note

The returned image can be safely cast to the same image type as that of the source image provided this type
is one of Fl_RGB_Image, Fl_SVG_Image, Fl_Pixmap, Fl_Bitmap, Fl_Tiled_Image, Fl_Anim_GIF_Image and Fl_Shared_Image. Returned objects copied from images of other, derived, image classes belong to the parent
class appearing in this list. For example, the copy of an Fl_GIF_Image is an object of class Fl_Pixmap.
Since FLTK 1.4.0 this method is 'const'. If you derive your own class from Fl_Image or any subclass your
overridden methods of 'Fl_Image::copy(int, int) const' and 'Fl_Image::copy() const' must also be 'const' for
inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not
been 'const'.
Reimplemented from Fl_RGB_Image.
12.136.3.4 desaturate()

```cpp
void Fl_SVG_Image::desaturate ( ) [virtual]
```

The `desaturate()` method converts an image to grayscale. If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from `Fl_RGB_Image`.

12.136.3.5 draw()

```cpp
void Fl_SVG_Image::draw ( int X, int Y, int W, int H, int cx = 0, int cy = 0 ) [virtual]
```

Draws the image to the current drawing surface with a bounding box. Arguments X,Y,W,H specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the cx and cy arguments.

In other words: `fl_push_clip(X,Y,W,H)` is applied, the image is drawn with its upper-left corner at X-cx,Y-cy and its own width and height, `fl_pop_clip()` is applied.

Reimplemented from `Fl_RGB_Image`.

12.136.3.6 normalize()

```cpp
void Fl_SVG_Image::normalize ( ) [virtual]
```

Makes sure the object is fully initialized. This function rasterizes the SVG image, and consequently initializes its array member, if that was not done before.

Reimplemented from `Fl_RGB_Image`.

12.136.3.7 resize()

```cpp
void Fl_SVG_Image::resize ( int width, int height )
```

Have the svg data (re-)rasterized using the given width and height values.

By default, the resulting image w() and h() will be close to width and height while preserving the width/height ratio of the SVG data. If proportional was set to `false`, the image is rasterized to the exact width and height values. In both cases, data_w() and data_h() values are set to w() and h(), respectively.

12.136.4 Member Data Documentation

12.136.4.1 proportional

```cpp
bool Fl_SVG_Image::proportional
```

Set this to `false` to allow image re-scaling that alters the image aspect ratio. Upon object creation, proportional is set to `true`, and the aspect ratio is kept constant.

The documentation for this class was generated from the following files:

- Fl_SVG_Image.H
- Fl_SVG_Image.cxx

12.137 Fl_Sys_Menu_Bar Class Reference

A class to create and modify menus that appear on macOS in the menu bar at the top of the screen.

```cpp
#include <Fl_Sys_Menu_Bar.H>
```

Inheritance diagram for Fl_Sys_Menu_Bar:
Public Types

- enum window_menu_style_enum { no_window_menu = 0, tabbing_mode_none, tabbing_mode_automatic, tabbing_mode_preferred }

  Possible styles of the Window menu in the system menu bar.

Public Member Functions

- int add (const char *label, const char *shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)
  Adds a new menu item.

- int add (const char *label, int shortcut, Fl_Callback *, void *user_data=0, int flags=0)
  Add a new menu item to the system menu bar.

- int add (const char *str)
  Forms-compatible procedure to add items to the system menu bar.

- void clear ()
  Set the Fl_Menu_Item array pointer to null, indicating a zero-length menu.

- int clear_submenu (int index)
  Clears the specified submenu pointed to by index of all menu items.

- Fl_Sys_Menu_Bar (int x, int y, int w, int h, const char *l=0)
  The constructor.

- int insert (int index, const char *label, const char *shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)
  Insert a new menu item.

- int insert (int index, const char *label, int shortcut, Fl_Callback *cb, void *user_data=0, int flags=0)
  insert in the system menu bar a new menu item

- const Fl_Menu_Item *menu () const
  Return the system menu's array of Fl_Menu_Item's.

- void menu (const Fl_Menu_Item *m)
  create a system menu bar using the given list of menu structs

- int mode (int i) const
  Gets the flags of item i.

- void mode (int i, int fl)
  Sets the flags of item i.

- void remove (int n)
  remove an item from the system menu bar

- void replace (int index, const char *name)
  rename an item from the system menu bar

- void setonly (Fl_Menu_Item *item)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

- void shortcut (int i, int s)
  Changes the shortcut of item i to n.

- void update () FL_OVERRIDE
  Updates the menu bar after any change to its items.

- virtual ~Fl_Sys_Menu_Bar ()
  The destructor.
Public Member Functions inherited from Fl_Menu_Bar

- **Fl_Menu_Bar**(int X, int Y, int W, int H, const char *l=0)
  Creates a new Fl_Menu_Bar widget using the given position, size, and label string.

- **int handle**(int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Menu_

- **int add**(const char *)
  This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.

- **int add**(const char *, int shortcut, Fl_Callback *, void *d=0, int e=0)
  Adds a new menu item.

- **int add**(const char *a, const char *b, Fl_Callback *c, void *d=0, int e=0)
  See int Fl_Menu_::add(const char* label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)

- **void clear()**
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

- **int clear_submenu**(int index)
  Clears the specified submenu pointed to by index of all menu items.

- **void copy**(const Fl_Menu_Item *, void *user_data=0)
  Sets the menu array pointer with a copy of m that will be automatically deleted.

- **Fl_Boxtype down_box()** const
  This box type is used to surround the currently-selected items in the menus.

- **void down_box**(Fl_Boxtype b)
  Sets the box type used to surround the currently-selected items in the menus.

- **Fl_Color down_color()** const
  For back compatibility, same as selection_color()

- **void down_color**(unsigned c)
  For back compatibility, same as selection_color()

- **int find_index**(const char *) const
  Find the menu item index for a given menu pathname, such as “Edit/Copy”.

- **int find_index**(const Fl_Menu_Item *) const
  Find the index into the menu array for a given item.

- **int find_index**(Fl_Callback *) const
  Find the index into the menu array for a given callback cb.

- **const Fl_Menu_Item * find_item**(const char *)
  Find the menu item for a given menu pathname, such as “Edit/Copy”.

- **const Fl_Menu_Item * find_item**(Fl_Callback *)
  Find the menu item for the given callback cb.

- **const Fl_Menu_Item * find_item_with_argument**(long)
  Find the menu item for the given user argument v.

- **const Fl_Menu_Item * find_item_with_user_data**(void *)
  Find the menu item for the given user data v.

- **Fl_Menu_**(int, int, int, int, const char *)
  Creates a new Fl_Menu_ widget using the given position, size, and label string.

- **void global()**
  Make the shortcuts for this menu work no matter what window has the focus when you type it.

- **int insert**(int index, const char *, int shortcut, Fl_Callback *, void *=0, int e=0)
  Inserts a new menu item at the specified index position.

- **int insert**(int index, const char *a, const char *b, Fl_Callback *c, void *=0, int e=0)
  See int Fl_Menu_::insert(const char* label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)
• int item_pathname (char *name, int namelen, const Fl_Menu_Item *finditem=0) const
  Get the menu 'pathname' for the specified menuitem.
• const Fl_Menu_Item * menu () const
  Returns a pointer to the array of Fl_Menu_Items.
• void menu (const Fl_Menu_Item *m)
  Sets the menu array pointer directly.
• Fl_Boxtype menu_box () const
  Get the box type for the menu popup windows.
• void menu_box (Fl_Boxtype b)
  Set the box type for the menu popup windows.
• const Fl_Menu_Item * menu_end ()
  Finishes menu modifications and returns menu().
• int mode (int i) const
  Gets the flags of item i.
• void mode (int i, int fl)
  Sets the flags of item i.
• const Fl_Menu_Item * mvalue () const
  Returns a pointer to the last menu item that was picked.
• const Fl_Menu_Item * picked (const Fl_Menu_Item *)
  When user picks a menu item, call this.
• const Fl_Menu_Item * prev_mvalue () const
  Returns a pointer to the menu item that was picked before the current one was picked.
• void remove (int)
  Deletes item i from the menu.
• void replace (int, const char *)
  Changes the text of item i.
• void setonly (Fl_Menu_Item *item)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.
• void shortcut (int i, int s)
  Changes the shortcut of item i to s.
• int size () const
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.
• void size (int W, int H)
• const Fl_Menu_Item * test_shortcut ()
  Returns the menu item with the entered shortcut (key value).
• const char * text () const
  Returns the title of the last item chosen.
• const char * text (int i) const
  Returns the title of item i.
• Fl_Color textcolor () const
  Get the current color of menu item labels.
• void textcolor (Fl_Color c)
  Sets the current color of menu item labels.
• Fl_Font textfont () const
  Gets the current font of menu item labels.
• void textfont (Fl_Font c)
  Sets the current font of menu item labels.
• Fl_Fontsize textsize () const
  Gets the font size of menu item labels.
• void textsize (Fl_Fontsize c)
  Sets the font size of menu item labels.
• int value () const  
  Returns the index into menu() of the last item chosen by the user.
• int value (const Fl_Menu_Item ∗)  
  The value is the index into menu() of the last item chosen by the user.
• int value (int i)  
  The value is the index into menu() of the last item chosen by the user.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()  
  Activates the widget.
• unsigned int active () const  
  Returns whether the widget is active.
• int active_r () const  
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const  
  Gets the label alignment.
• void align (Fl_Align alignment)  
  Sets the label alignment.
• long argument () const  
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)  
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const  
• virtual Fl_Group ∗ as_group ()  
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const  
• virtual Fl_Window ∗ as_window ()  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const  
• void bind_deimage (Fl_Image ∗img)  
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗img)  
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const  
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)  
  Sets the box type for the widget.
• Fl_Callback_p callback () const  
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗cb)  
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
Sets the current callback function and managed user data for the widget.

- `void callback (Fl_Callback ∗cb, void ∗p)`
  Sets the current callback function and data for the widget.

- `void callback (Fl_Callback0 ∗cb)`
  Sets the current callback function for the widget.

- `void callback (Fl_Callback1 ∗cb, long p=0)`
  Sets the current callback function for the widget.

- `unsigned int changed () const`
  Checks if the widget value changed since the last callback.

- `void clear_active ()`
  Marks the widget as inactive without sending events or changing focus.

- `void clear_changed ()`
  Marks the value of the widget as unchanged.

- `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.

- `void clear_output ()`
  Sets a widget to accept input.

- `void clear_visible ()`
  Hides the widget.

- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.

- `Fl_Color color () const`
  Gets the background color of the widget.

- `void color (Fl_Color bg)`
  Sets the background color of the widget.

- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- `Fl_Color color2 () const`
  For back compatibility only.

- `void color2 (unsigned a)`
  For back compatibility only.

- `int contains (const Fl_Widget ∗w) const`
  Checks if w is a child of this widget.

- `void copy_label (const char ∗new_label)`
  Sets the current label.

- `void copy_tooltip (const char ∗text)`
  Sets the current tooltip text.

- `uchar damage () const`
  Returns non-zero if `draw()` needs to be called.

- `void damage (uchar c)`
  Sets the damage bits for the widget.

- `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.

- `int damage_resize (int, int, int, int)`
  Internal use only.

- `void deactivate ()`
  Deactivates the widget.

- `Fl_Image ∗deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image ∗deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *wgt, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *wgt, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  ...
Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width `ww` and height `hh` accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**
  
  Changes the size or position of the widget.

- **Fl_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.

- **void set_visible ()**
  
  Makes the widget visible.

- **void set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  
  Returns whether the widget's label uses ' Pract to indicate shortcuts.

- **void shortcut_label (int value)**
  
  Sets whether the widget's label uses ' Pract to indicate shortcuts.

- **virtual void show ()**
  
  Makes a widget visible.

- **void size (int W, int H)**
  
  Changes the size of the widget.

- **int take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  
  Returns true if the widget's label contains the entered ' Pract shortcut.
• **const char** ∗ *tooltip () const*
  
  *Gets the current tooltip text.*

• **void tooltip (const char ∗text)**

  *Sets the current tooltip text.*

• **Fl_Window ∗ top_window () const**

  *Returns a pointer to the top-level window for the widget.*

• **Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const**

  *Finds the x/y offset of the current widget relative to the top-level window.*

• **uchar type () const**

  *Gets the widget type.*

• **void type (uchar t)**

  *Sets the widget type.*

• **int use_accents_menu ()**

  *Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.*

• **void ∗ user_data () const**

  *Gets the user data for this widget.*

• **void user_data (Fl_Callback_User_Data ∗v, bool auto_free)**

  *Sets the user data for this widget.*

• **void user_data (void ∗v)**

  *Sets the user data for this widget.*

• **unsigned int visible () const**

  *Returns whether a widget is visible.*

• **unsigned int visible_focus () const**

  *Checks whether this widget has a visible focus.*

• **void visible_focus (int v)**

  *Modifies keyboard focus navigation.*

• **int visible_r () const**

  *Returns whether a widget and all its parents are visible.*

• **int w () const**

  *Gets the widget width.*

• **Fl_When when () const**

  *Returns the conditions under which the callback is called.*

• **void when (uchar i)**

  *Sets the flags used to decide when a callback is called.*

• **Fl_Window ∗ window () const**

  *Returns a pointer to the nearest parent window up the widget hierarchy.*

• **int x () const**

  *Gets the widget position in its window.*

• **int y () const**

  *Gets the widget position in its window.*

• **virtual ∼Fl_Widget ()**

  *Destroys the widget.*

**Static Public Member Functions**

• **static void about (Fl_Callback ∗cb, void ∗data)**

  *Attaches a callback to the "About myprog" item of the system application menu.*

• **static void create_window_menu ()**

  *Adds a Window menu, to the end of the system menu bar.*

• **static window_menu_style_enum window_menu_style ()**

  *Get the style of the Window menu in the system menu bar.*

• **static void window_menu_style (window_menu_style_enum style)**

  *Set the desired style of the Window menu in the system menu bar.*
Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Menu_Item

• int item_pathname_ (char *name, int namelen, const Fl_Menu_Item *finditem, const Fl_Menu_Item *menu=0) const

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

12.137.1 Detailed Description

A class to create and modify menus that appear on macOS in the menu bar at the top of the screen.

On other than macOS platforms, Fl_Sys_Menu_Bar is a synonym of class Fl_Menu_Bar.

On the macOS platform, replace Fl_Menu_Bar with Fl_Sys_Menu_Bar, and a system menu at the top of the screen will be available. This menu will match an array of Fl_Menu_Item's exactly as in all other FLTK menus (except for the submenu with the application's own name and the 'Window' menu; see below). There is, though, an important difference between an Fl_Sys_Menu_Bar object under macOS and under other platforms: only a single object from this class can be created, because macOS uses a single system menu bar. Therefore, porting to macOS an app that creates, on other platforms, several Fl_Menu_Bar objects, one for each of several windows, is more complex than just replacing Fl_Menu_Bar by Fl_Sys_Menu_Bar.

On the macOS platform, the system menu bar of any FLTK app begins with the Application menu which the FLTK library automatically constructs. Functions Fl_Mac_App_Menu::custom_application_menu_items() and Fl_Sys_Menu_Bar::about() can be used to further customize the Application menu. The FLTK library also automatically constructs and handles a Window menu which can be further customized (or even removed) calling Fl_Sys_Menu_Bar::window_menu_style(window_menu_style_enum style). Other member functions of this class allow the app to generate the rest of the system menu bar. It is recommended to localize the system menu bar using the standard Mac OS X localization procedure (see Internationalization).

Changes to the menu state are immediately visible in the menubar when they are made using member functions of the Fl_Sys_Menu_Bar class. Other changes (e.g., by a call to Fl_Menu_Item::set()) should be followed by a call to update() to be visible in the menubar across all platforms. macOS global variable fl_sys_menu_bar points to the unique, current system menu bar.

A few FLTK menu features are not supported by the Mac System menu:

- no symbolic labels
- no embossed labels
- no font sizes

As described above, the submenu with the application's own name (usually the second submenu from the left, immediately following the "Apple" submenu) is a special case, and can be managed with
**Fl_Mac_App_Menu::custom_application_menu_items().** For example, to make your own "Appname -> Preferences" dialog, you might use:

```c
#include <FL/platform.H> // for Fl_Mac_App_Menu class
#include <FL/Fl_Sys_Menu_Bar.H> // for Fl_Menu_Item

void prefs_cb(Fl_Widget *w, void *data) {
    // ..Open your preferences dialog here..
}

int main(..) {
    // Items to add to the application menu
    static Fl_Menu_Item appitems[] = {
        { "Preferences", 0, prefs_cb, 0, 0 },
        { 0 }, { 0 }
    };
    Fl_Mac_App_Menu::custom_application_menu_items(appitems); // adds it
}
```

..the result being:

![Figure 12.46 Mac Application submenu](image)

### 12.137.2 Member Enumeration Documentation

#### 12.137.2.1 window_menu_style_enum

define Fl_Sys_Menu_Bar::window_menu_style_enum
Possible styles of the Window menu in the system menu bar.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_window_menu</td>
<td>No Window menu in the system menu bar.</td>
</tr>
<tr>
<td>tabbing_mode_none</td>
<td>No tabbed windows, but the system menu bar contains a Window menu.</td>
</tr>
<tr>
<td>tabbing_mode_automatic</td>
<td>Windows are created by themselves but can be tabbed later.</td>
</tr>
<tr>
<td>tabbing_mode_preferred</td>
<td>Windows are tabbed when created.</td>
</tr>
</tbody>
</table>

### 12.137.3 Constructor & Destructor Documentation

#### 12.137.3.1 Fl_Sys_Menu_Bar()

```c
Fl_Sys_Menu_Bar::Fl_Sys_Menu_Bar (int x, int y, int w, int h, const char *l = 0 )
```

The constructor.
On Mac OS X, all arguments are unused. On other platforms they are used as by `Fl_Menu_Bar::Fl_Menu_Bar()`.

### 12.137.4 Member Function Documentation

#### 12.137.4.1 about()

```c
void Fl_Sys_Menu_Bar::about (Fl_Callback * cb,`
```
void * data ) [static]
Attaches a callback to the "About myprog" item of the system application menu.
This cross-platform function is effective only under the MacOS platform.

Parameters

| cb    | a callback that will be called by "About myprog" menu item with NULL 1st argument. |
| data  | a pointer transmitted as 2nd argument to the callback. |

12.137.4.2  add() [1/3]

int Fl_Sys_Menu_Bar::add (  
    const char * label,  
    const char * shortcut,  
    Fl_Callback * cb,  
    void * user_data = 0,  
    int flags = 0 ) [inline]

Adds a new menu item.

See also

Fl_Menu_::add(const char* label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)

12.137.4.3  add() [2/3]

int Fl_Sys_Menu_Bar::add (  
    const char * label,  
    int shortcut,  
    Fl_Callback * cb,  
    void * user_data = 0,  
    int flags = 0 )

Add a new menu item to the system menu bar.
Add to the system menu bar a new menu item, with a title string, shortcut int, callback, argument to the callback, and flags.

Parameters

| label     | - new menu item's label |
| shortcut  | - new menu item's integer shortcut (can be 0 for none, or e.g. FL_ALT+'x') |
| cb        | - callback to be invoked when item selected (can be 0 for none, in which case the menubar's callback() can be used instead) |
| user_data | - argument to the callback |
| flags     | - item's flags, e.g. FL_MENU_TOGGLE, etc. |

Returns

the index into the menu() array, where the entry was added

See also

Fl_Menu_::add(const char* label, int shortcut, Fl_Callback *cb, void *user_data, int flags)

12.137.4.4  add() [3/3]

int Fl_Sys_Menu_Bar::add (  
    const char * str )

Forms-compatible procedure to add items to the system menu bar.
Returns
the index into the menu() array, where the entry was added

See also
Fl_Menu_::add(const char * str)

12.137.4.5 clear()
void Fl_Sys_Menu_Bar::clear ( )
Set the Fl_Menu_Item array pointer to null, indicating a zero-length menu.

See also
Fl_Menu_::clear()

12.137.4.6 clear_submenu()
int Fl_Sys_Menu_Bar::clear_submenu ( int index )
Clears the specified submenu pointed to by index of all menu items.

See also
Fl_Menu_::clear_submenu(int index)

12.137.4.7 create_window_menu()
void Fl_Sys_Menu_Bar::create_window_menu ( ) [static]
Adds a Window menu, to the end of the system menu bar.
FLTK apps typically don't need to call this function which is automatically called by the library the first time a window is shown. The default system menu bar contains a Window menu with a "Merge All Windows" item. Other Window menu styles can be obtained calling Fl_Sys_Menu_Bar::window_menu_style(window_menu_style_enum) before the first Fl_Window::show(). Alternatively, an app can call create_window_menu() after having populated the system menu bar, for example with menu(const Fl_Menu_Item *), and before the first Fl_Window::show(). This function does nothing on non MacOS platforms.

Version
1.4

12.137.4.8 draw()
void Fl_Sys_Menu_Bar::draw ( ) [protected], [virtual]
Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
Reimplemented from Fl_Menu_Bar.

12.137.4.9 insert() [1/2]
int Fl_Sys_Menu_Bar::insert ( int index,
const char * label,
const char * shortcut,
FL_Callback * cb,
void * user_data = 0,
int flags = 0) [inline]

Insert a new menu item.

See also

Fl_Menu_::insert(int index, const char * label, const char * shortcut, FL_Callback *cb, void *user_data=0, int flags=0)

12.137.4.10 insert() [2/2]

int Fl_Sys_Menu_Bar::insert (
    int index,
    const char * label,
    int shortcut,
    FL_Callback * cb,
    void * user_data = 0,
    int flags = 0 )

insert in the system menu bar a new menu item

Insert in the system menu bar a new menu item, with a title string, shortcut int, callback, argument to the callback, and flags.

Returns

the index into the menu() array, where the entry was inserted

See also

Fl_Menu_::insert(int index, const char * label, int shortcut, FL_Callback *cb, void *user_data, int flags)

12.137.4.11 menu()

void Fl_Sys_Menu_Bar::menu (
    const Fl_Menu_Item * m )

create a system menu bar using the given list of menu structs

Author

Matthias Melcher

Parameters

m | Zero-ending list of Fl_Menu_Item's

12.137.4.12 mode()

void Fl_Sys_Menu_Bar::mode ( 
    int i,
    int fl )

Sets the flags of item i.
See also

`Fl_Menu_::mode(int i, int fl)`

12.137.4.13 remove()

void Fl_Sys_Menu_Bar::remove (int index)

remove an item from the system menu bar

Parameters

| index | the index of the item to remove |

12.137.4.14 replace()

void Fl_Sys_Menu_Bar::replace (int index, const char * name)

rename an item from the system menu bar

Parameters

| index | the index of the item to rename |
| name  | the new item name as a UTF8 string |

12.137.4.15 update()

void Fl_Sys_Menu_Bar::update ( ) [virtual]

Updates the menu bar after any change to its items.

This is useful when the menu bar can be an Fl_Sys_Menu_Bar object.

Reimplemented from Fl_Menu_Bar.

12.137.4.16 window_menu_style()

void Fl_Sys_Menu_Bar::window_menu_style (Fl_Sys_Menu_Bar::window_menu_style_enum style ) [static]

Set the desired style of the Window menu in the system menu bar.

This function, to be called before the first call to Fl_Window::show(), allows to control whether the system menu bar should contain a Window menu, and if yes, whether new windows should be displayed in tabbed form. These are the effects of various values for style:

- no_window_menu: don't add a Window menu to the system menu bar
- tabbing_mode_none: add a simple Window menu to the system menu bar
- tabbing_mode_automatice: the window menu also contains "Merge All Windows" to group all windows in a single tabbed display mode. This is the default Window menu style for FLTK apps.
- tabbing_mode_preferred: new windows are displayed in tabbed mode when first created

The Window menu, if present, is entirely created and controlled by the FLTK library. Mac OS version 10.12 or later must be running for windows to be displayed in tabbed form. Under non MacOS platforms, this function does nothing.
The documentation for this class was generated from the following files:

- Fl_Sys_Menu_Bar.H
- Fl_Sys_Menu_Bar.cxx

12.138 Fl_Table Class Reference

A table of widgets or other content.

#include <Fl_Table.H>

Inheritance diagram for Fl_Table:

```
Fl_Widget
    └── Fl_Group
        └── Fl_Table
            └── Fl_Table_Row
```

**Public Types**

- enum TableContext {
  CONTEXT_NONE = 0, CONTEXT_STARTPAGE = 0x01, CONTEXT_ENDPAGE = 0x02, CONTEXT_ROW_HEADER = 0x04,
  CONTEXT_COL_HEADER = 0x08, CONTEXT_CELL = 0x10, CONTEXT_TABLE = 0x20, CONTEXT_RC_RESIZE = 0x40 }

  The context bit flags for Fl_Table related callbacks.

**Public Member Functions**

- void add (Fl_Widget &wgt)
  The specified widget is removed from its current group (if any) and added to the end of Fl_Table's group.
- void add (Fl_Widget *wgt)
  The specified widget is removed from its current group (if any) and added to the end of Fl_Table's group.
- Fl_Widget *const *array ()
  Returns a pointer to the array of children.
- int children () const
  Returns the number of children in the table.
- int callback_col ()
  Returns the current column the event occurred on.
- int callback_context ()
  Returns the current ‘table context’.
- int callback_row ()
  Returns the current row the event occurred on.
- Fl_Widget *child (int n) const
  Returns the child widget by an index.
- void callback (Fl_Widget * , void * )
  Callbacks will be called depending on the setting of Fl_Widget::when().
• virtual void clear ()
  Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.

• int col_header ()
  Returns if column headers are enabled or not.

• void col_header (int flag)
  Enable or disable column headers.

• int col_header_height ()
  Returns the column header height.

• void col_header_height (int height)
  Sets the height in pixels for column headers and redraws the table.

• int col_position ()
  Returns the current column scroll position as a column number.

• void col_position (int col)
  Sets the horizontal scroll position so 'col' is at the left, and causes the screen to redraw.

• int col_resize ()
  Returns if column resizing by the user is allowed.

• void col_resize (int flag)
  Allows/disallows column resizing by the user.

• int col_resize_min ()
  Returns the current column minimum resize value.

• void col_resize_min (int val)
  Sets the current column minimum resize value.

• int col_width (int col)
  Returns the current width of the specified column in pixels.

• void col_width (int col, int width)
  Sets the width of the specified column in pixels, and the table is redrawn.

• void col_width_all (int width)
  Convenience method to set the width of all columns to the same value, in pixels.

• int cols ()
  Get the number of columns in the table.

• virtual void cols (int val)
  Set the number of columns in the table and redraw.

• void do_callback (TableContext context, int row, int col)
  Calls the widget callback.

• void end ()
• int find (const Fl_Widget &wgt) const
• int find (const Fl_Widget ∗wgt) const

• Fl_Table (int X, int Y, int W, int H, const char ∗l=0)
  The constructor for Fl_Table.

• void get_selection (int &row_top, int &col_left, int &row_bot, int &col_right)
  Gets the region of cells selected (highlighted).

• void init_sizes ()
  Resets the internal array of widget sizes and positions.

• void insert (Fl_Widget &wgt, Fl_Widget ∗wgt)
  The specified widget is removed from its current group (if any) and inserted into Fl_Table's group before widget 'w2'.

• void insert (Fl_Widget &wgt, int n)
The specified widget is removed from its current group (if any) and inserted into the Fl_Table's group at position 'n'.

- **int is_interactive_resize ()**
  Returns 1 if someone is interactively resizing a row or column.

- **int is_selected (int r, int c)**
  See if the cell at row `r` and column `c` is selected.

- **int move_cursor (int R, int C)**
  Same as move_cursor(R,C,1);.

- **int move_cursor (int R, int C, int shiftselect)**
  Moves the selection cursor a relative number of rows/columns specified by R/C.

- **void remove (Fl_Widget &wgt)**
  The specified widget is removed from Fl_Table’s group.

- **void resize (int X, int Y, int W, int H) FL_OVERRIDE**
  Handle resize events if user resizes parent window.

- **int row_header ()**
  Returns if row headers are enabled or not.

- **void row_header (int flag)**
  Enables/disables showing the row headers.

- **Fl_Color row_header_color ()**
  Returns the current row header color.

- **void row_header_color (Fl_Color val)**
  Sets the row header color and causes the screen to redraw.

- **int row_header_width ()**
  Returns the current row header width (in pixels).

- **void row_header_width (int width)**
  Sets the row header width to n and causes the screen to redraw.

- **int row_height (int row)**
  Returns the current height of the specified row as a value in pixels.

- **void row_height (int row, int height)**
  Sets the height of the specified row in pixels, and the table is redrawn.

- **void row_height_all (int height)**
  Convenience method to set the height of all rows to the same value, in pixels.

- **int row_position ()**
  Returns the current row scroll position as a row number.

- **void row_position (int row)**
  Sets the vertical scroll position so 'row' is at the top, and causes the screen to redraw.

- **int row_resize ()**
  Returns if row resizing by the user is allowed.

- **void row_resize (int flag)**
  Allows/disallows row resizing by the user.

- **int row_resize_min ()**
  Returns the current row minimum resize value.

- **void row_resize_min (int val)**
  Sets the current row minimum resize value.

- **int rows ()**
  Returns the number of rows in the table.

- **virtual void rows (int val)**
  Sets the number of rows in the table, and the table is redrawn.

- **int scrollbar_size () const**
  Gets the current size of the scrollbars’ troughs, in pixels.

- **void scrollbar_size (int newSize)**
  Sets the pixel size of the scrollbars’ troughs to newSize, in pixels.
• void set_selection (int row_top, int col_left, int row_bot, int col_right)
  Sets the region of cells to be selected (highlighted).

• int tab_cell_nav () const
  Get state of table's 'Tab' key cell navigation flag.

• void tab_cell_nav (int val)
  Flag to control if Tab navigates table cells or not.

• void table_box (Fl_Boxtype val)
  Sets the kind of box drawn around the data table, the default being FL_NO_BOX.

• Fl_Boxtype table_box (void)
  Returns the current box type used for the data table.

• void top_row ()
  Returns the current top row shown in the table.

• void top_row (int row)
  Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.

• void visible_cells (int &r1, int &r2, int &c1, int &c2)
  Returns the range of row and column numbers for all visible and partially visible cells in the table.

• void when (Fl_When flags)
  The Fl_Widget::when() function is used to set a group of flags, determining when the widget callback is called:

• ~Fi_Table ()
  The destructor for Fl_Table.

Public Member Functions inherited from Fl_Group

• Fl_Widget const & _ddfdesign_kludge ()
  This is for forms compatibility only.

• void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

• void add (Fl_Widget *o)
  See void Fl_Group::add(Fl_Widget &w)

• void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget *const * array () const
  Returns a pointer to the array of children.

• Fl_Group const * as_group () const FL_OVERRIDE

• Fl_Group * as_group () FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

• Fl_Widget * child (int n) const
  Returns array()[n].

• int children () const
  Returns how many child widgets the group has.

• void clear ()
  Deletes all child widgets from memory recursively.

• unsigned int clip_children ()
  Returns the current clipping mode.

• void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

• void end ()
Exactly the same as current(this->parent()).

- **int find (const Fl_Widget &o) const**
  
  See int Fl_Group::find(const Fl_Widget *w) const.

- **int find (const Fl_Widget *) const**
  
  Searches the child array for the widget and returns the index.

- **Fl_Group (int, int, int, int, const char * = 0)**
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus (Fl_Widget *)**
  
  This is for forms compatibility only.

- **void init_sizes ()**
  
  Resets the internal array of widget sizes and positions.

- **void insert (Fl_Widget &, int i)**
  
  The widget is removed from its current group (if any) and then inserted into this group.

- **void insert (Fl_Widget &o, Fl_Widget *before)**
  
  This does insert(w, find(before)).

- **void remove (Fl_Widget &)**
  
  Removes a widget from the group but does not delete it.

- **void remove (Fl_Widget *o)**
  
  Removes the widget o from the group.

- **void remove (int index)**
  
  Removes the widget at index from the group but does not delete it.

- **Fl_Widget * resizable () const**
  
  Returns the group's resizable widget.

- **void resizable (Fl_Widget &o)**
  
  Sets the group's resizable widget.

- **void resizable (Fl_Widget *o)**
  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual ~Fl_Group ()**
  
  The destructor also deletes all the children.

**Public Member Functions inherited from Fl_Widget**

- **void _clear_fullscreen ()**

- **void _set_fullscreen ()**

- **void activate ()**

  Activates the widget.

- **unsigned int active () const**

  Returns whether the widget is active.

- **int active_r () const**

  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**

  Gets the label alignment.

- **void align (Fl_Align alignment)**

  Sets the label alignment.

- **long argument () const**

  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**

  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window * as_gl_window ()**

  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
virtual class Fl_Gl_Window const * as_gl_window () const
virtual Fl_Window * as_window ()

Returns an Fl_Window pointer if this widget is an Fl_Window.

virtual Fl_Window const * as_window () const

void bind_deimage (Fl_Image *img)

Sets the image to use as part of the widget label when in the inactive state.

void bind_deimage (int f)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

void bind_image (Fl_Image *img)

Sets the image to use as part of the widget label when in the active state.

void bind_image (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

Fl_Boxtype box () const

Gets the box type of the widget.

void box (Fl_Boxtype new_box)

Sets the box type for the widget.

Fl_Callback_p callback () const

Gets the current callback function for the widget.

void callback (Fl_Callback *cb)

Sets the current callback function for the widget.

void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)

Sets the current callback function and managed user data for the widget.

void callback (Fl_Callback *cb, void *p)

Sets the current callback function and data for the widget.

void callback (Fl_Callback0 *cb)

Sets the current callback function for the widget.

void callback (Fl_Callback1 *cb, long p=0)

Sets the current callback function for the widget.

unsigned int changed () const

Checks if the widget value changed since the last callback.

void clear_active ()

Marks the widget as inactive without sending events or changing focus.

void clear_changed ()

Marks the value of the widget as unchanged.

void clear_damage (uchar c=0)

Clears or sets the damage flags.

void clear_output ()

Sets a widget to accept input.

void clear_visible ()

Hides the widget.

void clear_visible_focus ()

Disables keyboard focus navigation with this widget.

Fl_Color color () const

Gets the background color of the widget.

void color (Fl_Color bg)

Sets the background color of the widget.

void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.

Fl_Color color2 () const

For back compatibility only.

void color2 (unsigned a)
For back compatibility only.

- `int contains` (const `Fl_Widget` *w) const
  Checks if `w` is a child of this widget.

- `void copy_label` (const char *new_label)
  Sets the current label.

- `void copy_tooltip` (const char *text)
  Sets the current tooltip text.

- `uchar damage()` const
  Returns non-zero if `draw()` needs to be called.

- `void damage`(uchar c)
  Sets the damage bits for the widget.

- `void damage`(uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- `int damage_resize`(int, int, int, int)
  Internal use only.

- `void deactivate`
  Deactivates the widget.

- `Fl_Image *deimage`
  Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image *deimage` const
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage`(Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage`(Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound` const
  Returns whether the inactive image is managed by the widget.

- `void do_callback`(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- `void do_callback`(Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- `void do_callback`(Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- `void draw_label`(int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h()` const
  Gets the widget height.

- `virtual void hide`
  Makes a widget invisible.

- `Fl_Image *image`
  Gets the image that is used as part of the widget label when in the active state.

- `const Fl_Image *image` const
  Gets the image that is used as part of the widget label when in the active state.

- `void image`(Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

- `void image`(Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

- `int image_bound` const
  Returns whether the image is managed by the widget.

- `int inside` (const `Fl_Widget` *wgt) const
  Checks if this widget is a child of `wgt`.
• int **is_label_copied** () const
  Returns whether the current label was assigned with **copy_label()**.
• const char **label** () const
  Gets the current label text.
• void **label** (const char **text**)
  Sets the current label pointer.
• void **label** (Fl_Labeltype a, const char **b**)
  Shortcut to set the label text and type in one call.
• Fl_Color **labelcolor** () const
  Gets the label color.
• void **labelcolor** (Fl_Color c)
  Sets the label color.
• Fl_Font **labelfont** () const
  Gets the font to use.
• void **labelfont** (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize **labelsize** () const
  Gets the font size in pixels.
• void **labelsize** (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype **labeltype** () const
  Gets the label type.
• void **labeltype** (Fl_Labeltype a)
  Sets the label type.
• void **measure_label** (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool **needs_keyboard** () const
  Returns whether this widget needs a keyboard.
• void **needs_keyboard** (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int **output** () const
  Returns if a widget is used for output only.
• Fl_Group **parent** () const
  Returns a pointer to the parent widget.
• void **parent** (Fl_Group **p**)
  Internal use only - "for hacks only".
• void **position** (int X, int Y)
  Repositions the window or widget.
• void **redraw** ()
  Schedules the drawing of the widget.
• void **redraw_label** ()
  Schedules the drawing of the label.
• Fl_Color **selection_color** () const
  Gets the selection color.
• void **selection_color** (Fl_Color a)
  Sets the selection color.
• void **set_active** ()
  Marks the widget as active without sending events or changing focus.
• void **set_changed** ()
  Marks the value of the widget as changed.
• void **set_output** ()
Sets a widget to output only.

- void **set_visible ()**
  
  Makes the widget visible.

- void **set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- int **shortcut_label () const**
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void **shortcut_label (int value)**
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void **show ()**
  
  Makes a widget visible.

- void **size (int W, int H)**
  
  Changes the size of the widget.

- int **take_focus ()**
  
  Gives the widget the keyboard focus.

- unsigned int **takesevents () const**
  
  Returns if the widget is able to take events.

- int **test_shortcut ()**
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- const char ∗ **tooltip () const**
  
  Gets the current tooltip text.

- void **tooltip (const char ∗text)**
  
  Sets the current tooltip text.

- Fl_Window ∗ **top_window () const**
  
  Returns a pointer to the top-level window for the widget.

- Fl_Window ∗ **top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar **type () const**
  
  Gets the widget type.

- void **type (uchar t)**
  
  Sets the widget type.

- int **use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void ∗ **user_data () const**
  
  Gets the user data for this widget.

- void **user_data (Fl_Callback_User_Data ∗v, bool auto_free)**
  
  Sets the user data for this widget.

- void **user_data (void ∗v)**
  
  Sets the user data for this widget.

- unsigned int **visible () const**
  
  Returns whether a widget is visible.

- unsigned int **visible_focus () const**
  
  Checks whether this widget has a visible focus.

- void **visible_focus (int v)**
  
  Modifies keyboard focus navigation.

- int **visible_r () const**
  
  Returns whether a widget and all its parents are visible.

- int **w () const**
  
  Gets the widget width.

- Fl_When **when () const**
  
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window *window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Types

• enum ResizeFlag
  RESIZE_NONE = 0 , RESIZE_COL_LEFT = 1 , RESIZE_COL_RIGHT = 2 , RESIZE_ROW_ABOVE = 3 ,
  RESIZE_ROW_BELOW = 4

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31
}
  flags possible values enumeration.

Protected Member Functions

• void change_cursor (Fl_Cursor newcursor)
  Change mouse cursor to different type.
• long col_scroll_position (int col)
  Returns the scroll position (in pixels) of the specified column 'col'.
• TableContext cursor2rowcol (int &R, int &C, ResizeFlag &resizeflag)
  Find row/col for the recent mouse event.
• void damage_zone (int r1, int c1, int r2, int c2, int r3=0, int c3=0)
  Sets the damage zone to the specified row/col values.
• void draw () FL_OVERRIDE
  Draws the entire Fl_Table.
• virtual void draw_cell (TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0)
  Subclass should override this method to handle drawing the cells.
• int find_cell (TableContext context, int R, int C, int &X, int &Y, int &W, int &H)
  Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.
• void get_bounds (TableContext context, int &X, int &Y, int &W, int &H)
  Returns the (X,Y,W,H) bounding region for the specified 'context'.
• int handle (int e) FL_OVERRIDE
  Handle FLTK events.
• int **is_fltk_container**
  
  Does the table contain any child fltk widgets?

• void **recalc_dimensions**
  
  Recalculate the dimensions of the table, and affect any children.

• void **redraw_range** (int topRow, int botRow, int leftCol, int rightCol)
  
  Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(DAMAGE_CHILD).

• int **row_col_clamp** (TableContext context, int &R, int &C)
  
  Return specified row/col values R and C to within the table’s current row/col limits.

• long **row_scroll_position** (int row)
  
  Returns the scroll position (in pixels) of the specified ‘row’.

• void **table_resized**
  
  Call this if table was resized, to recalculate internal data.

• void **table_scrolled**
  
  Recalculate internals after a scroll.

Protected Member Functions inherited from Fl_Group

• Fl_Rect * **bounds**
  
  Returns the internal array of widget sizes and positions.

• void **draw_child** (Fl_Widget &widget) const
  
  Forces a child to redraw.

• void **draw_children**
  
  Draws all children of the group.

• void **draw_outside_label** (const Fl_Widget &widget) const
  
  Parents normally call this to draw outside labels of child widgets.

• virtual int **on_insert** (Fl_Widget *, int)
  
  Allow derived groups to act when a widget is added as a child.

• virtual int **on_move** (int, int)
  
  Allow derived groups to act when a widget is moved within the group.

• virtual void **on_remove** (int)
  
  Allow derived groups to act when a child widget is removed from the group.

• int * **sizes**
  
  Returns the internal array of widget sizes and positions.

• void **update_child** (Fl_Widget &widget) const
  
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

• void **draw_backdrop** () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void **draw_box** () const
  
  Draws the widget box according its box style.

• void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget’s position and size.

• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.

- **void** draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

- **void** draw_label () const
  
  Draws the widget's label at the defined label position.

- **void** draw_label (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- **Fl_Widget** (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

- unsigned int flags () const
  
  Gets the widget flags mask.

- **void** h (int v)
  
  Internal use only.

- **void** set_flag (unsigned int c)
  
  Sets a flag in the flags mask.

- **void** w (int v)
  
  Internal use only.

- **void** x (int v)
  
  Internal use only.

- **void** y (int v)
  
  Internal use only.

Static Protected Member Functions

- static void scroll_cb (Fl_Widget ∗, void ∗)
  
  Callback for when someone moves a scrollbar.

Protected Attributes

- int botrow
  
  bottom row# of currently visible table on screen

- int current_col
  
  selection cursor's current column (-1 if none)

- int current_row
  
  selection cursor's current row (-1 if none)

- Fl_Scrollbar ∗ hscrollbar
  
  child horizontal scrollbar widget

- int leftcol
  
  left column# of currently visible table on screen

- int leftcol_scrollpos
  
  precomputed scroll position for left column

- int rightcol
  
  right column# of currently visible table on screen

- int select_col
  
  extended selection column (-1 if none)

- int select_row
  
  extended selection row (-1 if none)

- Fl_Scroll ∗ table
  
  child Fl_Scroll widget container for child fltk widgets (if any)

- int table_h
  
  table's virtual height (in pixels)

- int table_w
table's virtual width (in pixels)

- **int** tih
  Data table's inner h dimension, inside bounding box. See Table Dimension Diagram.

- **int** tiw
  Data table's inner w dimension, inside bounding box. See Table Dimension Diagram.

- **int** tix
  Data table's inner x dimension, inside bounding box. See Table Dimension Diagram.

- **int** tly
  Data table's inner y dimension, inside bounding box. See Table Dimension Diagram.

- **int** toh
  Data table's outer h dimension, outside bounding box. See Table Dimension Diagram.

- **int** toprow
  top row# of currently visible table on screen

- **int** toprow_scrollpos
  precomputed scroll position for top row

- **int** tow
  Data table's outer w dimension, outside bounding box. See Table Dimension Diagram.

- **int** tox
  Data table's outer x dimension, outside bounding box. See Table Dimension Diagram.

- **int** toy
  Data table's outer y dimension, outside bounding box. See Table Dimension Diagram.

- **Fl_Scrollbar** ∗ vscrollbar
  child vertical scrollbar widget

- **int** wiw
  Table widget's inner w dimension, inside bounding box. See Table Dimension Diagram.

- **int** wiw
  Table widget's inner w dimension, inside bounding box. See Table Dimension Diagram.

- **int** wix
  Table widget's inner x dimension, inside bounding box. See Table Dimension Diagram.

- **int** wiy
  Table widget's inner y dimension, inside bounding box. See Table Dimension Diagram.

Additional Inherited Members

Static Public Member Functions inherited from **Fl_Group**

- static Fl_Group ∗ current ()
  Returns the currently active group.

- static void current (Fl_Group ∗g)
  Sets the current group.

Static Public Member Functions inherited from **Fl_Widget**

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the 'x' shortcut in a given text.

- static int test_shortcut (const char ∗, const bool require_alt=false)
  Returns true if the given text contains the entered 'x' shortcut.
12.138.1 Detailed Description

A table of widgets or other content.
This is the base class for table widgets.
To be useful it must be subclassed and several virtual functions defined. Normally applications use widgets derived from this widget, and do not use this widget directly; this widget is usually too low level to be used directly by applications.

This widget does not handle the data in the table. The `draw_cell()` method must be overridden by a subclass to manage drawing the contents of the cells.

This widget can be used in several ways:

- As a custom widget; see examples/table-simple.cxx and test/table.cxx. Very optimal for even extremely large tables.
- As a table made up of a single FLTK widget instanced all over the table, simulating a numeric spreadsheet. See examples/table-spreadsheet.cxx and examples/table-spreadsheet-with-keyboard-nav.cxx. Optimal for large tables.
- As a regular container of FLTK widgets, one widget per cell. See examples/table-as-container.cxx. Not recommended for large tables.

![Figure 12.47 table-simple example](image)

### Figure 12.47 table-simple example

![Figure 12.48 table-as-container example](image)

![Figure 12.48 table-as-container example](image)

When acting as part of a custom widget, events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events are generated based on the setting for `Fl_Table::when()`.

When acting as a container for FLTK widgets, the FLTK widgets maintain themselves. Although the `draw_cell()` method must be overridden, its contents can be very simple. See the `draw_cell()` code in examples/table-simple.cxx.
The following variables are available to classes deriving from Fl_Table:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x()/y()/w()/h()</td>
<td>Fl_Table widget's outer dimension. The outer edge of the border of the Fl_Table. (Red in the diagram above)</td>
</tr>
<tr>
<td>wix/wiy/wiw/wih</td>
<td>Fl_Table widget's inner dimension. The inner edge of the border of the Fl_Table. eg. if the Fl_Table's box() is FL_NO_BOX, these values are the same as x()/y()/w()/h(). (Yellow in the diagram above)</td>
</tr>
<tr>
<td>tox/toy/tow/toh</td>
<td>The table's outer dimension. The outer edge of the border around the cells, but inside the row/col headings and scrollbars. (Green in the diagram above)</td>
</tr>
<tr>
<td>tix/tiy/tiw/tih</td>
<td>The table's inner dimension. The inner edge of the border around the cells, but inside the row/col headings and scrollbars. AKA the table's clip region. eg. if the table_box() is FL_NO_BOX, these values are the same as tox/toy/tow/toh. (Blue in the diagram above)</td>
</tr>
</tbody>
</table>

**CORE DEVELOPERS**
- Greg Ercolano : 12/16/2002 - initial implementation 12/16/02. Fl_Table, Fl_Table_Row, docs.
- Jean-Marc Lienher : 02/22/2004 - added keyboard nav + mouse selection, and ported Fl_Table into fltk-utf8-1.1.4

**OTHER CONTRIBUTORS**
- Inspired by the Feb 2000 version of FLVW's Flvw_Table widget. Mucho thanks to those folks.
- Mister Satan : 04/07/2003 - MinGW porting mods, and singleinput.cxx; a cool Fl_Input oriented spreadsheet example
- Marek Paliwoda : 01/08/2003 - Porting mods for Borland
- Ori Berger : 03/16/2006 - Optimizations for >500k rows/cols

**LICENSE**
Greg kindly gave his permission to integrate Fl_Table and Fl_Table_Row into FLTK, allowing FLTK license to apply while his widgets are part of the library. [updated by Greg, 04/26/17]

### 12.138.2 Member Enumeration Documentation

#### 12.138.2.1 TableContext

```cpp
enum Fl_Table::TableContext
```
The context bit flags for Fl_Table related callbacks. Should be used in draw_cell() to determine what’s being drawn, or in a callback() to determine where a recent event occurred.

**Enumerator**

<table>
<thead>
<tr>
<th>Enumerates</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTEXT_NONE</td>
<td>no known context</td>
</tr>
<tr>
<td>CONTEXT_STARTPAGE</td>
<td>before the table is redrawn</td>
</tr>
<tr>
<td>CONTEXT_ENDPAGE</td>
<td>after the table is redrawn</td>
</tr>
<tr>
<td>CONTEXT_ROW_HEADER</td>
<td>drawing or event occurred in the row header</td>
</tr>
<tr>
<td>CONTEXT_COL_HEADER</td>
<td>drawing or event occurred in the col header</td>
</tr>
<tr>
<td>CONTEXT_CELL</td>
<td>drawing or event occurred in a cell</td>
</tr>
<tr>
<td>CONTEXT_TABLE</td>
<td>drawing or event occurred in a dead zone of table</td>
</tr>
<tr>
<td>CONTEXT_RC_RESIZE</td>
<td>column or row is being resized</td>
</tr>
</tbody>
</table>

### 12.138.3 Constructor & Destructor Documentation

#### 12.138.3.1 Fl_Table()

```cpp
Fl_Table::Fl_Table (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char * l = 0 )
```

The constructor for Fl_Table.
This creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

#### 12.138.3.2 ~Fl_Table()

```cpp
Fl_Table::~Fl_Table ( )
```

The destructor for Fl_Table.
Destroys the table and its associated widgets.

### 12.138.4 Member Function Documentation

#### 12.138.4.1 array()

```cpp
Fl_Widget *const * Fl_Table::array ( ) [inline]
```

Returns a pointer to the array of children.
*This pointer is only valid until the next time a child is added or removed.*

#### 12.138.4.2 callback()

```cpp
void Fl_Table::callback (  
    Fl_Widget *,  
    void *)
```

Callbacks will be called depending on the setting of Fl_Widget::when().
Callback functions should use the following functions to determine the context/row/column:

- **Fl_Table::callback_row()** returns current row
- **Fl_Table::callback_col()** returns current column
- **Fl_Table::callback_context()** returns current table context

callback_row() and callback_col() will be set to the row and column number the event occurred on. If someone clicked on a row header, **row** will be 0. If someone clicked on a column header, **col** will be 0.
callback_context() will return one of the following:
### Fl_Table Class Reference

<table>
<thead>
<tr>
<th><strong>Function</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Fl_Table::CONTEXT_ROW_HEADER</strong></td>
<td>Someone clicked on a row header. Excludes resizing.</td>
</tr>
<tr>
<td><strong>Fl_Table::CONTEXT_COL_HEADER</strong></td>
<td>Someone clicked on a column header. Excludes resizing.</td>
</tr>
<tr>
<td><strong>Fl_Table::CONTEXT_CELL</strong></td>
<td>Someone clicked on a cell. To receive callbacks for FL_RELEASE events, you must set when(FL_WHEN_RELEASE).</td>
</tr>
<tr>
<td><strong>Fl_Table::CONTEXT_RC_RESIZE</strong></td>
<td>Someone is resizing rows/columns either interactively, or via the <code>col_width()</code> or <code>row_height()</code> API. Use <code>is_interactive_resize()</code> to determine interactive resizing. If resizing a column, R=0 and C=column being resized. If resizing a row, C=0 and R=row being resized. NOTE: To receive resize events, you must set when(FL_WHEN_CHANGED).</td>
</tr>
</tbody>
</table>

```cpp
class MyTable : public Fl_Table {
    // Handle events that happen on the table
    void event_callback2() {
        int R = callback_row(), // row where event occurred
             C = callback_col(); // column where event occurred
        TableContext context = callback_context(); // which part of table
        fprintf(stderr, "callback: Row=%d Col=%d Context=%d Event=%d\n",
                R, C, (int)context, (int)Fl::event());
    }

    // Actual static callback
    static void event_callback(Fl_Widget*, void* data) {
        MyTable *o = (MyTable*)data;
        o->event_callback2();
    }

public:
    // Constructor
    MyTable() {
        table.callback(&event_callback, (void*)this); // setup callback
        table.when(FL_WHEN_CHANGED|FL_WHEN_RELEASE); // when to call it
    }
};
```

#### 12.138.4.3 callback_col()

int Fl_Table::callback_col () [inline]

Returns the current column the event occurred on.
This function should only be used from within the user's callback function.

#### 12.138.4.4 callback_context()

TableContext Fl_Table::callback_context () [inline]

Returns the current 'table context'.
This function should only be used from within the user's callback function.

#### 12.138.4.5 callback_row()

int Fl_Table::callback_row () [inline]

Returns the current row the event occurred on.
This function should only be used from within the user's callback function.

#### 12.138.4.6 child()

Fl_Widget * Fl_Table::child (int n) const [inline]

Returns the child widget by an index.
When using the Fl_Table as a container for FLTK widgets, this method returns the widget pointer from the internal array of widgets in the container.
Typically used in loops, eg:
for ( int i=0; i<children(); i++ ) {
    Fl_Widget *w = child(i);
   [..]
}

12.138.4.7 children()

int Fl_Table::children ( ) const [inline]
Returns the number of children in the table.
When using the Fl_Table as a container for FLTK widgets, this method returns how many child widgets the table has.
See also

    child(int)

12.138.4.8 clear()

virtual void Fl_Table::clear ( ) [inline], [virtual]
Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.
See also

    rows(int), cols(int)

Reimplemented in Fl_Table_Row.

12.138.4.9 col_header()

void Fl_Table::col_header ( int flag ) [inline]
Enable or disable column headers.
If changed, the table is redrawn.

12.138.4.10 col_resize()

void Fl_Table::col_resize ( int flag ) [inline]
Allows/disallows column resizing by the user.
1=allow interactive resizing, 0=disallow interactive resizing. Since interactive resizing is done via the column headers, col_header() must also be enabled to allow resizing.

12.138.4.11 col_resize_min()

void Fl_Table::col_resize_min ( int val ) [inline]
Sets the current column minimum resize value.
This is used to prevent the user from interactively resizing any column to be smaller than 'pixels'. Must be a value >=1.

12.138.4.12 col_width()

void Fl_Table::col_width ( int col, int width )
Sets the width of the specified column in pixels, and the table is redrawn.
callback() will be invoked with CONTEXT_RC_RESIZE if the column's width was actually changed, and when() is FL_WHEN_CHANGED.
12.138.4.13  col_width_all()  

    void Fl_Table::col_width_all ( 
    int width) [inline]

Convenience method to set the width of all columns to the same value, in pixels. The screen is redrawn.

12.138.4.14  cursor2rowcol()  

    Fl_Table::TableContext Fl_Table::cursor2rowcol ( 
    int & R, 
    int & C, 
    ResizeFlag & resizeflag) [protected]

Find row/col for the recent mouse event. Returns the context, and the row/column values in R/C. Also returns 'resizeflag' if mouse is hovered over a resize boundary.

12.138.4.15  damage_zone()  

    void Fl_Table::damage_zone ( 
    int r1, 
    int c1, 
    int r2, 
    int c2, 
    int r3 = 0, 
    int c3 = 0 ) [protected]

Sets the damage zone to the specified row/col values. Calls redraw_range().

12.138.4.16  do_callback()  

    void Fl_Table::do_callback ( 
    TableContext context, 
    int row, 
    int col) [inline]

Calls the widget callback. Saves the specified 'context', 'row', and 'col' values, so that the user's callback can then access them with the member functions callback_context(), callback_row() and callback_col().

12.138.4.17  draw()  

    void Fl_Table::draw ( 
    void) [protected], [virtual]

Draws the entire Fl_Table. Lets fltk widgets draw themselves first, followed by the cells via calls to draw_cell(). Reimplemented from Fl_Group.

12.138.4.18  draw_cell()  

    virtual void Fl_Table::draw_cell ( 
    TableContext context, 
    int R = 0, 
    int C = 0, 
    int X = 0, 
    int Y = 0, 
    int W = 0, 
    int H = 0 ) [inline], [protected], [virtual]

Subclass should override this method to handle drawing the cells. This method will be called whenever the table is redrawn, once per cell.
Only cells that are completely (or partially) visible will be told to draw. `context` will be one of the following:

| Fl_Table::CONTEXT_STARTPAGE | When table, or parts of the table, are about to be redrawn. Use to initialize static data, such as font selections. R/C will be zero, X/Y/W/H will be the dimensions of the table's entire data area. (Useful for locking a database before accessing; see also `visible_cells()`) |
| Fl_Table::CONTEXT_ENDPAGE | When table has completed being redrawn. R/C will be zero, X/Y/W/H dimensions of table's data area. (Useful for unlocking a database after accessing) |
| Fl_Table::CONTEXT_ROW_HEADER | Whenever a row header cell needs to be drawn. R will be the row number of the header being redrawn, C will be zero, X/Y/W/H will be the fltk drawing area of the row header in the window |
| Fl_Table::CONTEXT_COL_HEADER | Whenever a column header cell needs to be drawn. R will be zero, C will be the column number of the header being redrawn, X/Y/W/H will be the fltk drawing area of the column header in the window |
| Fl_Table::CONTEXT_CELL | Whenever a data cell in the table needs to be drawn. R/C will be the row/column of the cell to be drawn, X/Y/W/H will be the fltk drawing area of the cell in the window |
| Fl_Table::CONTEXT_RC_RESIZE | Whenever table or row/column is resized or scrolled, either interactively or via `col_width()` or `row_height()`. R/C/X/Y/W/H will all be zero. Useful for fltk containers that need to resize or move the child fltk widgets. |

R and C will be set to the row and column number of the cell being drawn. In the case of row headers, C will be 0. In the case of column headers, R will be 0. X/Y/W/H will be the position and dimensions of where the cell should be drawn.

In the case of custom widgets, a minimal `draw_cell()` override might look like the following. With custom widgets it is up to the caller to handle drawing everything within the dimensions of the cell, including handling the selection color. Note all clipping must be handled as well; this allows drawing outside the dimensions of the cell if so desired for 'custom effects'.

```c
// This is called whenever Fl_Table wants you to draw a cell
void MyTable::draw_cell(TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0) {
    static char s[40];
    sprintf(s, "%d/%d", R, C); // text for each cell
    switch (context) {
    case CONTEXT_STARTPAGE: // Fl_Table telling us it's starting to draw page
        fl_font(Fl_HELVETICA, 16);
        return;
    case CONTEXT_ROW_HEADER: // Fl_Table telling us to draw row/col headers
    case CONTEXT_COL_HEADER:
        fl_push_clip(X, Y, W, H);
        { fl_draw_box(Fl_THIN_UP_BOX, X, Y, W, H, color());
          fl_color(Fl_BLACK);
          fl_draw(s, X, Y, W, H, Fl_ALIGN_CENTER);
        }
        fl_pop_clip();
        return;
    case CONTEXT_CELL: // Fl_Table telling us to draw cells
        fl_push_clip(X, Y, W, H);
        { // BG COLOR
          fl_color(row_selected(R) ? selection_color() : Fl_WHITE);
          fl_rectf(X, Y, W, H);
        // TEXT
          fl_color(Fl_BLACK);
        }
    }
```
12.138 Fl_Table Class Reference

```cpp
fl_draw(s, X, Y, W, H, FL_ALIGN_CENTER); // BORDER
fl_color(FL_LIGHT2);
fl_rect(X, Y, W, H);
}
fl_pop_clip();
return;
default:
return;

//NOTREACHED
}

12.138.4.19 find_cell()

int Fl_Table::find_cell(TableContext context,
                       int R,
                       int C,
                       int & X,
                       int & Y,
                       int & W,
                       int & H) [protected]

Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.

Returns

- 0 – on success, XYWH returns the region of the specified cell.
- -1 – if R or C are out of range, and X/Y/W/H will be set to zero.

12.138.4.20 get_selection()

void Fl_Table::get_selection {
    int & row_top,
    int & col_left,
    int & row_bot,
    int & col_right
}

Gets the region of cells selected (highlighted).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_top</td>
<td>Returns the top row of selection area</td>
</tr>
<tr>
<td>col_left</td>
<td>Returns the left column of selection area</td>
</tr>
<tr>
<td>row_bot</td>
<td>Returns the bottom row of selection area</td>
</tr>
<tr>
<td>col_right</td>
<td>Returns the right column of selection area</td>
</tr>
</tbody>
</table>

12.138.4.21 handle()

int Fl_Table::handle (int e) [protected], [virtual]

Handle FLTK events.
Reimplemented from Fl_Group.
Reimplemented in Fl_Table_Row.

12.138.4.22 init_sizes()

void Fl_Table::init_sizes () [inline]

Resets the internal array of widget sizes and positions.
```
void Fl_Table::insert ( Fl_Widget & wgt, Fl_Widget * w2 ) [inline]

The specified widget is removed from its current group (if any) and inserted into Fl_Table’s group before widget ‘w2’. This will append if ‘w2’ is not in Fl_Table’s group.

int Fl_Table::is_interactive_resize ( ) [inline]

Returns 1 if someone is interactively resizing a row or column. You can currently call this only from within your callback().

int Fl_Table::is_selected ( int r, int c )

See if the cell at row r and column c is selected.

Returns

1 if the cell is selected, 0 if not.

int Fl_Table::move_cursor ( int R, int C, int shiftselect )

Moves the selection cursor a relative number of rows/columns specified by R/C. R/C can be positive or negative, depending on the direction to move. A value of 0 for R or C prevents cursor movement on that axis.
If shiftselect is set, the selection range is extended to the new cursor position. If clear, the cursor is simply moved, and any previous selection is cancelled.
Used mainly by keyboard events (e.g. Fl_Right, Fl_Home, Fl_End..) to let the user keyboard navigate the selection cursor around.
The scroll positions may be modified if the selection cursor traverses into cells off the screen’s edge.
Internal variables select_row/select_col and current_row/current_col are modified, among others.
Examples:
R=1, C=0 -- moves the selection cursor one row downward.
R=5, C=0 -- moves the selection cursor 5 rows downward.
R=-5, C=0 -- moves the cursor 5 rows upward.
R=2, C=2 -- moves the cursor 2 rows down and 2 columns to the right.

void Fl_Table::recalc_dimensions ( ) [protected]

Recalculate the dimensions of the table, and affect any children. Internally, Fl_Group::resize() and init_sizes() are called.

void Fl_Table::recalc_range ( int topRow, int botRow,
Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(DAMAGE_CHILD). Extends any previously defined range to redraw.

12.138.4.29 resize()

void Fl_Table::resize (  
    int X,  
    int Y,  
    int W,  
    int H ) [virtual]

Handle resize events if user resizes parent window. This changes the size of Fl_Table, causing it to redraw. Reimplemented from Fl_Group.

12.138.4.30 row_col_clamp()

int Fl_Table::row_col_clamp (  
    TableContext context,  
    int & R,  
    int & C ) [protected]

Return specified row/col values R and C to within the table's current row/col limits.

Returns
0 if no changes were made, or 1 if they were.

12.138.4.31 row_header()

void Fl_Table::row_header (  
    int flag ) [inline]

Enables/disables showing the row headers.  
1=enabled, 0=disabled. If changed, the table is redrawn.

12.138.4.32 row_height()

void Fl_Table::row_height (  
    int row,  
    int height )

Sets the height of the specified row in pixels, and the table is redrawn.  
callback() will be invoked with CONTEXT_RC_RESIZE if the row's height was actually changed, and when() is FL_WHEN_CHANGED.

12.138.4.33 row_height_all()

void Fl_Table::row_height_all (  
    int height ) [inline]

Convenience method to set the height of all rows to the same value, in pixels. The screen is redrawn.

12.138.4.34 row_resize()

void Fl_Table::row_resize (  
    int flag ) [inline]

Allows/disallows row resizing by the user.  
1=allow interactive resizing, 0=disallow interactive resizing. Since interactive resizing is done via the row headers, row_header() must also be enabled to allow resizing.
12.138.4.35  row_resize_min()

void Fl_Table::row_resize_min (  
    int val  )  [inline]

Sets the current row minimum resize value.  
This is used to prevent the user from interactively resizing any row to be smaller than 'pixels'.  Must be a value >=1.

12.138.4.36  rows()

void Fl_Table::rows (  
    int val  )  [virtual]

Sets the number of rows in the table, and the table is redrawn.  
Reimplemented in Fl_Table_Row.

12.138.4.37  scrollbar_size() [1/2]

int Fl_Table::scrollbar_size ( ) const  [inline]

Gets the current size of the scrollbars' troughs, in pixels.  
If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.  

Returns  
Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also  
Fl::scrollbar_size(int)

12.138.4.38  scrollbar_size() [2/2]

void Fl_Table::scrollbar_size (  
    int newSize  )  [inline]

Sets the pixel size of the scrollbars' troughs to newSize, in pixels.  
Normally you should not need this method, and should use Fl::scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars.  This ensures your application has a consistent UI, is the default behavior, and is normally what you want.  
Only use THIS method if you really need to override the global scrollbar size.  The need for this should be rare.  
Setting newSize to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the default.  

Parameters  

| in     | newSize | Sets the scrollbar size in pixels.  
|--------|---------| If 0 (default), scrollbar size tracks the global Fl::scrollbar_size() |

See also  
Fl::scrollbar_size()

12.138.4.39  set_selection()

void Fl_Table::set_selection (  
    int row_top,  
    int col_left,  
    int row_bot,  
    int col_right )

Sets the region of cells to be selected (highlighted).
So for instance, set_selection(0,0,0,0) selects the top/left cell in the table. And set_selection(0,0,1,1) selects the four cells in rows 0 and 1, column 0 and 1.
To deselect all cells, use set_selection(-1,-1,-1,-1);

Parameters

| in | row_top | Top row of selection area |
| in | col_left | Left column of selection area |
| in | row_bot | Bottom row of selection area |
| in | col_right | Right column of selection area |

12.138.4.40 tab_cell_nav() [1/2]

int Fl_Table::tab_cell_nav ( ) const [inline]
Get state of table's 'Tab' key cell navigation flag.

Returns

1 if Tab configured to navigate cells in table
0 to navigate widget focus (default)

See also

tab_cell_nav(int)

12.138.4.41 tab_cell_nav() [2/2]

void Fl_Table::tab_cell_nav ( int val ) [inline]
Flag to control if Tab navigates table cells or not.
If on, Tab key navigates table cells. If off, Tab key navigates fltk widget focus. (default)
As of fltk 1.3, the default behavior of the Tab key is to navigate focus off of the current widget, and on to the next one. But in some applications, it's useful for Tab to be used to navigate cells in the Fl_Table.

Parameters

| in | val | If val is 1, Tab key navigates cells in table, not fltk widgets.
|    |     | If val is 0, Tab key will advance focus to the next fltk widget (default), and does not navigate cells in table. |

12.138.4.42 table_box()

void Fl_Table::table_box ( Fl_Boxtype val ) [inline]
Sets the kind of box drawn around the data table, the default being FL_NO_BOX.
Changing this value will cause the table to redraw.

12.138.4.43 table_resized()

void Fl_Table::table_resized ( ) [protected]
Call this if table was resized, to recalculate internal data.
Calls recall_dimensions(), and recalculates scrollbar sizes.

12.138.4.44 table_scrolled()

void Fl_Table::table_scrolled ( ) [protected]
Recalculate internals after a scroll. Call this if table has been scrolled or resized. Does not handle `redraw()`. TODO: Assumes t[xywh] has already been recalculated.

### 12.138.4.45 `top_row()` [1/2]

```cpp
int Fl_Table::top_row ( ) [inline]
```

Returns the current top row shown in the table.
This row may be partially obscured.

### 12.138.4.46 `top_row()` [2/2]

```cpp
void Fl_Table::top_row ( int row ) [inline]
```

Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.
If the table cannot be scrolled that far, it is scrolled as far as possible.

### 12.138.4.47 `visible_cells()`

```cpp
void Fl_Table::visible_cells ( int & r1, int & r2, int & c1, int & c2 ) [inline]
```

Returns the range of row and column numbers for all visible and partially visible cells in the table.
These values can be used e.g. by your `draw_cell()` routine during `CONTEXT_STARTPAGE` to figure out what cells
are about to be redrawn for the purposes of locking the data from a database before it's drawn.

```
leftcol rightcol
| toprow .. VISIBL-------------E|
| T A B L E | V I S I B L E |
| botrow .. '-------------|
```

E.g., in a table where the visible rows are 5-20, and the visible columns are 100-120, then those variables would be:

- `toprow = 5`
- `botrow = 20`
- `leftcol = 100`
- `rightcol = 120`

### 12.138.4.48 `when()`

```cpp
void Fl_Table::when ( Fl_When flags )
```

The `Fl_Widget::when()` function is used to set a group of flags, determining when the widget callback is called:

| FL_WHEN_CHANGED | callback() will be called when rows or columns are resized (interactively or via `col_width()` or `row_height()`), passing `CONTEXT_RC_RESIZE` via `callback_context()`.
| FL_WHEN_RELEASE | callback() will be called during `FL_RELEASE` events, such as when someone releases a mouse button somewhere on the table. |

The `callback()` routine is sent a `TableContext` that indicates the context the event occurred in, such as in a cell, in a header, or elsewhere on the table. When an event occurs in a cell or header, `callback_row()` and `callback_col()` can be used to determine the row and column. The callback can also look at the regular Fltk event values (i.e. `Fl::event()` and `Fl::event_button()`)) to determine what kind of event is occurring.

The documentation for this class was generated from the following files:
12.139 Fl_Table_Row Class Reference

A table with row selection capabilities.

```cpp
#include <Fl_Table_Row.H>
```

Inheritance diagram for Fl_Table_Row:

```

   |
   v
Fl_Table_Row
```

Public Types

- `enum TableRowSelectMode { SELECT_NONE, SELECT_SINGLE, SELECT_MULTI }`

Public Types inherited from Fl_Table

- `enum TableContext { CONTEXT_NONE = 0, CONTEXT_STARTPAGE = 0x01, CONTEXT_ENDPAGE = 0x02, CONTEXT_ROW_HEADER = 0x04, CONTEXT_COL_HEADER = 0x08, CONTEXT_CELL = 0x10, CONTEXT_TABLE = 0x20, CONTEXT_RC_RESIZE = 0x40 }
  The context bit flags for Fl_Table related callbacks.

Public Member Functions

- `void clear () FL_OVERRIDE`  
  Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.
- `Fl_Table_Row (int X, int Y, int W, int H, const char ∗=0)`
  The constructor for the Fl_Table_Row.
- `int row_selected (int row)`
  Checks to see if 'row' is selected.
- `int rows ()`
- `void rows (int val) FL_OVERRIDE`
  Sets the number of rows in the table, and the table is redrawn.
- `void select_all_rows (int flag=1)`  
  This convenience function changes the selection state for all rows based on 'flag'.
- `int select_row (int row, int flag=1)`  
  Changes the selection state for 'row', depending on the value of 'flag'.
- `TableRowSelectMode type () const`
- `void type (TableRowSelectMode val)`
  Sets the table selection mode.
- `~Fl_Table_Row ()`
  The destructor for the Fl_Table_Row.
Public Member Functions inherited from Fl_Table

- void add (Fl_Widget &wgt)
  The specified widget is removed from its current group (if any) and added to the end of Fl_Table's group.

- void add (Fl_Widget *wgt)
  The specified widget is removed from its current group (if any) and added to the end of Fl_Table's group.

- Fl_Widget *const *array ()
  Returns a pointer to the array of children.

- void begin ()

- void callback (Fl_Widget *, void *)
  Callbacks will be called depending on the setting of Fl_Widget::when().

- int callback_col ()
  Returns the current column the event occurred on.

- TableContext callback_context ()
  Returns the current 'table context'.

- int callback_row ()
  Returns the current row the event occurred on.

- Fl_Widget *child (int n) const
  Returns the child widget by an index.

- int children () const
  Returns the number of children in the table.

- int col_header ()
  Returns if column headers are enabled or not.

- void col_header (int flag)
  Enable or disable column headers.

- Fl_Color col_header_color ()
  Gets the color for column headers.

- void col_header_color (Fl_Color val)
  Sets the color for column headers and redraws the table.

- int col_header_height ()
  Gets the column header height.

- void col_header_height (int height)
  Sets the height in pixels for column headers and redraws the table.

- int col_position ()
  Returns the current column scroll position as a column number.

- void col_position (int col)
  Sets the horizontal scroll position so 'col' is at the left, and causes the screen to redraw.

- int col_resize ()
  Returns if column resizing by the user is allowed.

- void col_resize (int flag)
  Allows/disallows column resizing by the user.

- int col_resize_min ()
  Returns the current column minimum resize value.

- void col_resize_min (int val)
  Sets the current column minimum resize value.

- int col_width (int col)
  Returns the current width of the specified column in pixels.

- void col_width (int col, int width)
  Sets the width of the specified column in pixels, and the table is redrawn.

- void col_width_all (int width)
  Convenience method to set the width of all columns to the same value, in pixels.
• int **cols** ()
  
  Get the number of columns in the table.

• virtual void **cols** (int val)
  
  Set the number of columns in the table and redraw.

• void **do_callback** (TableContext context, int row, int col)
  
  Calls the widget callback.

• void **end** ()

• int **find** (const Fl_Widget &wgt) const
• int **find** (const Fl_Widget *wgt) const

  The constructor for Fl_Table.

• void **get_selection** (int &row_top, int &col_left, int &row_bot, int &col_right)

  Gets the region of cells selected (highlighted).

• void **init_sizes** ()

  Resets the internal array of widget sizes and positions.

• void **insert** (Fl_Widget &wgt, Fl_Widget *w2)
  
  The specified widget is removed from its current group (if any) and inserted into Fl_Table's group before widget 'w2'.

• void **insert** (Fl_Widget &wgt, int n)
  
  The specified widget is removed from its current group (if any) and inserted into the Fl_Table's group at position 'n'.

• int **is_interactive_resize** ()

  Returns 1 if someone is interactively resizing a row or column.

• int **is_selected** (int r, int c)

  See if the cell at row **r** and column **c** is selected.

• int **move_cursor** (int R, int C)

  Same as move_cursor(R,C,1);

• int **move_cursor** (int R, int C, int shiftselect)

  Moves the selection cursor a relative number of rows/columns specified by R/C.

• void **remove** (Fl_Widget &wgt)

  The specified widget is removed from Fl_Table's group.

• void **resize** (int X, int Y, int W, int H) FL_OVERRIDE

  Handle resize events if user resizes parent window.

• int **row_header** ()

  Returns if row headers are enabled or not.

• void **row_header** (int flag)

  Enables/disables showing the row headers.

• Fl_Color **row_header_color** ()

  Returns the current row header color.

• void **row_header_color** (Fl_Color val)

  Sets the row header color and causes the screen to redraw.

• int **row_header_width** ()

  Returns the current row header width (in pixels).

• void **row_header_width** (int width)

  Sets the row header width to n and causes the screen to redraw.

• int **row_height** (int row)

  Returns the current height of the specified row as a value in pixels.

• void **row_height** (int row, int height)

  Sets the height of the specified row in pixels, and the table is redrawn.

• void **row_height_all** (int height)

  Convenience method to set the height of all rows to the same value, in pixels.

• int **row_position** ()

  Returns the current row scroll position as a row number.
• void **row_position** (int row)
  Sets the vertical scroll position so 'row' is at the top, and causes the screen to redraw.

• int **row_resize** ()
  Returns if row resizing by the user is allowed.

• void **row_resize** (int flag)
  Allows/disallows row resizing by the user.

• int **row_resize_min** ()
  Returns the current row minimum resize value.

• void **row_resize_min** (int val)
  Sets the current row minimum resize value.

• int **rows** ()
  Returns the number of rows in the table.

• int **scrollbar_size** () const
  Gets the current size of the scrollbars' troughs, in pixels.

• void **scrollbar_size** (int newSize)
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

• void **set_selection** (int row_top, int col_left, int row_bot, int col_right)
  Sets the region of cells to be selected (highlighted).

• int **tab_cell_nav** () const
  Get state of table's 'Tab' key cell navigation flag.

• void **tab_cell_nav** (int val)
  Flag to control if Tab navigates table cells or not.

• void **table_box** (Fl_Boxtype val)
  Sets the kind of box drawn around the data table, the default being FL_NO_BOX.

• Fl_Boxtype **table_box** (void)
  Returns the current box type used for the data table.

• int **top_row** ()
  Returns the current top row shown in the table.

• void **top_row** (int row)
  Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.

• void **visible_cells** (int &r1, int &r2, int &c1, int &c2)
  Returns the range of row and column numbers for all visible and partially visible cells in the table.

• void **when** (Fl_When flags)
  The Fl_Widget::when() function is used to set a group of flags, determining when the widget callback is called:

• ~Fl_Table ()
  The destructor for Fl_Table.

Public Member Functions inherited from Fl_Group

• Fl_Widget * & _ddfdesign_kludge ()
  This is for forms compatibility only.

• void **add** (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

• void **add** (Fl_Widget +o)
  See void Fl_Group::add(Fl_Widget &w)

• void **add_resizable** (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget +const + array () const
  Returns a pointer to the array of children.

• Fl_Group const * as_group () const FL_OVERRIDE

• Fl_Group * as_group () FL_OVERRIDE
Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin ()**
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget * child (int n) const**
  
  Returns array()[n].

- **int children () const**
  
  Returns how many child widgets the group has.

- **void clear ()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()**
  
  Returns the current clipping mode.

- **void clip_children (int c)**
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child (int n)**
  
  Removes the widget at index from the group and deletes it.

- **void end ()**
  
  Exactly the same as current(this->parent()).

- **int find (const Fl_Widget &o) const**
  
  See int Fl_Group::find(const Fl_Widget *w) const.

- **int find (const Fl_Widget *) const**
  
  Searches the child array for the widget and returns the index.

- **Fl_Group (int, int, int, int, const char *)=0**
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus (Fl_Widget *)**
  
  This is for forms compatibility only.

- **void forms_end ()**
  
  Resets the internal array of widget sizes and positions.

- **void insert (Fl_Widget &, int i)**
  
  The widget is removed from its current group (if any) and then inserted into this group.

- **void insert (Fl_Widget &, Fl_Widget *)**
  
  This does insert(w, find(before)).

- **void remove (Fl_Widget &)**
  
  Removes a widget from the group but does not delete it.

- **void remove (Fl_Widget *)**
  
  Removes the widget o from the group.

- **void remove (int index)**
  
  Removes the widget at index from the group but does not delete it.

- **Fl_Widget * resizable () const**
  
  Returns the group's resizable widget.

- **void resizable (Fl_Widget &o)**
  
  Sets the group's resizable widget.

- **void resizable (Fl_Widget *)**
  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual ~Fl_Group ()**
  
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
    
    Activates the widget.
• unsigned int active () const
    
    Returns whether the widget is active.
• int active_r () const
    
    Returns whether the widget and all of its parents are active.
• Fl_Align align () const
    
    Gets the label alignment.
• void align (Fl_Align alignment)
    
    Sets the label alignment.
• long argument () const
    
    Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
    
    Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
    
    Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Window ∗ as_window ()
    
    Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
    
    Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
    
    Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
    
    Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
    
    Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
    
    Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
    
    Sets the box type for the widget.
• Fl_Callback_p callback () const
    
    Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
    
    Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
    
    Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
    
    Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗ cb)
    
    Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
    
    Sets the current callback function for the widget.
• unsigned int changed () const
    
    Checks if the widget value changed since the last callback.
• void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**  
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**  
  Clears or sets the damage flags.

- **void clear_output ()**  
  Sets a widget to accept input.

- **void clear_visible ()**  
  Hides the widget.

- **void clear_visible_focus ()**  
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**  
  Gets the background color of the widget.

- **void color (Fl_Color bg)**  
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**  
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**  
  For back compatibility only.

- **void color2 (unsigned a)**  
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**  
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**  
  Sets the current label.

- **void copy_tooltip (const char *text)**  
  Sets the current tooltip text.

- **uchar damage () const**  
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**  
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**  
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**  
  Internal use only.

- **void deactivate ()**  
  Deactivates the widget.

- **Fl_Image *deimage ()**  
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image *deimage () const**  
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**  
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**  
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**  
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**  
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**  
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• FL_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const FL_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (FL_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (FL_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (FL_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• FL_Color labelcolor () const
  Gets the label color.
• void labelcolor (FL_Color c)
  Sets the label color.
• FL_Font labelfont () const
  Gets the font to use.
• void labelfont (FL_Font f)
  Sets the font to use.
• FL_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (FL_Fontsize pix)
  Sets the font size in pixels.
• FL_Labeltype labeltype () const
  Gets the label type.
• void labeltype (FL_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
Returns if a widget is used for output only.

- **Fl_Group** - **parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char * tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **Fl_Window *top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window *top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.
• int **use_accents_menu** ()

  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void *user_data () const

  Gets the user data for this widget.

• void **user_data** (Fl_Callback_User_Data ∗v, bool auto_free)

  Sets the user data for this widget.

• void **user_data** (void ∗v)

  Sets the user data for this widget.

• void **user_data** (void ∗v)

  Sets the user data for this widget.

• unsigned int **visible** () const

  Returns whether a widget is visible.

• unsigned int **visible_focus** () const

  Checks whether this widget has a visible focus.

• void **visible_focus** (int v)

  Modifies keyboard focus navigation.

• int **visible_r** () const

  Returns whether a widget and all its parents are visible.

• int w () const

  Gets the widget width.

• FL_When when () const

  Returns the conditions under which the callback is called.

• void when (uchar i)

  Sets the flags used to decide when a callback is called.

• Fl_Window *window () const

  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const

  Gets the widget position in its window.

• int y () const

  Gets the widget position in its window.

• virtual ~Fl_Widget ()

  Destroys the widget.

Protected Member Functions

• int find_cell (TableContext context, int R, int C, int &X, int &Y, int &W, int &H)

• int handle (int event) FL_OVERRIDE

  Handle FLTK events.

Protected Member Functions inherited from Fl_Table

• void change_cursor (Fl_Cursor newcursor)

  Change mouse cursor to different type.

• long col_scroll_position (int col)

  Returns the scroll position (in pixels) of the specified column 'col'.

• TableContext cursor2rowcol (int &R, int &C, ResizeFlag &resizeflag)

  Find row/col for the recent mouse event.

• void damage_zone (int r1, int c1, int r2, int c2, int r3=0, int c3=0)

  Sets the damage zone to the specified row/col values.

• void draw () FL_OVERRIDE

  Draws the entire Fl_Table.

• virtual void draw_cell (TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0)

  Subclass should override this method to handle drawing the cells.

• int find_cell (TableContext context, int R, int C, int &X, int &Y, int &W, int &H)
Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.

- **void** get_bounds (TableContext context, int &X, int &Y, int &W, int &H)
  Returns the (X,Y,W,H) bounding region for the specified 'context'.

- **int** is_fltk_container ()
  Does the table contain any child fltk widgets?

- **void** recalc_dimensions ()
  Recalculate the dimensions of the table, and affect any children.

- **void** redraw_range (int topRow, int botRow, int leftCol, int rightCol)
  Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(DAMAGE_CHILD).

- **int** row_col_clamp (TableContext context, int &R, int &C)
  Return specified row/col values R and C to within the table's current row/col limits.

- **long** row_scroll_position (int row)
  Returns the scroll position (in pixels) of the specified 'row'.

- **void** table_resized ()
  Call this if table was resized, to recalculate internal data.

- **void** table_scrolled ()
  Recalculate internals after a scroll.

### Protected Member Functions inherited from Fl_Group

- **Fl_Rect** * bounds ()
  Returns the internal array of widget sizes and positions.

- **void** draw_child (Fl_Widget &widget) const
  Forces a child to redraw.

- **void** draw_children ()
  Draws all children of the group.

- **void** draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.

- **virtual int** on_insert (Fl_Widget ∗, int)
  Allow derived groups to act when a widget is added as a child.

- **virtual int** on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.

- **virtual void** on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.

- **int** * sizes ()
  Returns the internal array of widget sizes and positions.

- **void** update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

### Protected Member Functions inherited from Fl_Widget

- **void** clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- **void** draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void** draw_box () const
  Draws the widget box according its box style.

- **void** draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- **void** draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void** draw_focus () const
Draws a focus rectangle around the widget.

• void `draw_focus` (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void `draw_focus` (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void `draw_label` () const
  Draws the widget's label at the defined label position.

• void `draw_label` (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)
  Creates a widget at the given position and size.

• unsigned int `flags` () const
  Gets the widget flags mask.

• void `h` (int v)
  Internal use only.

• void `set_flag` (unsigned int c)
  Sets a flag in the flags mask.

• void `w` (int v)
  Internal use only.

• void `x` (int v)
  Internal use only.

• void `y` (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

• static Fl_Group ∗ `current` ()
  Returns the currently active group.

• static void `current` (Fl_Group ∗ g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

• static void `default_callback` (Fl_Widget ∗ widget, void ∗ data)
  The default callback for all widgets that don't set a callback.

• static unsigned int `label_shortcut` (const char ∗ t)
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int `test_shortcut` (const char ∗ t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Table

• enum `ResizeFlag`
  
  | RESIZE_NONE = 0 | RESIZE_COL_LEFT = 1 | RESIZE_COL_RIGHT = 2 | RESIZE_ROW_ABOVE = 3 | RESIZE_ROW_BELOW = 4 |
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,

} flags possible values enumeration.

Static Protected Member Functions inherited from Fl_Table

- static void scroll_cb (Fl_Widget *, void *)
  Callback for when someone moves a scrollbar.

Protected Attributes inherited from Fl_Table

- int botrow
  bottom row# of currently visible table on screen
- int current_col
  selection cursor's current column (-1 if none)
- int current_row
  selection cursor's current row (-1 if none)
- Fl_Scrollbar * hscrollbar
  child horizontal scrollbar widget
- int leftcol
  left column# of currently visible table on screen
- int leftcol_scrollpos
  precomputed scroll position for left column
- int rightcol
  right column# of currently visible table on screen
- int select_col
  extended selection column (-1 if none)
- int select_row
  extended selection row (-1 if none)
- Fl_Scroll * table
  child Fl_Scroll widget container for child Fltk widgets (if any)
- int table_h
  table's virtual height (in pixels)
- int table_w
  table's virtual width (in pixels)
- int tih
  Data table’s inner h dimension, inside bounding box. See Table Dimension Diagram.
- int tiw
  Data table’s inner w dimension, inside bounding box. See Table Dimension Diagram.
- int tix
  Data table’s inner x dimension, inside bounding box. See Table Dimension Diagram.
• int \texttt{tiy}
  Data table's inner \texttt{y} dimension, inside bounding box. See Table Dimension Diagram.

• int \texttt{toh}
  Data table's outer \texttt{h} dimension, outside bounding box. See Table Dimension Diagram.

• int \texttt{toprow}
  \texttt{top row\#} of currently visible table on screen

• int \texttt{toprow\_scrollpos}
  precomputed scroll position for top row

• int \texttt{tow}
  Data table's outer \texttt{w} dimension, outside bounding box. See Table Dimension Diagram.

• int \texttt{tox}
  Data table's outer \texttt{x} dimension, outside bounding box. See Table Dimension Diagram.

• int \texttt{toy}
  Data table's outer \texttt{y} dimension, outside bounding box. See Table Dimension Diagram.

• \texttt{Fl\_Scrollbar\* vscrollbar}
  child vertical scrollbar widget

• int \texttt{wih}
  Table widget's inner \texttt{h} dimension, inside bounding box. See Table Dimension Diagram.

• int \texttt{wiw}
  Table widget's inner \texttt{w} dimension, inside bounding box. See Table Dimension Diagram.

• int \texttt{wix}
  Table widget's inner \texttt{x} dimension, inside bounding box. See Table Dimension Diagram.

• int \texttt{wiy}
  Table widget's inner \texttt{y} dimension, inside bounding box. See Table Dimension Diagram.

12.139.1 Detailed Description

A table with row selection capabilities.

This class implements a simple table with the ability to select rows. This widget is similar to an \texttt{Fl\_Browser} with columns. Most methods of importance will be found in the \texttt{Fl\_Table} widget, such as \texttt{Fl\_Table::rows()} and \texttt{Fl\_Table::cols()}. To be useful it must be subclassed and at minimum the \texttt{draw\_cell()} method must be overridden to provide the content of the cells. This widget does \texttt{not} manage the cell's data content; it is up to the parent class's \texttt{draw\_cell()} method override to provide this.

Events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events are generated based on the values you supply for \texttt{Fl\_Table::when()}.

12.139.2 Constructor & Destructor Documentation

12.139.2.1 \texttt{Fl\_Table\_Row()}\newline
\texttt{Fl\_Table\_Row::Fl\_Table\_Row (} \newline
  \texttt{int X,} \newline
  \texttt{int Y,} \newline
  \texttt{int W,} \newline
  \texttt{int H,} \newline
  \texttt{const char \* l = 0 } \texttt{)} \texttt{[inline]}

The constructor for the \texttt{Fl\_Table\_Row}.\newline
This creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

12.139.2.2 \texttt{~Fl\_Table\_Row()}\newline
\texttt{Fl\_Table\_Row::~Fl\_Table\_Row ( } \texttt{)[inline]}

The destructor for the \texttt{Fl\_Table\_Row}.\newline
Destroyes the table and its associated widgets.
12.139.3 Member Function Documentation

12.139.3.1 clear()

```cpp
void Fl_Table_Row::clear() [inline], [virtual]
```
Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()//end() or add()//insert()//etc.

See also

- rows(int), cols(int)

Reimplemented from Fl_Table.

12.139.3.2 handle()

```cpp
int Fl_Table_Row::handle(int e) [protected], [virtual]
```
Handle FLTK events.
Reimplemented from Fl_Table.

12.139.3.3 row_selected()

```cpp
int Fl_Table_Row::row_selected(int row)
```
Checks to see if ‘row’ is selected.
Returns 1 if selected, 0 if not. You can change the selection of a row by clicking on it, or by using select_row(row, flag)

12.139.3.4 rows()

```cpp
void Fl_Table_Row::rows(int val) [virtual]
```
Sets the number of rows in the table, and the table is redrawn.
Reimplemented from Fl_Table.

12.139.3.5 select_all_rows()

```cpp
void Fl_Table_Row::select_all_rows(int flag = 1)
```
This convenience function changes the selection state for all rows based on ‘flag’. 0=deselect, 1=select, 2=toggle existing state.

12.139.3.6 select_row()

```cpp
int Fl_Table_Row::select_row(int row, int flag = 1)
```
Changes the selection state for ‘row’, depending on the value of ‘flag’. 0=deselected, 1=select, 2=toggle existing state.

12.139.3.7 type()

```cpp
void Fl_Table_Row::type(TableRowSelectMode val)
```
Sets the table selection mode.

- Fl_Table_Row::SELECT_NONE - No selection allowed
- Fl_Table_Row::SELECT_SINGLE - Only single rows can be selected
- Fl_Table_Row::SELECT_MULTI - Multiple rows can be selected
The documentation for this class was generated from the following files:

- Fl_Table_Row.H
- Fl_Table_Row.cxx

# 12.140 Fl_Tabs Class Reference

The `Fl_Tabs` widget is a container widget that displays a set of tabs, with each tab representing a different child widget.

```c
#include <Fl_Tabs.H>
```

Inheritance diagram for `Fl_Tabs`:

```
+----+      +----+      +----+
|    |      |    |      |    |
| Fl_Widget | Fl_Group | Fl_Tabs |
```

## Public Types

- `enum { OVERFLOW_COMPRESS = 0, OVERFLOW_CLIP, OVERFLOW_PULLDOWN, OVERFLOW_DRAG }`

## Public Member Functions

- `void client_area (int &rx, int &ry, int &rw, int &rh, int tabh=0)` 
  Returns the position and size available to be used by its children.
- `Fl_Tabs (int X, int Y, int W, int H, const char *L=0)` 
  Creates a new `Fl_Tabs` widget using the given position, size, and label string.
- `int handle (int)` FL_OVERRIDE 
  Handle all events in the tabs area and forward the rest to the selected child.
- `void handle_overflow (int ov)` 
  Set a method to handle an overflowing tab bar.
- `Fl_Widget* push () const` 
  Returns the tab group for the tab the user has currently down-clicked on and remains over until FL_RELEASE.
- `int push (Fl_Widget *)` 
  This is called by the tab widget's `handle()` method to set the tab group widget the user last FL_PUSH'ed on.
- `Fl_Align tab_align () const` 
  Gets the tab label alignment.
- `void tab_align (Fl_Align a)` 
  Sets the tab label alignment.
- `Fl_Widget* value ()` 
  Gets the currently visible widget/tab.
- `int value (Fl_Widget *)` 
  Sets the widget to become the current visible widget/tab.
- `virtual Fl_Widget* which (int event_x, int event_y)` 
  Return a pointer to the child widget with a tab at the given coordinates.
- `virtual ~Fl_Tabs ()` 
  Delete allocated resources and destroy all children.
Public Member Functions inherited from Fl_Group

- Fl_Widget *&_ddfdesign_kludge ()
  This is for forms compatibility only.
- void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
- void add (Fl_Widget *o)
  See void Fl_Group::add(Fl_Widget &w)
- void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
- Fl_Widget *const *array () const
  Returns a pointer to the array of children.
- Fl_Group const *as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
- Fl_Widget *child (int n) const
  Returns array()[n].
- int children () const
  Returns how many child widgets the group has.
- void clear ()
  Deletes all child widgets from memory recursively.
- unsigned int clip_children ()
  Returns the current clipping mode.
- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
- void end ()
  Exactly the same as current(this->parent()).
- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char *)=0
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget *W)
- void forms_end ()
  This is for forms compatibility only.
- void init_sizes ()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
Removes the widget at index from the group but does not delete it.

- **Fl_Widget** * resizable () const
  Returns the group's resizable widget.

- **void resizable (Fl_Widget &o)**
  Sets the group's resizable widget.

- **void resizable (Fl_Widget *o)**
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual ~Fl_Group ()**
  The destructor also deletes all the children.

### Public Member Functions inherited from **Fl_Widget**

- **void _clear_fullscreen ()**
- **void _set_fullscreen ()**
- **void activate ()**
  Activates the widget.

- **unsigned int active () const**
  Returns whether the widget is active.

- **int active_r () const**
  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**
  Gets the label alignment.

- **void align (Fl_Align alignment)**
  Sets the label alignment.

- **long argument () const**
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window * as_gl_window ()**
  Returns an **Fl_Gl_Window** pointer if this widget is an **Fl_Gl_Window**.

- **virtual class Fl_Gl_Window const * as_gl_window () const**

- **virtual Fl_Window * as_window ()**
  Returns an **Fl_Window** pointer if this widget is an **Fl_Window**.

- **virtual Fl_Window const * as_window () const**

- **void bind_deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void bind_deimage (int f)**
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  Gets the current callback function for the widget.

- **void callback (Fl_Callback *cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**
Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
- void copy_label (const char *new_label)
  Sets the current label.
- void copy_tooltip (const char *text)
  Sets the current tooltip text.
- uchar damage () const
  Returns non-zero if draw() needs to be called.
- void damage (uchar c)
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
- int damage_resize (int, int, int, int)
  Internal use only.
- void deactivate ()
  Deactivates the widget.
- Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
- const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
 Gets the label type.
• void labeltype ( Fl_Labeltype a )
  Sets the label type.
• void measure_label ( int &ww, int &hh ) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard ( bool needs )
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent ( Fl_Group *p )
  Internal use only - "for hacks only".
• void position ( int X, int Y )
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color ( Fl_Color a )
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label ( int value )
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size ( int W, int H )
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• **void tooltip(const char ∗text)**
  Sets the current tooltip text.

• **Fl_Window ∗ top_window() const**
  Returns a pointer to the top-level window for the widget.

• **Fl_Window ∗ top_window_offset(int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

• **uchar type() const**
  Gets the widget type.

• **void type(uchar t)**
  Sets the widget type.

• **int use_accents_menu()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void ∗ user_data() const**
  Gets the user data for this widget.

• **void user_data(Fl_Callback_User_Data ∗v, bool auto_free)**
  Sets the user data for this widget.

• **void user_data(void ∗v)**
  Sets the user data for this widget.

• **unsigned int visible() const**
  Returns whether a widget is visible.

• **unsigned int visible_focus() const**
  Checks whether this widget has a visible focus.

• **void visible_focus(int v)**
  Modifies keyboard focus navigation.

• **int visible_r() const**
  Returns whether a widget and all its parents are visible.

• **int w() const**
  Gets the widget width.

• **Fl_When when() const**
  Returns the conditions under which the callback is called.

• **void when(uchar i)**
  Sets the flags used to decide when a callback is called.

• **Fl_Window ∗ window() const**
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int x() const**
  Gets the widget position in its window.

• **int y() const**
  Gets the widget position in its window.

• **virtual ~Fl_Widget()**
  Destroys the widget.

### Protected Member Functions

• **void check_overflow_menu()**
  Check if the tabs overflow and sets the has_overflow_menu flag accordingly.

• **virtual void clear_tab_positions()**
  Clear internal array of tab positions and widths.

• **void draw() FL_OVERRIDE**
  Draw the tabs area, the optional pulldown button, and all children.

• **void draw_overflow_menu_button()**
  Draw square button-like graphics with a down arrow in the top or bottom right corner.
• virtual void draw_tab (int x1, int x2, int W, int H, Fl_Widget *o, int flags, int sel)
  Draw a tab in the top or bottom tabs area.
• void handle_overflow_menu ()
  This is called when the user clicks the overflow pulldown menu button.
• virtual int hit_close (Fl_Widget *o, int event_x, int event_y)
  Check whether the coordinates fall within the "close" button area of the tab.
• virtual int hit_overflow_menu (int event_x, int event_y)
  Determine if the coordinates are in the area of the overflow menu button.
• virtual int hit_tabs_area (int event_x, int event_y)
  Determine if the coordinates are within the tabs area.
• int on_insert (Fl_Widget *, int) FL_OVERRIDE
  Make sure that we redraw all tabs when new children are added.
• int on_move (int, int) FL_OVERRIDE
  Make sure that we redraw all tabs when children are moved.
• void on_remove (int) FL_OVERRIDE
  Make sure that we redraw all tabs when new children are removed.
• virtual void redraw_tabs ()
  Redraw all tabs (and only the tabs).
• void resize (int, int, int, int) FL_OVERRIDE
  Make sure that we redraw all tabs when the widget size changes.
• virtual int tab_height ()
  Return space (height) in pixels usable for tabs.
• virtual int tab_positions ()
  Calculate tab positions and widths.

Protected Member Functions inherited from Fl_Group
• Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
• void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
• void draw_children ()
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget
• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.

- void `draw_focus ()` const
  Draws a focus rectangle around the widget.

- void `draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const`
  Draws a focus rectangle around the widget.

- void `draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  Draws a focus box for the widget at the given position and size.

- void `draw_label ()` const
  Draws the widget's label at the defined label position.

- void `draw_label (int, int, int, int) const`
  Draws the label in an arbitrary bounding box.

- `Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)`
  Creates a widget at the given position and size.

- unsigned int `flags ()` const
  Gets the widget flags mask.

- void `h (int v)`
  Internal use only.

- void `set_flag (unsigned int c)`
  Sets a flag in the flags mask.

- void `w (int v)`
  Internal use only.

- void `x (int v)`
  Internal use only.

- void `y (int v)`
  Internal use only.

Protected Attributes

- int `has_overflow_menu`
  Set in OVERFLOW_PULLDOWN mode if tabs overflow. The actual menu array is created only on demand

- int `overflow_type`

- `Fl_Align tab_align_`
  Tab label alignment

- int `tab_count`
  Array size of tab positions etc.

- int ∗ `tab_flags`
  Array of tab flag of tabs per child.

- int `tab_offset`
  For pulldown and drag overflow, this is the horizontal offset when the tabs bar is dragged by the user

- int ∗ `tab_pos`
  Array of x-offsets of tabs per child + 1.

- int ∗ `tab_width`
  Array of widths of tabs per child.

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Group`

- static `Fl_Group ∗ current ()`
  Returns the currently active group.

- static void `current (Fl_Group ∗g)`
  Sets the current group.
Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  
  Returns true if the given text `t` contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , Copied_Label = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , Copied_Tooltip = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,

  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }

  flags possible values enumeration.

12.140.1 Detailed Description

The Fl_Tabs widget is a container widget that displays a set of tabs, with each tab representing a different child widget.

The user can select a tab by clicking on it, and the corresponding child widget will be displayed. The Fl_Tabs widget is useful for organizing a large number of controls or other widgets into a compact space, allowing the user to switch between different sets of controls as needed.

![Fl_Tabs](image)

Clicking the tab makes a child visible() by calling show() on it, and all other children are made invisible by calling hide() on them. Usually the children are Fl_Group widgets containing several widgets themselves.

Each child makes a card, and its label() is printed on the card tab, including the label font and style. The selection color of that child is used to color the tab, while the color of the child determines the background color of the pane. ‘&’ in labels are used to prefix a shortcut that is drawn underlined and that activates the corresponding tab; repeated ‘&’ avoids that.

The size of the tabs is controlled by the bounding box of the children (there should be some space between the children and the edge of the Fl_Tabs), and the tabs may be placed "inverted" on the bottom - this is determined by
which gap is larger. It is easiest to lay this out in FLUID, using the FLUID browser to select each child group and
resize them until the tabs look the way you want them to.
The background area behind and to the right of the tabs is "transparent", exposing the background detail of the
parent. The value of Fl_Tabs::box() does not affect this area. So if Fl_Tabs is resized by itself without the parent,
force the appropriate parent (visible behind the tabs) to redraw() to prevent artifacts.
See "Resizing Caveats" below on how to keep tab heights constant. See "Callback's Use Of when()" on how to
control the details of how clicks invoke the callback().
A typical use of the Fl_Tabs widget:

```cpp
// Typical use of Fl_Tabs
Fl_Tabs *tabs = new Fl_Tabs(10,10,300,200);
{
    Fl_Group *grp1 = new Fl_Group(20,30,280,170,"Tab1");
    { ..widgets that go in tab1.. }
    grp1->end();
    Fl_Group *grp2 = new Fl_Group(20,30,280,170,"Tab2");
    { ..widgets that go in tab2.. }
    grp2->end();
} tabs->end();
```

Default Appearance
The appearance of each "tab" is taken from the label() and color() of the child group corresponding to that "tab" and
panel. Where the "tabs" appear depends on the position and size of the child groups that make up the panels within
the Fl_Tabs widget, i.e. whether there is more space above or below them. The height of the "tabs" depends on
how much free space is available.

![Figure 12.51 Fl_Tabs Default Appearance](image1)

Highlighting The Selected Tab
The selected "tab" can be highlighted further by setting the selection_color() of the Fl_Tab itself, e.g.

```cpp
..
tabs = new Fl_Tabs(..);
tabs->selection_color(FL_DARK3);
..```

The result of the above looks like:

![Figure 12.52 Highlighting the selected tab](image2)

Uniform Tab and Panel Appearance
In order to have uniform tab and panel appearance, not only must the color() and selection_color() for each child
group be set, but also the selection_color() of the Fl_Tab itself any time a new "tab" is selected. This can be achieved
within the Fl_Tab callback, e.g.
void MyTabCallback(Fl_Widget *w, void*) {
    Fl_Tabs *tabs = (Fl_Tabs*)w;
    // When tab changed, make sure it has same color as its group
    tabs->selection_color( (tabs->value())->color() );
}

int main(..) {
    // Define tabs widget
    tabs = new Fl_Tabs(...);
    tabs->callback(MyTabCallback);

    // Create three tabs each colored differently
    grp1 = new Fl_Group(.. "One");
    grp1->color(9);
    grp1->selection_color(9);
    grp1->end();

    grp2 = new Fl_Group(.. "Two");
    grp2->color(10);
    grp2->selection_color(10);
    grp2->end();

    grp3 = new Fl_Group(.. "Three");
    grp3->color(14);
    grp3->selection_color(14);
    grp3->end();

    // Make sure default tab has same color as its group
    tabs->selection_color( (tab->value())->color() );

    return Fl::run();
}

The result of the above looks like:

![Fl Tabs with uniform colors](image)

If Fl_Tabs has no children, the widget will be drawn as a flat rectangle in the background color set by color().

**Close Button on Tabs**

The Fl_Tabs widget allows you to specify that a child widget should display a close button in its tab. If the FL_WHEN_CLOSED flag is set for the child widget, an "X" symbol will be displayed to the left of the label text in the tab. When the close button is clicked, the child widget's callback function will be called with the FL_REASON_CLOSED reason. It is then the responsibility of the child widget to remove itself from the Fl_Tabs container.

Tabs that are in a compressed state will not display a close button until they are fully expanded.

**Overflowing Tabs**

When the combined width of the tabs exceeds that of the Fl_Tabs widget, the tabs will overflow. Fl_Tabs provides four options for managing tabs overflow:

- **Fl_Tabs::OVERFLOW_COMPRESS**: proportionally compress the tabs to the left and right of the selected tab until they all fit within the widget.
- **Fl_Tabs::OVERFLOW_CLIP**: clips any tabs that extend beyond the right edge of the Fl_Tabs widget, making some tabs unreachable.
- **Fl_Tabs::OVERFLOW_PULLDOWN**: doesn't compress the tabs but instead generates a pulldown menu at the right end of the tabs area, displaying all available tabs.
- **Fl_Tabs::OVERFLOW_DRAG**: maintains the tabs' original sizes, allowing horizontal dragging of the tabs area using the mouse, a horizontal mouse wheel, or the horizontal scrolling gesture on touchpads.

**Resizing Caveats**

When Fl_Tabs is resized vertically, the default behavior scales the tab's height as well as its children. To keep the tab height constant during resizing, set the tab widget's resizable() to one of the tab's child groups, i.e.
Callback's Use Of when()

As of FLTK 1.3.3, Fl_Tabs() supports the following flags for when():

- **FL_WHEN_NEVER** – callback never invoked (all flags off)
- **FL_WHEN_CHANGED** – if flag set, invokes callback when a tab has been changed (on click or keyboard navigation)
- **FL_WHEN_NOT_CHANGED** – if flag set, invokes callback when the tabs remain unchanged (on click or keyboard navigation)
- **FL_WHEN_RELEASE** – if flag set, invokes callback on RELEASE of mouse button or keyboard navigation

Notes:

1. The above flags can be logically OR-ed (|) or added (+) to combine behaviors.
2. The default value for when() is FL_WHEN_RELEASE (inherited from Fl_Widget).
3. If FL_WHEN_RELEASE is the only flag specified, the behavior will be as if (FL_WHEN_RELEASE|FL_WHEN_CHANGED) was specified.
4. The value of changed() will be valid during the callback.
5. If both FL_WHEN_CHANGED and FL_WHEN_NOT_CHANGED are specified, the callback is invoked whether the tab has been changed or not. The changed() method can be used to determine the cause.
6. FL_WHEN_NOT_CHANGED can happen if someone clicks on an already selected tab, or if a keyboard navigation attempt results in no change to the tabs, such as using the arrow keys while at the left or right end of the tabs.
7. Fl::callback_reason() returns FL_REASON_SELECTED or FL_REASON_RESELECTED

**12.140.2 Member Enumeration Documentation**

**12.140.2.1 anonymous enum**

anonymous enum

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVERFLOW_COMPRESS</td>
<td>Tabs will be compressed and overlaid on top of each other.</td>
</tr>
<tr>
<td>OVERFLOW_CLIP</td>
<td>Only the first tabs that fit will be displayed.</td>
</tr>
<tr>
<td>OVERFLOW_PULLDOWN</td>
<td>Tabs that do not fit will be placed in a pull-down menu.</td>
</tr>
</tbody>
</table>
| OVERFLOW_DRAG       | The tab bar can be dragged horizontally to reveal additional tabs.

**12.140.3 Constructor & Destructor Documentation**

**12.140.3.1 Fl_Tabs()**

Fl_Tabs::Fl_Tabs {
int X,
int Y,
int W,
int H,
const char ∗ L = 0 )

Creates a new Fl_Tabs widget using the given position, size, and label string. The default boxtype is FL_THIN_UP_BOX.

Use add(Fl_Widget∗) to add each child, which are usually Fl_Group widgets. The children should be sized to stay away from the top or bottom edge of the Fl_Tabs widget, which is where the tabs will be drawn. All children of Fl_Tabs should have the same size and exactly fit on top of each other. They should only leave space above or below where the tabs will go, but not on the sides. If the first child of Fl_Tabs is set to "resizable()")", the riders will not resize when the tabs are resized.

The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the Fl_Tabs and all of its children can be automatic (local) variables, but you must declare the Fl_Tabs widget first so that it is destroyed last.

12.140.4 Member Function Documentation

12.140.4.1 clear_tab_positions()

void Fl_Tabs::clear_tab_positions ( ) [protected], [virtual]
Clear internal array of tab positions and widths.

See also

tab_positions().

12.140.4.2 client_area()

void Fl_Tabs::client_area ( 
    int & rx,
    int & ry,
    int & rw,
    int & rh,
    int tabh = 0 )

Returns the position and size available to be used by its children. If there isn't any child yet the tabh parameter will be used to calculate the return values. This assumes that the children's labelsize is the same as the Fl_Tabs' labelsize and adds a small border. If there are already children, the values of child(0) are returned, and tabh is ignored.

Note

Children should always use the same positions and sizes.

tabh can be one of

- 0: calculate label size, tabs on top
- -1: calculate label size, tabs on bottom
- > 0: use given tabh value, tabs on top (height = tabh)
- < -1: use given tabh value, tabs on bottom (height = -tabh)

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>tabh</th>
<th>position and optional height of tabs (see above)</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>rx,ry,rw, rh</td>
<td>(x,y,w,h) of client area for children</td>
</tr>
</tbody>
</table>

Generated by Doxygen
Since FLTK 1.3.0

12.140.4.3 draw()

```cpp
void Fl_Tabs::draw () [protected], [virtual]
```

Draw the tabs area, the optional pulldown button, and all children.
Reimplemented from Fl_Group.

12.140.4.4 draw_tab()

```cpp
void Fl_Tabs::draw_tab ( int x1,
int x2,
int W,
int H,
Fl_Widget * o,
int flags,
int what ) [protected], [virtual]
```

Draw a tab in the top or bottom tabs area.
Tabs can be selected, or on the left or right side of the selected tab. If overlapping, left tabs are drawn bottom to top using clipping. The selected tab is then the topmost, followed by the right side tabs drawn top to bottom.
Tabs with the FL_WHEN_CLOSE bit set will draw a cross on their left side only if they are not compressed/overlapping.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>x1</th>
<th>horizontal position of the left visible edge of the tab</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>x2</td>
<td>horizontal position of the following tab</td>
</tr>
<tr>
<td></td>
<td>W,H</td>
<td>width and height of the tab</td>
</tr>
<tr>
<td></td>
<td>o</td>
<td>the child widget that corresponds to this tab</td>
</tr>
<tr>
<td></td>
<td>flags</td>
<td>if bit 1 is set, this tab is overlapped by another tab</td>
</tr>
<tr>
<td></td>
<td>what</td>
<td>can be LEFT, SELECTED, or RIGHT to indicate if the tab is to the left side or the right side of the selected tab, or the selected tab itself</td>
</tr>
</tbody>
</table>

12.140.4.5 handle()

```cpp
int Fl_Tabs::handle ( int event ) [virtual]
```

Handle all events in the tabs area and forward the rest to the selected child.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>event</th>
<th>handle this event</th>
</tr>
</thead>
</table>

**Returns**

1 if the event was handled

Reimplemented from Fl_Group.

12.140.4.6 handle_overflow()

```cpp
void Fl_Tabs::handle_overflow ( int ov )
```
Set a method to handle an overflowing tab bar.
The Fl_Tabs widget allows you to specify how to handle the situation where there are more tabs than can be displayed at once. The available options are:

- **OVERFLOW_COMPRESS**: Tabs will be compressed and overlaid on top of each other.
- **OVERFLOW_CLIP**: Only the first tabs that fit will be displayed.
- **OVERFLOW_PULLDOWN**: Tabs that do not fit will be placed in a pull-down menu.
- **OVERFLOW_DRAG**: The tab bar can be dragged horizontally to reveal additional tabs.

You can set the desired behavior using the `overflow()` method.

**Parameters**

- `overflow type`

**See also**

OVERFLOW_COMPRESS, OVERFLOW_CLIP, OVERFLOW_PULLDOWN, OVERFLOW_DRAG

12.140.4.7 handle_overflow_menu()

```cpp
void Fl_Tabs::handle_overflow_menu ( ) [protected]
```

This is called when the user clicks the overflow pulldown menu button.

This method creates a menu item array that contains the titles of all tabs in the Fl_Tabs group. Visible and invisible tabs are separated by dividers to indicate their state. The menu is then presented until the user selects an item or cancels. The chosen tab is then selected and made visible. The menu item array is the deleted.

12.140.4.8 hit_close()

```cpp
int Fl_Tabs::hit_close ( Fl_Widget * o, int event_x, int event_y ) [protected], [virtual]
```

Check whether the coordinates fall within the "close" button area of the tab.

The Fl_Tabs::hit_close() method checks whether the given event coordinates fall within the area of the "close" button on the tab of the specified child widget. This method should be called after the Fl_Tabs::which() method, which updates a lookup table used to determine the width of each tab.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>o</code></td>
<td>check the tab of this widget</td>
</tr>
<tr>
<td><code>event_x</code>, <code>event_y</code></td>
<td>event coordinates</td>
</tr>
</tbody>
</table>

**Returns**

1 if we hit the close button, and 0 otherwise

12.140.4.9 hit_overflow_menu()

```cpp
int Fl_Tabs::hit_overflow_menu ( int event_x, int event_y ) [protected], [virtual]
```
Determine if the coordinates are in the area of the overflow menu button.
Parameters

\begin{itemize}
\item \texttt{event\_x, event\_y} \rightarrow \text{event coordinates}
\end{itemize}

Returns

1 if we hit the overflow menu button, and 0 otherwise

\subsection{hit\_tabs\_area()}

\begin{verbatim}
int Fl_Tabs::hit_tabs_area (  
    int event\_x,  
    int event\_y ) [protected], [virtual]
\end{verbatim}

Determine if the coordinates are within the tabs area.

Parameters

\begin{itemize}
\item \texttt{event\_x, event\_y} \rightarrow \text{event coordinates}
\end{itemize}

Returns

1 if we hit the tabs area, and 0 otherwise

\subsection{on\_insert()}

\begin{verbatim}
int Fl_Tabs::on_insert (  
    Fl_Widget * candidate,  
    int index ) [protected], [virtual]
\end{verbatim}

Make sure that we redraw all tabs when new children are added.
Reimplemented from \texttt{Fl\_Group}.

\subsection{on\_move()}

\begin{verbatim}
int Fl_Tabs::on_move (  
    int a,  
    int b ) [protected], [virtual]
\end{verbatim}

Make sure that we redraw all tabs when children are moved.
Reimplemented from \texttt{Fl\_Group}.

\subsection{on\_remove()}

\begin{verbatim}
void Fl_Tabs::on_remove (  
    int index ) [protected], [virtual]
\end{verbatim}

Make sure that we redraw all tabs when new children are removed.
Reimplemented from \texttt{Fl\_Group}.

\subsection{push() [1/2]}

\begin{verbatim}
Fl_Widget * Fl_Tabs::push ( ) const [inline]
\end{verbatim}

Returns the tab group for the tab the user has currently down-clicked on and remains over until FL\_RELEASE. Otherwise, returns NULL.
While the user is down-clicked on a tab, the return value is the tab group for that tab. But as soon as the user releases, or drags off the tab with the button still down, the return value will be NULL.
See also

`push(Fl_Widget*)`.

### 12.140.4.15 push()

```cpp
int Fl_Tabs::push (Fl_Widget * o)
```

This is called by the tab widget's handle() method to set the tab group widget the user last FL_PUSH'ed on. Set back to zero on FL_RELEASE.

As of this writing, the value is mainly used by draw_tab() to determine whether or not to draw a 'down' box for the tab when it's clicked, and to turn it off if the user drags off it.

See also

`push()`.

### 12.140.4.16 redraw_tabs()

```cpp
void Fl_Tabs::redraw_tabs () [protected], [virtual]
```

Redraw all tabs (and only the tabs).

This method sets the Fl_Tab's damage flags so the tab area is redrawn.

### 12.140.4.17 resize()

```cpp
void Fl_Tabs::resize (int X, int Y, int W, int H) [protected], [virtual]
```

Make sure that we redraw all tabs when the widget size changes.

Reimplemented from Fl_Group.

### 12.140.4.18 tab_align()

```cpp
Fl_Align Fl_Tabs::tab_align () const [inline]
```

Gets the tab label alignment.

See also

`tab_align(Fl_Align)`

### 12.140.4.19 tab_align()

```cpp
void Fl_Tabs::tab_align (Fl_Align a) [inline]
```

Sets the tab label alignment.

The default is FL_ALIGN_CENTER so tab labels are centered, but since the label space is measured (per label) to fit the labels, there wouldn't be any difference if labels were aligned left or right.

If you want to show an image (icon) next to the group's label you can set a different label alignment. FL_ALIGN_IMAGE_NEXT_TO_TEXT is the recommended alignment to show the icon left of the text.

### 12.140.4.20 tab_height()

```cpp
int Fl_Tabs::tab_height () [protected], [virtual]
```

Return space (height) in pixels usable for tabs.

The calculated height is the largest space between all children and the upper and lower widget boundaries, respectively. If the space at the bottom is larger than at the top, the value will be negative and the tabs should be placed at the bottom.
Returns

Vertical space that can be used for the tabs.

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 0</td>
<td>To put the tabs at the top of the widget.</td>
</tr>
<tr>
<td>&lt; 0</td>
<td>To put the tabs on the bottom.</td>
</tr>
<tr>
<td>Full</td>
<td>Height, if <code>children() == 0</code>.</td>
</tr>
</tbody>
</table>

### 12.140.4.21 tab_positions()

```cpp
int Fl_Tabs::tab_positions ( ) [protected], [virtual]
```

Calculate tab positions and widths.

This protected method calculates the horizontal display positions and widths of all tabs. If the number of children `nc` (see below) is `> 0` three internal arrays are allocated, otherwise the arrays are free’d and the pointers are set to NULL. Note that the first array is larger (`nc+1`).

- `tab_pos[nc+1]` : The left edges of each tab plus a fake left edge for a tab past the right-hand one.
- `tab_width[nc]` : The width of each tab
- `tab_flags[nc]` : Flags, bit 0 is set if the tab is compressed

If needed, these arrays are (re)allocated. These positions are actually of the left edge of the slope. They are either separated by the correct distance or by `EXTRASPACE` or by zero.

In `OVERFLOW_COMPRESS` mode, tab positions and widths are compressed to make the entire tabs bar fit into the width of `Fl_Tabs` while keeping the selected tab fully visible.

In other overflow modes, the tabs area may be dragged horizontally using `tab_offset`. The `tab_pos` array is not adjusted to the horizontal offset, but starts at this-`x()` plus the box’s left margin.

The protected variable `tab_count` is set to the currently allocated size, i.e. the number of children (`nc`).

Returns

Index of the selected item

Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
<td>If the number of children is 0 (zero).</td>
</tr>
</tbody>
</table>

Note

Return values in 1.3 were not documented. Return values before Sep 2023 were documented as 1 based index and 0 if there were no children. This was actually never the case. It always returned a 0 based index and the (useless) value of also 0 if there were no children. The current version return -1 if there are no children.

For this method to work, only on single child should be selected. Calling the method `value()` before calling `tab_positions()` will ensure that exactly one child is selected and return a pointer to that child.

See also

`clear_tab_positions()`

### 12.140.4.22 value() [1/2]

```cpp
Fl_Widget * Fl_Tabs::value ( )
```

Gets the currently visible widget/tab.
The `Fl_Tabs::value()` method returns a pointer to the currently visible child widget of the `Fl_Tabs` container. The visible child is the first child that is currently being displayed, or the last child if none of the children are being displayed. If child widgets have been added, moved, or deleted, this method ensures that only one tab is visible at a time.

Returns

a pointer to the currently visible child

**12.140.4.23 value() [2/2]**

```cpp
int Fl_Tabs::value ( Fl_Widget * newvalue )
```

Sets the widget to become the current visible widget/tab.

The `Fl_Tabs::value()` method allows you to set a particular child widget of the `Fl_Tabs` container to be the currently visible widget. If the specified widget is a child of the `Fl_Tabs` container, it will be made visible and all other children will be hidden. The method returns 1 if the value was changed, and 0 if the specified value was already set.

Parameters

- **in newvalue** a pointer to a child widget

Returns

1 if a different tab was chosen

0 if there was no change (new value already set)

**12.140.4.24 which()**

```cpp
Fl_Widget * Fl_Tabs::which ( int event_x, int event_y ) [virtual]
```

Return a pointer to the child widget with a tab at the given coordinates.

The `Fl_Tabs::which()` method returns a pointer to the child widget of the `Fl_Tabs` container that corresponds to the tab at the given event coordinates. If the event coordinates are outside the area of the tabs or if the `Fl_Tabs` container has no children, the method returns NULL.

Parameters

- **event_x, event_y** event coordinates

Returns

pointer to the selected child widget, or NULL

**12.140.5 Member Data Documentation**

**12.140.5.1 overflow_type**

```cpp
int Fl_Tabs::overflow_type [protected]
```

See also

OVERFLOW_COMPRESS, OVERFLOW_CLIP, etc.

**12.140.5.2 tab_count**

```cpp
int Fl_Tabs::tab_count [protected]
```
Array size of tab positions etc.
See also
  
  tab_positions()

12.140.5.3  tab_flags

int* Fl_Tabs::tab_flags  [protected]
Array of tab flag of tabs per child.

12.141  Fl_Terminal Class Reference

Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control.
#include <Fl_Terminal.H>
Inheritance diagram for Fl_Terminal:

```
        Fl_Widget
         ↓
       Fl_Group
         ↓
       Fl_Terminal
```

Classes

- class CharStyle
- class Cursor
- class EscapeSeq
- class Margin
- class PartialUtf8Buf
- class RingBuffer
- class Selection
- class Utf8Char
Public Types

- enum Attrib {
  NORMAL = 0x00, BOLD = 0x01, DIM = 0x02, ITALIC = 0x04,
  UNDERLINE = 0x08, _RESERVED_1 = 0x10, INVERSE = 0x20, _RESERVED_2 = 0x40,
  STRIKEOUT = 0x80 }

  Bits for the per-character attributes, which control text features such as italic, bold, underlined text, etc.

- enum CharFlags {
  FG_XTERM = 0x01, BG_XTERM = 0x02, EOL = 0x04,
  RESV_A = 0x08, RESV_B = 0x10, RESV_C = 0x20, RESV_D = 0x40, RESV_E = 0x80,
  COLORMASK = (FG_XTERM | BG_XTERM) }

  Per-character 8 bit flags (uchar) used to manage special states for characters.

- enum OutFlags { OFF = 0x00, CR_TO_LF = 0x01, LF_TO_CR = 0x02, LF_TO_CRLF = 0x04 }

  Output translation flags for special control character translations.

- enum RedrawStyle { NO_REDRAW = 0, RATE_LIMITED, PER_WRITE }

  Determines when Fl_Terminal calls redraw() if new text is added.

Public Member Functions

- void ansi (bool val)
  Enable/disable the ANSI mode flag.

- bool ansi (void) const
  Return the state of the ANSI flag.

- void append (const char ∗s, int len=-1)
  Appends string s to the terminal at the current cursor position using the current text color/attributes.

- void append_ascii (const char ∗s)
  Append NULL terminated ASCII string to terminal, slightly more efficient than append_utf8().

- void append_utf8 (const char ∗buf, int len=-1)
  Append NULL terminated UTF-8 string to terminal.

- void box (Fl_Boxtype val)
  Sets the box type, updates terminal margins et al.

- Fl_Boxtype box (void) const
  Returns the current box type.

- void clear (Fl_Color val)
  Clears the screen to a specific color val and homes the cursor.

- void clear (void)
  Clears the screen to the current textbgcolor(), and homes the cursor.

- void clear_history (void)
  Clears the scroll history buffer and adjusts scrollbar, forcing it to redraw().

- void clear_screen (bool scroll_to_hist=true)
  Clear the terminal screen only; does not affect the cursor position.

- void clear_screen_home (bool scroll_to_hist=true)
  Clear the terminal screen and home the cursor.

- void color (Fl_Color val)
  Sets the background color for the terminal's Fl_Group::box().

- Fl_Color color (void) const
  Return base widget Fl_Group's box() color()

- int cursor_col (void) const
  Return the cursor's current column position on the screen.

- void cursor_home (void)
  Move cursor to the home position (top/left).

- int cursor_row (void) const
  Return the cursor's current row position on the screen.
• void **cursorbgcolor** (Fl_Color val)
  
  Set the cursor's background color used for the cursor itself.

• **Fl_Color** **cursorbgcolor** (void) const

  Get the cursor's background color used for the cursor itself.

• void **cursorfgcolor** (Fl_Color val)

  Set the cursor's foreground color used for text under the cursor.

• **Fl_Color** **cursorfgcolor** (void) const

  Get the cursor's foreground color used for text under the cursor.

• void **display_columns** (int val)

  Set terminal's display width in columns of text characters.

• int **display_columns** (void) const

  Return terminal's display width in columns of text characters.

• void **display_rows** (int val)

  Set terminal's display height in lines of text (rows).

• int **display_rows** (void) const

  Return terminal's display height in lines of text (rows).

• void **draw** (void) FL_OVERRIDE

  Draws the entire Fl_Terminal.

• Fl_Terminal (int X, int Y, int W, int H, const char ∗L, int rows, int cols, int hist)

  Same as the default FLTK constructor, but lets the user force the rows, columns and history to specific sizes on creation.

• Fl_Terminal (int X, int Y, int W, int H, const char ∗L=0)

  The constructor for Fl_Terminal.

• int **handle** (int e) FL_OVERRIDE

  Handle FLTK events.

• void **history_lines** (int val)

  Set the number of lines of screen history.

• int **history_lines** (void) const

  Return the number of lines of screen history.

• void **history_rows** (int val)

  Set terminal's scrollback history buffer size in lines of text (rows).

• int **history_rows** (void) const

  Return terminal's scrollback history buffer size in lines of text (rows).

• int **history_use** (void) const

  Returns how many lines are "in use" by the screen history buffer.

• void **margin_bottom** (int val)

  Set the bottom margin; see Margins.

• int **margin_bottom** (void) const

  Return the bottom margin; see Margins.

• void **margin_left** (int val)

  Set the left margin; see Margins.

• int **margin_left** (void) const

  Return the left margin; see Margins.

• void **margin_right** (int val)

  Set the right margin; see Margins.

• int **margin_right** (void) const

  Return the right margin; see Margins.

• void **margin_top** (int val)

  Set the top margin; see Margins.

• int **margin_top** (void) const

  Return the top margin; see Margins.
• **void output_translate (Fl_Terminal::OutFlags val)**
  Sets the combined output translation flags to val.

• **Fl_Terminal::OutFlags output_translate (void) const**
  Return the current combined output translation flags.

• **void print_char (char c)**
  Prints single ASCII char c at current cursor position, and advances the cursor.

• **void print_char (const char *text, int len=-1)**
  Prints single UTF-8 char text of optional byte length len at current cursor position, and advances the cursor if the character is printable.

• **void printf (const char *fmt,...)**
  Appends printf formatted messages to the terminal.

• **void putchar (char c, int drow, int dcol)**
  Print the ASCII character c at the terminal's display position (drow,dcol).

• **void putchar (const char *text, int len, int drow, int dcol)**
  Print UTF-8 character text of length len at display position (drow,dcol).

• **void redraw_rate (float val)**
  Set the maximum rate redraw speed in floating point seconds if redraw_style() is set to RATE_LIMITED.

• **float redraw_rate (void) const**
  Get max rate redraw speed in floating point seconds.

• **void redraw_style (RedrawStyle val)**
  Set how Fl_Terminal manages screen redrawing.

• **RedrawStyle redraw_style (void) const**
  Get the redraw style.

• **void reset_terminal (void)**
  Resets terminal to default colors, clears screen, history and mouse selection, homes cursor, resets tabstops.

• **void resize (int X, int Y, int W, int H) FL_OVERRIDE**
  Handle widget resizing, such as if user resizes parent window.

• **int scrollbar_actual_size (void) const**
  Returns the scrollbar's actual size; actual width for vertical scrollbars, actual height for horizontal scrollbars.

• **void scrollbar_size (int val)**
  Set the width of the scrollbar's trough to val, in pixels.

• **int scrollbar_size (void) const**
  Get the current size of the scrollbar's trough, in pixels.

• **void selectionbgcolor (Fl_Color val)**
  Set mouse selection background color.

• **Fl_Color selectionbgcolor (void) const**
  Get mouse selection background color.

• **void selectionfgcolor (Fl_Color val)**
  Set mouse selection foreground color.

• **Fl_Color selectionfgcolor (void) const**
  Get mouse selection foreground color.

• **void show_unknown (bool val)**
  Set the "show unknown" flag.

• **bool show_unknown (void) const**
  Return the "show unknown" flag.

• **uchar textattrib () const**
  Get text attribute bits (underline, inverse, etc).

• **void textattrib (uchar val)**
  Set text attribute bits (underline, inverse, etc).

• **void textbgcolor (Fl_Color val)**
  Set text background color to fltk color val used by any new text added.
• **FL_Color** `textbgcolor` (void) const

  Return text’s current background color.

• void `textbgcolor_default (FL_Color val)`

  Set the default text background color used by any new text added after a reset (`<ESC>c, <ESC>[0m`, or `reset_terminal()`).

• **FL_Color** `textbgcolor_default` (void) const

  Return text’s default background color.

• void `textbgcolor_xterm (uchar val)`

  Sets the background text color as one of the 8 ‘xterm color’ values.

• void `textcolor (FL_Color val)`

  Set the text color for the terminal.

• **FL_Color** `textcolor` (void) const

  Return `textcolor()`. This is a convenience method that returns `textfgcolor_default()`.

• void `textfgcolor (FL_Color val)`

  Set text foreground drawing color to fltk color `val` used by any new text added.

• **FL_Color** `textfgcolor` (void) const

  Return text’s current foreground color.

• void `textfgcolor_default (FL_Color val)`

  Set the default text foreground color used by `<ESC>c, <ESC>[0m, and `reset_terminal()`.

• **FL_Color** `textfgcolor_default` (void) const

  Return text’s default foreground color.

• void `textfgcolor_xterm (uchar val)`

  Sets the foreground text color as one of the 8 ‘xterm color’ values.

• void `textfont (FL_Font val)`

  Sets the font used for all text displayed in the terminal.

• **FL_Font** `textfont` (void) const

  Return text font used to draw all text in the terminal.

• void `textsize (FL_Fontsize val)`

  Sets the font size used for all text displayed in the terminal.

• **FL_Fontsize** `textsize` (void) const

  Return text font size used to draw all text in the terminal.

• void `vprintf (const char ∗ fmt, va_list ap)`

  Appends printf formatted messages to the terminal.

• ~`Fl_Terminal` (void)

  The destructor for `Fl_Terminal`.

**Public Member Functions inherited from Fl_Group**

• **FL_Widget** ∗& _ddfdesign_kludge ()

  This is for forms compatibility only.

• void `add (FL_Widget &)`

  The widget is removed from its current group (if any) and then added to the end of this group.

• void `add (FL_Widget ∗)`

  See void Fl_Group::add(Fl_Widget &w)

• void `add_resizable (FL_Widget &o)`

  Adds a widget to the group and makes it the resizable widget.

• **FL_Widget** ∗`const ∗ array () const`

  Returns a pointer to the array of children.

• Fl_Group `const ∗ as_group () const FL_OVERRIDE`

  Returns an Fl_Group pointer if this widget is an Fl_Group.
• void **begin** ()
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

• **Fl_Widget** ∗ **child** (int n) const
  
  Returns `array()[n].`

• int **children** () const
  
  Returns how many child widgets the group has.

• void **clear** ()
  
  Deletes all child widgets from memory recursively.

• unsigned int **clip_children** ()
  
  Returns the current clipping mode.

• void **clip_children** (int c)
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

• virtual int **delete_child** (int n)
  
  Removes the widget at *index* from the group and deletes it.

• void **end** ()
  
  Exactly the same as current(this->parent()).

• int **find** (const Fl_Widget &o) const
  
  See int Fl_Group::find(const Fl_Widget ∗w) const.

• int **find** (const Fl_Widget ∗w) const
  
  Searches the child array for the widget and returns the index.

• **Fl_Group** (int, int, int, int, const char ∗=0)
  
  Creates a new Fl_Group widget using the given position, size, and label string.

• void **focus** (Fl_Widget ∗W)

• void **forms_end**()
  
  This is for forms compatibility only.

• void **init_sizes** ()
  
  Resets the internal array of widget sizes and positions.

• void **insert** (Fl_Widget &, int i)
  
  The widget is removed from its current group (if any) and then inserted into this group.

• void **insert** (Fl_Widget &o, Fl_Widget ∗before)
  
  This does insert(w, find(before)).

• void **remove** (Fl_Widget &)
  
  Removes a widget from the group but does not delete it.

• void **remove** (Fl_Widget ∗o)
  
  Removes the widget ∗o from the group.

• void **remove** (int index)
  
  Removes the widget at *index* from the group but does not delete it.

• **Fl_Widget** ∗ **resizable** () const
  
  Returns the group's resizable widget.

• void **resizable** (Fl_Widget &o)
  
  Sets the group's resizable widget.

• void **resizable** (Fl_Widget ∗o)
  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• virtual ∼**Fl_Group** ()
  
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- `void clear_changed ()`
  Marks the value of the widget as unchanged.

- `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.

- `void clear_output ()`
  Sets a widget to accept input.

- `void clear_visible ()`
  Hides the widget.

- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.

- `Fl_Color color () const`
  Gets the background color of the widget.

- `void color (Fl_Color bg)`
  Sets the background color of the widget.

- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- `Fl_Color color2 () const`
  For back compatibility only.

- `void color2 (unsigned a)`
  For back compatibility only.

- `int contains (const Fl_Widget ∗w) const`
  Checks if w is a child of this widget.

- `void copy_label (const char ∗new_label)`
  Sets the current label.

- `void copy_tooltip (const char ∗text)`
  Sets the current tooltip text.

- `uchar damage () const`
  Returns non-zero if draw() needs to be called.

- `void damage (uchar c)`
  Sets the damage bits for the widget.

- `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.

- `int damage_resize (int, int, int, int)`
  Internal use only.

- `void deactivate ()`
  Deactivates the widget.

- `Fl_Image ∗deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image ∗deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage (Fl_Image ∗img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound () const`
  Returns whether the inactive image is managed by the widget.

- `void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.

- `void do_callback (Fl_Widget ∗widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
Calls the widget callback function with arbitrary arguments.

void draw_label (int, int, int, int, Fl_Align) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.

int h () const
Gets the widget height.

virtual void hide ()
Makes a widget invisible.

Fl_Image * image ()
Gets the image that is used as part of the widget label when in the active state.

const Fl_Image * image () const
Gets the image that is used as part of the widget label when in the active state.

void image (Fl_Image &img)
Sets the image to use as part of the widget label when in the active state.

void image (Fl_Image *img)
Sets the image to use as part of the widget label when in the active state.

int image_bound () const
Returns whether the image is managed by the widget.

int inside (const Fl_Widget *wgt) const
Checks if this widget is a child of wgt.

int is_label_copied () const
Returns whether the current label was assigned with copy_label().

const char * label () const
Gets the current label text.

void label (const char *text)
Sets the current label pointer.

void label (Fl_Labeltype a, const char *b)
Shortcut to set the label text and type in one call.

Fl_Color labelcolor () const
Gets the label color.

void labelcolor (Fl_Color c)
Sets the label color.

Fl_Font labelfont () const
Gets the font to use.

void labelfont (Fl_Font f)
Sets the font to use.

Fl_Fontsize labelsize () const
Gets the font size in pixels.

void labelsize (Fl_Fontsize pix)
Sets the font size in pixels.

Fl_Labeltype labeltype () const
Gets the label type.

void labeltype (Fl_Labeltype a)
Sets the label type.

void measure_label (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.

bool needs_keyboard () const
Returns whether this widget needs a keyboard.

void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

unsigned int output () const
1574 Class Documentation

Returns if a widget is used for output only.

- **Fl_Group** → **parent ()** const
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **Fl_Color selection_color ()** const
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label ()** const
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents ()** const
  Returns if the widget is able to take events.

- **int testShortcut ()**
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- **const char * tooltip ()** const
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **Fl_Window * top_window ()** const
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type ()** const
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.
• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void **user_data** () const
  Gets the user data for this widget.

• void **user_data** (Fl_Callback_User_Data \*v, bool auto_free)
  Sets the user data for this widget.

• void **user_data** (void \*v)
  Sets the user data for this widget.

• unsigned int **visible** () const
  Returns whether a widget is visible.

• unsigned int **visible_focus** () const
  Checks whether this widget has a visible focus.

• void **visible_focus** (int v)
  Modifies keyboard focus navigation.

• int **visible_r** () const
  Returns whether a widget and all its parents are visible.

• int **w** () const
  Gets the widget width.

• Fl_When **when** () const
  Returns the conditions under which the callback is called.

• void **when** (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window **window** () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int **x** () const
  Gets the widget position in its window.

• int **y** () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Public Attributes

• Fl_Scrollbar \* **scrollbar**
  Vertical scrollbar.

Protected Member Functions

• void **clear_eod** (void)
  Clear from cursor to End Of Display (EOD), like *<ESC>\[J<ESC>\[0J*.

• void **clear_eol** (void)
  Clear from cursor to End Of Line (EOL), like *<ESC>\[K*.

• void **clear_line** (int row)
  Clear entire line for specified row.

• void **clear_line** (void)
  Clear entire line cursor is currently on.

• void **clear_mouse_selection** (void)
  Clear any current mouse selection.

• void **clear_sod** (void)
  Clear from cursor to Start Of Display (EOD), like *<ESC>\[1J*.

• void **clear_sol** (void)
  Clear from cursor to Start Of Line (SOL), like *<ESC>\[1K*.
- **void** **current_style** (const CharStyle &sty)
  
  Set current style for rendering text.

- **const CharStyle &** **current_style** (void) const
  
  Return current style for rendering text.

- **void** **cursor_col** (int col)
  
  Move cursor to the specified column col.

- **void** **cursor_cr** (void)
  
  Move cursor as if a CR (\r) was received.

- **void** **cursor_crlf** (int count=1)
  
  Move cursor as if a CR/LF pair (\r\n) was received.

- **void** **cursor_down** (int count=1, bool do_scroll=false)
  
  Moves cursor down count lines.

- **void** **cursor_eol** (void)
  
  Move cursor to the last column (at the far right) on the current line.

- **void** **cursor_left** (int count=1)
  
  Moves cursor left count columns, and cursor stops (does not wrap) if it hits screen edge.

- **void** **cursor_right** (int count=1, bool do_scroll=false)
  
  Moves cursor right count columns.

- **void** **cursor_row** (int row)
  
  Move cursor to the specified row row.

- **void** **cursor_sol** (void)
  
  Move cursor to the first column (at the far left) on the current line.

- **void** **cursor_tab_left** (int count=1)
  
  Tab left, do not wrap beyond left edge.

- **void** **cursor_tab_right** (int count=1)
  
  Tab right, do not wrap beyond right edge.

- **void** **cursor_up** (int count=1, bool do_scroll=false)
  
  Moves cursor up count lines.

- **void** **delete_chars** (int drow, int dcol, int rep)
  
  Delete char(s) at (drow,dcol) for 'rep' times.

- **void** **delete_chars** (int rep)
  
  Delete char(s) at cursor position for 'rep' times.

- **void** **delete_rows** (int count)
  
  Delete (count) rows at cursor position.

- **int** **disp_cols** (void) const
  
  Return the number of columns in the display area.

- **int** **disp_erow** (void) const
  
  Return the ending row# in the display area.

- **int** **disp_rows** (void) const
  
  Return the number of rows in the display area.

- **int** **disp_srow** (void) const
  
  Return the starting row# in the display area.

- **int** **draw_buff** (int Y) const
  
  Draws the buffer position we are scrolled to onto the FLTK screen starting at pixel position Y.

- **void** **draw_row** (int grow, int int Y) const
  
  Draw the specified global row, which is the row in ring_chars[].

- **void** **draw_row_bg** (int grow, int X, int Y) const
  
  Draw the background for the specified ring_chars[] global row grow starting at FLTK coords X and Y.

- **bool** **get_selection** (int &srow, int &scol, int &erow, int &ecol) const
  
  Return mouse selection's start/end position in the ring buffer, if any.

- **int** **h_to_row** (int H) const
Given a height in pixels, return number of rows that "fits" into that area.

- int handle_unknown_char (void)
  Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of show_unknown().

- int hist_cols (void) const
  Return the number of columns in the scrollback history.

- int hist_erow (void) const
  Return the ending row# of the scrollback history.

- int hist_rows (void) const
  Return the number of rows in the scrollback history.

- int hist_srow (void) const
  Return the starting row# of the scrollback history.

- int hist_use (void) const
  Return number of rows in use by the scrollback history.

- int hist_use_srow (void) const
  Return the starting row of the "in use" scrollback history.

- void insert_char (char c, int rep)
  Insert char 'c' at the current cursor position for 'rep' times.

- void insert_char_eol (char c, int drow, int dcol, int rep)
  Insert char 'c' for 'rep' times at display row 'drow' and column 'dcol'.

- void insert_rows (int count)
  Insert (count) rows at current cursor position.

- bool is_inside_selection (int row, int col) const
  Is global row/column inside the current mouse selection?

- bool is_selection (void) const
  Returns true if there's a mouse selection.

- int offset (void) const
  Returns the current offset into the ring buffer.

- void restore_cursor (void)
  Restore previously saved cursor position, if any. Used by ESC [ u.

- int ring_cols (void) const
  Return the number of columns in the ring buffer.

- int ring_erow (void) const
  Return the ending row# in the ring buffer (Always ring_rows()-1)

- int ring_rows (void) const
  Return the number of rows in the ring buffer.

- int ring_srow (void) const
  Return the starting row# in the ring buffer. (Always 0)

- void save_cursor (void)
  Save current cursor position. Used by ESC [ s.

- void scroll (int rows)
  Scroll the display up(+) or down(-) the specified rows.

- int scrollbar_width (void) const
  Return scrollbar width if visible, or 0 if not visible.

- bool selection_extend (int X, int Y)
  Extend selection to FLTK coords X,Y.

- const char * selection_text (void) const
  Return text selection (for copy()/paste() operations)

- int selection_text_len (void) const
  Return byte length of all UTF-8 chars in selection, or 0 if no selection.

- U8Char * u8c_cursor (void)
Return the Utf8Char for character under cursor.

- Utf8Char * u8c_disp_row (int drow)
  Return pointer to the first u8c character in row drow of the display.

- const Utf8Char * u8c_disp_row (int drow) const
  See docs for non-const version of u8c_disp_row(int)

- Utf8Char * u8c_hist_row (int hrow)
  Return u8c for beginning of a row inside the scrollback history.

- const Utf8Char * u8c_hist_row (int hrow) const
  See docs for non-const version of u8c_hist_row(int)

- const Utf8Char * u8c_hist_use_row (int hrow) const
  See docs for non-const version of u8c_hist_use_row(int)

- Utf8Char * u8c_ring_row (int grow)
  Return UTF-8 char for row grow in the ring buffer.

- const Utf8Char * u8c_ring_row (int grow) const
  See docs for non-const version of u8c_ring_row(int)

- int w_to_col (int W) const
  Given a width in pixels, return number of columns that "fits" into that area.

- const Utf8Char * walk_selection (const Utf8Char *u8c, int &row, int &col) const
  Walk the mouse selection one character at a time from beginning to end, returning a Utf8Char* to the next character in the selection, or NULL if the end was reached, or if there's no selection.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.

- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.

- void draw_children ()
  Draws all children of the group.

- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.

- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.

- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.

- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.

- int * sizes ()
  Returns the internal array of widget sizes and positions.

- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const
  Draws the widget box according its box style.
- `void draw_box` (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- `void draw_box` (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- `void draw_focus` () const
  Draws a focus rectangle around the widget.

- `void draw_focus` (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus rectangle around the widget.

- `void draw_focus` (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- `void draw_label` () const
  Draws the widget's label at the defined label position.

- `void draw_label` (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- `Fl_Widget` (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

- `unsigned int flags` () const
  Gets the widget flags mask.

- `void h` (int v)
  Internal use only.

- `void set_flag` (unsigned int c)
  Sets a flag in the flags mask.

- `void w` (int v)
  Internal use only.

- `void x` (int v)
  Internal use only.

- `void y` (int v)
  Internal use only.

### Additional Inherited Members

### Static Public Member Functions inherited from `Fl_Group`

- static `Fl_Group ∗current` ()
  Returns the currently active group.

- static `void current` (Fl_Group ∗g)
  Sets the current group.

### Static Public Member Functions inherited from `Fl_Widget`

- static `void default_callback` (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.

- static `unsigned int label_shortcut` (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.

- static `int test_shortcut` (const char ∗, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,  
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,

12.141.1 Detailed Description

Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control.

12.141.2 Fl_Terminal

![Figure 12.54 Fl_Terminal widget showing a linux manual page](image)

Fl_Terminal is an output-only text widget supporting ASCII and UTF-8/Unicode. It supports most terminal text features, such as most VT100/xterm style escape sequences (see The Escape Codes Fl_Terminal Supports), text colors/attributes, scrollback history, mouse selection, etc.

It is recommended that accessing features such as setting text colors and cursor positioning is best done with ANSI/XTERM escape sequences. But if one sets ansi(false) then this is not possible, so the public API can be used for common operations, e.g.

<table>
<thead>
<tr>
<th>Public API</th>
<th>ESC code equivalent</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear_screen_home()</td>
<td>ESC [ H ESC [ 2 J</td>
<td>Clear screen, home cursor</td>
</tr>
<tr>
<td>cursor_home()</td>
<td>ESC [ H</td>
<td>Home the cursor</td>
</tr>
<tr>
<td>clear_history()</td>
<td>ESC [ 3 J</td>
<td>Clear scrollback history</td>
</tr>
<tr>
<td>reset_terminal()</td>
<td>ESC [ c</td>
<td>Reset terminal</td>
</tr>
</tbody>
</table>

To access more advanced API calls, one can derive a class from Fl_Terminal to access protected methods manipulate the terminal more directly, e.g.
### Protected API

<td>etc...</td>
<td>etc...</td>
<td>etc...</td>
</tr>
</tbody>
</table>

Many commonly used API functions are public, such as `textfgcolor()` for setting text colors. Others, such as `cursor_up()` are protected to prevent common misuse, and are available only to subclasses.

For applications that need input support, the widget can be subclassed to provide keyboard input, and advanced features like pseudo ttys, termio, serial port I/O, etc., as such features are beyond the scope of FLTK.

#### 12.141.2.1 Examples

```c++
//
// Fl_Terminal: Simple Use
//
Fl_Terminal *tty = new Fl_Terminal(...);

tty->append("Hello world.\n"); // simple strings
tty->append("\033[31mThis text is red.\033[0m\n"); // colored text
tty->printf("The value of x is %.02f\n", x); // printf() formatting

tty->home(); // home the cursor
tty->clear_screen(); // clear the screen
tty->textfgcolor(0xff000000); // change the text color to RED
tty->textbgcolor(0x0000ff00); // change the background color to BLUE

// R G B
```

There are also public methods for doing what most "\033[" escape codes do, so that if `ansi(bool)` is set to "false", one can still change text colors or clear the screen via application control, e.g.

```c++
tty->home(); // home the cursor
tty->clear_screen(); // clear the screen
```

When creating the widget, the width/height determine the default column and row count for the terminal's display based on the current font size. The column width determines where text will wrap.

You can specify wider column sizes than the screen using `display_columns(colwidth)`. When this value is larger than the widget's width, text will wrap off-screen, and can be revealed by resizing the widget wider.
12.141.2.2 Writing To Terminal From Applications

An application needing terminal output as part of its user interface can instance `Fl_Terminal`, and write text strings with:

- `append()` to append strings
- `printf()` to append formatted strings

Single character output can be done with:

- `print_char()` to print a single ASCII/UTF-8 char at the cursor
- `putchar()` to put single ASCII/UTF-8 char at an x,y position

12.141.2.3 Text Attributes

The terminal's text supports these attributes:

- Italic - italicized text: `\033[3m`
- Bold - brighter/thicker text: `\033[1m`
- Dim - lower brightness text: `\033[2m`
- Underline - text that is underlined: `\033[4m`
- Strikeout - text that has a line through the text: `\033[9m`
- Inverse - text whose background and foreground colors are swapped: `\033[7m`
- Normal - normal text: `\033[0m`

12.141.2.4 Text and Background Colors

There's at least two ways to specify colors for text and background colors:

- 3 bit / 8 Color Values
- Full 24 bit R/G/B colors
12.141 Fl_Terminal Class Reference

Example of 3 bit colors:

![Figure 12.56 Fl_Terminal 3 bit colors](image)

Example application source code using 3 bit colors:
```
// Text colors
tty->append("\033[31m Red text. \033[0m\n"); // Print red text..
```
```
// Background colors
tty->append("\033[41m Red Background. \033[0m\n"); // background will be red
```

Example of 24 bit colors:
```
// 24 bit Text Color
tty->append("\033[38;2;0;0;255m Text is BLUE. \033[0m\n"); // RGB: R=0, G=0, B=255
```
```
// 24 bit Background Color
tty->append("\033[48;2;0;0;255m Background is BLUE. \033[0m\n"); // RGB: R=0, G=0, B=255
```

For more on the ANSI escape codes, see The Escape Codes Fl_Terminal Supports.
12.141.2.5 Features

Most standard terminal behaviors are supported, e.g.

- ASCII + UTF-8/Unicode
- scrollback history management
- mouse selection + copy/paste (\^C, \^A)
- autoscroll during selection

Most popular ANSI/DEC VT100/Xterm escape sequences are supported (see The Escape Codes Fl_Terminal Supports), including:

- per-character colors for text and background
- per-character text attributes: bold/dim, underline, strikeout
- scrolling up/down
- character insert/delete for characters/rows/screen
- clearing characters/rows/screen

Does not (yet) support:

- programmable regions (scroll regions and attribute blocks)
- dynamic line wrap (where resizing display dynamically re-wraps long lines)

Will likely never implement as part of this widget:

- pty/termio management (such features should be subclassed)
- Different per-character font family + sizes (font family/size is global only)
- variable width fonts

Regarding the font family+size; the way the terminal is currently designed, the font family and size must not vary within text; rows have to be consistent height. Varying widths are tricky too, esp. when it comes to moving the cursor up/down within a column; varying widths are supported (due to Unicode characters sometimes being "wide", but not heights.

12.141.2.6 Margins

The margins define the amount of space (in pixels) around the outside of the text display area, the space between the widget's inner edge (inside the box()) and the text display area's outer edge. The margins can be inspected and changed with the margin_left(), margin_right(), margin_top() and margin_bottom() methods.

textbgcolor() textbgcolor()

12.141.2.7 Caveats

• This widget is not a full terminal emulator; it does not do stdio redirection, pseudo ttys/termios/character cooking, keyboard input processing, full curses(3) support. However, such features CAN be implemented with subclassing.

• The printf() and vprintf() functions are limited to strings no longer than 1024 characters (including NULL). For printing longer strings, use append() which has no string limits.

• For background colors textbgcolor() and textbgcolor_default(), the special color value 0xffffffff lets the widget's box() color() show through behind the text.

12.141.3 Member Enumeration Documentation

12.141.3.1 Attrib

enum Fl_Terminal::Attrib

Bits for the per-character attributes, which control text features such as italic, bold, underlined text, etc.

NOTE: enum names with a leading underbar must not be used, and are reserved for future use.

 Enumerator

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>all attributes off</td>
</tr>
<tr>
<td>BOLD</td>
<td>bold text: uses bold font, color brighter than normal</td>
</tr>
<tr>
<td>DIM</td>
<td>dim text; color slightly darker than normal</td>
</tr>
<tr>
<td>ITALIC</td>
<td>italic font text</td>
</tr>
</tbody>
</table>
### 12.141.3.2 CharFlags

`enum Fl_Terminal::CharFlags`

Per-character 8 bit flags (uchar) used to manage special states for characters.

#### Enumerator

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FG_XTERM</td>
<td>this char's fg color is an XTERM color; can be affected by Dim+Bold</td>
</tr>
<tr>
<td>BG_XTERM</td>
<td>this char's bg color is an XTERM color; can be affected by Dim+Bold</td>
</tr>
<tr>
<td>EOL</td>
<td>TODO: char at EOL, used for line re-wrap during screen resizing.</td>
</tr>
</tbody>
</table>

### 12.141.3.3 OutFlags

`enum Fl_Terminal::OutFlags`

Output translation flags for special control character translations.

#### Enumerator

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>no output translation</td>
</tr>
<tr>
<td>CR_TO_LF</td>
<td>carriage return generates a vertical line-feed (\r -&gt; \n)</td>
</tr>
<tr>
<td>LF_TO_CR</td>
<td>line-feed generates a carriage return (\n -&gt; \r)</td>
</tr>
<tr>
<td>LF_TO_CRLF</td>
<td>line-feed generates a carriage return line-feed (\n -&gt; \r\n)</td>
</tr>
</tbody>
</table>

### 12.141.3.4 RedrawStyle

`enum Fl_Terminal::RedrawStyle`

Determines when `Fl_Terminal` calls `redraw()` if new text is added.

RATE_LIMITED is the recommended setting, using `redraw_rate(float)` to determine the maximum rate of redraws.

See also

`redraw_style()`, `redraw_rate()`

#### Enumerator

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_REDRAW</td>
<td>app must call <code>redraw()</code> as needed to update text to screen</td>
</tr>
<tr>
<td>RATE_LIMITED</td>
<td>timer controlled redraws. (DEFAULT)</td>
</tr>
<tr>
<td>PER_WRITE</td>
<td>redraw triggered after every <code>append()</code> / <code>printf()</code> / etc. operation</td>
</tr>
</tbody>
</table>
12.141.4 Constructor & Destructor Documentation

12.141.4.1 Fl_Terminal() [1/2]

Fl_Terminal::Fl_Terminal (  
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0  )

The constructor for Fl_Terminal.
This creates an empty terminal with defaults:

- white on black text; see textfgcolor(Fl_Color), textbgcolor(Fl_Color)
- rows/cols based on the W and H values, see display_rows(), display_columns()
- scrollback history of 100 lines, see history_rows()
- redraw_style() set to RATE_LIMITED, redraw_rate() set to 0.10 seconds

Note: While Fl_Terminal derives from Fl_Group, it's not intended for user code to use it as a parent for other widgets, so end() is called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X,Y,W,H</th>
<th>position and size.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>label string (optional), may be NULL.</td>
</tr>
</tbody>
</table>

12.141.4.2 Fl_Terminal() [2/2]

Fl_Terminal::Fl_Terminal (  
    int X,
    int Y,
    int W,
    int H,
    const char * L,
    int rows,
    int cols,
    int hist  )

Same as the default FLTK constructor, but lets the user force the rows, columns and history to specific sizes on creation.
Since the row/cols/hist are specified directly, this prevents the widget from auto-calculating the initial text buffer size based on the widget's pixel width/height, bypassing calls to the font system before the widget is displayed.

Note

fluid uses this constructor internally to avoid font calculations that opens the display, useful for when running in a headless context. (issue 837)

12.141.4.3 ~Fl_Terminal()

Fl_Terminal::~Fl_Terminal (  
    void  )

The destructor for Fl_Terminal.
Destroyes the terminal display, scroll history, and associated widgets.
12.141.5 Member Function Documentation

12.141.5.1 ansi() [1/2]

```cpp
void Fl_Terminal::ansi (bool val)
```
Enable/disable the ANSI mode flag.
If true, ANSI and VT100/xterm codes will be processed. If false, these codes won't be processed and will either be ignored or print the error character "¿", depending on the value of show_unknown().

See also
- show_unknown(), The Escape Codes Fl_Terminal Supports

12.141.5.2 ansi() [2/2]

```cpp
bool Fl_Terminal::ansi () const
```
Return the state of the ANSI flag.

See also
- ansi(bool)

12.141.5.3 append()

```cpp
void Fl_Terminal::append (const char ∗s, int len = -1)
```
Appends string `s` to the terminal at the current cursor position using the current text color/attributes.
If `s` is NULL, the UTF-8 character cache is cleared, which is recommended before starting a block reading loop, and again after the block loop has completed.
If `len` is not specified, it's assumed `s` is a NULL terminated string. If `len` is specified, it can be used for writing strings that aren't NULL terminated, such as block reads on a pipe, network, or other block oriented data source.
Redraws of the terminal widget are by default handled automatically, but can be changed with redraw_rate() and redraw_style().

**Block I/O**
When reading block oriented sources (such as pipes), append() will handle partial UTF-8 chars straddling the block boundaries. It does this using an internal byte cache, which should be cleared before and after block I/O loops by calling append(NULL) as shown in the example below, to prevent the possibilities of partial UTF-8 characters left behind by an interrupted or incomplete block loop.

```cpp
// Example block reading a command pipe in Unix

// Run command and read as a pipe
FILE ∗fp = popen("ls -la", "r");
if (!fp) { ..error_handling.. }

// Enable non-blocking I/O
int fd = fileno(fp);
fcntl(fd, F_SETFL, O_NONBLOCK);

// Clear UTF-8 character cache before starting block loop
G_tty->append(NULL); // prevents leftover partial UTF-8 bytes

// Block read loop
while (1) {
    Fl::wait(0.05); // give fltk .05 secs of cpu to manage UI
    ssize_t bytes = read(fd, s, sizeof(s)); // read block from pipe
    if (bytes == -1 && errno == EAGAIN) continue; // no data yet? continue
    if (bytes > 0) G_tty->append(s); // append output to terminal
    else break; // end of pipe?
}

// Flush cache again after block loop completes
G_tty->append(NULL);

// Close pipe, done
pclose(fp);
```
Note

- String can contain ASCII or UTF-8 chars
- len is optional; if unspecified, expects s to be a NULL terminated string
- Handles partial UTF-8 chars split between calls (e.g. block oriented writes)
- If s is NULL, this clears the "partial UTF-8" character cache
- Redraws are managed automatically by default; see redraw_style()

12.141.5.4  append_ascii()

void Fl_Terminal::append_ascii (  
    const char * s )
Append NULL terminated ASCII string to terminal, slightly more efficient than append_utf8().
  
- If s is NULL, behavior is to do nothing
- Redraws are triggered automatically, depending on redraw_style()

12.141.5.5  append_utf8()

void Fl_Terminal::append_utf8 (  
    const char * buf,  
    int len = -1 )
Append NULL terminated UTF-8 string to terminal.
  
- If buf is NULL, UTF-8 cache buffer is cleared
- If optional len isn't specified or is -1, strlen(text) is used.
- If len is 0 or < -1, no changes are made
- Handles UTF-8 chars split across calls (e.g. block writes from pipes, etc)
- Redraws are triggered automatically, depending on redraw_style()

12.141.5.6  box()

void Fl_Terminal::box (  
    Fl_Boxtype val ) [inline]
Sets the box type, updates terminal margins et al.  
Default is FL_DOWN_FRAME.
FL_XXX_FRAME types are handled in a special way by this widget, and guarantee the background is a flat field.
FL_XXX_BOX may draw gradients as inherited by Fl::scheme().

12.141.5.7  clear() [1/2]

void Fl_Terminal::clear (  
    Fl_Color val )
Clears the screen to a specific color val and homes the cursor.
See also  
  clear_screen(), clear_screen_home(), cursor_home()

12.141.5.8  clear() [2/2]

void Fl_Terminal::clear (  
    void )
Clears the screen to the current textbgcolor(), and homes the cursor.
See also  
  clear_screen(), clear_screen_home(), cursor_home()
12.141.5.9  clear_screen()

void Fl_Terminal::clear_screen (  
    bool scroll_to_hist = true )

Clear the terminal screen only; does not affect the cursor position.
Also clears the current mouse selection.
If 'scroll_to_hist' is true, the screen is cleared by scrolling the contents into the scrollback history, where
it can be retrieved with the scrollbar. This is the default behavior. If false, the screen is cleared and the scrollback
history is unchanged.
Similar to the escape sequence "<ESC>[2J".

See also
  clear_screen_home()

12.141.5.10  clear_screen_home()

void Fl_Terminal::clear_screen_home (  
    bool scroll_to_hist = true )

Clear the terminal screen and home the cursor.
Also clears the current mouse selection.
If 'scroll_to_hist' is true, the screen is cleared by scrolling the contents into the scrollback history, where
it can be retrieved with the scrollbar. This is the default behavior. If false, the screen is cleared and the scrollback
history is unchanged.
Similar to the escape sequence "<ESC>[2J<ESC>[H".

See also
  clear_screen()

12.141.5.11  color()

void Fl_Terminal::color (  
    Fl_Color val )

Sets the background color for the terminal's Fl_Group::box().
If the textbgcolor() and textbgcolor_default() are set to the special "see through" color 0xffffffff when any text was
added, changing color() affects the color that shows through behind that existing text.
Otherwise, whatever specific background color was set for existing text will persist after changing color().
To see the effects of a change to color(), follow up with a call to redraw().
The default value is 0x0.

12.141.5.12  cursor_col()

void Fl_Terminal::cursor_col (  
    int col ) [protected]

Move cursor to the specified column col.
This value is clamped to the range (0..display_columns()-1).

12.141.5.13  cursor_cr()

void Fl_Terminal::cursor_cr (  
    void ) [protected]

Move cursor as if a CR (\r) was received.
Same as cursor_sol()

12.141.5.14  cursor_down()

void Fl_Terminal::cursor_down (  
    int count = 1,  
    bool do_scroll = false ) [protected]
Moves cursor down \texttt{count} lines. If cursor hits screen bottom, it either stops (does not wrap) if \texttt{do_scroll} is false, or wraps and scrolls up if \texttt{do_scroll} is true.

**Parameters**

<table>
<thead>
<tr>
<th>count</th>
<th>Number of lines to move cursor down</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{do_scroll}</td>
<td>Enable scrolling if set to true</td>
</tr>
</tbody>
</table>

**12.141.5.15 cursor_right()**

```cpp
void Fl_Terminal::cursor_right(
    int count = 1,
    bool do_scroll = false \} [protected]
```

Moves cursor right \texttt{count} columns. If cursor hits right edge of screen, it either stops (does not wrap) if \texttt{do_scroll} is false, or wraps and scrolls up one line if \texttt{do_scroll} is true.

**12.141.5.16 cursor_row()**

```cpp
void Fl_Terminal::cursor_row(
    int row \) [protected]
```

Move cursor to the specified \texttt{row}. This value is clamped to the range (0..\texttt{display_rows()}-1).

**12.141.5.17 cursor_up()**

```cpp
void Fl_Terminal::cursor_up(
    int count = 1,
    bool do_scroll = false \} [protected]
```

Moves cursor up \texttt{count} lines. If cursor hits screen top, it either stops (does not wrap) if \texttt{do_scroll} is false, or scrolls down if \texttt{do_scroll} is true.

**12.141.5.18 delete_rows()**

```cpp
void Fl_Terminal::delete_rows(
    int count \} [protected]
```

Delete \texttt{count} rows at cursor position. Causes rows to scroll up, and empty lines created at bottom of screen. Lines deleted by scroll up are NOT moved into the scroll history.

**12.141.5.19 display_columns() [1/2]**

```cpp
void Fl_Terminal::display_columns(
    int dcols \)
```

Set terminal’s display width in columns of text characters. This value is normally managed automatically by \texttt{resize()} based on the current font size, and should not be changed. You CAN make the \texttt{display_columns()} larger than the width of the widget; text in the terminal will simply run off the screen edge and be clipped; the only way to reveal that text is if the user enlarges the widget, or the font size made smaller.

To change the display width, it is best to use \texttt{resize()} instead.

**12.141.5.20 display_columns() [2/2]**

```cpp
int Fl_Terminal::display_columns(
    void \} const
```

Return terminal’s display width in columns of text characters.
This value is normally managed automatically by `resize()` based on the current font size.

### 12.141.5.21 display_rows() [1/2]

```cpp
void Fl_Terminal::display_rows ( int drows )
```

Set terminal's display height in lines of text (rows).
This value is normally managed automatically by `resize()` based on the current font size, and should not be changed. To change the display height, use `resize()` instead.

### 12.141.5.22 display_rows() [2/2]

```cpp
int Fl_Terminal::display_rows () const
```

Return terminal's display height in lines of text (rows).
This value is normally managed automatically by `resize()` based on the current font size.

### 12.141.5.23 draw()

```cpp
void Fl_Terminal::draw ( void ) [virtual]
```

Draws the entire Fl_Terminal.
Let the group draw itself first (scrollbar should be only member), followed by the terminal's screen contents.
Reimplemented from Fl_Group.

### 12.141.5.24 draw_buff()

```cpp
void Fl_Terminal::draw_buff ( int Y ) const [protected]
```

Draws the buffer position we are scrolled to onto the FLTK screen starting at pixel position Y.
This can be anywhere in the ring buffer, not just the 'active display'; depends on what position the scrollbar is set to.
Handles attributes, colors, text selections, cursor.

### 12.141.5.25 draw_row()

```cpp
void Fl_Terminal::draw_row ( int grow, int Y ) const [protected]
```

Draw the specified global row, which is the row in ring_chars[].
The global row includes history + display buffers.

### 12.141.5.26 draw_row_bg()

```cpp
void Fl_Terminal::draw_row_bg ( int grow, int X, int Y ) const [protected]
```

Draw the background for the specified ring_chars[] global row `grow` starting at FLTK coords X and Y.
Note we may be called to draw display, or even history if we're scrolled back. If there's any change in bg color, we draw the filled rects here.
If the bg color for a character is the special "see through" color 0xffffffff, no pixels are drawn.

### 12.141.5.27 get_selection()

```cpp
bool Fl_Terminal::get_selection ( int & srow, int & scol, int & erow, int & ecol ) const [protected]
```
Return mouse selection’s start/end position in the ring buffer, if any.
Ensures (start < end) to allow walking ’forward’ thru selection, left-to-right, top-to-bottom. The row/col values are indexes into the entire ring buffer.

Example: walk the characters of the mouse selection:

```c
// Get selection
int srow,scol,erow,ecol;
if (get_selection(srow,scol,erow,ecol)) { // mouse selection exists?
    // Walk entire selection from start to end
    for (int row=srow; row<=erow; row++) { // walk rows of selection
        const Utf8Char *u8c = u8c_ring_row(row); // ptr to first character in row
        int col_start = (row==srow) ? scol : 0; // start row? start at scol
        int col_end = (row==erow) ? ecol : ring_cols(); // end row? end at ecol
        u8c += col_start; // include col offset (if any)
        for (int col=col_start; col<=col_end; col++,u8c++) { // walk columns
            ..do something with each char at *u8c..
        }
    }
}
```

Returns:

- true – valid selection values returned
- false – no selection was made, returned values undefined

See also

`walk_selection()`, `is_selection()`

**Parameters**

<table>
<thead>
<tr>
<th>srow</th>
<th>starting row for selection</th>
</tr>
</thead>
<tbody>
<tr>
<td>scol</td>
<td>starting column for selection</td>
</tr>
<tr>
<td>erow</td>
<td>ending row for selection</td>
</tr>
<tr>
<td>ecol</td>
<td>ending column for selection</td>
</tr>
</tbody>
</table>

**h_to_row()**

```c
int Fl_Terminal::h_to_row ( int H ) const [protected]
```

Given a height in pixels, return number of rows that “fits” into that area. This is used by the constructor to size the row/cols to fit the widget size.

**handle()**

```c
int Fl_Terminal::handle ( int e ) [virtual]
```

Handle FLTK events.
Reimplemented from Fl_Group.

**handle_unknown_char()**

```c
int Fl_Terminal::handle_unknown_char ( void ) [protected]
```

Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of `show_unknown()`.

Returns 1 if tty modified, 0 if not.
See also

    show_unknown()

12.141.5.31  history_lines()

    void Fl_Terminal::history_lines ( int val )
Set the number of lines of screen history.
Large values can be briefly heavy on cpu and memory usage.

12.141.5.32  history_use()

    int Fl_Terminal::history_use ( void ) const
Returns how many lines are "in use" by the screen history buffer.
This value will be 0 if history was recently cleared with e.g. clear_history() or "<ESC>c".
Return value will be in the range 0 .. (history_lines()-1).

12.141.5.33  insert_char()

    void Fl_Terminal::insert_char ( char c, int rep ) [protected]
Insert char ‘c’ at the current cursor position for ‘rep’ times.
Does not wrap; characters at end of line are lost.

12.141.5.34  insert_rows()

    void Fl_Terminal::insert_rows ( int count ) [protected]
Insert (count) rows at current cursor position.
Causes rows below to scroll down, and empty lines created. Lines deleted by scroll down are NOT moved into the
scroll history.

12.141.5.35  is_inside_selection()

    bool Fl_Terminal::is_inside_selection ( int grow, int gcol ) const [protected]
Is global row/column inside the current mouse selection?

Returns

    • true – (grow,gcol) is inside a valid selection.
    • false – (grow,gcol) is outside, or no valid selection.

12.141.5.36  output_translate()

    void Fl_Terminal::output_translate ( Fl_Terminal::OutFlags val )
Sets the combined output translation flags to val.
val can be sensible combinations of the OutFlags bit flags.
The default is LF_TO_CRLF, so that ‘n’ will generate both carriage-return (CR) and line-feed (LF).
For ‘r’ and ‘n’ to be handled literally, use output_translate(Fl_Terminal::OutFlags::OFF);
To disable all output translations, use 0 or Fl_Terminal::OutFlags::OFF.
12.141.5.37 print_char() [1/2]

void Fl_Terminal::print_char (char c)
Prints single ASCII char c at current cursor position, and advances the cursor.
The character is displayed at the current cursor position using the current text color/attributes.
  • c must be ASCII, not utf-8
  • Does not trigger redraws

12.141.5.38 print_char() [2/2]

void Fl_Terminal::print_char (const char *text, int len = -1)
Prints single UTF-8 char text of optional byte length len at current cursor position, and advances the cursor if
the character is printable.
Handles ASCII and control codes (CR, LF, etc).
The character is displayed at the current cursor position using the current text color/attributes.
Handles control codes and can be used to construct ANSI/XTERM escape sequences.
  • If optional len isn't specified or <0, strlen(text) is used.
  • text must not be NULL.
  • len must not be 0.
  • text must be a single char only (whether UTF-8 or ASCII)
  • text can be an ASCII character, though not as efficient as print_char()
  • Invalid UTF-8 chars show the error character (¿) depending on show_unknown(bool).
  • Does not trigger redraws

See also
  show_unknown(bool), handle_unknown_char()

12.141.5.39 printf()

void Fl_Terminal::printf (const char *fmt, ...)
Appends printf formatted messages to the terminal.
The string can contain UTF-8, crlf's, and ANSI sequences are also supported. Example:

```c
#include <FL/Fl_Terminal.H>
int main(..) {
  // Create a terminal, and append some messages to it
  Fl_Terminal *tty = new Fl_Terminal(..);
  // Append three lines of formatted text to the buffer
  tty->printf("The current date is: %s.\nThe time is: %s\n", date_str, time_str);
  tty->printf("The current PID is %ld.\n", (long) getpid());
}
```

Note
  The expanded string is currently limited to 1024 characters (including NULL). For longer strings use append() which has no string limits.

Generated by Doxygen
12.141.5.40  putchar() [1/2]

void Fl_Terminal::putchar (char c, int drow, int dcol)

Print the ASCII character c at the terminal's display position (drow,dcol). The character MUST be printable (in range 0x20 - 0x7e), and is displayed using the current text color/attributes. Characters outside that range are either ignored or print the error character (¿), depending on show_unknown(bool). This is a very low level method.

No range checking is done on drow,dcol:
  • drow must be in range 0..(display_rows()-1)
  • dcol must be in range 0..(display_columns()-1)
  • Does not trigger redraws
  • Does NOT handle control codes, ANSI or XTERM escape sequences.

See also
  show_unknown(bool), handle_unknown_char(), is_printable()

12.141.5.41  putchar() [2/2]

void Fl_Terminal::putchar (const char *text, int len, int drow, int dcol)

Print UTF-8 character text of length len at display position (drow,dcol). The character is displayed using the current text color/attributes. This is a very low level method.

No range checking is done on drow,dcol:
  • drow must be in range 0..(display_rows()-1)
  • dcol must be in range 0..(display_columns()-1)
  • Does not trigger redraws
  • Does not handle ANSI or XTERM escape sequences
  • Invalid UTF-8 chars show the error character (¿) depending on show_unknown(bool).

See also
  handle_unknown_char()

12.141.5.42  redraw_rate()

void Fl_Terminal::redraw_rate (float val)

Set the maximum rate redraw speed in floating point seconds if redraw_style() is set to RATELIMITED. When output is sent to the terminal, rather than calling redraw() right away, a timer is started with this value indicating how long to wait before calling redraw(), causing the output to be shown. 0.10 is recommended (1/10th of a second), to limit redraws to no more than 10 redraws per second.

The value that works best depends on how fast data arrives, and how fast the font system can draw text at runtime. Values too small cause too many redraws to occur, causing the terminal to get backlogged if large bursts of data arrive quickly. Values too large cause realtime output to be too "choppy".
12.141.5.43  **redraw_style()** [1/2]

```
void Fl_Terminal::redraw_style (RedrawStyle val)
```

Set how Fl_Terminal manages screen redrawing.

This setting is relevant when Fl_Terminal is used for high bandwidth data; too many redraws will slow things down, too few cause redraws to be ‘choppy’ when realtime data comes in.

Redrawing can be cpu intensive, depending on how many rows/cols are being displayed; worst case: large display + small font. Speed largely depends on the end user's graphics hardware and font drawing system.

<table>
<thead>
<tr>
<th>RedrawStyle enum</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_REDRAW</td>
<td>App must call <code>redraw()</code> as needed to update text to screen</td>
</tr>
<tr>
<td>RATE_LIMITED</td>
<td>Rate limited, timer controlled redraws. (DEFAULT) See <code>redraw_rate()</code></td>
</tr>
<tr>
<td>PER_WRITE</td>
<td>Redraw triggered every call to <code>append()</code> / <code>printf()</code> / etc.</td>
</tr>
</tbody>
</table>

The default style is RATE_LIMITED, which is the easiest to use, and automates redrawing to be capped at 10 redraws per second max. See `redraw_rate(float)` to control this automated redraw speed.

See also

`redraw_rate()`, `RedrawStyle`

12.141.5.44  **redraw_style()** [2/2]

```
Fl_Terminal::RedrawStyle Fl_Terminal::redraw_style () const
```

Get the redraw style.

This determines when the terminal redraws itself while text is being added to it.

Value will be one of the Fl_Terminal::RedrawStyle enum values.

See also

`redraw_style(Fl_Terminal::RedrawStyle)`

12.141.5.45  **reset_terminal()**

```
void Fl_Terminal::reset_terminal ()
```

Resets terminal to default colors, clears screen, history and mouse selection, homes cursor, resets tabstops.

Same as "<ESC>c"

12.141.5.46  **resize()**

```
void Fl_Terminal::resize (int X, int Y, int W, int H) [virtual]
```

Handle widget resizing, such as if user resizes parent window.

This may increase the column width of the widget if the width of the widget is made larger than it was.

Note

Resizing currently does not rewrap existing text. Currently enlarging makes room for longer lines, and shrinking the size lets long lines run off the right edge of the display, hidden from view. This behavior may change in the future to rewrap.

Reimplemented from Fl_Group.
12.141.5.47  scroll()

void Fl_Terminal::scroll (  
   int rows ) [protected]
Scroll the display up(+) or down(-) the specified rows.
   • Negative value scrolls "down", clearing top line, and history unaffected.
   • Postive value scrolls "up", clearing bottom line, rotating top line into history.

12.141.5.48  scrollbar_size() [1/2]

void Fl_Terminal::scrollbar_size (  
   int val )
Set the width of the scrollbar's trough to val, in pixels.
Only use this method if you need to override the global scrollbar size.
Setting val to the special value 0 causes the widget to track the global Fl::scrollbar_size().
See also
   Fl::scrollbar_size()

12.141.5.49  scrollbar_size() [2/2]

int Fl_Terminal::scrollbar_size (  
   void ) const
Get the current size of the scrollbar's trough, in pixels.
If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.
Returns
   Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.
See also
   Fl::scrollbar_size(int)

12.141.5.50  selection_extend()

bool Fl_Terminal::selection_extend (  
   int X,  
   int Y ) [protected]
Extend selection to FLTK coords X,Y.
Returns true if extended, false if nothing done (X,Y offscreen)

12.141.5.51  selection_text()

const char * Fl_Terminal::selection_text (  
   void ) const [protected]
Return text selection (for copy()/paste() operations)
   • Returns allocated NULL terminated string for entire selection.
   • Caller must free() this memory when done.
   • Unicode safe.
12.141.5.52  selection_text_len()

int Fl_Terminal::selection_text_len (  
  void ) const [protected]  
Return byte length of all UTF-8 chars in selection, or 0 if no selection.  
NOTE: Length includes trailing white on each line.

12.141.5.53  show_unknown() [1/2]

void Fl_Terminal::show_unknown (  
  bool val  )  
Set the "show unknown" flag.  
If true, unknown escape sequences and unprintable control characters will be shown with the error character "¿".  
If false, those sequences and characters will be ignored.  
See also  
  handle_unknown_char()  

12.141.5.54  show_unknown() [2/2]

bool Fl_Terminal::show_unknown (  
  void ) const  
Return the "show unknown" flag.  
See show_unknown(bool) for more info.

12.141.5.55  textattrib() [1/2]

uchar Fl_Terminal::textattrib ( ) const  
Get text attribute bits (underline, inverse, etc).  
This is the default attribute used for all newly printed text.  
See also  
  textattrib(uchar), Fl_Terminal::Attrib

12.141.5.56  textattrib() [2/2]

void Fl_Terminal::textattrib (  
  uchar val  )  
Set text attribute bits (underline, inverse, etc).  
This will be the default attribute used for all newly printed text.  
See also  
  Fl_Terminal::Attrib

12.141.5.57  textbgcolor()

void Fl_Terminal::textbgcolor (  
  Fl_Color val  )  
Set text background color to fltk color val used by any new text added.  
Use this for temporary color changes, similar to <ESC>[48;2;<R>;<G>;<B>m  
This setting does not affect the 'default' text colors used by <ESC>[0m, <ESC>c, reset_terminal(), etc. To set that too, also set textbgcolor_default(Fl_Color), e.g.
The special color value 0xffffffff (all ff's) is the "see through" color, which lets the widget's own Fl_Group::color() show through behind the text. This special text background color is the default, and is what most situations need.

See also

     textbgcolor_default(Fl_Color)

12.141.5.58  textbgcolor_default() [1/2]

void Fl_Terminal::textbgcolor_default ( Fl_Color val )

Set the default text background color used by any new text added after a reset (\texttt{\textasciitilde}<ESC>c, \texttt{\textasciitilde}<ESC>[0m, or reset_terminal()). Does not affect the 'current' text background color; use textbgcolor(Fl_Color) to set that.

The special color value 0xffffffff (all ff's) is the "see through" color, which lets the widget's own Fl_Group::color() show through behind the text. This special text background color is the default, and is what most situations need.

See also

     textbgcolor(Fl_Color)

12.141.5.59  textbgcolor_default() [2/2]

Fl_Color Fl_Terminal::textbgcolor_default ( void ) const [inline]

Return text's default background color.

See also

     textbgcolor()

12.141.5.60  textbgcolor_xterm()  

void Fl_Terminal::textbgcolor_xterm ( uchar val )

Sets the background text color as one of the 8 'xterm color' values.

This will be the foreground color used for all newly printed text, similar to the \texttt{\textasciitilde}<ESC>\{#m escape sequence, where # is between 40 and 47. This color will be reset to the default bg color if reset_terminal() is called, or by \texttt{\textasciitilde}<ESC>c, \texttt{\textasciitilde}<ESC>[0m, etc. The xterm color intensity values can be influenced by the Dim/Bold/Normal modes (which can be set with e.g. \texttt{\textasciitilde}<ESC>\{1m, textattrib(), etc), so the actual RGB values of these colors allow room for Dim/Bold to influence their brightness. For instance, "Normal Red" is not full brightness to allow "Bold Red" to be brighter. This goes for all colors except 'Black', which is not influenced by Dim or Bold; Black is always Black. The 8 color xterm values are:

- 0 = Black
- 1 = Red
- 2 = Green
- 3 = Yellow
- 4 = Blue
- 5 = Magenta
- 6 = Cyan
- 7 = White
See also
textbgcolor_default(Fl_Color)

12.141.5.61  textcolor()

void Fl_Terminal::textcolor (  
Fl_Color val  )

Set the text color for the terminal.  
This is a convenience method that sets both textfgcolor() and textfgcolor_default(), ensuring both are set to the same value.

12.141.5.62  textfgcolor()

void Fl_Terminal::textfgcolor (  
Fl_Color val  )

Set text foreground drawing color to fltk color val used by any new text added.  
Use this for temporary color changes, similar to <ESC>[38;2;<R>;<G>;<B>m.  
This setting does not affect the 'default' text colors used by <ESC>[0m, <ESC>c, reset_terminal(), etc. To change both the current and default fg color, also use textfgcolor_default(Fl_Color). Example:

// Set both 'current' and 'default' colors  
Fl_Color amber = 0xd0704000;  
tty->textfgcolor(amber);  // set 'current' fg color  
tty->textfgcolor_default(amber);  // set 'default' fg color used by ESC[0m reset

See also
textfgcolor_default(Fl_Color)

12.141.5.63  textfgcolor_default() [1/2]

void Fl_Terminal::textfgcolor_default (  
Fl_Color val  )

Set the default text foreground color used by <ESC>c, <ESC>[0m, and reset_terminal().  
Does not affect the 'current' text foreground color; use textfgcolor(Fl_Color) to set that.

See also
textfgcolor(Fl_Color)

12.141.5.64  textfgcolor_default() [2/2]

Fl_Color Fl_Terminal::textfgcolor_default (  
void ) const [inline]

Return text's default foreground color.

See also
textfgcolor()

12.141.5.65  textfgcolor_xterm()

void Fl_Terminal::textfgcolor_xterm (  
uchar val  )

Sets the foreground text color as one of the 8 'xterm color' values.  
This will be the foreground color used for all newly printed text, similar to the <ESC>[#m escape sequence, where # is between 30 and 37.  
This color will be reset to the default fg color if reset_terminal() is called, or by <ESC>c, <ESC>[0m, etc.
The xterm color intensity values can be influenced by the Dim/Bold/Normal modes (which can be set with e.g. 
<ESC>[1m, textattrib(), etc), so the actual RGB values of these colors allow room for Dim/Bold to influence their 
brightness. For instance, "Normal Red" is not full brightness to allow "Bold Red" to be brighter. This goes for all 
colors except 'Black', which is not influenced by Dim or Bold; Black is always Black.
The 8 color xterm values are:

- 0 = Black
- 1 = Red
- 2 = Green
- 3 = Yellow
- 4 = Blue
- 5 = Magenta
- 6 = Cyan
- 7 = White

See also

textfgcolor_default(Fl_Color)

12.141.5.66  textfont()

void Fl_Terminal::textfont ( 
    Fl_Font val )

Sets the font used for all text displayed in the terminal.
This affects all existing text (in display and history) as well as any newly printed text.
Only monospace fonts are recommended, such as FL_COURIER or FL_SCREEN. Custom fonts configured with 
Fl::set_font() will also work, as long as they are monospace.

12.141.5.67  textsize()

void Fl_Terminal::textsize ( 
    Fl_Fontsize val )

Sets the font size used for all text displayed in the terminal.
This affects all existing text (in display and history) as well as any newly printed text.
Changing this will affect the display_rows() and display_columns().

12.141.5.68  u8cDisp_row()

Fl_Terminal::Utf8Char * Fl_Terminal::u8cDisp_row ( 
    int drow ) [protected]

Return pointer to the first u8c character in row drow of the display.

- 'drow' is indexed relative to the beginning of the display buffer.

- This can be used to walk all columns in the specified row, e.g.
  
  `// Print all chars in first row of display (ASCII and UTF-8)`
  `Utf8Char u8c = u8cDisp_row(0);`  // first char of first display row
  `int scol = 0, ecol = disp_cols();`  // start/end for column loop
  `for (int col=scol; col<ecol; col++, u8c++) {`  // loop from first char to last
      `char *text = u8c->text_utf8();`  // text string for char
      `int len = u8c->length();`  // text string length for char
      `::printf("<%.*s>", len, text);`  // print potentially multibyte char
  }`
12.141.5.69  u8c_hist_row()

Fl_Terminal::Utf8Char * Fl_Terminal::u8c_hist_row (  
    int hrow ) [protected]

Return u8c for beginning of a row inside the scrollback history.  
'hrow' is indexed relative to the beginning of the scrollback history buffer.

See also

    u8c_disp_row(int) for example use.

12.141.5.70  u8c_hist_use_row()

Fl_Terminal::Utf8Char * Fl_Terminal::u8c_hist_use_row (  
    int hurow ) [protected]

Return u8c for beginning of row hurow inside the 'in use' part of the scrollback history.  
'hurow' is indexed relative to the beginning of the 'in use' part of the scrollback history buffer. This may be a different from u8c_hist_row(int) if the history was recently cleared, and there aren't many (or any) rows in the history buffer that have been populated with scrollback text yet.

See also

    u8c_disp_row(int) for example use.

12.141.5.71  u8c_ring_row()

Fl_Terminal::Utf8Char * Fl_Terminal::u8c_ring_row (  
    int grow ) [protected]

Return UTF-8 char for row grow in the ring buffer.  
grow is globally indexed relative to the beginning of the ring buffer, so this method can access ANY character in the entire ring buffer (hist or disp) by the global index.
Scolling offset is NOT applied; this is raw access to the ring's rows.  Should really ONLY be used for making a complete copy of the ring.

Example:
// Walk ALL rows and cols in the ring buffer..
for (int row=0; row<ring.rows(); row++) {  
    Utf8Char *u8c = ring.u8c_ring_row(row);  
    for (int col=0; col<ring.cols(); col++,u8c++) {  
        ..make use of u8c->xxx() methods..  
    }  
}

12.141.5.72  vprintf()

void Fl_Terminal::vprintf (  
    const char * fmt,  
    va_list ap )

Appends printf formatted messages to the terminal.  
Subclasses can use this to implement their own printf() functionality.  
The string can contain UTF-8, crlf's, and ANSI sequences are also supported when ansi(bool) is set to 'true'.

Note
The expanded string is currently limited to 1024 characters (including NULL). For longer strings use append() which has no string limits.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fmt</td>
<td>is a printf format string for the message text.</td>
</tr>
<tr>
<td>ap</td>
<td>is a va_list created by va_start() and closed with va_end(), which the caller is responsible for handling.</td>
</tr>
</tbody>
</table>
12.141.5.73  \textbf{w\_to\_col()}

\begin{verbatim}
int Fl_Terminal::w_to_col (int W) const [protected]
\end{verbatim}

Given a width in pixels, return number of columns that "fits" into that area. This is used by the constructor to size the row/cols to fit the widget size.

12.141.5.74  \textbf{walk\_selection()}

\begin{verbatim}
const Fl_Terminal::Utf8Char * Fl_Terminal::walk_selection (const Utf8Char * u8c,
int & row,
int & col) const [protected]
\end{verbatim}

Walk the mouse selection one character at a time from beginning to end, returning a Utf8Char* to the next character in the selection, or NULL if the end was reached, or if there's no selection. This is easier to use for walking the selection than \texttt{get\_selection()}. \texttt{u8c} should start out as NULL, rewinding to the beginning of the selection. If the returned Utf8Char* is not NULL, \texttt{row} and \texttt{col} return the character's row/column position in the ring buffer.

\begin{verbatim}
// EXAMPLE: Walk the entire mouse selection, if any
int row,col; // the returned row/col for each char
Utf8Char *u8c = NULL; // start with NULL to begin walk
while ((u8c = walk_selection(u8c, row, col))) { // loop until end char reached
   .do something with *u8c..
}
\end{verbatim}

See also \texttt{get\_selection()}, \texttt{is\_selection()}

\begin{tabular}{|c|}
\hline
\texttt{u8c} & NULL on first iter \\
\hline
\texttt{row} & returned row# \\
\hline
\texttt{col} & returned col# \\
\hline
\end{tabular}

12.141.6  \textbf{Member Data Documentation}

12.141.6.1  \textbf{scrollbar}

\begin{verbatim}
Fl_Scrollbar* Fl_Terminal::scrollbar
\end{verbatim}

Vertical scrollbar. Public, so that it can be accessed directly.

\textbf{Todo} Support scrollbar\_left/right() - See \texttt{Fl\_Browser\_::scrollbar} docs

The documentation for this class was generated from the following files:

\begin{itemize}
\item \texttt{Fl\_Terminal.H}
\item \texttt{Fl\_Terminal.cxx}
\end{itemize}

12.142  \textbf{Fl\_Text\_Buffer Class Reference}

This class manages Unicode text displayed in one or more \texttt{Fl\_Text\_Display} widgets.

\texttt{#include <Fl\_Text\_Buffer.H>}

\begin{itemize}
\item \texttt{void add\_modify\_callback (Fl\_Text\_Modify\_Cb bufModifiedCB, void *cbArg)}
\end{itemize}
12.142 Fl_Text_Buffer Class Reference

Adds a callback function that is called whenever the text buffer is modified.

- void **add_predelete_callback** (Fl_Text_Predelete_Cb bufPredelCB, void *cbArg)

  Adds a callback routine to be called before text is deleted from the buffer.

- void **add_modify_callback** (void *cbArg)

  Calls all modify callbacks that have been registered using the add_modify_callback() method.

- void **add_predelete_callbacks** ()

  Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.

- bool **can_redo** () const

  Check if undo is enabled and if the last undo action can be redone.

- bool **can_undo** () const

  Check if undo is enabled and if the last action can be undone.

- void **canUndo** (char flag=1)

  Enable or disable undo actions for this text buffer.

- unsigned int **char_at** (int pos) const

  Returns the character at the specified position pos in the buffer.

- void **copy** (Fl_Text_Buffer *fromBuf, int fromStart, int fromEnd, int toPos)

  Copies text from another Fl_Text_Buffer to this one.

- int **count_displayed_characters** (int lineStartPos, int targetPos) const

  Count the number of displayed characters between buffer position lineStartPos and targetPos.

- int **count_lines** (int startPos, int endPos) const

  Counts the number of newlines between startPos and endPos in buffer.

- int **findchar_backward** (int startPos, unsigned int searchChar, int *foundPos) const

  Search backwards in buffer buf for character searchChar, starting with the character before startPos, returning the result in foundPos.

- int **findchar_forward** (int startPos, unsigned searchChar, int *foundPos) const

  Finds the next occurrence of the specified character.

- Fl_Text_Buffer (int requestedSize=0, int preferredGapSize=1024)

  Create an empty text buffer of a pre-determined size.

- int **highlight** ()

  Returns a non-zero value if text has been highlighted, 0 otherwise.

- void **highlight** (int start, int end)

  Highlights the specified text within the buffer.

- int **highlight_position** (int *start, int *end)

  Highlights the specified text between start and end within the buffer.

- const Fl_Text_Selection * **highlight_selection** () const

  Returns the current highlight selection.

- char * **highlight_text** ()

  Returns the highlighted text.

- void **insert** (int pos, const char *text, int insertedLength=-1)

  Inserts null-terminated string text at position pos.
• int insertfile (const char *file, int pos, int buflen=128 *1024)
  Inserts a file at the specified position.
• bool is_word_separator (int pos) const
  Returns whether character at position pos is a word separator.
• int length () const
  Returns the number of bytes in the buffer.
• int line_end (int pos) const
  Finds and returns the position of the end of the line containing position pos (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).
• int line_start (int pos) const
  Returns the position of the start of the line containing position pos.
• char * line_text (int pos) const
  Returns the text from the entire line containing the specified character position.
• int loadfile (const char *file, int buflen=128 *1024)
  Loads a text file into the buffer.
• int next_char (int ix) const
  Returns the index of the next character.
• int next_char_clipped (int ix) const
• int outputfile (const char *file, int start, int end, int buflen=128 *1024)
  Writes the specified portions of the text buffer to a file.
• int prev_char (int ix) const
  Returns the index of the previous character.
• int prev_char_clipped (int ix) const
• Fl_Text_Selection * primary_selection ()
  Returns the primary selection.
• const Fl_Text_Selection * primary_selection () const
  Returns the primary selection.
• void printf (const char *fmt,...)
  Appends printf formatted messages to the end of the buffer.
• int redo (int *cp=0)
  Redo previous undo action.
• void remove (int start, int end)
  Deletes a range of characters in the buffer.
• void remove_modify_callback (Fl_Text_Modify_Cb bufModifiedCB, void *cbArg)
  Removes a modify callback.
• void remove_predelete_callback (Fl_Text_Predelete_Cb predelCB, void *cbArg)
  Removes a callback routine bufPreDeleteCB associated with argument cbArg to be called before text is deleted from the buffer.
• void remove_secondary_selection ()
  Removes the text from the buffer corresponding to the secondary text selection object.
• void remove_selection ()
  Removes the text in the primary selection.
• void replace (int start, int end, const char *text, int insertedLength=-1)
  Deletes the characters between start and end, and inserts the null-terminated string text in their place in the buffer.
• void replace_secondary_selection (const char *text)
  Replaces the text from the buffer corresponding to the secondary text selection object with the new string text.
• void replace_selection (const char *text)
  Replaces the text in the primary selection.
• int rewind_lines (int startPos, int nLines)
  Finds and returns the position of the first character of the line nLines backwards from startPos (not counting the character pointed to by startPos if that is a newline) in the buffer.
- int `savefile` (const char *file, int buflen=128 * 1024)
  Saves a text file from the current buffer.
- int `search_backward` (int startPos, const char *searchString, int *foundPos, int matchCase=0) const
  Search backwards in buffer for string `searchString`, starting with the character at `startPos`, returning the result in `foundPos`.
- int `search_forward` (int startPos, const char *searchString, int *foundPos, int matchCase=0) const
  Search forwards in buffer for string `searchString`, starting with the character `startPos`, and returning the result in `foundPos`.
- void `secondary_select` (int start, int end)
  Selects a range of characters in the secondary selection.
- int `secondary_selected` () const
  Returns a non-zero value if text has been selected in the secondary text selection, 0 otherwise.
- const Fl_Text_Selection * `secondary_selection` () const
  Returns the secondary selection.
- int `secondary_selection_position` (int *start, int *end) const
  Returns the current selection in the secondary text selection object.
- char * `secondary_selection_text` ()
  Returns the text in the secondary selection.
- void `secondary_unselect` ()
  Clears any selection in the secondary text selection object.
- void `select` (int start, int end)
  Selects a range of characters in the buffer.
- int `selected` () const
  Returns a non-zero value if text has been selected, 0 otherwise.
- int `selection_position` (int *start, int *end) const
  Gets the selection position.
- char * `selection_text` ()
  Returns the currently selected text.
- int `skip_displayed_characters` (int lineStartPos, int nChars)
  Count forward from buffer position `lineStartPos` in displayed characters.
- int `skip_lines` (int startPos, int nLines)
  Finds the first character of the line `nLines` forward from `startPos` in the buffer and returns its position.
- int `tab_distance` () const
  Gets the tab width.
- void `tab_distance` (int tabDist)
  Set the hardware tab distance (width) used by all displays for this buffer, and used in computing offsets for rectangular selection operations.
- char * `text` () const
  Get a copy of the entire contents of the text buffer.
- void `text` (const char *text)
  Replaces the entire contents of the text buffer.
- char * `text_range` (int start, int end) const
  Get a copy of a part of the text buffer.
- int `undo` (int *cp=0)
  Undo text modification according to the undo variables or insert text from the undo buffer.
- void `unhighlight` ()
  Unhighlights text in the buffer.
- void `unselect` ()
  Cancels any previous selection on the primary text selection object.
- int `utf8_align` (int) const
  Align an index into the buffer to the current or previous UTF-8 boundary.
• void vprintf (const char *fmt, va_list ap)
  Can be used by subclasses that need their own printf() style functionality.

• int word_end (int pos) const
  Returns the position corresponding to the end of the word.

• int word_start (int pos) const
  Returns the position corresponding to the start of the word.

• ~Fl_Text_Buffer ()
  Frees a text buffer.

Public Attributes

• int input_file_was_transcoded
  true if the loaded file has been transcoded to UTF-8.

• void(transcoding_warning_action)(Fl_Text_Buffer *)
  Pointer to a function called after reading a non UTF-8 encoded file.

Static Public Attributes

• static const char * file_encoding_warning_message
  This message may be displayed using the fl_alert() function when a file which was not UTF-8 encoded is input.

Protected Member Functions

• int apply_undo (Fl_Text_Undo_Action *action, int *cursorPos)
  Apply the current undo/redo operation, called from undo() or redo().

• void call_modify_callbacks (int pos, int nDeleted, int nInserted, int nRestyled, const char *deletedText) const
  Calls the stored modify callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.

• void call_predelete_callbacks (int pos, int nDeleted) const
  Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.

• int insert_ (int pos, const char *text, int insertedLength=-1)
  Internal (non-redisplaying) version of insert().

• void move_gap (int pos)
  Move the gap to start at a new position.

• void reallocate_with_gap (int newGapStart, int newGapLen)
  Reallocates the text storage in the buffer to have a gap starting at newGapStart and a gap size of newGapLen, preserving the buffer’s current contents.

• void redisplay_selection (Fl_Text_Selection *oldSelection, Fl_Text_Selection *newSelection) const
  Calls the stored redisplay procedure(s) for this buffer to update the screen for a change in a selection.

• void remove_ (int start, int end)
  Internal (non-redisplaying) version of remove().

• void remove_selection_ (Fl_Text_Selection *sel)
  Removes the text from the buffer corresponding to sel.

• void replace_selection_ (Fl_Text_Selection *sel, const char *text)
  Replaces the text in selection sel.

• char * selection_text_ (Fl_Text_Selection *sel) const

• void update_selections (int pos, int nDeleted, int nInserted)
  Updates all of the selections in the buffer for changes in the buffer’s text.
Protected Attributes

- char * mBuf
  allocated memory where the text is stored
- char mCanUndo
  if this buffer is used for attributes, it must not do any undo calls
- void ** mCbArgs
  caller arguments for modifyProcs above
- int mCursorPosHint
  hint for reasonable cursor position after a buffer modification operation
- int mGapEnd
  points to the first character after the gap
- int mGapStart
  points to the first character of the gap
- Fl_Text_Selection mHighlight
  highlighted areas
- int mLength
  length of the text in the buffer (the length of the buffer itself must be calculated: gapEnd - gapStart + length)
- Fl_Text_Modify_Cb * mModifyProcs
  procedures to call when buffer is modified to redisplay contents
- int mNModifyProcs
  number of modify-redisplay procs attached
- int mNPredelProcs
  number of pre-delete procs attached
- void ** mPredeleteCbArgs
  caller argument for pre-delete proc above
- Fl_Text_Predel_Cb * mPredelProcs
  procedure to call before text is deleted from the buffer; at most one is supported.
- int mPreferredGapSize
  the default allocation for the text gap is 1024 bytes and should only be increased if frequent and large changes in buffer size are expected
- Fl_Text_Selection mPrimary
  highlighted areas
- Fl_Text_Undo_Action_List * mRedoList
  List of redo event.
- Fl_Text_Selection mSecondary
  highlighted areas
- int mTabDist
  equiv.
- Fl_Text_Undo_Action * mUndo
  local undo event
- Fl_Text_Undo_Action_List * mUndoList
  List of undo event.

12.142.1 Detailed Description

This class manages Unicode text displayed in one or more Fl_Text_Display widgets. All text in Fl_Text_Buffer must be encoded in UTF-8. All indices used in the function calls must be aligned to the start of a UTF-8 sequence. All indices and pointers returned will be aligned. All functions that return a single character will return that in an unsigned int in UCS-4 encoding. The Fl_Text_Buffer class is used by the Fl_Text_Display and Fl_Text_Editor to manage complex text data and is based upon the excellent NEdit text editor engine - see https://sourceforge.net/projects/nedit/.
12.142.2 Constructor & Destructor Documentation

12.142.2.1 Fl_Text_Buffer()

Fl_Text_Buffer::Fl_Text_Buffer (  
    int requestedSize = 0,  
    int preferredGapSize = 1024  
)  
Create an empty text buffer of a pre-determined size.

Parameters

<table>
<thead>
<tr>
<th>requestedSize</th>
<th>use this to avoid unnecessary re-allocation if you know exactly how much the buffer will need to hold</th>
</tr>
</thead>
<tbody>
<tr>
<td>preferredGapSize</td>
<td>Initial size for the buffer gap (empty space in the buffer where text might be inserted if the user is typing sequential characters)</td>
</tr>
</tbody>
</table>

12.142.3 Member Function Documentation

12.142.3.1 add_modify_callback()

void Fl_Text_Buffer::add_modify_callback (  
    Fl_Text_Modify_Cb bufModifiedCB,  
    void * cbArg  
)  
Adds a callback function that is called whenever the text buffer is modified. The callback function is declared as follows:

typedef void (*Fl_Text_Modify_Cb)(int pos, int nInserted, int nDeleted,  
                                 int nRestyled, const char* deletedText,  
                                 void* cbArg);

12.142.3.2 address() [1/2]

char * Fl_Text_Buffer::address (  
    int pos  
)  [inline]  
Convert a byte offset in buffer into a memory address.

Parameters

| pos | byte offset into buffer |

Returns

byte offset converted to a memory address

12.142.3.3 address() [2/2]

const char * Fl_Text_Buffer::address (  
    int pos  
) const  [inline]  
Convert a byte offset in buffer into a memory address.

Parameters

| pos | byte offset into buffer |

Returns

byte offset converted to a memory address
12.142.3.4  append()

void Fl_Text_Buffer::append (  
    const char * t,  
    int addedLength = -1 ) [inline]

Appends the text string to the end of the buffer.

Parameters

<table>
<thead>
<tr>
<th>t</th>
<th>UTF-8 encoded text</th>
</tr>
</thead>
<tbody>
<tr>
<td>addedLength</td>
<td>number of bytes to append, or -1 to indicate t is null-terminated</td>
</tr>
</tbody>
</table>

12.142.3.5  appendfile()

int Fl_Text_Buffer::appendfile (  
    const char * file,  
    int buflen = 128*1024 ) [inline]

Appends the named file to the end of the buffer.
See also insertfile().

12.142.3.6  byte_at()

char Fl_Text_Buffer::byte_at (  
    int pos ) const

Returns the raw byte at the specified position pos in the buffer.
Positions start at 0.

Parameters

| pos  | byte offset into buffer |

Returns

unencoded raw byte

12.142.3.7  can_redo()

bool Fl_Text_Buffer::can_redo ( ) const

Check if undo is enabled and if the last undo action can be redone.

Check if undo is enabled and if the last undo action can be redone.
See also
canUndo()

12.142.3.8  can_undo()

bool Fl_Text_Buffer::can_undo ( ) const

Check if undo is enabled and if the last action can be undone.

See also
canUndo()

12.142.3.9  canUndo()

void Fl_Text_Buffer::canUndo (  
    char flag = 1 )
Enable or disable undo actions for this text buffer.
Undo actions are enabled for text buffer by default. If used as a style buffer in Fl_Text_Display, undo actions are
disabled as they are handled by the text buffer.

See also
    can_undo()

12.142.3.10  char_at()

    unsigned int Fl_Text_Buffer::char_at ( int pos ) const

Returns the character at the specified position pos in the buffer.
Positions start at 0.

Parameters

    pos  byte offset into buffer, pos must be at a UTF-8 character boundary

Returns
    Unicode UCS-4 encoded character

12.142.3.11  copy()

    void Fl_Text_Buffer::copy ( Fl_Text_Buffer ∗ fromBuf, int fromStart, int fromEnd, int toPos )

Copies text from another Fl_Text_Buffer to this one.

Parameters

    fromBuf  source text buffer, may be the same as this
    fromStart  byte offset into buffer
    fromEnd  byte offset into buffer
    toPos  destination byte offset into buffer

12.142.3.12  count_displayed_characters()

    int Fl_Text_Buffer::count_displayed_characters ( int lineStartPos, int targetPos ) const

Count the number of displayed characters between buffer position lineStartPos and targetPos.
Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and
control characters are expanded.

12.142.3.13  count_lines()

    int Fl_Text_Buffer::count_lines ( int startPos, int endPos ) const

Counts the number of newlines between startPos and endPos in buffer.
The character at position endPos is not counted.
12.142.3.14 findchar_backward()

```cpp
int Fl_Text_Buffer::findchar_backward (  
    int startPos,  
    unsigned int searchChar,  
    int * foundPos ) const
```

Search backwards in buffer buf for character searchChar, starting with the character before startPos, returning the result in foundPos.

Returns 1 if found, 0 if not. The difference between this and search_backward() is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: newline.

**Parameters**

<table>
<thead>
<tr>
<th>startPos</th>
<th>byte offset to start position</th>
</tr>
</thead>
<tbody>
<tr>
<td>searchChar</td>
<td>UCS-4 character that we want to find</td>
</tr>
<tr>
<td>foundPos</td>
<td>byte offset where the character was found</td>
</tr>
</tbody>
</table>

**Returns**

1 if found, 0 if not

12.142.3.15 findchar_forward()

```cpp
int Fl_Text_Buffer::findchar_forward (  
    int startPos,  
    unsigned searchChar,  
    int * foundPos ) const
```

Finds the next occurrence of the specified character. Search forwards in buffer for character searchChar, starting with the character startPos, and returning the result in foundPos. Returns 1 if found, 0 if not. The difference between this and search_forward() is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: newline.

**Parameters**

<table>
<thead>
<tr>
<th>startPos</th>
<th>byte offset to start position</th>
</tr>
</thead>
<tbody>
<tr>
<td>searchChar</td>
<td>UCS-4 character that we want to find</td>
</tr>
<tr>
<td>foundPos</td>
<td>byte offset where the character was found</td>
</tr>
</tbody>
</table>

**Returns**

1 if found, 0 if not

12.142.3.16 highlight_text()

```cpp
char * Fl_Text_Buffer::highlight_text ( )
```

Returns the highlighted text.

When you are done with the text, free it using the free() function.

12.142.3.17 insert()

```cpp
void Fl_Text_Buffer::insert (  
    int pos,  
    const char * text,  
    int insertedLength = -1 )
```

Inserts null-terminated string text at position pos.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>insertion position as byte offset (must be UTF-8 character aligned)</td>
</tr>
<tr>
<td>text</td>
<td>UTF-8 encoded text</td>
</tr>
<tr>
<td>insertedLength</td>
<td>number of bytes to insert, or -1 to indicate text is null-terminated</td>
</tr>
</tbody>
</table>

12.142.3.18  **insert()**

```cpp
int Fl_Text_Buffer::insert_ (  
  int pos,  
  const char * text,  
  int insertedLength = -1 ) [protected]
```

Internal (non-redisplaying) version of `insert()`.

Returns the length of text inserted (this is just `strlen(text)` if `insertedLength` == `-1`, however this calculation can be expensive and the length will be required by any caller who will continue on to call redisplay). `pos` must be contiguous with the existing text in the buffer (i.e. not past the end).

Returns

the number of bytes inserted

12.142.3.19  **insertfile()**

```cpp
int Fl_Text_Buffer::insertfile (  
  const char * file,  
  int pos,  
  int buflen = 128*1024 )
```

Inserts a file at the specified position.

Returns

- 0 on success
- non-zero on error (`strerror()` contains reason)
- 1 indicates open for read failed (no data loaded)
- 2 indicates error occurred while reading data (data was partially loaded)

File can be UTF-8 or CP1252 encoded. If the input file is not UTF-8 encoded, the `Fl_Text_Buffer` widget will contain data transcoded to UTF-8. By default, the message `Fl_Text_Buffer::file_encoding_warning_message` will warn the user about this.

See also

`input_file_was_transcoded` and `transcoding_warning_action`.

12.142.3.20  **is_word_separator()**

```cpp
bool Fl_Text_Buffer::is_word_separator (  
  int pos ) const
```

Returns whether character at position `pos` is a word separator.

Pos must be at a character boundary.

12.142.3.21  **length()**

```cpp
int Fl_Text_Buffer::length ( ) const [inline]
```

Returns the number of bytes in the buffer.

Returns

size of text in bytes
12.142.3.22  line_end()

int Fl_Text_Buffer::line_end (  
    int pos ) const

Finds and returns the position of the end of the line containing position pos (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).

Parameters

| pos | byte index into buffer |

Returns

byte offset to line end

12.142.3.23  line_start()

int Fl_Text_Buffer::line_start (  
    int pos ) const

Returns the position of the start of the line containing position pos.

Parameters

| pos | byte index into buffer |

Returns

byte offset to line start

12.142.3.24  line_text()

c char * Fl_Text_Buffer::line_text (  
    int pos ) const

Returns the text from the entire line containing the specified character position. When you are done with the text, free it using the free() function.

Parameters

| pos | byte index into buffer |

Returns

copy of UTF-8 text, must be free'd

12.142.3.25  loadfile()

int Fl_Text_Buffer::loadfile (  
    const char * file,  
    int buflen = 128*1024 ) [inline]

Loads a text file into the buffer.
See also insertfile().

12.142.3.26  next_char()

int Fl_Text_Buffer::next_char (  
    int ix ) const
Returns the index of the next character.
12.142 Fl_Text_Buffer Class Reference

Parameters

*ix*  |  index to the current character

### 12.142.3.27 outputfile()

```cpp
int Fl_Text_Buffer::outputfile (
    const char * file,
    int start,
    int end,
    int buflen = 128*1024 )
```

Writes the specified portions of the text buffer to a file.

**Returns**

- 0 on success
- non-zero on error (strerror() contains reason)
- 1 indicates open for write failed (no data saved)
- 2 indicates error occurred while writing data (data was partially saved)

**See also**

savefile(const char *file, int buflen)

### 12.142.3.28 prev_char()

```cpp
int Fl_Text_Buffer::prev_char ( int ix ) const
```

Returns the index of the previous character.

Parameters

*ix*  |  index to the current character

### 12.142.3.29 printf()

```cpp
void Fl_Text_Buffer::printf ( const char * fmt,
    ... )
```

Appends printf formatted messages to the end of the buffer.

**Example:**

```cpp
#include <FL/Fl_Text_Display.H>
int main(..) { 
    // Create a text display widget and assign it a text buffer
    Fl_Text_Display *tdsp = new Fl_Text_Display();
    Fl_Text_Buffer *tbuf = new Fl_Text_Buffer();
    tdsp->buffer(tbuf);
     // Append three lines of formatted text to the buffer
    tbuf->printf("The current date is: %s\nThe time is: %s\n", date_str, time_str);
    tbuf->printf("The current PID is %ld\n", (long)getpid());
};
```

**Note**

The expanded string is currently limited to 1024 characters.
Parameters

\textit{fmt} is a printf format string for the message text.

\subsection{remove()}

\begin{verbatim}
void Fl_Text_Buffer::remove (  
    int start,  
    int end )
\end{verbatim}

Deletes a range of characters in the buffer.

Parameters

- \textit{start}: byte offset to first character to be removed
- \textit{end}: byte offset to character after last character to be removed

\subsection{remove()}

\begin{verbatim}
void Fl_Text_Buffer::remove_ (  
    int start,  
    int end ) [protected]
\end{verbatim}

Internal (non-redisplaying) version of \textit{remove()}. Removes the contents of the buffer between \textit{start} and \textit{end} (and moves the gap to the site of the delete).

\subsection{replace()}

\begin{verbatim}
void Fl_Text_Buffer::replace (  
    int start,  
    int end,  
    const char * text,  
    int insertedLength = -1 )
\end{verbatim}

Deletes the characters between \textit{start} and \textit{end}, and inserts the null-terminated string \textit{text} in their place in the buffer.

Parameters

- \textit{start}: byte offset to first character to be removed and new insert position
- \textit{end}: byte offset to character after last character to be removed
- \textit{text}: UTF-8 encoded text
- \textit{insertedLength}: number of bytes to insert, or -1 to indicate \textit{text} is null-terminated

\subsection{rewind_lines()}

\begin{verbatim}
int Fl_Text_Buffer::rewind_lines (  
    int startPos,  
    int nLines )
\end{verbatim}

Finds and returns the position of the first character of the line \textit{nLines} backwards from \textit{startPos} (not counting the character pointed to by \textit{startpos} if that is a newline) in the buffer. \textit{nLines} == 0 means find the beginning of the line.

\subsection{savefile()}

\begin{verbatim}
int Fl_Text_Buffer::savefile (  
    const char * file,  
    int buflen = 128*1024 ) [inline]
\end{verbatim}
Saves a text file from the current buffer.

Returns

- 0 on success
- non-zero on error (strerror() contains reason)
- 1 indicates open for write failed (no data saved)
- 2 indicates error occurred while writing data (data was partially saved)

See also

outputfile(const char *file, int start, int end, int buflen)

12.142.3.35 search_backward()

int Fl_Text_Buffer::search_backward {
    int startPos,
    const char * searchString,
    int * foundPos,
    int matchCase = 0 ) const

Search backwards in buffer for string searchString, starting with the character at startPos, returning the result in foundPos.

Returns 1 if found, 0 if not.

Parameters

| startPos  | byte offset to start position |
| searchString | UTF-8 string that we want to find |
| foundPos | byte offset where the string was found |
| matchCase | if set, match character case |

Returns 1 if found, 0 if not.

12.142.3.36 search_forward()

int Fl_Text_Buffer::search_forward {
    int startPos,
    const char * searchString,
    int * foundPos,
    int matchCase = 0 ) const

Search forwards in buffer for string searchString, starting with the character startPos, and returning the result in foundPos.

Returns 1 if found, 0 if not.

Parameters

| startPos  | byte offset to start position |
| searchString | UTF-8 string that we want to find |
| foundPos | byte offset where the string was found |
| matchCase | if set, match character case |
Returns

1 if found, 0 if not

12.142.3.37 secondary_selection_text()

char * Fl_Text_Buffer::secondary_selection_text ( )
Returns the text in the secondary selection.
When you are done with the text, free it using the free() function.

12.142.3.38 selection_text()

char * Fl_Text_Buffer::selection_text ( )
Returns the currently selected text.
When you are done with the text, free it using the free() function.

12.142.3.39 skip_displayed_characters()

int Fl_Text_Buffer::skip_displayed_characters ( int lineStartPos, int nChars )
Count forward from buffer position `lineStartPos` in displayed characters.
Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and control characters are expanded.

Parameters

<table>
<thead>
<tr>
<th>lineStartPos</th>
<th>byte offset into buffer</th>
</tr>
</thead>
<tbody>
<tr>
<td>nChars</td>
<td>number of bytes that are sent to the display</td>
</tr>
</tbody>
</table>

Returns

byte offset in input after all output bytes are sent

12.142.3.40 tab_distance()

int Fl_Text_Buffer::tab_distance ( ) const [inline]
Gets the tab width.
The tab width is measured in characters. The pixel position is calculated using an average character width.

12.142.3.41 text() [1/2]

char * Fl_Text_Buffer::text ( ) const
Get a copy of the entire contents of the text buffer.
Memory is allocated to contain the returned string, which the caller must free.

Returns

newly allocated text buffer - must be free'd, text is UTF-8

12.142.3.42 text() [2/2]

void Fl_Text_Buffer::text ( const char * text )
Replaces the entire contents of the text buffer.

Parameters

| text | Text must be valid UTF-8. If null, an empty string is substituted. |
12.142.3.43  text_range()

char * Fl_Text_Buffer::text_range (  
   int start,  
   int end ) const

Get a copy of a part of the text buffer.
Return a copy of the text between start and end character positions from text buffer buf. Positions start at 0, and the range does not include the character pointed to by end. When you are done with the text, free it using the free() function.

Parameters

<table>
<thead>
<tr>
<th>start</th>
<th>byte offset to first character</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>byte offset after last character in range</td>
</tr>
</tbody>
</table>

Returns

newly allocated text buffer - must be free'd, text is UTF-8

12.142.3.44  undo()

int Fl_Text_Buffer::undo (  
   int * cursorPos = 0 )

Undo text modification according to the undo variables or insert text from the undo buffer.
Take the previous changes and undo them.
Return the previous cursor position in cursorPos. Returns 1 if the undo was applied. CursorPos will be at a character boundary.

12.142.3.45  vprintf()

void Fl_Text_Buffer::vprintf (  
   const char * fmt,  
   va_list ap )

Can be used by subclasses that need their own printf() style functionality.

Note

The expanded string is currently limited to 1024 characters.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>fmt</th>
<th>is a printf format string for the message text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>ap</td>
<td>is a va_list created by va_start() and closed with va_end(), which the caller is responsible for handling.</td>
</tr>
</tbody>
</table>

12.142.3.46  word_end()

int Fl_Text_Buffer::word_end (  
   int pos ) const

Returns the position corresponding to the end of the word.

Parameters

| pos | byte index into buffer |

Generated by Doxygen
Returns
byte offset to word end

12.142.3.47 word_start()

```c
int Fl_Text_Buffer::word_start (int pos ) const
```

Returns the position corresponding to the start of the word.

Parameters

| pos | byte index into buffer |

Returns
byte offset to word start

### 12.142.4 Member Data Documentation

#### 12.142.4.1 file_encoding_warning_message

```c
const char * Fl_Text_Buffer::file_encoding_warning_message [static]
```

Initial value:

```
"Displayed text contains the UTF-8 transcoding\n"of the input file which was not UTF-8 encoded.\n"Some changes may have occurred."
```

This message may be displayed using the fl_alert() function when a file which was not UTF-8 encoded is input.

#### 12.142.4.2 mTabDist

```c
int Fl_Text_Buffer::mTabDist [protected]
```

equiv. number of characters in a tab

#### 12.142.4.3 transcoding_warning_action

```c
void(* Fl_Text_Buffer::transcoding_warning_action) (Fl_Text_Buffer *)
```

Pointer to a function called after reading a non UTF-8 encoded file.

This function is called after reading a file if the file content was transcoded to UTF-8. Its default implementation calls fl_alert() with the text of file_encoding_warning_message. No warning message is displayed if this pointer is set to NULL. Use input_file_was_transcoded to be informed if file input required transcoding to UTF-8.

The documentation for this class was generated from the following files:

- Fl_Text_Buffer.H
- Fl_Text_Buffer.cxx

### 12.143 Fl_Text_Display Class Reference

Rich text display widget.

```c
#include <Fl_Text_Display.H>
```

Inheritance diagram for Fl_Text_Display:
Classes

- struct Style_Table_Entry

  This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.

Public Types

- enum {
  NORMAL_CURSOR, CARET_CURSOR, DIM_CURSOR, BLOCK_CURSOR, HEAVY_CURSOR, SIMPLE_CURSOR
}

  text display cursor shapes enumeration

- enum { CURSOR_POS, CHARACTER_POS }

  the character position is the left edge of a character, whereas the cursor is thought to be between the centers of two consecutive characters.

- enum {
  DRAG_NONE = -2, DRAG_START_DND = -1, DRAG_CHAR = 0, DRAG_WORD = 1, DRAG_LINE = 2
}

  drag types - they match Fl::event_clicks() so that single clicking to start a collection selects by character, double clicking selects by word and triple clicking selects by line.

- enum { WRAP_NONE, WRAP_AT_COLUMN, WRAP_AT_PIXEL, WRAP_AT_BOUNDS }

  wrap types - used in wrap_mode()

- enum {
  ATTR_BGCOLOR = 0x0001, ATTR_BGCOLOR_EXT = 0x0002, ATTR_BGCOLOR_EXT_ = 0x0003, ATTR_UNDERLINE = 0x0004,
  ATTR_GRAMMAR = 0x0008, ATTR_SPELLING = 0x000C, ATTR_STRIKE_THROUGH = 0x0010, ATTR_LINES_MASK = 0x001C
}

  attribute flags in Style_Table_Entry.attr

- typedef void(* Unfinished_Style_Cb) (int, void *)

Public Member Functions

- Fl_Text_Buffer * buffer () const

  Gets the current text buffer associated with the text widget.

- void buffer (Fl_Text_Buffer &buf)

  Sets the current text buffer associated with the text widget.

- void buffer (Fl_Text_Buffer *buf)

  Attach a text buffer to display, replacing the current buffer (if any).

- double col_to_x (double col) const

  Convert a column number into an x pixel position.

- int count_lines (int start, int end, bool start_pos_is_line_start) const

  Count the number of lines between two positions.

- Fl_Color cursor_color () const

  Gets the text cursor color.

- void cursor_color (Fl_Color n)
Sets the text cursor color.

- int **cursor_style** () const
- void **cursor_style** (int style)
  
  Sets the text cursor style.

- Fl_Text_Display (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new text display widget.

- Fl_Color **grammar_underline_color** () const
  
  Gets the underline color for style attribute ATTR_GRAMMAR.

- void **grammar_underline_color** (Fl_Color color)
  
  Sets the underline color for style attribute ATTR_GRAMMAR.

- int **handle** (int e) FL_OVERRIDE
  
  Event handling.

- void **hide_cursor** ()
  
  Hides the text cursor.

- void **highlight_data** (Fl_Text_Buffer *styleBuffer, const Style_Table_Entry *styleTable, int nStyles, char unfinishedStyle, Unfinished_Style_Cb unfinishedHighlightCB, void *cbArg)
  
  Attach (or remove) highlight information in text display and redisplay.

- int **in_selection** (int x, int y) const
  
  Check if a pixel position is within the primary selection.

- void **insert** (const char *text)
  
  Inserts "text" at the current cursor location.

- int **insert_position** () const
  
  Gets the position of the text insertion cursor for text display.

- void **insert_position** (int newPos)
  
  Sets the position of the text insertion cursor for text display.

- int **line_end** (int startPos, bool startPosIsLineStart) const
  
  Returns the end of a line.

- int **line_start** (int pos) const
  
  Return the beginning of a line.

- Fl_Align **linenumber_align** () const
  
  Returns the alignment used for line numbers (if enabled).

- void **linenumber_align** (Fl_Align val)
  
  Set alignment for line numbers (if enabled).

- Fl_Color **linenumberbgcolor** () const
  
  Returns the background color used for line numbers (if enabled).

- void **linenumberbgcolor** (Fl_Color val)
  
  Set the background color used for line numbers (if enabled).

- Fl_Color **linenumberfgcolor** () const
  
  Return the foreground color used for line numbers (if enabled).

- void **linenumberfgcolor** (Fl_Color val)
  
  Set the foreground color used for line numbers (if enabled).

- Fl_Font **linenumberfont** () const
  
  Return the font used for line numbers (if enabled).

- void **linenumberfont** (Fl_Font val)
  
  Set the font used for line numbers (if enabled).

- const char * **linenumberformat** () const
  
  Returns the line number printf() format string.

- void **linenumberformat** (const char *val)
  
  Sets the printf() style format string used for line numbers.

- Fl_Fontsize **linenumbersize** () const
  
  Return the font size used for line numbers (if enabled).
• void linenumber_size (Fl_Fontsize val)
  Set the font size used for line numbers (if enabled).

• int linenumber_width () const
  Return the screen area width provided for line numbers.

• void linenumber_width (int width)
  Set width of screen area for line numbers.

• int move_down ()
  Moves the current insert position down one line.

• int move_left ()
  Moves the current insert position left one character.

• int move_right ()
  Moves the current insert position right one character.

• int move_up ()
  Moves the current insert position up one line.

• void next_word (void)
  Moves the current insert position right one word.

• void overstrike (const char ∗text)
  Replaces text at the current insert position.

• int position_style (int lineStartPos, int lineLen, int lineIndex) const
  Find the correct style for a character.

• int position_to_xy (int pos, int ∗x, int ∗y) const
  Convert a character index into a pixel position.

• void previous_word (void)
  Moves the current insert position left one word.

• virtual void recalc_display ()
  Recalculate the display's visible lines and scrollbar sizes.

• void redisplay_range (int start, int end)
  Marks text from start to end as needing a redraw.

• void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Change the size of the displayed text area.

• int rewind_lines (int startPos, int nLines)
  Skip a number of lines back.

• void scroll (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

• Fl_Align scrollbar_align () const
  Gets the scrollbar alignment type.

• void scrollbar_align (Fl_Align a)
  Sets the scrollbar alignment type.

• int scrollbar_size () const
  Gets the current size of the scrollbars' troughs, in pixels.

• void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

• int scrollbar_width () const
  Returns the global value Fl::scrollbar_size() unless a specific scrollbar_width_ has been set.

• void scrollbar_width (int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

• Fl_Color secondary_selection_color () const
  Gets the background color for the secondary selection block.

• void secondary_selection_color (Fl_Color color)
  Sets the background color for the secondary selection block.

• int shortcut () const
• void shortcut (int s)
• void show_cursor (int b=1)
  Shows the text cursor.
• void show_insert_position ()
  Scrolls the text buffer to show the current insert position.
• int skip_lines (int startPos, int nLines, bool startPosIsLineStart)
  Skip a number of lines forward.
• Fl_Color spelling_underline_color () const
  Gets the underline color for style attribute ATTR_SPELLING.
• void spelling_underline_color (Fl_Color color)
  Sets the underline color for style attribute ATTR_SPELLING.
• Fl_Text_Buffer * style_buffer () const
  Gets the current style buffer associated with the text widget.
• Fl_Color textcolor () const
  Gets the default color of text in the widget.
• void textcolor (Fl_Color n)
  Sets the default color of text in the widget.
• Fl_Font textfont () const
  Gets the default font used when drawing text in the widget.
• void textfont (Fl_Font s)
  Sets the default font used when drawing text in the widget.
• Fl_Fontsize textsize () const
  Gets the default size of text in the widget.
• void textsize (Fl_Fontsize s)
  Sets the default size of text in the widget.
• int word_end (int pos) const
  Moves the insert position to the end of the current word.
• int word_start (int pos) const
  Moves the insert position to the beginning of the current word.
• void wrap_mode (int wrap, int wrap_margin)
  Set the new text wrap mode.
• int wrapped_column (int row, int column) const
  Nobody knows what this function does.
• int wrapped_row (int row) const
  Nobody knows what this function does.
• double x_to_col (double x) const
  Convert an x pixel position into a column number.
• ~Fl_Text_Display ()
  Free a text display and release its associated memory.

Public Member Functions inherited from Fl_Group

• Fl_Widget * & _ddfdesign_kludge ()
  This is for forms compatibility only.
• void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
• void add (Fl_Widget &w)
  See void Fl_Group::add(Fl_Widget &w)
• void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
• Fl_Widget * const * array () const
Returns a pointer to the array of children.

- Fl_Group const * as_group () const FL_OVERRIDE
- Fl_Group const * as_group () FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
- Fl_Widget * child (int n) const
  Returns array()[n].
- int children () const
  Returns how many child widgets the group has.
- void clear ()
  Deletes all child widgets from memory recursively.
- unsigned int clip_children ()
  Returns the current clipping mode.
- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
- void end ()
  Exactly the same as current(this->parent()).
- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char * =0)
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget *W)
- void forms_end ()
  This is for forms compatibility only.
- void init_sizes ()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
  Removes the widget at index from the group but does not delete it.
- Fl_Widget * resizable () const
  Returns the group’s resizable widget.
- void resizable (Fl_Widget &o)
  Sets the group’s resizable widget.
- void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- virtual ~Fl_Group ()
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  
  Gets the widget height.

• virtual void hide ()
  
  Makes a widget invisible.

• Fl_Image * image ()
  
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const
  
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  
  Gets the current label text.

• void label (const char *text)
  
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  
  Gets the label color.

• void labelcolor (Fl_Color c)
  
  Sets the label color.

• Fl_Font labelfont () const
  
  Gets the font to use.

• void labelfont (Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize labelsize () const
  
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  
  Sets whether this widget needs a keyboard.

• unsigned int output () const
Returns if a widget is used for output only.

- **Fl_Group** ∗ parent () const
  
  Returns a pointer to the parent widget.

- void parent (Fl_Group ∗p)
  
  Internal use only - "for hacks only".

- void position (int X, int Y)
  
  Repositions the window or widget.

- void redraw ()
  
  Schedules the drawing of the widget.

- void redraw_label ()
  
  Schedules the drawing of the label.

- Fl_Color selection_color () const
  
  Gets the selection color.

- void selection_color (Fl_Color a)
  
  Sets the selection color.

- void set_active ()
  
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  
  Marks the value of the widget as changed.

- void set_output ()
  
  Sets a widget to output only.

- void set_visible ()
  
  Makes the widget visible.

- void set_visible_focus ()
  
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- void shortcut_label (int value)
  
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- virtual void show ()
  
  Makes a widget visible.

- void size (int W, int H)
  
  Changes the size of the widget.

- int take_focus ()
  
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  
  Returns if the widget is able to take events.

- int testShortcut ()
  
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- const char ∗ tooltip () const
  
  Gets the current tooltip text.

- void tooltip (const char ∗text)
  
  Sets the current tooltip text.

- Fl_Window ∗ top_window () const
  
  Returns a pointer to the top-level window for the widget.

- Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  
  Gets the widget type.

- void type (uchar t)
  
  Sets the widget type.
• **int** `use_accents_menu()`  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void** `user_data()` const  
  Gets the user data for this widget.

• **void** `user_data(Fl_Callback_User_Data *v, bool auto_free)`  
  Sets the user data for this widget.

• **void** `user_data(void *v)`  
  Sets the user data for this widget.

• **unsigned int** `visible()` const  
  Returns whether a widget is visible.

• **unsigned int** `visible_focus()` const  
  Checks whether this widget has a visible focus.

• **void** `visible_focus(int v)`  
  Modifies keyboard focus navigation.

• **int** `visible_r()` const  
  Returns whether a widget and all its parents are visible.

• **int** `w()` const  
  Gets the widget width.

• **Fl_When** `when()` const  
  Returns the conditions under which the callback is called.

• **void** `when(uchar i)`  
  Sets the flags used to decide when a callback is called.

• **Fl_Window ** `window()` const  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int** `x()` const  
  Gets the widget position in its window.

• **int** `y()` const  
  Gets the widget position in its window.

• virtual **`~Fl_Widget()`**  
  Destroys the widget.

**Protected Types**

• **enum** {
  `DRAW_LINE`, `FIND_INDEX`, `FIND_INDEX_FROM_ZERO`, `GET_WIDTH`, `FIND_CURSOR_INDEX`}

**Protected Types inherited from Fl_Widget**

• **enum** {
  `INACTIVE = 1<<0`, `INVISIBLE = 1<<1`, `OUTPUT = 1<<2`, `NOBORDER = 1<<3`,
  `FORCE_POSITION = 1<<4`, `NON_MODAL = 1<<5`, `SHORTCUT_LABEL = 1<<6`, `CHANGED = 1<<7`,
  `OVERRIDE = 1<<8`, `VISIBLE_FOCUS = 1<<9`, `COPYED_LABEL = 1<<10`, `CLIP_CHILDREN = 1<<11`,
  `MENU_WINDOW = 1<<12`, `TOOLTIP_WINDOW = 1<<13`, `MODAL = 1<<14`, `NO_OVERLAY = 1<<15`,
  `GROUP_RELATIVE = 1<<16`, `COPYED_TOOLTIP = 1<<17`, `FULLSCREEN = 1<<18`,
  `MAC_USE_ACCENTS_MENU = 1<<19`,
  `NEEDS_KEYBOARD = 1<<20`, `IMAGE_BOUND = 1<<21`, `DEIMAGE_BOUND = 1<<22`,
  `AUTO_DELETE_USER_DATA = 1<<23`,
  `MAXIMIZED = 1<<24`, `USERFLAG3 = 1<<29`, `USERFLAG2 = 1<<30`, `USERFLAG1 = 1<<31`}

  flags possible values enumeration.
Protected Member Functions

- `void absolute_top_line_number(int oldFirstChar)`
  
  Re-calculate absolute top line number for a change in scroll position.

- `void calc_last_char()`
  
  Update last display character index.

- `void calc_line_starts(int startLine, int endLine)`
  
  Update the line starts array.

- `void clear_rect(int style, int x, int y, int width, int height) const`
  
  Clear a rectangle with the appropriate background color for `style`.

- `void display_insert()`
  
  Scroll the display to bring insertion cursor into view.

- `void draw() FL_OVERRIDE`
  
  Draw the widget.

- `void draw_cursor(int, int)`
  
  Draw a cursor with top center at `X`, `Y`.

- `void draw_line_numbers(bool clearAll)`
  
  Refresh the line number area.

- `void draw_range(int start, int end)`
  
  Draw a range of text.

- `void draw_string(int style, int x, int y, int toX, const char *string, int nChars) const`
  
  Draw a text segment in a single style.

- `void draw_text(int X, int Y, int W, int H)`
  
  Refresh a rectangle of the text display.

- `void draw_vline(int visLineNum, int leftClip, int rightClip, int leftCharIndex, int rightCharIndex)`
  
  Draw a single line of text.

- `int empty_vlines() const`
  
  Return true if there are lines visible with no corresponding buffer text.

- `void extend_range_for_styles(int *start, int *end)`
  
  I don't know what this does!

- `void find_line_end(int pos, bool start_pos_is_line_start, int *lineEnd, int *nextLineStart) const`
  
  Finds both the end of the current line and the start of the next line.

- `void find_wrap_range(const char *deletedText, int pos, int nInserted, int nDeleted, int *modRangeStart, int *modRangeEnd, int *linesInserted, int *linesDeleted)`
  
  Wrapping calculations.

- `int find_x(const char *s, int len, int style, int x) const`
  
  Find the index of the character that lies at the given x position / closest cursor position.

- `int get_absolute_top_line_number() const`
  
  Returns the absolute (non-wrapped) line number of the first line displayed.

- `int handle_rmb(int readonly)`
  
  Handle right mouse button down events.

- `int handle_vline(int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const`
  
  Universal pixel machine.

- `int longest_vline() const`
  
  Find the longest line of all visible lines.

- `void maintain_absolute_top_line_number(int state)`
  
  Line numbering stuff, currently unused.

- `int maintaining_absolute_top_line_number() const`
  
  Returns true if a separate absolute top line number is being maintained.

- `void measure_deleted_lines(int pos, int nDeleted)`
  
  Generated by Doxygen
Wrapping calculations.

- **double measure_proportional_character** (const char *s, int colNum, int pos) const
  Wrapping calculations.

- **int measure_vline** (int visLineNum) const
  Returns the width in pixels of the displayed line pointed to by "visLineNum".

- **void offset_line_starts** (int newTopLineNum)
  Offset line start counters for a new vertical scroll position.

- **int position_to_line** (int pos, int *lineNum) const
  Convert a position index into a line number offset.

- **int position_to_linecol** (int pos, int *lineNum, int *column) const
  Find the line and column number of position pos.

- **void reset_absolute_top_line_number** ()
  Reestablish the absolute (non-wrapped) top line number.

- **int scroll_** (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

- **double string_width** (const char *string, int length, int style) const
  Find the width of a string in the font of a particular style.

- **void update_h_scrollbar** ()
  Update horizontal scrollbar.

- **void update_line_starts** (int pos, int charsInserted, int charsDeleted, int linesInserted, int linesDeleted, int scrolled)
  Update line start arrays and variables.

- **void update_v_scrollbar** ()
  Update vertical scrollbar.

- **int vline_length** (int visLineNum) const
  Count number of bytes in a visible line.

- **int wrap_uses_character** (int lineEndPos) const
  Check if the line break is caused by a newline or by line wrapping.

- **void wrapped_line_counter** (Fl_Text_Buffer *buf, int startPos, int maxPos, int maxLines, bool startPosIsLineStart, int styleBufOffset, int *retPos, int *retLines, int *retLineStart, int *retLineEnd, bool countLastLineMissingNewLine=true) const
  Wrapping calculations.

- **int xy_to_position** (int x, int y, int PosType=CHARACTER_POS) const
  Translate a pixel position into a character index.

- **void xy_to_rowcol** (int x, int y, int *row, int *column, int PosType=CHARACTER_POS) const
  Translate pixel coordinates into row and column.

Protected Member Functions inherited from Fl_Group

- **Fl_Rect * bounds** ()
  Returns the internal array of widget sizes and positions.

- **void draw_child** (Fl_Widget &widget) const
  Forces a child to redraw.

- **void draw_children** ()
  Draws all children of the group.

- **void draw_outside_label** (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.

- **virtual int on_insert** (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.

- **virtual int on_move** (int, int)
  Allow derived groups to act when a widget is moved within the group.

- **virtual void on_remove** (int)
Allow derived groups to act when a child widget is removed from the group.

- **int * sizes ()**
  Returns the internal array of widget sizes and positions.

- **void update_child (FL_Widget &widget) const**
  Draws a child only if it needs it.

**Protected Member Functions inherited from FL_Widget**

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

- **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box () const**
  Draws the widget box according its box style.

- **void draw_box (FL_Boxtype t, FL_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const**
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus () const**
  Draws a focus rectangle around the widget.

- **void draw_focus (FL_Boxtype t, int X, int Y, int W, int H) const**
  Draws a focus rectangle around the widget.

- **void draw_focus (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const**
  Draws a focus box for the widget at the given position and size.

- **void draw_label () const**
  Draws the widget's label at the defined label position.

- **void draw_label (int, int, int, int) const**
  Draws the label in an arbitrary bounding box.

- **FL_Widget (int x, int y, int w, int h, const char *label=0L)**
  Creates a widget at the given position and size.

- **unsigned int flags () const**
  Gets the widget flags mask.

- **void h (int v)**
  Internal use only.

- **void set_flag (unsigned int c)**
  Sets a flag in the flags mask.

- **void w (int v)**
  Internal use only.

- **void x (int v)**
  Internal use only.

- **void y (int v)**
  Internal use only.

**Static Protected Member Functions**

- **static void buffer_modified_cb (int pos, int nInserted, int nDeleted, int nRestyled, const char *deletedText, void *cbArg)**
  This is called whenever the buffer is modified.

- **static void buffer_predelete_cb (int pos, int nDeleted, void *cbArg)**
  This is called before any characters are deleted.

- **static void h_scrollbar_cb (FL_Scrollbar *w, FL_Text_Display *d)**
  Callback for drag or valueChanged on horizontal scrollbar.
• static void `scroll_timer_cb` (void *)
  
  Timer callback for scroll events.

• static void `v_scrollbar_cb` (Fl_Scrollbar *w, Fl_Text_Display *d)
  
  Callback for drag or valueChanged on vertical scrollbar.

Protected Attributes

• Unfinished_Style_Cb `mUnfinishedHighlightCB`
Rich text display widget.

This is the FLTK text display widget. It allows the user to view multiple lines of text and supports highlighting, word wrap, mixes of font faces and colors, line numbers and scrolling. The buffer that is displayed in the widget is managed by the Fl_Text_Buffer class. A single Text Buffer can be displayed by multiple Text Displays.
**Example Use**

```cpp
#include <FL/Fl_Text_Display.H>

int main() {
  Fl_Text_Buffer *buff = new Fl_Text_Buffer();
  Fl_Text_Display *disp = new Fl_Text_Display(10, 10, 640, 480);
  disp->buffer(buff); // attach text buffer to display widget
  buff->text("line one
  \nline two"); // add some text to buffer
}
```

**Features**

- Word wrap: `wrap_mode()`, `wrapped_column()`, `wrapped_row()`
- Font control: `textfont()`, `textsize()`, `textcolor()`
• Font styling: `highlight_data()`

• Cursor: `cursor_style()`, `show_cursor()`, `hide_cursor()`, `cursor_color()`

• Line numbers: `linenumber_width()`, `linenumber_font()`, `linenumber_size()`, `linenumberbgcolor()`, `linenumberbgcolor()`,
  `linenumber_align()`, `linenumberformat()`

Note that other features may be available via `Fl_Text_Editor` and `Fl_Text_Buffer` classes.

Note

Line numbers were added in FLTK 1.3.3.

12.143.3 Constructor & Destructor Documentation

12.143.3.1 Fl_Text_Display()

```cpp
Fl_Text_Display::Fl_Text_Display ( 
    int X, 
    int Y, 
    int W, 
    int H, 
    const char ∗ l = 0 )
```

Creates a new text display widget.

**Parameters**

<table>
<thead>
<tr>
<th>X,Y,W,H</th>
<th>position and size of widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>l</td>
<td>label text, defaults to none</td>
</tr>
</tbody>
</table>

12.143.3.2 ~Fl_Text_Display()

```cpp
Fl_Text_Display::~Fl_Text_Display ( )
```

Free a text display and release its associated memory.

**Note**

The text buffer that the text display displays is a separate entity and is not freed, nor are the style buffer or style table.

**See also**

`Fl_Text_Display::buffer(Fl_Text_Buffer ∗ buf)`

12.143.4 Member Function Documentation

12.143.4.1 absolute_top_line_number()

```cpp
void Fl_Text_Display::absolute_top_line_number ( 
    int oldFirstChar ) [protected]
```

Re-calculate absolute top line number for a change in scroll position. Does nothing if the absolute top line number is not being maintained.

12.143.4.2 buffer() [1/3]

```cpp
Fl_Text_Buffer ∗ Fl_Text_Display::buffer ( ) const [inline]
```

Gets the current text buffer associated with the text widget. Multiple text widgets can be associated with the same text buffer.

**Returns**

- current text buffer
See also

```cpp
Fl_Text_Display::buffer(Fl_Text_Buffer* buf)
Fl_Text_Display::buffer(Fl_Text_Buffer& buf)
```

### 12.143.4.3 buffer() [2/3]

```cpp
void Fl_Text_Display::buffer (Fl_Text_Buffer & buf) [inline]
```

Sets the current text buffer associated with the text widget.
Multiple text widgets can be associated with the same text buffer.

**Parameters**

- `buf` new text buffer

See also

```cpp
Fl_Text_Display::buffer(Fl_Text_Buffer* buf)
```

### 12.143.4.4 buffer() [3/3]

```cpp
void Fl_Text_Display::buffer (Fl_Text_Buffer * buf)
```

Attach a text buffer to display, replacing the current buffer (if any).
Multiple text widgets can be associated with the same text buffer.

**Note**

The caller is responsible for the old (replaced) buffer (if any). This method does not delete the old buffer.

**Parameters**

- `buf` attach this text buffer

### 12.143.4.5 buffer_modified_cb()

```cpp
void Fl_Text_Display::buffer_modified_cb (int pos, int nInserted, int nDeleted, int nRestyled, const char * deletedText, void * cbArg) [static], [protected]
```

This is called whenever the buffer is modified.
Callback attached to the text buffer to receive modification information.
This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or
text in this callback, or line counting may get out of sync.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pos</code></td>
<td>starting index of modification</td>
</tr>
<tr>
<td><code>nInserted</code></td>
<td>number of bytes we inserted (must be UTF-8 aligned!)</td>
</tr>
<tr>
<td><code>nDeleted</code></td>
<td>number of bytes deleted (must be UTF-8 aligned!)</td>
</tr>
<tr>
<td><code>nRestyled</code></td>
<td>??</td>
</tr>
<tr>
<td><code>deletedText</code></td>
<td>this is what was removed, must not be NULL if nDeleted is set</td>
</tr>
</tbody>
</table>
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>cbArg</em></td>
<td>&quot;this&quot; pointer for static callback function</td>
</tr>
</tbody>
</table>

#### 12.143.4.6 buffer_predelete_cb()

```c
void Fl_Text_Display::buffer_predelete_cb ( int pos, int nDeleted, void * cbArg ) [static], [protected]
```

This is called before any characters are deleted. Callback attached to the text buffer to receive delete information before the modifications are actually made. This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or text in this callback, or line counting may get out of sync.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>pos</em></td>
<td>starting index of deletion</td>
</tr>
<tr>
<td><em>nDeleted</em></td>
<td>number of bytes we will delete (must be UTF-8 aligned!)</td>
</tr>
<tr>
<td><em>cbArg</em></td>
<td>&quot;this&quot; pointer for static callback function</td>
</tr>
</tbody>
</table>

#### 12.143.4.7 calc_last_char()

```c
void Fl_Text_Display::calc_last_char ( ) [protected]
```

Update last display character index. Given a Fl_Text_Display with a complete, up-to-date lineStarts array, update the lastChar entry to point to the last buffer position displayed.

#### 12.143.4.8 calc_line_starts()

```c
void Fl_Text_Display::calc_line_starts ( int startLine, int endLine ) [protected]
```

Update the line starts array. Scan through the text in the Text Display's buffer and recalculate the line starts array values beginning at index "startLine" and continuing through (including) "endLine". It assumes that the line starts entry preceding "startLine" (or mFirstChar if startLine is 0) is good, and re-counts newlines to fill in the requested entries. Out of range values for "startLine" and "endLine" are acceptable.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>startLine</em>, <em>endLine</em></td>
<td>range of lines to scan as line numbers</td>
</tr>
</tbody>
</table>

#### 12.143.4.9 clear_rect()

```c
void Fl_Text_Display::clear_rect ( int style, int X, int Y, int width, int height ) const [protected]
```

Clear a rectangle with the appropriate background color for *style*. 
### Parameters

<table>
<thead>
<tr>
<th>style</th>
<th>index into style table</th>
</tr>
</thead>
<tbody>
<tr>
<td>X,Y, width, height</td>
<td>size and position of background area</td>
</tr>
</tbody>
</table>

#### 12.143.4.10 col_to_x()  

```cpp
double Fl_Text_Display::col_to_x (double col) const
```

Convert a column number into an x pixel position.

**Parameters**
- `col` an approximate column number based on the main font

**Returns**
- number of pixels from the left margin to the left of an average sized character

**See also**
- `x_to_col()`

#### 12.143.4.11 count_lines()  

```cpp
int Fl_Text_Display::count_lines (int startPos, int endPos, bool startPosIsLineStart) const
```

Count the number of lines between two positions.

Same as `Fl_Text_Buffer::count_lines()`, but takes into account wrapping if wrapping is turned on. If the caller knows that `startPos` is at a line start, it can pass `startPosIsLineStart` as True to make the call more efficient by avoiding the additional step of scanning back to the last newline.

**Parameters**
- `startPos` index to first character
- `endPos` index after last character
- `startPosIsLineStart` avoid scanning back to the line start

**Returns**
- number of lines

#### 12.143.4.12 cursor_color() [1/2]

```cpp
Fl_Color Fl_Text_Display::cursor_color ( ) const [inline]
```

Gets the text cursor color.

**Returns**
- cursor color

#### 12.143.4.13 cursor_color() [2/2]

```cpp
void Fl_Text_Display::cursor_color ( Fl_Color n ) [inline]
```

Generated by Doxygen
Sets the text cursor color.

Parameters

\[ n \] new cursor color

12.143.4.14 cursor_style()

void Fl_Text_Display::cursor_style {
    int style
}

Sets the text cursor style.
Sets the text cursor style to one of the following:

- \texttt{Fl_Text_Display::NORMAL_CURSOR} - Shows an I beam.
- \texttt{Fl_Text_Display::CARET_CURSOR} - Shows a caret under the text.
- \texttt{Fl_Text_Display::DIM_CURSOR} - Shows a dimmed I beam.
- \texttt{Fl_Text_Display::BLOCK_CURSOR} - Shows an unfilled box around the current character.
- \texttt{Fl_Text_Display::HEAVY_CURSOR} - Shows a thick I beam.

This call also switches the cursor on and may trigger a redraw.

Parameters

\[ \text{style} \] new cursor style

12.143.4.15 display_insert()

void Fl_Text_Display::display_insert ( ) [protected]

Scroll the display to bring insertion cursor into view.
Note: it would be nice to be able to do this without counting lines twice (scroll_() counts them too) and/or to count
from the most efficient starting point, but the efficiency of this routine is not as important to the overall performance
of the text display.

12.143.4.16 draw()

void Fl_Text_Display::draw (void ) [protected], [virtual]

Draw the widget.
This function tries to limit drawing to smaller areas if possible.
Reimplemented from \texttt{Fl_Group}.

12.143.4.17 draw_cursor()

void Fl_Text_Display::draw_cursor {
    int X,
    int Y ) [protected]

Draw a cursor with top center at \( X, Y \).

Parameters

\[ X,Y \] cursor position in pixels
12.143.4.18  **draw_line_numbers()**

```cpp
void Fl_Text_Display::draw_line_numbers ( bool clearAll ) [protected]
```

Refresh the line number area.

**Parameters**

| clearAll | (currently unused) If False, only draws the line number text, does not clear the area behind it. If True, clears the area and redraws the text. Use False to avoid a 'flash' for single buffered windows. |

12.143.4.19  **draw_range()**

```cpp
void Fl_Text_Display::draw_range ( int startPos, int endpos ) [protected]
```

Draw a range of text.

Refresh all of the text between buffer positions `startpos` and `endpos` not including the character at the position `endpos`.

If `endpos` points beyond the end of the buffer, refresh the whole display after `startpos`, including blank lines which are not technically part of any range of characters.

**Parameters**

| startPos | index of first character to draw |
| endpos   | index after last character to draw |

12.143.4.20  **draw_string()**

```cpp
void Fl_Text_Display::draw_string ( int style, int X, int Y, int toX, const char * string, int nChars ) const [protected]
```

Draw a text segment in a single style.

Draw a string or blank area according to parameter `style`, using the appropriate colors and drawing method for that style, with top left corner at `X`, `Y`. If style says to draw text, use `string` as source of characters, and draw `nChars`. If style is FILL, erase rectangle where text would have drawn from `X` to `toX` and from `Y` to the maximum y extent of the current font(s).

**Parameters**

| style    | index into style lookup table |
| X,Y      | drawing origin                |
| toX      | rightmost position if this is a fill operation |
| string   | text if this is a drawing operation |
| nChars   | number of characters to draw  |

12.143.4.21  **draw_text()**

```cpp
void Fl_Text_Display::draw_text ( int left, 
```

Generated by Doxygen
Refresh a rectangle of the text display.

Parameters

| left, top | are in coordinates of the text drawing window. |
| width, height | size in pixels |

**12.143.4.22 draw_vline()**

```cpp
void Fl_Text_Display::draw_vline (  
    int visLineNum,  
    int leftClip,  
    int rightClip,  
    int leftCharIndex,  
    int rightCharIndex ) [protected]
```

Draw a single line of text. Draw the text on a single line represented by `visLineNum` (the number of lines down from the top of the display), limited by `leftClip` and `rightClip` window coordinates and `leftCharIndex` and `rightCharIndex` character positions (not including the character at position `rightCharIndex`).

Parameters

| visLineNum | index of line in the visible line number lookup |
| leftClip, rightClip | pixel position of clipped area |
| leftCharIndex, rightCharIndex | index into line of segment that we want to draw |

**12.143.4.23 empty_vlines()**

```cpp
int Fl_Text_Display::empty_vlines ( ) const [protected]
```

Return true if there are lines visible with no corresponding buffer text.

Returns

1 if there are empty lines

**12.143.4.24 extend_range_for_styles()**

```cpp
void Fl_Text_Display::extend_range_for_styles (  
    int * startPos,  
    int * endpos ) [protected]
```

I don't know what this does! Extend the range of a redraw request (from `*start` to `*end`) with additional redraw requests resulting from changes to the attached style buffer (which contains auxiliary information for coloring or styling text).

Parameters

| startPos | ?? |
| endpos | ?? |

**Todo** Unicode?
12.143.4.25 *find_line_end()*

```cpp
void Fl_Text_Display::find_line_end (  
    int startPos,  
    bool startPosIsLineStart,  
    int *lineEnd,  
    int *nextLineStart  
) const [protected]
```

Finds both the end of the current line and the start of the next line.

Why? In continuous wrap mode, if you need to know both, figuring out one from the other can be expensive or error prone. The problem comes when there’s a trailing space or tab just before the end of the buffer. To translate an end of line value to or from the next lines start value, you need to know whether the trailing space or tab is being used as a line break or just a normal character, and to find that out would otherwise require counting all the way back to the beginning of the line.

**Parameters**

<table>
<thead>
<tr>
<th>startPos</th>
<th>startPosIsLineStart</th>
<th>lineEnd</th>
<th>nextLineStart</th>
</tr>
</thead>
</table>

12.143.4.26 *find_wrap_range()*

```cpp
void Fl_Text_Display::find_wrap_range (  
    const char *deletedText,  
    int pos,  
    int nInserted,  
    int nDeleted,  
    int *modRangeStart,  
    int *modRangeEnd,  
    int *linesInserted,  
    int *linesDeleted  
) [protected]
```

Wrapping calculations.

When continuous wrap is on, and the user inserts or deletes characters, wrapping can happen before and beyond the changed position. This routine finds the extent of the changes, and counts the deleted and inserted lines over that range. It also attempts to minimize the size of the range to what has to be counted and re-displayed, so the results can be useful both for delimiting where the line starts need to be recalculated, and for deciding what part of the text to redisplay.

**Parameters**

<table>
<thead>
<tr>
<th>deletedText</th>
<th>pos</th>
<th>nInserted</th>
<th>nDeleted</th>
<th>modRangeStart</th>
<th>modRangeEnd</th>
<th>linesInserted</th>
<th>linesDeleted</th>
</tr>
</thead>
</table>

12.143.4.27 *find_x()*

```cpp
int Fl_Text_Display::find_x (  
    const char * s,  
    int len,  
```
Find the index of the character that lies at the given x position / closest cursor position.

Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>s</td>
<td>UTF-8 text string</td>
<td></td>
</tr>
<tr>
<td>len</td>
<td>length of string</td>
<td></td>
</tr>
<tr>
<td>style</td>
<td>index into style lookup table</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>position in pixels - negative returns closest cursor position</td>
<td></td>
</tr>
</tbody>
</table>

Returns

index into buffer

12.143.4.28 get_absolute_top_line_number()

int Fl_Text_Display::get_absolute_top_line_number ( ) const [protected]

Returns the absolute (non-wrapped) line number of the first line displayed.
Returns 0 if the absolute top line number is not being maintained.

12.143.4.29 grammar_underline_color() [1/2]

Fl_Color Fl_Text_Display::grammar_underline_color ( ) const [inline]

Gets the underline color for style attribute ATTR_GRAMMAR.

Returns

underline color

12.143.4.30 grammar_underline_color() [2/2]

void Fl_Text_Display::grammar_underline_color ( Fl_Color color ) [inline]

Sets the underline color for style attribute ATTR_GRAMMAR.

Parameters

color underline color

12.143.4.31 handle()

int Fl_Text_Display::handle ( int e ) [virtual]

Event handling.
Reimplemented from Fl_Group.
Reimplemented in Fl_Text_Editor.

12.143.4.32 handle_rmb()

int Fl_Text_Display::handle_rmb ( int readonly ) [protected]

Handle right mouse button down events.
Returns

0 for no op, 1 to cut, 2 to copy, 3 to paste

### 12.143.4.33 handle_vline()

```cpp
int Fl_Text_Display::handle_vline (int mode,
    int lineStartPos,
    int lineLen,
    int leftChar,
    int rightChar,
    int Y,
    int bottomClip,
    int leftClip,
    int rightClip ) const [protected]
```

Universal pixel machine.
We use a single function that handles all line layout, measuring, and drawing

- draw a text range
- return the width of a text range in pixels
- return the index of a character that is at a pixel position

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mode</code></td>
<td>DRAW_LINE, GET_WIDTH, FIND_INDEX, FIND_INDEX_FROM_ZERO, or FIND_CURSOR_INDEX</td>
</tr>
<tr>
<td><code>lineStartPos</code></td>
<td>index of first character</td>
</tr>
<tr>
<td><code>lineLen</code></td>
<td>size of string in bytes</td>
</tr>
<tr>
<td><code>leftChar</code>, <code>rightChar</code></td>
<td>drawing position</td>
</tr>
<tr>
<td><code>Y</code></td>
<td>stop work when we reach the clipped area. rightClip is the X position that we search in FIND_INDEX.</td>
</tr>
<tr>
<td><code>bottomClip</code>, <code>leftClip</code>, <code>rightClip</code></td>
<td>stop work when we reach the clipped area. rightClip is the X position that we search in FIND_INDEX.</td>
</tr>
</tbody>
</table>

**Return values**

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DRAW_LINE</td>
<td>index of last drawn character</td>
</tr>
<tr>
<td>GET_WIDTH</td>
<td>width in pixels of text segment if we would draw it</td>
</tr>
<tr>
<td>FIND_INDEX</td>
<td>index of character at given x position in window coordinates</td>
</tr>
<tr>
<td>FIND_INDEX_FROM_ZERO</td>
<td>index of character at given x position without scrolling and widget offsets</td>
</tr>
</tbody>
</table>

**Todo** we need to handle hidden hyphens and tabs here!
we handle all styles and selections
we must provide code to get pixel positions of the middle of a character as well

### 12.143.4.34 highlight_data()

```cpp
void Fl_Text_Display::highlight_data (Fl_Text_Buffer ∗ styleBuffer,
    const Style_Table_Entry ∗ styleTable,
    int nStyles,
    char unfinishedStyle,
```
Unfinished_Syle_Cb unfinishedHighlightCB,
void * cbArg )

Attach (or remove) highlight information in text display and redisplay.
Highlighting information consists of a style buffer which parallels the normal text buffer, but codes font and color information for the display; a style table which translates style buffer codes (indexed by buffer character - 'A') into fonts and colors; and a callback mechanism for as-needed highlighting, triggered by a style buffer entry of "unfinished←
Style". Style buffer can trigger additional redisplay during a normal buffer modification if the buffer contains a primary Fl_Text_Selection (see extend_range_for_styles() for more information on this protocol).
Style buffers, tables, and their associated memory are managed by the caller.
Styles are ranged from 65 ('A') to 126.

Note

Style information in the style buffer must have the same byte offset as the corresponding character in the text buffer. UTF-8 characters can have a maximum length of four bytes. Style information must take this into account and fill the unused bytes with 0. See fl_utf8len().

Text: "*g r ü r n", where normal style is 'A', and bold is 'B'
Text Buffer(hex): 67 72 c3 bc 6e : gr..n
Style Buffer(hex): 42 41 41 00 42 : BAA.B

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>styleBuffer</td>
<td>this buffer works in parallel to the text buffer. For every character in the text buffer, the style buffer has a byte at the same offset that contains an index into an array of possible styles.</td>
</tr>
<tr>
<td>styleTable</td>
<td>a list of styles indexed by the style buffer</td>
</tr>
<tr>
<td>nStyles</td>
<td>number of styles in the style table</td>
</tr>
<tr>
<td>unfinishedStyle</td>
<td>if this style is found, the callback below is called</td>
</tr>
<tr>
<td>unfinishedHighlightCB</td>
<td>if a character with an unfinished style is found, this callback will be called</td>
</tr>
<tr>
<td>cbArg</td>
<td>an optional argument for the callback above, usually a pointer to the Text Display.</td>
</tr>
</tbody>
</table>

See also

Fl_Text_Display::style_buffer()

12.143.4.35  in_selection()

int Fl_Text_Display::in_selection ( int X, int Y ) const

Check if a pixel position is within the primary selection.

Parameters

| X, Y | pixel position to test |

Returns

1 if position (X, Y) is inside of the primary Fl_Text_Selection

12.143.4.36 insert()

void Fl_Text_Display::insert ( const char * text )

Inserts "text" at the current cursor location.
This has the same effect as inserting the text into the buffer using insert(insert_position(),text) and then moving the insert position after the newly inserted text, except that it's optimized to do less redrawing.
Parameters

text new text in UTF-8 encoding.

12.143.47 insert_position() [1/2]

int Fl_Text_Display::insert_position ( ) const [inline]

Gets the position of the text insertion cursor for text display.
The insert position is the byte count (offset) from the beginning of the text buffer (starting with 0). Returns 0 (zero) if no buffer is associated to the text display. Returns buffer()->length() if the insert position is at the end of the buffer.

Returns

insert position index into text buffer

See also

insert_position(int)

12.143.48 insert_position() [2/2]

void Fl_Text_Display::insert_position ( int newPos )

Sets the position of the text insertion cursor for text display.
Moves the insertion cursor in front of the character at newPos. This function may trigger a redraw.

Parameters

newPos new caret position

12.143.49 line_end()

int Fl_Text_Display::line_end ( int startPos, bool startPosIsLineStart ) const

Returns the end of a line.
Same as buffer()->line_end(startPos), but takes into account line breaks when wrapping is turned on. If the caller knows that startPos is at a line start, it can pass startPosIsLineStart as True to make the call more efficient by avoiding the additional step of scanning back to the last newline.

Note that the definition of the end of a line is less clear when continuous wrap is on. With continuous wrap off, it's just a pointer to the newline that ends the line. When it's on, it's the character beyond the last displayable character on the line, where a whitespace character which has been "converted" to a newline for wrapping is not considered displayable. Also note that a line can be wrapped at a non-whitespace character if the line had no whitespace. In this case, this routine returns a pointer to the start of the next line. This is also consistent with the model used by visLineLength.

Parameters

startPos index to starting character

startPosIsLineStart avoid scanning back to the line start

Returns

new position as index
12.143.4.40  line_start()

int Fl_Text_Display::line_start (  
   int pos ) const

Return the beginning of a line.  
Same as buffer()->line_start(pos), but returns the character after last wrap point rather than the last newline.

Parameters

| pos | index to starting character |

Returns

   new position as index

12.143.4.41  linenumber_align()

void Fl_Text_Display::linenumber_align (  
   Fl_Align val )

Set alignment for line numbers (if enabled).  
Valid values are FL_ALIGN_LEFT, FL_ALIGN_CENTER or FL_ALIGN_RIGHT.

Version

   1.3.3

12.143.4.42  linenumberbgcolor()

void Fl_Text_Display::linenumberbgcolor (  
   Fl_Color val )

Set the background color used for line numbers (if enabled).

Version

   1.3.3

12.143.4.43  linenumberfgcolor()

void Fl_Text_Display::linenumberfgcolor (  
   Fl_Color val )

Set the foreground color used for line numbers (if enabled).

Version

   1.3.3

12.143.4.44  linenumberfont()

void Fl_Text_Display::linenumberfont (  
   Fl_Font val )

Set the font used for line numbers (if enabled).

Version

   1.3.3
### linenumber_format()

```cpp
void Fl_Text_Display::linenumber_format ( const char * val )
```

Sets the printf() style format string used for line numbers. Default is "%d" for normal unpadded decimal integers. An internal copy of `val` is allocated and managed; it is automatically freed whenever a new value is assigned, or when the widget is destroyed. The value of `val` must not be NULL.

Example values:

- "%d" -- For normal line numbers without padding (Default)
- "%03d" -- For 000 padding
- "%x" -- For hexadecimal line numbers
- "%o" -- For octal line numbers

**Version**

1.3.3

### linenumber_size()

```cpp
void Fl_Text_Display::linenumber_size ( Fl_Fontsize val )
```

Set the font size used for line numbers (if enabled).

**Version**

1.3.3

### linenumber_width()

```cpp
void Fl_Text_Display::linenumber_width ( int width )
```

Set width of screen area for line numbers. Use to also enable/disable line numbers. A value of 0 disables line numbering, values >0 enable the line number display.

**Parameters**

| width | The new width of the area for line numbers to appear, in pixels. 0 disables line numbers (default) |

### longest_vline()

```cpp
int Fl_Text_Display::longest_vline ( ) const [protected]
```

Find the longest line of all visible lines.

**Returns**

the width of the longest visible line in pixels

### maintain_absolute_top_line_number()

```cpp
void Fl_Text_Display::maintain_absolute_top_line_number ( int state ) [protected]
```

Line numbering stuff, currently unused.

In continuous wrap mode, internal line numbers are calculated after wrapping. A separate non-wrapped line count is maintained when line numbering is turned on. There is some performance cost to maintaining this line count, so normally absolute line numbers are not tracked if line numbering is off. This routine allows callers to specify that...
they still want this line count maintained (for use via Fl_Text_Display::position_to_linecol()). More specifically, this allows the line number reported in the statistics line to be calibrated in absolute lines, rather than post-wrapped lines.

### 12.143.4.50 maintaining_absolute_top_line_number()

```cpp
int Fl_Text_Display::maintaining_absolute_top_line_number ( ) const [protected]
```

Returns true if a separate absolute top line number is being maintained. The absolute top line number is used for displaying line numbers in continuous wrap mode or showing in the statistics line (the latter is currently not available in FLTK).

### 12.143.4.51 measure_deleted_lines()

```cpp
void Fl_Text_Display::measure_deleted_lines ( int pos, int nDeleted ) [protected]
```

Wrapping calculations. This is a stripped-down version of the findWrapRange() function above, intended to be used to calculate the number of "deleted" lines during a buffer modification. It is called before the modification takes place. This function should only be called in continuous wrap mode with a non-fixed font width. In that case, it is impossible to calculate the number of deleted lines, because the necessary style information is no longer available after the modification. In other cases, we can still perform the calculation afterwards (possibly even more efficiently).

**Parameters**

- `pos`
- `nDeleted`

### 12.143.4.52 measure_proportional_character()

```cpp
double Fl_Text_Display::measure_proportional_character ( const char * s, int xPix, int pos ) const [protected]
```

Wrapping calculations. Measure the width in pixels of the first character of string "s" at a particular column "colNum" and buffer position "pos". This is for measuring characters in proportional or mixed-width highlighting fonts.

A note about proportional and mixed-width fonts: the mixed width and proportional font code in nedit does not get much use in general editing, because nedit doesn't allow per-language-mode fonts, and editing programs in a proportional font is usually a bad idea, so very few users would choose a proportional font as a default. There are still probably mixed-width syntax highlighting cases where things don't redraw properly for insertion/deletion, though static display and wrapping and resizing should now be solid because they are now used for online help display.

**Parameters**

- `s` text string
- `xPix` x pixel position needed for calculating tab widths
- `pos` offset within string
Returns
width of character in pixels

12.143.4.53  measure_vline()

int Fl_Text_Display::measure_vline {
    int visLineNum) const  [protected]

Returns the width in pixels of the displayed line pointed to by "visLineNum".

Parameters
visLineNum  index into visible lines array

Returns
width of line in pixels

12.143.4.54  move_down()

int Fl_Text_Display::move_down ( )

Moves the current insert position down one line.

Returns
1 if the cursor moved, 0 if the beginning of the text was reached

12.143.4.55  move_left()

int Fl_Text_Display::move_left ( )

Moves the current insert position left one character.

Returns
1 if the cursor moved, 0 if the beginning of the text was reached

12.143.4.56  move_right()

int Fl_Text_Display::move_right ( )

Moves the current insert position right one character.

Returns
1 if the cursor moved, 0 if the end of the text was reached

12.143.4.57  move_up()

int Fl_Text_Display::move_up ( )

Moves the current insert position up one line.

Returns
1 if the cursor moved, 0 if the beginning of the text was reached

12.143.4.58  offset_line_starts()

void Fl_Text_Display::offset_line_starts {
    int newTopLineNum) [protected]

Offset line start counters for a new vertical scroll position.
Offset the line starts array, mTopLineNum, mFirstChar and lastChar, for a new vertical scroll position given by newTopLineNum. If any currently displayed lines will still be visible, salvage the line starts values, otherwise, count lines from the nearest known line start (start or end of buffer, or the closest value in the mLineStarts array)
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>newTopLineNum</code></td>
<td>index into buffer</td>
</tr>
</tbody>
</table>

12.143.459  **overstrike()**

```cpp
void Fl_Text_Display::overstrike (const char * text)
```

Replaces text at the current insert position.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>text</code></td>
<td>new text in UTF-8 encoding</td>
</tr>
</tbody>
</table>

**Todo**  Unicode? Find out exactly what we do here and simplify.

12.143.460  **position_style()**

```cpp
int Fl_Text_Display::position_style (int lineStartPos, int lineLen, int lineIndex) const
```

Find the correct style for a character.

Determine the drawing method to use to draw a specific character from "buf". `lineStartPos` gives the character index where the line begins, `lineIndex`, the number of characters past the beginning of the line, and `lineLen` the number of displayed characters past the beginning of the line. Passing `lineStartPos` of -1 returns the drawing style for "no text".

Why not just: `position_style(pos)`? Because style applies to blank areas of the window beyond the text boundaries, and because this routine must also decide whether a position is inside of a rectangular `Fl_Text_Selection`, and do so efficiently, without re-counting character positions from the start of the line.

Note that style is a somewhat incorrect name, drawing method would be more appropriate.

If `lineIndex` is pointing to the last character in a line, and the second to last character has the `ATTR_BGCOLOR_EXT` set, the background color will extend into the remaining line.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lineStartPos</code></td>
<td>beginning of this line</td>
</tr>
<tr>
<td><code>lineLen</code></td>
<td>number of bytes in line</td>
</tr>
<tr>
<td><code>lineIndex</code></td>
<td>position of character within line</td>
</tr>
</tbody>
</table>

Returns

- style for the given character

12.143.461  **position_to_line()**

```cpp
int Fl_Text_Display::position_to_line (int pos, int * lineNum) const [protected]
```

Convert a position index into a line number offset.

Find the line number of position `pos` relative to the first line of displayed text, counting from 0 to `visible lines - 1`. The line number is returned in `lineNum`.

Returns 0 if the line is not displayed. In this case `lineNum` is 0 as well.

Returns 1 if the line is displayed. In this case `lineNum` is the relative line number.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>pos</th>
<th>byte position in buffer</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>lineNum</td>
<td>relative line number of byte pos in buffer</td>
</tr>
</tbody>
</table>

Returns

whether the character at byte position pos is currently displayed

Return values

| 0 | pos is not displayed; lineNum is invalid (zero) |
| 1 | pos is displayed; lineNum is valid |

12.143.4.62 position_to_linecol()

int Fl_Text_Display::position_to_linecol (  
    int pos,  
    int * lineNum,  
    int * column ) const [protected]

Find the line and column number of position pos.
This only works for displayed lines. If the line is not displayed, the function returns 0 (without the mLineStarts array it could turn in to very long calculation involving scanning large amounts of text in the buffer). If continuous wrap mode is on, returns the absolute line number (as opposed to the wrapped line number which is used for scrolling).

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>character index</th>
</tr>
</thead>
<tbody>
<tr>
<td>lineNum</td>
<td>absolute (unwrapped) line number</td>
</tr>
<tr>
<td>column</td>
<td>character offset to the beginning of the line</td>
</tr>
</tbody>
</table>

Returns

0 if pos is off screen, line number otherwise

Todo a column number makes little sense in the UTF-8/variable font width environment. We will have to further define what exactly we want to return. Please check the functions that call this particular function.

12.143.4.63 position_to_xy()

int Fl_Text_Display::position_to_xy (  
    int pos,  
    int * X,  
    int * Y ) const

Convert a character index into a pixel position.
Translate a buffer text position to the XY location where the top left of the cursor would be positioned to point to that character. Returns 0 if the position is not displayed because it is vertically out of view. If the position is horizontally out of view, returns the X coordinate where the position would be if it were visible.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>character index</th>
</tr>
</thead>
<tbody>
<tr>
<td>X, Y</td>
<td>pixel position of character on screen</td>
</tr>
</tbody>
</table>
Returns

0 if character vertically out of view, X & Y positions otherwise

12.143.4.64  redisplay_range()

```cpp
void Fl_Text_Display::redisplay_range (int startpos, int endpos)
```

Marks text from start to end as needing a redraw.
This function will trigger a damage event and later a redraw of parts of the widget.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startpos</td>
<td>index of first character needing redraw</td>
</tr>
<tr>
<td>endpos</td>
<td>index after last character needing redraw</td>
</tr>
</tbody>
</table>

12.143.4.65  reset_absolute_top_line_number()

```cpp
void Fl_Text_Display::reset_absolute_top_line_number ( ) [protected]
```

Reestablish the absolute (non-wrapped) top line number.
Count lines from the beginning of the buffer to reestablish the absolute (non-wrapped) top line number. If mode is not continuous wrap, or the number is not being maintained, does nothing.

12.143.4.66  resize()

```cpp
void Fl_Text_Display::resize (int X, int Y, int W, int H) [virtual]
```

Change the size of the displayed text area.
Calling this function will trigger a recalculation of all visible lines and of all scrollbar sizes.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X,Y,W,H</td>
<td>new position and size of this widget</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Group.

12.143.4.67  rewind_lines()

```cpp
int Fl_Text_Display::rewind_lines (int startPos, int nLines)
```

Skip a number of lines back.
Same as buffer()->rewind_lines(startPos, nLines), but takes into account line breaks when wrapping is turned on.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startPos</td>
<td>index to starting character</td>
</tr>
<tr>
<td>nLines</td>
<td>number of lines to skip back</td>
</tr>
</tbody>
</table>
12.143.4.68 scroll()

void Fl_Text_Display::scroll ( 
    int topLineNum, 
    int horizOffset )

Scrolls the current buffer to start at the specified line and column.

Parameters

<table>
<thead>
<tr>
<th>topLineNum</th>
<th>top line number</th>
</tr>
</thead>
<tbody>
<tr>
<td>horizOffset</td>
<td>column number</td>
</tr>
</tbody>
</table>

**Todo** Column numbers make little sense here.

12.143.4.69 scroll()

int Fl_Text_Display::scroll_ ( 
    int topLineNum, 
    int horizOffset ) [protected]

Scrolls the current buffer to start at the specified line and column.

Parameters

<table>
<thead>
<tr>
<th>topLineNum</th>
<th>top line number</th>
</tr>
</thead>
<tbody>
<tr>
<td>horizOffset</td>
<td>in pixels</td>
</tr>
</tbody>
</table>

Returns

0 if nothing changed, 1 if we scrolled

12.143.4.70 scroll_timer_cb()

void Fl_Text_Display::scroll_timer_cb ( 
    void * user_data ) [static], [protected]

Timer callback for scroll events.
This timer event scrolls the text view proportionally to how far the mouse pointer has left the text area. This allows for smooth scrolling without "wiggeling" the mouse.

12.143.4.71 scrollbar_align()[1/2]

Fl_Align Fl_Text_Display::scrollbar_align ( ) const [inline]

Gets the scrollbar alignment type.

Returns

scrollbar alignment

12.143.4.72 scrollbar_align()[2/2]

void Fl_Text_Display::scrollbar_align ( 
    Fl_Align a ) [inline]

Sets the scrollbar alignment type.
Parameters

\begin{verbatim}
a new scrollbar alignment
\end{verbatim}

12.143.4.73 scrollbar_size() [1/2]

```
int Fl_Text_Display::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.
If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also

Fl::scrollbar_size(int)

12.143.4.74 scrollbar_size() [2/2]

```
void Fl_Text_Display::scrollbar_size (
   int newSize ) [inline]
```

Sets the pixel size of the scrollbars' troughs to newSize, in pixels.
Normally you should not need this method, and should use Fl::scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.
Only use THIS method if you really need to override the global scrollbar size. Setting newSize to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the default.

Parameters

\begin{verbatim}
in newSize Sets the scrollbar size in pixels.
If 0 (default), scrollbar size tracks the global Fl::scrollbar_size()
\end{verbatim}

See also

Fl::scrollbar_size()

12.143.4.75 scrollbar_width() [1/2]

```
int Fl_Text_Display::scrollbar_width () const [inline]
```

Returns the global value Fl::scrollbar_size() unless a specific scrollbar_width_ has been set.

Deprecated Use scrollbar_size() instead.

Todo This method should eventually be removed.

12.143.4.76 scrollbar_width() [2/2]

```
void Fl_Text_Display::scrollbar_width ( 
   int width ) [inline]
```

Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

Deprecated Use scrollbar_size() instead.

Todo This method should eventually be removed
12.143.4.77  secondary_selection_color() [1/2]

**Fl_Color Fl_Text_Display::secondary_selection_color ( ) const [inline]**

Gets the background color for the secondary selection block.

Returns

- background color

12.143.4.78  secondary_selection_color() [2/2]

**void Fl_Text_Display::secondary_selection_color ( Fl_Color color ) [inline]**

Sets the background color for the secondary selection block.

Parameters

- color  background color

12.143.4.79  shortcut() [1/2]

**int Fl_Text_Display::shortcut ( ) const [inline]**

**Todo** FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!

Returns

- the current shortcut key

12.143.4.80  shortcut() [2/2]

**void Fl_Text_Display::shortcut ( int s ) [inline]**

**Todo** FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!

Parameters

- s  the new shortcut key

12.143.4.81  show_cursor()

**void Fl_Text_Display::show_cursor ( int b = 1 )**

Shows the text cursor.

This function may trigger a redraw.

Parameters

- b  show(1) or hide(0) the text cursor (caret).
12.143.4.82  show_insert_position()

void Fl_Text_Display::show_insert_position ( )
Scrolls the text buffer to show the current insert position.
This function triggers a complete recalculation, ending in a call to Fl_Text_Display::display_insert()

12.143.4.83  skip_lines()

int Fl_Text_Display::skip_lines ( int startPos, int nLines, bool startPosIsLineStart )
Skip a number of lines forward.
Same as Fl_Text_Buffer::skip_lines(startPos, nLines), but takes into account line breaks when wrapping is turned on. If the caller knows that startPos is at a line start, it can pass startPosIsLineStart as True to make the call more efficient by avoiding the additional step of scanning back to the last newline.

Parameters

<table>
<thead>
<tr>
<th>startPos</th>
<th>index to starting character</th>
</tr>
</thead>
<tbody>
<tr>
<td>nLines</td>
<td>number of lines to skip ahead</td>
</tr>
<tr>
<td>startPosIsLineStart</td>
<td>avoid scanning back to the line start</td>
</tr>
</tbody>
</table>

Returns

new position as index

12.143.4.84  spelling_underline_color() [1/2]

Fl_Color Fl_Text_Display::spelling_underline_color { } const [inline]
Gets the underline color for style attribute ATTR_SPELLING.

Returns

underline color

12.143.4.85  spelling_underline_color() [2/2]

void Fl_Text_Display::spelling_underline_color ( Fl_Color color ) [inline]
Sets the underline color for style attribute ATTR_SPELLING.

Parameters

| color | underline color |

12.143.4.86  string_width()

double Fl_Text_Display::string_width ( const char * string, int length, int style ) const [protected]
Find the width of a string in the font of a particular style.

Parameters

| string | the text |
Parameters

<table>
<thead>
<tr>
<th>length</th>
<th>number of bytes in string</th>
</tr>
</thead>
<tbody>
<tr>
<td>style</td>
<td>index into style table</td>
</tr>
</tbody>
</table>

Returns

width of text segment in pixels

12.143.4.87  style_buffer()

*Fl_Text_Buffer* Fl_Text_Display::style_buffer() const [inline]

Gets the current style buffer associated with the text widget.
Multiple text widgets can be associated with the same style buffer.

Returns

current style buffer

See also

Fl_Text_Display::highlight_data()

12.143.4.88  textcolor() [1/2]

*Fl_Color* Fl_Text_Display::textcolor() const [inline]

Gets the default color of text in the widget.

Returns

text color unless overridden by a style

12.143.4.89  textcolor() [2/2]

void Fl_Text_Display::textcolor(
    *Fl_Color* n ) [inline]

Sets the default color of text in the widget.

Parameters

| n       | new text color |

12.143.4.90  textfont() [1/2]

*Fl_Font* Fl_Text_Display::textfont() const [inline]

Gets the default font used when drawing text in the widget.

Returns

current text font face unless overridden by a style

12.143.4.91  textfont() [2/2]

void Fl_Text_Display::textfont(
    *Fl_Font* s ) [inline]

Sets the default font used when drawing text in the widget.
Parameters

s default text font face

12.143.4.92  textbox() [1/2]

Fl_Fontsize Fl_Text_Display::textsize ( ) const [inline]
Gets the default size of text in the widget.

Returns

current text height unless overridden by a style

12.143.4.93  textbox() [2/2]

void Fl_Text_Display::textbox ( Fl_Fontsize s ) [inline]
Sets the default size of text in the widget.

Parameters

s new text size

12.143.4.94  update_h_scrollbar()

void Fl_Text_Display::update_h_scrollbar ( ) [protected]
Update horizontal scrollbar.
Update the minimum, maximum, slider size, page increment, and value for the horizontal scrollbar.

12.143.4.95  update_line_starts()

void Fl_Text_Display::update_line_starts ( int pos,
int charsInserted,
int charsDeleted,
int linesInserted,
int linesDeleted,
int * scrolled ) [protected]
Update line start arrays and variables.
Update the line starts array, mTopLineNum, mFirstChar and lastChar for this text display after a modification to the text buffer, given by the position pos where the change began, and the numbers of characters and lines inserted and deleted.

Parameters

<table>
<thead>
<tr>
<th>pos</th>
<th>index into buffer of recent changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>charsInserted</td>
<td>number of bytes(!) inserted</td>
</tr>
<tr>
<td>charsDeleted</td>
<td>number of bytes(!) deleted</td>
</tr>
<tr>
<td>linesInserted</td>
<td>number of lines</td>
</tr>
<tr>
<td>linesDeleted</td>
<td>number of lines</td>
</tr>
<tr>
<td>out</td>
<td>scrolled set to 1 if the text display needs to be scrolled</td>
</tr>
</tbody>
</table>

12.143.4.96  update_v_scrollbar()

void Fl_Text_Display::update_v_scrollbar ( ) [protected]

Generated by Doxygen
Update vertical scrollbar.
Update the minimum, maximum, slider size, page increment, and value for the vertical scrollbar.

12.143.4.97  vline_length()

```cpp
text
int Fl_Text_Display::vline_length (int visLineNum) const [protected]
```

Count number of bytes in a visible line.
Return the length of a line (number of bytes) by examining entries in the line starts array rather than by scanning for newlines.

Parameters

| visLineNum | index of line in visible line array |

Returns

text

number of bytes in this line

12.143.4.98  word_end()

```cpp
text
int Fl_Text_Display::word_end (int pos) const [inline]
```

Moves the insert position to the end of the current word.

Parameters

| pos | start calculation at this index |

Returns

text

index of first character after the end of the word

12.143.4.99  word_start()

```cpp
text
int Fl_Text_Display::word_start (int pos) const [inline]
```

Moves the insert position to the beginning of the current word.

Parameters

| pos | start calculation at this index |

Returns

text

beginning of the words

12.143.4.100  wrap_mode()

```cpp
text
void Fl_Text_Display::wrap_mode (int wrap, int wrapMargin)
```

Set the new text wrap mode.
If wrap mode is not zero, this call enables automatic word wrapping at column wrapMargin. Word-wrapping does not change the text buffer itself, only the way the text is displayed. Different Text Displays can have different wrap modes, even if they share the same Text Buffer.
Valid wrap modes are:

- WRAP_NONE: don't wrap text at all
- WRAP_AT_COLUMN: wrap text at the given text column
- WRAP_AT_PIXEL: wrap text at a pixel position
- WRAP_AT_BOUNDS: wrap text so that it fits into the widget width

Parameters

<table>
<thead>
<tr>
<th>wrap</th>
<th>new wrap mode (see above)</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapMargin</td>
<td>In WRAP_AT_COLUMN mode, text will wrap at the n'th character. For variable width fonts, an average character width is calculated. The column width is calculated using the current textfont or the first style when this function is called. If the font size changes, this function must be called again. In WRAP_AT_PIXEL mode, this is the pixel position.</td>
</tr>
</tbody>
</table>

12.143.4.101 wrap Uses_character()

int Fl_Text_Display::wrap_uses_character (int lineEndPos) const [protected]

Check if the line break is caused by a newline or by line wrapping.

Line breaks in continuous wrap mode usually happen at newlines ('n') or whitespace. This line-terminating character is not included in line width measurements and has a special status as a non-visible character. However, lines with no whitespace are wrapped without the benefit of a line terminating character, and this distinction causes endless trouble with all of the text display code which was originally written without continuous wrap mode and always expects to wrap at a newline character.

Given the position of the end of the line, as returned by Fl_Text_Display::line_end() or Fl_Text_Buffer::line_end(), this returns true if there is a line terminating character, and false if there's not. On the last character in the buffer, this function can't tell for certain whether a trailing space was used as a wrap point, and just guesses that it wasn't. So if an exact accounting is necessary, don't use this function.

Parameters

| lineEndPos | index of character where the line wraps |

Returns

1 if a \n character causes the line wrap

12.143.4.102 wrapped_column()

int Fl_Text_Display::wrapped_column (int row, int column) const

Nobody knows what this function does.

Correct a column number based on an unconstrained position (as returned by TextDXYToUnconstrainedPosition) to be relative to the last actual newline in the buffer before the row and column position given, rather than the last line start created by line wrapping. This is an adapter for rectangular selections and code written before continuous wrap mode, which thinks that the unconstrained column is the number of characters from the last newline. Obviously this is time consuming, because it involves character re-counting.

Parameters

| row | |
| column | |
Returns

something unknown

Todo  What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function TextDXYToUnconstrainedPosition does not exist (nedit port?)

Todo  Unicode?

12.143.4.103  wrapped_line_counter()

void Fl_Text_Display::wrapped_line_counter (  
    Fl_Text_Buffer * buf,  
    int startPos,  
    int maxPos,  
    int maxLines,  
    bool startPosIsLineStart,  
    int styleBufOffset,  
    int * retPos,  
    int * retLines,  
    int * retLineStart,  
    int * retLineEnd,  
    bool countLastLineMissingNewLine = true ) const [protected]

Wrapping calculations.
Count forward from startPos to either maxPos or maxLines (whichever is reached first), and return all relevant positions and line count. The provided textBuffer may differ from the actual text buffer of the widget. In that case it must be a (partial) copy of the actual text buffer and the styleBufOffset argument must indicate the starting position of the copy, to take into account the correct style information.

Parameters

| in   | buf                        | The text buffer to operate on |
| in   | startPos                   | Starting index position into the buffer |
| in   | maxPos                     | Maximum index position into the buffer we'll reach |
| in   | maxLines                   | Maximum number of lines we'll reach |
| in   | startPosIsLineStart        | Flag indicating if startPos is start of line. (If set, prevents our having to find the line start) |
| in   | styleBufOffset             | Offset index position into style buffer. |
| out  | retPos                     | Position where counting ended. When counting lines, the position returned is the start of the line "maxLines" lines beyond "startPos". |
| out  | retLines                   | Number of line breaks counted |
| out  | retLineStart               | Start of the line where counting ended |
| out  | retLineEnd                 | End position of the last line traversed |
| out  | countLastLineMissingNewLine | |

12.143.4.104  wrapped_row()

int Fl_Text_Display::wrapped_row (  
    int row ) const

Nobody knows what this function does.
Correct a row number from an unconstrained position (as returned by TextDXYToUnconstrainedPosition) to a straight number of newlines from the top line of the display. Because rectangular selections are based on newlines, rather than display wrapping, and anywhere a rectangular selection needs a row, it needs it in terms of un-wrapped lines.
**Parameters**

- **row**

**Returns**

- something unknown

**Todo** What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function TextDXYToUnconstrainedPosition does not exist (nedit port?)

### x_to_col()

```cpp
double Fl_Text_Display::x_to_col ( double x ) const
```

Convert an x pixel position into a column number.

**Parameters**

- **x** number of pixels from the left margin

**Returns**

- an approximate column number based on the main font

### xy_to_position()

```cpp
int Fl_Text_Display::xy_to_position ( int X, int Y, int posType = CHARACTER_POS ) const [protected]
```

Translate a pixel position into a character index.

Translate window coordinates to the nearest (insert cursor or character cell) text position. The parameter `posType` specifies how to interpret the position: CURSOR_POS means translate the coordinates to the nearest cursor position, and CHARACTER_POS means return the position of the character closest to \((X, Y)\).

**Parameters**

<table>
<thead>
<tr>
<th>X, Y</th>
<th>pixel position</th>
</tr>
</thead>
<tbody>
<tr>
<td>posType</td>
<td>CURSOR_POS or CHARACTER_POS</td>
</tr>
</tbody>
</table>

**Returns**

- index into text buffer

### xy_to_rowcol()

```cpp
void Fl_Text_Display::xy_to_rowcol ( int X, int Y, int * row, int * column, int posType = CHARACTER_POS ) const [protected]
```

Translate pixel coordinates into row and column.

Translate window coordinates to the nearest row and column number for positioning the cursor. This, of course, makes no sense when the font is proportional, since there are no absolute columns. The parameter `posType`
specifies how to interpret the position: CURSOR_POS means translate the coordinates to the nearest position between characters, and CHARACTER_POS means translate the position to the nearest character cell.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>X,Y</td>
<td>pixel coordinates</td>
</tr>
<tr>
<td>out</td>
<td>row, column nearest row and column</td>
</tr>
<tr>
<td>posType</td>
<td>CURSOR_POS or CHARACTER_POS</td>
</tr>
</tbody>
</table>

Fl_Text_Editor
```

Classes

- struct **Key_Binding**
  
  Simple linked list item associating a key/state to a function.

Public Types

- typedef int(∗Key_Func)(int key, Fl_Text_Editor ∗editor)
  
  Key function binding callback type.

Public Types inherited from Fl_Text_Display

- enum {NORMAL_CURSOR, CARET_CURSOR, DIM_CURSOR, BLOCK_CURSOR, HEAVY_CURSOR, SIMPLE_CURSOR}
  
  text display cursor shapes enumeration
- enum {CURSOR_POS, CHARACTER_POS}
  
  the character position is the left edge of a character, whereas the cursor is thought to be between the centers of two consecutive characters.
- enum {
  DRAG_NONE = -2, DRAG_START_DND = -1, DRAG_CHAR = 0, DRAG_WORD = 1, DRAG_LINE = 2
  }
  
  drag types - they match Fl::event_clicks() so that single clicking to start a collection selects by character, double clicking selects by word and triple clicking selects by line.
- enum {WRAP_NONE, WRAP_AT_COLUMN, WRAP_AT_PIXEL, WRAP_AT_BOUNDS}
wrap types - used in wrap_mode()

• enum {
  ATTR_BGCOLOR = 0x0001, ATTR_BGCOLOR_EXT = 0x0002, ATTR_BGCOLOR_EXT = 0x0003,
  ATTR_UNDERLINE = 0x0004,
  ATTR_GRAMMAR = 0x0008, ATTR_SPELLING = 0x000C, ATTR_STRIKE THROUGH = 0x0010,
  ATTR_LINES_MASK = 0x001C
}

attribute flags in Style_Table_Entry.attr

• typedef void(* Unfinished_Style_Cb) (int, void *)

Public Member Functions

• void add_default_key_bindings (Key_Binding **list)
  Adds all of the default editor key bindings to the specified key binding list.

• void add_key_binding (int key, int state, Key_Func f)
  Adds a key of state state with the function f.

• void add_key_binding (int key, int state, Key_Func f, Key_Binding **list)
  Adds a key of state state with the function function to an arbitrary key binding list list.

• Key_Func bound_key_function (int key, int state) const
  Returns the function associated with a key binding.

• Key_Func bound_key_function (int key, int state, Key_Binding *list) const
  Returns the function associated with a key binding.

• void default_key_function (Key_Func f)
  Sets the default key function for unassigned keys.

• Fl_Text_Editor (int X, int Y, int W, int H, const char *l=0)
  The constructor creates a new text editor widget.

• int handle (int e) FL_OVERRIDE
  Event handling.

• int insert_mode ()
  Gets the current insert mode; if non-zero, new text is inserted before the current cursor position.

• void insert_mode (int b)
  Sets the current insert mode; if non-zero, new text is inserted before the current cursor position.

• void remove_all_key_bindings ()
  Removes all of the key bindings associated with the text editor or list.

• void remove_all_key_bindings (Key_Binding **list)
  Removes all of the key bindings associated with the text editor or list.

• void remove_key_binding (int key, int state)
  Removes the key binding associated with the key "key" of state "state".

• void remove_key_binding (int key, int state, Key_Binding **list)
  Removes the key binding associated with the key key of state state from the Key_Binding list list.

• int tab_nav () const
  Checks if Tab focus navigation is enabled.

• void tab_nav (int val)
  Enables or disables Tab key focus navigation.

Public Member Functions inherited from Fl_Text_Display

• Fl_Text_Buffer * buffer () const
  Gets the current text buffer associated with the text widget.

• void buffer (Fl_Text_Buffer &buf)
  Sets the current text buffer associated with the text widget.

• void buffer (Fl_Text_Buffer +buf)
  Attach a text buffer to display, replacing the current buffer (if any).
• double col_to_x (double col) const
  Convert a column number into an x pixel position.
• int count_lines (int start, int end, bool start_pos_is_line_start) const
  Count the number of lines between two positions.
• Fl_Color cursor_color () const
  Gets the text cursor color.
• void cursor_color (Fl_Color n)
  Sets the text cursor color.
• int cursor_style () const
• void cursor_style (int style)
  Sets the text cursor style.
• Fl_Text_Display (int X, int Y, int W, int H, const char ∗l=0)
  Creates a new text display widget.
• Fl_Color grammar_underline_color () const
  Gets the underline color for style attribute ATTR_GRAMMAR.
• void grammar_underline_color (Fl_Color color)
  Sets the underline color for style attribute ATTR_GRAMMAR.
• void hide_cursor ()
  Hides the text cursor.
• void highlight_data (Fl_Text_Buffer ∗styleBuffer, const Style_Table_Entry ∗styleTable, int nStyles, char unfinishedStyle, Unfinished_Style_Cb unfinishedHighlightCB, void ∗cbArg)
  Attach (or remove) highlight information in text display and redisplay.
• int in_selection (int x, int y) const
  Check if a pixel position is within the primary selection.
• void insert (const char ∗text)
  Inserts "text" at the current cursor location.
• int insert_position () const
  Gets the position of the text insertion cursor for text display.
• void insert_position (int newPos)
  Sets the position of the text insertion cursor for text display.
• int line_end (int startPos, bool startPosIsLineStart) const
  Returns the end of a line.
• int line_start (int pos) const
  Return the beginning of a line.
• Fl_Align linenumber_align () const
  Returns the alignment used for line numbers (if enabled).
• void linenumber_align (Fl_Align val)
  Set alignment for line numbers (if enabled).
• Fl_Color linenumberbgcolor () const
  Returns the background color used for line numbers (if enabled).
• void linenumberbgcolor (Fl_Color val)
  Set the background color used for line numbers (if enabled).
• Fl_Color linenumberfgcolor () const
  Return the foreground color used for line numbers (if enabled).
• void linenumberfgcolor (Fl_Color val)
  Set the foreground color used for line numbers (if enabled).
• Fl_Font linenumberfont () const
  Return the font used for line numbers (if enabled).
• void linenumberfont (Fl_Font val)
  Set the font used for line numbers (if enabled).
• const char ∗linenumberformat () const
Returns the line number printf() format string.

- void linenumber_format (const char *val)
  Sets the printf() style format string used for line numbers.

- Fl_Fontsize linenumber_size () const
  Return the font size used for line numbers (if enabled).

- void linenumber_size (Fl_Fontsize val)
  Set the font size used for line numbers (if enabled).

- int linenumber_width () const
  Return the screen area width provided for line numbers.

- void linenumber_width (int width)
  Set width of screen area for line numbers.

- int move_down ()
  Moves the current insert position down one line.

- int move_left ()
  Moves the current insert position left one character.

- int move_right ()
  Moves the current insert position right one character.

- int move_up ()
  Moves the current insert position up one line.

- void next_word (void)
  Moves the current insert position right one word.

- void overstrike (const char *text)
  Replaces text at the current insert position.

- int position_style (int lineStartPos, int lineLen, int lineIndex) const
  Find the correct style for a character.

- int position_to_xy (int pos, int *x, int *y) const
  Convert a character index into a pixel position.

- void previous_word (void)
  Moves the current insert position left one word.

- virtual void recalc_display ()
  Recalculate the display’s visible lines and scrollbar sizes.

- void redisplay_range (int start, int end)
  Marks text from start to end as needing a redraw.

- void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Change the size of the displayed text area.

- int rewind_lines (int startPos, int nLines)
  Skip a number of lines back.

- void scroll (int topLineNum, int horizOffset)
  Scrolls the current buffer to start at the specified line and column.

- Fl_Align scrollbar_align () const
  Gets the scrollbar alignment type.

- void scrollbar_align (Fl_Align a)
  Sets the scrollbar alignment type.

- int scrollbar_size () const
  Gets the current size of the scrollbars' troughs, in pixels.

- void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

- int scrollbar_width () const
  Returns the global value Fl::scrollbar_size() unless a specific scrollbar_width_ has been set.

- void scrollbar_width (int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.
- **Fl_Color secondary_selection_color () const**
  
  Gets the background color for the secondary selection block.

- **void secondary_selection_color (Fl_Color color)**
  
  Sets the background color for the secondary selection block.

- **int shortcut () const**

- **void shortcut (int s)**

- **void show_cursor (int b=1)**
  
  Shows the text cursor.

- **void show_insert_position ()**
  
  Scrolls the text buffer to show the current insert position.

- **int skip_lines (int startPos, int nLines, bool startPosIsLineStart)**
  
  Skip a number of lines forward.

- **Fl_Color spelling_underline_color () const**
  
  Gets the underline color for style attribute ATTR_SPELLING.

- **void spelling_underline_color (Fl_Color color)**
  
  Sets the underline color for style attribute ATTR_SPELLING.

- **Fl_Text_Buffer * style_buffer () const**
  
  Gets the current style buffer associated with the text widget.

- **Fl_Color textcolor () const**
  
  Gets the default color of text in the widget.

- **void textcolor (Fl_Color n)**
  
  Sets the default color of text in the widget.

- **Fl_Font textfont () const**
  
  Gets the default font used when drawing text in the widget.

- **void textfont (Fl_Font s)**
  
  Sets the default font used when drawing text in the widget.

- **Fl_Fontsize textsize () const**
  
  Gets the default size of text in the widget.

- **void textsize (Fl_Fontsize s)**
  
  Sets the default size of text in the widget.

- **int word_end (int pos) const**
  
  Moves the insert position to the end of the current word.

- **int word_start (int pos) const**
  
  Moves the insert position to the beginning of the current word.

- **void wrap_mode (int wrap, int wrap_margin)**
  
  Set the new text wrap mode.

- **int wrapped_column (int row, int column) const**
  
  Nobody knows what this function does.

- **int wrapped_row (int row) const**
  
  Nobody knows what this function does.

- **double x_to_col (double x) const**
  
  Convert an x pixel position into a column number.

- **Fl_Text_Display ()**
  
  Free a text display and release its associated memory.
Public Member Functions inherited from Fl_Group

- **Fi_Widget** & _ddfdesign_kludge ()
  This is for forms compatibility only.
- void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
- void add (Fl_Widget *o)
  See void Fl_Group::add(Fl_Widget &w)
- void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
- Fl_Widget *const * array () const
  Returns a pointer to the array of children.
- Fl_Group *as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
- Fl_Widget * child (int n) const
  Returns array()[n].
- int children () const
  Returns how many child widgets the group has.
- void clear ()
  Deletes all child widgets from memory recursively.
- unsigned int clip_children ()
  Returns the current clipping mode.
- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
- void end ()
  Exactly the same as current(this->parent()).
- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char * =0)
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget *W)
- void forms_end ()
  This is for forms compatibility only.
- void init_sizes ()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
Removes the widget at index from the group but does not delete it.

- **Fl_Widget** ∗ resizable () const
  Returns the group's resizable widget.

- **void** resizable (**Fl_Widget** &o)
  Sets the group's resizable widget.

- **void** resizable (**Fl_Widget** ∗o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual** ~**Fl_Group** ()
  The destructor also deletes all the children.

### Public Member Functions inherited from **Fl_Widget**

- **void** _clear_fullscreen ()
- **void** _set_fullscreen ()
- **void** activate ()
  Activates the widget.

- **unsigned int** active () const
  Returns whether the widget is active.

- **int** active_r () const
  Returns whether the widget and all of its parents are active.

- **Fl_Align** align () const
  Gets the label alignment.

- **void** align (**Fl_Align** alignment)
  Sets the label alignment.

- **long** argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- **void** argument (**long** v)
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual** class **Fl_Gl_Window** ∗ as_gl_window ()
  Returns an **Fl_Gl_Window** pointer if this widget is an **Fl_Gl_Window**.

- **virtual** class **Fl_Gl_Window** const ∗ as_gl_window () const
- **virtual** class **Fl_Window** ∗ as_window ()
  Returns an **Fl_Window** pointer if this widget is an **Fl_Window**.

- **virtual** **Fl_Window** const ∗ as_window () const
- **void** bind_deimage (**Fl_Image** ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

- **void** bind_deimage (**int** f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void** bind_image (**Fl_Image** ∗img)
  Sets the image to use as part of the widget label when in the active state.

- **void** bind_image (**int** f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype** box () const
  Gets the box type of the widget.

- **void** box (**Fl_Boxtype** new_box)
  Sets the box type for the widget.

- **Fl_Callback_p** callback () const
  Gets the current callback function for the widget.

- **void** callback (**Fl_Callback** ∗cb)
  Sets the current callback function for the widget.

- **void** callback (**Fl_Callback** ∗cb, **Fl_Callback_User_Data** ∗p, **bool** auto_free)
Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void **deimage** (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void **deimage** (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

• int **deimage_bound** () const
  Returns whether the inactive image is managed by the widget.

• void **do_callback** (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void **do_callback** (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void **do_callback** (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void **draw_label** (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int **h** () const
  Gets the widget height.

• virtual void **hide** ()
  Makes a widget invisible.

• Fl_Image * **image** ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * **image** () const
  Gets the image that is used as part of the widget label when in the active state.

• void **image** (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void **image** (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• int **image_bound** () const
  Returns whether the image is managed by the widget.

• int **inside** (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int **is_label_copied** () const
  Returns whether the current label was assigned with copy_label().

• const char * **label** () const
  Gets the current label text.

• void **label** (const char *text)
  Sets the current label pointer.

• void **label** (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color **labelcolor** () const
  Gets the label color.

• void **labelcolor** (Fl_Color c)
  Sets the label color.

• Fl_Font **labelfont** () const
  Gets the font to use.

• void **labelfont** (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize **labelsize** () const
  Gets the font size in pixels.

• void **labelsize** (Fl_Fontsize pix)
  Sets the font size in pixels.
Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.

• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  
  

  Sets the current tooltip text.

• Fl_Window * top_window () const
  
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  
  Gets the widget type.

• void type (uchar t)
  
  Sets the widget type.

• int use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  
  Sets the user data for this widget.

• void user_data (void *v)
  
  Sets the user data for this widget.

• unsigned int visible () const
  
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  
  Modifies keyboard focus navigation.

• int visible_r () const
  
  Returns whether a widget and all its parents are visible.

• int w () const
  
  Gets the widget width.

• Fl_When when () const
  
  Returns the conditions under which the callback is called.

• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  
  Gets the widget position in its window.

• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Static Public Member Functions

• static int kf_backspace (int c, Fl_Text_Editor *e)
  
  Does a backspace for key 'c' in the current buffer of editor 'e'.

• static int kf_c_s_move (int c, Fl_Text_Editor *e)
  
  Extends the current selection in the direction indicated by control key 'c' in editor 'e'.

• static int kf_copy (int c, Fl_Text_Editor *e)
  
  Does a copy of selected text or the current character in the current buffer of editor 'e'.

• static int kf_ctrl_move (int c, Fl_Text_Editor *e)
  
  Moves the current text cursor in the direction indicated by control key 'c' in editor 'e'.
• static int kf_cut (int c, Fl_Text_Editor *e)
  
  Does a cut of selected text in the current buffer of editor 'e'.

• static int kf_default (int c, Fl_Text_Editor *e)
  
  Inserts the text associated with key 'c' in editor 'e'.

• static int kf_delete (int c, Fl_Text_Editor *e)
  
  Does a delete of selected text or the current character in the current buffer of editor 'e'.

• static int kf_down (int c, Fl_Text_Editor *e)
  
  Moves the text cursor one line down for editor 'e'.

• static int kf_end (int c, Fl_Text_Editor *e)
  
  Moves the text cursor to the end of the current line in editor 'e'.

• static int kf_enter (int c, Fl_Text_Editor *e)
  
  Inserts a newline for key 'c' at the current cursor position in editor 'e'.

• static int kf_home (int c, Fl_Text_Editor *e)
  
  Moves the text cursor to the beginning of the current line in editor 'e'.

• static int kf_ignore (int c, Fl_Text_Editor *e)
  
  Ignores the key 'c' in editor 'e'.

• static int kf_insert (int c, Fl_Text_Editor *e)
  
  Toggles the insert mode for editor 'e'.

• static int kf_left (int c, Fl_Text_Editor *e)
  
  Moves the text cursor one character to the left in editor 'e'.

• static int kf_move (int c, Fl_Text_Editor *e)
  
  Moves the text cursor in the direction indicated by key 'c' in editor 'e'.

• static int kf_page_down (int c, Fl_Text_Editor *e)
  
  Moves the text cursor down one page for editor 'e'.

• static int kf_page_up (int c, Fl_Text_Editor *e)
  
  Moves the text cursor up one page for editor 'e'.

• static int kf_paste (int c, Fl_Text_Editor *e)
  
  Does a paste of selected text in the current buffer of editor 'e'.

• static int kf_redo (int c, Fl_Text_Editor *e)
  
  Redo last undo action.

• static int kf_right (int c, Fl_Text_Editor *e)
  
  Moves the text cursor one character to the right for editor 'e'.

• static int kf_select_all (int c, Fl_Text_Editor *e)
  
  Selects all text in the current buffer in editor 'e'.

• static int kf_shift_move (int c, Fl_Text_Editor *e)
  
  Extends the current selection in the direction of key 'c' in editor 'e'.

• static int kf_undo (int c, Fl_Text_Editor *e)
  
  Undoes last edit in the current buffer of editor 'e'.

• static int kf_up (int c, Fl_Text_Editor *e)
  
  Moves the text cursor one line up for editor 'e'.

**Static Public Member Functions inherited from Fl_Group**

• static Fl_Group * current ()
  
  Returns the currently active group.

• static void current (Fl_Group *g)
  
  Sets the current group.
Static Public Member Functions inherited from **Fl_Widget**
- static void **default_callback** (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int **labelShortcut** (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
- static int **testShortcut** (const char ∗t, const bool require_alt=false)
  Returns true if the given text ‘t’ contains the entered ‘&x’ shortcut.

Protected Member Functions
- int **handleKey** ()
  Handles a key press in the editor.
- void **maybeDoCallback** (Fl_Callback_Reason reason=FL_REASON_CHANGED)
  does or does not a callback according to changed() and when() settings

Protected Member Functions inherited from **Fl_Text_Display**
- void **absoluteTopLineNumber** (int oldFirstChar)
  Re-calculate absolute top line number for a change in scroll position.
- void **calcLastChar** ()
  Update last display character index.
- void **calcLineStarts** (int startLine, int endLine)
  Update the line starts array.
- void **clearRect** (int style, int x, int y, int width, int height) const
  Clear a rectangle with the appropriate background color for style.
- void **displayInsert** ()
  Scroll the display to bring insertion cursor into view.
- void **draw** () FL_OVERRIDE
  Draw the widget.
- void **drawCursor** (int, int)
  Draw a cursor with top center at X, Y.
- void **drawLineNumbers** (bool clearAll)
  Refresh the line number area.
- void **drawRange** (int start, int end)
  Draw a range of text.
- void **drawString** (int style, int x, int y, int toX, const char ∗string, int nChars) const
  Draw a text segment in a single style.
- void **drawText** (int X, int Y, int W, int H)
  Refresh a rectangle of the text display.
- void **drawVLine** (int visLineNum, int leftClip, int rightClip, int leftCharIndex, int rightCharIndex)
  Draw a single line of text.
- int **emptyVlines** () const
  Return true if there are lines visible with no corresponding buffer text.
- void **extendRangeForStyles** (int ∗start, int ∗end)
  I don’t know what this does!
- void **findLineEnd** (int pos, bool start_pos_is_line_start, int ∗lineEnd, int ∗nextLineStart) const
  Finds both the end of the current line and the start of the next line.
- void **findWrapRange** (const char ∗deletedText, int pos, int nInserted, int nDeleted, int ∗modRangeStart, int ∗modRangeEnd, int ∗linesInserted, int ∗linesDeleted)
  Wrapping calculations.
- int **findX** (const char ∗s, int len, int style, int x) const
Find the index of the character that lies at the given x position / closest cursor position.

- **int get_absolute_top_line_number () const**
  Returns the absolute (non-wrapped) line number of the first line displayed.

- **int handle_rmb (int readonly)**
  Handle right mouse button down events.

- **int handle_vline (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const**
  Universal pixel machine.

- **int longest_vline () const**
  Find the longest line of all visible lines.

- **void maintain_absolute_top_line_number (int state)**
  Line numbering stuff, currently unused.

- **int maintaining_absolute_top_line_number () const**
  Returns true if a separate absolute top line number is being maintained.

- **void measure_deleted_lines (int pos, int nDeleted)**
  Wrapping calculations.

- **double measure_proportional_character (const char ∗s, int colNum, int pos) const**
  Wrapping calculations.

- **int measure_vline (int visLineNum) const**
  Returns the width in pixels of the displayed line pointed to by "visLineNum".

- **void offset_line_starts (int newTopLineNum)**
  Offset line start counters for a new vertical scroll position.

- **int position_to_line (int pos, int ∗lineNum) const**
  Convert a position index into a line number offset.

- **int position_to_linecol (int pos, int ∗lineNum, int ∗column) const**
  Find the line and column number of position pos.

- **void reset_absolute_top_line_number ()**
  Reestablish the absolute (non-wrapped) top line number.

- **int scroll_ (int topLineNum, int horizOffset)**
  Scrolls the current buffer to start at the specified line and column.

- **double string_width (const char ∗string, int length, int style) const**
  Find the width of a string in the font of a particular style.

- **void update_h_scrollbar ()**
  Update horizontal scrollbar.

- **void update_line_starts (int pos, int charInserted, int charDeleted, int linesInserted, int linesDeleted, int ∗scrolled)**
  Update line start arrays and variables.

- **void update_v_scrollbar ()**
  Update vertical scrollbar.

- **int vline_length (int visLineNum) const**
  Count number of bytes in a visible line.

- **int wrapUsesCharacter (int lineEndPos) const**
  Check if the line break is caused by a newline or by line wrapping.

- **void wrapped_line_counter (FL_Text_Buffer ∗buf, int startPos, int maxPos, int maxLines, bool startPosLineStart, int styleBufOffset, int ∗retPos, int ∗retLines, int ∗retLineStart, int ∗retLineEnd, bool countLastLineMissingNewLine=true) const**
  Wrapping calculations.

- **int xy_to_position (int x, int y, int PosType=CHARACTER_POS) const**
  Translate a pixel position into a character index.

- **void xy_to_rowcol (int x, int y, int ∗row, int ∗column, int PosType=CHARACTER_POS) const**
  Translate pixel coordinates into row and column.
Protected Member Functions inherited from Fl_Group

- \texttt{Fl\_Rect\ *} \texttt{bounds()} \newline
  Returns the internal array of widget sizes and positions.
- void \texttt{draw\_child(Fl\_Widget} \&\texttt{widget}) \texttt{const} \newline
  Forces a child to redraw.
- void \texttt{draw\_children()} \newline
  Draws all children of the group.
- void \texttt{draw\_outside\_label}(const Fl\_Widget \&\texttt{widget}) \texttt{const} \newline
  Parents normally call this to draw outside labels of child widgets.
- virtual int \texttt{on\_insert(Fl\_Widget} \&\texttt{w}, \texttt{int} \texttt{)} \newline
  Allow derived groups to act when a widget is added as a child.
- virtual int \texttt{on\_move}(\texttt{int}, \texttt{int}) \newline
  Allow derived groups to act when a widget is moved within the group.
- virtual void \texttt{on\_remove}(\texttt{int}) \newline
  Allow derived groups to act when a child widget is removed from the group.
- int \* \texttt{sizes()} \newline
  Returns the internal array of widget sizes and positions.
- void \texttt{update\_child(Fl\_Widget} \&\texttt{widget}) \texttt{const} \newline
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void \texttt{clear\_flag}(\texttt{unsigned int} \texttt{c}) \newline
  Clears a flag in the flags mask.
- void \texttt{draw\_backdrop()} \texttt{const} \newline
  If \texttt{FL\_ALIGN\_IMAGE\_BACKDROP} is set, the image or deimage will be drawn.
- void \texttt{draw\_box()} \texttt{const} \newline
  Draws the widget box according its box style.
- void \texttt{draw\_box(Fl\_Boxtype} \texttt{t}, Fl\_Color \texttt{c}) \texttt{const} \newline
  Draws a box of type \texttt{t}, of color \texttt{c} at the widget's position and size.
- void \texttt{draw\_box(Fl\_Boxtype} \texttt{t}, \texttt{int} \texttt{x}, \texttt{int} \texttt{y}, \texttt{int} \texttt{w}, \texttt{int} \texttt{h, Fl\_Color} \texttt{c}) \texttt{const} \newline
  Draws a box of type \texttt{t}, of color \texttt{c} at the position \texttt{X,Y} and size \texttt{W,H}.
- void \texttt{draw\_focus()} \texttt{const} \newline
  Draws a focus rectangle around the widget.
- void \texttt{draw\_focus(Fl\_Boxtype} \texttt{t}, \texttt{int} \texttt{X}, \texttt{int} \texttt{Y}, \texttt{int} \texttt{W}, \texttt{int} \texttt{H}) \texttt{const} \newline
  Draws a focus rectangle around the widget.
- void \texttt{draw\_focus(Fl\_Boxtype} \texttt{t}, \texttt{int} \texttt{x}, \texttt{int} \texttt{y}, \texttt{int} \texttt{w, int} \texttt{h, Fl\_Color} \texttt{bg}) \texttt{const} \newline
  Draws a focus box for the widget at the given position and size.
- void \texttt{draw\_label()} \texttt{const} \newline
  Draws the widget's label at the defined label position.
- void \texttt{draw\_label}(\texttt{int}, \texttt{int}, \texttt{int}, \texttt{int}) \texttt{const} \newline
  Draws the label in an arbitrary bounding box.
- Fl\_Widget(\texttt{int} \texttt{x, int} \texttt{y, int} \texttt{w, int} \texttt{h, const} char \texttt{*label}=0L) \newline
  Creates a widget at the given position and size.
- unsigned int \texttt{flags()} \texttt{const} \newline
  Gets the widget flags mask.
- void \texttt{h(}int \texttt{v)} \newline
  Internal use only.
- void \texttt{set\_flag}(\texttt{unsigned int} \texttt{c}) \newline
  Sets a flag in the flags mask.
- void \texttt{w(}int \texttt{v)}
• void x (int v)  
  *Internal use only.*
• void y (int v)  
  *Internal use only.*

12.144.1 Detailed Description
This is the FLTK text editor widget.
It allows the user to edit multiple lines of text and supports highlighting and scrolling. The buffer that is displayed in
the widget is managed by the Fl_Text_Buffer class.

12.144.2 Member Function Documentation
12.144.2.1 add_key_binding()

void Fl_Text_Editor::add_key_binding (  
  int key,
  int state,
  Key_Func function,
  Key_Binding ** list )

Adds a key of state state with the function function to an arbitrary key binding list list.
This can be used in derived classes to add global key bindings by using the global (static) Key_Binding list
Fl_Text_Editor::global_key_bindings.

12.144.2.2 handle()

int Fl_Text_Editor::handle (  
  int e ) [virtual]

Event handling.
Reimplemented from Fl_Text_Display.

12.144.2.3 insert_mode() [1/2]

int Fl_Text_Editor::insert_mode ( ) [inline]

Gets the current insert mode; if non-zero, new text is inserted before the current cursor position.
Otherwise, new text replaces text at the current cursor position.

12.144.2.4 insert_mode() [2/2]

void Fl_Text_Editor::insert_mode (  
  int b ) [inline]

Sets the current insert mode; if non-zero, new text is inserted before the current cursor position.
Otherwise, new text replaces text at the current cursor position.

12.144.2.5 kf_backspace()

int Fl_Text_Editor::kf_backspace (  
  int c,
  Fl_Text_Editor * e ) [static]

Does a backspace for key 'c' in the current buffer of editor 'e'.
Any current selection is deleted. Otherwise, the character left is deleted and the cursor moved. The key value 'c'
is currently unused.
12.144.2.6 kf_c_s_move()

int Fl_Text_Editor::kf_c_s_move (  
    int c,  
    Fl_Text_Editor * e ) [static]
Extends the current selection in the direction indicated by control key 'c' in editor 'e'.
See also
    kf_ctrl_move().

12.144.2.7 kf_copy()

int Fl_Text_Editor::kf_copy (  
    int c,  
    Fl_Text_Editor * e ) [static]
Does a copy of selected text or the current character in the current buffer of editor 'e'.
The key value 'c' is currently unused.

12.144.2.8 kf_ctrl_move()

int Fl_Text_Editor::kf_ctrl_move (  
    int c,  
    Fl_Text_Editor * e ) [static]
Moves the current text cursor in the direction indicated by control key 'c' in editor 'e'.
Supported values for 'c' are currently:
    FL_Home -- moves the cursor to the beginning of the document
    FL_End -- moves the cursor to the end of the document
    FL_Left -- moves the cursor left one word
    FL_Right -- moves the cursor right one word
    FL_Up -- scrolls up one line, without moving cursor
    FL_Down -- scrolls down one line, without moving cursor
    FL_Page_Up -- moves the cursor to the beginning of the top line on the current page
    FL_Page_Down -- moves the cursor to the beginning of the last line on the current page

12.144.2.9 kf_cut()

int Fl_Text_Editor::kf_cut (  
    int c,  
    Fl_Text_Editor * e ) [static]
Does a cut of selected text in the current buffer of editor 'e'.
The key value 'c' is currently unused.

12.144.2.10 kf_default()

int Fl_Text_Editor::kf_default (  
    int c,  
    Fl_Text_Editor * e ) [static]
Inserts the text associated with key 'c' in editor 'e'.
Honors the current selection and insert/overstrike mode.

12.144.2.11 kf_delete()

int Fl_Text_Editor::kf_delete (  
    int c,  
    Fl_Text_Editor * e ) [static]
Does a delete of selected text or the current character in the current buffer of editor 'e'.
The key value 'c' is currently unused.
12.144.2.12  kf_down()

int Fl_Text_Editor::kf_down (  
    int c,  
    Fl_Text_Editor * e ) [static]

Moves the text cursor one line down for editor 'e'.
Same as kf_move(FL_Down, e). The key value 'c' is currently unused.

12.144.2.13  kf_end()

int Fl_Text_Editor::kf_end (  
    int c,  
    Fl_Text_Editor * e ) [static]

Moves the text cursor to the end of the current line in editor 'e'.
Same as kf_move(FL_End, e). The key value 'c' is currently unused.

12.144.2.14  kf_enter()

int Fl_Text_Editor::kf_enter (  
    int c,  
    Fl_Text_Editor * e ) [static]

Inserts a newline for key 'c' at the current cursor position in editor 'e'.
The key value 'c' is currently unused.

12.144.2.15  kf_home()

int Fl_Text_Editor::kf_home (  
    int c,  
    Fl_Text_Editor * e ) [static]

Moves the text cursor to the beginning of the current line in editor 'e'.
Same as kf_move(FL_Home, e). The key value 'c' is currently unused.

12.144.2.16  kf_ignore()

int Fl_Text_Editor::kf_ignore (  
    int c,  
    Fl_Text_Editor * e ) [static]

Ignores the key 'c' in editor 'e'.
This method can be used as a keyboard binding to disable a key that might otherwise be handled or entered as text.
An example would be disabling FL_Escape, so that it isn't added to the buffer when invoked by the user.

12.144.2.17  kf_insert()

int Fl_Text_Editor::kf_insert (  
    int c,  
    Fl_Text_Editor * e ) [static]

Toggles the insert mode for editor 'e'.
The key value 'c' is currently unused.

12.144.2.18  kf_left()

int Fl_Text_Editor::kf_left (  
    int c,  
    Fl_Text_Editor * e ) [static]

Moves the text cursor one character to the left in editor 'e'.
Same as kf_move(FL_Left, e). The key value 'c' is currently unused.
12.144.2.19  kf_m_s_move()

int Fl_Text_Editor::kf_m_s_move (    
    int c,    
    Fl_Text_Editor * e ) [static]

Extends the current selection in the direction indicated by meta key 'c' in editor 'e'.

See also

kf_meta_move().

12.144.2.20  kf_meta_move()

int Fl_Text_Editor::kf_meta_move (    
    int c,    
    Fl_Text_Editor * e ) [static]

Moves the current text cursor in the direction indicated by meta key 'c' in editor 'e'.

Supported values for 'c' are currently:

- FL_Up -- moves cursor to the beginning of the current document
- FL_Down -- moves cursor to the end of the current document
- FL_Left -- moves the cursor to the beginning of the current line
- FL_Right -- moves the cursor to the end of the current line

12.144.2.21  kf_move()

int Fl_Text_Editor::kf_move (    
    int c,    
    Fl_Text_Editor * e ) [static]

Moves the text cursor in the direction indicated by key 'c' in editor 'e'.

Supported values for 'c' are currently:

- FL_Home -- moves the cursor to the beginning of the current line
- FL_End -- moves the cursor to the end of the current line
- FL_Left -- moves the cursor left one character
- FL_Right -- moves the cursor right one character
- FL_Up -- moves the cursor up one line
- FL_Down -- moves the cursor down one line
- FL_Page_Up -- moves the cursor up one page
- FL_Page_Down -- moves the cursor down one page

12.144.2.22  kf_page_down()

int Fl_Text_Editor::kf_page_down (    
    int c,    
    Fl_Text_Editor * e ) [static]

Moves the text cursor down one page for editor 'e'.

Same as kf_move(FL_Page_Down, e). The key value 'c' is currently unused.

12.144.2.23  kf_page_up()

int Fl_Text_Editor::kf_page_up (    
    int c,    
    Fl_Text_Editor * e ) [static]

Moves the text cursor up one page for editor 'e'.

Same as kf_move(FL_Page_Up, e). The key value 'c' is currently unused.

12.144.2.24  kf_paste()

int Fl_Text_Editor::kf_paste (    
    int c,    
    Fl_Text_Editor * e ) [static]

Does a paste of selected text in the current buffer of editor 'e'.

Any current selection is replaced with the pasted content. The key value 'c' is currently unused.
12.144.2.25  kf_redo()

int Fl_Text_Editor::kf_redo (  
    int c,  
    Fl_Text_Editor * e ) [static]

Redo last undo action.  
Also deselects previous selection. The key value 'c' is currently unused.

12.144.2.26  kf_right()

int Fl_Text_Editor::kf_right (  
    int c,  
    Fl_Text_Editor * e ) [static]

Moves the text cursor one character to the right for editor 'e'.  
Same as kf_move(FL_Right, e). The key value 'c' is currently unused.

12.144.2.27  kf_select_all()

int Fl_Text_Editor::kf_select_all (  
    int c,  
    Fl_Text_Editor * e ) [static]

Selects all text in the current buffer in editor 'e'.  
The key value 'c' is currently unused.

12.144.2.28  kf_shift_move()

int Fl_Text_Editor::kf_shift_move (  
    int c,  
    Fl_Text_Editor * e ) [static]

Extends the current selection in the direction of key 'c' in editor 'e'.  
See also  
    kf_move()

12.144.2.29  kf_undo()

int Fl_Text_Editor::kf_undo (  
    int c,  
    Fl_Text_Editor * e ) [static]

Undo last edit in the current buffer of editor 'e'.  
Also deselects previous selection. The key value 'c' is currently unused.

12.144.2.30  kf_up()

int Fl_Text_Editor::kf_up (  
    int c,  
    Fl_Text_Editor * e ) [static]

Moves the text cursor one line up for editor 'e'.  
Same as kf_move(FL_Up, e). The key value 'c' is currently unused.

12.144.2.31  remove_key_binding()

void Fl_Text_Editor::remove_key_binding {  
    int key,  
    int state,  
    Key_Binding ** list )

Removes the key binding associated with the key key of state state from the Key_Binding list list.  
This can be used in derived classes to remove global key bindings by using the global (static) Key_Binding list Fl_Text_Editor::global_keyBindings.
12.144.2.32  tab_nav() [1/2]

int Fl_Text_Editor::tab_nav ( ) const
Check if Tab focus navigation is enabled.
If disabled (default), hitting Tab inserts a tab character into the editor buffer.
If enabled, hitting Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget.

Returns
if Tab inserts tab characters or moves the focus

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>Tab inserts tab characters (default)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Tab navigation is enabled.</td>
</tr>
</tbody>
</table>

See also
tab_nav(int), Fl::OPTION_ARROW_FOCUS.

Version
1.3.4 ABI feature

12.144.2.33  tab_nav() [2/2]

void Fl_Text_Editor::tab_nav ( int val )
Enables or disables Tab key focus navigation.
When disabled (default), tab characters are inserted into Fl_Text_Editor. Only the mouse can change focus. This behavior is desirable when Fl_Text_Editor is used, e.g. in a source code editor.
When enabled, Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget. This behavior is desirable when Fl_Text_Editor is used e.g. in a database input form.
Currently, this method is implemented as a convenience method that adjusts the key bindings for the Tab key. This implementation detail may change in the future. Know that changing the editor's key bindings for Tab and Shift-Tab may affect tab navigation.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>val</th>
<th>If val is 0, Tab inserts a tab character (default).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If val is 1, Tab navigates widget focus.</td>
</tr>
</tbody>
</table>

See also
tab_nav(), Fl::OPTION_ARROW_FOCUS.

Version
1.3.4 ABI feature

12.144.3  Member Data Documentation

12.144.3.1  global_key_bindings

Key_Binding* Fl_Text_Editor::global_key_bindings [static], [protected]
Global key binding list.
Derived classes can add key bindings for all Fl_Text_Editor widgets by adding a Key_Binding to this list.
See also

```cpp
add_key_binding(int key, int state, Key_Func f, Key_Binding** list);
```

The documentation for this class was generated from the following files:

- Fl_Text_Editor.H
- Fl_Text_Editor.hxx

**12.145 Fl_Text_Selection Class Reference**

This is an internal class for Fl_Text_Buffer to manage text selections.
```cpp
#include <Fl_Text_Buffer.H>
```

**Public Member Functions**

- **int end() const**
  Returns the byte offset to the character after the last selected character.
- **int includes (int pos) const**
  Returns true if position `pos` is in the Fl_Text_Selection.
- **int length() const**
  Returns the size in bytes of the selection.
- **int position (int *startpos, int *endpos) const**
- **bool selected() const**
  Returns true if any text is selected.
- **void selected (bool b)**
  Modifies the 'selected' flag.
- **int selected (int *startpos, int *endpos) const**
  Returns the status and the positions of this selection.
- **void set (int startpos, int endpos)**
  Sets the selection range.
- **int start() const**
  Returns the byte offset to the first selected character.
- **void update (int pos, int nDeleted, int nInserted)**
  Updates a selection after text was modified.

**Protected Attributes**

- **int mEnd**
  byte offset to the character after the last selected character
- **bool mSelected**
  this flag is set if any text is selected
- **int mStart**
  byte offset to the first selected character

**Friends**

- **class Fl_Text_Buffer**
12.145.1 Detailed Description

This is an internal class for Fl_Text_Buffer to manage text selections. All methods use byte (not UTF-8 character) offsets and start at 0. This class works correctly with UTF-8 strings assuming that the parameters for all calls are on character boundaries.

If the selection is inactive (not currently used), then selected() returns false and start() and end() return 0 (zero). The stored offsets are in ascending order, hence the following conditions are true (pseudo code):

```cpp
if (!selected()) : (start() == 0) && (end() == 0) && (start() == end())
if (selected()) : start() < end()
always : 0 <= start() <= end()
always : length() == end() - start()
```

The selection size in bytes can always (unconditionally) be computed by

```cpp
int size = sel->end() - sel->start();
```

See also

`length()`

Note

The protected member variables mStart and mEnd are not necessarily 0 (zero) if mSelected == false because they are not cleared when selected(false) is called (as of Jul 2017). This may be changed in the future.

12.145.2 Member Function Documentation

12.145.2.1 end()

```cpp
int Fl_Text_Selection::end ( ) const [inline]
```

Returns the byte offset to the character after the last selected character. The returned offset is only valid if selected() returns true (non-zero). The offset is 0 if no text is selected (since FLTK 1.4.0).

Note

In FLTK 1.3.x the returned offset could be non-zero even if selected() would have returned 0.

Returns

byte offset or 0 if not selected.

12.145.2.2 includes()

```cpp
int Fl_Text_Selection::includes ( int pos ) const
```

Returns true if position pos is in the Fl_Text_Selection. pos must be at a character boundary.

12.145.2.3 length()

```cpp
int Fl_Text_Selection::length ( ) const [inline]
```

Returns the size in bytes of the selection. This is a convenience method. It always returns the same as end() - start() and it returns 0 if selected() == false.

Returns

size in bytes or 0 if not selected.

Since

FLTK 1.4.0

---

Generated by Doxygen
12.145.2.4  position()

```cpp
int Fl_Text_Selection::position (  
    int * startpos,  
    int * endpos ) const [inline]
```

**Deprecated** "in 1.4.0 - use selected(startpos, endpos) instead"

12.145.2.5  selected() [1/3]

```cpp
bool Fl_Text_Selection::selected ( ) const [inline]
```

Returns true if any text is selected.

Returns

true if any text has been selected, or false if no text is selected.

12.145.2.6  selected() [2/3]

```cpp
void Fl_Text_Selection::selected (  
    bool b ) [inline]
```

Modifies the 'selected' flag.

Parameters

<table>
<thead>
<tr>
<th>b</th>
<th>new flag</th>
</tr>
</thead>
</table>

12.145.2.7  selected() [3/3]

```cpp
int Fl_Text_Selection::selected (  
    int * startpos,  
    int * endpos ) const
```

Returns the status and the positions of this selection.

This method returns the same as selected() as an int (0 or 1) in its return value and the offsets to the start of the selection in startpos and to the byte after the last selected character in endpos, if selected() is true. If selected() is false, both offsets are set to 0.

**Note**

In FLTK 1.3.x startpos and endpos were not modified if selected() was false.

Parameters

<table>
<thead>
<tr>
<th>startpos</th>
<th>return byte offset to first selected character</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpos</td>
<td>return byte offset pointing after last selected character</td>
</tr>
</tbody>
</table>

Returns

whether the selection is active (selected()) or not

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>if not selected</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if selected</td>
</tr>
</tbody>
</table>
See also

- selected(), start(), end()

### 12.145.2.8 set()

```cpp
void Fl_Text_Selection::set ( int startpos, int endpos )
```

Sets the selection range. startpos and endpos must be at a character boundary. If startpos \(!=\) endpos selected() is set to true, else to false. If startpos is greater than endpos they are swapped so that startpos \(\leq\) endpos.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>startpos</th>
<th>byte offset to first selected character</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>endpos</td>
<td>byte offset pointing after last selected character</td>
</tr>
</tbody>
</table>

### 12.145.2.9 start()

```cpp
int Fl_Text_Selection::start ( ) const [inline]
```

Returns the byte offset to the first selected character. The returned offset is only valid if selected() returns true. If the selection is not valid the returned offset is 0 since FLTK 1.4.0.

**Note**

In FLTK 1.3.x the returned offset could be non-zero even if selected() would have returned 0.

**Returns**

byte offset or 0 if not selected.

### 12.145.2.10 update()

```cpp
void Fl_Text_Selection::update ( int pos, int nDeleted, int nInserted )
```

Updates a selection after text was modified. Updates an individual selection for changes in the corresponding text.

**Parameters**

<table>
<thead>
<tr>
<th>pos</th>
<th>byte offset into text buffer at which the change occurred</th>
</tr>
</thead>
<tbody>
<tr>
<td>nDeleted</td>
<td>number of bytes deleted from the buffer</td>
</tr>
<tr>
<td>nInserted</td>
<td>number of bytes inserted into the buffer</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Text_Buffer.H
- Fl_Text_Buffer.cxx

## 12.146 Fl_Tile Class Reference

The `Fl_Tile` class lets you resize its children by dragging the border between them.
Inheritance diagram for Fl_Tile:

```
Fl_Widget
   ↓
Fl_Group
   ↓
Fl_Tile
```

**Classes**

- struct `Size_Range`

**Public Member Functions**

- virtual void `drag_intersection` (int `oldx`, int `oldy`, int `newx`, int `newy`)
  
  Drags the intersection at `(oldx, oldy)` to `(newx, newy)`.

- `Fl_Tile` (int `X`, int `Y`, int `W`, int `H`, const char ∗`L`=0)

  Creates a new `Fl_Tile` widget using the given position, size, and label string.

- int `handle` (int `event`) FL_OVERRIDE

  Handles the specified event.

- void `init_size_range` (int `default_min_w`=-1, int `default_min_h`=-1)

  Initialize the size range mode of `Fl_Tile` and set the default minimum width and height.

- virtual void `move_intersection` (int `oldx`, int `oldy`, int `newx`, int `newy`)

  Drags the intersection at `(oldx, oldy)` to `(newx, newy)`.

- void `position` (int `oldx`, int `oldy`, int `newx`, int `newy`)

- void `position` (int `x`, int `y`)

- void `resize` (int `X`, int `Y`, int `W`, int `H`) FL_OVERRIDE

  Resizes the `Fl_Tile` widget and its children.

- void `size_range` (Fl_Widget ∗`w`, int `minw`, int `minh`, int `maxw`=0x7FFFFFFF, int `maxh`=0x7FFFFFFF)

  Set the allowed size range for the give child widget.

- void `size_range` (int `index`, int `minw`, int `minh`, int `maxw`=0x7FFFFFFF, int `maxh`=0x7FFFFFFF)

  Set the allowed size range for the child at the given index.

- ∼`Fl_Tile` () FL_OVERRIDE

  Destructor.

**Public Member Functions inherited from Fl_Group**

- Fl_Widget ∗& _ddfdesign_kludge ()

  This is for forms compatibility only.

- void `add` (Fl_Widget ∗)

  The widget is removed from its current group (if any) and then added to the end of this group.

- void `add` (Fl_Widget ∗`o`)

  See void Fl_Group::add(Fl_Widget ∗`w`)

- void `add_resizable` (Fl_Widget ∗`w`)

  Adds a widget to the group and makes it the resizable widget.

- Fl_Widget ∗`const` ∗`array` () const

  Returns a pointer to the array of children.

- Fl_Group ∗`const` ∗`as_group` () const FL_OVERRIDE

- Fl_Group ∗`as_group` () FL_OVERRIDE

  Returns an Fl_Group pointer if this widget is an Fl_Group.

- void `begin` ()
Sets the current group so you can build the widget tree by just constructing the widgets.

- `Fl_Widget * child (int n) const`
  Returns `array()[n].`

- `int children () const`
  Returns how many child widgets the group has.

- `void clear ()`
  Deletes all child widgets from memory recursively.

- `unsigned int clip_children ()`
  Returns the current clipping mode.

- `void clip_children (int c)`
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- `virtual int delete_child (int n)`
  Removes the widget at index from the group and deletes it.

- `void end ()`
  Exactly the same as current(this->parent()).

- `int find (const Fl_Widget &o) const`
  See int Fl_Group::find(const Fl_Widget *w) const.

- `int find (const Fl_Widget *) const`
  Searches the child array for the widget and returns the index.

- `Fl_Group (int, int, int, int, const char *)=0)`
  Creates a new Fl_Group widget using the given position, size, and label string.

- `void focus (Fl_Widget *)`

- `void forms_end ()`
  This is for forms compatibility only.

- `void init_sizes ()`
  Resets the internal array of widget sizes and positions.

- `void insert (Fl_Widget &, int i)`
  The widget is removed from its current group (if any) and then inserted into this group.

- `void insert (Fl_Widget &o, Fl_Widget *) before)`
  This does insert(w, find(before)).

- `void remove (Fl_Widget &)`
  Removes a widget from the group but does not delete it.

- `void remove (Fl_Widget *) o)`
  Removes the widget o from the group.

- `void remove (int index)`
  Removes the widget at index from the group but does not delete it.

- `Fl_Widget * resizable () const`
  Returns the group's resizable widget.

- `void resizable (Fl_Widget &o)`
  Sets the group's resizable widget.

- `void resizable (Fl_Widget *) o)`
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- `virtual ~Fl_Group ()`
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  
  Activates the widget.
- unsigned int active () const
  
  Returns whether the widget is active.
- int active_r () const
  
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  
  Gets the label alignment.
- void align (Fl_Align alignment)
  
  Sets the label alignment.
- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.
- Fl_Callback ∗ p callback () const
  
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  
  Sets the current callback function for the widget.
- unsigned int changed () const
  
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.
  • void clear_changed ()
    Marks the value of the widget as unchanged.
  • void clear_damage (uchar c=0)
    Clears or sets the damage flags.
  • void clear_output ()
    Sets a widget to accept input.
  • void clear_visible ()
    Hides the widget.
  • void clear_visible_focus ()
    Disables keyboard focus navigation with this widget.
  • Fl_Color color () const
    Gets the background color of the widget.
  • void color (Fl_Color bg)
    Sets the background color of the widget.
  • void color (Fl_Color bg, Fl_Color sel)
    Sets the background and selection color of the widget.
  • Fl_Color color2 () const
    For back compatibility only.
  • void color2 (unsigned a)
    For back compatibility only.
  • int contains (const Fl_Widget ∗w) const
    Checks if w is a child of this widget.
  • void copy_label (const char ∗new_label)
    Sets the current label.
  • void copy_tooltip (const char ∗text)
    Sets the current tooltip text.
  • uchar damage () const
    Returns non-zero if draw() needs to be called.
  • void damage (uchar c)
    Sets the damage bits for the widget.
  • void damage (uchar c, int x, int y, int w, int h)
    Sets the damage bits for an area inside the widget.
  • int damage_resize (int, int, int, int)
    Internal use only.
  • void deactivate ()
    Deactivates the widget.
  • Fl_Image ∗deimage ()
    Gets the image that is used as part of the widget label when in the inactive state.
  • const Fl_Image ∗deimage () const
    Gets the image that is used as part of the widget label when in the inactive state.
  • void deimage (Fl_Image &img)
    Sets the image to use as part of the widget label when in the inactive state.
  • void deimage (Fl_Image ∗img)
    Sets the image to use as part of the widget label when in the inactive state.
  • int deimage_bound () const
    Returns whether the inactive image is managed by the widget.
  • void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
    Calls the widget callback function with default arguments.
  • void do_callback (Fl_Widget ∗w, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
    Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗wgt, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group * p)`
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.

- `void set_visible ()`
  Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  Returns whether the widget's label uses '&' to indicate shortcuts.

- `void shortcut_label (int value)`
  Sets whether the widget's label uses '&' to indicate shortcuts.

- `virtual void show ()`
  Makes a widget visible.

- `void size (int W, int H)`
  Changes the size of the widget.

- `int take_focus ()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.

- `int test_shortcut ()`
  Returns true if the widget's label contains the entered 'x' shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.

- `void tooltip (const char * text)`
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• void visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• Fl_Cursor cursor (int n)
  Returns the cursor for cursor index n.

• int on_insert (Fl_Widget *, int) FL_OVERRIDE
  Insert a new entry in the size range list.

• int on_move (int, int) FL_OVERRIDE
  Move the entry in the size range list.

• void on_remove (int) FL_OVERRIDE
  Remove the entry from the size range list.

• void request_grow_b (int old_b, int &new_b, Fl_Rect *final_size)
  Request for children to change their layout.

• void request_grow_l (int old_l, int &new_l, Fl_Rect *final_size)
  Request for children to change their layout.

• void request_grow_r (int old_r, int &new_r, Fl_Rect *final_size)
  Request for children to change their layout.

• void request_grow_t (int old_t, int &new_t, Fl_Rect *final_size)
  Request for children to change their layout.

• void request_shrink_b (int old_b, int &new_b, Fl_Rect *final_size)
  Request for children to change their layout.
• void request_shrink_l (int old_l, int &new_l, Fl_Rect ∗final_size)
  Request for children to change their layout.
• void request_shrink_r (int old_r, int &new_r, Fl_Rect ∗final_size)
  Request for children to change their layout.
• void request_shrink_t (int old_t, int &new_t, Fl_Rect ∗final_size)
  Request for children to change their layout.
• void set_cursor (int n)
  Set one of four cursors used for dragging etc…

Protected Member Functions inherited from Fl_Group

• Fl_Rect ∗bounds ()
  Returns the internal array of widget sizes and positions.
• void draw () FL_OVERRIDE
  Draws the widget.
• void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
• void draw_children ()
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
• int ∗sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget’s label at the defined label position.
• void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
gets the widget flags mask.

- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Protected Attributes

- int cursor_
  current cursor index (0..3)
- Fl_Cursor * cursors_
  points at the array of 4 cursors (may be overridden)
- int default_min_h_
- int default_min_w_
- Size_Range * size_range_
- int size_range_capacity_
- int size_range_size_

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int labelShortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int testShortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
    INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
    FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,

12.146 Fl_Tile Class Reference

12.146.1 Detailed Description

The Fl_Tile class lets you resize its children by dragging the border between them.

For the tiling to work correctly, the children of an Fl_Tile must cover the entire area of the widget, but must not overlap. This means that all children must touch each other at their edges, and no gaps can be left inside the Fl_Tile.

Fl_Tile does not normally draw any graphics of its own. The "borders" which can be seen in the snapshot above are actually part of the children. Their boxtypes have been set to FL_DOWN_BOX creating the impression of "ridges" where the boxes touch. What you see are actually two adjacent FL_DOWN_BOX's drawn next to each other. All neighboring widgets share the same edge - the widget's thick borders make it appear as though the widgets aren't actually touching, but they are. If the edges of adjacent widgets do not touch, then it will be impossible to drag the corresponding edges.

Note

Fl_Tile works in two distinctive modes. In classic mode, the range of motion for edges and intersections is controlled using an invisible child that is marked as the resizable() widget of the tile group. Classic mode is described in detail a few paragraphs down.

Fl_Tile size_range mode

By assigning a default minimum size to all children with Fl_Tile::init_size_range(int default_minimum_width, int default_minimum_height) or by assigning minimal sizes to individual children with Fl_Tile::size_range(Fl_Widget *child, int minimum_width, int minimum_height), the tile group is put into size_range operation mode.

In this mode, the child that is marked resizable() will behave as it would in a regular Fl_Group widget. When dragging edges or intersections with the mouse, Fl_Tile will ensure that none of the children shrinks to a size that is smaller than requested. When resizing the Fl_Tile group, size ranges are not enforced by the tile. Instead, the size range of the enclosing window should be limited to a valid range.

Tile does not differentiate between visible and invisible children. If children are created smaller than their assigned minimum size, dragging intersections may cause unexpected jumps in size. Zero width or height widget are not harmful, but should be avoided.

Example for a center document tile and two tool boxes on the left and right

```plaintext
Fl_Window win(400, 300, "My App");
Fl_Tile tile(0, 0, 400, 300);
Fl_Box left_tool_box(0, 0, 100, 300, "Tools");
left_tool_box.box(FL_DOWN_BOX);
tile.size_range(&left_tool_box, 50, 50);
Fl_Box document(100, 0, 200, 300, "Document");
document.box(FL_DOWN_BOX);
tile.size_range(&document, 100, 50);
Fl_Box right_tool_box(300, 0, 100, 300, "More\nTools");
right_tool_box.box(FL_DOWN_BOX);
```
tile.size_range(right_tool_box, 50, 50);
tile.end();
tile.resizeable(document);

win.end();
win.resizeable(tile);
win.show(argc, argv);
win.size_range(200, 50);

**Fl_Tile classic mode**

*Fl_Tile* allows objects to be resized to zero dimensions. To prevent this you can use the `resizeable()` to limit where corners can be dragged to. For more information see note below.

Even though objects can be resized to zero sizes, they must initially have non-zero sizes so the *Fl_Tile* can figure out their layout. If desired, call `position()` after creating the children but before displaying the window to set the borders where you want.

**Note on `resizeable(Fl_Widget &w)`:** The “resizeable” child widget (which should be invisible) limits where the borders can be dragged to. All dragging will be limited inside the resizeable widget’s borders. If you don’t set it, it will be possible to drag the borders right to the edges of the *Fl_Tile* widget, and thus resize objects on the edges to zero width or height. When the entire *Fl_Tile* widget is resized, the `resizeable()` widget will keep its border distance to all borders the same (this is normal resize behavior), so that you can effectively set a border width that will never change. To ensure correct event delivery to all child widgets the `resizeable()` widget must be the first child of the *Fl_Tile* widget group. Otherwise some events (e.g. FL_MOVE and FL_ENTER) might be consumed by the `resizeable()` widget so that they are lost for widgets covered (overlapped) by the `resizeable()` widget.

**Note**

You can still resize widgets inside the `resizeable()` to zero width and/or height, i.e. box 2b above to zero width and box 3a to zero height.

See also

```cpp
void Fl_Group::resizeable(Fl_Widget &w)
```

**Example for resizeable with 20 pixel border distance:**

```cpp
int dx = 20, dy = dx;
Fl_Tile tile(50, 50, 300, 300);
Fl_Box r(tile.x()+dx,tile.y()+dy,tile.w()-2*dx,tile.h()-2*dy);
tile.resizeable(r);
// ... create widgets inside tile (see test/tile.cxx) ...
tile.end();
```

See also the complete example program in test/tile.cxx.

## 12.146.2 Constructor & Destructor Documentation

### 12.146.2.1 Fl_Tile()

```cpp
Fl_Tile::Fl_Tile ( int X, int Y, int W, int H, const char * L = 0 )
```

Creates a new *Fl_Tile* widget using the given position, size, and label string. The default boxtype is FL_NO_BOX.

The destructor also deletes all the children. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the *Fl_Tile* and all of its children can be automatic (local) variables, but you must declare the *Fl_Tile* first, so that it is destroyed last.

See also

- class Fl_Group
12.146.3 Member Function Documentation

12.146.3.1 cursor()

Fl_Cursor Fl_Tile::cursor ( int n ) [inline], [protected]

Returns the cursor for cursor index n.

See also

Fl_Tile::set_cursor(int)

12.146.3.2 drag_intersection()

void Fl_Tile::drag_intersection ( int oldx, int oldy, int newx, int newy ) [virtual]

Drags the intersection at (oldx,oldy) to (newx,newy).

See also

Fl_Tile::move_intersection(int oldx, int oldy, int newx, int newy) , but this method does not call init_sizes() and is used for interactive children layout using the mouse.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>oldx,oldy</th>
<th>move the intersection at this coordinate, pass zero to disable drag in that direction.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>newx,newy</td>
<td>move the intersection as close to this new coordinate as possible</td>
</tr>
</tbody>
</table>

12.146.3.3 handle()

int Fl_Tile::handle ( int event ) [virtual]

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in    | event | the kind of event received |

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>
12.146.3.4 init_size_range()

```c
void Fl_Tile::init_size_range (  
    int default_min_w = -1,  
    int default_min_h = -1 )
```

Initialize the size range mode of Fl_Tile and set the default minimum width and height. The default minimum width and height is the size of the mouse pointer grab area at about 4 pixel units.

**Parameters**

- `default_min_w`: default minimum width
- `default_min_h`: default minimum height

12.146.3.5 move_intersection()

```c
void Fl_Tile::move_intersection (  
    int oldx,  
    int oldy,  
    int newx,  
    int newy ) [virtual]
```

Drags the intersection at `(oldx,oldy)` to `(newx,newy)`. This redraws all the necessary children.

If no size ranges are set, the new intersection position is limited to the size of the tile group. The `resizable()` option is not taken into account here.

If size ranges are set, the actual new position of the intersection will depend on the size range of every individual child. No child will be smaller than their `minw` and `minh`. After the new position is found, `move_intersection()` will call `init_sizes()`. The `resizable()` range is ignored.

**Parameters**

- `oldx(oldy)`: old intersection coordinates
- `newx(newy)`: new intersection coordinates

12.146.3.6 on_insert()

```c
int Fl_Tile::on_insert (  
    Fl_Widget * candidate,  
    int index ) [protected], [virtual]
```

Insert a new entry in the size range list.

Reimplemented from Fl_Group.

12.146.3.7 on_move()

```c
int Fl_Tile::on_move (  
    int oldIndex,  
    int newIndex ) [protected], [virtual]
```

Move the entry in the size range list.

Reimplemented from Fl_Group.

12.146.3.8 on_remove()

```c
void Fl_Tile::on_remove (  
```

See also

- Fl_Event

Reimplemented from Fl_Group.
int index ) [protected], [virtual]
Remove the entry from the size range list.
Reimplemented from Fl_Group.

12.146.3.9 position()

void Fl_Tile::position (  
    int oldx,  
    int oldy,  
    int newx,  
    int newy ) [inline]

 Deprecated "in 1.4.0 - use move_intersection(p) instead"

12.146.3.10 request_grow_b()

void Fl_Tile::request_grow_b (  
    int old_b,  
    int & new_b,  
    Fl_Rect * final_size ) [protected]
Request for children to change their layout.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

12.146.3.11 request_grow_l()

void Fl_Tile::request_grow_l (  
    int old_l,  
    int & new_l,  
    Fl_Rect * final_size ) [protected]
Request for children to change their layout.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>old_l</td>
</tr>
<tr>
<td>in,out</td>
<td>new_l</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
</tr>
</tbody>
</table>

12.146.3.12 request_grow_r()

void Fl_Tile::request_grow_r (  
    int old_r,  
    int & new_r,  
    Fl_Rect * final_size ) [protected]
Request for children to change their layout.
12.146.3.13 request_grow_t()

```cpp
void Fl_Tile::request_grow_t ( int old_r, int &new_r, Fl_Rect *final_size ) [protected]
```

Request for children to change their layout.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>old_r</td>
<td>grow all children with this current right edge toward the right edge of this tile</td>
</tr>
<tr>
<td>in,out</td>
<td>new_r</td>
<td>try to grow to this coordinate, return the maximum possible growth (currently maxw is ignored, so we always grow to new_r)</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
<td>write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

12.146.3.14 request_shrink_b()

```cpp
void Fl_Tile::request_shrink_b ( int old_b, int &new_b, Fl_Rect *final_size ) [protected]
```

Request for children to change their layout.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>old_b</td>
<td>shrink all children with this current bottom edge toward the top edge of this tile</td>
</tr>
<tr>
<td>in,out</td>
<td>new_b</td>
<td>try to shrink to this coordinate, return the maximum possible shrinkage</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
<td>If not NULL, write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

12.146.3.15 request_shrink_l()

```cpp
void Fl_Tile::request_shrink_l ( int old_l, int &new_l, Fl_Rect *final_size ) [protected]
```

Request for children to change their layout.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>old_l</td>
<td>shrink all children with the left edge at old_l to shrink to new_l towards the right side of the tile. If the child can not shrink by that amount, it will ask all other children that touch its right side to shrink by the remainder (recursion). new_l will return the the maximum possible value while maintaining minimum width for all children involved.</td>
</tr>
<tr>
<td>in,out</td>
<td>new_l</td>
<td>request_shrink_r asks children to shrink toward the left, so that their right edge is as close as possible to new_r. request_shrink_t and request_shrink_b provide the same functionality for vertical resizing.</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
<td>If not NULL, write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

12.146.3.17  request_shrink_t()

```c
void Fl_Tile::request_shrink_t (  
    int old_t,  
    int & new_t,  
    Fl_Rect * final_size ) [protected]
```

Request for children to change their layout.

See also

```c
Fl_Tile::request_shrink_l(int old_l, int &new_l, Fl_Rect *final_size)
```

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>old_t</th>
<th>shrink all children with this current top edge toward the bottom edge of this tile</th>
</tr>
</thead>
<tbody>
<tr>
<td>in,out</td>
<td>new_t</td>
<td>try to shrink to this coordinate, return the maximum possible shrinkage</td>
</tr>
<tr>
<td>in,out</td>
<td>final_size</td>
<td>if not NULL, write the new position and size of all affected children into this list of Fl_Rect</td>
</tr>
</tbody>
</table>

12.146.3.18  resize()

```c
void Fl_Tile::resize (  
    int X,  
    int Y,  
    int W,  
    int H ) [virtual]
```

Resizes the Fl_Tile widget and its children.

Fl_Tile implements its own resize() method. It does not use Fl_Group::resize() to resize itself and its children. In size_range mode, the child marked resizable() is resized first. Only if its minimum size is reached, other widgets in the tile will resize too.
In classic mode or when no resizable child is set, enlarging works by moving the lower-right corner and resizing the bottom and right border widgets accordingly. Shrinking the Fl_Tile works in the opposite way by shrinking the bottom and right border widgets, unless they are reduced to zero width or height, resp. or to their minimal sizes defined by the resizable() widget. In this case other widgets will be shrunk as well.

See the Fl_Tile class documentation about how the resizable() works.
Reimplemented from Fl_Group.

12.146.3.19 set_cursor()

```cpp
void Fl_Tile::set_cursor (int n) [protected]
```

Set one of four cursors used for dragging etc... Fl_Tile uses an array of four cursors that are set depending on user actions:

- 0: normal cursor
- 1: horizontal dragging
- 2: vertical dragging
- 3: dragging an intersection

This method sets the window cursor for the given index n.

12.146.3.20 size_range() [1/2]

```cpp
void Fl_Tile::size_range (Fl_Widget * w, int minw, int minh, int maxw = 0x7FFFFFFF, int maxh = 0x7FFFFFFF)
```

Set the allowed size range for the give child widget. Fl_Tile currently supports only the minimal width and height setting.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>w</th>
<th>set the range for this child widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>minw,minh</td>
<td>minimum width and height for that child</td>
</tr>
<tr>
<td>in</td>
<td>maxw,maxh</td>
<td>maximum size, defaults to infinite, currently ignored</td>
</tr>
</tbody>
</table>

12.146.3.21 size_range() [2/2]

```cpp
void Fl_Tile::size_range (int index, int minw, int minh, int maxw = 0x7FFFFFFF, int maxh = 0x7FFFFFFF)
```

Set the allowed size range for the child at the given index. Fl_Tile currently supports only the minimal width and height setting.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>index</th>
<th>set the range for the child at this index</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>minw,minh</td>
<td>minimum width and height for that child</td>
</tr>
<tr>
<td>in</td>
<td>maxw,maxh</td>
<td>maximum size, defaults to infinite, currently ignored</td>
</tr>
</tbody>
</table>

### 12.147 FL_Tiled_Image Class Reference

This class supports tiling of images over a specified area.

```cpp
#include <Fl_Tiled_Image.H>
```

#### Inheritance diagram for Fl_Tiled_Image:

```
Fl_Tiled_Image
\|   \|   \|   \|
|   |   |   |   |
|   Fl_Image       |
|   \|   \|   \|   |
|       \|   \|   |
|       |   Fl_Image
```

#### Public Member Functions

- **void color_average (FL_Color c, float i) FL_OVERRIDE**
  
  The color_average() method averages the colors in the image with the provided FLTK color value.

- **Fl_Image * copy () const**

- **Fl_Image * copy (int W, int H) const FL_OVERRIDE**
  
  Creates a resized copy of the image.

- **void desaturate () FL_OVERRIDE**
  
  The desaturate() method converts an image to grayscale.

- **void draw (int X, int Y)**

- **void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE**
  
  Draws a tiled image.

- **Fl_Tiled_Image (Fl_Image *i, int W=0, int H=0)**
  
  The constructors create a new tiled image containing the specified image.

- **Fl_Image * image ()**
  
  Gets the image that is tiled.

- **virtual ~Fl_Tiled_Image ()**
  
  The destructor frees all memory and server resources that are used by the tiled image.

#### Public Member Functions inherited from Fl_Image

- **virtual class Fl_Shared_Image * as_shared_image ()**
  
  Returns whether an image is an Fl_Shared_Image or not.

- **Fl_Image * copy () const**
  
  Creates a copy of the image in the same size.

- **int count () const**
  
  Returns the number of data values associated with the image.

- **int d () const**
  
  Returns the image depth.

- **const char *const * data () const**
  
  Returns a pointer to the current image data array.

- **int data_h () const**
  
  Returns the height of the image data.

- **int data_w () const**
  
  Returns the width of the image data.

- **void draw (int X, int Y)**

Generated by Doxygen
Draws the image to the current drawing surface.

- **int fail () const**
  Returns a value that is not 0 if there is currently no image available.

- **Fl_Image (int W, int H, int D)**
  The constructor creates an empty image with the specified width, height, and depth.

- **int h () const**
  Returns the current image drawing height in FLTK units.

- **void inactive ()**
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

- **virtual void label (Fl_Menu_Item ∗m)**
  This method is an obsolete way to set the image attribute of a menu item.

- **virtual void label (Fl_Widget ∗w)**
  This method is an obsolete way to set the image attribute of a widget or menu item.

- **int ld () const**
  Returns the current line data size in bytes.

- **virtual void release ()**
  Releases an Fl Image - the same as 'delete this'.

- **virtual void scale (int width, int height, int proportional=1, int can_expand=0)**
  Sets the drawing size of the image.

- **virtual void uncache ()**
  If the image has been cached for display, delete the cache data.

- **int w () const**
  Returns the current image drawing width in FLTK units.

- **virtual ~Fl_Image ()**
  The destructor is a virtual method that frees all memory used by the image.

### Protected Attributes

- **int alloc_image_**
- **Fl_Image ∗image_**

### Additional Inherited Members

#### Static Public Member Functions inherited from Fl_Image

- **static Fl_Labeltype define_FL_IMAGE_LABEL ()**
- **static Fl_RGB_Scaling RGB_scaling ()**
  Returns the currently used RGB image scaling method.

- **static void RGB_scaling (Fl_RGB_Scaling)**
  Sets the RGB image scaling method used for copy(int, int).

- **static Fl_RGB_Scaling scaling_algorithm ()**
  Gets what algorithm is used when resizing a source image to draw it.

- **static void scaling_algorithm (Fl_RGB_Scaling algorithm)**
  Sets what algorithm is used when resizing a source image to draw it.

#### Static Public Attributes inherited from Fl_Image

- **static const int ERR_FILE_ACCESS = -2**
- **static const int ERR_FORMAT = -3**
- **static const int ERR_MEMORY_ACCESS = -4**
- **static const int ERR_NO_IMAGE = -1**
- **static bool register_images_done = false**

  True after fl_register_images() was called, false before.
Protected Member Functions inherited from Fl_Image

- void d (int D)
  Sets the current image depth.
- void data (const char *const *p, int c)
  Sets the current data pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h (int H)
  Sets the height of the image data.
- void ld (int LD)
  Sets the current line data size in bytes.
- void w (int W)
  Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

12.147.1 Detailed Description
This class supports tiling of images over a specified area. The source (tile) image is not copied unless you call the color_average(), desaturate(), or inactive() methods.

12.147.2 Constructor & Destructor Documentation

12.147.2.1 Fl_Tiled_Image()

Fl_Tiled_Image::Fl_Tiled_Image ( Fl_Image *i, int W = 0, int H = 0 )
The constructors create a new tiled image containing the specified image. Use a width and height of 0 to tile the whole window/widget.

Note
Due to implementation constraints in FLTK 1.3.3 and later width and height of 0 may not work as expected when used as background image in widgets other than windows. You may need to center and clip the image (label) and set the label type to FL_NORMAL_LABEL. Doing so will let the tiled image fill the whole widget as its background image. Other combinations of label flags may or may not work.

#include "bg.xpm"
Fl_Pixmap *bg_xpm = new Fl_Pixmap(bg_xpm);
Fl_Tiled_Image *bg_tiled = new Fl_Tiled_Image(bg_xpm,0,0);
Fl_Box *box = new Fl_Box(40,40,300,100,"");
box->box(FL_UP_BOX);
box->labeltype(FL_NORMAL_LABEL);
box->align(FL_ALIGN_INSIDE | FL_ALIGN_CENTER | FL_ALIGN_CLIP);
box->image(bg_tiled);

Note
Setting an image (label) for a window may not work as expected due to implementation constraints in FLTK 1.3.x and maybe later. The reason is the way Fl::scheme() initializes the window's label type and image. A possible workaround is to use another Fl_Group as the only child widget and to set the background image for this group as described above.

Todo
Fix Fl_Tiled_Image as background image for widgets and windows and fix the implementation of Fl::scheme(const char *).
12.147.3 Member Function Documentation

12.147.3.1 color_average()

```cpp
void Fl_Tiled_Image::color_average ( 
    Fl_Color c,
    float i ) [virtual]
```

The color_average() method averages the colors in the image with the provided FLTK color value. The first argument specifies the FLTK color to be used. The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from Fl_Image.

12.147.3.2 copy()

```cpp
Fl_Image * Fl_Tiled_Image::copy ( 
    int W,
    int H ) const [virtual]
```

Creates a resized copy of the image. The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use Fl_Image::release() for all types of images (i.e. all subclasses of Fl_Image) instead of operator delete for Fl_Image's and Fl_Image::release() for Fl_Shared_Image's. The new image data will be converted to the requested size. RGB images are resized using the algorithm set by Fl_Image::RGB_scaling().

For the new image the following equations are true:

- \( w() == data_w() == W \)
- \( h() == data_h() == H \)

Parameters

<table>
<thead>
<tr>
<th></th>
<th>W/H</th>
<th>Requested width and height of the new image</th>
</tr>
</thead>
</table>

Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of Fl_RGB_Image, Fl_SVG_Image, Fl_Pixmap, Fl_Bitmap, Fl_Tiled_Image, Fl_Anim_GIF_Image and Fl_Shared_Image. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an Fl_RGB_Image is an object of class Fl_Pixmap.

Since FLTK 1.4.0 this method is ‘const’. If you derive your own class from Fl_Image or any subclass your overridden methods of ‘Fl_Image::copy() const’ and ‘Fl_Image::copy(int, int) const’ must also be ‘const’ for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been ‘const’.

Reimplemented from Fl_Image.

12.147.3.3 desaturate()

```cpp
void Fl_Tiled_Image::desaturate ( ) [virtual]
```

The desaturate() method converts an image to grayscale. If the image contains an alpha channel (depth = 4), the alpha channel is preserved. An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from Fl_Image.
12.147.3.4 draw()

void Fl_Tiled_Image::draw (  
    int X,  
    int Y,  
    int W,  
    int H,  
    int cx = 0,  
    int cy = 0 ) [virtual]  

Draws a tiled image.
Tiled images can be used as background images for widgets and windows. However, due to implementation con-
straints, you must take care when setting label types and alignment flags. Only certain combinations work as
expected, others may yield unexpected results and undefined behavior.

This draw method can draw multiple copies of one image in an area given by X, Y, W, H.
The optional arguments cx and cy can be used to crop the image starting at offsets (cx, cy). cx and cy must be
\geq 0 (negative values are ignored). If one of the values is greater than the image width or height resp. (cx \geq
image()->w() or cy \geq image()->h()) nothing is drawn, because the resulting image would be empty.

After calculating the resulting image size the image is drawn as often as necessary to fill the given area, starting at
the top left corner.
If both W and H are 0 the image is repeated as often as necessary to fill the entire window, unless there is a valid
clip region. If you want to fill only one particular widget's background, then you should either set a clip region in your
draw() method or use the label alignment flags FL_ALIGN_INSIDE|FL_ALIGN_CLIP to make sure the image
is clipped.
This may be improved in a later version of the library.
Reimplemented from Fl_Image.
The documentation for this class was generated from the following files:

- Fl_Tiled_Image.H
- Fl_Tiled_Image.cxx

12.148 Fl_Timeout Class Reference

The internal class Fl_Timeout handles all timeout related functions.
#include <Fl_Timeout.h>

Static Public Member Functions

- static void add_timeout (double time, Fl_Timeout_Handler cb, void *data)
  Adds a one-shot timeout callback.
- static void do_timeouts ()
  Elapse timers and call their callbacks if any timers are expired.
- static void elapse_timeouts ()
  Elapse all timers w/o calling their callbacks.
- static int has_timeout (Fl_Timeout_Handler cb, void *data)
  Returns true if the timeout exists and has not been called yet.
- static void remove_timeout (Fl_Timeout_Handler cb, void *data)
  Remove a timeout callback.
- static void repeat_timeout (double time, Fl_Timeout_Handler cb, void *data)
  Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.
- static double time_to_wait (double tw)
  Returns the delay in seconds until the next timer expires, limited by ttw.

Protected Member Functions

- double delay ()
  Get the timer's delay in seconds.
• void delay (double t)
  Set the timer's delay in seconds.
• void insert ()
  Insert this timer entry into the active timer queue.
• void make_current ()
  Remove the timeout from the active timer queue and push it onto the stack of currently running callbacks.
• void release ()
  Remove the top-most timeout from the stack of currently running timeout callbacks and insert it into the list of free timers.

Static Protected Member Functions

• static Fl_Timeout * current ()
  Returns the first (top-most) timeout from the current timeout stack.
• static Fl_Timeout * get (double time, Fl_Timeout_Handler cb, void *data)
  Get an Fl_Timeout instance for further handling.

Protected Attributes

• Fl_Timeout_Handler callback
• void * data
• Fl_Timeout * next
• int skip
• double time

Static Protected Attributes

• static Fl_Timeout * current_timeout = 0
  The list of current timeouts is used to store the timeout whose callback is called while the callback is executed.
• static Fl_Timeout * first_timeout = 0
  List of active timeouts.
• static Fl_Timeout * free_timeout = 0
  List of free timeouts after use.

12.148.1 Detailed Description

The internal class Fl_Timeout handles all timeout related functions. All code is platform independent except retrieving a timestamp which requires calling a system driver function and potentially results in different timer resolutions (from milliseconds to microseconds).
Related user documentation:

• Fl_Timeout_Handler
• Fl::add_timeout(double time, Fl_Timeout_Handler cb, void *data)
• Fl::repeat_timeout(double time, Fl_Timeout_Handler cb, void *data)
• Fl::has_timeout(Fl_Timeout_Handler cb, void *data)
• Fl::remove_timeout(Fl_Timeout_Handler cb, void *data)
12.148.2 Member Function Documentation

12.148.2.1 add_timeout()

```c
void Fl_Timeout::add_timeout (
    double time,
    Fl_Timeout_Handler cb,
    void * data ) [static]
```

Adds a one-shot timeout callback.

The callback function `cb` will be called by `Fl::wait()` at `time` seconds after this function is called.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>time</th>
<th>delta time in seconds until the timer expires</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>cb</td>
<td>callback function</td>
</tr>
<tr>
<td>in</td>
<td>data</td>
<td>optional user data (default: NULL)</td>
</tr>
</tbody>
</table>

Implements `Fl::add_timeout(double time, Fl_Timeout_Handler cb, void *data)`

See also

`Fl::add_timeout(double time, Fl_Timeout_Handler cb, void *data)`

12.148.2.2 current()

`Fl_Timeout * Fl_Timeout::current ( ) [static], [protected]`

Returns the first (top-most) timeout from the current timeout stack. This returns a pointer to the timeout but does not remove it from the list of current timeouts. This should be the timeout that is currently executing its callback.

Returns

`Fl_Timeout*` The current timeout whose callback is running.

Return values

`NULL` if no callback is currently running.

12.148.2.3 elapse_timeouts()

`void Fl_Timeout::elapse_timeouts ( ) [static]`

Elapse all timers w/o calling their callbacks. All timer values are adjusted by the delta time since the last call. This method does NOT call timer callbacks if timers are expired. This must be called before new timers are added to the timer queue to make sure that the next timer decrement does not count down too much time.

See also

`Fl_Timeout::do_timeouts()`

12.148.2.4 get()

`Fl_Timeout * Fl_Timeout::get ( double time,
                                 Fl_Timeout_Handler cb,
                                 void * data ) [static], [protected]`

Get an `Fl_Timeout` instance for further handling.

The timer object will be initialized with the input parameters as given by `Fl::add_timeout()` or `Fl::repeat_timeout()`. `Fl_Timeout` objects are maintained in three queues:

- active timer queue
- list (stack, i.e. LIFO) of currently executing timer callbacks
- free timer entries.

When the FLTK program is launched all queues are empty. Whenever a new timer object is required the `get()` method is called and a timer object is either found in the queue of free timer entries or a new timer object is created (operator new).
Active timer entries are inserted into the "active timer queue" until they expire and their callback is called. Before the callback is called the timer entry is inserted into the list of current timers, i.e. it becomes the \texttt{Fl\_Timeout::current()} timeout. This can be used in \texttt{Fl::repeat\_timeout()} to find out if and how long the current timeout has been delayed. When a timer is no longer used it is popped from the current list and inserted into the "free timer" list so it can be reused later. Timer queue entries are never returned to the system, there's no garbage collection. The total number of timer objects is determined by the largest number of concurrently active timers.

### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>time</th>
<th>requested delta time</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>\texttt{cb}</td>
<td>timer callback</td>
</tr>
<tr>
<td>in</td>
<td>\texttt{data}</td>
<td>userdata for timer callback</td>
</tr>
</tbody>
</table>

### Returns

\texttt{Fl\_Timeout\*} Timer entry

### See also

\texttt{Fl::add\_timeout()}, \texttt{Fl::repeat\_timeout()}

#### 12.148.2.5 \texttt{has\_timeout()}

```c
int Fl\_Timeout::has\_timeout (  
    Fl\_Timeout\_Handler \texttt{cb},  
    void * \texttt{data} ) \texttt{[static]}
```

Returns true if the timeout exists and has not been called yet.

### Parameters

<table>
<thead>
<tr>
<th>in \texttt{cb}</th>
<th>Timer callback (must match)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in \texttt{data}</td>
<td>Callback user data (must match)</td>
</tr>
</tbody>
</table>

### Returns

whether the timer was found in the queue

### Return values

<table>
<thead>
<tr>
<th>0</th>
<th>not found</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>found</td>
</tr>
</tbody>
</table>

Implements \texttt{Fl::has\_timeout(Fl\_Timeout\_Handler cb, void *data)}

### See also

\texttt{Fl::has\_timeout(Fl\_Timeout\_Handler cb, void *data)}

#### 12.148.2.6 \texttt{insert()}

```c
void Fl\_Timeout::insert ( ) \texttt{[protected]}
```

Insert this timer entry into the active timer queue. The timer is inserted at the required position so the timer queue is always ordered by due time.
12.148.2.7 make_current()

```cpp
void Fl_Timeout::make_current ( ) [protected]
```

Remove the timeout from the active timer queue and push it onto the stack of currently running callbacks.
This becomes the current() timeout which can be used in Fl::repeat_timeout().

See also

```cpp
Fl_Timeout::current()
```

12.148.2.8 release()

```cpp
void Fl_Timeout::release ( ) [protected]
```

Remove the top-most timeout from the stack of currently running timeout callbacks and insert it into the list of free
timers.

Typical code in the library would look like:

```cpp
// The timeout \p t has expired, run its callback
(t->callback)(t->data);
```

12.148.2.9 remove_timeout()

```cpp
void Fl_Timeout::remove_timeout (  
    Fl_Timeout_Handler cb,  
    void * data ) [static]
```

Remove a timeout callback.
This method removes all matching timeouts, not just the first one. This may change in the future.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>cb</th>
<th>Timer callback to be removed (must match)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>data</td>
<td>Wildcard if NULL, must match otherwise</td>
</tr>
</tbody>
</table>

Implements Fl::remove_timeout(Fl_Timeout_Handler cb, void *data)

See also

```cpp
Fl::remove_timeout(Fl_Timeout_Handler cb, void *data)
```

12.148.2.10 repeat_timeout()

```cpp
void Fl_Timeout::repeat_timeout (  
    double time,  
    Fl_Timeout_Handler cb,  
    void * data ) [static]
```

Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>time</th>
<th>delta time in seconds until the timer expires</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>cb</td>
<td>callback function</td>
</tr>
<tr>
<td>in</td>
<td>data</td>
<td>optional user data (default: NULL)</td>
</tr>
</tbody>
</table>

Implements Fl::repeat_timeout(double time, Fl_Timeout_Handler cb, void *data)

See also

```cpp
Fl::repeat_timeout(double time, Fl_Timeout_Handler cb, void *data)
```
12.148.2.11  time_to_wait()

double Fl_Timeout::time_to_wait (  
    double ttw  ) [static]

Returns the delay in seconds until the next timer expires, limited by \( ttw \).
This function calculates the time to wait for the FLTK event queue processing, depending on the given value \( ttw \).
If at least one timer is active and its timeout value is smaller than \( ttw \) then this value is returned. \( Fl::wait() \) will wait no longer than until the next timer expires.
If no timer is active this returns the input value \( ttw \) unchanged.
If at least one timer is expired this returns 0.0 so the event processing does not wait.

Parameters

| in  | ttw | time to wait from \( Fl::wait() \) etc. (upper limit) |

Returns

delay until next timeout or 0.0 (see description)

12.148.3  Member Data Documentation

12.148.3.1  current_timeout

\( Fl::Timeout :: current_timeout = 0 \) [static], [protected]
The list of current timeouts is used to store the timeout whose callback is called while the callback is executed.
This is used like a stack, the current timeout is pushed to the front of the list and once the callback is finished, that timeout is removed and entered into the free list.
Background: \( Fl::repeat\_timeout() \) needs to know which timeout triggered it and the exact schedule time and/or the delay of that timeout, i.e. how long the scheduled time was missed before the callback was called. A static, global variable is not sufficient since the user code can call other functions, e.g. dialogs, that run a nested event loop which can run another timeout callback. Hence this list of "current" timeouts is used like a stack (last in, first out).

See also

\( Fl::Timeout :: push() \) Member function (method)

12.148.3.2  first_timeout

\( Fl::Timeout :: first\_timeout = 0 \) [static], [protected]
List of active timeouts.
These timeouts can be triggered when due, which calls their callbacks. The lifetime of a timeout:

- active, in this queue
- callback running, in queue \( current\_timeout \)
- done, in list of free timeouts, ready to be reused.

12.148.3.3  free_timeout

\( Fl::Timeout :: free\_timeout = 0 \) [static], [protected]
List of free timeouts after use.
Timeouts can be reused many times.
The documentation for this class was generated from the following files:

- \( Fl::Timeout.h \)
- \( Fl::Timeout.cpp \)
12.149 Fl_Timer Class Reference

This is provided only to emulate the Forms Timer widget.

```c
#include <Fl_Timer.H>
```

Inheritance diagram for Fl_Timer:

```
Fl_Widget
  ↓
Fl_Timer
```

Public Member Functions

- `char direction () const`
  
  Gets or sets the direction of the timer.

- `void direction (char d)`
  
  Gets or sets the direction of the timer.

- `Fl_Timer (uchar t, int x, int y, int w, int h, const char ∗l)`
  
  Creates a new Fl_Timer widget using the given type, position, size, and label string.

- `int handle (int) FL_OVERRIDE`
  
  Handles the specified event.

- `char suspended () const`
  
  Gets or sets whether the timer is suspended.

- `void suspended (char d)`
  
  Gets or sets whether the timer is suspended.

- `double value () const`
  
  
  See void Fl_Timer::value(double)

- `void value (double)`
  
  Sets the current timer value.

- `~Fl_Timer ()`
  
  Destroys the timer and removes the timeout.

Public Member Functions inherited from Fl_Widget

- `void _clear_fullscreen ()`

- `void _set_fullscreen ()`

- `void activate ()`
  
  Activates the widget.

- `unsigned int active () const`
  
  Returns whether the widget is active.

- `int active_r () const`
  
  Returns whether the widget and all of its parents are active.

- `Fl_Align align () const`
  
  Gets the label alignment.

- `int active_r () const`
  
  Returns whether the widget and all of its parents are active.

- `Fl_Align align () const`
  
  Gets the label alignment.

- `void align (Fl_Align alignment)`
  
  Sets the label alignment.

- `long argument () const`
  
  Gets the current user data (long) argument that is passed to the callback function.

- `void argument (long v)`
  
  Sets the current user data (long) argument that is passed to the callback function.

- `virtual class Fl_Gl_Window ∗ as_gl_window ()`
Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.

- virtual class `Fl_Gl_Window` const * as_gl_window () const
- virtual `Fl_Group` const * as_group ()
  Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

- virtual `Fl_Group` const * as_group () const
- virtual `Fl_Window` const * as_window ()
  Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.

- void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- `Fl_Boxtype` box () const
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- `Fl_Callback_p` callback () const
  Gets the current callback function for the widget.

- void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- `Fl_Color` color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
Sets the background and selection color of the widget.

- **FL_Color color2 () const**
  - For back compatibility only.
- **void color2 (unsigned a)**
  - For back compatibility only.
- **int contains (const FL_Widget *w) const**
  - Checks if w is a child of this widget.
- **void copy_label (const char *new_label)**
  - Sets the current label.
- **void copy_tooltip (const char *text)**
  - Sets the current tooltip text.
- **uchar damage () const**
  - Returns non-zero if draw() needs to be called.
- **void damage (uchar c)**
  - Sets the damage bits for the widget.
- **void damage (uchar c, int x, int y, int w, int h)**
  - Sets the damage bits for an area inside the widget.
- **int damage_resize (int, int, int, int)**
  - Internal use only.
- **void deactivate ()**
  - Deactivates the widget.
- **FL_Image *deimage ()**
  - Gets the image that is used as part of the widget label when in the inactive state.
- **const FL_Image *deimage () const**
  - Gets the image that is used as part of the widget label when in the inactive state.
- **void deimage (Fl_Image &img)**
  - Sets the image to use as part of the widget label when in the inactive state.
- **void deimage (Fl_Image *img)**
  - Sets the image to use as part of the widget label when in the inactive state.
- **int deimage_bound () const**
  - Returns whether the inactive image is managed by the widget.
- **void do_callback (FL_Callback_Reas one=FL_REASON_UNKNOWN)**
  - Calls the widget callback function with default arguments.
- **void do_callback (FL_Widget *widget, long arg, FL_Callback_Reas one=FL_REASON_UNKNOWN)**
  - Calls the widget callback function with arbitrary arguments.
- **void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reas one=FL_REASON_UNKNOWN)**
  - Calls the widget callback function with arbitrary arguments.
- **void draw_label (int, int, int, int, FL_Align) const**
  - Draws the label in an arbitrary bounding box with an arbitrary alignment.
- **int h () const**
  - Gets the widget height.
- **virtual void hide ()**
  - Makes a widget invisible.
- **FL_Image *image ()**
  - Gets the image that is used as part of the widget label when in the active state.
- **const FL_Image *image () const**
  - Gets the image that is used as part of the widget label when in the active state.
- **void image (FL_Image &img)**
  - Sets the image to use as part of the widget label when in the active state.
- **void image (FL_Image *img)**
  - Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗ label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group ∗ parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group ∗p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.

• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char ∗ tooltip () const
  Gets the current tooltip text.

• void tooltip (const char ∗text)
  Sets the current tooltip text.

• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void ∗ user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void ∗v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according to its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  Draws the widget's label at the defined label position.

• void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

• unsigned int flags () const
  Gets the widget flags mask.

• void h (int v)
  Internal use only.

• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void \texttt{w} (int v)
  \textit{Internal use only.}
• void \texttt{x} (int v)
  \textit{Internal use only.}
• void \texttt{y} (int v)
  \textit{Internal use only.}

**Additional Inherited Members**

**Static Public Member Functions inherited from \texttt{Fl_Widget}**

• static void \texttt{default_callback} (\texttt{Fl_Widget} \ast widget, void \ast data)
  \textit{The default callback for all widgets that don't set a callback.}
• static unsigned int \texttt{label_shortcut} (const char \ast t)
  \textit{Returns the Unicode value of the '&x' shortcut in a given text.}
• static int \texttt{test_shortcut} (const char \ast t, const bool require_alt=false)
  \textit{Returns true if the given text \texttt{t} contains the entered '&x' shortcut.}

**Protected Types inherited from \texttt{Fl_Widget}**

  \textit{flags possible values enumeration.}

12.149.1 Detailed Description

This is provided only to emulate the Forms Timer widget. It works by making a timeout callback every 1/5 second. This is wasteful and inaccurate if you just want something to happen a fixed time in the future. You should directly call \texttt{Fl::add_timeout()} instead.

12.149.2 Constructor & Destructor Documentation

12.149.2.1 \texttt{Fl_Timer()}

\begin{verbatim}
Fl_Timer::Fl_Timer ( 
  uchar t,
  int X,
  int Y,
  int W,
  int H,
  const char * l )
\end{verbatim}

Creates a new \texttt{Fl_Timer} widget using the given type, position, size, and label string. The type parameter can be any of the following symbolic constants:

• \texttt{FL_NORMAL_TIMER} - The timer just does the callback and displays the string "Timer" in the widget.
• \texttt{FL_VALUE_TIMER} - The timer does the callback and displays the current timer value in the widget.
• \texttt{FL_HIDDEN_TIMER} - The timer just does the callback and does not display anything.
### 12.149.3 Member Function Documentation

#### 12.149.3.1 direction() [1/2]

```cpp
char Fl_Timer::direction ( ) const [inline]
```

Gets or sets the direction of the timer.
If the direction is zero then the timer will count up, otherwise it will count down from the initial value().

#### 12.149.3.2 direction() [2/2]

```cpp
void Fl_Timer::direction (char d ) [inline]
```

Gets or sets the direction of the timer.
If the direction is zero then the timer will count up, otherwise it will count down from the initial value().

#### 12.149.3.3 draw()

```cpp
void Fl_Timer::draw ( ) [protected], [virtual]
```

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.
Override this function to draw your own widgets.
If you ever need to call another widget's `draw` method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:
```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

#### 12.149.3.4 handle()

```cpp
int Fl_Timer::handle (int event ) [virtual]
```

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>event</th>
<th>the kind of event received</th>
</tr>
</thead>
</table>

**Return values**

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

**See also**

- `Fl_Event`

Reimplemented from `Fl_Widget`.

Generated by Doxygen
12.149.3.5  suspended()

```cpp
char Fl_Timer::suspended ( ) const [inline]
```

Gets or sets whether the timer is suspended.

The documentation for this class was generated from the following files:

- FL_Timer.H
- forms_timer.cxx

12.150  Fl_Toggle_Button Class Reference

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off.

```cpp
#include <Fl_Toggle_Button.H>
```

Inheritance diagram for Fl_Toggle_Button:

```
+----------------+          +-------------------+
| Fl_Toggle_Button|  ↓                |
|                 |  ↓                |
| Fl_Button       |  ↓                |
|                 |  ↓                |
| Fl_Widget       |
```

Public Member Functions

- **Fl_Toggle_Button (int X, int Y, int W, int H, const char ∗l=0)**
  
  Creates a new Fl_Toggle_Button widget using the given position, size, and label string.

Public Member Functions inherited from Fl_Button

- **int clear ()**
  
  Same as value(0).

- **uchar compact ()**
  
  Return true if buttons are rendered as compact buttons.

- **void compact (uchar v)**
  
  Decide if buttons should be rendered in compact mode.

- **Fl_Boxtype down_box () const**
  
  Returns the current down box type, which is drawn when value() is non-zero.

- **void down_box (Fl_Boxtype b)**
  
  Sets the down box type.

- **Fl_Color down_color () const**
  
  (for backwards compatibility)

- **void down_color (unsigned c)**
  
  (for backwards compatibility)

- **Fl_Button (int X, int Y, int W, int H, const char ∗L=0)**
  
  The constructor creates the button using the given position, size, and label.

- **int handle (int) FL_OVERRIDE**
  
  Handles the specified event.

- **int set ()**
  
  Same as value(1).

- **void setonly ()**
  
  Turns on this button and turns off all other radio buttons in the group (calling value(1) or set () does not do this).
• int **shortcut** () const  
  Returns the current shortcut key for the button.

• void **shortcut** (const char *s)  
  (for backwards compatibility)

• void **shortcut** (int s)  
  Sets the shortcut key to s.

• char **value** () const  
  Returns the current value of the button (0 or 1).

• int **value** (int v)  
  Sets the current value of the button.

**Public Member Functions inherited from Fl_Widget**

• void **_clear_fullscreen** ()

• void **_set_fullscreen** ()

• void **activate** ()
  Activates the widget.

• unsigned int **active** () const  
  Returns whether the widget is active.

• int **active_r** () const  
  Returns whether the widget and all of its parents are active.

• Fl_Align **align** () const  
  Gets the label alignment.

• void **align** (Fl_Align alignment)  
  Sets the label alignment.

• long **argument** () const  
  Gets the current user data (long) argument that is passed to the callback function.

• void **argument** (long v)  
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * as_gl_window ()  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * as_gl_window () const

• virtual Fl_Group * as_group ()  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const * as_group () const

• virtual Fl_Window * as_window ()  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * as_window () const

• void **bind_deimage** (Fl_Image *img)  
  Sets the image to use as part of the widget label when in the inactive state.

• void **bind_deimage** (int f)  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void **bind_image** (Fl_Image *img)  
  Sets the image to use as part of the widget label when in the active state.

• void **bind_image** (int f)  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype **box** () const  
  Gets the box type of the widget.

• void **box** (Fl_Boxtype new_box)  
  Sets the box type for the widget.

• Fl_Callback_p **callback** () const

Generated by Doxygen
Gets the current callback function for the widget.

- void callback (Fl_Callback cb)
  - Sets the current callback function for the widget.

- void callback (Fl_Callback cb, Fl_Callback_User_Data p, bool auto_free)
  - Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback cb, void p)
  - Sets the current callback function and data for the widget.

- void callback (Fl_Callback cb)
  - Sets the current callback function for the widget.

- void callback (Fl_Callback cb, long p=0)
  - Sets the current callback function for the widget.

- unsigned int changed () const
  - Checks if the widget value changed since the last callback.

- void clear_active ()
  - Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  - Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  - Clears or sets the damage flags.

- void clear_output ()
  - Sets a widget to accept input.

- void clear_visible ()
  - Hides the widget.

- void clear_visible_focus ()
  - Disables keyboard focus navigation with this widget.

- void color (Fl_Color bg)
  - Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  - Sets the background and selection color of the widget.

- void color2 (unsigned a)
  - For back compatibility only.

- Fl_Color color () const
  - Gets the background color of the widget.

- void contains (const Fl_Widget w) const
  - Checks if w is a child of this widget.

- void copy_label (const char new_label)
  - Sets the current label.

- void copy_tooltip (const char text)
  - Sets the current tooltip text.

- uchar damage () const
  - Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  - Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  - Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  - Internal use only.

- void deactivate ()
  - Deactivates the widget.
Fl_Toggle_Button Class Reference

- FL_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const FL_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (FL_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (FL_Image img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int h () const
  Gets the widget height.

- virtual void hide ()
  Makes a widget invisible.

- FL_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.

- const FL_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.

- void image (FL_Image &img)
  Sets the image to use as part of the widget label when in the active state.

- void image (FL_Image img)
  Sets the image to use as part of the widget label when in the active state.

- int image_bound () const
  Returns whether the image is managed by the widget.

- int inside (const FL_Widget *wgt) const
  Checks if this widget is a child of wgt.

- int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

- const char * label () const
  Gets the current label text.

- void label (const char *text)
  Sets the current label pointer.

- void label (FL_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

- FL_Color labelcolor () const
  Gets the label color.

- void labelcolor (FL_Color c)
  Sets the label color.

- FL_Font labelfont () const
  Gets the font to use.

- void labelfont (FL_Font f)
  Sets the font to use.

- FL_Fontsize labelsize () const
  Gets the font size to use.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - “for hacks only”.
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int take_sevets () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int xoff, int yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.

Protected Member Functions inherited from Fl_Button

- void draw () FL_OVERRIDE
  
  Draws the widget.
- void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.
- void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
12.150 Fl_Toggle_Button Class Reference

Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  *Internal use only.*

- void set_flag (unsigned int c)
  *Internal use only.*

- void w (int v)
  *Internal use only.*

- void x (int v)
  *Internal use only.*

- void y (int v)
  *Internal use only.*

Static Protected Member Functions inherited from Fl_Button

- static void key_release_timeout (void *)

Static Protected Attributes inherited from Fl_Button

- static Fl_Widget_Tracker * key_release_tracker = 0

12.150.1 Detailed Description

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off. The Fl_Toggle_Button subclass displays the "on" state by drawing a pushed-in button. Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for type() and when().

12.150.2 Constructor & Destructor Documentation

12.150.2.1 Fl_Toggle_Button()

Fl_Toggle_Button::Fl_Toggle_Button (int X, int Y, int W, int H, const char *L = 0L)

Creates a new Fl_Toggle_Button widget using the given position, size, and label string.

The constructor creates the button using the given position, size, and label.

The inherited destructor deletes the toggle button.

The Button type() is set to FL_TOGGLE_BUTTON.

Parameters

| In | X, Y, W, H | position and size of the widget |
| In | L | widget label, default is no label |

The documentation for this class was generated from the following files:

- Fl_Toggle_Button.H
- Fl_Button.cxx

Generated by Doxygen
The Fl_Tooltip class provides tooltip support for all FLTK widgets.

```c
#include <Fl_Tooltip.H>
```

### Static Public Member Functions

- **static Fl_Color color ()**
  
  Gets the background color for tooltips.

- **static void color (Fl_Color c)**
  
  Sets the background color for tooltips.

- **static Fl_Widget * current ()**
  
  Gets the current widget target.

- **static void current (Fl_Widget *)**
  
  Sets the current widget target.

- **static Fl_Window * current_window ()**
  
  Returns the window that is used for tooltips.

- **static float delay ()**
  
  Gets the tooltip delay.

- **static void delay (float f)**
  
  Sets the tooltip delay.

- **static void disable ()**
  
  Same as enable(0), disables tooltips on all widgets.

- **static void enable (int b=1)**
  
  Enables tooltips on all widgets (or disables if b is false).

- **static int enabled ()**
  
  Returns non-zero if tooltips are enabled.

- **static void enter_area (Fl_Widget *w, int X, int Y, int W, int H, const char *tip)**
  
  You may be able to use this to provide tooltips for internal pieces of your widget.

- **static Fl_Font font ()**
  
  Gets the typeface for the tooltip text.

- **static void font (Fl_Font i)**
  
  Sets the typeface for the tooltip text.

- **static float hidedelay ()**
  
  Gets the time until an open tooltip hides again.

- **static void hidedelay (float f)**
  
  Sets the time until an open tooltip hides again.

- **static float hoverdelay ()**
  
  Gets the tooltip hover delay, the delay between tooltips.

- **static void hoverdelay (float f)**
  
  Sets the tooltip hover delay, the delay between tooltips.

- **static int margin_height ()**
  
  Gets the amount of extra space above and below the tooltip’s text.

- **static void margin_height (int v)**
  
  Sets the amount of extra space above and below the tooltip’s text.

- **static int margin_width ()**
  
  Gets the amount of extra space left/right of the tooltip’s text.

- **static void margin_width (int v)**
  
  Sets the amount of extra space left/right of the tooltip’s text.

- **static Fl_Fontsize size ()**
  
  Gets the size of the tooltip text.

- **static void size (Fl_Fontsize s)**
Sets the size of the tooltip text.

- static Fl_Color textcolor ()

  Gets the color of the text in the tooltip.

- static void textcolor (Fl_Color c)

  Sets the color of the text in the tooltip.

- static int wrap_width ()

  Gets the maximum width for tooltip's text before it word wraps.

- static void wrap_width (int v)

  Sets the maximum width for tooltip's text before it word wraps.

Static Public Attributes

- static void(* enter)(Fl_Widget *w) = nothing
- static void(* exit)(Fl_Widget *w) = nothing

Friends

- class Fl_TooltipBox
- void Fl_Widget::copy_tooltip (const char *)
- void Fl_Widget::tooltip (const char *)

12.151.1 Detailed Description

The Fl_Tooltip class provides tooltip support for all FLTK widgets. It contains only static methods.

12.151.2 Member Function Documentation

12.151.2.1 color() [1/2]

static Fl_Color Fl_Tooltip::color () [inline], [static]
Gets the background color for tooltips.
The default background color is a pale yellow.

12.151.2.2 color() [2/2]

static void Fl_Tooltip::color (Fl_Color c) [inline], [static]
Sets the background color for tooltips.
The default background color is a pale yellow.
12.151.2.3 current()

void Fl_Tooltip::current ( 
    Fl_Widget * w ) [static]

Sets the current widget target.
Acts as though enter(widget) was done but does not pop up a tooltip. This is useful to prevent a tooltip from
reappearing when a modal overlapping window is deleted. FLTK does this automatically when you click the mouse
button.

12.151.2.4 delay() [1/2]

static float Fl_Tooltip::delay ( ) [inline], [static]

Gets the tooltip delay.
The default delay is 1.0 seconds.

12.151.2.5 delay() [2/2]

static void Fl_Tooltip::delay ( 
    float f ) [inline], [static]

Sets the tooltip delay.
The default delay is 1.0 seconds.

12.151.2.6 disable()

static void Fl_Tooltip::disable ( ) [inline], [static]

Same as enable(0), disables tooltips on all widgets.

12.151.2.7 enable()

static void Fl_Tooltip::enable ( 
    int b = 1 ) [inline], [static]

Enables tooltips on all widgets (or disables if b is false).

12.151.2.8 enabled()

static int Fl_Tooltip::enabled ( ) [inline], [static]

Returns non-zero if tooltips are enabled.

12.151.2.9 enter_area()

void Fl_Tooltip::enter_area ( 
    Fl_Widget * wid, 
    int x, 
    int y, 
    int w, 
    int h, 
    const char * t ) [static]

You may be able to use this to provide tooltips for internal pieces of your widget.
Call this after setting Fl::belowmouse() to your widget (because that calls the above enter() method). Then figure
out what thing the mouse is pointing at, and call this with the widget (this pointer is used to remove the tooltip if
the widget is deleted or hidden, and to locate the tooltip), the rectangle surrounding the area, relative to the top-left
corner of the widget (used to calculate where to put the tooltip), and the text of the tooltip (which must be a pointer to static data as it is not copied).

12.151.2.10  font() [1/2]

static Fl_Font Fl_Tooltip::font ( ) [inline], [static]
Gets the typeface for the tooltip text.

12.151.2.11  font() [2/2]

static void Fl_Tooltip::font (Fl_Font i) [inline], [static]
Sets the typeface for the tooltip text.

12.151.2.12  hidedelay() [1/2]

static float Fl_Tooltip::hidedelay ( ) [inline], [static]
Gets the time until an open tooltip hides again.
The default delay is 12.0 seconds.

12.151.2.13  hidedelay() [2/2]

static void Fl_Tooltip::hidedelay (float f) [inline], [static]
Sets the time until an open tooltip hides again.
The default delay is 12.0 seconds.

12.151.2.14  hoverdelay() [1/2]

static float Fl_Tooltip::hoverdelay ( ) [inline], [static]
Gets the tooltip hover delay, the delay between tooltips.
The default delay is 0.2 seconds.

12.151.2.15  hoverdelay() [2/2]

static void Fl_Tooltip::hoverdelay (float f) [inline], [static]
Sets the tooltip hover delay, the delay between tooltips.
The default delay is 0.2 seconds.

12.151.2.16  margin_height() [1/2]

static int Fl_Tooltip::margin_height ( ) [inline], [static]
Gets the amount of extra space above and below the tooltip's text.
Default is 3.

12.151.2.17  margin_height() [2/2]

static void Fl_Tooltip::margin_height (int v) [inline], [static]
Sets the amount of extra space above and below the tooltip's text.
Default is 3.
12.151.2.18 margin_width() [1/2]

static int Fl_Tooltip::margin_width ( ) [inline], [static]

Gets the amount of extra space left/right of the tooltip's text.
Default is 3.

12.151.2.19 margin_width() [2/2]

static void Fl_Tooltip::margin_width ( int v ) [inline], [static]

Sets the amount of extra space left/right of the tooltip's text.
Default is 3.

12.151.2.20 size() [1/2]

static Fl_Fontsize Fl_Tooltip::size ( ) [inline], [static]

Gets the size of the tooltip text.

12.151.2.21 size() [2/2]

static void Fl_Tooltip::size ( Fl_Fontsize s ) [inline], [static]

Sets the size of the tooltip text.

12.151.2.22 textcolor() [1/2]

static Fl_Color Fl_Tooltip::textcolor ( ) [inline], [static]

Gets the color of the text in the tooltip.
The default is black.

12.151.2.23 textcolor() [2/2]

static void Fl_Tooltip::textcolor ( Fl_Color c ) [inline], [static]

Sets the color of the text in the tooltip.
The default is black.

12.151.2.24 wrap_width() [1/2]

static int Fl_Tooltip::wrap_width ( ) [inline], [static]

Gets the maximum width for tooltip's text before it word wraps.
Default is 400.

12.151.2.25 wrap_width() [2/2]

static void Fl_Tooltip::wrap_width ( int v ) [inline], [static]

Sets the maximum width for tooltip's text before it word wraps.
Default is 400.

The documentation for this class was generated from the following files:

- Fl_Tooltip.H
- Fl.cxx
- Fl_Tooltip.cxx
12.152  **Fl_Tree Class Reference**

Tree widget.

```cpp
#include <Fl_Tree.H>
```

Inheritance diagram for Fl_Tree:

```
Fl_Widget
  ↓
Fl_Group
  ↓
Fl_Tree
```

**Public Member Functions**

- `Fl_Tree_Item * add (const char *path, Fl_Tree_Item *newitem=0)`
  Adds a new item, given a menu style 'path'.
- `Fl_Tree_Item * add (Fl_Tree_Item *parent_item, const char *name)`
  Add a new child item labeled 'name' to the specified 'parent_item'.
- `void calc_dimensions ()`
  Recalculate widget dimensions and scrollbar visibility, normally managed automatically.
- `void calc_tree ()`
  Recalculates the tree’s sizes and scrollbar visibility, normally managed automatically.
- `Fl_Tree_Item * callback_item ()`
  Gets the item that caused the callback.
- `void callback_item (Fl_Tree_Item *item)`
  Sets the item that was changed for this callback.
- `Fl_Tree_Reason callback_reason () const`
  Gets the reason for this callback.
- `void callback_reason (Fl_Tree_Reason reason)`
  Sets the reason for this callback.
- `void clear ()`
  Clear the entire tree’s children, including the root.
- `void clear_children (Fl_Tree_Item *item)`
  Clear all the children for 'item'.
- `int close (const char *path, int docallback=1)`
  Closes the item specified by 'path'.
- `int close (Fl_Tree_Item *item, int docallback=1)`
  Closes the specified 'item'.
- `Fl_Image * closeicon () const`
  Returns the icon to be used as the ‘close’ icon.
- `void closeicon (Fl_Image *val)`
  Sets the icon to be used as the ‘close’ icon.
- `Fl_Color connectorcolor () const`
  Get the connector color used for tree connection lines.
- `void connectorcolor (Fl_Color val)`
  Set the connector color used for tree connection lines.
- `Fl_Tree_Connector connectorstyle () const`
  Returns the line drawing style for inter-connecting items.
- `void connectorstyle (Fl_Tree_Connector val)`
  Sets the line drawing style for inter-connecting items.
• int connectorwidth () const
  
  Gets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.

• void connectorwidth (int val)
  
  Sets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.

• int deselect (const char *path, int docallback=1)
  
  Deselect an item specified by 'path'.

• int deselect (Fl_Tree_Item *item, int docallback=1)
  
  Deselect the specified item.

• int deselect_all (Fl_Tree_Item *item=0, int docallback=1)
  
  Deselect 'item' and all its children.

• void display (Fl_Tree_Item *item)
  
  Displays 'item', scrolling the tree as necessary.

• int displayed (Fl_Tree_Item *item)
  
  See if 'item' is currently displayed on-screen (visible within the widget).

• int extend_selection (Fl_Tree_Item *from, Fl_Tree_Item *to, int val=1, bool visible=false)
  
  Extend a selection between 'from' and 'to' depending on 'visible'.

• int extend_selection_dir (Fl_Tree_Item *from, Fl_Tree_Item *to, int dir, int val, bool visible)
  
  Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.

• Fl_Tree_Item *find_clicked (int yonly=0)
  
  Non-const version of Fl_Tree::find_clicked(int yonly) const.

• const Fl_Tree_Item *find_clicked (int yonly=0) const
  
  Find the item that was last clicked on.

• Fl_Tree_Item *find_item (const char *path)
  
  Non-const version of Fl_Tree::find_item(const char *path) const.

• const Fl_Tree_Item *find_item (const char *path) const
  
  Find the item, given a menu style path, e.g.

• Fl_Tree_Item *first ()
  
  Returns the first item in the tree, or 0 if none.

• Fl_Tree_Item *first_selected_item ()
  
  Returns the first selected item in the tree.

• Fl_Tree_Item *first_visible ()
  
  Returns the first open(), visible item in the tree, or 0 if none.

• Fl_Tree_Item *first_visible_item ()
  
  Returns the first open(), visible item in the tree, or 0 if none.

• Fl_Tree (int X, int Y, int W, int H, const char *L=0)
  
  Constructor.

• Fl_Tree_Item *get_item_focus () const
  
  Get the item that currently has keyboard focus.

• int get_selected_items (Fl_Tree_Item_Array &items)
  
  Returns the currently selected items as an array of 'ret_items'.

• int handle (int e) FL_OVERRIDE
  
  Standard FLTK event handler for this widget.

• int hposition () const
  
  Returns the horizontal scroll position as a pixel offset.

• void hposition (int pos)
  
  Sets the horizontal scroll offset to position 'pos'.

• Fl_Tree_Item *insert (Fl_Tree_Item *item, const char *name, int pos)
  
  Insert a new item 'name' into 'item's children at position 'pos'.

• Fl_Tree_Item *insert_above (Fl_Tree_Item *above, const char *name)
  
  Inserts a new item 'name' above the specified Fl_Tree_Item 'above'.

Generated by Doxygen
• int is_close (const char *path) const
  See if item specified by 'path' is closed.
• int is_close (Fl_Tree_Item *item) const
  See if the specified 'item' is closed.
• int is_hscroll_visible () const
  See if the horizontal scrollbar is currently visible.
• int is_open (const char *path) const
  See if item specified by 'path' is open.
• int is_open (Fl_Tree_Item *item) const
  See if 'item' is open.
• int is_scrollbar (Fl_Widget *w)
  See if widget 'w' is one of the Fl_Tree widget's scrollbars.
• int is_selected (const char *path)
  See if item specified by 'path' is selected.
• int is_selected (Fl_Tree_Item *item) const
  See if the specified 'item' is selected.
• int is_vscroll_visible () const
  See if the vertical scrollbar is currently visible.
• Fl_Tree_Item *item_clicked ()
  Return the item that was last clicked.
• Fl_Tree_Item_Draw_Mode item_draw_mode () const
  Get the 'item draw mode' used for the tree.
• void item_draw_mode (Fl_Tree_Item_Draw_Mode mode)
  Set the 'item draw mode' used for the tree to 'mode'.
• void item_draw_mode (int mode)
  Set the 'item draw mode' used for the tree to integer 'mode'.
• void item_labelbgcolor (Fl_Color val)
  Set the default label background color used for creating new items.
• Fl_Color item_labelbgcolor (void) const
  Get the default label background color used for creating new items.
• void item_labelfgcolor (Fl_Color val)
  Set the default label foreground color used for creating new items.
• Fl_Color item_labelfgcolor (void) const
  Get the default label foreground color used for creating new items.
• Fl_Font item_labelfont () const
  Get the default font face used for creating new items.
• void item_labelfont (Fl_Font val)
  Set the default font face used for creating new items.
• Fl_Fontsize item_labelsize () const
  Get the default label fontsize used for creating new items.
• void item_labelsize (Fl_Fontsize val)
  Set the default label font size used for creating new items.
• int item_pathname (char *pathname, int pathnamelen, const Fl_Tree_Item *item) const
  Return 'pathname' of size 'pathnamelen' for the specified 'item'.
• Fl_Tree_Item_Reselect_Mode item_reselect_mode () const
  Returns the current item re/selection mode.
• void item_reselect_mode (Fl_Tree_Item_Reselect_Mode mode)
  Sets the item re/selection mode.
• int labelmarginleft () const
  Get the amount of white space (in pixels) that should appear to the left of the label text.
• void labelmarginleft (int val)
Set the amount of white space (in pixels) that should appear to the left of the label text.

- **Fl_Tree_Item** * last ()
  Returns the last item in the tree.
- **Fl_Tree_Item** * last_selected_item ()
  Returns the last selected item in the tree.
- **Fl_Tree_Item** * last_visible ()
  Returns the last open(), visible item in the tree.
- **Fl_Tree_Item** * last_visible_item ()
  Returns the last open(), visible item in the tree.

• **int** linespacing () const
  Get the amount of white space (in pixels) that should appear between items in the tree.

• **void** linespacing (int val)
  Sets the amount of white space (in pixels) that should appear between items in the tree.

• **void** load (class Fl_Preferences &)
  Load FLTK preferences.

• **int** marginbottom () const
  Get the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.

• **void** marginbottom (int val)
  Sets the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.

• **int** marginleft () const
  Get the amount of white space (in pixels) that should appear between the widget’s left border and the tree’s contents.

• **void** marginleft (int val)
  Set the amount of white space (in pixels) that should appear between the widget’s left border and the left side of the tree’s contents.

• **int** margintop () const
  Get the amount of white space (in pixels) that should appear between the widget’s top border and the top of the tree’s contents.

• **void** margintop (int val)
  Sets the amount of white space (in pixels) that should appear between the widget’s top border and the top of the tree’s contents.

- **Fl_Tree_Item** * next (Fl_Tree_Item *item=0)
  Return the next item after 'item', or 0 if no more items.

- **Fl_Tree_Item** * next_item (Fl_Tree_Item *item, int dir=FL_Down, bool visible=false)
  Returns next item after 'item' in direction 'dir' depending on 'visible'.

- **Fl_Tree_Item** * next_selected_item (Fl_Tree_Item *item=0, int dir=FL_Down)
  Returns the next selected item above or below 'item', depending on 'dir'.

- **Fl_Tree_Item** * next_visible_item (Fl_Tree_Item *start, int dir)
  Returns next open(), visible item above (dir==FL_Up) or below (dir==FL_Down) the specified 'item', or 0 if no more items.

• **int** open (const char *path, int docallback=1)
  Opens the item specified by 'path'.

• **int** open (Fl_Tree_Item *item, int docallback=1)
  Open the specified 'item'.

• **void** open_toggle (Fl_Tree_Item *item, int docallback=1)
  Toggle the open state of 'item'.

• **int** openchild_marginbottom () const
  Get the amount of white space (in pixels) that should appear below an open child tree's contents.

• **void** openchild_marginbottom (int val)
  Set the amount of white space (in pixels) that should appear below an open child tree's contents.

• **Fl_Image** * openicon () const
Returns the icon to be used as the 'open' icon.

- void openicon (Fl_Image *val)
  
  Sets the icon to be used as the 'open' icon.

- const Fl_Tree_Prefs & prefs () const

- Fl_Tree_Item * prev (Fl_Tree_Item *item=0)
  
  Return the previous item before 'item', or 0 if no more items.

- void recalc_tree ()
  
  Schedule tree to recalc the entire tree size.

- int remove (Fl_Tree_Item *item)
  
  Remove the specified 'item' from the tree.

- void resize (int, int, int, int) FL_OVERRIDE
  
  Resizes the Fl_Group widget and all of its children.

- Fl_Tree_Item * root ()
  
  Returns the root item.

- void root (Fl_Tree_Item *newitem)
  
  Sets the root item to 'newitem'.

- void root_label (const char *new_label)
  
  Set the label for the root item to 'new_label'.

- int scrollbar_size () const
  
  Gets the default size of scrollbars' troughs for this widget in pixels.

- void scrollbar_size (int size)
  
  Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.

- int select (const char *path, int docallback=1)
  
  Select the item specified by 'path'.

- int select (Fl_Tree_Item *item, int docallback=1)
  
  Select the specified 'item'.

- int select_all (Fl_Tree_Item *item=0, int docallback=1)
  
  Select 'item' and all its children.

- int select_only (Fl_Tree_Item *selitem, int docallback=1)
  
  Select only the specified item, deselecting all others that might be selected.

- void select_toggle (Fl_Tree_Item *item, int docallback=1)
  
  Toggle the select state of the specified 'item'.

- Fl_Boxtype selectbox () const
  
  Sets the style of box used to draw selected items.

- void selectbox (Fl_Boxtype val)
  
  Gets the style of box used to draw selected items.

- Fl_Tree_Select selectmode () const
  
  Gets the tree's current selection mode.

- void selectmode (Fl_Tree_Select val)
  
  Sets the tree's selection mode.

- void set_item_focus (Fl_Tree_Item *item)
  
  Set the item that currently should have keyboard focus.

- void show_item (Fl_Tree_Item *item)
  
  Adjust the vertical scrollbar to show 'item' at the top of the display IF it is currently off-screen (for instance show_item_top()).

- void show_item (Fl_Tree_Item *item, int yoff)
  
  Adjust the vertical scrollbar so that 'item' is visible 'yoff' pixels from the top of the Fl_Tree widget's display.

- void show_item_bottom (Fl_Tree_Item *item)
  
  Adjust the vertical scrollbar so that 'item' is at the bottom of the display.

- void show_item_middle (Fl_Tree_Item *item)
  
  Adjust the vertical scrollbar so that 'item' is in the middle of the display.
• void show_item_top (Fl_Tree_Item *item)
  Adjust the vertical scrollbar so that 'item' is at the top of the display.

• void show_self ()
  Print the tree as 'ascii art' to stdout.

• int showcollapse () const
  Returns 1 if the collapse icon is enabled, 0 if not.

• void showcollapse (int val)
  Set if we should show the collapse icon or not.

• int showroot () const
  Returns 1 if the root item is to be shown, or 0 if not.

• void showroot (int val)
  Set if the root item should be shown or not.

• Fl_Tree_Sort sortorder () const
  Set the default sort order used when items are added to the tree.

• void sortorder (Fl_Tree_Sort val)
  Gets the sort order used to add items to the tree.

• Fl_Image * usericon () const
  Returns the Fl_Image being used as the default user icon for all newly created items.

• void usericon (Fl_Image *val)
  Sets the Fl_Image to be used as the default user icon for all newly created items.

• int usericonmarginleft () const
  Get the amount of white space (in pixels) that should appear to the left of the usericon.

• void usericonmarginleft (int val)
  Set the amount of white space (in pixels) that should appear to the left of the usericon.

• int vposition () const
  Returns the vertical scroll position as a pixel offset.

• void vposition (int pos)
  Sets the vertical scroll offset to position 'pos'.

• int widgetmarginleft () const
  Get the amount of white space (in pixels) that should appear to the left of the child Fltk widget (if any).

• void widgetmarginleft (int val)
  Set the amount of white space (in pixels) that should appear to the left of the child Fltk widget (if any).

• ~Fl_Tree ()
  Destructor.

Public Member Functions inherited from Fl_Group

• Fl_Widget *& _ddfdesign_kludge ()
  This is for forms compatibility only.

• void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

• void add (Fl_Widget &o)
  See void Fl_Group::add(Fl_Widget &w)

• void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget * const * array () const
  Returns a pointer to the array of children.

• Fl_Group const * as_group () const FL_OVERRIDE

• Fl_Group * as_group () FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• void begin ()
  Destructor.
Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget** + child (int n) const
  Returns array\[n\].
- int children () const
  Returns how many child widgets the group has.
- void clear ()
  Deletes all child widgets from memory recursively.
- unsigned int clip_children ()
  Returns the current clipping mode.
- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
- void end ()
  Exactly the same as current(this->parent()).
- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char *0)
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget &W)
- void forms_end ()
  This is for forms compatibility only.
- void init_sizes ()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
  Removes the widget at index from the group but does not delete it.
- Fl_Widget *resizable () const
  Returns the group’s resizable widget.
- void resizable (Fl_Widget &o)
  Sets the group’s resizable widget.
- void resizable (Fl_Widget *)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- virtual ~Fl_Group ()
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- `void clear_changed ()`
  Marks the value of the widget as unchanged.

- `void clear_damage (uchar c=0)`
  Clears or sets the damage flags.

- `void clear_output ()`
  Sets a widget to accept input.

- `void clear_visible ()`
  Hides the widget.

- `void clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.

- `Fl_Color color () const`
  Gets the background color of the widget.

- `void color (Fl_Color bg)`
  Sets the background color of the widget.

- `void color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.

- `Fl_Color color2 () const`
  For back compatibility only.

- `void color2 (unsigned a)`
  For back compatibility only.

- `int contains (const Fl_Widget *w) const`
  Checks if w is a child of this widget.

- `void copy_label (const char *new_label)`
  Sets the current label.

- `void copy_tooltip (const char *text)`
  Sets the current tooltip text.

- `uchar damage () const`
  Returns non-zero if draw() needs to be called.

- `void damage (uchar c)`
  Sets the damage bits for the widget.

- `void damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.

- `int damage_resize (int, int, int, int)`
  Internal use only.

- `void deactivate ()`
  Deactivates the widget.

- `Fl_Image *deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image *deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound () const`
  Returns whether the inactive image is managed by the widget.

- `void do_callback (Fl_Callback_Reasnick reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.

- `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reasnick reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
• void *do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
Returns if a widget is used for output only.

- **Fl_Group** * parent () const
  
  Returns a pointer to the parent widget.

- void parent (Fl_Group * p)
  
  Internal use only - “for hacks only”.

- void position (int X, int Y)
  
  Repositions the window or widget.

- void redraw ()
  
  Schedules the drawing of the widget.

- void redraw_label ()
  
  Schedules the drawing of the label.

- **Fl_Color** selection_color () const
  
  Gets the selection color.

- void selection_color (Fl_Color a)
  
  Sets the selection color.

- void set_active ()
  
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  
  Marks the value of the widget as changed.

- void set_output ()
  
  Sets a widget to output only.

- void set_visible ()
  
  Makes the widget visible.

- void set_visible_focus ()
  
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label (int value)
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void show ()
  
  Makes a widget visible.

- void size (int W, int H)
  
  Changes the size of the widget.

- int take_focus ()
  
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  
  Returns if the widget is able to take events.

- int testShortcut ()
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- const char * tooltip () const
  
  Gets the current tooltip text.

- void tooltip (const char * text)
  
  Sets the current tooltip text.

- **Fl_Window** * top_window () const
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window** * top_window_offset (int & xoff, int & yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  
  Gets the widget type.

- void type (uchar t)
  
  Sets the widget type.
• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void *user_data() const
  Gets the user data for this widget.
• void **user_data** (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void **user_data** (void *v)
  Sets the user data for this widget.
• unsigned int **visible()** const
  Returns whether a widget is visible.
• unsigned int **visible_focus()** const
  Checks whether this widget has a visible focus.
• void **visible_focus**(int v)
  Modifies keyboard focus navigation.
• int **visible_r()** const
  Returns whether a widget and all its parents are visible.
• int **w()** const
  Gets the widget width.
• Fl_When **when()** const
  Returns the conditions under which the callback is called.
• void **when**(uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * **window()** const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int **x()** const
  Gets the widget position in its window.
• int **y()** const
  Gets the widget position in its window.
• virtual ~**Fl_Widget** ()
  Destroys the widget.

**Protected Member Functions**

• void **do_callback_for_item** (Fl_Tree_Item *item, Fl_Tree_Reason reason)
  Do the callback for the specified 'item' using 'reason', setting the callback_item() and callback_reason().
• void **draw** () FL_OVERRIDE
  Standard FLTK draw() method, handles drawing the tree widget.
• void **item_clicked**(Fl_Tree_Item *val)
  Set the item that was last clicked.

**Protected Member Functions inherited from Fl_Group**

• Fl_Rect * **bounds()**
  Returns the internal array of widget sizes and positions.
• void **draw_child**(Fl_Widget &widget) const
  Forces a child to redraw.
• void **draw_children()**
  Draws all children of the group.
• void **draw_outside_label**(const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
• virtual int **on_insert**(Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
virtual int on_move (int, int)  
Allow derived groups to act when a widget is moved within the group.

virtual void on_remove (int)  
Allow derived groups to act when a child widget is removed from the group.

int * sizes ()  
Returns the internal array of widget sizes and positions.

void update_child (Fl_Widget &widget) const  
Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

void clear_flag (unsigned int c)  
Clears a flag in the flags mask.

void draw_backdrop () const  
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

void draw_box () const  
Draws the widget box according its box style.

void draw_box (Fl_Boxtype t, Fl_Color c) const  
Draws a box of type t, of color c at the widget's position and size.

void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const  
Draws a box of type t, of color c at the position X,Y and size W,H.

void draw_focus () const  
Draws a focus rectangle around the widget.

void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const  
Draws a focus rectangle around the widget.

void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const  
Draws a focus box for the widget at the given position and size.

void draw_label () const  
Draws the widget's label at the defined label position.

void draw_label (int, int, int, int) const  
Draws the label in an arbitrary bounding box.

void h (int v)  
Internal use only.

void set_flag (unsigned int c)  
Sets a flag in the flags mask.

void w (int v)  
Internal use only.

void x (int v)  
Internal use only.

void y (int v)  
Internal use only.
Protected Attributes

- **Fl_Scrollbar _hscroll**
  Horizontal scrollbar.
- int _tih
  Tree widget inner xywh dimension: inside borders + scrollbars.
- int _tiw
- int _tix
- int _tiy
- int _toh
  Tree widget outer xywh dimension: outside scrollbars, inside widget border.
- int _tow
- int _tox
- int _toy
- int _tree_h
  the calculated height of the entire tree hierarchy. See calc_tree()
- int _tree_w
  the calculated width of the entire tree hierarchy. See calc_tree()
- **Fl_Scrollbar _vscroll**
  Vertical scrollbar.

Friends

- class Fl_Tree_Item

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

- static Fl_Group *current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the 'x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text contains the entered 'x' shortcut.

Protected Types inherited from Fl_Widget

- enum {

12.152.1 Detailed Description

Tree widget.

Figure 12.62 Fl_Tree example program

Fl_Tree  // Top level widget
|--- Fl_Tree_Item  // Items in the tree
|--- Fl_Tree_Prefs  // Preferences for the tree
|   |--- Fl_Tree_Connector (enum) // Connection modes
|   |--- Fl_Tree_Select (enum) // Selection modes
|--- Fl_Tree_Sort (enum) // Sort behavior

Similar to Fl_Browser, Fl_Tree is a browser of Fl_Tree_Item’s arranged in a parented hierarchy, or ‘tree’. Subtrees can be expanded or closed. Items can be added, deleted, inserted, sorted and re-ordered.
The tree items may also contain other FLTK widgets, like buttons, input fields, or even "custom" widgets.
The callback() is invoked depending on the value of when():

- FL_WHEN_RELEASE – callback invoked when left mouse button is released on an item
- FL_WHEN_CHANGED – callback invoked when left mouse changes selection state

The simple way to define a tree:

```c
#include <FL/Fl_Tree.H>
[..]
Fl_Tree tree(X,Y,W,H);
tree.begin();
tree.add("Flintstones/Fred");
tree.add("Flintstones/Wilma");
tree.add("Flintstones/Pebbles");
tree.add("Simpsons/Homer");
tree.add("Simpsons/Marge");
tree.add("Simpsons/Bart");
tree.add("Simpsons/Lisa");
tree.end();
```

FEATURES

- Items can be added with add(), removed with remove(), completely cleared with clear(), inserted with insert() and insert_above(), selected/deselected with select() and deselect(), open/closed with open() and close(), positioned on the screen with show_item_top(), show_item_middle() and show_item_bottom(),
- item children can be swapped around with Fl_Tree_Item::swap_children(),
- items can be moved around with Fl_Tree_Item::move(),

Generated by Doxygen
an item's children can be walked with Fl_Tree_Item::first() and Fl_Tree_Item::next(), an item's children can be
indexed directly with Fl_Tree_Item::child() and Fl_Tree_Item::children(),
items can be moved from one subtree to another with Fl_Tree_Item::deparent() and Fl_Tree_Item::reparent(),
sorting can be controlled when items are add(ED via sortorder()).
You can walk the entire tree with first() and next().
You can walk visible items with first_visible_item() and next_visible_item().
You can walk selected items with first_selected_item() and next_selected_item().
Items can be found by their pathname using find_item(const char *), and an item's pathname can be found
with item_pathname().
The selected items' colors are controlled by selection_color() (inherited from Fl_Widget).
A hook is provided to allow you to redefine how item's labels are drawn via Fl_Tree::item_draw_callback().
Items can be interactively dragged using FL_TREE_SELECT_SINGLE_DRAGGABLE.

SELECTION OF ITEMS
The tree can have different selection behaviors controlled by selectmode(). The background color used for
selected items is the Fl_Tree::selection_color(). The foreground color for selected items is controlled internally
with fl_contrast().

CHILD WIDGETS
FLTK widgets (including custom widgets) can be assigned to tree items via Fl_Tree_Item::widget().

When an Fl_Tree_Item::widget() is defined, the default behavior is for the widget() to be shown in place of the
item's label (if it has one). Only the widget()'s width will be used; the widget()'s x() and y() position will be
managed by the tree, and the h() will track the item's height. This default behavior can be altered (ABI 1.3.1):
Setting Fl_Tree::item_draw_mode()'s FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET flag causes the label
+ widget to be displayed together in that order, and adding the FL_TREE_ITEM_HEIGHT_FROM_WIDGET
flag causes widget's height to define the widget()'s height.

ICONS
The tree's open/close icons can be redefined with Fl_Tree::openicon(), Fl_Tree::closeicon(). User icons can
either be changed globally with Fl_Tree::usericon(), or on a per-item basis with Fl_Tree_Item::usericon().

Various default preferences can be globally manipulated via Fl_Tree_Prefs, including colors, margins, icons,
connection lines, etc.

FONTS AND COLORS
When adding new items to the tree, the new items get the defaults for fonts and colors from:

- Fl_Tree::item_labelfont() – The default item label font (default: FL_HELVETICA)
- Fl_Tree::item_labelsize() – The default item label size (default: FL_NORMAL_SIZE)
- Fl_Tree::item_labelfgcolor() – The default item label foreground color (default: FL_FOREGROUND_COLOR)
- Fl_Tree::item_labelbgcolor() – The default item label background color (default: 0xffffffff, which tree uses
  as 'transparent')

Each item (Fl_Tree_Item) inherits a copy of these font/color attributes when created, and each item has its
own methods to let the app change these values on a per-item basis using methods of the same name:
• `Fl_Tree_Item::labelfont()` – The item's label font (default: FL_HELVETICA)
• `Fl_Tree_Item::labelsize()` – The item's label size (default: FL_NORMAL_SIZE)
• `Fl_Tree_Item::labelfgcolor()` – The item's label foreground color (default: FL_FOREGROUND_COLOR)
• `Fl_Tree_Item::labelbgcolor()` – The item's label background color (default: 0xffffffff, which uses the tree's own bg color)

CALLBACKS

The tree's `callback()` will be invoked when items change state or are open/closed. `when()` controls when mouse/keyboard events invoke the callback. `callback_item()` and `callback_reason()` can be used to determine the cause of the callback. e.g.

```c
void MyTreeCallback(Fl_Widget *w, void *data) {
    Fl_Tree *tree = (Fl_Tree*)w;
    Fl_Tree_Item *item = (Fl_Tree_Item*)tree->callback_item(); // get selected item

    switch (tree->callback_reason()) {
        case FL_TREE_REASON_SELECTED: [..]
        case FL_TREE_REASON_DESELECTED: [..]
        case FL_TREE_REASON_RESELECTED: [..]
        case FL_TREE_REASON_OPENED: [..]
        case FL_TREE_REASON_CLOSED: [..]
    }
}
```

SIMPLE EXAMPLES

To find all the selected items:

```c
for ( Fl_Tree_Item *i=first_selected_item(); i; i=next_selected_item(i) )
    printf("Item %s is selected
", i->label());
```

To get an item's full menu pathname, use `Fl_Tree::item_pathname()`, e.g.

```c
char pathname[256] = "???";
tree->item_pathname(pathname, sizeof(pathname), item); // eg. "Parent/Child/Item"
```

To walk all the items of the tree from top to bottom:

```c
// Walk all the items in the tree, and print their labels
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) ) {
    printf("Item: %s
", item->label());
}
```

To recursively walk all the children of a particular item, define a function that uses recursion:

```c
// Find all of the item's children and print an indented report of their labels
void my_print_all_children(Fl_Tree_Item *item, int indent=0) {
    for ( int t=0; t<item->children(); t++ ) {
        printf("%*s Item: %s
", indent, "", item->child(t)->label());
        my_print_all_children(item->child(t), indent+4); // recurse
    }
}
```
To change the default label font and color when creating new items:

```cpp
    tree = new Fl_Tree(..);
    tree->item_labelfont(FL_COURIER); // Use Courier font for all new items
    tree->item_labelfgcolor(FL_RED); // Use red color for labels of all new items
    // Now create the items in the tree using the above defaults.
    tree->add("Aaa");
    tree->add("Bbb");
```

To change the font and color of all existing items in the tree:

```cpp
    // Change the font and color of all items currently in the tree
    for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) ) {
        item->labelfont(FL_COURIER);
        item->labelcolor(FL_RED);
    }
```

**DISPLAY DESCRIPTION**

The following image shows the tree's various visual elements and the methods that control them:

![Figure 12.63 Fl_Tree elements](image)

The following shows the protected dimension variables 'tree inner' (tix..) and 'tree outer' (tox..):

![Figure 12.64 Fl_Tree inner/outer dimensions](image)
KEYBOARD BINDINGS

The following table lists keyboard bindings for navigating the tree:

<table>
<thead>
<tr>
<th>Keyboard</th>
<th>FL_TREE_SELECT&lt;-_MULTI</th>
<th>FL_TREE_SELECT&lt;-_SINGLE</th>
<th>FL_TREE_SELECT&lt;-_NONE</th>
</tr>
</thead>
<tbody>

12.152.2 Member Function Documentation

12.152.2.1 add() [1/2]

\[ Fl_Tree_Item * Fl_Tree::add ( \]
\[ \text{const char * path,} \]
\[ \text{Fl_Tree_Item * item = 0 )} \]

Adds a new item, given a menu style 'path'. Any parent nodes that don't already exist are created automatically. Adds the item based on the value of sortorder(). If 'item' is NULL, a new item is created. To specify items or submenus that contain slashes ('/' or '\') use an escape character to protect them, e.g.

```
: tree->add("/Holidays/Photos/12\25\2010"); // Adds item "12/25/2010"
: tree->add("/Pathnames/c:\\Program Files\\MyApp");  // Adds item "c:\Program Files\MyApp"
```

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>path</th>
<th>The path to the item, e.g. &quot;Flintstone/Fred&quot;.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>item</td>
<td>The new item to be added. If NULL, a new item is created with a name that is the last element in 'path'.</td>
</tr>
</tbody>
</table>

Returns

The new item added, or 0 on error.
**12.152.2.2 add()** [2/2]

```c
Fl_Tree_Item * Fl_Tree::add (  
    Fl_Tree_Item * parent_item,  
    const char * name )
```

Add a new child item labeled 'name' to the specified 'parent_item'.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>parent_item</th>
<th>The parent item the new child item will be added to. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>name</td>
<td>The label for the new item</td>
</tr>
</tbody>
</table>

**Returns**

The new item added.

**Version**

1.3.3

---

**12.152.2.3 calc_dimensions()**

```c
void Fl_Tree::calc_dimensions ( )
```

Recalculate widget dimensions and scrollbar visibility, normally managed automatically.

Low overhead way to update the tree widget's outer/inner dimensions and re-determine scrollbar visibility based on these changes without recalculating the entire size of the tree data.

Assumes that either the tree's size in _tree_w/_tree_h are correct so that scrollbar visibility can be calculated easily, or are both zero indicating scrollbar visibility can't be calculated yet.

This method is called when the widget is resized or if the scrollbar's sizes are changed (affects tree widget's inner dimensions tix/y/w/h), and also used by calc_tree().

**Version**

1.3.3 ABI feature

---

**12.152.2.4 calc_tree()**

```c
void Fl_Tree::calc_tree ( )
```

Recalculates the tree's sizes and scrollbar visibility, normally managed automatically.

On return:

- _tree_w will be the overall pixel width of the entire viewable tree
- _tree_h will be the overall pixel height
- scrollbar visibility and pan sizes are updated
- internal _tix/_tiy/_tiw/_tih dimensions are updated

_tree_w/_tree_h include the tree's margins (e.g. marginleft()), whether items are open or closed, label contents and font sizes, etc.

The tree hierarchy's size is managed separately from the widget's size as an optimization; this way resize() on the widget doesn't involve recalculating the tree's hierarchy needlessly, as widget size has no bearing on the tree hierarchy.

The tree hierarchy's size only changes when items are added/removed, open/closed, label contents or font sizes changed, margins changed, etc.
This calculation involves walking the entire tree from top to bottom, potentially a slow calculation if the tree has many items (potentially hundreds of thousands), and should therefore be called sparingly. For this reason, `recalc_tree()` is used as a way to schedule calculation when changes affect the tree hierarchy's size.

Apps may want to call this method directly if the app makes changes to the tree's geometry, then immediately needs to work with the tree's new dimensions before an actual redraw (and recal) occurs. (This use by an app should only rarely be needed)

12.152.2.5 `callback_item()` [1/2]

```c
Fl_Tree_Item * Fl_Tree::callback_item ( )
```

Gets the item that caused the callback.

The `callback()` can use this value to see which item changed.

12.152.2.6 `callback_item()` [2/2]

```c
void Fl_Tree::callback_item ( Fl_Tree_Item * item )
```

Sets the item that was changed for this callback.

Used internally to pass the item that invoked the callback.

12.152.2.7 `callback_reason()` [1/2]

```c
Fl_Tree_Reason Fl_Tree::callback_reason ( ) const
```

Gets the reason for this callback.

The `callback()` can use this value to see why it was called. Example:

```c
  void MyTreeCallback(Fl_Widget *w, void *userdata) {
    Fl_Tree *tree = (Fl_Tree*)w;
    Fl_Tree_Item *item = tree->callback_item(); // the item changed (can be NULL if more than one item was changed!)
    switch ( tree->callback_reason() ) { // reason callback was invoked
      case FL_TREE_REASON_OPENED: ..item was opened..
      case FL_TREE_REASON_CLOSED: ..item was closed..
      case FL_TREE_REASON_SELECTED: ..item was selected..
      case FL_TREE_REASON_RESELECTED: ..item was reselected (double-clicked, etc)..
      case FL_TREE_REASON_DESELECTED: ..item was deselected..
    }
  }
```

See also

`item_reselect_mode()` – enables `FL_TREE_REASON_RESELECTED` events

12.152.2.8 `callback_reason()` [2/2]

```c
void Fl_Tree::callback_reason ( Fl_Tree_Reason reason )
```

Sets the reason for this callback.

Used internally to pass the reason the callback was invoked.

12.152.2.9 `clear()`

```c
void Fl_Tree::clear ( void )
```

Clear the entire tree's children, including the root.

The tree will be left completely empty.

---

Generated by Doxygen
12.152.2.10  clear_children()

    void Fl_Tree::clear_children (  
        Fl_Tree_Item * item  )

Clear all the children for 'item'.
Item may not be NULL.

12.152.2.11  close() [1/2]

    int Fl_Tree::close (  
        const char * path,  
        int docallback = 1 )

Closes the item specified by 'path'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. close("Holidays/12\25\/2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the
reason the callback was called.

Parameters

| in | path              | the tree item's pathname (e.g. "Flintstones/Fred") |
|    | docallback        | A flag that determines if the callback() is invoked or not: |
|    |                   | • 0 - callback() is not invoked |
|    |                   | • 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_CLOSED |

Returns

• 1 – OK: item closed
• 0 – OK: item was already closed, no change
• -1 – ERROR: item was not found

See also

   open(), close(), is_open(), is_close(), callback_item(), callback_reason()

12.152.2.12  close() [2/2]

    int Fl_Tree::close (  
        Fl_Tree_Item * item,  
        int docallback = 1 )

Closes the specified 'item'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the
reason the callback was called.

Parameters

| in | item              | the item to be closed. Must not be NULL. |
|    | docallback        | A flag that determines if the callback() is invoked or not: |
|    |                   | • 0 - callback() is not invoked |
|    |                   | • 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_CLOSED |
Returns

- 1 – item was closed
- 0 – item was already closed, no change

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

12.152.2.13 closeicon() [1/2]

Fl_Image * Fl_Tree::closeicon ( ) const
Returns the icon to be used as the 'close' icon.
If none was set, the internal default is returned, a simple '[ ]' icon.

12.152.2.14 closeicon() [2/2]

void Fl_Tree::closeicon ( Fl_Image * val )
Sets the icon to be used as the 'close' icon.
This overrides the built in default '[ ]' icon.

Parameters

| in | val | – The new image, or zero to use the default '[ ]' icon. |

12.152.2.15 connectorstyle()

void Fl_Tree::connectorstyle ( Fl_Tree_Connector val )
Sets the line drawing style for inter-connecting items.
See Fl_Tree_Connector for possible values.

12.152.2.16 deselect() [1/2]

int Fl_Tree::deselect ( const char * path,
   int docallback = 1 )
Deselect an item specified by 'path'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. deselect("← Holidays/12\25\2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

| in | path | – the tree item’s pathname (e.g. "Flintstones/Fred") |
| in | docallback | – A flag that determines if the callback() is invoked or not: |
|     |             | • 0 - the callback() is not invoked |
|     |             | • 1 - the callback() is invoked if item changed state (default), callback_reason() will be FL_TREE_REASON_DESELECTED |
Returns

- 1 - OK: item's state was changed
- 0 - OK: item was already deselected, no change was made
- -1 - ERROR: item was not found

12.152.2.17 deselect() [2/2]

```c
int Fl_Tree::deselect (Fl_Tree_Item *item, int docallback = 1)
```

Deselect the specified `item`.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling `redraw()` if anything changed.
The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>the item to be deselected. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>the callback() is invoked if item changed state (default), callback_reason() will be FL_TREE_REASON_DESELECTED</td>
</tr>
</tbody>
</table>

Returns

- 0 - item was already deselected, no change was made
- 1 - item's state was changed

12.152.2.18 deselect_all()

```c
int Fl_Tree::deselect_all (Fl_Tree_Item *item = 0, int docallback = 1)
```

Deselect 'item' and all its children.
If item is NULL, first() is used.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling `redraw()` if anything changed.
The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item that will be deselected (along with all its children). If NULL, first() is used.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>the callback() is invoked for each item that changed state (default), callback_reason() will be FL_TREE_REASON_DESELECTED</td>
</tr>
</tbody>
</table>
12.152 Fl_Tree Class Reference

Returns
Count of how many items were actually changed to the deselected state.

12.152.2.19 display()

void Fl_Tree::display (Fl_Tree_Item * item)
Displays 'item', scrolling the tree as necessary.

Parameters

| in      | item | The item to be displayed. If NULL, first() is used. |

12.152.2.20 displayed()

int Fl_Tree::displayed (Fl_Tree_Item * item)
See if 'item' is currently displayed on-screen (visible within the widget).
This can be used to detect if the item is scrolled off-screen. Checks to see if the item's vertical position is within the
top and bottom edges of the display window. This does NOT take into account the hide() / show() or open() / close() status of the item.

Parameters

| in      | item | The item to be checked. If NULL, first() is used. |

Returns
1 if displayed, 0 if scrolled off screen or no items are in tree.

12.152.2.21 draw()

void Fl_Tree::draw ()
[protected], [virtual]
Standard FLTK draw() method, handles drawing the tree widget.
Reimplemented from Fl_Group.

12.152.2.22 extend_selection()

int Fl_Tree::extend_selection (Fl_Tree_Item * from,
Fl_Tree_Item * to,
int val = 1,
bool visible = false)
Extend a selection between 'from' and 'to' depending on 'visible'.
Similar to the more efficient extend_selection_dir(Fl_Tree_Item*,Fl_Tree_Item*,int dir,int val,bool vis) method, but direction (up or down) doesn't need to be known.
We're less efficient because we search the tree for to/from, then operate on items in between. The more efficient method avoids the "search", but necessitates a direction to be specified to find 'to'.
Used by SHIFT-click to extend a selection between two items inclusive.
Handles calling redraw() if anything changed.

Parameters

| in      | from | Starting item |
| in      | to   | Ending item   |
### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>val</th>
<th>Select or deselect items (0=deselect, 1=select, 2=toggle)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>visible</td>
<td>true=affect only open(), visible items, false=affect open or closed items (default)</td>
</tr>
</tbody>
</table>

### Returns

The number of items whose selection states were changed, if any.

### Version

1.3.3 ABI feature

#### 12.152.23 `extend_selection_dir()`

```cpp
def int Fl_Tree::extend_selection_dir (Fl_Tree_Item *from, Fl_Tree_Item *to, int dir, int val, bool visible)
```

Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.

**Efficient:** does not walk entire tree; starts with 'from' and stops at 'to' while moving in direction 'dir'. Dir must be specified though.

- If dir cannot be known in advance, such as during SHIFT-click operations, the method `extend_selection(Fl_Tree_Item*, Fl_Tree_Item*, int, bool)` should be used.
- Handles calling `redraw()` if anything changed.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>from</th>
<th>Starting item</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>to</td>
<td>Ending item</td>
</tr>
<tr>
<td>in</td>
<td>dir</td>
<td>Direction to extend selection (FL_Up or FL_Down)</td>
</tr>
<tr>
<td>in</td>
<td>val</td>
<td>0=deselect, 1=select, 2=toggle</td>
</tr>
<tr>
<td>in</td>
<td>visible</td>
<td>true=affect only open(), visible items, false=affect open or closed items (default)</td>
</tr>
</tbody>
</table>

### Returns

The number of items whose selection states were changed, if any.

### Version

1.3.3

#### 12.152.24 `find_clicked()`

```cpp
def const Fl_Tree_Item * Fl_Tree::find_clicked (int yonly = 0) const
```

Find the item that was last clicked on.

- You should use `callback_item()` instead, which is fast, and is meant to be used within a callback to determine the item clicked.
- This method walks the entire tree looking for the first item that is under the mouse. (The value of the 'yonly' flag affects whether both x and y events are checked, or just y)
Use this method /only/ if you've subclassed Fl_Tree, and are receiving events before Fl_Tree has been able to process and update callback_item().

Parameters

| in | yonly | – 0: check both event's X and Y values. – 1: only check event's Y value, don't care about X. |

Returns

The item clicked, or NULL if no item was under the current event.

Version

1.3.0
1.3.3 ABI feature: added yonly parameter

12.152.2.25 find_item()

const Fl_Tree_Item * Fl_Tree::find_item ( const char * path ) const

Find the item, given a menu style path, e.g. "/Parent/Child/item". There is both a const and non-const version of this method. Const version allows pure const methods to use this method to do lookups without causing compiler errors.

To specify items or submenus that contain slashes ("/" or ") use an escape character to protect them, e.g.

```c
    tree->add("/Holidays/Photos/12\25\2010"); // Adds item "12/25/2010"
    tree->add("/Pathnames/c:\\Program Files\\MyApp"); // Adds item "c:\Program Files\MyApp"
```

Parameters

| in | path | – the tree item's pathname to be found (e.g. "Flintstones/Fred") |

Returns

The item, or NULL if not found.

See also

item_pathname()

12.152.2.26 first()

Fl_Tree_Item * Fl_Tree::first ( )

Returns the first item in the tree, or 0 if none.

Use this to walk the tree in the forward direction, e.g.

```c
    for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) )
    printf("Item: %s\n", item->label());
```

Returns

First item in tree, or 0 if none (tree empty).

See also

first(), next(), last(), prev()
12.152.2.27 first_selected_item()

Fl_Tree_Item * Fl_Tree::first_selected_item ( )
Returns the first selected item in the tree.
Use this to walk the tree from top to bottom looking for all the selected items, e.g.

```c
// Walk tree forward, from top to bottom
for ( Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i) )
    printf("Selected item: %s\n", i->label());
```

Returns
The first selected item, or 0 if none.

See also
first_selected_item(), last_selected_item(), next_selected_item()

12.152.2.28 first_visible()

Fl_Tree_Item * Fl_Tree::first_visible ( )
Returns the first open(), visible item in the tree, or 0 if none.

Deprecated in 1.3.3 ABI – use first_visible_item() instead.

12.152.2.29 first_visible_item()

Fl_Tree_Item * Fl_Tree::first_visible_item ( )
Returns the first open(), visible item in the tree, or 0 if none.

Returns
First visible item in tree, or 0 if none.

See also
first_visible_item(), last_visible_item(), next_visible_item()

Version
1.3.3

12.152.2.30 get_selected_items()

int Fl_Tree::get_selected_items ( Fl_Tree_Item_Array & ret_items )
Returns the currently selected items as an array of 'ret_items'.
Example:

```c
// Get selected items as an array
Fl_Tree_Item_Array items;
tree->get_selected_items(items);
// Manipulate the returned array
for ( int t=0; t<items.total(); t++ )
    Fl_Tree_Item *item = items[t];
    // do stuff with each selected item...
```
Parameters

<table>
<thead>
<tr>
<th></th>
<th>out</th>
<th>ret_items</th>
<th>The returned array of selected items.</th>
</tr>
</thead>
</table>

Returns

The number of items in the returned array.

See also

first_selected_item(), next_selected_item()

Version

1.3.3 ABI feature

12.152.2.31 handle()

int Fl_Tree::handle (  
    int e ) [virtual]

Standard FLTK event handler for this widget.

Todo add Fl_Widget_Tracker (see Fl_Browser_cxx::handle())

Reimplemented from Fl_Group.

12.152.2.32 hposition() [1/2]

int Fl_Tree::hposition ( ) const

Returns the horizontal scroll position as a pixel offset.
The position returned is how many pixels of the tree are scrolled off the left edge of the screen.

See also

hposition(int), vposition(), vposition(int)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

12.152.2.33 hposition() [2/2]

void Fl_Tree::hposition (  
    int pos )

Sets the horizontal scroll offset to position 'pos'.
The position is how many pixels of the tree are scrolled off the left edge of the screen.

Parameters

<table>
<thead>
<tr>
<th></th>
<th>pos</th>
<th>The vertical position (in pixels) to scroll the tree to.</th>
</tr>
</thead>
</table>

See also

hposition(), vposition(), vposition(int)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.
12.152.2.34 insert()

**Fl_Tree_Item** * Fl_Tree::insert (  
  **Fl_Tree_Item** * item,  
  const char * name,  
  int pos )  
Insert a new item 'name' into 'item's children at position 'pos'.
If pos is out of range the new item is
  • prepended if pos < 0 or  
  • appended if pos > item->children().

Note: pos == children() is not considered out of range: the item is appended to the child list.

Example:

```
    tree->add("Aaa/000"); // "000" is index 0 in Aaa's children
    tree->add("Aaa/111"); // "111" is index 1 in Aaa's children
    tree->add("Aaa/222"); // "222" is index 2 in Aaa's children
    // How to use insert() to insert a new item between Aaa/111 + Aaa/222
    Fl_Tree_Item *item = tree->find_item("Aaa"); // get parent item Aaa
    if (item) tree->insert(item, "New item", 2); // insert as a child of Aaa at index #2
```

Parameters

<table>
<thead>
<tr>
<th>in item</th>
<th>The existing item to insert new child into. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in name</td>
<td>The label for the new item</td>
</tr>
<tr>
<td>in pos</td>
<td>The position of the new item in the child list</td>
</tr>
</tbody>
</table>

Returns

The new item added.

See also

insert_above()

12.152.2.35 insert_above()

**Fl_Tree_Item** * Fl_Tree::insert_above (  
  **Fl_Tree_Item** * above,  
  const char * name )  
Inserts a new item 'name' above the specified Fl_Tree_Item 'above'.

Example:

```
    tree->add("Aaa/000"); // "000" is index 0 in Aaa's children
    tree->add("Aaa/111"); // "111" is index 1 in Aaa's children
    tree->add("Aaa/222"); // "222" is index 2 in Aaa's children
    // How to use insert_above() to insert a new item above Aaa/222
    Fl_Tree_Item *item = tree->find_item("Aaa/222"); // get item Aaa/222
    if (item) tree->insert_above(item, "New item"); // insert new item above it
```

Parameters

<table>
<thead>
<tr>
<th>in above</th>
<th>– the item above which to insert the new item. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in name</td>
<td>– the name of the new item</td>
</tr>
</tbody>
</table>
Returns

The new item added, or 0 if 'above' could not be found.

See also

insert()

12.152.2.36  is_close() [1/2]

int Fl_Tree::is_close ( const char * path ) const

See if item specified by 'path' is closed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. is_close("Holidays/12\25\2010").

Parameters

| in   | path     | - the tree item's pathname (e.g. "Flintstones/Fred") |

Returns

- 1 - OK: item is closed
- 0 - OK: item is open
- -1 - ERROR: item was not found

12.152.2.37  is_close() [2/2]

int Fl_Tree::is_close ( Fl_Tree_Item * item ) const

See if the specified 'item' is closed.

Parameters

| in | item     | - the item to be tested. Must not be NULL. |

Returns

- 1 : item is closed
- 0 : item is open

12.152.2.38  is_hscroll_visible()

int Fl_Tree::is_hscroll_visible ( ) const

See if the horizontal scrollbar is currently visible.

Returns

1 if scrollbar visible, 0 if not.

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.
12.152.2.39  **is_open() [1/2]**

```cpp
int Fl_Tree::is_open (  
    const char * path ) const  
```

**See if item specified by 'path' is open.**
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_open("←Holidays/12\25\2010")`.
Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

**Parameters**

- **in path** – the tree item's pathname (e.g. "Flintstones/Fred")

**Returns**

- 1 - OK: item is open
- 0 - OK: item is closed
- -1 - ERROR: item was not found

**See also**

`Fl_Tree_Item::visible_r()`

12.152.2.40  **is_open() [2/2]**

```cpp
int Fl_Tree::is_open (  
    Fl_Tree_Item * item ) const  
```

**See if 'item' is open.**
Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

**Parameters**

- **in item** – the item to be tested. Must not be NULL.

**Returns**

- 1 : item is open
- 0 : item is closed

12.152.2.41  **is_scrollbar()**

```cpp
int Fl_Tree::is_scrollbar (  
    Fl_Widget * w )  
```

See if widget 'w' is one of the Fl_Tree widget's scrollbars.
Use this to skip over the scrollbars when walking the child() array. Example:

```cpp
for ( int i=0; i<tree->children(); i++ ) { // walk children  
    Fl_Widget *w = tree->child(i);  
    if ( tree->is_scrollbar(w) ) continue; // skip scrollbars  
    ..do work here..  
}  
```

**Parameters**

- **in w** – Widget to test
12.152 Fl_Tree Class Reference

Returns

1 if \( w \) is a scrollbar, 0 if not.

**Todo** should be const

### 12.152.2.42 is_selected() [1/2]

```cpp
int Fl_Tree::is_selected (const char * path)
```

See if item specified by 'path' is selected.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_selected("Holidays/12/25/2010").`

**Parameters**

- **path** – the tree item's pathname (e.g. "Flintstones/Fred")

**Returns**

- 1 : item selected
- 0 : item deselected
- -1 : item was not found

### 12.152.43 is_selected() [2/2]

```cpp
int Fl_Tree::is_selected (Fl_Tree_Item * item) const
```

See if the specified 'item' is selected.

**Parameters**

- **item** – the item to be tested. Must not be NULL.

**Returns**

- 1 : item selected
- 0 : item deselected

### 12.152.44 is_vscroll_visible()

```cpp
int Fl_Tree::is_vscroll_visible () const
```

See if the vertical scrollbar is currently visible.

**Returns**

1 if scrollbar visible, 0 if not.

### 12.152.45 item_clicked() [1/2]

```cpp
Fl_Tree_Item * Fl_Tree::item_clicked ()
```

Return the item that was last clicked.
Valid only from within the `callback()`.

**Returns**

The item clicked, or 0 if none. 0 may also be used to indicate several items were clicked/changed.

**Deprecated** in 1.3.3 ABI – use `callback_item()` instead.

Generated by Doxygen
12.152.2.46 item_clicked() [2/2]

void Fl_Tree::item_clicked ( Fl_Tree_Item * item ) [protected]
Set the item that was last clicked.
Should only be used by subclasses needing to change this value. Normally Fl_Tree manages this value.

Deprecated in 1.3.3 ABI – use callback_item() instead.

12.152.2.47 item_draw_mode() [1/3]

Fl_Tree_Item_Draw_Mode Fl_Tree::item_draw_mode () const
Get the 'item draw mode' used for the tree.

Version
1.3.1 ABI feature

12.152.2.48 item_draw_mode() [2/3]

void Fl_Tree::item_draw_mode ( Fl_Tree_Item_Draw_Mode mode )
Set the 'item draw mode' used for the tree to 'mode'.
This affects how items in the tree are drawn, such as when a widget() is defined. See Fl_Tree_Item_Draw_Mode for possible values.

Version
1.3.1 ABI feature

12.152.2.49 item_draw_mode() [3/3]

void Fl_Tree::item_draw_mode ( int mode )
Set the 'item draw mode' used for the tree to integer 'mode'.
This affects how items in the tree are drawn, such as when a widget() is defined. See Fl_Tree_Item_Draw_Mode for possible values.

Version
1.3.1 ABI feature

12.152.2.50 item_labelbgcolor() [1/2]

void Fl_Tree::item_labelbgcolor ( Fl_Color val )
Set the default label background color used for creating new items.
A special case is made for color 0xffffffff (default) which is treated as 'transparent'. To change the background color on a per-item basis, use Fl_Tree_Item::labelbgcolor(Fl_Color)

12.152.2.51 item_labelbgcolor() [2/2]

Fl_Color Fl_Tree::item_labelbgcolor () const
Get the default label background color used for creating new items.
If the color is 0xffffffff, it is 'transparent'.
12.152.2.52  item_labelfgcolor()
void Fl_Tree::item_labelfgcolor (  
    Fl_Color val  
)  
Set the default label foreground color used for creating new items.  
To change the foreground color on a per-item basis, use Fl_Tree_Item::labelfgcolor(Fl_Color)

12.152.2.53  item_labelfont()
void Fl_Tree::item_labelfont (  
    Fl_Font val  
)  
Set the default font face used for creating new items.  
To change the font face on a per-item basis, use Fl_Tree_Item::labelfont(Fl_Font)

12.152.2.54  item_labelsize()
void Fl_Tree::item_labelsize (  
    Fl_Fontsize val  
)  
Set the default label font size used for creating new items.  
To change the font size on a per-item basis, use Fl_Tree_Item::labelsize(Fl_Fontsize)

12.152.2.55  item_pathname()
int Fl_Tree::item_pathname (  
    char * pathname,  
    int pathnamelen,  
    const Fl_Tree_Item * item ) const  
Return 'pathname' of size 'pathnamelen' for the specified 'item'.  
If 'item' is NULL, root() is used.  
The tree's root will be included in the pathname if showroot() is on.  
Menu items or submenus that contain slashes ('/' or '\') in their names will be escaped with a backslash.  
This is symmetrical with the add() function which uses the same escape pattern to set names.

Parameters

| out | pathname | The string to use to return the pathname |
| in  | pathnamelen | The maximum length of the string (including NULL). Must not be zero. |
| in  | item       | The item whose pathname is to be returned. |

Returns

- 0 : OK (pathname returns the item's pathname)
- -1 : item not found (pathname="")
- -2 : pathname not large enough (pathname="")

See also

find_item()

12.152.2.56  item_reselect_mode()[1/2]
Fl_Tree_Item_Reselect_Mode Fl_Tree::item_reselect_mode ( ) const  
Returns the current item re/selection mode.

Version

1.3.1 ABI feature
item_reselect_mode() [2/2]

```c
void Fl_Tree::item_reselect_mode ( Fl_Tree_Item_Reselect_Mode mode )
```

Sets the item re/selection mode.
See `Fl_Tree_Item_Reselect_Mode` for possible values.

**Version**

1.3.1 ABI feature

last()

```c
Fl_Tree_Item * Fl_Tree::last ( )
```

Returns the last item in the tree.
This can be used to walk the tree in reverse, e.g.

```c
for ( Fl_Tree_Item *item = tree->last(); item; item = tree->prev() )
   printf("Item: %s\n", item->label());
```

Returns

Last item in the tree, or 0 if none (tree empty).

See also

`first(), next(), last(), prev()`

last_selected_item()

```c
Fl_Tree_Item * Fl_Tree::last_selected_item ( )
```

Returns the last selected item in the tree.
Use this to walk the tree in reverse from bottom to top looking for all the selected items, e.g.

```c
for ( Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up) )
   printf("Selected item: %s\n", i->label());
```

Returns

The last selected item, or 0 if none.

See also

`first_selected_item(), last_selected_item(), next_selected_item()`

Version

1.3.3

last_visible()

```c
Fl_Tree_Item * Fl_Tree::last_visible ( )
```

Returns the last open(), visible item in the tree.

**Deprecated** in 1.3.3 – use `last_visible_item()` instead.
12.152.2.61 last_visible_item()

Fl_Tree_Item * Fl_Tree::last_visible_item ( )

Returns the last open(), visible item in the tree.

Returns

Last visible item in the tree, or 0 if none.

See also

first_visible_item(), last_visible_item(), next_visible_item()

Version

1.3.3

12.152.2.62 load()

void Fl_Tree::load ( class Fl_Preferences & prefs )

Load FLTK preferences.

Read a preferences database into the tree widget.

A preferences database is a hierarchical collection of data which can be directly loaded into the tree view for inspection.

Parameters

| in  | prefs | the Fl_Preferences database |

12.152.2.63 next()

Fl_Tree_Item * Fl_Tree::next ( Fl_Tree_Item * item = 0 )

Return the next item after 'item', or 0 if no more items.

Use this code to walk the entire tree:

```c
for ( Fl_Tree_Item *i = tree->first(); i; i = tree->next(i) )
    printf("Item: %s\n", i->label());
```

Parameters

| in  | item | The item to use to find the next item. If NULL, returns 0. |

Returns

Next item in tree, or 0 if at last item.

See also

first(), next(), last(), prev()

12.152.2.64 next_item()

Fl_Tree_Item * Fl_Tree::next_item ( Fl_Tree_Item * item, 0 )

Parameters

| in  | item | |

Returns

Next item in tree, or 0 if at last item.

See also

first(), next(), last(), prev()
int dir = FL_Down,
bool visible = false)

Returns next item after 'item' in direction 'dir' depending on 'visible'.
Next item will be above (if dir==FL_Up) or below (if dir==FL_Down). If 'visible' is true, only items whose parents are open() will be returned. If 'visible' is false, even items whose parents are close()ed will be returned.
If item is 0, the return value will be the result of this truth table:

<table>
<thead>
<tr>
<th>visible=true</th>
<th>visible=false</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir=FL_Up</td>
<td>last_visible_item()</td>
</tr>
<tr>
<td>dir=FL_Down</td>
<td>first_visible_item()</td>
</tr>
</tbody>
</table>

Example use:

for ( Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_item(i, FL_Down, true) )
    printf("Item: %s\n", i->label());
for ( Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_item(i, FL_Up, true) )
    printf("Item: %s\n", i->label());
for ( Fl_Tree_Item *i=tree->first(); i; i=tree->next_item(i, FL_Down, false) )
    printf("Item: %s\n", i->label());
for ( Fl_Tree_Item *i=tree->last(); i; i=tree->next_item(i, FL_Up, false) )
    printf("Item: %s\n", i->label());

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item to use to find the next item. If NULL, returns 0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>dir</td>
<td>Can be FL_Up or FL_Down (default=FL_Down or 'next')</td>
</tr>
<tr>
<td>in</td>
<td>visible</td>
<td>true=return only open(), visible items, false=return open or closed items (default)</td>
</tr>
</tbody>
</table>

Returns

Next item in tree in the direction and visibility specified, or 0 if no more items of specified visibility in that direction.

See also

first(), last(), next(),
first_visible_item(), last_visible_item(), next_visible_item(),
first_selected_item(), last_selected_item(), next_selected_item()

Version

1.3.3

12.152.2.65 next_selected_item()

Fl_Tree_Item * Fl_Tree::next_selected_item (  
    Fl_Tree_Item * item = 0,
    int dir = FL_Down )

Returns the next selected item above or below 'item', depending on 'dir'.
If 'item' is 0, search starts at either first() or last(), depending on 'dir': first() if 'dir' is FL_Down (default), last() if 'dir' is FL_Up.
Use this to walk the tree looking for all the selected items, e.g.
// Walk down the tree (forwards)
for ( Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i, FL_Down) )
  printf("Item: %s\n", i->label());

// Walk up the tree (backwards)
for ( Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up) )
  printf("Item: %s\n", i->label());

Parameters

| in  | item | The item above or below which we'll find the next selected item. If NULL, first() is used if FL_Down, last() if FL_Up. (default=NULL) |
| in  | dir  | The direction to go. FL_Up for moving up the tree, FL_Down for down the tree (default) |

Returns

The next selected item, or 0 if there are no more selected items.

See also

first_selected_item(), last_selected_item(), next_selected_item()

Version

1.3.3

12.152.2.66 next_visible_item()

Fl_Tree_Item * Fl_Tree::next_visible_item ( Fl_Tree_Item *item, int dir )

Returns next open(), visible item above (dir==FL_Up) or below (dir==FL_Down) the specified 'item', or 0 if no more items. If 'item' is 0, returns last() if 'dir' is FL_Up, or first() if dir is FL_Down.

Parameters

| in  | item  | The item above/below which we'll find the next visible item |
| in  | dir   | The direction to search. Can be FL_Up or FL_Down. |

Returns

The item found, or 0 if there's no visible items above/below the specified item.

Version

1.3.3
12.152.2.67 open() [1/2]

int Fl_Tree::open (  
    const char * path,  
    int docallback = 1 )

Opens the item specified by 'path'.
This causes the item's children (if any) to be shown.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. open("Holidays/12\25\2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>path</th>
<th>– the tree item's pathname (e.g. &quot;Flintstones/Fred&quot;)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>– A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_OPENED</td>
</tr>
</tbody>
</table>

Returns

• 1 – OK: item opened
• 0 – OK: item was already open, no change
• -1 – ERROR: item was not found

See also

open(), close(), is_open(), is_close(), callback_item(), callback_reason()

12.152.2.68 open() [2/2]

int Fl_Tree::open (  
    Fl_Tree_Item * item,  
    int docallback = 1 )

Open the specified 'item'.
This causes the item's children (if any) to be shown.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>– the item to be opened. Must not be NULL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>– A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_OPENED</td>
</tr>
</tbody>
</table>
Returns

- 1 – item was opened
- 0 – item was already open, no change

See also

`open()`, `close()`, `is_open()`, `is_close()`, `callback_item()`, `callback_reason()`

### 12.152.2.69 open_toggle()

```cpp
void Fl_Tree::open_toggle(
    Fl_Tree_Item *item,
    int docallback = 1
)
```

Toggle the open state of 'item'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling `redraw()` if anything changed.
The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

#### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>the item whose open state is to be toggled. Must not be NULL.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>in</th>
<th>docallback</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td>0 - callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td>1 - callback() is invoked (default), callback_reason() will be either FL_TREE_REASON_OPENED or FL_TREE_REASON_CLOSED</td>
</tr>
</tbody>
</table>

See also

`open()`, `close()`, `is_open()`, `is_close()`, `callback_item()`, `callback_reason()`

### 12.152.2.70 openicon() [1/2]

```cpp
Fl_Image * Fl_Tree::openicon() const
```

Returns the icon to be used as the 'open' icon.
If none was set, the internal default is returned, a simple '[+] icon.

### 12.152.2.71 openicon() [2/2]

```cpp
void Fl_Tree::openicon(
    Fl_Image * val
)
```

Sets the icon to be used as the 'open' icon.
This overrides the built in default '[+] icon.

#### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>val</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>The new image, or zero to use the default [+] icon.</td>
</tr>
</tbody>
</table>

### 12.152.2.72 prev()

```cpp
Fl_Tree_Item * Fl_Tree::prev(
    Fl_Tree_Item * item = 0
)
```

Return the previous item before 'item', or 0 if no more items.

Generated by Doxygen
This can be used to walk the tree in reverse, e.g.

```c
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->prev(item) )
  printf("Item: %s\n", item->label());
```

Parameters

| in  | item | The item to use to find the previous item. If NULL, returns 0. |

Returns

Previous item in tree, or 0 if at first item.

See also

first(), next(), last(), prev()

12.152.2.73 recalc_tree()

```c
void Fl_Tree::recalc_tree ( )
```

Schedule tree to recalc the entire tree size.

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

12.152.2.74 remove()

```c
int Fl_Tree::remove ( Fl_Tree_Item *item )
```

Remove the specified 'item' from the tree.

item may not be NULL. If it has children, all those are removed too. If item being removed has focus, no item will have focus.

Returns

0 if done, -1 if 'item' not found.

12.152.2.75 resize()

```c
void Fl_Tree::resize ( int X, int Y, int W, int H ) [virtual]
```

Resizes the Fl_Group widget and all of its children.

The Fl_Group widget first resizes itself, and then it moves and resizes all its children according to the rules documented for Fl_Group::resizable(Fl_Widget*)

See also

Fl_Group::resizable(Fl_Widget*)

Fl_Group::resizable()

Fl_Widget::resize(int,int,int,int)

Reimplemented from Fl_Group.
12.152.2.76 root()

void Fl_Tree::root (  
    Fl_Tree_Item * newitem  
)  
Sets the root item to 'newitem'.
If a root item already exists, clear() is called first to clear it before replacing it with newitem.
Use this to install a custom item (derived from Fl_Tree_Item) as the root of the tree. This allows the derived class to implement custom drawing by overriding Fl_Tree_Item::draw_item_content().

Version

1.3.3

12.152.2.77 root_label()

void Fl_Tree::root_label (  
    const char * new_label  
)  
Set the label for the root item to 'new_label'.
Makes an internally managed copy of 'new_label'.

12.152.2.78 scrollbar_size() [1/2]

int Fl_Tree::scrollbar_size ( ) const  
Gets the default size of scrollbars' troughs for this widget in pixels.
If this value is zero (default), this widget will use the global Fl::scrollbar_size() value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also

Fl::scrollbar_size(int)

12.152.2.79 scrollbar_size() [2/2]

void Fl_Tree::scrollbar_size (  
    int size  
)  
Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.
Normally you should not need this method, and should use the global Fl::scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, and is the default behavior.
Normally this is what you want.
Only use this method if you really need to override just THIS instance of the widget's scrollbar size. (This need should be rare.)
Setting size to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the default.

Parameters

| in  | size | Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global Fl::scrollbar_size() |

See also

Fl::scrollbar_size()

12.152.2.80 select() [1/2]

int Fl_Tree::select (  
    const char * path,  
)
int docallback = 1 )

Select the item specified by 'path'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. select("Holidays/12\25\2010").
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>path</th>
<th>– the tree item's pathname (e.g. &quot;Flintstones/Fred&quot;)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>– A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 - the callback() is invoked if item changed state (default), callback_reason() will be FL_TREE_REASON_SELECTED</td>
</tr>
</tbody>
</table>

Returns

- 1 : OK: item's state was changed
- 0 : OK: item was already selected, no change was made
- -1 : ERROR: item was not found

12.152.2.81 select() [2/2]

int Fl_Tree::select ( Fl_Tree_Item * item, int docallback = 1 )

Select the specified 'item'.
Use 'deselect()' to deselect it.
Invokes the callback depending on the value of optional parameter docallback.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>– the item to be selected. Must not be NULL</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>– A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 - the callback() is invoked if item changed state, callback_reason() will be FL_TREE_REASON_SELECTED</td>
</tr>
</tbody>
</table>

Returns

- 1 - item's state was changed
- 0 - item was already selected, no change was made

12.152.2.82 select_all()

int Fl_Tree::select_all ( Fl_Tree_Item * item = 0, int docallback = 1 )
Select 'item' and all its children.
If item is NULL, first() is used.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item that will be selected (along with all its children). If NULL, first() is used.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - the callback() is invoked for each item that changed state (default),</td>
</tr>
<tr>
<td></td>
<td></td>
<td>callback_reason() will be FL_TREE_REASON_SELECTED</td>
</tr>
</tbody>
</table>

Returns

Count of how many items were actually changed to the selected state.

12.152.2.83  select_only()

int Fl_Tree::select_only (Fl_Tree_Item ∗ selitem, int docallback = 1)

Select only the specified item, deselecting all others that might be selected.
If 'selitem' is 0, first() is used.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use callback_item() and callback_reason() respectively to determine the item changed and the reason the callback was called.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>selitem</th>
<th>The item to be selected. If NULL, first() is used.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallback</td>
<td>A flag that determines if the callback() is invoked or not:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 - the callback() is not invoked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 - the callback() is invoked for each item that changed state (default),</td>
</tr>
<tr>
<td></td>
<td></td>
<td>callback_reason() will be either FL_TREE_REASON_SELECTED or FL_TREE_REASON_DESELECTED</td>
</tr>
</tbody>
</table>

Returns

The number of items whose selection states were changed, if any.

12.152.2.84  select_toggle()

void Fl_Tree::select_toggle (Fl_Tree_Item ∗ item, int docallback = 1)

Toggle the select state of the specified 'item'.
Invokes the callback depending on the value of optional parameter 'docallback'.
Handles calling redraw() if anything changed.
The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

### Parameters

| in | item | – the item to be selected. Must not be NULL. |
| in | docallback | – A flag that determines if the `callback()` is invoked or not: |
| | | • 0 - the `callback()` is not invoked |
| | | • 1 - the `callback()` is invoked (default), `callback_reason()` will be either `FL_TREE_REASON_SELECTED` or `FL_TREE_REASON_DESELECTED` |

#### 12.152.2.85 selectbox() [1/2]

```cpp
Fl_Boxtype Fl_Tree::selectbox ( ) const
```

Sets the style of box used to draw selected items.
This is an fltk `Fl_Boxtype`. The default is influenced by FLTK's current `Fl::scheme()`.

#### 12.152.2.86 selectbox() [2/2]

```cpp
void Fl_Tree::selectbox ( Fl_Boxtype val )
```

Gets the style of box used to draw selected items.
This is an fltk `Fl_Boxtype`. The default is influenced by FLTK's current `Fl::scheme()`.

#### 12.152.2.87 selectmode() [1/2]

```cpp
Fl_Tree_Select Fl_Tree::selectmode ( ) const
```

Gets the tree's current selection mode.
See `Fl_Tree_Select` for possible values.

#### 12.152.2.88 selectmode() [2/2]

```cpp
void Fl_Tree::selectmode ( Fl_Tree_Select val )
```

Sets the tree's selection mode.
See `Fl_Tree_Select` for possible values.

#### 12.152.2.89 set_item_focus()

```cpp
void Fl_Tree::set_item_focus ( Fl_Tree_Item * item )
```

Set the item that currently should have keyboard focus.
Handles calling `redraw()` to update the focus box (if it is visible).

### Parameters

| in | item | The item that should take focus. If NULL, none will have focus. |

#### 12.152.2.90 show_item() [1/2]

```cpp
void Fl_Tree::show_item ( Fl_Tree_Item * item )
```

Adjust the vertical scrollbar to show `item` at the top of the display IF it is currently off-screen (for instance `show_item_top()`).
If it is already on-screen, no change is made.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>item</code></td>
<td>The item to be shown. If NULL, <code>first()</code> is used.</td>
</tr>
</tbody>
</table>

See also

- `show_item_top()`, `show_item_middle()`, `show_item_bottom()`

### 12.152.2.91 show_item()

```cpp
void Fl_Tree::show_item (Fl_Tree_Item *item, int yoff)
```

Adjust the vertical scrollbar so that 'item' is visible 'yoff' pixels from the top of the Fl_Tree widget's display. For instance, `yoff=0` will position the item at the top. If `yoff` is larger than the vertical scrollbar's limit, the value will be clipped. So if `yoff=100`, but scrollbar's max is 50, then 50 will be used.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>item</code></td>
<td>The item to be shown. If NULL, <code>first()</code> is used.</td>
</tr>
<tr>
<td><code>yoff</code></td>
<td>The pixel offset from the top for the displayed position.</td>
</tr>
</tbody>
</table>

See also

- `show_item_top()`, `show_item_middle()`, `show_item_bottom()`

### 12.152.2.92 show_item_bottom()

```cpp
void Fl_Tree::show_item_bottom (Fl_Tree_Item *item)
```

Adjust the vertical scrollbar so that 'item' is at the bottom of the display.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>item</code></td>
<td>The item to be shown. If NULL, <code>first()</code> is used.</td>
</tr>
</tbody>
</table>

### 12.152.2.93 show_item_middle()

```cpp
void Fl_Tree::show_item_middle (Fl_Tree_Item *item)
```

Adjust the vertical scrollbar so that 'item' is in the middle of the display.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>item</code></td>
<td>The item to be shown. If NULL, <code>first()</code> is used.</td>
</tr>
</tbody>
</table>

### 12.152.2.94 show_item_top()

```cpp
void Fl_Tree::show_item_top (Fl_Tree_Item *item)
```

Adjust the vertical scrollbar so that 'item' is at the top of the display.
Parameters

| in | item | The item to be shown. If NULL, first() is used. |

**12.152.2.95 show_self()**

```cpp
void Fl_Tree::show_self ( )
```

Print the tree as 'ascii art' to stdout.
Used mainly for debugging.

Todo should be const

**Version**

1.3.0

**12.152.2.96 showcollapse() [1/2]**

```cpp
int Fl_Tree::showcollapse ( ) const
```

Returns 1 if the collapse icon is enabled, 0 if not.

See also

- `showcollapse(int)`

**12.152.2.97 showcollapse() [2/2]**

```cpp
void Fl_Tree::showcollapse ( int val )
```

Set if we should show the collapse icon or not.
If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via `open()` and `close()`.

Parameters

| in | val | 1: shows collapse icons (default), 0: hides collapse icons. |

**12.152.2.98 showroot()**

```cpp
void Fl_Tree::showroot ( int val )
```

Set if the root item should be shown or not.

Parameters

| in | val | 1 – show the root item (default), 0 – hide the root item. |

**12.152.2.99 sortorder()**

```cpp
Fl_Tree_Sort Fl_Tree::sortorder ( ) const
```

Set the default sort order used when items are added to the tree.
See `Fl_Tree_Sort` for possible values.
12.152.2.100 usericon() [1/2]

```
Fl_Image * Fl_Tree::usericon ( ) const
```

Returns the Fl_Image being used as the default user icon for all newly created items. Returns zero if no icon has been set, which is the default.

12.152.2.101 usericon() [2/2]

```
void Fl_Tree::usericon ( Fl_Image * val )
```

Sets the Fl_Image to be used as the default user icon for all newly created items. If you want to specify user icons on a per-item basis, use Fl_Tree_Item::usericon() instead.

Parameters

- `val`: The new image to be used, or zero to disable user icons.

12.152.2.102 vposition() [1/2]

```
int Fl_Tree::vposition ( ) const
```

Returns the vertical scroll position as a pixel offset. The position returned is how many pixels of the tree are scrolled off the top edge of the screen.

See also

- vposition(int), hposition(), hposition(int)

12.152.2.103 vposition() [2/2]

```
void Fl_Tree::vposition ( int pos )
```

Sets the vertical scroll offset to position 'pos'. The position is how many pixels of the tree are scrolled off the top edge of the screen.

Parameters

- `pos`: The vertical position (in pixels) to scroll the tree to.

See also

- vposition(), hposition(), hposition(int)

The documentation for this class was generated from the following files:

- Fl_Tree.H
- Fl_Tree.cxx

12.153 Fl_Tree_Item Class Reference

Tree widget item.

```
#include <Fl_Tree_Item.H>
```

Public Member Functions

- `void activate (int val=1)`
  
  Change the item's activation state to the optionally specified 'val'.
- `Fl_Tree_Item * add (const Fl_Tree_Prefs &prefs, char **arr)`
Descend into the path specified by 'arr', and add a new child there.

- **FL_Tree_Item** → add (const Fl_Tree_Prefs &prefs, char **arr, FL_Tree_Item *newitem)
  Descend into path specified by 'arr' and add 'newitem' there.

- **FL_Tree_Item** → add (const Fl_Tree_Prefs &prefs, const char *new_label)
  Add a new child to this item with the name 'new_label' and defaults from 'prefs'.

- **FL_Tree_Item** → add (const Fl_Tree_Prefs &prefs, const char *new_label, FL_Tree_Item *newitem)
  Add 'item' as immediate child with 'new_label' and defaults from 'prefs'.

- **FL_Tree_Item** → child (int index)
  Return the child item for the given 'index'.

- const **FL_Tree_Item** → child (int t) const
  Return the const child item for the given 'index'.

- int children () const
  Return the number of children this item has.

- void clear_children ()
  Clear all the children for this item.

- void close ()
  Close this item and all its children.

- void deactivate ()
  Deactivate the item; the callback() won't be invoked when clicked.

- **FL_Tree_Item** → deparent (int index)
  Deparent child at index position 'pos'.

- int depth () const
  Returns how many levels deep this item is in the hierarchy.

- void deselect ()
  Disable the item's selection state.

- int deselect_all ()
  Deselect item and all its children.

- void draw (int X, int &Y, int W, FL_Tree_Item *itemfocus, int &tree_item_xmax, int lastchild=1, int render=1)
  Draw this item and its children.

- virtual int draw_item_content (int render)
  Draw the item content.

- int event_on_collapse_icon (const Fl_Tree_Prefs &prefs) const
  Was the event on the 'collapse' button of this item?

- int event_on_item (const Fl_Tree_Prefs &prefs) const
  Was event anywhere on the item?

- int event_on_label (const Fl_Tree_Prefs &prefs) const
  Was event on the label() of this item?

- int event_on_user_icon (const Fl_Tree_Prefs &prefs) const
  Was the event on the 'user icon' of this item, if any?

- int find_child (const char *name)
  Return the index of the immediate child of this item that has the label 'name'.

- int find_child (FL_Tree_Item *item)
  Find index number for the specified 'item' in the current item's list of children.

- **FL_Tree_Item** → find_child_item (char **arr)
  Non-const version of FL_Tree_Item::find_child_item(char **arr) const.

- const **FL_Tree_Item** → find_child_item (char **arr) const
  Find child item by descending array 'arr' of names.

- **FL_Tree_Item** → find_child_item (const char *name)
  Non-const version of FL_Tree_Item::find_child_item(const char *name) const.

- const **FL_Tree_Item** → find_child_item (const char *name) const
  Return the /immediate/ child of current item that has the label 'name'.
• **Fl_Tree_Item** *find_clicked* (const Fl_Tree_Prefs &prefs, int yonly=0)
  Non-const version of Fl_Tree_Item::find_clicked(const Fl_Tree_Prefs&, int) const.
  `find_clicked` finds the item that the last event was over.

• **Fl_Tree_Item** *find_item* (char **arr)
  Non-const version of Fl_Tree_Item::find_item(char **names) const.
  `find_item` finds an item by descending array of 'names'.

• **Fl_Tree_Item** (const Fl_Tree_Item *o)
  Copy constructor.

• **Fl_Tree_Item** (const Fl_Tree_Prefs &prefs)
  Constructor.

• **Fl_Tree_Item** (Fl_Tree *tree)
  Constructor.

• int **h** () const
  The item's height.

• int has_children () const
  See if this item has children.

• Fl_Tree_Item *insert* (const Fl_Tree_Prefs &prefs, const char *new_label, int pos=0)
  Insert a new item named 'new_label' into current item's children at a specified position 'pos'.

• Fl_Tree_Item *insert_above* (const Fl_Tree_Prefs &prefs, const char *new_label)
  Insert a new item named 'new_label' above this item.

• char is_activated () const
  See if the item is activated.

• char is_active () const
  See if the item is activated. Alias for is_activated().

• int is_close () const
  See if the item is 'closed'.

• int is_open () const
  See if the item is 'open'.

• int is_root () const
  Is this item the root of the tree?

• char is_selected () const
  See if the item is selected.

• int is_visible () const
  See if the item is visible.

• const char * label () const
  Return the label.

• void label (const char *val)
  Set the label to 'name'.

• int label_h () const
  The item's label height.

• int label_w () const
  The item's maximum label width to right edge of Fl_Tree's inner width within scrollbars.

• int label_x () const
  The item's label x position relative to the window.

• int label_y () const
  The item's label y position relative to the window.

• Fl_Color labelbgcolor () const
  Return item's label background text color.

• void labelbgcolor (Fl_Color val)
Set item's label background color.

- **FL_Color** `labelcolor()` const
  
  Return item's label text color. Alias for `labelfgcolor()` const.

  • void `labelcolor(FL_Color val)`
  
  Set item's label text color. Alias for `labelfgcolor(FL_Color)`.

- **FL_Color** `labelfgcolor()` const
  
  Return item's label foreground text color.

  • void `labelfgcolor(FL_Color val)`
  
  Set item's label foreground text color.

- **FL_Font** `labelfont()` const
  
  Get item's label font face.

  • void `labelfont(FL_Font val)`
  
  Set item's label font face.

- **FL_Fontsize** `labelsizesize()` const
  
  Get item's label font size.

  • void `labelsizesize(FL_Fontsize val)`
  
  Set item's label font size.

- int `move(FL_Tree_Item *item, int op=0, int pos=0)`
  
  Move the current item above/below/into the specified `item`, where `op` determines the type of move:

  - int move (int to, int from)
  
  Move an item within its parent using index numbers.

  - int `move_above(FL_Tree_Item *item)`
  
  Move the current item above the specified `item`.

  - int `move_below(FL_Tree_Item *item)`
  
  Move the current item below the specified `item`.

  - int `move_into(FL_Tree_Item *item, int pos=0)`
  
  Parent the current item as a child of the specified `item`.

  - **FL_Tree_Item** * `next()`
  
  Return the next item in the tree.

  - **FL_Tree_Item** * `next_displayed(FL_Tree_Prefs &prefs)`
  
  Same as `next_visible()`.

  - **FL_Tree_Item** * `next_sibling()`
  
  Return this item's next sibling.

  - **FL_Tree_Item** * `next_visible(FL_Tree_Prefs &prefs)`
  
  Return the next `open()`, `visible()` item.

  • void `open()`
  
  Open this item and all its children.

  • void `open_toggle()`
  
  Toggle the item's open/closed state.

  - **FL_Tree_Item** * `parent()`
  
  Return the parent for this item. Returns NULL if we are the root.

  - const **FL_Tree_Item** * `parent()` const
  
  Return the const parent for this item. Returns NULL if we are the root.

  • void `parent(FL_Tree_Item *val)`
  
  Set the parent for this item.

  - const **FL_Tree_Prefs & prefs()** const
  
  Return the parent tree's prefs.

  - **FL_Tree_Item** * `prev()`
  
  Return the previous item in the tree.

  - **FL_Tree_Item** * `prev_displayed(FL_Tree_Prefs &prefs)`
  
  Same as `prev_visible()`.
• `Fl_Tree_Item * prev_sibling ()`
  Return this item's previous sibling.

• `Fl_Tree_Item * prev_visible (Fl_Tree_Prefs &prefs)`
  Return the previous open(), visible() item.

• `int remove_child (const char *new_label)`
  Remove immediate child (and its children) by its label 'name'.

• `int remove_child (Fl_Tree_Item *item)`
  Remove 'item' from the current item's children.

• `int reparent (Fl_Tree_Item *newchild, int index)`
  Reparent specified item as a child of ourself at position 'pos'.

• `Fl_Tree_Item * replace (Fl_Tree_Item *new_item)`
  Replace the current item with a new item.

• `Fl_Tree_Item * replace_child (Fl_Tree_Item *olditem, Fl_Tree_Item *newitem)`
  Replace existing child 'olditem' with 'newitem'.

• `void select (int val=1)`
  Change the item's selection state to the optionally specified 'val'.

• `int select_all ()`
  Select item and all its children.

• `void select_toggle ()`  
  Toggle the item's selection state.

• `void show_self (const char *indent="") const`  
  Print the tree as 'ascii art' to stdout.

• `int swap_children (Fl_Tree_Item *a, Fl_Tree_Item *b)`
  Swap two of our immediate children, given item pointers.

• `void swap_children (int ax, int bx)`
  Swap two of our children, given two child index values 'ax' and 'bx'.

• `Fl_Tree * tree ()`
  Return the tree for this item.

• `const Fl_Tree * tree () const`  
  Return the tree for this item.

• `void update_prev_next (int index)`
  Update our _prev_sibling and _next_sibling pointers to point to neighbors given index as being our current position in the parent's item array.

• `void * user_data () const`  
  Retrieve the user-data value that has been assigned to the item.

• `void user_data (void *data)`
  Set a user-data value for the item.

• `Fl_Image * userdeicon () const`  
  Return the deactivated version of the user icon, if any.

• `void userdeicon (Fl_Image *val)`
  Set the usericon to draw when the item is deactivated.

• `Fl_Image * usericon () const`  
  Get the item's user icon as an Fl_Image. Returns '0' if disabled.

• `void usericon (Fl_Image *val)`
  Set the item's user icon to an Fl_Image.

• `int visible () const`  
  See if the item is visible. Alias for is_visible().

• `int visible_r () const`  
  See if item and all its parents are open() and visible().

• `int w () const`  
  The entire item's width to right edge of Fl_Tree's inner width within scrollbars.
**FL_Widget**

- **widget()** const
  
  Return FLTK widget assigned to this item.

- **void widget(Fl_Widget *val)**
  
  Assign an FLTK widget to this item.

- **int x() const**
  
  The item's x position relative to the window.

- **int y() const**
  
  The item's y position relative to the window.

### Protected Member Functions

- **void _Init(const Fl_Tree_Prefs &prefs, Fl_Tree *tree)**

- **int calc_item_height(const Fl_Tree_Prefs &prefs) const**

  Return the item's 'visible' height.

- **void draw_horizontal_connector(int x1, int x2, int y, const Fl_Tree_Prefs &prefs)**

  Internal: Horizontal connector line based on preference settings.

- **void draw_vertical_connector(int x, int y1, int y2, const Fl_Tree_Prefs &prefs)**

  Internal: Vertical connector line based on preference settings.

- **Fl_Color drawbgcolor() const**

  Returns the recommended background color used for drawing this item.

- **Fl_Color drawfgcolor() const**

  Returns the recommended foreground color used for drawing this item.

- **void hide_widgets()**

  Internal: Hide the FLTK widget() for this item and all children.

- **int is_flag(unsigned short val) const**

  See if flag set. Returns 0 or 1.

- **void recalc_tree()**

  Call this when our geometry is changed.

- **void set_flag(unsigned short flag, int val)**

  Set a flag to an on or off value. val is 0 or 1.

- **void show_widgets()**

  Internal: Show the FLTK widget() for this item and all children.

### 12.153.1 Detailed Description

Tree widget item.

This class is a single tree item, and manages all of the item's attributes. **Fl_Tree_Item** is used by **Fl_Tree**, which is comprised of many instances of **Fl_Tree_Item**.

**Fl_Tree_Item** is hierarchical; it dynamically manages an **Fl_Tree_Item_Array** of children that are themselves instances of **Fl_Tree_Item**. Each item can have zero or more children. When an item has children, **close()** and **open()** can be used to hide or show them.

Items have their own attributes; font size, face, color. Items maintain their own hierarchy of children.

When you make changes to items, you'll need to tell the tree to **redraw()** for the changes to show up.

**New 1.3.3 ABI feature:** You can define custom items by either adding a custom widget to the item with **Fl_Tree_Item::widget()**, or override the **draw_item_content()** method if you want to just redefine how the label is drawn.

The following shows the **Fl_Tree_Item**'s dimensions, useful when overriding the **draw_item_content()** method:
12.153.2 Constructor & Destructor Documentation

12.153.2.1 Fl_Tree_Item() [1/2]

Fl_Tree_Item::Fl_Tree_Item ( const Fl_Tree_Prefs & prefs )

Constructor.
Makes a new instance of Fl_Tree_Item using defaults from 'prefs'.

Deprecated in 1.3.3 ABI – you must use Fl_Tree_Item(Fl_Tree*) for proper horizontal scrollbar behavior.

12.153.2.2 Fl_Tree_Item() [2/2]

Fl_Tree_Item::Fl_Tree_Item ( Fl_Tree * tree )

Constructor.
Makes a new instance of Fl_Tree_Item for 'tree'.
This must be used instead of the older, deprecated Fl_Tree_Item(Fl_Tree_Prefs) constructor for proper horizontal scrollbar calculation.

Version
1.3.3 ABI feature

12.153.3 Member Function Documentation

12.153.3.1 activate()

void Fl_Tree_Item::activate ( int val = 1 ) [inline]

Change the item's activation state to the optionally specified 'val'.
When deactivated, the item will be 'grayed out'; the callback() won’t be invoked if the user clicks on the label. If a widget() is associated with the item, its activation state will be changed as well.
If 'val' is not specified, the item will be activated.

12.153.3.2 add() [1/4]

Fl_Tree_Item * Fl_Tree_Item::add ( const Fl_Tree_Prefs & prefs, char ** arr )

Descend into the path specified by 'arr', and add a new child there.
Should be used only by Fl_Tree's internals. Adds the item based on the value of prefs.sortorder().

Returns
the item added.

Version
1.3.0 release
12.153.3.3  add() [2/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (  
    const Fl_Tree_Prefs & prefs,  
    char ** arr,  
    Fl_Tree_Item * newitem )
```

Descend into path specified by 'arr' and add 'newitem' there.
Should be used only by Fl_Tree's internals. If item is NULL, a new item is created. Adds the item based on the
value of prefs.sortorder().

Returns

the item added.

Version

1.3.3 ABI feature

12.153.3.4  add() [3/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (  
    const Fl_Tree_Prefs & prefs,  
    const char * new_label )
```

Add a new child to this item with the name 'new_label' and defaults from 'prefs'.
An internally managed copy is made of the label string. Adds the item based on the value of prefs.sortorder().

Returns

the item added

Version

1.3.0 release

12.153.3.5  add() [4/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (  
    const Fl_Tree_Prefs & prefs,  
    const char * new_label,  
    Fl_Tree_Item * item )
```

Add 'item' as immediate child with 'new_label' and defaults from 'prefs'.
If 'item' is NULL, a new item is created. An internally managed copy is made of the label string. Adds the item
based on the value of prefs.sortorder().

Returns

the item added

Version

1.3.3

12.153.3.6  calc_item_height()

```
int Fl_Tree_Item::calc_item_height (  
    const Fl_Tree_Prefs & prefs ) const [protected]
```

Return the item's 'visible' height.
Takes into account the item's:

- visibility (if lis_visible(), returns 0)
12.153 Fl_Tree_Item Class Reference

- labelfont() height: if label() != NULL
- widget() height: if widget() != NULL
- openicon() height (if not NULL)
- usericon() height (if not NULL) Does NOT include Fl_Tree::linespacing();

Returns
  maximum pixel height

12.153.3.7 child()

const Fl_Tree_Item * Fl_Tree_Item::child (  
  int t ) const

Return the const child item for the given 'index'.
Return const child item for the specified 'index'.

12.153.3.8 deactivate()

void Fl_Tree_Item::deactivate ( ) [inline]

Deactivate the item; the callback() won't be invoked when clicked.
Same as activate(0)

12.153.3.9 deparent()

Fl_Tree_Item * Fl_Tree_Item::deparent (  
  int pos )

Deparent child at index position 'pos'.
This creates an "orphaned" item that is still allocated, but has no parent or siblings. Normally the caller would want
  to immediately reparent the orphan elsewhere.
A successfully orphaned item will have its parent() and prev_sibling()/next_sibling() set to NULL.

Returns
  • pointer to orphaned item on success
  • NULL on error (could not deparent the item)

See also
  reparent()

12.153.3.10 depth()

int Fl_Tree_Item::depth ( ) const

Returns how many levels deep this item is in the hierarchy.
For instance; root has a depth of zero, and its immediate children would have a depth of 1, and so on. Use e.g. for
determining the horizontal indent of this item during drawing.

12.153.3.11 deselect_all()

int Fl_Tree_Item::deselect_all ( ) [inline]

Deselect item and all its children.
Returns count of how many items were in the 'selected' state, ie. how many items were "changed".
12.153.3.12 draw()

```c
void Fl_Tree_Item::draw (  
    int X,  
    int & Y,  
    int W,  
    Fl_Tree_Item * itemfocus,  
    int & tree_item_xmax,  
    int lastchild = 1,  
    int render = 1 )
```

Draw this item and its children.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X</td>
</tr>
<tr>
<td>in,out</td>
<td>Y</td>
</tr>
<tr>
<td>in</td>
<td>W</td>
</tr>
<tr>
<td>in</td>
<td>itemfocus</td>
</tr>
<tr>
<td>in,out</td>
<td>tree_item_xmax</td>
</tr>
<tr>
<td>in</td>
<td>lastchild</td>
</tr>
<tr>
<td>in</td>
<td>render</td>
</tr>
</tbody>
</table>

Version

1.3.3 ABI feature: modified parameters

12.153.3.13 draw_horizontal_connector()

```c
void Fl_Tree_Item::draw_horizontal_connector (  
    int x1,  
    int x2,  
    int y,  
    const Fl_Tree_Prefs & prefs ) [protected]
```

Internal: Horizontal connector line based on preference settings.

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x1</td>
</tr>
<tr>
<td>in</td>
<td>x2</td>
</tr>
<tr>
<td>in</td>
<td>y</td>
</tr>
<tr>
<td>in</td>
<td>prefs</td>
</tr>
</tbody>
</table>

12.153.3.14 draw_item_content()

```c
int Fl_Tree_Item::draw_item_content (  
    int render ) [virtual]
```

Draw the item content.

This method can be overridden to implement custom drawing by filling the label_[xywh]() area with content.

A minimal example of how to override draw_item_content() and draw just a normal item’s background and label ourselves:

```c
class MyTreeItem : public Fl_Tree_Item {  
public:  
    MyTreeItem(); { }  
    ~MyTreeItem(); } }  
    // DRAW OUR CUSTOM CONTENT FOR THE ITEM
```
int draw_item_content(int render) {  
    // Our item's dimensions + text content  
    int X=label_x(), Y=label_y(), W=label_w(), H=label_h();  
    const char *text = label() ? label() : "";  
    // Rendering? Do any drawing that's needed  
    if ( render ) {  
        // Draw bg -- a filled rectangle  
        fl_color(drawbgcolor()); fl_rectf(X,Y,W,H);  
        // Draw label  
        fl_font(labelfont(), labelsize()); // use item's label font/size  
        fl_color(drawfgcolor()); // use recommended fg color  
        fl_draw(text, X,Y,W,H, FL_ALIGN_LEFT); // draw the item's label  
    }  
    // Rendered or not, we must calculate content's max X position  
    int lw=0, lh=0;  
    fl_measure(text, lw, lh); // get width of label text  
    return X + lw; // return X + label width  
}  

You can draw anything you want inside draw_item_content() using any of the fl_draw.H functions, as long as it's within the label's xywh area.

To add instances of your custom item to the tree, you can use:

// Example #1: using add()  
MyTreeItem *bart = new MyTreeItem(..); // class derived from Fl_Tree_Item  
tree->add("/Simpsons/Bart", bart); // Add item as /Simpsons/Bart  
..or you can insert or replace existing items:  
// Example #2: using replace()  
MyTreeItem *marge = new MyTreeItem(..); // class derived from Fl_Tree_Item  
item = tree->add("/Simpsons/Marge"); // create item  
item->replace(mi); // replace it with our own

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in render</td>
<td>Whether we should render content (1), or just tally the geometry (0). Fl_Tree may want only to find the widest item in the tree for scrollbar calculations.</td>
</tr>
</tbody>
</table>

Returns

the right-most X coordinate, or 'xmax' of content we drew, i.e. the "scrollable" content. The tree uses the largest xmax to determine the maximum width of the tree's content (needed for e.g. computing the horizontal scrollbar's size).

Version

1.3.3 ABI feature

12.153.3.15 draw_vertical_connector()

void Fl_Tree_Item::draw_vertical_connector (  
    int x,  
    int y1,  
    int y2,  
    const Fl_Tree_Prefs & prefs ) [protected]

Internal: Vertical connector line based on preference settings.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in x</td>
<td>The x position of the vertical connector</td>
</tr>
<tr>
<td>in y1</td>
<td>The top of the vertical connector</td>
</tr>
<tr>
<td>in y2</td>
<td>The bottom of the vertical connector</td>
</tr>
<tr>
<td>in prefs</td>
<td>The Fl_Tree prefs</td>
</tr>
</tbody>
</table>
12.153.3.16 drawbgcolor()

`Fl_Color Fl_Tree_Item::drawbgcolor ( ) const` [protected]

Returns the recommended background color used for drawing this item.

See also

draw_item_content()

Version

1.3.3 ABI

12.153.3.17 drawfgcolor()

`Fl_Color Fl_Tree_Item::drawfgcolor ( ) const` [protected]

Returns the recommended foreground color used for drawing this item.

See also

draw_item_content()

Version

1.3.3 ABI ABI

12.153.3.18 find_child() [1/2]

```c
int Fl_Tree_Item::find_child ( const char * name )
```

Return the index of the immediate child of this item that has the label 'name'.

Returns

index of found item, or -1 if not found.

Version

1.3.0 release

12.153.3.19 find_child() [2/2]

```c
int Fl_Tree_Item::find_child ( Fl_Tree_Item * item )
```

Find the index number for the specified 'item' in the current item's list of children.

Returns

the index, or -1 if not found.

12.153.3.20 find_child_item() [1/2]

```c
const Fl_Tree_Item * Fl_Tree_Item::find_child_item ( char ** arr ) const
```

Find child item by descending array 'arr' of names.
Does not include self in search. Only `Fl_Tree` should need this method.

Returns

item, or 0 if not found

Version

1.3.0 release
12.153.3.21 find_child_item() [2/2]

const Fl_Tree_Item * Fl_Tree_Item::find_child_item (const char * name) const

Return the /immediate/ child of current item that has the label 'name'.

Returns

const found item, or 0 if not found.

Version

1.3.3

12.153.3.22 find_clicked()

const Fl_Tree_Item * Fl_Tree_Item::find_clicked (const Fl_Tree_Prefs & prefs, int yonly = 0) const

Find the item that the last event was over.
If 'yonly' is 1, only check event's y value, don't care about x.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>prefs</th>
<th>The parent tree's Fl_Tree_Prefs</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>yonly</td>
<td>– 0: check both event's X and Y values. – 1: only check event's Y value, don't care about X.</td>
</tr>
</tbody>
</table>

Returns

pointer to clicked item, or NULL if none found

Version

1.3.3 ABI feature

12.153.3.23 find_item()

const Fl_Tree_Item * Fl_Tree_Item::find_item (char ** names) const

Find item by descending array of 'names'.
Includes self in search. Only Fl_Tree should need this method. Use Fl_Tree::find_item() instead.

Returns

const item, or 0 if not found

12.153.3.24 hide_widgets()

void Fl_Tree_Item::hide_widgets () [protected]

Internal: Hide the FLTK widget() for this item and all children.
Used by close() to hide widgets.

12.153.3.25 insert()

Fl_Tree_Item * Fl_Tree_Item::insert (const Fl_Tree_Prefs & prefs, const char * new_label, int pos = 0)

Insert a new item named 'new_label' into current item's children at a specified position 'pos'.
If pos is out of range the new item is
• prepended if \( pos < 0 \) or
• appended if \( pos > \text{item->children()} \).

Returns
the new item inserted

See also
Fl_Tree::insert()

12.153.3.26  insert_above()

\texttt{Fl\_Tree\_Item} \* Fl\_Tree\_Item::insert_above (  
\hspace{1em} \text{const Fl\_Tree\_Prefs} \& \text{prefs,}  
\hspace{1em} \text{const char} \* \text{new\_label} )

Insert a new item named \texttt{'new\_label'} above this item.

Returns
the new item inserted, or 0 if an error occurred.

12.153.3.27  label()

\texttt{void Fl\_Tree\_Item::label (}  
\hspace{1em} \text{const char} \* \text{name} )

Set the label to \texttt{'name'}.
Makes and manages an internal copy of \texttt{'name'}.

12.153.3.28  label_h()

\texttt{int Fl\_Tree\_Item::label_h (} \text{const [inline]}  
\hspace{1em} \text{The item's label height.}  
\hspace{1em} \text{Version}  
\hspace{2em} 1.3.3

12.153.3.29  label_w()

\texttt{int Fl\_Tree\_Item::label_w (} \text{const [inline]}  
\hspace{1em} \text{The item's maximum label width to right edge of Fl\_Tree's inner width within scrollbars.}  
\hspace{1em} \text{Version}  
\hspace{2em} 1.3.3

12.153.3.30  label_x()

\texttt{int Fl\_Tree\_Item::label_x (} \text{const [inline]}  
\hspace{1em} \text{The item's label x position relative to the window.}  
\hspace{1em} \text{Version}  
\hspace{2em} 1.3.3
12.153.31  **label_y()**

```cpp
int Fl_Tree_Item::label_y ( ) const [inline]
```

The item’s label y position relative to the window.

**Version**

1.3.3

12.153.32  **labelbgcolor() [1/2]**

```cpp
Fl_Color Fl_Tree_Item::labelbgcolor ( ) const [inline]
```

Return item’s label background text color.

If the color is 0xffffffff, the default behavior is the parent tree’s bg color will be used. (An overloaded `draw_item_content()` can override this behavior.)

12.153.33  **labelbgcolor() [2/2]**

```cpp
void Fl_Tree_Item::labelbgcolor ( Fl_Color val ) [inline]
```

Set item’s label background color.

A special case is made for color 0xffffffff which uses the parent tree's bg color.

12.153.34  **move() [1/2]**

```cpp
int Fl_Tree_Item::move ( Fl_Tree_Item * item, int op = 0, int pos = 0 )
```

Move the current item above/below/into the specified `item`, where `op` determines the type of move:

- 0: move above `item` (`pos` ignored)
- 1: move below `item` (`pos` ignored)
- 2: move into `item` as a child (at optional position `pos`)

..and `pos` determines an optional index position after the move.

**Returns**

0 on success. a negative number on error:

-1: one of the items has no parent
-2: item’s index could not be determined
-3: bad ‘op’
-4: index range error
-5: could not deparent
-6: could not reparent at ‘pos’

(Other return values reserved for future use.)

**See also**

`move_above(), move_below(), move_into(), move(int,int)`

Generated by Doxygen
**12.153.3.35 move() [2/2]**

```cpp
int Fl_Tree_Item::move (int to, int from)
```

Move an item within its parent using index numbers.
Item is moved 'to' its new position 'from' its old position.

Returns

- 0: Success
- -1: range error (e.g. if 'to' or 'from' out of range).
- (Other return values reserved for future use)

See also

move_above(), move_below(), move_into(), move(Fl_Tree_Item*,int,int)

**12.153.3.36 move_above()**

```cpp
int Fl_Tree_Item::move_above (Fl_Tree_Item* item)
```

Move the current item above the specified 'item'.
This is the equivalent of calling move(item,0,0).

Returns

- 0 on success.
- On error returns a negative value; see move(Fl_Tree_Item*,int,int) for possible error codes.

See also

move_below(), move_into(), move(int,int), move(Fl_Tree_Item*,int,int)

**12.153.3.37 move_below()**

```cpp
int Fl_Tree_Item::move_below (Fl_Tree_Item* item)
```

Move the current item below the specified 'item'.
This is the equivalent of calling move(item,1,0).

Returns

- 0 on success.
- On error returns a negative value; see move(Fl_Tree_Item*,int,int) for possible error codes.

See also

move_above(), move_into(), move(int,int), move(Fl_Tree_Item*,int,int)

**12.153.3.38 move_into()**

```cpp
int Fl_Tree_Item::move_into (Fl_Tree_Item* item, int pos = 0)
```

Parent the current item as a child of the specified 'item'.
This is the equivalent of calling move(item,2,pos).
Returns

0 on success.
On error returns a negative value; see `move(Fl_Tree_Item*,int,int)` for possible error codes.

See also

`move_above(), move_below(), move(int,int), move(Fl_Tree_Item*,int,int)`

12.153.3.39 next()

`Fl_Tree_Item* Fl_Tree_Item::next()`

Return the next item in the tree.
This method can be used to walk the tree forward. For an example of how to use this method, see `Fl_Tree::first()`.

Returns

the next item in the tree, or 0 if there's no more items.

12.153.3.40 next_displayed()

`Fl_Tree_Item* Fl_Tree_Item::next_displayed(Fl_Tree_Prefs & prefs)`

Same as `next_visible()`.

Deprecated in 1.3.3 for confusing name, use `next_visible()` instead

12.153.3.41 next_sibling()

`Fl_Tree_Item* Fl_Tree_Item::next_sibling()`

Return this item's next sibling.
Moves to the next item below us at the same level (sibling). Use this to move down the tree without changing `depth()`, effectively skipping over this item's children/descendents.

Returns

item's next sibling, or 0 if none.

12.153.3.42 next_visible()

`Fl_Tree_Item* Fl_Tree_Item::next_visible(Fl_Tree_Prefs & prefs)`

Return the next open(), visible() item.
(If this item has children and is closed, children are skipped)
This method can be used to walk the tree forward, skipping items that are not currently open/visible to the user.

Returns

the next open() visible() item below us, or 0 if there's no more items.

Version

1.3.3

12.153.3.43 parent()

`void Fl_Tree_Item::parent(Fl_Tree_Item* val)`

Set the parent for this item.
Should only be used by `Fl_Tree`'s internals.
12.153.3.44  prefs()

const Fl_Tree_Prefs & Fl_Tree_Item::prefs ( ) const
Return the parent tree's prefs.

Returns
    a reference to the parent tree's Fl_Tree_Prefs

Version
    1.3.3 ABI feature

12.153.3.45  prev()

Fl_Tree_Item * Fl_Tree_Item::prev ( )
Return the previous item in the tree.
This method can be used to walk the tree backwards. For an example of how to use this method, see Fl_Tree::last().

Returns
    the previous item in the tree, or 0 if there's no item above this one (hit the root).

12.153.3.46  prev_displayed()

Fl_Tree_Item * Fl_Tree_Item::prev_displayed ( Fl_Tree_Prefs & prefs )
Same as prev_visible().

Deprecated in 1.3.3 for confusing name, use prev_visible()

12.153.3.47  prev_sibling()

Fl_Tree_Item * Fl_Tree_Item::prev_sibling ( )
Return this item's previous sibling.
Moves to the previous item above us at the same level (sibling). Use this to move up the tree without changing depth().

Returns
    This item's previous sibling, or 0 if none.

12.153.3.48  prev_visible()

Fl_Tree_Item * Fl_Tree_Item::prev_visible ( Fl_Tree_Prefs & prefs )
Return the previous open(), visible() item.
(If this item above us has children and is closed, its children are skipped)
This method can be used to walk the tree backward, skipping items that are not currently open/visible to the user.

Returns
    the previous open() visible() item above us, or 0 if there's no more items.

12.153.3.49  recalc_tree()

void Fl_Tree_Item::recalc_tree ( ) [protected]
Call this when our geometry is changed.
(Font size, label contents, etc) Schedules tree to recalculate itself, as changes to us may affect tree widget's scrollbar visibility and tab sizes.

Version
    1.3.3 ABI
12.153.3.50  remove_child() [1/2]

int Fl_Tree_Item::remove_child ( const char * name )
Remove immediate child (and its children) by its label 'name'.
If more than one item matches 'name', only the first matching item is removed.

Parameters

| in name | The label name of the immediate child to remove |

Returns

0 if removed, -1 if not found.

Version

1.3.3

12.153.3.51  remove_child() [2/2]

int Fl_Tree_Item::remove_child ( Fl_Tree_Item * item )
Remove 'item' from the current item's children.

Returns

0 if removed, -1 if item not an immediate child.

12.153.3.52  reparent()

int Fl_Tree_Item::reparent ( Fl_Tree_Item * newchild, int pos )
Reparent specified item as a child of ourself at position 'pos'.
Typically 'newchild' was recently orphaned with deparent().

Returns

- 0: on success
- -1: on error (e.g. if 'pos' out of range) with no changes made.

See also

deparent()

12.153.3.53  replace()

Fl_Tree_Item * Fl_Tree_Item::replace ( Fl_Tree_Item * newitem )
Replace the current item with a new item.
The current item is destroyed if successful. No checks are made to see if an item with the same name exists.
This method can be used to, for example, install 'custom' items into the tree derived from Fl_Tree_Item; see draw_item_content().

Parameters

| in newitem | The new item to replace the current item |
Returns

newitem on success, NULL if could not be replaced.

See also

Fl_Tree_Item::draw_item_content(), Fl_Tree::root(Fl_Tree_Item*)

Version

1.3.3 ABI feature

**12.153.3.54 replace_child()**

```c
Fl_Tree_Item* Fl_Tree_Item::replace_child (  
    Fl_Tree_Item* olditem,  
    Fl_Tree_Item* newitem)
```

Replace existing child 'olditem' with 'newitem'.
The 'olditem' is destroyed if successful. Can be used to put custom items (derived from Fl_Tree_Item) into the tree. No checks are made to see if an item with the same name exists.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>olditem</th>
<th>The item to be found and replaced</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>newitem</td>
<td>The new item to take the place of 'olditem'</td>
</tr>
</tbody>
</table>

Returns

newitem on success and 'olditem' is destroyed. NULL on error if 'olditem' was not found as an immediate child.

See also

replace(), Fl_Tree_Item::draw()

Version

1.3.3 ABI feature

**12.153.3.55 select()**

```c
void Fl_Tree_Item::select (  
    int val = 1) [inline]
```

Change the item's selection state to the optionally specified 'val'.
If 'val' is not specified, the item will be selected.

**12.153.3.56 select_all()**

```c
int Fl_Tree_Item::select_all () [inline]
```

Select item and all its children.
Returns count of how many items were in the 'deselected' state, ie. how many items were "changed".

**12.153.3.57 show_self()**

```c
void Fl_Tree_Item::show_self (  
    const char* indent = "") const
```

Print the tree as 'ascii art' to stdout.
Used mainly for debugging.
show_widgets()

```c
void Fl_Tree_Item::show_widgets ( ) [protected]
```

Internal: Show the FLTK widget() for this item and all children.
Used by open() to re-show widgets that were hidden by a previous close()

swap_children() [1/2]

```c
int Fl_Tree_Item::swap_children ( Fl_Tree_Item * a, Fl_Tree_Item * b )
```

Swap two of our immediate children, given item pointers.
Use e.g. for sorting.
This method is SLOW because it involves linear lookups.
For speed, use swap_children(int,int) instead.

Parameters

| in | a,b | The item ptrs of the two items to swap. Both must be immediate children of the current item. |

Returns

- 0 : OK
- -1 : failed: item 'a' or 'b' is not our child.

swap_children() [2/2]

```c
void Fl_Tree_Item::swap_children ( int ax, int bx )
```

Swap two of our children, given two child index values 'ax' and 'bx'.
Use e.g. for sorting.
No range checking is done on either index value.

Parameters

| in | ax,bx | the index of the items to swap |

tree() [1/2]

```c
Fl_Tree * Fl_Tree_Item::tree ( ) [inline]
```

Return the tree for this item.

Version

1.3.4

tree() [2/2]

```c
const Fl_Tree * Fl_Tree_Item::tree ( ) const [inline]
```

Return the tree for this item.

Version

1.3.3
12.153.3.63  update_prev_next()

void Fl_Tree_Item::update_prev_next (  
    int index  
)  

Update our _prev_sibling and _next_sibling pointers to point to neighbors given index as being our current position in the parent's item array.  
Call this whenever items in the array are added/removed/moved/swapped/etc.  

Parameters  

| in  | index | Our index# in the parent.  
|-----|-------| Special case if index=-1: become an orphan; null out all parent/sibling associations. |

12.153.3.64  userdeicon() [1/2]

Fl_Image * Fl_Tree_Item::userdeicon () const [inline]  
Return the deactivated version of the user icon, if any.  
Returns 0 if none.  

12.153.3.65  userdeicon() [2/2]

void Fl_Tree_Item::userdeicon (  
    Fl_Image * val  
) [inline]  
Set the usericon to draw when the item is deactivated.  
Use '0' to disable. No internal copy is made; caller must manage icon's memory.  
To create a typical 'grayed out' version of your usericon image, you can do the following:  
// Create tree + usericon for items  
Fl_Tree *tree = new Fl_Tree(...);  
Fl_Image *usr_icon = new Fl_Pixmap(...); // your usericon  
Fl_Image *de_icon = usr_icon->copy(); // make a copy, and..  
de_icon->inactive(); // make it 'grayed out'  
...  
for ( .. ) { // item loop..  
    item = tree->add("..."); // create new item  
    item->usericon(usr_icon); // assign usericon to items  
    item->userdeicon(de_icon); // assign userdeicon to items  
    ..  
}  

In the above example, the app should 'delete' the two icons when they're no longer needed (e.g. after the tree is destroyed)  
Version  

1.3.4  

12.153.3.66  usericon()

void Fl_Tree_Item::usericon (  
    Fl_Image * val  
) [inline]  
Set the item's user icon to an Fl_Image.  
Use '0' to disable. No internal copy is made, caller must manage icon's memory.  
Note, if you expect your items to be deactivated(), use userdeicon(Fl_Image*) to set up a 'grayed out' version of your icon to be used for display.  
See also  
userdeicon(Fl_Image*)  

12.153.3.67  visible_r()

int Fl_Tree_Item::visible_r ( ) const  
See if item and all its parents are open() and visible().
Returns

1 – item and its parents are open() and visible() 0 – item (or one of its parents) are invisible or closed.

The documentation for this class was generated from the following files:

- Fl_Tree_Item.H
- Fl_Tree_Item.cxx

### 12.154 Fl_Tree_Item_Array Class Reference

Manages an array of Fl_Tree_Item pointers.

```c
#include <Fl_Tree_Item_Array.H>
```

#### Public Member Functions

- **void** add (Fl_Tree_Item *val)
  - Add an item to the end of the array.
- **void** clear ()
  - Clear the entire array.
- **int** deparent (int pos)
  - Deparent item at 'pos' from our list of children.
- **Fl_Tree_Item_Array** (const Fl_Tree_Item_Array *o)
  - Copy constructor. Makes new copy of array, with new instances of each item.
- **Fl_Tree_Item_Array** (int new_chunksize=10)
  - Constructor; creates an empty array.
- **void** insert (int pos, Fl_Tree_Item *new_item)
  - Insert an item at index position pos.
- **int** manage_item_destroy () const
- **void** manage_item_destroy (int val)
  - Option to control if Fl_Tree_Item_Array's destructor will also destroy the Fl_Tree_Item's.
- **int** move (int to, int from)
  - Move item at 'from' to new position 'to' in the array.
- **Fl_Tree_Item * operator[] (int i)**
  - Return the item and index i.
- **const Fl_Tree_Item * operator[] (int i) const**
  - Const version of operator[](int i)
- **int** remove (Fl_Tree_Item *item)
  - Remove the item from the array.
- **void** remove (int index)
  - Remove the item at.
- **int** reparent (Fl_Tree_Item *item, Fl_Tree_Item *newparent, int pos)
  - Reparent specified item as a child of ourself.
- **void** replace (int pos, Fl_Tree_Item *new_item)
  - Replace the item at index with newitem.
- **void** swap (int ax, int bx)
  - Swap the two items at index positions ax and bx.
- **int** total () const
  - Return the total items in the array, or 0 if empty.
- **~Fl_Tree_Item_Array ()**
  - Destructor. Calls each item's destructor, destroys internal_items array.
12.154.1 Detailed Description

Manages an array of Fl_Tree_Item pointers. Because FLTK 1.x.x. has mandated that templates and STL not be used, we use this class to dynamically manage the arrays. None of the methods do range checking on index values; the caller must be sure that index values are within the range 0<index<total() (unless otherwise noted).

12.154.2 Constructor & Destructor Documentation

12.154.2.1 Fl_Tree_Item_Array()

Fl_Tree_Item_Array::Fl_Tree_Item_Array ( 
    int new_chunksize = 10 )

Constructor; creates an empty array. The optional ‘chunksize’ can be specified to optimize memory allocation for potentially large arrays. Default chunksize is 10.

12.154.3 Member Function Documentation

12.154.3.1 add()

void Fl_Tree_Item_Array::add ( 
    Fl_Tree_Item * val )

Add an item+ to the end of the array. Assumes the item was created with ‘new’, and will remain allocated. Fl_Tree_Item_Array will handle calling the item’s destructor when the array is cleared or the item remove()'ed.

12.154.3.2 clear()

void Fl_Tree_Item_Array::clear ( )

Clear the entire array. Each item will be deleted (destructors will be called), and the array will be cleared. total() will return 0.

12.154.3.3 deparent()

int Fl_Tree_Item_Array::deparent ( 
    int pos )

Deparent item at 'pos' from our list of children. Similar to a remove() without the destruction of the item. This creates an orphaned item (still allocated, has no parent) which soon after is typically reparented elsewhere. \returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

12.154.3.4 insert()

void Fl_Tree_Item_Array::insert ( 
    int pos, 
    Fl_Tree_Item * new_item )

Insert an item at index position pos. Handles enlarging array if needed, total increased by 1. If \p pos \>= total(), the item is appended to the array. If \p pos \< 0, the item is prepended (works like pos == 0).
12.154.3.5  **manage_item_destroy()**

```c
void Fl_Tree_Item_Array::manage_item_destroy (  
    int val  )  [inline]
```

Option to control if `Fl_Tree_Item_Array`'s destructor will also destroy the `Fl_Tree_Item`'s.
If set: items and item array is destroyed. If clear: only the item array is destroyed, not items themselves.

12.154.3.6  **move()**

```c
int Fl_Tree_Item_Array::move (  
    int to,  
    int from )
```

Move item at 'from' to new position 'to' in the array.
Due to how the moving an item shuffles the array around, a positional 'move' implies things that may not be obvious:

- When 'from' moved lower in tree, appears BELOW item that was at 'to'.
- When 'from' moved higher in tree, appears ABOVE item that was at 'to'.

Returns
0 on success, -1 on range error (e.g. if 'to' or 'from' out of range)

12.154.3.7  **remove() [1/2]**

```c
int Fl_Tree_Item_Array::remove (  
    Fl_Tree_Item * item)
```

Remove the item from the array.
\returns 0 if removed, or -1 if the item was not in the array.

12.154.3.8  **remove() [2/2]**

```c
void Fl_Tree_Item_Array::remove (  
    int index )
```

Remove the item at.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>index</th>
<th>from the array.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>The item will be delete'd (if non-NULL), so its destructor will be called.</td>
</tr>
</tbody>
</table>

12.154.3.9  **reparent()**

```c
int Fl_Tree_Item_Array::reparent (  
    Fl_Tree_Item * item,  
    Fl_Tree_Item * newparent,  
    int pos )
```

Reparent specified item as a child of ourself.
Typically 'newchild' was recently orphaned with deparent().
\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

12.154.3.10  **replace()**

```c
void Fl_Tree_Item_Array::replace (  
```

Replace the item at index with newitem.
Old item at index position will be destroyed, and the new item will take it's place, and stitched into the linked list.

The documentation for this class was generated from the following files:

- Fl_Tree_Item_Array.H
- Fl_Tree_Item_Array.cxx

### 12.155 Fl_Tree_Prefs Class Reference

Tree widget's preferences.
#include <Fl_Tree_Prefs.H>

#### Public Member Functions

- **Fl_Image * closedeicon () const**
  
  Return the deactivated version of the close icon, if any.

- **Fl_Image * closeicon () const**
  
  Gets the default 'close' icon Returns the Fl_Image+ of the icon, or 0 if none.

- **void closeicon (Fl_Image +val)**

  Sets the icon to be used as the 'close' icon.

- **Fl_Color connectorcolor () const**

  Get the connector color used for tree connection lines.

- **void connectorcolor (Fl_Color val)**

  Set the connector color used for tree connection lines.

- **Fl_Tree_Connector connectorstyle () const**

  Get the connector style.

- **void connectorstyle (Fl_Tree_Connector val)**

  Set the connector style.

- **void connectorstyle (int val)**

  Set the connector style [integer].

- **int connectorwidth () const**

  Get the tree connection line's width.

- **void connectorwidth (int val)**

  Set the tree connection line's width.

- **void do_item_draw_callback (Fl_Tree_Item +o) const**

- **Fl_Tree_Prefs ()**

  Fl_Tree_Prefs constructor.

- **Fl_Tree_Item_Draw_Callback * item_draw_callback () const**

- **void item_draw_callback (Fl_Tree_Item_Draw_Callback +cb, void +data=0)**

- **Fl_Tree_Item_Draw_Mode item_draw_mode () const**

  Get the 'item draw mode' used for the tree.

- **void item_draw_mode (Fl_Tree_Item_Draw_Mode val)**

  Set the 'item draw mode' used for the tree to val.

- **void * item_draw_user_data () const**

- **Fl_Color item_labelbgcolor () const**

  Get the default label background color.

- **void item_labelbgcolor (Fl_Color val)**

  Set the default label background color.

- **Fl_Color item_labelsfgcolor () const**

  Get the default label foreground color.

- **void item_labelsfgcolor (Fl_Color val)**
Set the default label foreground color.

- FL_Font item_labelfont () const
  Return the label's font.

- void item_labelfont (FL_Font val)
  Set the label's font to val.

- FL_Fontsize item_labelsize () const
  Return the label's size in pixels.

- void item_labelsize (FL_Fontsize val)
  Set the label's size in pixels to val.

- FL_Tree_Item_Reselect_Mode item_reselect_mode () const
  Returns the current item re/selection mode.

- void item_reselect_mode (FL_Tree_Item_Reselect_Mode mode)
  Sets the item re/selection mode.

- FL_Color labelbgcolor () const
  Obsolete: Get the default label background color. Please use item_labelbgcolor() instead.

- void labelbgcolor (FL_Color val)
  Obsolete: Set the default label background color. Please use item_labelbgcolor(FL_Color) instead.

- FL_Color labelfgcolor () const
  Obsolete: Get the default label foreground color. Please use item_labelfgcolor() instead.

- void labelfgcolor (FL_Color val)
  Obsolete: Set the default label foreground color. Please use item_labelfgcolor(FL_Color) instead.

- FL_Font labelfont () const
  Obsolete: Return the label's font. Please use item_labelfont() instead.

- void labelfont (FL_Font val)
  Obsolete: Set the label's font to val. Please use item_labelfont(FL_Font) instead.

- int labelmarginleft () const
  Get the label's left margin value in pixels.

- void labelmarginleft (int val)
  Set the label's left margin value in pixels.

- FL_Fontsize labelsize () const
  Obsolete: Return the label's size in pixels. Please use item_labelsize() instead.

- void labelsize (FL_Fontsize val)
  Obsolete: Set the label's size in pixels to val. Please use item_labelsize(FL_Fontsize) instead.

- int linespacing () const
  Get the line spacing value in pixels.

- void linespacing (int val)
  Set the line spacing value in pixels.

- int marginbottom () const
  Get the bottom margin's value in pixels.

- void marginbottom (int val)
  Set the bottom margin's value in pixels This is the extra distance the vertical scroller lets you travel.

- int marginleft () const
  Get the left margin's value in pixels.

- void marginleft (int val)
  Set the left margin's value in pixels.

- int margintop () const
  Get the top margin's value in pixels.

- void margintop (int val)
  Set the top margin's value in pixels.

- int openchild_marginbottom () const
  Get the margin below an open child in pixels.
1820 Class Documentation

- **void openchild_marginbottom**(int val)
  
  Set the margin below an open child in pixels.

- **Fl管局Its* opendeicon () const
  
  Return the deactivated version of the open icon, if any.

- **Fl管局Its* openicon () const
  
  Get the current default 'open' icon.

- **void openicon (Fl管局Its* val)
  
  Sets the default icon to be used as the 'open' icon when items are add()ed to the tree.

- **Fl管局Its* selectbox () const
  
  Get the current default 'open' icon.

- **void selectbox (Fl管局Its* val)
  
  Set the default selection box's box drawing style to val.

- **Fl管局Its* selectmode () const
  
  Get the selection mode used for the tree.

- **void selectmode (Fl管局Its* val)
  
  Set the selection mode used for the tree to val.

- **char showcollapse () const
  
  Returns 1 if the collapse icon is enabled, 0 if not.

- **void showcollapse (int val)
  
  Set if we should show the collapse icon or not.

- **int showroot () const
  
  Returns 1 if the root item is to be shown, or 0 if not.

- **void showroot (int val)
  
  Set if the root item should be shown or not.

- **Fl管局Its* sortorder () const
  
  Get the default sort order value.

- **void sortorder (Fl管局Its* val)
  
  Set the default sort order value.

- **Fl管局Its* userdeicon () const
  
  Return the deactivated version of the user icon, if any.

- **Fl管局Its* usericon () const
  
  Gets the default 'user icon' (default is 0)

- **void usericon (Fl管局Its* val)
  
  Sets the default 'user icon' Returns the Fl管局Its* of the icon, or 0 if none (default).

- **int usericonmarginleft () const
  
  Get the user icon's left margin value in pixels.

- **void usericonmarginleft (int val)
  
  Set the user icon's left margin value in pixels.

- **int widgetmarginleft () const
  
  Get the widget's left margin value in pixels.

- **void widgetmarginleft (int val)
  
  Set the widget's left margin value in pixels.

- **~Fl管局Its* ()
  
  Fl管局Its destructor.

12.155.1 Detailed Description

Tree widget's preferences.  
Fl管局Its Preferences class.
This class manages the Fl管局Its's defaults. You should probably be using the methods in Fl管局Its instead of trying to accessing tree's preferences settings directly.
12.155.2 Member Function Documentation

12.155.2.1 closedeicon()

Fl_Image * Fl_Tree_Prefs::closedeicon ( ) const [inline]
Return the deactivated version of the close icon, if any.
Returns 0 if none.

12.155.2.2 closeicon()

void Fl_Tree_Prefs::closeicon ( Fl_Image * val )
Sets the icon to be used as the 'close' icon.
This overrides the built in default '[-]' icon.

Parameters

| in  | val | - The new image, or zero to use the default [-] icon. |

12.155.2.3 item_draw_mode()

void Fl_Tree_Prefs::item_draw_mode ( Fl_Tree_Item_Draw_Mode val ) [inline]
Set the 'item draw mode' used for the tree to val.
This affects how items in the tree are drawn, such as when a widget() is defined. See Fl_Tree_Item_Draw_Mode for possible values.

12.155.2.4 item_labelbgcolor() [1/2]

Fl_Color Fl_Tree_Prefs::item_labelbgcolor ( ) const [inline]
Get the default label background color.
This returns the Fl_Tree::color() unless item_labelbgcolor() has been set explicitly.

12.155.2.5 item_labelbgcolor() [2/2]

void Fl_Tree_Prefs::item_labelbgcolor ( Fl_Color val ) [inline]
Set the default label background color.
Once set, overrides the default behavior of using Fl_Tree::color().

12.155.2.6 marginbottom()

int Fl_Tree_Prefs::marginbottom ( ) const [inline]
Get the bottom margin's value in pixels.
This is the extra distance the vertical scroller lets you travel.

12.155.2.7 opendeicon()

Fl_Image * Fl_Tree_Prefs::opendeicon ( ) const [inline]
Return the deactivated version of the open icon, if any.
Returns 0 if none.

12.155.2.8 openicon() [1/2]

Fl_Image * Fl_Tree_Prefs::openicon ( ) const [inline]
Get the current default 'open' icon.
Returns the Fl_Image* of the icon, or 0 if none.
12.155.2.9  openicon() [2/2]

void Fl_Tree_Prefs::openicon (  
    Fl_Image * val )
Sets the default icon to be used as the 'open' icon when items are add()ed to the tree.  
This overrides the built in default '[+]' icon.

Parameters

| in | val | – The new image, or zero to use the default [+ ] icon. |

12.155.2.10  selectmode()

void Fl_Tree_Prefs::selectmode (  
    Fl_Tree_Select val ) [inline]
Set the selection mode used for the tree to val.  
This affects how items in the tree are selected when clicked on and dragged over by the mouse.  
See Fl_Tree_Select for possible values.

12.155.2.11  showcollapse()

void Fl_Tree_Prefs::showcollapse (  
    int val ) [inline]
Set if we should show the collapse icon or not.  
If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via open() and close().

Parameters

| in | val | 1: shows collapse icons (default), 0: hides collapse icons. |

12.155.2.12  showroot()

void Fl_Tree_Prefs::showroot (  
    int val ) [inline]
Set if the root item should be shown or not.

Parameters

| in | val | 1 – show the root item (default)  

0 – hide the root item. |

12.155.2.13  sortorder()

void Fl_Tree_Prefs::sortorder (  
    Fl_Tree_Sort val ) [inline]
Set the default sort order value.  
Defines the order new items appear when add()ed to the tree.  
See Fl_Tree_Sort for possible values.

12.155.2.14  userdeicon()

Fl_Image * Fl_Tree_Prefs::userdeicon ( ) const [inline]
Return the deactivated version of the user icon, if any.  
Returns 0 if none.

The documentation for this class was generated from the following files:
The **Fl_Valuator** class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

```cpp
#include <Fl_Valuator.H>
```

Inheritance diagram for **Fl_Valuator**:

```
Fl_Widget
  └── Fl_Valuator
      ├── Fl_Adjuster
      ├── Fl_Counter
      ├── Fl_Dial
      │    └── Fl_Fill_Dial
      │         └── Fl_Line_Dial
      ├── Fl_Roller
      └── Fl_Slider
          └── Fl_Scrollbar
```

### Public Member Functions

- **void bounds** (double a, double b)
  
  *Sets the minimum (a) and maximum (b) values for the valuator widget.*

- **double clamp** (double)
  
  *Clamps the passed value to the valuator range.*

- **virtual int format** (char *)
  
  *Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*

- **double increment** (double, int)
  
  *Adds n times the step value to the passed value.*

- **double maximum** () const
  
  *Gets the maximum value for the valuator.*

- **void maximum** (double a)
  
  *Sets the maximum value for the valuator.*

- **double minimum** () const
  
  *Gets the minimum value for the valuator.*

- **void minimum** (double a)
  
  *Sets the minimum value for the valuator.*

- **void precision** (int digits)
  
  *Sets the step value to 1.0 / 10^digits.*

- **void range** (double a, double b)
  
  *Sets the minimum and maximum values for the valuator.*

- **double round** (double)
  
  *Round the passed value to the nearest step increment.*

- **double step** () const
  
  *Gets or sets the step value.*

- **void step** (double a, int b)
See double Fl_Valuator::step() const

• void step (double s)
  See double Fl_Valuator::step() const.
• void step (int a)
  See double Fl_Valuator::step() const

• double value () const
  Gets the floating point(double) value.
• int value (double)
  Sets the current value.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback () const
 Gets the current callback function for the widget.
• void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
  Sets the current label.
• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
- `Fl_Image * deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.
- `const Fl_Image * deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.
- `void deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.
- `void deimage (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the inactive state.
- `int deimage_bound () const`
  Returns whether the inactive image is managed by the widget.
- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.
- `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
- `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.
- `virtual void draw ()=0`
  Draws the widget.
- `void draw_label (int, int, int, int, Fl_Align) const`
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`
  Gets the widget height.
- `virtual int handle (int event)`
  Handles the specified event.
- `virtual void hide ()`
  Makes a widget invisible.
- `Fl_Image * image ()`
  Gets the image that is used as part of the widget label when in the active state.
- `const Fl_Image * image () const`
  Gets the image that is used as part of the widget label when in the active state.
- `void image (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the active state.
- `void image (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`
  Returns whether the image is managed by the widget.
- `int inside (const Fl_Widget *wgt) const`
  Checks if this widget is a child of `wgt`.
- `int is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.
- `const char * label () const`
  Gets the current label text.
- `void label (const char *text)`
  Sets the current label pointer.
- `void label (Fl_Labeltype a, const char *b)`
  Shortcut to set the label text and type in one call.
- `Fl_Color labelcolor () const`
  Gets the label color.
- `void labelcolor (Fl_Color c)`
  Sets the label color.
- `Fl_Font labelfont () const`
Gets the font to use.

- void labelfont (Fl_Font f)
  Sets the font to use.

- Fl_Fontsize labelsizes () const
  Gets the font size in pixels.

- void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

- Fl_Labeltype labeltype () const
  Gets the label type.

- void labeltype (Fl_Labeltype a)
  Sets the label type.

- void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

- bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

- void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

- unsigned int output () const
  Returns if a widget is used for output only.

- Fl_Group * parent () const
  Returns a pointer to the parent widget.

- void parent (Fl_Group *p)
  Internal use only - "for hacks only".

- void position (int X, int Y)
  Repositions the window or widget.

- void redraw ()
  Schedules the drawing of the widget.

- void redraw_label ()
  Schedules the drawing of the label.

- virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

- Fl_Color selection_color () const
  Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget’s label uses ’&’ to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget’s label uses ’&’ to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int useAccentsMenu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Protected Member Functions

- **Fl_Valuator** (int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.

- **void handle_drag** (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

- **void handle_push**()
  Stores the current value in the previous value.

- **void handle_release**()
  Called after an FL_WHEN_RELEASE event is received and before the callback.

- **int horizontal**() const
  Tells if the valuator is an FL_HORIZONTAL one.

- **double previous_value**() const
  Gets the previous floating point value before an event changed it.

- **void set_value** (double v)
  Sets the current floating point value.

- **double softclamp** (double)
  Clamps the value, but accepts v if the previous value is not already out of range.

- **virtual void value_damage**()
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- **void clear_flag** (unsigned int c)
  Clears a flag in the flags mask.

- **void draw_backdrop** () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box** () const
  Draws the widget box according its box style.

- **void draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus** () const
  Draws a focus rectangle around the widget.

- **void draw_focus** (Fl_Boxtype t, int x, int y, int w, int h)
  Draws a focus rectangle around the widget.

- **void draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg)
  Draws a focus box for the widget at the given position and size.

- **void draw_label** () const
  Draws the widget's label at the defined label position.

- **void draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- **Fl_Widget** (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- **unsigned int flags** () const
  Gets the widget flags mask.

- **void h** (int v)
  Internal use only.

- **void set_flag** (unsigned int c)
  Sets a flag in the flags mask.

- **void w** (int v)

Generated by Doxygen
Internal use only.

• void \texttt{x} (int \texttt{v})

Internal use only.

• void \texttt{y} (int \texttt{v})

Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from \texttt{Fl_Widget}

• static void \texttt{default\_callback} (\texttt{Fl\_Widget \ast \texttt{widget}}, void \texttt{\ast \texttt{data}})

\textit{The default callback for all widgets that don't set a callback.}

• static unsigned int \texttt{label\_shortcut} (const char \texttt{\ast \texttt{t}})

\textit{Returns the Unicode value of the \textquotesingle\&x\textquotesingle\ shortcut in a given text.}

• static int \texttt{test\_shortcut} (const char \texttt{\ast \texttt{t}}, const bool require\_alt=false)

\textit{Returns true if the given text \texttt{t} contains the entered \textquotesingle\&x\textquotesingle\ shortcut.}

12.156.1 Detailed Description

The \texttt{Fl\_Valuator} class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

There are probably more of these classes in FLTK than any others:
In the above diagram each box surrounds an actual subclass. These are further differentiated by setting the `type()` of the widget to the symbolic value labeling the widget. The ones labelled "0" are the default versions with a type(0). For consistency the symbol FL_VERTICAL is defined as zero.

### 12.156.2 Constructor & Destructor Documentation

#### 12.156.2.1 `Fl_Valuator()`

```cpp
Fl_Valuator::Fl_Valuator ( int X, int Y, int W, int H, const char * L ) [protected]
```

Creates a new `Fl_Valuator` widget using the given position, size, and label string. The default boxtype is FL_NO_BOX.

### 12.156.3 Member Function Documentation

#### 12.156.3.1 `format()`

```cpp
int Fl_Valuator::format ( char * buffer ) [virtual]
```

Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter. The actual format used depends on the current step value. If the step value has been set to zero then a %g format is used. If the step value is non-zero, then a %f format is used, where the precision is calculated to show sufficient digits for the current step value. An integer step value, such as 1 or 1.0, gives a precision of 0, so the formatted value will appear as an integer.

This method is used by the `Fl_Valuator_...` group of widgets to format the current value into a text string. The return value is the length of the formatted text. The formatted value is written into `buffer`. `buffer` should have space for at least 128 bytes.

You may override this function to create your own text formatting.

#### 12.156.3.2 `increment()`

```cpp
double Fl_Valuator::increment ( )
```
double v,
int n )
Adds n times the step value to the passed value.
If step was set to zero it uses fabs(maximum() - minimum()) / 100.

12.156.3.3 maximum() [1/2]

double Fl_Valuator::maximum ( ) const [inline]
Gets the maximum value for the valuator.

12.156.3.4 maximum() [2/2]

void Fl_Valuator::maximum ( 
    double a ) [inline]
Sets the maximum value for the valuator.

12.156.3.5 minimum() [1/2]

double Fl_Valuator::minimum ( ) const [inline]
Gets the minimum value for the valuator.

12.156.3.6 minimum() [2/2]

void Fl_Valuator::minimum ( 
    double a ) [inline]
Sets the minimum value for the valuator.

12.156.3.7 precision()

void Fl_Valuator::precision ( 
    int digits )
Sets the step value to 1.0 / 10^digits.
Precision digits is limited to 0...9 to avoid internal overflow errors. Values outside this range are clamped.

Note
For negative values of digits the step value is set to A = 1.0 and B = 1, i.e. 1.0/1 = 1.

12.156.3.8 range()

void Fl_Valuator::range ( 
    double a,
    double b ) [inline]
Sets the minimum and maximum values for the valuator.
When the user manipulates the widget, the value is limited to this range. This clamping is done after rounding to the step value (this makes a difference if the range is not a multiple of the step).
The minimum may be greater than the maximum. This has the effect of "reversing" the object so the larger values are in the opposite direction. This also switches which end of the filled sliders is filled.
Some widgets consider this a "soft" range. This means they will stop at the range, but if the user releases and grabs the control again and tries to move it further, it is allowed.
The range may affect the display. You must redraw() the widget after changing the range.
12.156.3.9  round()

double Fl_Valuator::round (double v)
Round the passed value to the nearest step increment.
Does nothing if step is zero.

12.156.3.10  step()

double Fl_Valuator::step ( ) const [inline]
Gets or sets the step value.
As the user moves the mouse the value is rounded to the nearest multiple of the step value. This is done before clamping it to the range. For most widgets the default step is zero.
For precision the step is stored as the ratio of a double A and an integer B = A/B. You can set these values directly. Currently setting a floating point value sets the nearest A/1 or 1/B value possible.

12.156.3.11  value() [1/2]

double Fl_Valuator::value ( ) const [inline]
Gets the floating point(double) value.
See int value(double)

12.156.3.12  value() [2/2]

int Fl_Valuator::value (double v)
Sets the current value.
The new value is not clamped or otherwise changed before storing it. Use clamp() or round() to modify the value before calling value(). The widget is redrawn if the new value is different than the current one. The initial value is zero.
changed() will return true if the user has moved the slider, but it will be turned off by value(x) and just before doing a callback (the callback can turn it back on if desired).

12.156.3.13  value_damage()

void Fl_Valuator::value_damage ( ) [protected], [virtual]
Asks for partial redraw.
Reimplemented in Fl_Adjuster.
The documentation for this class was generated from the following files:

- Fl_Valuator.H
- Fl_Valuator.cxx

12.157  Fl_Value_Input Class Reference

The Fl_Value_Input widget displays a numeric value.
#include <Fl_Value_Input.H>
Inheritance diagram for Fl_Value_Input:
Public Member Functions

- **FL_Color cursor_color () const**
  
  Gets the color of the text cursor.

- **void cursor_color (FL_Color n)**
  
  Sets the color of the text cursor.

- **FL_Value_Input (int x, int y, int w, int h, const char ∗l=0)**
  
  Creates a new FL_Value_Input widget using the given position, size, and label string.

- **int handle (int) FL_OVERRIDE**

  Handles the specified event.

- **void resize (int, int, int, int) FL_OVERRIDE**

  Changes the size or position of the widget.

- **int shortcut () const**

  Returns the current shortcut key for the Input.

- **void shortcut (int s)**

  Sets the shortcut key to s.

- **char soft () const**

  If "soft" is turned on, the user is allowed to drag the value outside the range.

- **void soft (char s)**

  See void FL_Value_Input::soft(char s)

- **FL_Color textcolor () const**

  Gets the color of the text in the value box.

- **void textcolor (FL_Color n)**

  Sets the color of the text in the value box.

- **FL_Font textfont () const**

  Gets the typeface of the text in the value box.

- **void textfont (FL_Font s)**

  Sets the typeface of the text in the value box.

- **FL_Fontsize textsize () const**

  Gets the size of the text in the value box.

- **void textsize (FL_Fontsize s)**

  Sets the size of the text in the value box.

Public Member Functions inherited from FL_Valuator

- **void bounds (double a, double b)**

  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp (double)**

  Clamps the passed value to the valuator range.

- **virtual int format (char ∗)**

  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment (double, int)**

  Adds n times the step value to the passed value.

- **double maximum () const**

  Gets the maximum value for the valuator.

- **void maximum (double a)**

  Sets the maximum value for the valuator.

- **double minimum () const**

  Gets the minimum value for the valuator.

- **void minimum (double a)**

  Sets the minimum value for the valuator.

- **void precision (int digits)**
Sets the step value to $1.0 / 10^{10}$.

- void **range** (double a, double b)
  
  Sets the minimum and maximum values for the valuator.

- double **round** (double)
  
  Round the passed value to the nearest step increment.

- double **step** () const
  
  Gets or sets the step value.

- void **step** (double a, int b)
  
  See double **Fl_Valuator::step()** const

- void **step** (double s)
  
  See double **Fl_Valuator::step()** const.

- void **step** (int a)
  
  See double **Fl_Valuator::step()** const

- double **value** () const
  
  Gets the floating point(double) value.

- int **value** (double)
  
  Sets the current value.

**Public Member Functions inherited from Fl_Widget**

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
  
  Activates the widget.
- unsigned int **active** () const
  
  Returns whether the widget is active.
- int **active_r** () const
  
  Returns whether the widget and all of its parents are active.
- **Fl_Align** **align** () const
  
  Gets the label alignment.
- void **align** (**Fl_Align** alignment)
  
  Sets the label alignment.
- long **argument** () const
  
  Gets the current user data (long) argument that is passed to the callback function.
- void **argument** (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class **Fl_GL_Window** ∗ **as_gl_window** ()
  
  Returns an **Fl_GL_Window** pointer if this widget is an **Fl_GL_Window**.
- virtual class **Fl_GL_Window** const ∗ **as_gl_window** ()

- virtual class **Fl_Group** ∗ **as_group** ()
  
  Returns an **Fl_Group** pointer if this widget is an **Fl_Group**.
- virtual **Fl_Group** const ∗ **as_group** ()
- virtual **Fl_Window** ∗ **as_window** ()
  
  Returns an **Fl_Window** pointer if this widget is an **Fl_Window**.
- virtual **Fl_Window** const ∗ **as_window** ()

- void **bind_deimage** (**Fl_Image** ∗ img)
  
  Sets the image to use as part of the widget label when in the inactive state.
- void **bind_deimage** (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void **bind_image** (**Fl_Image** ∗ img)
Sets the image to use as part of the widget label when in the active state.

- void **bind_image** (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype** box () const
  Gets the box type of the widget.

- void box (**Fl_Boxtype** new_box)
  Sets the box type for the widget.

- **Fl_Callback_p** callback () const
  Gets the current callback function for the widget.

- void callback (**Fl_Callback** +cb)
  Sets the current callback function for the widget.

- void callback (**Fl_Callback** +cb, **Fl_Callback_User_Data** +p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (**Fl_Callback** +cb, void +p)
  Sets the current callback function and data for the widget.

- void callback (**Fl_Callback0** +cb)
  Sets the current callback function for the widget.

- void callback (**Fl_Callback1** +cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- **Fl_Color** color () const
  Gets the background color of the widget.

- void color (**Fl_Color** bg)
  Sets the background color of the widget.

- void color (**Fl_Color** bg, **Fl_Color** sel)
  Sets the background and selection color of the widget.

- **Fl_Color** color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (**const** **Fl_Widget** +w) const
  Checks if w is a child of this widget.

- void copy_label (**const** char +new_label)
  Sets the current label.

- void copy_tooltip (**const** char +text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if **draw()** needs to be called.
- void damage (uchar c)
  
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.
- int damage_resize (int, int, int)
  
  Internal use only.
- void deactivate ()
  
  Deactivates the widget.
- Fl_Image * deimage ()
  
  Gets the image that is used as part of the widget label when in the inactive state.
- const Fl_Image * deimage () const
  
  Gets the image that is used as part of the widget label when in the inactive state.
- void deimage (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.
- void deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.
- int deimage_bound () const
  
  Returns whether the inactive image is managed by the widget.
- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.
- void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.
- void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.
- void draw_label (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int h () const
  
  Gets the widget height.
- virtual void hide ()
  
  Makes a widget invisible.
- Fl_Image * image ()
  
  Gets the image that is used as part of the widget label when in the active state.
- const Fl_Image * image () const
  
  Gets the image that is used as part of the widget label when in the active state.
- void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.
- void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.
- int image_bound () const
  
  Returns whether the image is managed by the widget.
- int inside (const Fl_Widget *wgt) const
  
  Checks if this widget is a child of wgt.
- int is_label_copied () const
  
  Returns whether the current label was assigned with copy_label().
- const char * label () const
  
  Gets the current label text.
- void label (const char *text)
  
  Sets the current label text.
- void label (Fl_Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.
- Fl_Color labelcolor () const
Gets the label color.

- `void labelcolor (Fl_Color c)`
  Sets the label color.

- `Fl_Font labelfont () const`
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

- `void labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group * p)`
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.

- `void set_visible ()`
  Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  Returns whether the widget's label uses '\&' to indicate shortcuts.

- `void shortcut_label (int value)`
  Sets whether the widget's label uses '\&' to indicate shortcuts.
• virtual void show ()
    Makes a widget visible.
• void size (int W, int H)
    Changes the size of the widget.
• int take_focus ()
    Gives the widget the keyboard focus.
• unsigned int takesevents () const
    Returns if the widget is able to take events.
• int test_shortcut ()
    Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
    Gets the current tooltip text.
• void tooltip (const char *text)
    Sets the current tooltip text.
• Fl_Window * top_window () const
    Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
    Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
    Gets the widget type.
• void type (uchar t)
    Sets the widget type.
• int use_accents_menu ()
    Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
    Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
    Sets the user data for this widget.
• void user_data (void *v)
    Sets the user data for this widget.
• unsigned int visible () const
    Returns whether a widget is visible.
• unsigned int visible_focus () const
    Checks whether this widget has a visible focus.
• void visible_focus (int v)
    Modifies keyboard focus navigation.
• int visible_r () const
    Returns whether a widget and all its parents are visible.
• int w () const
    Gets the widget width.
• Fl_When when () const
    Returns the conditions under which the callback is called.
• void when (uchar i)
    Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
    Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
    Gets the widget position in its window.
• int y () const
    Gets the widget position in its window.
• virtual ~Fl_Widget ()
    Destroys the widget.
Public Attributes

- **Fl_Input** input

Protected Member Functions

- void **draw ()** FL_OVERRIDE
  
  Draws the widget.

Protected Member Functions inherited from **Fl_Valuator**

- **Fl_Valuator** (int X, int Y, int W, int H, const char ∗L)
  
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void **handle_drag** (double newvalue)
  
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void **handle_push ()**
  
  Stores the current value in the previous value.
- void **handle_release ()**
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int **horizontal ()** const
  
  Tells if the valuator is an FL_HORIZONTAL one.
- double **previous_value ()** const
  
  Gets the previous floating point value before an event changed it.
- void **set_value** (double v)
  
  Sets the current floating point value.
- double **softclamp** (double)
  
  Clamps the value, but accepts v if the previous value is not already out of range.

Protected Member Functions inherited from **Fl_Widget**

- void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.
- void **draw_backdrop ()** const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box ()** const
  
  Draws the widget box according its box style.
- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus ()** const
  
  Draws a focus rectangle around the widget.
- void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.
- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.
- void **draw_label ()** const
  
  Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.
- **Fl_Widget** (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.
- unsigned int **flags ()** const

**12.157.1 Detailed Description**

The **Fl_Value_Input** widget displays a numeric value. The user can click in the text field and edit it - there is in fact a hidden **Fl_Input** widget with type(FL_FLOAT_INPUT) or type(FL_INT_INPUT) in there - and when they hit return or tab the value updates to what they typed and the callback is done.

If **step()** is non-zero and integral, then the range of numbers is limited to integers instead of floating point numbers. As well as displaying the value as an integer, typed input is also limited to integer values, even if the hidden **Fl_Input** widget is of type(FL_FLOAT_INPUT).

If **step()** is non-zero, the user can also drag the mouse across the object and thus slide the value. The left button moves one **step()** per pixel, the middle by 10 **step()**, and the right button by 100 * step(). It is therefore impossible to select text by dragging across it, although clicking can still move the insertion cursor.

If **step()** is non-zero and integral, then the range of numbers are limited to integers instead of floating point values.
12.157.2 Constructor & Destructor Documentation

12.157.2.1 Fl_Value_Input()

Fl_Value_Input::Fl_Value_Input (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char ∗ l = 0 )

Creates a new Fl_Value_Input widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

12.157.3 Member Function Documentation

12.157.3.1 cursor_color() [1/2]

Fl_Color Fl_Value_Input::cursor_color ( ) const [inline]

Gets the color of the text cursor.
The text cursor is black by default.

12.157.3.2 cursor_color() [2/2]

void Fl_Value_Input::cursor_color (  
  Fl_Color n ) [inline]

Sets the color of the text cursor.
The text cursor is black by default.

12.157.3.3 draw()

void Fl_Value_Input::draw ( ) [protected], [virtual]

Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget ∗s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar  
s->draw();  // calls Fl_Scrollbar::draw()

Implements Fl_Widget.

12.157.3.4 handle()

int Fl_Value_Input::handle (  
  int event ) [virtual]

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in | event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Widget.

12.157.3.5 resize()

```cpp
void Fl_Value_Input::resize (  
    int x,  
    int y,  
    int w,  
    int h ) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does not call the redraw() method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call resize() a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for resize(X, Y, w(), h()), and size(W, H) is a shortcut for resize(x(), y(), W, H).

Parameters

| in | x,y | new position relative to the parent window |
| in | w,h | new size |

See also

position(int,int), size(int,int)

Reimplemented from Fl_Widget.

12.157.3.6 shortcut() [1/2]

```cpp
int Fl_Value_Input::shortcut ( ) const [inline]
```

Returns the current shortcut key for the Input.

See also

Fl_Value_Input::shortcut(int)
12.157.3.7 shortcut() [2/2]

```cpp
void Fl_Value_Input::shortcut ( int s ) [inline]
```

Sets the shortcut key to `s`.
Setting this overrides the use of '&' in the `label()`. The value is a bitwise OR of a key and a set of shift flags, for example `FL_ALT | 'a'`, `FL_ALT | (FL_F + 10)`, or just 'a'. A value of 0 disables the shortcut.
The key can be any value returned by `Fl::event_key()`, but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.
The shift flags can be any set of values accepted by `Fl::event_state()`. If the bit is on that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

12.157.3.8 soft()

```cpp
char Fl_Value_Input::soft ( ) const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.
If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value.
The default is true.

12.157.3.9 textcolor()

```cpp
Fl_Color Fl_Value_Input::textcolor ( ) const [inline]
```

Gets the color of the text in the value box.

12.157.3.10 textfont() [1/2]

```cpp
Fl_Font Fl_Value_Input::textfont ( ) const [inline]
```

Gets the typeface of the text in the value box.

12.157.3.11 textfont() [2/2]

```cpp
void Fl_Value_Input::textfont ( Fl_Font s ) [inline]
```

Sets the typeface of the text in the value box.

12.157.3.12 textsize() [1/2]

```cpp
Fl_Fontsize Fl_Value_Input::textsize ( ) const [inline]
```

Gets the size of the text in the value box.

12.157.3.13 textsize() [2/2]

```cpp
void Fl_Value_Input::textsize ( Fl_Fontsize s ) [inline]
```

Sets the size of the text in the value box.

The documentation for this class was generated from the following files:

- Fl_Value_Input.H
- Fl_Value_Input.cxx
### 12.158  Fl_Value_Output Class Reference

The **Fl_Value_Output** widget displays a floating point value. 

```c
#include <Fl_Value_Output.H>
```

Inheritance diagram for Fl_Value_Output:

```
Fl_Widget
   ^
   |  
Fl_Valuator
     ^
     |  
Fl_Value_Output
```

#### Public Member Functions

- **Fl_Value_Output** (int x, int y, int w, int h, const char ∗l=0)
  
  Creates a new **Fl_Value_Output** widget using the given position, size, and label string.

- **int handle** (int) **FL_OVERRIDE**
  
  Handles the specified event.

- **uchar soft** () const
  
  If "soft" is turned on, the user is allowed to drag the value outside the range.

- **void soft** (uchar s)
  
  If "soft" is turned on, the user is allowed to drag the value outside the range.

- **Fl_Color textcolor** () const
  
  Sets the color of the text in the value box.

- **void textcolor** (Fl_Color s)
  
  Gets the color of the text in the value box.

- **Fl_Font textfont** () const
  
  Gets the typeface of the text in the value box.

- **void textfont** (Fl_Font s)
  
  Sets the typeface of the text in the value box.

- **Fl_Fontsize textsize** () const
  
  Gets the size of the text in the value box.

- **void textsize** (Fl_Fontsize s)

#### Public Member Functions inherited from **Fl_Valuator**

- **void bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp** (double)
  
  Clamps the passed value to the valuator range.

- **virtual int format** (char ∗)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment** (double, int)
  
  Adds n times the step value to the passed value.

- **double maximum** () const
  
  Gets the maximum value for the valuator.

- **void maximum** (double a)
  
  Sets the maximum value for the valuator.

- **double minimum** () const
  
  Gets the minimum value for the valuator.
• void **minimum**(double a)
  
  Sets the minimum value for the valuator.

• void **precision**(int digits)
  
  Sets the step value to \(1.0 / 10^{\text{digits}}\).

• void **range**(double a, double b)
  
  Sets the minimum and maximum values for the valuator.

• double **round**(double)
  
  Round the passed value to the nearest step increment.

• double **step**(const)
  
  Gets or sets the step value.

• void **step**(double a, int b)
  
  See double Fl_Valuator::step() const

• void **step**(double s)
  
  See double Fl_Valuator::step() const.

• void **step**(int a)
  
  See double Fl_Valuator::step() const

• double **value**(const)
  
  Gets the floating point(double) value.

• int **value**(double)
  
  Sets the current value.

**Public Member Functions inherited from Fl_Widget**

• void **_clear_fullscreen**(const)
  
  Activates the widget.

• unsigned int **active**(const)
  
  Returns whether the widget is active.

• int **active_r**(const)
  
  Returns whether the widget and all of its parents are active.

• Fl_Align **align**(const)
  
  Gets the label alignment.

• void **align**(Fl_Align alignment)
  
  Sets the label alignment.

• long **argument**(const)
  
  Gets the current user data (long) argument that is passed to the callback function.

• void **argument**(long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window **as_gl_window**(const)
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window **as_gl_window**(const)
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual Fl_Group **as_group**(const)
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group **as_group**(const)
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Window **as_window**(const)
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window **as_window**(const)
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual bind_deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.
**void bind_deimage (int f)**

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

**void bind_image (Fl_Image *img)**

Sets the image to use as part of the widget label when in the active state.

**void bind_image (int f)**

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

**Fl_Boxtype box () const**

Gets the box type of the widget.

**void box (Fl_Boxtype new_box)**

Sets the box type for the widget.

**Fl_Callback_p callback () const**

Gets the current callback function for the widget.

**void callback (Fl_Callback *cb)**

Sets the current callback function for the widget.

**void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**

Sets the current callback function and managed user data for the widget.

**void callback (Fl_Callback *cb, void *p)**

Sets the current callback function and data for the widget.

**void callback (Fl_Callback0 *cb)**

Sets the current callback function for the widget.

**void callback (Fl_Callback1 *cb, long p=0)**

Sets the current callback function for the widget.

**unsigned int changed () const**

Checks if the widget value changed since the last callback.

**void clear_active ()**

Marks the widget as inactive without sending events or changing focus.

**void clear_changed ()**

Marks the value of the widget as unchanged.

**void clear_damage (uchar c=0)**

Clears or sets the damage flags.

**void clear_output ()**

Sets a widget to accept input.

**void clear_visible ()**

Hides the widget.

**void clear_visible_focus ()**

Disables keyboard focus navigation with this widget.

**Fl_Color color () const**

Gets the background color of the widget.

**void color (Fl_Color bg)**

Sets the background color of the widget.

**void color (Fl_Color bg, Fl_Color sel)**

Sets the background and selection color of the widget.

**Fl_Color color2 () const**

For back compatibility only.

**void color2 (unsigned a)**

For back compatibility only.

**int contains (const Fl_Widget *w) const**

Checks if w is a child of this widget.

**void copy_label (const char *new_label)**

Sets the current label.

**void copy_tooltip (const char *text)**

Generated by Doxygen
Sets the current tooltip text.

- **uchar damage () const**
  
  Returns non-zero if `draw()` needs to be called.

- **void damage (uchar c)**
  
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  
  Internal use only.
