# FLTK Programming Manual

## 1 Preface

1.1 Preface

1.1.1 Organization

1.1.2 Conventions

1.1.3 Abbreviations

1.1.4 Copyrights and Trademarks

## 2 Introduction to FLTK

2.1 History of FLTK

2.2 Features

2.3 Licensing

2.4 What Does “FLTK” Mean?

2.5 Building and Installing FLTK with CMake

2.6 Building and Installing FLTK Under UNIX and macOS with make

2.7 Building FLTK Under Microsoft Windows

2.7.1 GNU toolsets (Cygwin or MinGW) hosted on Windows

2.7.2 Using the Visual C++ DLL Library

2.8 Internet Resources

2.9 Reporting Bugs

## 3 FLTK Basics

3.1 Writing Your First FLTK Program

3.1.1 Creating the Widgets

3.1.2 Creating Widget Hierarchies

3.1.3 Get/Set Methods

3.1.4 Redrawing After Changing Attributes

3.1.5 Labels

3.1.6 Showing the Window

3.1.7 The Main Event Loop

3.2 Naming Conventions

3.3 Header Files

3.4 Compiling Programs that Use FLTK

3.4.1 Compiling Programs with Standard Compilers

3.4.2 Compiling Programs with the 'fltk-config' Script

3.4.3 Compiling Multiple Source Files with 'fltk-config'

3.4.4 Compiling Programs with Makefiles

3.4.5 Compiling Programs with Microsoft Visual C++

## 4 Common Widgets and Attributes

4.1 Buttons

4.2 Text

4.3 Valuators

4.4 Groups

4.5 Setting the Size and Position of Widgets

4.6 Colors

FLTK Programming Manual

FLTK 1.4.0 Programming Manual
By F. Costantini, D. Gibson, M. Melcher, A. Schlosser, B. Spitzak and M. Sweet.
Copyright © 1998 - 2024 by Bill Spitzak and others.

This software and manual are provided under the terms of the GNU Library General Public License. Permission is granted to reproduce this manual or any portion for any purpose, provided this copyright and permission notice are preserved.
1.1 Preface

This manual describes the Fast Light Tool Kit ("FLTK") version 1.4.0, a C++ Graphical User Interface ("GUI") toolkit for UNIX, Microsoft Windows and Apple OS X.

Version 1.4.0 introduces support for a new windowing system under Linux/Unix: Wayland. FLTK applications under Linux/Unix run, unchanged, as Wayland or X11 clients depending on what’s available at run-time.

Each of the chapters in this manual is designed as a tutorial for using FLTK, while the appendices provide a convenient reference for all FLTK widgets, functions, and operating system interfaces.

This manual may be printed, modified, and/or used under the terms of the FLTK license provided in Software License.

1.1.1 Organization

This manual is organized into the following chapters and appendices:

- Introduction to FLTK
- FLTK Basics
- Common Widgets and Attributes
- Adding and Extending Widgets
- Using OpenGL
- Programming with FLUID
  - GUI Attributes
  - Selecting and Moving Widgets
  - Image Labels
- FLTK Runtime Options
- Advanced FLTK
- Unicode and UTF-8 Support
- Appendices:
  - Constants and Enumerations
  - GLUT Compatibility
    - class Fl_Glut_Window
  - Forms Compatibility
  - Operating System Issues
  - Migrating Code from FLTK 1.3 to 1.4
  - Software License
  - Example Source Code
  - FAQ (Frequently Asked Questions)
1.1 Preface

- Designing a Simple Text Editor
- Drawing Things in FLTK
- Handling Events
- Adding and Extending Widgets
- Using OpenGL
- Programming with FLUID
- FLTK Runtime Options
- Advanced FLTK
- Unicode and UTF-8 Support
- Constants and Enumerations
- GLUT Compatibility
- Forms Compatibility
- Operating System Issues
- Migrating Code from FLTK 1.3 to 1.4
- Developer Information
- Software License
- Example Source Code

1.1.2 Conventions

This manual was generated using Doxygen (see http://www.doxygen.org/) to process the source code itself, special comments in the code, and additional documentation files. In general, Doxygen recognizes and denotes the following entities as shown:

- classes, such as Fl_Widget,
- methods, such as Fl_Widget::callback(Fl_Callback *cb, void *p),
- functions, such as fl_draw(const char *str, int x, int y),
- internal links, such as Conventions,
- external links, such as http://www.stack.nl/~dimitri/doxygen/

Other code samples and commands are shown in regular courier type.
1.1.3 Abbreviations

The following abbreviations are used in this manual:

X11

The X Window System version 11.

Xlib

The X Window System interface library.

MS Windows, WIN32

The Microsoft Windows Application Programmer’s Interface for Windows 2000, Windows XP, Windows Vista, Windows 7 and later Windows versions. FLTK uses the preprocessor definition _WIN32 for the 32 bit and 64 bit MS Windows API.

OS X, APPLE

The Apple desktop operating system OS X 10.0 and later. MacOS 8 and 9 support was dropped after FLTK 1.0.10. FLTK uses the preprocessor definition APPLE for OS X.

1.1.4 Copyrights and Trademarks

FLTK is Copyright © 1998 - 2024 by Bill Spitzak and others. Use and distribution of FLTK is governed by the GNU Library General Public License with 4 exceptions, located in Software License.

UNIX is a registered trademark of the X Open Group, Inc. Microsoft and Windows are registered trademarks of Microsoft Corporation. OpenGL is a registered trademark of Silicon Graphics, Inc. Apple, Macintosh, MacOS, and Mac OS X are registered trademarks of Apple Computer, Inc.

1.2 Introduction to FLTK

The Fast Light Tool Kit ("FLTK") is a cross-platform C++ GUI toolkit for UNIX®/Linux® (X11 or Wayland), Microsoft® Windows®, and Apple® macOS®.

FLTK provides modern GUI functionality without the bloat and supports 3D graphics via OpenGL® and its built-in GLUT emulation. It was originally developed by Mr. Bill Spitzak and is currently maintained by a small group of developers across the world with a central repository in the US.
1.2 Introduction to FLTK

1.2.1 History of FLTK

It has always been Bill's belief that the GUI API of all modern systems is much too high level. Toolkits (even FLTK) are not what should be provided and documented as part of an operating system. The system only has to provide arbitrary shaped but featureless windows, a powerful set of graphics drawing calls, and a simple unalterable method of delivering events to the owners of the windows. NeXT (if you ignored NextStep) provided this, but they chose to hide it and tried to push their own baroque toolkit instead.

Many of the ideas in FLTK were developed on a NeXT (but not using NextStep) in 1987 in a C toolkit Bill called "views". Here he came up with passing events downward in the tree and having the handle routine return a value indicating whether it used the event, and the table-driven menus. In general he was trying to prove that complex UI ideas could be entirely implemented in a user space toolkit, with no knowledge or support by the system.

After going to film school for a few years, Bill worked at Sun Microsystems on the (doomed) NeWS project. Here he found an even better and cleaner windowing system, and he reimplemented "views" atop that. NeWS did have an unnecessarily complex method of delivering events which hurt it. But the designers did admit that perhaps the user could write just as good of a button as they could, and officially exposed the lower level interface.

With the death of NeWS Bill realized that he would have to live with X. The biggest problem with X is the "window manager", which means that the toolkit can no longer control the window borders or drag the window around.

At Digital Domain Bill discovered another toolkit, "Forms". Forms was similar to his work, but provided many more widgets, since it was used in many real applications, rather than as theoretical work. He decided to use Forms, except he integrated his table-driven menus into it. Several very large programs were created using this version of Forms.

The need to switch to OpenGL and GLX, portability, and a desire to use C++ subclassing required a rewrite of Forms. This produced the first version of FLTK. The conversion to C++ required so many changes it made it impossible to recompile any Forms objects. Since it was incompatible anyway, Bill decided to incorporate his older ideas as much as possible by simplifying the lower level interface and the event passing mechanism.

Bill received permission to release it for free on the Internet, with the GNU general public license. Response from Internet users indicated that the Linux market dwarfed the SGI and high-speed GL market, so he rewrote it to use X for all drawing, greatly speeding it up on these machines. That is the version you have now.

Digital Domain has since withdrawn support for FLTK. While Bill is no longer able to actively develop it, he still contributes to FLTK in his free time and is a part of the FLTK development team.

1.2.2 Features

FLTK was designed to be statically linked. This was done by splitting it into many small objects and designing it so that functions that are not used do not have pointers to them in the parts that are used, and thus do not get linked in. This allows you to make an easy-to-install program or to modify FLTK to the exact requirements of your application without worrying about bloat. FLTK works fine as a shared library, though, and is now included with several Linux distributions.

Here are some of the core features unique to FLTK:

- `sizeof(Fl_Widget) == 64 to 92.`

- The "core" (the "hello" program compiled & linked with a static FLTK library using gcc on a 486 and then stripped) is 114K.

- The FLUID program (which includes every widget) is 538K.
• Written directly atop core libraries (Xlib, Wayland, Windows or Cocoa) for maximum speed, and carefully optimized for code size and performance.

• Precise low-level compatibility between the X11, Windows and MacOS versions - only about 10% of the code is different.

• Interactive user interface builder program. Output is human-readable and editable C++ source code.

• Support for overlay hardware, with emulation if none is available.

• Very small & fast portable 2-D drawing library to hide Xlib, Cairo, Windows, or macOS Quartz.

• OpenGL/Mesa drawing area widget.

• Support for OpenGL overlay hardware on both X11 and Windows, with emulation if none is available.

• Text widgets with cut & paste, undo, and support for Unicode text and international input methods.

• Compatibility header file for the GLUT library.

• Compatibility header file for the XForms library.

1.2.3 Licensing

FLTK comes with complete free source code. FLTK is available under the terms of the GNU Library General Public License with exceptions that allow for static linking. Contrary to popular belief, it can be used in commercial software - even Bill Gates could use it!

1.2.4 What Does "FLTK" Mean?

FLTK was originally designed to be compatible with the Forms Library written for SGI machines. In that library all the functions and structures started with "fl_". This naming was extended to all new methods and widgets in the C++ library, and this prefix was taken as the name of the library. It is almost impossible to search for "FL" on the Internet, due to the fact that it is also the abbreviation for Florida. After much debating and searching for a new name for the toolkit, which was already in use by several people, Bill came up with "FLTK", including a bogus excuse that it stands for "The Fast Light Toolkit".

1.2.5 Building and Installing FLTK with CMake

Starting with version 1.4, the recommended FLTK building system is CMake. See file README.CMake of the FLTK source tree for all information. It's also possible to use configure and make as follows to build and install FLTK,
1.2.6 Building and Installing FLTK Under UNIX and macOS with make

In most cases you can just type "make". This will run configure with the default of no options and then compile everything.

FLTK uses GNU autoconf to configure itself for your UNIX platform. The main things that the configure script will look for are the X11 and OpenGL (or Mesa) header and library files. If these cannot be found in the standard include/library locations you’ll need to define the CFLAGS, CXXFLAGS, and LDFLAGS environment variables. For the Bourne and Korn shells you’d use:

```
CFLAGS=-Iincludedir; export CFLAGS
CXXFLAGS=-Iincludedir; export CXXFLAGS
LDFLAGS=-Llibdir; export LDFLAGS
```

For C shell and tcsh, use:

```
setenv CFLAGS "-Iincludedir"
setenv CXXFLAGS "-Iincludedir"
setenv LDFLAGS "-Llibdir"
```

By default configure will look for a C++ compiler named CC, c++, g++, or gcc in that order. To use another compiler you need to set the CXX environment variable:

```
CXX=xlC; export CXX
setenv CXX "xlC"
```

The CC environment variable can also be used to override the default C compiler (cc or gcc), which is used for a few FLTK source files.

You can run configure yourself to get the exact setup you need. Type ".configure <options>". where options are:

- **--enable-cygwin**
  
  Enable the Cygwin libraries under Windows

- **--enable-debug**

  Enable debugging code & symbols

- **--disable-gl**

  Disable OpenGL support

- **--disable-svg**

  Disable support of reading and writing of Support Vector Graphics (.svg) files.

- **--disable-print**

  Disable print support for an X11/Wayland platform

- **--enable-shared**

  Enable generation of shared libraries
–enable-threads

Enable multithreading support

–enable-wayland

This is the default for Linux and FreeBSD systems equipped with the Wayland software. Enable the use of Wayland for all window operations, of Cairo for all graphics and of Pango for text drawing. Resulting FLTK apps run as Wayland clients if a Wayland compositor is available at run-time, and as X11 clients otherwise but keep using Cairo and Pango for all graphics.

–disable-xft

Disables the Xft library, resulting in non anti-aliased fonts (X11 platform).

–enable-usecairo

All drawing operations use the Cairo library (rather than Xlib) producing antialiased graphics (X11 platform, implies –enable-pango).

–enable-pango

Enable the Pango library for drawing any text in any script with any font under X11/Wayland.

–enable-x11

When targeting cygwin, build with X11 GUI instead of windows GDI. Also applicable to macOS platforms supplemented with XQuartz.

–enable-cairo

Enable support of class Fl_Cairo_Window (all platforms, requires the Cairo library).

–enable-cairoext

Enable the FLTK instrumentation for cairo extended use (requires –enable-cairo).

–disable-gdiplus

Don't use GDI+ when drawing curves and oblique lines (Windows platform).

–enable-cp936

Under X11, enable use of the GB2312 locale

–bindir=/path

Set the location for executables [default = $prefix/bin]
1.2 Introduction to FLTK

--datadir=/path
Set the location for data files. [default = $prefix/share]

--libdir=/path
Set the location for libraries [default = $prefix/lib]

--includedir=/path
Set the location for include files. [default = $prefix/include]

--mandir=/path
Set the location for man pages. [default = $prefix/man]

--prefix=/dir
Set the directory prefix for files [default = /usr/local]

When the configure script is done you can just run the "make" command. This will build the library, FLUID tool, and all of the test programs.

To install the library, become root and type "make install". This will copy the "fluid" executable to "bindir", the header files to "includedir", and the library files to "libdir".

1.2.7 Building FLTK Under Microsoft Windows

NOTE: This documentation section is currently under review. More up-to-date information for this release may be available in the file "README.Windows.txt" and you should read that file to determine if there are changes that may be applicable to your build environment.

FLTK 1.3 is officially supported on Windows (2000,) 2003, XP, and later. Older Windows versions prior to Windows 2000 are not officially supported, but may still work. The main reason is that the OS version needs to support UTF-8. FLTK 1.3 is known to work on recent versions of Windows such as Windows 7, Windows 8/8.1 and Windows 10 and has been reported to work in both 32-bit and 64-bit versions of these.

FLTK currently supports the following development environments on the Windows platform:

CAUTION: Libraries built by any one of these build environments can not be mixed with object files from any of the other environments! (They use incompatible C++ conventions internally.)

Free Microsoft Visual C++ 2008 Express and Visual C++ 2010 Express or later versions using workspace and project files generated by CMake. Older versions and the commercial versions can be used as well, if they can open the project files. Be sure to get your service packs!

Since FLTK 1.4 the project files MUST be generated with CMake. Please read "README.CMake.txt" for more information about this.
1.2.7.1 GNU toolsets (Cygwin or MinGW) hosted on Windows

If using Cygwin with the Cygwin shell, or MinGW with the Msys shell, these build environments behave very much like a Unix or macOS build and the notes above in the section on Building and Installing FLTK Under UNIX and Apple macOS apply, in particular the descriptions of using the "configure" script and its related options.

In general for a build using these tools, e.g. for the Msys shell with MinGW, it should suffice to "cd" into the directory where you have extracted the FLTK tarball and type:

```
./configure
make
```

This will build the FLTK libraries and they can then be utilised directly from the build location. NOTE: this may be simpler than "installing" them in many cases as different tool chains on Windows have different ideas about where the files should be "installed" to.

For example, if you "install" the libraries using Msys/MinGW with the following command:

```
makemake install
```

Then Msys will "install" the libraries to where it thinks the path "/usr/local/" leads to. If you only ever build code from within the Msys environment this works well, but the actual "Windows path" these files are located in will be something like "C:\msys\1.0\local\lib", depending on where your Msys installation is rooted, which may not be useful to other tools.

If you want to install your built FLTK libraries in a non-standard location you may do:

```
sh configure --prefix=C:/FLTK
make
```

Where the value passed to "prefix" is the path at which you would like FLTK to be installed.

A subsequent invocation of "make install" will then place the FLTK libraries and header files into that path.

The other options to "configure" may also be used to tailor the build to suit your environment.

1.2.7.2 Using the Visual C++ DLL Library

The "fltkdll.dsp" project file builds a DLL-version of the FLTK library. Because of name mangling differences between PC compilers (even between different versions of Visual C++) you can only use the DLL that is generated with the same version compiler that you built it with.

When compiling an application or DLL that uses the FLTK DLL, you will need to define the FL_DLL preprocessor symbol to get the correct linkage commands embedded within the FLTK header files.

1.2.8 Internet Resources

FLTK is available on the 'net in a bunch of locations:

WWW

https://www.fltk.org/
https://www.fltk.org/bugs.php [for reporting bugs]
https://www.fltk.org/software.php [download source code]
https://www.fltk.org/newsgroups.php [newsgroup/forums]

NNTP Newsgroups

https://groups.google.com/forum/#!forum/fltkgeneral [Google Groups interface]
news://fltk.org:1024/ [NNTP interface]
https://www.fltk.org/newsgroups.php [web interface]
1.2.9 Reporting Bugs

To report a bug in FLTK, or for feature requests, please use the form at https://www.fltk.org/bugs.php, and click on "Submit Bug or Feature Request".

You'll be prompted for the FLTK version, operating system & version, and compiler that you are using. We will be unable to provide any kind of help without that basic information.

For general support and questions, please use the fltk.general newsgroup (see above, "NNTP Newsgroups") or the web interface to the newsgroups at https://www.fltk.org/newsgroups.php.

1.3 FLTK Basics

This chapter teaches you the basics of writing and compiling programs that use FLTK.

1.3.1 Writing Your First FLTK Program

Up to FLTK 1.3.x all FLTK programs were required to include the file <FL/Fl.H> as the first FLTK header file.

Since FLTK 1.4.0 this requirement was relaxed and <FL/Fl.H> needs only be included if the class Fl is used or if some other stuff like enumerations is used in the source code. Example code in this documentation may still include it "everywhere" even if it is no longer strictly required.

In addition the program must include a header file for each FLTK class it uses. Listing 1 shows a simple "Hello, World!" program that uses FLTK to display the window.

Listing 1 - "hello.cxx"

```c
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>

int main(int argc, char **argv) {
  Fl_Window *window = new Fl_Window(340, 180);
  Fl_Box *box = new Fl_Box(20, 40, 300, 100, "Hello, World!");
  box->box(FL_UP_BOX);
  box->labelfont(FL_BOLD + FL_ITALIC);
  box->labelsize(36);
  box->labeltype(FL_SHADOW_LABEL);
  window->end();
  window->show(argc, argv);
  return Fl::run();
}
```

After including the required header files, the program then creates a window. All following widgets will automatically be children of this window.

```c
Fl_Window *window = new Fl_Window(340, 180);
```

Then we create a box with the "Hello, World!" string in it. FLTK automatically adds the new box to window, the current grouping widget.

```c
Fl_Box *box = new Fl_Box(20, 40, 300, 100, "Hello, World!");
```

Next, we set the type of box and the font, size, and style of the label:

```c
box->box(FL_UP_BOX);
box->labelfont(FL_BOLD + FL_ITALIC);
box->labelsize(36);
box->labeltype(FL_SHADOW_LABEL);
```

We tell FLTK that we will not add any more widgets to window.

```c
window->end();
```
Finally, we show the window and enter the FLTK event loop:

```c
window->show(argc, argv);
return Fl::run();
```

The resulting program will display the "Hello, World!" window:

![Hello, World! Window](image)

Figure 1.1 The Hello, World! Window

You can quit the program by closing the window or pressing the **ESC**ape key.

### 1.3.1.1 Creating the Widgets

The widgets are created using the C++ `new` operator. For most widgets the arguments to the constructor are:

```
Fl_Widget(x, y, width, height, label)
```

The `x` and `y` parameters determine where the widget or window is placed on the screen. In FLTK the top left corner of the window or screen is the origin (i.e. `x = 0, y = 0`).

The `width` and `height` parameters determine the size of the widget or window. The maximum widget size is typically governed by the underlying window system or hardware.

**What Units Do FLTK Functions Use?** describes the unit FLTK employs for `x`, `y`, `width`, and `height`, and more generally, for all graphical quantities.

`label` is a pointer to a character string to label the widget with or `NULL`. If not specified the label defaults to `NULL`. The label string must be in static storage such as a string constant because FLTK does not make a copy of it - it just uses the pointer.

### 1.3.1.2 Creating Widget Hierarchies

Widgets are commonly ordered into functional groups, which in turn may be grouped again, creating a hierarchy of widgets. FLTK makes it easy to fill groups by automatically adding all widgets that are created between a `myGroup->begin()` and `myGroup->end()`. In this example, `myGroup` would be the current group.

Newly created groups and their derived widgets implicitly call `begin()` in the constructor, effectively adding all subsequently created widgets to itself until `end()` is called.

Calling `end()` on one group widget transfers the "current group" property to the parent of that widget. Calling `end()` on a top level window (which has no parent) sets the current group to `NULL`.

Setting the current group to `NULL` will stop automatic hierarchies. New widgets can now be added manually using `Fl_Group::add(...)` and `Fl_Group::insert(...).`
1.3 FLTK Basics

1.3.1.3 Get/Set Methods

box->box(FL_UP_BOX) sets the type of box the Fl_Box draws, changing it from the default of FL_NO_BOX, which means that no box is drawn. In our "Hello, World!" example we use FL_UP_BOX, which means that a raised button border will be drawn around the widget. More details are available in the Box Types section.

You could examine the boxtype by doing box->box(). FLTK uses method name overloading to make short names for get/set methods. A "set" method is always of the form "void name(type)", and a "get" method is always of the form "type name() const".

1.3.1.4 Redrawing After Changing Attributes

Almost all of the get/set pairs are very fast, short inline functions and thus very efficient. However, the "set" methods do not call redraw() - you have to call it yourself. This greatly reduces code size and execution time. The only common exceptions are value() which calls redraw() and label() which calls redraw_label() if necessary.

1.3.1.5 Labels

All widgets support labels. In the case of window widgets, the label is used for the label in the title bar. Our example program calls the labelfont(), labelsize(), and labeltype() methods.

The labelfont() method sets the typeface and style that is used for the label, which for this example we are using FL_BOLD and FL_ITALIC.

The labelsize() method sets the height of the font in FLTK units.

The labeltype() method sets the type of label. FLTK supports normal, embossed, and shadowed labels internally, and more types can be added as desired.

A complete list of all label options can be found in the section on Labels and Label Types.

1.3.1.6 Showing the Window

The show() method shows the widget or window. For windows you can also provide the command-line arguments to allow users to customize the appearance, size, and position of your windows.

1.3.1.7 The Main Event Loop

All FLTK applications (and most GUI applications in general) are based on a simple event processing model. User actions such as mouse movement, button clicks, and keyboard activity generate events that are sent to an application. The application may then ignore the events or respond to the user, typically by redrawing a button in the "down" position, adding the text to an input field, and so forth.

FLTK also supports idle, timer, and file pseudo-events that cause a function to be called when they occur. Idle functions are called when no user input is present and no timers or files need to be handled - in short, when the application is not doing anything. Idle callbacks are often used to update a 3D display or do other background processing.

Timer functions are called after a specific amount of time has expired. They can be used to pop up a progress dialog after a certain amount of time or do other things that need to happen at more-or-less regular intervals. FLTK timers are not 100% accurate, so they should not be used to measure time intervals, for example.

File functions are called when data is ready to read or write, or when an error condition occurs on a file. They are most often used to monitor network connections (sockets) for data-driven displays.

FLTK applications must periodically check (Fl::check()) or wait (Fl::wait()) for events or use the Fl::run() method to enter a standard event processing loop. Calling Fl::run() is equivalent to the following code:

```c
while (Fl::wait());
```

Fl::run() does not return until all of the windows under FLTK control are closed by the user or your program.
1.3.2 Naming Conventions

All public symbols in FLTK start with the characters 'F' and 'L':

- Functions are either `Fl::foo()` or `fl_foo()`.

- Class and type names are capitalized: `Fl_Foo`.

- Constants and Enumerations are uppercase: `FL_FOO`.

- All header files start with `<FL/...>`.

1.3.3 Header Files

The proper way to include FLTK header files is:

```
#include <FL/Fl_xyz.H>
```

**Note**

Case is significant on many operating systems, and the C standard uses the forward slash (/) to separate directories. Do not use any of the following include lines:

```
#include <FL/Fl_xyz.H>
#include <fl/fl_xyz.h>
#include <Fl/fl_xyz.h>
```

1.3.4 Compiling Programs that Use FLTK

Since FLTK 1.4 CMake is the recommended build system. The details below show the "old" methods and reference information in case you like to write your build configuration manually (e.g. Makefiles, Visual Studio, other IDE's ...).

CMake can simplify this task substantially. For now, refer to README.CMake.txt for further information.

**Todo** This section needs a major rework. Add a chapter "Building FLTK with CMake".

1.3.4.1 Compiling Programs with Standard Compilers

Under UNIX (and under Microsoft Windows when using the GNU development tools) you will probably need to tell the compiler where to find the header files. This is usually done using the `-I` option:

```c
cc++ -I/usr/local/include ...
```

**Note**

You need a C++ compiler to build FLTK. The commands given in this chapter are examples using `c++`. Please replace this command with the C++ compiler suitable for your system or use the `fltk-config` script as described below (this is recommended).
The `fltk-config` script included with FLTK can be used on systems with a Posix compliant shell, for instance Unix/Linux, macOS, Windows with MinGW, MSYS2, or Cygwin.

**Note**

`fltk-config` is not designed to work on Windows with Visual Studio compilers. If it works, then only by accident and this is undefined behavior.

`fltk-config --help` displays all available options.

`fltk-config` can be used to get the compiler and the options that are required by your compiler to build a program using the FLTK library:

```bash
fltk-config --cc
fltk-config --cxx
```

return the C and C++ compiler commands used to build FLTK.

```bash
c++ `fltk-config --cxxflags` ...
```

can be used to include the required compiler flags in the command line.

Similarly, when linking your application you will need to tell the compiler to use the FLTK library:

```bash
c++ ... -L/usr/local/lib -lfltk -lXext -lX11 ... -lm -ldl
```

Aside from the "fltk" library, there are also the following libraries:

- "fltk_forms" for the XForms compatibility classes (deprecated)
- "fltk_gl" for the OpenGL and GLUT classes
- "fltk_images" for the image file classes, Fl_Help_Dialog widget, and system icon support.

The libraries are named `fltk.lib`, `fltk_forms.lib`, `fltk_gl.lib`, and `fltk_images.lib` under Windows.

**Note**

The separate `fltk_cairo` library is no longer necessary since FLTK 1.4.0. However, this release of FLTK builds a dummy `fltk_cairo` library for backwards compatibility. You are advised to remove the usage of the `fltk_cairo` library from your build systems and tools. The `fltk_cairo` library will be removed in a future release.

As before, the `fltk-config` script can be used to get the options that are required by your linker:

```bash
c++ ... `fltk-config --ldflags`
```

The forms, GL, and images libraries are included with the "--use-foo" options, as follows:

```bash
c++ ... `fltk-config --use-forms --ldflags`
c++ ... `fltk-config --use-gl --ldflags`
c++ ... `fltk-config --use-cairo --ldflags`
c++ ... `fltk-config --use-forms --use-gl --use- images --ldflags`
```

The option "--use-cairo" may be used to build your program with Cairo libs if you use Cairo in your code. It does no longer include the `fltk_cairo` lib but all necessary Cairo compiler flags and Cairo libs, if and only if FLTK has been built with the optional Cairo support by configure or CMake.

Finally, you can use the `fltk-config` script to compile one or more source files as a FLTK program.

The following examples will create an executable named `filename` (or `filename.exe` under Windows) from a single source file:

```bash
fltk-config --compile filename.cxx
fltk-config --use-forms --compile filename.cpp
fltk-config --use-gl --compile filename.C
fltk-config --use-images --compile filename.cc
fltk-config --use-cairo --compile filename.cpp
fltk-config --use-forms --use-gl --use-images --compile filename.cpp
```

**Note**

`'fltk-config --compile'` accepts only a limited set of file extensions for C++ source files: `.cpp`, `.cxx`, `.cc`, and `.C` (capital 'C').
1.3.4.3 Compiling Multiple Source Files with 'fltk-config'

Before version 1.4.0 fltk-config accepted only a single source file and no additional compiler options or libraries. As of FLTK 1.4.0 it is possible to use additional compiler flags, more than one source file, and additional link libraries.

This is intended to be used for quick prototyping and not for production code development. It can be used to test compiler command options (like --Wall or --Wextra) or additional link libraries if these are required.

Building from more than one source file with flags and libraries can be achieved as follows:

```
fltk-config [USE-FLAGS] --compile MAIN [FLAGS] [SOURCES] [--link LFLAGS LIBS]
```

where

- arguments in [...] are optional
- USE-FLAGS are as described above, e.g. --use-images
- MAIN is the main C++ source file as documented above
- FLAGS are additional compiler flags
- SOURCES are additional source files or libraries
- --link is used to separate source files and flags from linker flags and libs
- LFLAGS are optional linker flags
- LIBS are additional libraries to link against

The final commandline is composed like this example:
```
$ fltk-config --compile main.cxx button.o --link -L/usr/include/cairo/ -lcairo
g++ {fltk-flags} -o main -Wextra main.cxx button.o x1.a {fltk-libs} -L/usr/include/cairo/ -lcairo
```

where {fltk-flags} are the compiler flags generated by fltk-config as before and {fltk-libs} are the usual linker flags and libraries. All optional parameters are used as-is, i.e. there is no syntax checking or special parsing except: the order of flags and source files is preserved (from the commandline) but all flags (--something) are positioned before all sources, i.e. arguments w/o leading dash ('-'). All compiler flags and libraries generated from the library build follow all options and source files given on the commandline, and finally everything after --link is appended.

1.3.4.4 Compiling Programs with Makefiles

The previous sections described how to use fltk-config to build a program from the command line, and this is very convenient for small test programs. But fltk-config can also be used to set the compiler and linker options as variables within a Makefile that can be used to build larger programs.

```
CXX = $(shell fltk-config --cxx)
DEBUG = -g
CXXFLAGS = $(shell fltk-config --use-gl --use-images --cxxflags ) -I.
LDFLAGS = $(shell fltk-config --use-gl --use-images --ldflags )
LDSTATIC = $(shell fltk-config --use-gl --use-images --ldstaticflags )
LINK = $(CXX)
TARGET = cube
OBJS = CubeMain.o CubeView.o CubeViewUI.o
SRCS = CubeMain.cxx CubeView.cxx CubeViewUI.cxx

.SUFFIXES: .o .cxx
%.o: %.cxx
  $(CXX) $(CXXFLAGS) $(DEBUG) -c $<
all: $(TARGET)
  $(LINK) -o $(TARGET) $(OBJS) $(LDSTATIC)
$(TARGET): $(OBJS)
  CubeMain.o: CubeMain.cxx CubeViewUI.h
  CubeView.o: CubeView.cxx CubeViewUI.h
  CubeViewUI.o: CubeViewUI.cxx CubeViewUI.h
clean: $(TARGET) $(OBJS)
  rm -f *.o 2>&1 | /dev/null
  rm -f $(TARGET) 2>&1 | /dev/null
```

Generated by Doxygen
1.3.4.5 Compiling Programs with Microsoft Visual C++

In Visual C++ you will need to tell the compiler where to find the FLTK header files. This can be done by selecting "Settings" from the "Project" menu and then changing the "Preprocessor" settings under the "C/C++" tab.

You will also need to add the following libraries to the Linker settings:

- `fltk.lib` or `fltkd.lib`, the main FLTK library (postfix 'd' = Debug)
- all FLTK libraries your program requires (`fltk_gl`, `fltk_images`, ...)
- additional libraries like `libpng.lib`, `libjpeg.lib`, etc.
- the Windows Common Controls (`comctl32.lib`) and
- the GDIplus library if used to build FLTK (`gdiplus.lib`) and
- the Windows Socket (`ws2_32.lib`) libraries.

**Note**

There's a Linker setting "Additional Library Directories" or similar; the exact name depends on the Visual Studio version you're using. You can and **should** use this to simplify adding the libraries above. If you set this to the FLTK library path you can just use the library **names** and don't need to use the full paths to all libraries.

You must also define `_WIN32` if the compiler doesn't do this. Currently all known Windows compilers define `_WIN32` - unless you use Cygwin (that's correct, you must not define `_WIN32` if you use Cygwin).

More information can be found in README.Windows.txt.

You can build your Microsoft Windows applications as Console or Desktop applications. If you want to use the standard `C main()` function as the entry point, FLTK includes a `WinMain()` function that will call your `main()` function for you.

## 1.4 Common Widgets and Attributes

This chapter describes many of the widgets that are provided with FLTK and covers how to query and set the standard attributes.

### 1.4.1 Buttons

FLTK provides many types of buttons:

- **Fl_Button** - A standard push button.

- **Fl_Check_Button** - A button with a check box.

- **Fl_Light_Button** - A push button with a light.

- **Fl_Repeat_Button** - A push button that repeats when held.
• **FL_Return_Button** - A push button that is activated by the *Enter* key.

• **FL_Round_Button** - A button with a radio circle.

![Figure 1.2 FLTK Button Widgets](image)

All of these buttons just need the corresponding `<FL/Fl_xyz_Button.H>` header file. The constructor takes the bounding box of the button and optionally a label string:

```cpp
Fl_Button *button = new Fl_Button(x, y, width, height, "label");
Fl_Light_Button *lbutton = new Fl_Light_Button(x, y, width, height);
Fl_Round_Button *rbutton = new Fl_Round_Button(x, y, width, height, "label");
```

Each button has an associated `type()` which allows it to behave as a push button, toggle button, or radio button:

```cpp
button->type(FL_NORMAL_BUTTON);
lbutton->type(FL_TOGGLE_BUTTON);
rbutton->type(FL_RADIO_BUTTON);
```

For toggle and radio buttons, the `value()` method returns the current button state (0 = off, 1 = on). The `set()` and `clear()` methods can be used on toggle buttons to turn a toggle button on or off, respectively. Radio buttons can be turned on with the `setonly()` method; this will also turn off other radio buttons in the same group.

### 1.4.2 Text

FLTK provides several text widgets for displaying and receiving text:

• **Fl_Input** - A one-line text input field.

• **Fl_Output** - A one-line text output field.

• **Fl_Multiline_Input** - A multi-line text input field.

• **Fl_Multiline_Output** - A multi-line text output field.

• **Fl_Text_Display** - A multi-line text display widget.

• **Fl_Text_Editor** - A multi-line text editing widget.

• **Fl_Help_View** - A HTML text display widget.

The `Fl_Output` and `Fl_Multiline_Output` widgets allow the user to copy text from the output field but not change it.

The `value()` method is used to get or set the string that is displayed:

```cpp
Fl_Input *input = new Fl_Input(x, y, width, height, "label");
input->value("Now is the time for all good men...");
```

The string is copied to the widget's own storage when you set the `value()` of the widget.

The `Fl_Text_Display` and `Fl_Text_Editor` widgets use an associated `Fl_Text_Buffer` class for the value, instead of a simple string.
1.4.3 Valuators

Unlike text widgets, valuators keep track of numbers instead of strings. FLTK provides the following valuators:

- **FL.Counter** - A widget with arrow buttons that shows the current value.
- **FL.Dial** - A round knob.
- **FL.Roller** - An SGI-like dolly widget.
- **FL.Scrollbar** - A standard scrollbar widget.
- **FL.Slider** - A scrollbar with a knob.
- **FL.Value_Slider** - A slider that shows the current value.

The `value()` method gets and sets the current value of the widget. The `minimum()` and `maximum()` methods set the range of values that are reported by the widget.
1.4.4 Groups

The Fl_Group widget class is used as a general purpose "container" widget. Besides grouping radio buttons, the groups are used to encapsulate windows, tabs, and scrolled windows. The following group classes are available with FLTK:

- Fl_Double_Window - A double-buffered window on the screen.
- Fl_Gl_Window - An OpenGL window on the screen.
- Fl_Group - The base container class; can be used to group any widgets together.
- Fl_Pack - A collection of widgets that are packed into the group area.
- Fl_Scroll - A scrolled window area.
- Fl_Tabs - Displays child widgets as tabs.
- Fl_Tile - A tiled window area.
- Fl_Window - A window on the screen.
- Fl_Wizard - Displays one group of widgets at a time.

1.4.5 Setting the Size and Position of Widgets

The size and position of widgets is usually set when you create them. You can access them with the x(), y(), w(), and h() methods.

You can change the size and position by using the position(), resize(), and size() methods:

```
button->position(x, y);
group->resize(x, y, width, height);
window->size(width, height);
```

If you change a widget's size or position after it is displayed you will have to call redraw() on the widget's parent.
1.4 Common Widgets and Attributes

1.4.6 Colors

FLTK stores the colors of widgets as an 32-bit unsigned number that is either an index into a color palette of 256 colors or a 24-bit RGB color. The color palette is not the X or MS Windows colormap, but instead is an internal table with fixed contents.

See the Colors section of Drawing Things in FLTK for implementation details.

There are symbols for naming some of the more common colors:

- FL_BLACK
- FL_RED
- FL_GREEN
- FL_YELLOW
- FL_BLUE
- FL_MAGENTA
- FL_CYAN
- FL_WHITE

Other symbols are used as the default colors for all FLTK widgets.

- FL_FOREGROUND_COLOR
- FL_BACKGROUND_COLOR
- FL_INACTIVE_COLOR
- FL_SELECTION_COLOR

The full list of named color values can be found in FLTK Enumerations.

A color value can be created from its RGB components by using the `fl_rgb_color()` function, and decomposed again with `Fl::get_color()`:

```cpp
Fl_Color c = fl_rgb_color(85, 170, 255); // RGB to Fl_Color
Fl::get_color(c, r, g, b); // Fl_Color to RGB
```

The widget color is set using the `color()` method:

```cpp
button->color(FL_RED); // set color using named value
```

Similarly, the label color is set using the `labelcolor()` method:

```cpp
button->labelcolor(FL_WHITE);
```

The Fl_Color encoding maps to a 32-bit unsigned integer representing RGBI, so it is also possible to specify a color using a hex constant as a color map index:

```cpp
button->color(0x000000ff); // colormap index #255 (FL_WHITE)
```

or specify a color using a hex constant for the RGB components:

```cpp
button->color(0xff000000); // RGB: red
button->color(0x00ff0000); // RGB: green
button->color(0x0000ff00); // RGB: blue
button->color(0xffffff00); // RGB: white
```

Note

If TrueColor is not available, any RGB colors will be set to the nearest entry in the colormap.
1.4.7 Box Types

The type Fl_Boxtype stored and returned in Fl_Widget::box() is an enumeration defined in Enumerations.H.

These are the standard box types included with FLTK:

![Figure 1.4 FLTK Standard Box Types](image)

**FL_NO_BOX** means nothing is drawn at all, so whatever is already on the screen remains. The **FL_..._FRAME** types only draw their edges, leaving the interior unchanged. The blue color in the image above is the area that is not drawn by the frame types.

### 1.4.7.1 Making Your Own Boxtypes

You can define your own boxtypes by making a small function that draws the box and adding it to the table of boxtypes.

#### The Drawing Function

The drawing function is passed the bounding box and background color for the widget:

```c
void xyz_draw(int x, int y, int w, int h, Fl_Color c) {
    ...
}
```

A simple drawing function might fill a rectangle with the given color and then draw a black outline:

```c
void xyz_draw(int x, int y, int w, int h, Fl_Color c) {
    fl_color(c);
    fl_rectf(x, y, w, h);
    fl_color(FL_BLACK);
    fl_rect(x, y, w, h);
}
```

**Fl_Boxtype fl_down(Fl_Boxtype b)**
fl_down() returns the “pressed” or “down” version of a box. If no “down” version of a given box exists, the behavior of this function is undefined and some random box or frame is returned. See Drawing Functions for more details.

Fl_Boxtype fl_frame(Fl_Boxtype b)

fl_frame() returns the unfilled, frame-only version of a box. If no frame version of a given box exists, the behavior of this function is undefined and some random box or frame is returned. See Drawing Functions for more details.

Fl_Boxtype fl_box(Fl_Boxtype b)

fl_box() returns the filled version of a frame. If no filled version of a given frame exists, the behavior of this function is undefined and some random box or frame is returned. See Drawing Functions for more details.

Adding Your Box Type

The Fl::set_boxtype() method adds or replaces the specified box type:

```c
#define XYZ_BOX FL_FREE_BOXTYPE
Fl::set_boxtype(XYZ_BOX, xyz_draw, 1, 1, 2, 2);
```

The last 4 arguments to Fl::set_boxtype() are the offsets for the x, y, width, and height values that should be subtracted when drawing the label inside the box.

A complete box design contains four box types in this order: a filled, neutral box (UP_BOX), a filled, depressed box (DOWN_BOX), and the same as outlines only (UP_FRAME and DOWN_FRAME). The function fl_down(Fl_Boxtype) expects the neutral design on a boxtype with a numerical value evenly dividable by two. fl_frame(Fl_Boxtype) expects the UP_BOX design at a value dividable by four.

1.4.8 Labels and Label Types

The label(), align(), labelfont(), labelsize(), labeltype(), image(), and deimage() methods control the labeling of widgets.
The label() method sets the string that is displayed for the label. Symbols can be included with the label string by escaping them using the "@" symbol - "@@" displays a single at sign. These are the available symbols:

![FLTK label symbols](image)

The @ sign may also be followed by the following optional "formatting" characters, in this order:

- '#' forces square scaling, rather than distortion to the widget's shape.
- +[1-9] or -[1-9] tweaks the scaling a little bigger or smaller.
- '$' flips the symbol horizontally, '%' flips it vertically.
- [0-9] - rotates by a multiple of 45 degrees. '5' and '6' do no rotation while the others point in the direction of that key on a numeric keypad. '0', followed by four more digits rotates the symbol by that amount in degrees.

Thus, to show a very large arrow pointing downward you would use the label string "@+92->".

Symbols and text can be combined in a label, however the symbol must be at the beginning and/or at the end of the text. If the text spans multiple lines, the symbol or symbols will scale up to match the height of all the lines.
align()

The `align()` method positions the label. The following constants are defined and may be OR'd together as needed:

- `FL_ALIGN_CENTER` - center the label in the widget.
- `FL_ALIGN_TOP` - align the label at the top of the widget.
- `FL_ALIGN_BOTTOM` - align the label at the bottom of the widget.
- `FL_ALIGN_LEFT` - align the label to the left of the widget.
- `FL_ALIGN_RIGHT` - align the label to the right of the widget.
- `FL_ALIGN_LEFT_TOP` - The label appears to the left of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_RIGHT_TOP` - The label appears to the right of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_LEFT_BOTTOM` - The label appears to the left of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_RIGHT_BOTTOM` - The label appears to the right of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_INSIDE` - align the label inside the widget.
- `FL_ALIGN_CLIP` - clip the label to the widget's bounding box.
- `FL_ALIGN_WRAP` - wrap the label text as needed.
- `FL_ALIGN_TEXT_OVER_IMAGE` - show the label text over the image.
- `FL_ALIGN_IMAGE_OVER_TEXT` - show the label image over the text (default).
- `FL_ALIGN_IMAGE_NEXT_TO_TEXT` - The image will appear to the left of the text.
- `FL_ALIGN_TEXT_NEXT_TO_IMAGE` - The image will appear to the right of the text.
- `FL_ALIGN_IMAGE_BACKDROP` - The image will be used as a background for the widget.
labeltype()

The `labeltype()` method sets the type of the label. The following standard label types are included:

- `FL_NORMAL_LABEL` - draws the text.
- `FL_NO_LABEL` - does nothing.
- `FL_SHADOW_LABEL` - draws a drop shadow under the text.
- `FL_ENGRAVED_LABEL` - draws edges as though the text is engraved.
- `FL_EMBOSSED_LABEL` - draws edges as though the text is raised.
- `FL_ICON_LABEL` - draws the icon (`Fl_Image`) associated with the text.
- `FL_IMAGE_LABEL` - draws the image (`Fl_Image`) associated with the text.
- `FL_MULTI_LABEL` - draws multiple parts side by side, see `Fl_Multi_Label`.

Note

Some of these labeltypes are no longer necessary for normal widgets. Widgets allow for an image and a text side by side, depending on the widget's `align()` flag. `FL_MULTI_LABEL` was designed to be used with `Fl_MENU_ITEM`'s to support icons or small images, typically left of the menu text.

As of this writing (FLTK 1.4.0, Sep 2017) `Fl_MENU_ITEMS` support only one label part (text or image), but using `Fl_Multi_Label` as the label can extend this to more than one part.

See also

- class `Fl_Multi_Label`, `Fl_Widget::align()`

image() and deimage()

The `image()` and `deimage()` methods set an image that will be displayed with the widget. The `deimage()` method sets the image that is shown when the widget is inactive, while the `image()` method sets the image that is shown when the widget is active.

To make an image you use a subclass of `Fl_Image`.

Making Your Own Label Types

Label types are actually indexes into a table of functions that draw them. The primary purpose of this is to use this to draw the labels in ways inaccessible through the `fl_font()` mechanism (e.g. `FL_ENGRAVED_LABEL`) or with program-generated letters or symbology.
Label Type Functions

To setup your own label type you will need to write two functions: one to draw and one to measure the label. The draw function is called with a pointer to a Fl_Label structure containing the label information, the bounding box for the label, and the label alignment:

```c
void xyz_draw(const Fl_Label *label, int x, int y, int w, int h, Fl_Align align) {
    ...
}
```

The label should be drawn inside this bounding box, even if FL_ALIGN_INSIDE is not enabled. The function is not called if the label value is NULL.

The measure function is called with a pointer to a Fl_Label structure and references to the width and height:

```c
void xyz_measure(const Fl_Label *label, int &w, int &h) {
    ...
}
```

The function should measure the size of the label and set \( w \) and \( h \) to the size it will occupy.

Adding Your Label Type

The Fl::set_labeltype() method creates a label type using your draw and measure functions:

```c
#define XYZ_LABEL FL_FREE_LABELTYPE
Fl::set_labeltype(XYZ_LABEL, xyz_draw, xyz_measure);
```

The label type number \( n \) can be any integer value starting at the constant FL_FREE_LABELTYPE. Once you have added the label type you can use the labeltype() method to select your label type.

The Fl::set_labeltype() method can also be used to overload an existing label type such as FL_NORMAL_LABEL.

Making your own symbols

It is also possible to define your own drawings and add them to the symbol list, so they can be rendered as part of any label.

To create a new symbol, you implement a drawing function `void drawit(Fl_Color c)` which typically uses the functions described in Drawing Complex Shapes to generate a vector shape inside a two-by-two units sized box around the origin. This function is then linked into the symbols table using fl_add_symbol():

```c
int fl_add_symbol(const char *name, void (*drawit)(Fl_Color), int scalable)
```

`name` is the name of the symbol without the "@"; `scalable` must be set to 1 if the symbol is generated using scalable vector drawing functions.

```c
int fl_draw_symbol(const char *name, int x, int y, int w, int h, Fl_Color col)
```

This function draws a named symbol fitting the given rectangle.
1.4.9 Callbacks

Callbacks are functions that are called when the value of a widget changes. A callback function is sent a `Fl_Widget` pointer of the widget that changed and a pointer to data that you provide:

```c
void xyz_callback(Fl_Widget *w, void *data) {
...
}
```

The `callback()` method sets the callback function for a widget. You can optionally pass a pointer to some data needed for the callback:

```c
int xyz_data;
button->callback(xyz_callback, &xyz_data);
```

Note

You cannot delete a widget inside a callback, as the widget may still be accessed by FLTK after your callback is completed. Instead, use the `Fl::delete_widget()` method to mark your widget for deletion when it is safe to do so.

Many programmers new to FLTK or C++ try to use a non-static class method instead of a static class method or function for their callback. Since callbacks are done outside a C++ class, the `this` pointer is not initialized for class methods.

To work around this problem, define a static method in your class that accepts a pointer to the class, and then have the static method call the class method(s) as needed. The data pointer you provide to the `callback()` method of the widget can be a pointer to the instance of your class.

```c
class Foo {
  void my_callback(Fl_Widget *w);
  static void my_static_callback(Fl_Widget *w, void *f) {
    ((Foo *)f)->my_callback(w);
  }
  ...
  ...
  w->callback(my_static_callback, (void *)this);
}
```

In an effort to make callbacks easier, more flexible, and type safe, FLTK provides three groups of macros that generate the code needed to call class methods directly with up to five custom parameters.

- `FL_FUNCTION_CALLBACK_#(WIDGET, FUNCTION, ...)` creates code for callbacks to functions and static class methods with up to five arguments. The `#` must be replaced by the number of callback arguments.
- `FL_METHOD_CALLBACK_#(WIDGET, CLASS, SELF, METH, ...)` creates code for callbacks to arbitrary public class methods
- `FL_INLINE_CALLBACK_#(WIDGET, ..., FUNCTION_BODY)` creates code for callback functions that are very close to (almost in the same line) the widget creation code, similar to lambda function in C++11. The last argument of this macro is the callback code.

The syntax is a bit unconventional, but the resulting code is flexible and needs no additional maintenance. It is also C++98 compatible. For example:

```c
#include <FL/fl_callback_macros.H>

... Fl_String *str = new Fl_String("FLTK");
Fl_Button *btn = new Fl_Button(10, 10, 100, 100);
FL_METHOD_CALLBACK_2(btn, Fl_String, str, insert, int, 2, const char *, "...");
...
Fl_Button *inline_cb_btn_2 = new Fl_Button(390, 60, 180, 25, "2 args");
FL_INLINE_CALLBACK_2( inline_cb_btn_2, const char *, text, "FLTK", int, number, 2,
  { fl_message("We received the message %s with %d!", text, number); })
...
```

- `FL_INLINE_CALLBACK_2`
1.4.10 When and Reason

Normally callbacks are performed only when the value of the widget changes. You can change this using the `Fl_Widget::when()` method:

```cpp
button->when(FL_WHEN_NEVER);
button->when(FL_WHEN_CHANGED);
button->when(FL_WHEN_RELEASE);
button->when(FL_WHEN_RELEASE_ALWAYS);
button->when(FL_WHEN_ENTER_KEY);
button->when(FL_WHEN_ENTER_KEY_ALWAYS);
button->when(FL_WHEN_CHANGED | FL_WHEN_NOT_CHANGED);
```

Within the callback, you can query why the callback was called using `Fl::callback_reason()`. For example, setting

```cpp
myInput->when(FL_WHEN_RELEASE | FL_WHEN_CHANGED)
```

for a text input field may return `FL_REASON_LOST_FOCUS` or `FL_REASON_CHANGED` as a callback reason.

1.4.11 Shortcuts

Shortcuts are key sequences that activate widgets such as buttons or menu items. The `shortcut()` method sets the shortcut for a widget:

```cpp
button->shortcut(FL_Enter);
button->shortcut(FL_SHIFT + 'b');
button->shortcut(FL_CTRL + 'b');
button->shortcut(FL_ALT + 'b');
button->shortcut(FL_CTRL + FL_ALT + 'b');
button->shortcut(0); // no shortcut
```

The shortcut value is the key event value - the ASCII value or one of the special keys described in `Fl::event_key()` Values combined with any modifiers like `Shift`, `Alt`, and `Control`.

1.5 Coordinates and Layout Widgets

This chapter describes the coordinate systems that apply when positioning widgets manually, and some of the basics of FLTK layout widgets that are used to position widgets automatically.

1.5.1 The Widget Coordinate System

All widgets have constructors with `x` and `y` parameters to let the programmer specify the desired initial position of the top left corner during explicit manual layout within `Fl_Window` and `Fl_Group` container widgets.

This position is always relative to the enclosing `Fl_Window`, which is usually, but not always, the top-level application window, or a free-floating pop-up dialog window. In some cases it could also be a subwindow embedded in a higher-level window, as shown in the figure below.

![Figure 1.7 FLTK coordinate system](image)

`Fl_Window TL(0, 0, 250, 100)`
`x, y relative to main window`

`Fl_Group BL(100, 250, 100)`
`x, y relative to main window`

`Fl_Box tl(25, 50, 200, 40)`
`x, y relative to TL window`

`Fl_Box bl(25, 150, 200, 40)`
`x, y relative to main window`

`Fl_Window TR(250, 0, 250, 100)`
`x, y relative to main window`

`Fl_Window BR(250, 100, 250, 100)`
`x, y relative to main window`

`Fl_Box tr(25, 50, 200, 40)`
`x, y relative to TR window`

`Fl_Box br(25, 150, 200, 40)`
`x, y relative to BR window`

Figure 1.7 FLTK coordinate system

Generated by Doxygen
The positions of the TL and BR sub-windows and the TR and BL groups are all relative to the top-left corner of the main window. The positions of the boxes inside the TR and BL groups are also relative to the main window, but the boxes inside the TL and BR sub-windows are positioned relative to the enclosing sub-window.

In other words, the widget hierarchy and positions can be summarized as:

```
Fl_Window main window
Fl_Window TL subwindow # x, y relative to main window
   Fl_Box tl box # x, y relative to TL subwindow
Fl_Window BR subwindow # x, y relative to main window
   Fl_Box br box # x, y relative to BR subwindow
Fl_Group TR group # x, y relative to main window
   Fl_Box tr box # x, y relative to main window
Fl_Group BL group # x, y relative to main window
   Fl_Box bl box # x, y relative to main window
```

1.5.2 Layout and Container Widgets

There are four main groups of widgets derived from Fl_Group for a range of different purposes.

The first group are composite widgets that each contain a fixed set of components that work together for a specific purpose, rather than layout widgets as such, and are not discussed here.

The second group are basically containers offering the same manual layout features as Fl_Group, as described above, but which add one new capability. These widgets are Fl_Scroll, Fl_Tabs and Fl_Wizard.

The third group are layout managers that relocate and resize the child widgets added to them in order to satisfy a particular layout algorithm. These widgets are Fl_Flex, Fl_Grid, Fl_Pack, and Fl_Tile.

The final group consists of Fl_Window and its derivatives. Their special capability is that they can be top-level application windows and dialogs that interface with the operating system window manager, but can also be embedded within other windows and groups as shown in the example above. Note that the window manager may impose its own constraints on the position of top-level windows, and the x and y position parameters may be treated as hints, or even ignored. The Fl_Window class has an extra constructor that omits them.

Descriptions of layout and container widgets follow in alphabetical order.

1.5.2.1 The Fl_Flex Layout Widget

The Fl_Flex widget allows the layout of its direct children as a single row or column. If its type() is set to give the row or horizontal layout, the children are all resized to have the same height as the Fl_Flex and are moved next to each other. If set to give the column or vertical layout, the children are all resized to have the same width as the Fl_Flex and are then stacked below each other.

Widget positions (x, y) need not be given by the user because widgets are positioned inside the Fl_Flex container in the order of its children. Widget sizes can be set to (0, 0) as in Fl_Pack since they are calculated by Fl_Flex.

This is similar to Fl_Pack described below and Fl_Flex is designed to act as a drop-in replacement of Fl_Pack with some minor differences.

Other than Fl_Pack the Fl_Flex widget does not resize itself but resizes its children to fill the entire space of the Fl_Flex container. Single children of Fl_Flex can be set to fixed sizes to inhibit this resizing behavior. In this case the remaining space is distributed to all non-fixed widgets.

Fl_Flex widgets can be nested inside each other and with Fl_Grid in any combination.

The name Fl_Flex was inspired by the CSS ‘flex’ container.

Figure 1.8 Simple Fl_Flex Layout

Fl_Flex was added in FLTK 1.4.0.
1.5.2.2 The Fl_Grid Layout Widget

Fl_Grid is the most flexible layout container in FLTK 1.4. It is based on a flexible grid of cells that can be assigned one widget per cell which is the anchor of the widget. Widgets can span multiple rows and columns and the cells can constitute a sparse matrix. Widgets can be aligned inside their cells in several ways (left, right, top, bottom) and can stretch horizontally, vertically, or both, i.e. fill the entire cell.

Widget positions (x, y) need not be given by the user because widgets are assigned to a particular grid cell by row and column number. Widget sizes can be given as their minimal sizes and will be resized appropriately depending on the free space.

Optional margins around all cells inside the widget border and gaps between rows and cells make the layout even more flexible.

The Fl_Grid widget should be designed with a grid (matrix) and its minimal size in mind. It is designed to enlarge cells and widgets in a flexible way when the Fl_Grid widget itself is created or resized.

Additional free space inside the Fl_Grid container is distributed to widgets by considering minimal row heights, column widths, sizes of widgets, and row and column weights. These weights are used to distribute the free space proportionally according to the row and column weights.

Fl_Grid widgets can be nested inside each other and with Fl_Flex and other subclasses of Fl_Group in any combination.

Note

We don't recommend to use Fl_Pack as child widgets although this may work as well.

The name Fl_Grid was inspired by the CSS ‘grid’ container but it has some properties in common with HTML <table> containers as well, for instance row and column spanning.

Figure 1.9 Simple Fl_Grid Layout

Fl_Grid was added in FLTK 1.4.0.
1.5.2.3 The Fl_Pack Layout Widget

The Fl_Pack widget allows the layout of its direct children as a single row, or column. If its type() is set to give the row or horizontal layout, the children are all resized to have the same height as the Fl_Pack and are moved next to each other. If set to give the column or vertical layout, the children are all resized to have the same width as the Fl_Pack and are then stacked below each other. The Fl_Pack then resizes itself to shrink-wrap itself around all of the children.

Fl_Pack widgets are often used inside an Fl_Scroll, as shown in the diagram below, to avoid having to deal with tricky resize behavior when used with nested widgets.

Since FLTK 1.4.0 Fl_Flex (described above) can in many cases be used as a drop-in replacement for Fl_Pack if this "shrink-wrap" behavior is not required. Note that the Fl_Pack layout algorithm can cause some issues because its widget size can change depending on its children and particularly because this is done late, i.e. during draw() and not as usual during resize of the window.

Note

We recommend that developers evaluate whether using Fl_Flex or Fl_Grid instead of Fl_Pack can be a better solution with more predictable and reliable resizing behavior of the overall program layout.

1.5.2.4 The Fl_Scroll Container Widget

The Fl_Scroll container widget can hold an assortment of widgets that may extend beyond its own width and height, in which case horizontal and/or vertical scrollbars may appear automatically so that you can scroll and view the entire contents.
1.5.2.5 The Fl_Tabs Container Widget

The Fl_Tabs widget provides a front-to-back stack of individual panels which usually contain Fl_Group widgets and their children. The user can switch between panels by clicking on the small tabs that protrude from the panels. The appearance of each tab is determined by the child widget’s label and related attributes.

![Fl_Tabs container widget](image)

Figure 1.12 Fl_Tabs container widget

1.5.2.6 The Fl_Tile Layout Widget

The Fl_Tile widget allows the user to resize one or more of its children by dragging on the border between adjacent child widgets. However, the programmer must first explicitly layout the child widgets so that their borders exactly fill the width and height of the Fl_Tile without having any gaps between them, or at the edges. Some care is needed when initially positioning the children and setting the resizable() widget within the Fl_Tile to prevent squeezing a child to have a zero width or height. For more information see the Fl_Tile widget manual page, and How Does Resizing Work?.

![Fl_Tile layout widget](image)

Figure 1.13 The Fl_Tile layout widget

1.5.2.7 The Fl_Wizard Container Widget

The Fl_Wizard widget derives from the Fl_Tabs class, but instead of having tabs that the user can click to select the corresponding panel, the programmer uses the prev(), next() or value() methods to show the appropriate panel. For example, the user might be able to click on "Next" and "Prev" navigation buttons or keys, as shown below.

![Fl_Wizard container widget](image)

Figure 1.14 Fl_Wizard container widget
1.6 How Does Resizing Work?

This chapter describes the basic mechanism behind the creation of resizable user interface elements in FLTK.

FLTK uses a simple, but very versatile system to resize even the most complex dialogs and interfaces. The resizing is implemented within the `Fl_Group` widget, and the exact resizing behavior of that group is determined by its `resizable()` attribute.

1.6.1 Resizing can be disabled

Summary:
```
group = new Fl_Group(xg, yg, wg, hg, "No Resizing");
child1 = new Fl_Box(xb, yb, wb, hb, "B"); // or other widget type
...
group->resizable((Fl_Widget*)0); // no resizing
group->end()
```

The `resizable` may be set to the NULL pointer, which means that the group will not resize. Note that this is the default behavior for `Fl_Window` and `Fl_Pack` derived widgets, and therefore the programmer must explicitly set the window's `resizable` attribute if they want to allow the window to be resized.

1.6.2 Resizing can be simple

Summary:
```
group = new Fl_Group(xg, yg, wg, hg, "Simple Resizing");
child1 = new Fl_Box(xb, yb, wb, hb, "B"); // or other widget type
...
group->resizable(group); // simple proportional resizing
group->end()
```

The `resizable` may be set to the group itself, which means that all widgets within the group will resize as the group itself is resized. This is the default behavior for `Fl_Group` widgets, and is shown in the diagram below.

If the group is stretched horizontally, the widths of the widgets within the group are adjusted proportionally. The same is true for vertical resizing.

![Figure 1.15 Proportional resizing example](image)

Figure 1.15 Proportional resizing example
1.6 How Does Resizing Work?

1.6.3 Resizing can be complex

Summary:

```cpp
  group = new Fl_Group(xg, yg, wg, hg, "Complex Resizing");
  child1 = new Fl_Box(xb, yb, wb, hb, "B"); // or other widget type
  ...
  group->resizable(child1); // complex resizing
  group->end()
```

It is when the group's `resizable` attribute is set to one of the group's child widgets, that things become really interesting.

In the diagram below, imagine vertical lines extending from the left and right sides of the yellow widget marked "resizable", and horizontal lines extending from the top and bottom sides. Exactly which widgets resize, and by how much, is determined by which ones lie completely or partially within this cross.

The widgets marked B, C, J, K and M clearly lie completely or partially within the vertical part of the cross; the widgets marked E, F, G, H and N lie completely or partially within the horizontal part of the cross; and the widgets marked A, D, I and L do not overlap with the cross at all. The resizing behavior is as follows:

- the width and height of the `resizable` widget increase to match the change in the width and height of the group widget as it is stretched;

- the widths of those widgets that overlap with the vertical part of the cross increase proportionally as the width of the group widget increases, but their heights remain unchanged, i.e. the widgets marked B, C, J, K and M;

- the heights of those widgets that overlap with the horizontal part of the cross increase proportionally as the height of the group widget increases, but their widths remain unchanged, i.e. the widgets marked E, F, G, H and N;

- the widths and heights of the remaining widgets stay the same, i.e. the widgets marked A, D, I and L stay the same size.

![Figure 1.16 Complex resizing example](image-url)
1.6.4 Practical examples

Why is this so powerful, you may ask. Well, every widget group can have a completely independent resizing strategy. By replacing one or more of the group's "normal" child widgets with another group widget where all of the above rules can be applied again, it is possible to create a hierarchy of group widgets with very complex layouts and resizing behavior.

Consider a simple dialog box, consisting of an icon box and a message area on the top and a button at the bottom right: which widget should be the resizable one?

Setting the resizable to be the icon box won't give us what we want:

![Figure 1.17 Resizing dialog example (a)](image)

The message text area would be the logical choice so that the user can expand the dialog to see if there is more of an explanation below the short error message. This results in the behavior shown in the diagram below.

![Figure 1.18 Resizing dialog example (b)](image)

The result is close to what we want, but not quite: the text area will fully resize, the "!" icon box will resize vertically but not horizontally, which we can live with, but the "Darn!" button will - wait a minute - resize horizontally?

That's ugly. How do we stop that from happening? Simple: put it in its own group and set the resizable to an invisible box widget, as shown in the diagram below.
1.6 How Does Resizing Work?

Now the invisible box, shown as "R", takes all of the horizontal resizing and the "Darn!" box will stay as it is. Here's the skeleton code:

```c
dialog = new Fl_Window(300, 100);
icon = new Fl_Box(0, 0, 50, 50, "!");
text = new Fl_Box(50, 0, 250, 40, "Out of Memory Error");
btns = new Fl_Group(50, 50, 250, 50); // parent group
darn = new Fl_Button(200, 50, 100, 50, "Darn!");
R = new Fl_Box(50, 50, 150, 50); // "invisible" box
R->hide(); // make sure it's invisible
btns->resizable(R); // make *R* parent group resizable
dialog->resizable(text);
dialog->end();
```

Imagine instead that you have a group that has a button, an input field, another button and a second input field, all next to each other, and you want the input fields to resize equally, but not the buttons. How could you achieve this?

Setting either of the input fields to be the `resizable` leaves the other one fixed, as shown below:

![Figure 1.20 Resizing input fields example (b)](image1)

The answer is to leave the `resizable` of the group set to itself, and to create two equal size subgroups, each of which will resize equally. Add a button and input field to each subgroup, and set each subgroup's `resizable` to the input field, as shown below. Tada!
In FLTK it is possible to solve almost any layout and resizing problem by introducing an invisible box into a group, or an extra group into the widget hierarchy. It might take some thought to achieve exactly what you want and sometimes it is necessary to introduce parallel hierarchies in order to get widgets in different groups to resize together.

Imagine you have a group containing three widgets in a row, and you want the widget in the middle to stay the same size when the group is stretched and the ones on either side and the padding between them to resize symmetrically. As described earlier, the default resizing behavior for a group results in proportional resizing of the child widgets (and also of the margins and padding between them) as shown below, which is clearly not what you want.

![Figure 1.22 Resizing a row of widgets (a)](image)

Simply adding a group around A and B and setting its `resizable` to A, as in the previous btn-input example, will mean that B stays the same size, but the other widgets won't resize symmetrically, so what else is needed? It isn't immediately obvious how to solve this problem, even for experienced FLTK users. This is possibly because users are generally advised to design widgets so that they don't overlap.

Albrecht Schlosser proposed an innovative technique that involves an invisible box that deliberately overlaps others to achieve the desired behavior. For the current example, this means inserting two new groups into the existing group and adding a hidden resizable widget.

The first group, shown in red below, extends from the left edge of the parent group to the middle of the gap between boxes B and C on the right. This first group contains boxes A and B, where A is the first group's `resizable` attribute.

The second group, shown in blue, extends from the right edge of the first group to the right edge of the parent group. This second group contains box C, where C is the second group's `resizable`.

The extra box widget is added to the parent group and is set as the group's `resizable`. The three `resizable` widgets are shown in yellow.

The clever bit is that this extra box widget is not horizontally aligned with any of the existing groups and widgets in the usual way, but instead overlaps the right and left parts of the two new groups by the same small amount, which means that its midpoint is aligned with the edge between the groups.

Note that, for clarity, the height of the original group has been increased to allow space for the additional annotation and to highlight the extra resizable box in the extra space at the bottom of the group. This is fine for the horizontal-only resizing shown here, but means that widgets A, B and C will never change height because the extra resizable box does not overlap them vertically. Only the padding below them will be resized.

![Figure 1.23 Resizing a row of widgets (b)](image)
In a real application, you probably want to allow widgets A, B and C to resize vertically while the height of any padding or widgets above or below remains fixed, so the extra resizable box has to lie within the height of widgets A, B and C. Obviously after calling `hide()` on the box it is no longer visible, and may therefore be the same height as the other widgets, or a fraction of the height, as shown below.

![Figure 1.24 Resizing a row of widgets (c)](image)

To summarize the key points of the new technique:

- The new resizable widget must overlap the widgets on each side by exactly the same amount.
- The width of the new resizable widget is not fixed, but should probably be a relatively small value to avoid potential problems.
- The total width of the two new groups must equal the width of the existing group and there can be no offsets or gaps between them because margins and gaps will affect the resizing behavior.
- The same principles apply to vertical resizing.

### 1.7 Designing a Simple Text Editor

This chapter guides you through the design of a simple FLTK-based text editor.

The complete source code for our text editor can be found in the `test/editor.cxx` file.

The tutorial comprises multiple chapters, and you can activate the relevant code by adjusting the `TUTORIAL_\_\_CHAPTER` macro at the top of the source file to match the chapter number.

Each chapter builds on the previous one. The documentation, as well as the source code, can be read sequentially, maintaining a consistent program structure while introducing additional features step by step.

**Note**

The tutorial uses several global variables for brevity. Additionally, the order of code blocks is rather uncommon but helps to keep related features within a chapter.
1.7.1 Determining the Goals of the Text Editor

As our first step, we define what we want our text editor to do:

1. Edit a single text document.
2. Provide a menubar/menus for all functions.
3. Load from a file.
4. Save to a file.
5. Keep track of when the file has been changed.
7. Search and replace functionality.
8. Multiple views of the same text.

1.7.2 Chapter 1: A Minimal App

Let's ensure that we can set up our build process to compile and verify our code as we add features. We begin by writing a minimal program with no other purpose than opening a window.

The code for that is barely longer than a "Hello, world" program and is marked in the source code as TUTORIAL

```c
#include <FL/Fl_Double_Window.H>
#include <FL/Fl.H>

Fl_Double_Window *app_window = NULL;

void tut1_build_app_window() {
    app_window = new Fl_Double_Window(640, 480, "FLTK Editor");
}

int main (int argc, char **argv) {
    tut1_build_app_window();
    app_window->show(argc, argv);
    return Fl::run();
}
```

Passing `argc` and `argv` to `Fl_Double_Window::show()` allows FLTK to parse command line options, providing the user with the ability to change the color or graphical scheme of the editor at launch time.

`Fl::run()` will return when no more windows in the app are visible. In other words, if all windows in an app are closed, hidden, or deleted. Pressing "Escape" or clicking the "Close" button in the window frame will close our only window, prompting `Fl::run()` to return, effectively ending the app.

When building FLTK from source, the CMake environment includes the necessary rules to build the editor. You can find more information on how to write your own CMake files in the README.CMake.txt text in the top FLTK directory.

For Linux and macOS, FLTK comes with the fltk-config script that generates the compiler commands for you:

```
fltk-config --compile editor.cxx
```

If the code compiles and links correctly, running the app will pop up an empty application window on the desktop screen. You can close the window and quit the app by pressing the 'Escape' key or by clicking the "Close" button in the window frame.

Congratulations, you've just built a minimal FLTK app.
1.7 Designing a Simple Text Editor

1.7.3 Chapter 2: Adding a Menu Bar

In this chapter, we will add the main menu bar with a File menu and a Quit button. This is a good time to define a flag that will track changes in the text later.

```cpp
// remove `main()' from chapter 1, but keep the rest of the code, then add...
#include <FL/Fl_Menu_Bar.H>
#include <FL/fl_ask.H>

Fl_Menu_Bar *app_menu_bar = NULL;
bool text_changed = false;

void menu_quit_callback(Fl_Widget *, void *) { /* TODO */ }

void tut2_build_app_menu_bar() {
    app_window->begin();
    app_menu_bar = new Fl_Menu_Bar(0, 0, app_window->w(), 25);
    app_menu_bar->add("File/Quit Editor", FL_COMMAND+'q', menu_quit_callback);
    app_window->callback(menu_quit_callback);
    app_window->end();
}

int main (int argc, char **argv) {
    tut1_build_app_window();
    tut2_build_app_menu_bar();
    app_window->show(argc, argv);
    return Fl::run();
}
```

`begin()` tells FLTK to add all widgets created hereafter to our `app_window`. In this particular case, it is redundant because creating the window in the previous chapter already called `begin()` for us.

In the next line, we create the menu bar and add our first menu item to it. Menus can be constructed like file paths, with forward slashes `'/'` separating submenus from menu items.

Our basic callback is simple:

```cpp
void menu_quit_callback(Fl_Widget *, void *) {
    Fl::hide_all_windows();
}
```

`Fl::hide_all_windows()` will make all windows invisible, causing `Fl::run()` to return and `main` to exit.

The next line, `app_window->callback(menu_quit_callback)` links the same `menu_quit_callback` to the `app_window` as well. Assigning the window callback removes the default "Escape" key handling and allows the `menu_quit_callback` to handle that keypress with a friendly dialog box instead of just quitting the app.

The `Fl_Widget*` parameter in the callback will either be `app_window` if called through the window callback, or `app_menu_bar` if called by one of the menu items.

One of our goals was to keep track of text changes. If we know the text changed and is unsaved, we should notify the user that she is about to lose her work. We achieve this by adding a dialog box in the Quit callback that queries if the user really wants to quit, even if text was changed:

```cpp
void menu_quit_callback(Fl_Widget *, void *) {
    if (text_changed) {
        int c = fl_choice("Changes in your text have not been saved.\nDo you want to quit the editor anyway?", "Quit", "Cancel", NULL);
        if (c == 1) return;
        Fl::hide_all_windows();
    }
}
```
1.7.4 Chapter 3: Adding a Text Editor widget

FLTK comes with a pretty capable built-in text editing widget. We will use this `Fl_Text_Editor` widget here to allow users to edit their documents.

`Fl_Text_Editor` needs an `Fl_Text_Buffer` to do anything useful. What might seem like an unnecessary extra step is a great feature: we can assign one text buffer to multiple text editors. In a later chapter, we will use this feature to implement a split editor window.

```cpp
#include <FL/Fl_Text_Buffer.H>
#include <FL/Fl_Text_Editor.H>
#include <FL/filename.H>

Fl_Text_Editor *app_editor = NULL;
Fl_Text_Editor *app_split_editor = NULL; // for later
Fl_Text_Buffer *app_text_buffer = NULL;
char app_filename[FL_PATH_MAX] = "";

// ... callbacks go here

void tut3_build_main_editor() {
  app_window->begin();
  app_text_buffer = new Fl_Text_Buffer();
  app_text_buffer->add_modify_callback(text_changed_callback, NULL);
  app_editor = new Fl_Text_Editor(0, app_menu_bar->h(),
                                 app_window->w(), app_window->h() - app_menu_bar->h());
  app_editor->buffer(app_text_buffer);
  app_editor->textfont(FL_COURIER);
  app_window->resizable(app_editor);
  app_window->end();
}
```

By setting the `app_editor` to be the `resizable()` property of `app_window`, we make our application window resizable on the desktop, and we ensure that resizing the window will only resize the text editor vertically, but not our menu bar.

To keep track of changes to the document, we add a callback to the text editor that will be called whenever text is added or deleted. The text modify callback sets our `text_changed` flag if text was changed:

```cpp
// insert before tut3_build_main_editor()
void text_changed_callback(int, int n_inserted, int n_deleted, int, const char*, void*) {
  if (n_inserted || n_deleted)
    text_changed = true;
}
```

To wrap this chapter up, we add a "File/New" menu and link it to a callback that clears the text buffer, clears the current filename, and marks the buffer as unchanged.

```cpp
// insert before tut3_build_main_editor()
void menu_new_callback(Fl_Widget*, void*) {
  app_text_buffer->text("");
  text_changed = false;
}
```

1.7.5 Chapter 4: Reading and Writing Files

In this chapter, we will add support for loading and saving text files, so we need three more menu items in the File menu: Open, Save, and Save As.

```cpp
#include <FL/Fl_Native_File_Chooser.H>
#include <FL/platform.H>
#include <errno.h>

// ... add callbacks here

void tut4_add_file_support() {
  int ix = app_menu_bar->find_index(menu_quit_callback);
  app_menu_bar->insert(ix, "Open", FL_COMMAND+'o', menu_open_callback, NULL, FL_MENU_DIVIDER);
  app_menu_bar->insert(ix+1, "Save", FL_COMMAND+'s', menu_save_callback);
  app_menu_bar->insert(ix+2, "Save as...", FL_COMMAND+'S', menu_save_as_callback, NULL, FL_MENU_DIVIDER);
}
```
1.7 Designing a Simple Text Editor

Note

The menu shortcuts FL_COMMAND+'s' and FL_COMMAND+'S' look the same at a first glance, but the second shortcut is actually Ctrl-Shift-S due to the capital letter 'S'. Also, we use FL_COMMAND as our menu shortcut modifier key. FL_COMMAND translates to FL_CTRL on Windows and Linux, and to FL_META on macOS, better known as the cloverleaf, or simply "the Apple key".

We implement the Save As callback first, because we will want to call it from the Open callback later. The basic callback is only a few lines of code.

```c
void menu_save_as_callback(Fl_Widget*, void*) {
    Fl_Native_File_Chooser file_chooser;
    file_chooser.title("Save File As...");
    file_chooser.type(Fl_Native_File_Chooser::BROWSE_SAVE_FILE);
    if (file_chooser.show() == 0) {
        app_text_buffer->savefile(file_chooser.filename());
        strncpy(app_filename, file_chooser.filename(), FL_PATH_MAX-1);
        text_changed = false;
    }
}
```

However if the user has already set a file name including path information, it is the polite thing to preload the file chooser with that information. This little chunk of code will separate the file name from the path before we call file_chooser.show():

```c
// insert before 'if (file_chooser.show()...'
if (app_filename[0]) {
    char temp_filename[FL_PATH_MAX];
    strncpy(temp_filename, app_filename, FL_PATH_MAX-1);
    const char *name = fl_filename_name(temp_filename);
    if (name) {
        file_chooser.preset_file(name);
        temp_filename[name - temp_filename] = 0;
        file_chooser.directory(temp_filename);
    }
}
```

Great. Now let's add code for our File/Save menu. If no filename was set yet, it falls back to our Save As callback. FL_Text_Editor::savefile() writes the contents of our text widget into a UTF-8 encoded text file.

```c
void menu_save_callback(Fl_Widget*, void*) {
    if (!app_filename[0]) {
        menu_save_as_callback(NULL, NULL);
    } else {
        app_text_buffer->savefile(file_chooser.filename());
        text_changed = false;
    }
}
```

On to loading a new file. Let's write the function to load a file from a given file name:

```c
void load(const char *filename) {
    if (app_text_buffer->loadfile(filename) == 0) {
        strncpy(app_filename, filename, FL_PATH_MAX-1);
        text_changed = false;
    } else {
        fl_alert("Failed to load file
n%s
n%s", filename, strerror(erno));
    }
}
```

A friendly app should warn the user if file operations fail. This can be done in three lines of code, so let's add an alert dialog after every loadfile and savefile call. This is exemplary for load(), and the code is very similar for the two other locations.

```c
void load(const char *filename) {
    if (app_text_buffer->loadfile(filename) == 0) {
        strncpy(app_filename, filename, FL_PATH_MAX-1);
        text_changed = false;
    } else {
        fl_alert("Failed to load file\n%s\n%s", filename, strerror(erno));
    }
}
```

If the user selects our pulldown "Load" menu, we first check if the current text was modified and provide a dialog box that offers to save the changes before loading a new text file:

```c
void menu_open_callback(Fl_Widget*, void*) {
    if (text_changed) {
        int r = fl_choice("The current file has not been saved.\n" "Would you like to save it now?", "Cancel", "Save", "Don't Save");
        if (r == 2)
```
If the user did not cancel the operation, we pop up a file chooser for loading the file, using similar code as in Save As.

```c
...  
    Fl_Native_File_Chooser file_chooser;  
    file_chooser.title("Open File...");  
    file_chooser.type(Fl_Native_File_Chooser::BROWSE_FILE);  
...  

Again, we preload the file chooser with the last used path and file name:

```c
...  
    if (app_filename[0]) {  
        char temp_filename[FL_PATH_MAX];  
        strncpy(temp_filename, app_filename, FL_PATH_MAX-1);  
        const char *name = fl_filename_name(temp_filename);  
        if (name) {  
            file_chooser.preset_file(name);  
            temp_filename[name - temp_filename] = 0;  
            file_chooser.directory(temp_filename);  
        }  
    }  
...  
```

And finally, we pop up the file chooser. If the user cancels the file dialog, we do nothing and keep the current file. Otherwise, we call the `load()` function that we already wrote:

```c
...  
    if (file_chooser.show() == 0)  
        load(file_chooser.filename());  
...  
```

We really should support two more ways to load documents from a file. Let's modify the "show and run" part of `main()` to handle command line parameters and desktop drag'n'drop operations. For that, we refactor the last two lines of `main()` into a new function:

```c
// ... new function here
int main (int argc, char **argv) {  
    tut1_build_app_window();  
    tut2_build_app_menu_bar();  
    tut3_build_main_editor();  
    tut4_add_file_support();  
    // ... refactor those into the new function  
    // app_window->show(argc, argv);  
    // return Fl::run();  
    return tut4_handle_commandline_and_run(argc, argv);  
}  
```

Our function to show the window and run the app has a few lines of boilerplate code. `Fl::args_to_utf8()` converts the command line argument from whatever the host system provides into Unicode. `Fl::args()` goes through the list of arguments and gives `args_handler()` a chance to handle each argument. It also makes sure that FLTK specific args are still forwarded to FLTK, so "-scheme plastic" and "-background #aaccff" will draw beautiful blue buttons in a plastic look.

`fl_open_callback()` lets FLTK know what to do if a user drops a text file onto our editor icon (Apple macOS). Here, we ask it to call the `load()` function that we wrote earlier.

```c
// ... args_handler here
int tut4_handle_commandline_and_run(int argc, char **argv) {  
    int i = 0;  
    Fl::args_to_utf8(argc, argv);  
    Fl::args(argc, argv, i, args_handler);  
    fl_open_callback(load);  
    app_window->show(argc, argv);  
    return Fl::run();  
}  
```

Last work item for this long chapter: what should our `args_handler` do? We could handle additional command line options here, but for now, all we want to handle is file names and paths. Let's make this easy: if the current arg does not start with a '-', we assume it is a file name, and we call `load()`:

```c
int args_handler(int argc, char **argv, int &i) {  
    if (argv[i++][0] != '-') {  
        load(argv[i]);  
    }  
}  
```
1.7 Designing a Simple Text Editor

```c
i++;     
return 1;
}
return 0;
```

So this is our basic but quite functional text editor app in about 100 lines of code. The following chapters add some user convenience functions and show off some FLTK features including split editors and syntax highlighting.

1.7.6 Chapter 5: Cut, Copy, and Paste

The FLTK Text Editor widget comes with built-in cut, copy, and paste functionality, but as a courtesy, we should also offer these as menu items in the main menu.

In our feature list, we noted that we want to implement a split text editor. This requires that the callbacks know which text editor has the keyboard focus. Calling `Fl::focus()` may return `NULL` or other unknown widgets, so we add a little test in our callbacks:

```c
void menu_cut_callback(Fl_Widget*, void* v) {
  Fl_Widget *e = Fl::focus();
  if (e && (e == app_editor || e == app_split_editor))
    Fl_Text_Editor::kf_cut(0, (Fl_Text_Editor*)e);
}
```

We can write very similar callbacks for undo, redo, copy, paste, and delete. Adding a new menu and the six menu items follows the same pattern as before. Using the Menu/Item notation will create an Edit menu for us:

```c
void tut5_cut_copy_paste() {
  app_menu_bar->add("Edit/Undo", FL_COMMAND+'z', menu_undo_callback);
  app_menu_bar->add("Edit/Redo", FL_COMMAND+'Z', menu_redo_callback, NULL, FL_MENU_DIVIDER);
  app_menu_bar->add("Edit/Cut", FL_COMMAND+'x', menu_cut_callback);
  app_menu_bar->add("Edit/Copy", FL_COMMAND+'c', menu_copy_callback);
  app_menu_bar->add("Edit/Paste", FL_COMMAND+'v', menu_paste_callback);
  app_menu_bar->add("Edit/Delete", 0, menu_delete_callback);
}
```

1.7.7 Chapter 6: Find and Find Next

Corporate called. They want a dialog box for their users that can search for some word in the text file. We can add this functionality using a callback and a standard FLTK dialog box.

Here is some code to find a string in a text editor. The first four lines make sure that we start our search at the cursor position of the current editor window. The rest of the code searches the string and marks it if found.

```c
void find_next(const char *needle) {
  Fl_Text_Editor *editor = app_editor;
  Fl_Widget *e = Fl::focus();
  if (e && (e == app_editor || e == app_split_editor))
    editor = app_split_editor;
  int pos = editor->insert_position();
  int found = app_text_buffer->search_forward(pos, needle, &pos);
  if (found) {
    app_text_buffer->select(pos, pos + (int)strlen(needle));
    editor->insert_position(pos + (int)strlen(needle));
    editor->show_insert_position();
  } else {
    fl_alert("No further occurrences of '%s' found!", needle);
  }
}
```

The callbacks are short, using the FLTK text field dialog box and the `find_next` function that we already implemented. The last searched text is saved in `last_find_text` to be reused by `menu_find_next_callback`. If no search text was set yet, or it was set to an empty text, "Find Next" will forward to `menu_find_callback` and pop up our "Find Text" dialog.

```c
char last_find_text[1024] = "";
void menu_find_callback(Fl_Widget*, void* v) {
  const char *find_text = fl_input("Find in text:", last_find_text);
  if (find_text) {
    strncpy(last_find_text, find_text, sizeof(last_find_text)-1);
    find_next(find_text);
  }
}
```

Generated by Doxygen
void menu_find_next_callback(Fl_Widget*, void* v) {
    if (last_find_text[0]) {
        find_next(last_find_text);
    } else {
        menu_find_callback(NULL, NULL);
    }
}

And of course we need to add two menu items to our main application menu.
...
app_menu_bar->add("Find/Find...", FL_COMMAND+'f', menu_find_callback);
app_menu_bar->add("Find/Find Next", FL_COMMAND+'g', menu_find_next_callback, NULL, FL_MENU_DIVIDER);
...

1.7.8 Chapter 7: Replace and Replace Next

To implement the next feature, we will need to implement our own “Find and Replace” dialog box. To make this dialog box useful, it needs the following elements:

• a text input field for the text that we want to find
• a text input field for the replacement text
• a button to find the next occurrence
• a button to replace the current text and find the next occurrence
• a button to close the dialog

This is rather complex functionality, so instead of adding more global variables, we will pack this dialog into a class, derived from Fl_Window.

Let's implement the text replacement code first:
char last_replace_text[1024] = ""

void replace_selection(const char *new_text) {
    Fl_Text_Editor *editor = app_editor;
    Fl_Widget *e = Fl::focus();
    if (e && e == app_split_editor)
        editor = app_split_editor;
    int start, end;
    if (app_text_buffer->selection_position(&start, &end)) {
        app_text_buffer->remove_selection();
        app_text_buffer->insert(start, new_text);
        app_text_buffer->select(start, start + (int)strlen(new_text));
        editor->insert_position(start + (int)strlen(new_text));
        editor->show_insert_position();
    }
}

As before, the first four lines anticipate a split editor and find the editor that has focus. The code then deletes the currently selected text, replaces it with the new text, selects the new text, and finally sets the text cursor to the end of the new text.
The Replace_Dialog class

The Replace_Dialog class holds pointers to our active UI elements as well as all the callbacks for the dialog buttons.

```cpp
class Replace_Dialog : public Fl_Double_Window {
  Fl_Input *find_text_input;
  Fl_Input *replace_text_input;
  Fl_Button *find_next_button;
  Fl_Button *replace_and_find_button;
  Fl_Button *close_button;

public:
  Replace_Dialog(const char *label);
  void show() FL_OVERRIDE;
private:
  static void find_next_callback(Fl_Widget*, void*);
  static void replace_and_find_callback(Fl_Widget*, void*);
  static void close_callback(Fl_Widget*, void*);
};

Replace_Dialog *replace_dialog = NULL;
```

The constructor creates the dialog and marks it as "non modal". This will make the dialog hover over the application window like a toolbox window until the user closes it, allowing multiple "find and replace" operations. So here is our constructor:

```cpp
Replace_Dialog::Replace_Dialog(const char *label)
  : Fl_Double_Window(430, 110, label)
  {
    find_text_input = new Fl_Input(100, 10, 320, 25, "Find:oug");
    replace_text_input = new Fl_Input(100, 40, 320, 25, "Replace:oug");
    Fl_Flex* button_field = new Fl_Flex(100, 70, w()-100, 40);  
    button_field->type(Fl_Flex::HORIZONTAL);
    button_field->margin(0, 5, 10, 10);
    button_field->gap(10);
    find_next_button = new Fl_Button(0, 0, 0, 0, "Next");
    find_next_button->callback(find_next_callback, this);
    replace_and_find_button = new Fl_Button(0, 0, 0, 0, "Replace");
    replace_and_find_button->callback(replace_and_find_callback, this);
    close_button = new Fl_Button(0, 0, 0, 0, "Close");
    close_button->callback(close_callback, this);
    button_field->end();
    set_non_modal();
  }
```

All buttons are created inside an `Fl_Flex` group. They will be arranged automatically by `Fl_Flex`, so there is no need to set x and y coordinates or a width or height. `button_field` will lay out the buttons for us.

Note

There is no need to write a destructor or delete individual widgets. When we delete an instance of `Replace_Dialog`, all children are deleted for us.

The `show()` method overrides the window's show method. It adds some code to preload the values of the text fields for added convenience. It then pops up the dialog box by calling the original `Fl_Double_Window::show()`.

```cpp
void Replace_Dialog::show() {
  find_text_input->value(last_find_text);
  replace_text_input->value(last_replace_text);
  Fl_Double_Window::show();
}
```

The buttons in the dialog need callbacks to be useful. If callbacks are defined within a class, they must be defined static, but a pointer to the class can be provided through the `user_data` field. We have done that in the constructor by adding `this` as the last argument when setting the callback, for example in `close_button->callback(close_callback, close_callback, this);`.

The callback itself can then extract the `this` pointer with a static cast:

```cpp
void Replace_Dialog::close_callback(Fl_Widget*, void* my_dialog) {
  Replace_Dialog *dlg = static_cast<Replace_Dialog*>(my_dialog);
  dlg->hide();
}
```

The callback for the Find button uses our already implemented `find_next` function:

```cpp
void Replace_Dialog::find_next_callback(Fl_Widget*, void* my_dialog) {
  Fl_Double_Window *dlg = static_cast<Replace_Dialog*>(my_dialog);
  strncpy(last_find_text,dlg->find_text_input->value(), sizeof(last_find_text)-1);
```
strncpy(last_replace_text, dlg->replace_text_input->value(), sizeof(last_replace_text)-1);
if (last_find_text[0])
    find_next(last_find_text);
}

The Replace button callback calls our newly implemented replace_selection function and then continues on to the find_next_callback:
void Replace_Dialog::replace_and_find_callback(Fl_Widget*, void* my_dialog) {
    Replace_Dialog *dlg = static_cast<Replace_Dialog*>(my_dialog);
    replace_selection(dlg->replace_text_input->value());
    find_next_callback(NULL, my_dialog);
}

This long chapter comes close to its end. We are missing menu items that pop up our dialog and that allow a quick "Replace and Find Next" functionality without popping up the dialog. The code is quite similar to the "Find" and "Find Next" code in the previous chapter:
void menu_replace_callback(Fl_Widget*, void*) {
    if (!replace_dialog)
        replace_dialog = new Replace_Dialog("Find and Replace");
    replace_dialog->show();
}

void menu_replace_next_callback(Fl_Widget*, void*) {
    if (!last_find_text[0]) {
        menu_replace_callback(NULL, NULL);
    } else {
        replace_selection(last_replace_text);
        find_next(last_find_text);
    }
}

void tut7_implement_replace() {
    app_menu_bar->add("Find/Replace...", FL_COMMAND+'r', menu_replace_callback);
    app_menu_bar->add("Find/Replace Next", FL_COMMAND+'t', menu_replace_next_callback);
}

1.7.9 Chapter 8: Editor Features

Chapter 7 was long an intense. Let’s relax and implement something simple here. We want menus with check boxes that can toggle some text editor features on and off:
void tut8_editor_features() {
    app_menu_bar->add("Window/Line Numbers", FL_COMMAND+'l', menu_linenumbers_callback, NULL, FL_MENU_TOGGLE);
    app_menu_bar->add("Window/Word Wrap", 0, menu_wordwrap_callback, NULL, FL_MENU_TOGGLE);
}

The Fl_Widget parameter in callbacks always points to the widget that causes the callback. Menu items are not derived from widgets, so to find out which menu item caused a callback, we can do this:
void menu_linenumbers_callback(Fl_Widget*, void*) {
    Fl_Menu_Bar* menu = static_cast<Fl_Menu_Bar*>(w);
    const Fl_Menu_Item* linenumber_item = menu->mvalue();
    if (linenumber_item->value()) {
        app_editor->linenumber_width(40);
    } else {
        app_editor->linenumber_width(0);
    }
    app_editor->redraw();
}

Setting the width enables the line numbers, setting it to 0 disables the line number display. When changing the value of a widget, FLTK will make sure that the widget is redrawn to reflect the new value. When changing other attributes such as colors or fonts, FLTK assumes that many attributes are changed at the same time and leaves it to the user to call Fl_Widget::redraw() when done. Here we call app_editor->redraw() to make sure that the change in the line number setting is also drawn on screen.

Let’s not forget to update the line number display for a potential split editor widget as well:
// add before the end of menu_linenumbers_callback
if (app_split_editor) {
    const Fl_Menu_Item* linenumber_item = menu->mvalue();
    if (linenumber_item->value()) {
        app_split_editor->linenumber_width(40);
    } else {
        app_split_editor->linenumber_width(0);
    }
    app_split_editor->redraw();
}

The word wrap feature is activated by calling Fl_Text_Editor::wrap_mode() with the parameters Fl_Text_Display::WRAP_AT_BOUNDS and 0. It's deactivated with Fl_Text_Display::WRAP_NONE. The implementation of the callback is the same as menu_linenumbers_callback.
1.7 Designing a Simple Text Editor

1.7.10 Chapter 9: Split Editor

When editing long source code files, it can be really helpful to split the editor to view statements at the top of the text while adding features at the bottom of the text in a split text view.

FLTK can link multiple text editors to a single text buffer. Let’s implement this now. This chapter will show you how to rearrange widgets in an existing widget tree.

Our initializer removes the main text editor from the widget tree and replaces it with an Fl_Tile. A tile can hold multiple widgets that can then be resized interactively by the user by clicking and dragging the divider between those widgets.

We start by replacing the editor widget with a tile group of the same size.

```c
#include <FL/Fl_Tile.H>
Fl_Tile *app_tile = NULL;

void tut9_split_editor() {
    app_window->begin();
    app_tile = new Fl_Tile(app_editor->x(), app_editor->y(),
                           app_editor->w(), app_editor->h());
    app_window->remove(app_editor);

    Next we add our existing editor as the first child of the tile and create another text editor app_split_editor as the second child of the tile, but it’s hidden for now with a height of zero pixels.

    Note
    Creating the new Fl_Tile also calls Fl_Tile::begin().

    Adding app_editor to the tile would have also removed it from app_window, so app_window->remove(app_editor) in the code above is not really needed, but illustrates what we are doing.
    app_tile->add(app_editor);
    app_split_editor = new Fl_Text_Editor(app_tile->x(), app_tile->y()+app_tile->h(),
                                          app_tile->w(), 0);
    app_split_editor->buffer(app_text_buffer);
    app_split_editor->textfont(FL_COURIER);
    app_split_editor->hide();

    Now we clean up after ourselves and make sure that the resizables are all set correctly. Lastly, we add a menu item with a callback.
    app_tile->end();
    app_tile->size_range(0, 25, 25);
    app_tile->size_range(1, 25, 25);
    app_window->end();
    app_window->resizable(app_tile);
    app_tile->resizable(app_editor);
    app_menu_bar->add("Window/Split", FL_COMMAND+'-', menu_split_callback, NULL, FL_MENU_TOGGLE);
}
```

Now with all widgets in place, the callback’s job is to show and resize, or hide and resize the split editor. We can implement that like here:

```c
void menu_split_callback(Fl_Widget* w, void*) {
    Fl_Menu_Bar* menu = static_cast<Fl_Menu_Bar*>(w);
    const Fl_Menu_Item* splitview_item = menu->mvalue();
    if (splitview_item->value()) {
        int h_split = app_tile->h()/2;
        app_editor->size(app_tile->w(), h_split);
        app_split_editor->resize(app_tile->x(), app_tile->y() + h_split,
                                  app_tile->w(), app_tile->h() - h_split);
        app_split_editor->show();
    } else {
        app_editor->size(app_tile->w(), app_tile->h());
        app_split_editor->resize(app_tile->x(), app_tile->y()+app_tile->h(),
                                 app_tile->w(), 0);
        app_split_editor->hide();
    }
    app_tile->resizable(app_editor);
    app_tile->init_sizes();
    app_tile->redraw();
}
```

Generated by Doxygen
1.7.11 Chapter 10: Syntax Highlighting

Chapter 10 adds a lot of code to implement "C" language syntax highlighting. Not all code is duplicated here in the documentation. Please check out test/editor.cxx for all the details.

The Fl_Text_Editor widget supports highlighting of text with different fonts, colors, and sizes. The implementation is based on the excellent NEdit text editor core, from https://sourceforge.net/projects/nedit/, which uses a parallel "style" buffer which tracks the font, color, and size of the text that is drawn.

Styles are defined using the Fl_Text_Display::Style_Table_Entry structure defined in <FL/Fl_Text_Display.H>:

```c
struct Style_Table_Entry {
  FL_Color color;
  FL_Font font;
  int size;
  unsigned attr;
};
```

The `color` member sets the color for the text, the `font` member sets the FLTK font index to use, and the `size` member sets the pixel size of the text. The `attr` member is currently not used.

For our text editor we'll define 7 styles for plain code, comments, keywords, and preprocessor directives:

```c
Fl_Text_Display::Style_Table_Entry styletable[] = {
  { FL_BLACK, FL_COURIER, FL_NORMAL_SIZE }, // A - Plain
  { FL_DARK_GREEN, FL_COURIER_ITALIC, FL_NORMAL_SIZE }, // B - Line comments
  { FL_DARK_GREEN, FL_COURIER_ITALIC, FL_NORMAL_SIZE }, // C - Block comments
  { FL_BLUE, FL_COURIER, FL_NORMAL_SIZE }, // D - Strings
  { FL_DARK_RED, FL_COURIER, FL_NORMAL_SIZE }, // E - Directives
  { FL_DARK_RED, FL_COURIER_BOLD, FL_NORMAL_SIZE }, // F - Types
  { FL_BLUE, FL_COURIER_BOLD, FL_NORMAL_SIZE } // G - Keywords
};
```

You'll notice that the comments show a letter next to each style - each style in the style buffer is referenced using a character starting with the letter 'A'.

You call the `highlight_data()` method to associate the style data and buffer with the text editor widget:

```c
app_editor->highlight_data(app_style_buffer, styletable, sizeof(styletable) / sizeof(styletable[0]), 'A', style_unfinished_cb, 0);
```

Finally, you need to add a callback to the main text buffer so that changes to the text buffer are mirrored in the style buffer:

```c
app_text_buffer->add_modify_callback(style_update, app_editor);
```

The `style_update()` function, like the `change_cb()` function described earlier, is called whenever text is added or removed from the text buffer. It mirrors the changes in the style buffer and then updates the style data as necessary:

```c
// 'style_update()' - Update the style buffer...

void style_update(int pos, // I - Position of update
                  int nInserted, // I - Number of inserted chars
                  int nDeleted, // I - Number of deleted chars
                  int nRestyled, // I - Number of restyled chars
                  const char *deletedText, // I - Text that was deleted
                  void (*cbArg) { // I - Callback data
  int start, // Start of text
       end; // End of text
  char last; // Last style on line
  // Style data
  *text;
}
```

// If this is just a selection change, just unselect the style buffer...
if (nInserted == 0 && nDeleted == 0) {
  app_style_buffer->unselect();
  return;
```
1.7 Designing a Simple Text Editor

```c
if (nInserted > 0) {
  // Insert characters into the style buffer...
  style = new char[nInserted + 1];
  memset(style, 'A', nInserted);
  style[nInserted] = '\0';
  app_style_buffer->replace(pos, pos + nDeleted, style);
  delete[] style;
} else {
  // Just delete characters in the style buffer...
  app_style_buffer->remove(pos, pos + nDeleted);
}
```

The `style_parse()` function scans a copy of the text in the buffer and generates the necessary style characters for display. It assumes that parsing begins at the start of a line:

```c
for (current = *style, col = 0, last = 0; length > 0; text ++) {
  // Check for directives, comments, strings, and keywords...
  if (current == '\*') {
    // Set style to directive current = 'E';
    } else if (strncmp(text, "/*", 2) == 0) {
    current = 'C';
    } else if (strncmp(text, "\\\\", 2) == 0) {
    // Quoted quote...
    *style++ = current;
```
*style++ = current;
text ++;
length --;
col += 2;
continue;
} else if (*text == '\"') {
current = 'D';
if (!last && islower(*text)) {
  // Might be a keyword...
  for (temp = text, bufptr = buf;
     islower(*temp) && bufptr < (buf + sizeof(buf) - 1);
     bufptr++ = *temp++);
  if (*last && islower(*temp)) {
    *bufptr = '\"';
    bufptr = buf;
  }
  if (bsearch(bufptr, code_types,
      sizeof(code_types) / sizeof(code_types[0]),
      sizeof(code_types[0]), compare_keywords)) {
    while (text < temp) {
      *style++ = 'F';
text ++;
      length --;
col ++;
    }
text --;
    length ++;
    last = 1;
    continue;
  } else if (bsearch(bufptr, code_keywords,
      sizeof(code_keywords) / sizeof(code_keywords[0]),
      sizeof(code_keywords[0]), compare_keywords)) {
    while (text < temp) {
      *style++ = 'G';
text ++;
      length --;
col ++;
    }
text --;
    length ++;
    last = 1;
    continue;
  }
}
} else if (*text == '\n') {
  // Close a C comment...
  *style++ = current;
  *style++ = current;
text ++;
  length --;
col += 2;
continue;
} else if (*text == '\"') {
  // Quoted end quote...
  *style++ = current;
  *style++ = current;
text ++;
  length --;
col += 2;
continue;
} else if (*text == '\"') {
  // End quote...
  *style++ = current;
col ++;
current = 'A';
continue;
}
}
}
} else if (*text == ('\' || *text == '\')) {
  // Copy style info...
  if (current == 'A' && strncmp(text, "*/", 2) == 0) {
    // Close a C comment...
    *style++ = current;
    *style++ = current;
text ++;
    length --;
col += 2;
    continue;
  } else if (strncmp(text, "\\", 2) == 0) {
    // Quoted end quote...
    *style++ = current;
    *style++ = current;
text ++;
    length --;
col += 2;
    continue;
  } else if (*text == '\"') {
    // End quote...
    *style++ = current;
col ++;
current = 'A';
    continue;
  }
}
if (current == 'A' && (*text == '{' || *text == '}')) {
  *style++ = 'G';
else {
  *style++ = current;
col ++;
}
last = isalnum(*text) || *text == '.';
if (*text == '\n') {
  // Reset column and possibly reset the style
  col = 0;
}
1.8 Drawing Things in FLTK

This chapter covers the drawing functions that are provided with FLTK.

1.8.1 When Can You Draw Things in FLTK?

There are only certain places you can execute FLTK code that draws to the computer's display. Calling these functions at other places will result in undefined behavior!

- The most common place is inside the virtual `Fl_Widget::draw()` method. To write code here, you must subclass one of the existing `Fl_Widget` classes and implement your own version of `draw()`.

- You can also create custom `boxtypes` and `labeltypes`. These involve writing small procedures that can be called by existing `Fl_Widget::draw()` methods. These "types" are identified by an 8-bit index that is stored in the widget's `box()`, `labeltype()`, and possibly other properties.

- You can call `Fl_Window::make_current()` to do incremental update of a widget. Use `Fl_Widget::window()` to find the window.

In contrast, code that draws to other drawing surfaces than the display (i.e., instances of derived classes of the `Fl_Surface_Device` class, except `Fl_Display_Device`, such as `Fl_Printer` and `Fl_Copy_Surface`) can be executed at any time as follows:

1. Make your surface the new current drawing surface calling the `Fl_Surface_Device::push_current(Fl_Surface_Device *)` function.
2. Make a series of calls to any of the drawing functions described below; these will operate on the new current drawing surface;
3. Set the current drawing surface back to its previous state calling `Fl_Surface_Device::pop_current()`.

1.8.2 What Units Do FLTK Functions Use?

Before version 1.4 all graphical quantities used by FLTK were in pixel units: a window of width 500 units was 500 pixels wide, a line of length 10 units was 10 pixels long, lines of text written using a 14-point font were 14 pixels below each other. This organization is not sufficient to support GUI apps that can be drawn on screens of varying pixel density, especially on High-DPI screens, because widgets become very small and text becomes unreadable.

FLTK version 1.4 introduces a new feature, a screen-specific `scale factor` which is a float number with a typical value in the 1-2.5 range and is used as follows: any graphical element with an FLTK value of \( v \) units is drawn on the screen with \( v \times \text{scale} \) units. Thus, a window with width 500 units is 500\times scale pixels wide, a line of length 10 units is 10\times scale pixels long, lines of text written using a 14-point font are 14\times scale pixels below each other. Consider a system with two screens, one with regular DPI and one with a twice higher DPI. If the first screen's scale factor is set to 1 and that of the second screen to 2, the GUI of any FLTK app appears equally sized on the two screens.

FLTK uses several units to measure graphical elements:
• All quantities used by the public FLTK API to measure graphical elements (e.g., window widths, line lengths, font sizes, clipping regions, image widths and heights) are in FLTK units except if it’s explicitly documented another unit is used. FLTK units are both platform- and DPI-independent. An example of FLTK API using another unit is Fl_Gl_Window::pixel_w().

• Just before drawing to a screen, the library internally multiplies all quantities expressed in FLTK units by the current value of the scale factor for the screen in use and obtains quantities in drawing units. The current scale factor value, for an Fl_Window named window, is given by

```cpp
int nscreen = window->screen_num(); // the screen where window is mapped
float s = Fl::screen_scale(nscreen); // this screen’s scale factor
```

One drawing unit generally corresponds to one screen pixel ...

• ... but not on macOS and for retina displays, where one drawing unit corresponds to two pixels.

• ... and not with the Wayland platform, where one drawing unit may correspond to 1, 2, or 3 pixels according to the current value of the Wayland-defined, integer-valued scale factor.

At application start time, FLTK attempts to detect the adequate scale factor value for each screen of the system. Here is how that’s done under the X11, Windows, and Wayland platforms. If the resulting scale factor is not satisfactory, and also under the macOS platform, it's possible to set the FLTK_SCALING_FACTOR environmental variable to the desired numerical value (e.g., 1.75) and any FLTK app will start scaled with that value. Furthermore, it's possible to change the scale factor value of any screen at run time with ctrl/+/-/0/ keystrokes which enlarge, shrink, and reset, respectively, all FLTK windows on a screen and their content. Under macOS, the corresponding GUI scaling shortcuts are cmd/+/-/0/.

GUI rescaling involves also image drawing: the screen area covered by the drawn image contains a number of pixels that grows with the scale factor. When FLTK draws images, it maps the image data (the size of these data is given by Fl_Image::data_w() and Fl_Image::data_h()) to the screen area whose size (in FLTK units) is given by Fl_Image::w() and Fl_Image::h()). How exactly such mapping is performed depends on the image type, the platform and some hardware features. The most common case for Fl_RGB_Images is that FLTK uses a scaled drawing system feature that directly maps image data to screen pixels. An important feature of FLTK for image drawing is the Fl_Image::scale() member function, new in FLTK version 1.4. This function controls the image drawing size (in FLTK units, given by Fl_Image::w() and Fl_Image::h()) independently from the size of the image data (given by Fl_Image::data_w() and Fl_Image::data_h()). An image with large enough data size can thus be drawn at the full resolution of the screen even when the screen area covered by the image grows following the GUI scale factor.

The Fl_Image_Surface class is intended to create an Fl_RGB_Image from a series of FLTK drawing operations. The Fl_Image_Surface constructor allows to control whether the size in pixels of the resulting image matches the FLTK units used when performing drawing operations, or matches the number of pixels corresponding to these FLTK units given the current value of the scale factor. The first result is obtained with new Fl_Image_Surface(w, h), the second with new Fl_Image_Surface(w, h, 1).

When drawing to Fl_Printer or Fl_PostScript_File_Device, the drawing unit is initially one point, that is, 1/72 of an inch. This unit is changed by calls to Fl_Paged_Device::scale().

### 1.8.3 Drawing Functions

To use the drawing functions you must first include the `<FL/fl_draw.H>` header file. FLTK provides the following types of drawing functions:

- Boxes
- Clipping
- Colors
- Line Dashes and Thickness
1.8 Drawing Things in FLTK

- Drawing Fast Shapes
- Drawing Complex Shapes
- Drawing Text
- Fonts
- Character Encoding
- Drawing Overlays
- Drawing Images
- Direct Image Drawing
- Direct Image Reading
- Image Classes
- Offscreen Drawing

1.8.3.1 Boxes

FLTK provides three functions that can be used to draw boxes for buttons and other UI controls. Each function uses the supplied upper-lefthand corner and width and height to determine where to draw the box.

```cpp
void fl_draw_box(Fl_Boxtype b, int x, int y, int w, int h, Fl_Color c)
```

The `fl_draw_box()` function draws a standard boxtypet b in the specified color c.

```cpp
void fl_frame(const char *s, int x, int y, int w, int h)
void fl_frame2(const char *s, int x, int y, int w, int h)
```

The `fl_frame()` and `fl_frame2()` functions draw a series of line segments around the given box. The string s must contain groups of 4 letters which specify one of 24 standard grayscale values, where ‘A’ is black and ‘X’ is white. The results of calling these functions with a string that is not a multiple of 4 characters in length are undefined.

The only difference between `fl_frame()` and `fl_frame2()` is the order of the line segments:

- For `fl_frame()` the order of each set of 4 characters is: top, left, bottom, right.
- For `fl_frame2()` the order of each set of 4 characters is: bottom, right, top, left.

Note that `fl_frame(Fl_Boxtype b)` is described in the Box Types section.
1.8.3.2 Clipping

You can limit all your drawing to a rectangular region by calling `fl_push_clip()`, and put the drawings back by using `fl_pop_clip()`. This rectangle is measured in FLTK units and is unaffected by the current transformation matrix.

In addition, the system may provide clipping when updating windows which may be more complex than a simple rectangle.

```c
void fl_push_clip(int x, int y, int w, int h)
void fl_clip(int x, int y, int w, int h)
```

Intersect the current clip region with a rectangle and push this new region onto the stack.

The `fl_clip()` version is deprecated and will be removed from future releases.

```c
void fl_push_no_clip()
```

Pushes an empty clip region on the stack so nothing will be clipped.

```c
void fl_pop_clip()
```

Restore the previous clip region.

**Note:** You must call `fl_pop_clip()` once for every time you call `fl_push_clip()`. If you return to FLTK with the clip stack not empty unpredictable results occur.

```c
int fl_not_clipped(int x, int y, int w, int h)
```

Returns non-zero if any of the rectangle intersects the current clip region. If this returns 0 you don't have to draw the object.

**Note:** Under X this returns 2 if the rectangle is partially clipped, and 1 if it is entirely inside the clip region.

```c
int fl_clip_box(int x, int y, int w, int h, int &X, int &Y, int &W, int &H)
```

Intersect the rectangle \(x, y, w, h\) with the current clip region and returns the bounding box of the result in \(X, Y, W, H\). Returns non-zero if the resulting rectangle is different than the original. This can be used to limit the necessary drawing to a rectangle. \(W\) and \(H\) are set to zero if the rectangle is completely outside the region.

```c
void fl_clip_region(Fl_Region r)
Fl_Region fl_clip_region()
```

Replace the top of the clip stack with a clipping region of any shape. `Fl_Region` is an operating system specific type. The second form returns the current clipping region.
1.8.3.3 Colors

FLTK manages colors as 32-bit unsigned integers, encoded as RGBI. When the "RGB" bytes are non-zero, the value is treated as RGB. If these bytes are zero, the "I" byte will be used as an index into the colormap. Colors with both "RGB" set and an "I" > 0 are reserved for special use.

Values from 0 to 255, i.e. the "I" index value, represent colors from the FLTK standard colormap and are allocated as needed on screens without TrueColor support. The `Fl_Color` enumeration type defines the standard colors and color cube for the first 256 colors. All of these are named with symbols in `<FL/Enumerations.H>`. Example:

![FLTK default colormap](image)

Color values greater than 255 are treated as 24-bit RGB values. These are mapped to the closest color supported by the screen, either from one of the 256 colors in the FLTK colormap or a direct RGB value on TrueColor screens.

```c
Fl_Color fl_rgb_color(uchar r, uchar g, uchar b)
Fl_Color fl_rgb_color(uchar grayscale)
```

Generate `Fl_Color` out of specified 8-bit RGB values or one 8-bit grayscale value.

```c
void fl_color(Fl_Color c)
void fl_color(int c)
```

Sets the color for all subsequent drawing operations. Please use the first form: the second form is only provided for back compatibility.
For colormapped displays, a color cell will be allocated out of \texttt{fl_colormap} the first time you use a color. If the colormap fills up then a least-squares algorithm is used to find the closest color.

\texttt{Fl\_Color fl\_color()}

Returns the last color that was set using \texttt{fl\_color()}. This can be used for state save/restore.

\texttt{void fl\_color(uchar r, uchar g, uchar b)}

Set the color for all subsequent drawing operations. The closest possible match to the RGB color is used. The RGB color is used directly on TrueColor displays. For colormap visuals the nearest index in the gray ramp or color cube is used.

\texttt{unsigned Fl::get\_color(Fl\_Color i)}

\texttt{void Fl::get\_color(Fl\_Color i, uchar &red, uchar &green, uchar &blue)}

Generate RGB values from a colormap index value \texttt{i}. The first returns the RGB as a 32-bit unsigned integer, and the second decomposes the RGB into three 8-bit values.

\texttt{Fl::get\_system\_colors()}

\texttt{Fl::foreground()}

\texttt{Fl::background()}

\texttt{Fl::background2()}

The first gets color values from the user preferences or the system, and the other routines are used to apply those values.

\texttt{Fl::own\_colormap()}

\texttt{Fl::free\_color(Fl\_Color i, int overlay)}

\texttt{Fl::set\_color(Fl\_Color i, unsigned c)}

\texttt{Fl::own\_colormap()} is used to install a local colormap [X11 only].

\texttt{Fl::free\_color()} and \texttt{Fl::set\_color()} are used to remove and replace entries from the colormap.

There are two predefined graphical interfaces for choosing colors. The function \texttt{fl\_show\_colormap()} shows a table of colors and returns an \texttt{Fl\_Color} index value. The \texttt{Fl\_Color\_Chooser} widget provides a standard RGB color chooser.

As the \texttt{Fl\_Color} encoding maps to a 32-bit unsigned integer representing RGBI, it is also possible to specify a color using a hex constant as a color map index:
or specify a color using a hex constant for the RGB components:

```cpp
// RGB COLOR ASSIGNMENTS
color(0xRRGGBB00)
  | | | Must be zero
  | | Blue (8 bits)
  | Green (8 bits)
  Red (8 bits)
```

```cpp
button->color(0xff000000);  // RGB: red
button->color(0x00ff0000);  // RGB: green
button->color(0x0000ff00);  // RGB: blue
button->color(0xffffff00);  // RGB: white
```

**Note**

If TrueColor is not available, any RGB colors will be set to the nearest entry in the colormap.

### 1.8.3.4 Line Dashes and Thickness

FLTK supports drawing of lines with different styles and widths. Full functionality is not available under Windows 95, 98, and Me due to the reduced drawing functionality these operating systems provide.

```cpp
void fl_line_style(int style, int width, char∗ dashes)
```

Set how to draw lines (the “pen”). If you change this it is your responsibility to set it back to the default with `fl_line_style(0)`.

**Note:** Because of how line styles are implemented on MS Windows systems, you *must* set the line style *after* setting the drawing color. If you set the color after the line style you will lose the line style settings!

`style` is a bitmask which is a bitwise-OR of the following values. If you don’t specify a dash type you will get a solid line. If you don’t specify a cap or join type you will get a system-defined default of whatever value is fastest.
width is the number of FLTK units thick to draw the lines. Zero results in the system-defined default, which on both X and Windows is somewhat different and nicer than 1.

dashes is a pointer to an array of dash lengths, measured in FLTK units. The first location is how long to draw a solid portion, the next is how long to draw the gap, then the solid, etc. It is terminated with a zero-length entry. A NULL pointer or a zero-length array results in a solid line. Odd array sizes are not supported and result in undefined behavior.

Note: The dashes array does not work under Windows 95, 98, or Me, since those operating systems do not support complex line styles.

1.8.3.5 Drawing Fast Shapes

These functions are used to draw almost all the FLTK widgets. They draw on exact pixel boundaries and are as fast as possible. Their behavior is duplicated exactly on all platforms FLTK is ported. It is undefined whether these are affected by the transformation matrix, so you should only call these while the matrix is set to the identity matrix (the default).

void fl_point(int x, int y)

Draw a single pixel at the given coordinates.

void fl_rectf(int x, int y, int w, int h)
void fl_rectf(int x, int y, int w, int h, Fl_Color c)

Color a rectangle that exactly fills the given bounding box.

void fl_rectf(int x, int y, int w, int h, uchar r, uchar g, uchar b)
Color a rectangle with "exactly" the passed \( r, g, b \) color. On screens with less than 24 bits of color this is done by drawing a solid-colored block using \texttt{fl\_draw\_image()} so that the correct color shade is produced.

```c
void fl_rect(int x, int y, int w, int h)
void fl_rect(int x, int y, int w, int h, Fl_Color c)
```

Draw a 1-pixel border inside this bounding box.

```c
void fl_rounded_rect(int x, int y, int w, int h, int radius)
void fl_rounded_rectf(int x, int y, int w, int h, int radius)
```

Draw an outlined or filled rectangle with rounded corners.

```c
void fl_line(int x, int y, int x1, int y1)
void fl_line(int x, int y, int x1, int y1, int x2, int y2)
```

Draw one or two lines between the given points.

```c
void fl_loop(int x, int y, int x1, int y1, int x2, int y2)
void fl_loop(int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
```

Outline a 3 or 4-sided polygon with lines.

```c
void fl_polygon(int x, int y, int x1, int y1, int x2, int y2)
void fl_polygon(int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
```

Fill a 3 or 4-sided polygon. The polygon must be convex.

```c
void fl_xyline(int x, int y, int x1)
void fl_xyline(int x, int y, int x1, int y2)
void fl_xyline(int x, int y, int x1, int y2, int x3)
```

Draw horizontal and vertical lines. A horizontal line is drawn first, then a vertical, then a horizontal.

```c
void fl_yxline(int x, int y, int y1)
void fl_yxline(int x, int y, int y1, int x2)
void fl_yxline(int x, int y, int y1, int x2, int y3)
```

Draw vertical and horizontal lines. A vertical line is drawn first, then a horizontal, then a vertical.

```c
void fl_arc(int x, int y, int w, int h, double a1, double a2)
void fl_pie(int x, int y, int w, int h, double a1, double a2)
```
Draw ellipse sections using integer coordinates. These functions match the rather limited circle drawing code provided by X and MS Windows. The advantage over using `fl_arc()` with floating point coordinates is that they are faster because they often use the hardware, and they draw much nicer small circles, since the small sizes are often hard-coded bitmaps.

If a complete circle is drawn it will fit inside the passed bounding box. The two angles are measured in degrees counter-clockwise from 3’oclock and are the starting and ending angle of the arc, \( a_2 \) must be greater or equal to \( a_1 \).

![Figure 1.26 fl_pie() and fl_arc()](image)

`fl_arc()` draws a series of lines to approximate the arc. Notice that the integer version of `fl_arc()` has a different number of arguments to the other `fl_arc()` function described later in this chapter.

`fl_pie()` draws a filled-in pie slice. This slice may extend outside the line drawn by `fl_arc()`; to avoid this use \( w-1 \) and \( h-1 \).

```c
void fl_scroll(int X, int Y, int W, int H, int dx, int dy, void (draw_area)(void, int, int, int, int), void* data) {
    // Scroll a rectangle and draw the newly exposed portions. The contents of the rectangular area is first shifted by dx and dy FLTK units. The callback is then called for every newly exposed rectangular area,
```

1.8 Drawing Things in FLTK

1.8.3.6 Drawing Complex Shapes

The complex drawing functions let you draw arbitrary shapes with 2-D linear transformations. The functionality matches that found in the Adobe® PostScript™ language. The exact pixels that are filled are less defined than for the fast drawing functions so that FLTK can take advantage of drawing hardware. On both X and MS Windows the transformed vertices are rounded to integers before drawing the line segments: this severely limits the accuracy of these functions for complex graphics, so use OpenGL when greater accuracy and/or performance is required.

```c
void fl_load_matrix(double a, double b, double c, double d, double x, double y);
void fl_load_identity();
```

Set the current transformation.

```c
void fl_push_matrix();
void fl_pop_matrix();
```

Save and restore the current transformation. The maximum depth of the stack is 32 entries.

```c
void fl_scale(double x, double y);
void fl_scale(double x);
void fl_translate(double x, double y);
void fl_rotate(double d);
void fl_mult_matrix(double a, double b, double c, double d, double x, double y);
```

Concatenate another transformation onto the current one. The rotation angle is in degrees (not radians) and is counter-clockwise.

```c
double fl_transform_x(double x, double y);
double fl_transform_y(double x, double y);
double fl_transform_dx(double x, double y);
double fl_transform_dy(double x, double y);
void fl_transformed_vertex(double xf, double yf);
```

Transform a coordinate or a distance using the current transformation matrix. After transforming a coordinate pair, it can be added to the vertex list without any further translations using `fl_transformed_vertex()`.

```c
void fl_begin_points();
void fl_end_points();
```

Start and end drawing a list of points. Points are added to the list with `fl_vertex()`.

```c
void fl_begin_line();
void fl_end_line();
```
Start and end drawing lines.

```c
void fl_begin_loop()
void fl_end_loop()
```

Start and end drawing a closed sequence of lines.

```c
void fl_begin_polygon()
void fl_end_polygon()
```

Start and end drawing a convex filled polygon.

```c
void fl_begin_complex_polygon()
void fl_gap()
void fl_end_complex_polygon()
```

Start and end drawing a complex filled polygon. This polygon may be concave, may have holes in it, or may be several disconnected pieces. Call `fl_gap()` to separate loops of the path. It is unnecessary but harmless to call `fl_gap()` before the first vertex, after the last one, or several times in a row.

`fl_gap()` should only be called between `fl_begin_complex_polygon()` and `fl_end_complex_polygon()`. To outline the polygon, use `fl_begin_loop()` and replace each `fl_gap()` with a `fl_end_loop(); fl_begin_loop()` pair.

**Note:** For portability, you should only draw polygons that appear the same whether "even/odd" or "non-zero" winding rules are used to fill them. Holes should be drawn in the opposite direction of the outside loop.

```c
void fl_vertex(double x, double y)
```

Add a single vertex to the current path.

```c
void fl_curve(double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)
```

Add a series of points on a Bézier curve to the path. The curve ends (and two of the points are) at $X_0, Y_0$ and $X_3, Y_3$.

```c
void fl_arc(double x, double y, double r, double start, double end)
```
Add a series of points to the current path on the arc of a circle; you can get elliptical paths by using scale and rotate before calling `fl_arc()`. The center of the circle is given by $x$ and $y$, and $r$ is its radius. `fl_arc()` takes `start` and `end` angles that are measured in degrees counter-clockwise from 3 o'clock. If `end` is less than `start` then it draws the arc in a clockwise direction.

`fl_arc()`, `fl_circle()` and `fl_draw()`: 65

![Figure 1.27 fl_arc(x,y,r,a1,a2)](image)

```c
void fl_circle(double x, double y, double r)
```

`fl_circle(x,y,r)` is equivalent to `fl_arc(x,y,r,0,360)` but may be faster. It must be the only thing in the path: if you want a circle as part of a complex polygon you must use `fl_arc()`.

**Note:** `fl_circle()` draws incorrectly if the transformation is both rotated and non-square scaled.

1.8.3.7 Drawing Text

All text is drawn in the current font. It is undefined whether this location or the characters are modified by the current transformation.

```c
void fl_draw(const char *, int x, int y)
void fl_draw(const char *, int n, int x, int y)
```

Draw a null-terminated string or an array of $n$ bytes starting at the given location. In both cases, the text must be UTF-8 encoded. Text is aligned to the left and to the baseline of the font. To align to the bottom, subtract `fl_descent()` from $y$. To align to the top, subtract `fl_descent()` and add `fl_height()`. This version of `fl_draw()` provides direct access to the text drawing function of the underlying OS. It does not apply any special handling to control characters.

```c
void fl_rtl_draw(const char *str, int n, int x, int y)
```
Draw a UTF-8 string of length n bytes right to left starting at the given x, y location.

```c
void fl_draw(const char* str, int x, int y, int w, int h, Fl_Align align, Fl_Image* img, int draw_symbols)
```

Fancy string drawing function which is used to draw all the labels. The string is formatted and aligned inside the passed box. Handles ‘\t’ and ‘\n’, expands all other control characters to ^X, and aligns inside or against the edges of the box described by x, y, w and h. See Fl_Widget::align() for values for align. The value FL_ALIGN_INSIDE is ignored, as this function always prints inside the box.

If img is provided and is not NULL, the image is drawn above or below the text as specified by the align value.

The draw_symbols argument specifies whether or not to look for symbol names starting with the "@" character.

```c
void fl_measure(const char *str, int& w, int& h, int draw_symbols)
```

Measure how wide and tall the string will be when printed by the fl_draw(...align) function. This includes leading/trailing white space in the string, kerning, etc.

If the incoming w is non-zero it will wrap to that width.

This will probably give unexpected values unless you have called fl_font() explicitly in your own code. Refer to the full documentation for fl_measure() for details on usage and how to avoid common pitfalls.

See also

- `fl_text_extents()` – measure the ‘inked’ area of a string
- `fl_width()` – measure the width of a string or single character
- `fl_height()` – measure the height of the current font
- `fl_descent()` – the height of the descender for the current font

```c
int fl_height()
```

Recommended minimum line spacing for the current font. You can also just use the value of size passed to fl_font().
1.8 Drawing Things in FLTK

See also

\texttt{fl\_text\_extents()}, \texttt{fl\_measure()}, \texttt{fl\_width()}, \texttt{fl\_descent()}

\textbf{int fl\_descent()}

Recommended distance above the bottom of a \texttt{fl\_height()} tall box to draw the text at so it looks centered vertically in that box.

\textbf{double fl\_width(const char* txt)}
\texttt{double fl\_width(const char* txt, int n)}
\texttt{double fl\_width(unsigned int unicode\_char)}

Return the width of a nul-terminated string, a sequence of \texttt{n} characters, or a single character in the current font.

See also

\texttt{fl\_measure()}, \texttt{fl\_text\_extents()}, \texttt{fl\_height()}, \texttt{fl\_descent()}

\textbf{void fl\_text\_extents(const char* txt, int& dx, int& dy, int& w, int& h)}

Determines the minimum dimensions of a nul-terminated string, i.e. the 'inked area'.

Given a string "\texttt{txt}" drawn using \texttt{fl\_draw(txt, x, y)} you would determine its extents in \texttt{FLTK units} on the display using \texttt{fl\_text\_extents(txt, dx, dy, wo, ho)} such that a bounding box that exactly fits around the inked area of the text could be drawn with \texttt{fl\_rect(x+dx, y+dy, wo, ho)}.

Refer to the full documentation for \texttt{fl\_text\_extents()} for details on usage.

See also

\texttt{fl\_measure()}, \texttt{fl\_width()}, \texttt{fl\_height()}, \texttt{fl\_descent()}

\textbf{const char* fl\_shortcut\_label(int shortcut)}

Unparse a shortcut value as used by \texttt{Fl\_Button} or \texttt{Fl\_Menu\_Item} into a human-readable string like "Alt+N". This only works if the shortcut is a character key or a numbered function key. If the shortcut is zero an empty string is returned. The return value points at a static buffer that is overwritten with each call.
1.8.3.8 Fonts

FLTK supports a set of standard fonts based on the Times, Helvetica/Arial, Courier, and Symbol typefaces, as well as custom fonts that your application may load. Each font is accessed by an index into a font table.

Initially only the first 16 faces are filled in. There are symbolic names for them: FL_HELVETICA, FL_TIMES, FL_COURIER, and modifier values FL_BOLD and FL_ITALIC which can be added to these, and FL_SYMBOL and FL_ZAPF_DINGBATS. Faces greater than 255 cannot be used in Fl_Widget labels, since Fl_Widget stores the index as a byte.

One important thing to note about 'current font' is that there are so many paths through the GUI event handling code as widgets are partially or completely hidden, exposed and then re-drawn and therefore you can not guarantee that 'current font' contains the same value that you set on the other side of the event loop. Your value may have been superseded when a widget was redrawn. You are strongly advised to set the font explicitly before you draw any text or query the width and height of text strings, etc.

```c
void fl_font(int face, int size)
```

Set the current font, which is then used by the routines described above. You may call this outside a draw context if necessary to call fl_width(), but on X this will open the display.

The font is identified by a `face` and a `size`. The size of the font is measured in FLTK units and not "points". Lines should be spaced `size` FLTK units apart or more.

```c
int fl_font()
int fl_size()
```

Returns the face and size set by the most recent call to `fl_font(a,b)`. This can be used to save/restore the font.

1.8.3.9 Character Encoding

FLTK 1.3 and later versions expect all text in Unicode UTF-8 encoding. UTF-8 is ASCII compatible for the first 128 characters. International characters are encoded in multibyte sequences.

FLTK expects individual characters, characters that are not part of a string, in UCS-4 encoding, which is also ASCII compatible, but requires 4 bytes to store a Unicode character.

FLTK can draw accurately any Unicode-supported script for which the system contains relevant fonts. Under X11 platforms, this requires to build the library with the OPTION_USE_PANGO CMake option turned On (or with configure --enable-pango).

Plain text drawing starting at a user-given coordinate is well supported by FLTK, including for right-to-left scripts. Further text-related operations (i.e., selection, formatting, input, and editing) are functional with left-to-right scripts only.

For more information about character encodings, see the chapter on Unicode and UTF-8 Support.
1.8.3.10 Drawing Overlays

These functions allow you to draw interactive selection rectangles without using the overlay hardware. FLTK will XOR a single rectangle outline over a window.

```c
void fl_overlay_rect(int x, int y, int w, int h)
void fl.overlay_clear()
```

`fl_overlay_rect()` draws a selection rectangle, erasing any previous rectangle by XOR-ing it first. `fl.overlay_clear()` will erase the rectangle without drawing a new one.

Using these functions is tricky. You should make a widget with both a `handle()` and `draw()` method. `draw()` should call `fl.overlay_clear()` before doing anything else. Your `handle()` method should call `window()->make_current()` and then `fl_overlay_rect()` after FL_DRAG events, and should call `fl.overlay_clear()` after a FL_RELEASE event.

1.8.4 Drawing Images

To draw images, you can either do it directly from data in your memory, or you can create a `Fl_Image` object. The advantage of drawing directly is that it is more intuitive, and it is faster if the image data changes more often than it is redrawn. The advantage of using the object is that FLTK will cache translated forms of the image (on X it uses a server pixmap) and thus redrawing is much faster.

1.8.4.1 Direct Image Drawing

The behavior when drawing images when the current transformation matrix is not the identity is not defined, so you should only draw images when the matrix is set to the identity.

```c
void fl_draw_image(const uchar *buf, int X, int Y, int W, int H, int D, int L)
void fl_draw_image_mono(const uchar *buf, int X, int Y, int W, int H, int D, int L)
```

Draw an 8-bit per color RGB or luminance image. The pointer points at the "r" data of the top-left pixel. Color data must be in r, g, b order. The top left corner is given by X and Y and the size of the image is given by W and H. D is the delta to add to the pointer between pixels, it may be any value greater or equal to 3, or it can be negative to flip the image horizontally. L is the delta to add to the pointer between lines (if 0 is passed it uses W * D), and may be larger than W * D to crop data, or negative to flip the image vertically.

It is highly recommended that you put the following code before the first `show()` of any window in your program to get rid of the dithering if possible:

```c
Fl::visual(FL_RGB);
```

Gray scale (1-channel) images may be drawn. This is done if `abs(D)` is less than 3, or by calling `fl_draw_image_mono()`. Only one 8-bit sample is used for each pixel, and on screens with different numbers of bits for red, green, and blue only gray colors are used. Setting D greater than 1 will let you display one channel of a color image.
Note: The X version does not support all possible visuals. If FLTK cannot draw the image in the current visual it will abort. FLTK supports any visual of 8 bits or less, and all common TrueColor visuals up to 32 bits.

typedef void (∗Fl_Draw_Image_Cb)(void ∗data, int x, int y, int w, uchar ∗buf)
void fl_draw_image(Fl_Draw_Image_Cb cb, void ∗data, int X, int Y, int W, int H, int D)
void fl_draw_image_mono(Fl_Draw_Image_Cb cb, void ∗data, int X, int Y, int W, int H, int D)

Call the passed function to provide each scan line of the image. This lets you generate the image as it is being drawn, or do arbitrary decompression of stored data, provided it can be decompressed to individual scan lines easily.

The callback is called with the void* user data pointer which can be used to point at a structure of information about the image, and the x, y, and w of the scan line desired from the image. 0,0 is the upper-left corner of the image, not X, Y. A pointer to a buffer to put the data into is passed. You must copy w pixels from scanline y, starting at pixel x, to this buffer.

Due to cropping, less than the whole image may be requested. So x may be greater than zero, the first y may be greater than zero, and w may be less than W. The buffer is long enough to store the entire W*D pixels, this is for convenience with some decompression schemes where you must decompress the entire line at once: decompress it into the buffer, and then if x is not zero, copy the data over so the x'th pixel is at the start of the buffer.

You can assume the y's will be consecutive, except the first one may be greater than zero.

If D is 4 or more, you must fill in the unused bytes with zero.

int fl_draw_pixmap(char const* data, int x, int y, Fl_Color bg)
int fl_draw_pixmap(const char const* cdata, int x, int y, Fl_Color bg)

Draws XPM image data, with the top-left corner at the given position. The image is dithered on 8-bit displays so you won't lose color space for programs displaying both images and pixmaps. This function returns zero if there was any error decoding the XPM data.

To use an XPM, do:

#include "foo.xpm"
...
fl_draw_pixmap(foo, X, Y);

Transparent colors are replaced by the optional Fl_Color argument. To draw with true transparency you must use the Fl_Pixmap class.

int fl_measure_pixmap(char const* data, int &, int &)
int fl_measure_pixmap(const char const* cdata, int &, int &)

An XPM image contains the dimensions in its data. This function finds and returns the width and height. The return value is non-zero if the dimensions were parsed ok and zero if there was any problem.
1.8.4.2 Direct Image Reading

FLTK provides a single function for reading from the current window or off-screen buffer into a RGB(A) image buffer.

uchar* fl_read_image(uchar *p, int X, int Y, int W, int H, int alpha)

Read a RGB(A) image from the current window or off-screen buffer. The \( p \) argument points to a buffer that can hold the image and must be at least \( W \cdot H \cdot 3 \) bytes when reading RGB images and \( W \cdot H \cdot 4 \) bytes when reading RGBA images. If NULL, \( \text{fl_read_image}() \) will create an array of the proper size which can be freed using delete[].

The \( \text{alpha} \) parameter controls whether an alpha channel is created and the value that is placed in the alpha channel. If 0, no alpha channel is generated.

1.8.4.3 Image Classes

FLTK provides a base image class called Fl_Image which supports creating, copying, and drawing images of various kinds, along with some basic color operations. Images can be used as labels for widgets using the image() and deimage() methods or drawn directly. Images can be drawn scaled to any size, independently from the size of the image’s data (see Fl_Image::scale()).

The Fl_Image class does almost nothing by itself, but is instead supported by three basic image types:

- Fl_Bitmap
- Fl_Pixmap
- Fl_RGB_Image

The Fl_Bitmap class encapsulates a mono-color bitmap image. The draw() method draws the image using the current drawing color.

The Fl_Pixmap class encapsulates a colormapped image. The draw() method draws the image using the colors in the file, and masks off any transparent colors automatically.

The Fl_RGB_Image class encapsulates a full-color (or grayscale) image with 1 to 4 color components. Images with an even number of components are assumed to contain an alpha channel that is used for transparency. The transparency provided by the draw() method is either a 24-bit blend against the existing window contents or a “screen door” transparency mask, depending on the platform and screen color depth.

char fl_can_do_alpha_blending()
fl_can_do_alpha_blending() will return 1, if your platform supports true alpha blending for RGBA images, or 0, if FLTK will use screen door transparency.

FLTK also provides several image classes based on the three standard image types for common file formats:

- Fl_GIF_Image
- Fl_Anim_GIF_Image
- Fl_JPEG_Image
- Fl_PNG_Image
- Fl_PNM_Image
- Fl_XBM_Image
- Fl_XPM_Image
- Fl_SVG_Image
- Fl_BMP_Image
- Fl_ICO_Image

Each of these image classes loads a named file of the corresponding format. The Fl_Shared_Image class can be used to load any type of image file - the class examines the file and constructs an image of the appropriate type.

Finally, FLTK provides a special image class called Fl_Tiled_Image to tile another image object in the specified area. This class can be used to tile a background image in a Fl_Group widget, for example.

virtual Fl_Image* Fl_Image::copy()
virtual Fl_Image* Fl_Image::copy(int W, int H) const

The copy() method creates a copy of the image. The second form specifies the new size of the image - the image is resized using the nearest-neighbor algorithm (this is the default).

Note
As of FLTK 1.3.3 the image resizing algorithm can be changed. See Fl_Image::RGB_scaling(Fl_RGB_Scaling method)

virtual void Fl_Image::draw(int x, int y, int w, int h, int ox, int oy)

The draw() method draws the image object. x, y, w, h indicates the destination rectangle. ox, oy, w, h is the source rectangle. This source rectangle is copied to the destination. The source rectangle may extend outside the image, i.e. ox and oy may be negative and w and h may be bigger than the image, and this area is left unchanged.

Note
See exceptions for Fl_Tiled_Image::draw() regarding arguments ox, oy, w, and h.

virtual void Fl_Image::draw(int x, int y)

Draws the image with the upper-left corner at x, y. This is the same as doing img->draw(x, y, img->w(), img->h(), 0, 0) where img is a pointer to any Fl_Image type.
1.8.5 Offscreen Drawing

Sometimes it can be very useful to generate a complex drawing in memory first and copy it to the screen at a later point in time. This technique can significantly reduce the amount of repeated drawing. Offscreen drawing functions are declared in `<FL/fl_draw.H>`.

`Fl_Double_Window` uses offscreen rendering to avoid flickering on systems that don't support double-buffering natively.

FLTK can draw into an offscreen buffer at any time. There is no need to wait for an `Fl_Widget::draw()` to occur.

Note

In FLTK 1.3.x and earlier versions all offscreen drawing functions described below were implemented as macros and created certain temporary variables to save context information. You needed to create local scope blocks with curly braces `{ ... }` if you used offscreen functions more than once in a function or method. This is no longer necessary since offscreen drawing is now implemented in real functions (no macros).

Example:

```c
Fl_Offscreen oscr = fl_create_offscreen(120, 120);
fl_begin_offscreen(oscr);
fl_color(FL_WHITE);
fl_rectf(0, 0, 120, 120);
fl_end_offscreen();
// other code here
fl_begin_offscreen(oscr);
fl_color(FL_BLACK);
fl_rectf(10, 10, 100, 100);
fl_end_offscreen();
// other code here
fl_delete_offscreen(oscr);
```

**Fl_Offscreen fl_create_offscreen(int w, int h)**

Create an RGB offscreen buffer containing as many pixels as in a screen area of size \( w, h \) FLTK units.

**void fl_delete_offscreen(Fl_Offscreen)**

Delete a previously created offscreen buffer. All drawings are lost.

**void fl_begin_offscreen(Fl_Offscreen)**

Send all subsequent drawing commands to this offscreen buffer.

**void fl_end_offscreen()**

Quit sending drawing commands to this offscreen buffer.

**void fl_copy_offscreen(int x, int y, int w, int h, Fl_Offscreen osrc, int srcx, int srcy)**

Copy a rectangular area of the size \( w \times h \) from \( srcx, srcy \) in the offscreen buffer into the current drawing surface at \( x, y \).

**void fl_rescale_offscreen(Fl_Offscreen &osrc)**

Adapts the offscreen's size in pixels to a changed value of the scale factor while keeping the offscreen's graphical content.
1.9 Handling Events

This chapter discusses the FLTK event model and how to handle events in your program or widget.

1.9.1 The FLTK Event Model

Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application. Events can also come from other programs like the window manager.

Events are identified by the integer argument passed to a `handle()` method that overrides the `Fl_Widget::handle()` virtual method. Other information about the most recent event is stored in static locations and acquired by calling the `Fl::event_∗()` methods. This static information remains valid until the next event is read from the window system, so it is ok to look at it outside of the `handle()` method.

Event numbers can be converted to their actual names using the `fl_eventnames[]` array defined in `<FL/names.h>`; see next chapter for details.

In the next chapter, the `MyClass::handle()` example shows how to override the `Fl_Widget::handle()` method to accept and process specific events.

1.9.2 Mouse Events

1.9.2.1 FL_PUSH

A mouse button has gone down with the mouse pointing at this widget. You can find out what button by calling `Fl::event_button()`. You find out the mouse position by calling `Fl::event_x()` and `Fl::event_y()`.

A widget indicates that it "wants" the mouse click by returning non-zero from its `handle()` method, as in the `MyClass::handle()` example. It will then become the `Fl::pushed()` widget and will get `FL_DRAG` and the matching `FL_RELEASE` events. If `handle()` returns zero then FLTK will try sending the `FL_PUSH` to another widget.

1.9.2.2 FL_DRAG

The mouse has moved with a button held down. The current button state is in `Fl::event_state()`. The mouse position is in `Fl::event_x()` and `Fl::event_y()`.

In order to receive `FL_DRAG` events, the widget must return non-zero when handling `FL_PUSH`.

1.9.2.3 FL_RELEASE

A mouse button has been released. You can find out what button by calling `Fl::event_button()`.

In order to receive the `FL_RELEASE` event, the widget must return non-zero when handling `FL_PUSH`.

1.9.2.4 FL_MOVE

The mouse has moved without any mouse buttons held down. This event is sent to the `Fl::belowmouse()` widget.

In order to receive `FL_MOVE` events, the widget must return non-zero when handling `FL_ENTER`. 
1.9 Handling Events

1.9.2.5 FL_MOUSEWHEEL

The user has moved the mouse wheel. The \texttt{Fl::event\_dx()} and \texttt{Fl::event\_dy()} methods can be used to find the amount to scroll horizontally and vertically.

1.9.3 Focus Events

1.9.3.1 FL_ENTER

The mouse has been moved to point at this widget. This can be used for highlighting feedback. If a widget wants to highlight or otherwise track the mouse, it indicates this by returning non-zero from its \texttt{handle()} method. It then becomes the \texttt{Fl::belowmouse()} widget and will receive \texttt{FL\_MOVE} and \texttt{FL\_LEAVE} events.

1.9.3.2 FL_LEAVE

The mouse has moved out of the widget.

In order to receive the \texttt{FL\_LEAVE} event, the widget must return non-zero when handling \texttt{FL\_ENTER}.

1.9.3.3 FL_FOCUS

This indicates an attempt to give a widget the keyboard focus.

If a widget wants the focus, it should change itself to display the fact that it has the focus, and return non-zero from its \texttt{handle()} method. It then becomes the \texttt{Fl::focus()} widget and gets \texttt{FL\_KEYDOWN}, \texttt{FL\_KEYUP}, and \texttt{FL\_UNFOCUS} events.

The focus will change either because the window manager changed which window gets the focus, or because the user tried to navigate using tab, arrows, or other keys. You can check \texttt{Fl::event\_key()} to figure out why it moved. For navigation it will be the key pressed and for interaction with the window manager it will be zero.

1.9.3.4 FL_UNFOCUS

This event is sent to the previous \texttt{Fl::focus()} widget when another widget gets the focus or the window loses focus.
1.9.4 Keyboard Events

1.9.4.1 FL_KEYBOARD, FL_KEYDOWN, FL_KEYUP

A key was pressed (FL_KEYDOWN) or released (FL_KEYUP). FL_KEYBOARD is a synonym for FL_KEYDOWN, and both names are used interchangeably in this documentation.

The key can be found in Fl::event_key(). The text that the key should insert can be found with Fl::event_text() and its length is in Fl::event_length().

If you use the key, then handle() should return 1. If you return zero then FLTK assumes you ignored the key and will then attempt to send it to a parent widget. If none of them want it, it will change the event into a FL_SHORTCUT event. FL_KEYBOARD events are also generated by the character palette/map.

To receive FL_KEYBOARD events you must also respond to the FL_FOCUS and FL_UNFOCUS events by returning 1. This way FLTK knows whether to bother sending your widget keyboard events. (Some widgets don’t need them, e.g. Fl_Box.)

If you are writing a text-editing widget you may also want to call the Fl::compose() function to translate individual keystrokes into characters.

FL_KEYUP events are sent to the widget that currently has focus. This is not necessarily the same widget that received the corresponding FL_KEYDOWN event because focus may have changed between events.

Todo Add details on how to detect repeating keys, since on some X servers a repeating key will generate both FL_KEYUP and FL_KEYDOWN, such that to tell if a key is held down during FL_KEYUP or not.

1.9.4.2 FL_SHORTCUT

If the Fl::focus() widget is zero or ignores an FL_KEYBOARD event then FLTK tries sending this event to every widget it can, until one of them returns non-zero. FL_SHORTCUT is first sent to the Fl::belowmouse() widget, then its parents and siblings, and eventually to every widget in the window, trying to find an object that returns non-zero. FLTK tries really hard to not to ignore any keystrokes!

You can also make “global” shortcuts by using Fl::add_handler(). A global shortcut will work no matter what windows are displayed or which one has the focus.

1.9.5 Widget Events

1.9.5.1 FL_DEACTIVATE

This widget is no longer active, due to deactivate() being called on it or one of its parents. Please note that although active() may still return true for this widget after receiving this event, it is only truly active if active() is true for both it and all of its parents. (You can use active_r() to check this).

1.9.5.2 FL_ACTIVATE

This widget is now active, due to activate() being called on it or one of its parents.
1.9 Handling Events

1.9.5.3 FL_HIDE

This widget is no longer visible, due to hide() being called on it or one of its parents, or due to a parent window being minimized. Please note that although visible() may still return true for this widget after receiving this event, it is only truly visible if visible() is true for both it and all of its parents. (You can use visible_r() to check this).

1.9.5.4 FL_SHOW

This widget is visible again, due to show() being called on it or one of its parents, or due to a parent window being restored. A child Fl_Window will respond to this by actually creating the window if not done already, so if you subclass a window, be sure to pass FL_SHOW to the base class handle() method!

Note

The events in this chapter ("Widget Events"), i.e. FL_ACTIVATE, FL_DEACTIVATE, FL_SHOW, and FL_HIDE, are the only events deactivated and invisible widgets can usually get, depending on their states. Under certain circumstances, there may also be FL_LEAVE or FL_UNFOCUS events delivered to deactivated or hidden widgets.

1.9.6 Clipboard Events

1.9.6.1 FL_PASTE

You should get this event some time after you call Fl::paste(). The contents of Fl::event_text() is the text to insert and the number of characters is in Fl::event_length().

1.9.6.2 FL_SELECTIONCLEAR

The Fl::selection_owner() will get this event before the selection is moved to another widget. This indicates that some other widget or program has claimed the selection. Motif programs used this to clear the selection indication. Most modern programs ignore this.

1.9.7 Drag and Drop Events

FLTK supports drag and drop of text and files from any application on the desktop to an FLTK widget. Text is transferred using UTF-8 encoding.

See Fl::dnd() for drag and drop from an FLTK widget.

The drag and drop data is available in Fl::event_text() at the concluding FL_PASTE. On some platforms, the event text is also available for the FL_DND_* events, however application must not depend on that behavior because it depends on the protocol used on each platform.

FL_DND_* events cannot be used in widgets derived from Fl_Group or Fl_Window.
1.9.7.1 Dropped filenames

Files are received as a list of full path and file names.

- On some X11 platforms, files are received as a URL-encoded UTF-8 string, that is, non-ASCII bytes (and a few others such as space and %) are replaced by the 3 bytes "%XY" where XY are the byte's hexadecimal value. The `fl_decode_uri()` function can be used to transform in-place the received string into a proper UTF-8 string. On these platforms, strings corresponding to dropped files are further prepended by `file://` (or other prefixes such as `computer://`).

- Other X11 situations put all dropped filenames in a single line, separated by spaces.

- On non-X11 platforms, including Wayland, files dropped are received one pathname per line, with no `\n` after the last pathname.

1.9.7.2 FL_DND_ENTER

The mouse has been moved to point at this widget. A widget that is interested in receiving drag’n’drop data must return 1 to receive `FL_DND_DRAG`, `FL_DND_LEAVE` and `FL_DND_RELEASE` events.

1.9.7.3 FL_DND_DRAG

The mouse has been moved inside a widget while dragging data. A widget that is interested in receiving drag’n’drop data should indicate the possible drop position.

1.9.7.4 FL_DND_LEAVE

The mouse has moved out of the widget.

1.9.7.5 FL_DND_RELEASE

The user has released the mouse button dropping data into the widget. If the widget returns 1, it will receive the data in the immediately following `FL_PASTE` event.

1.9.8 Other events

1.9.8.1 FL_SCREEN_CONFIGURATION_CHANGED

Sent whenever the screen configuration changes (a screen is added/removed, a screen resolution is changed, screens are moved). Use `Fl::add_handler()` to be notified of this event.

1.9.8.2 FL_FULLSCREEN

The application window has been changed from normal to fullscreen, or from fullscreen to normal. If you are using a X window manager which supports Extended Window Manager Hints, this event will not be delivered until the change has actually happened.
1.9.9 Fl::event_*( ) methods

FLTK keeps the information about the most recent event in static storage. This information is good until the next event is processed. Thus it is valid inside handle( ) and callback( ) methods.

These are all trivial inline functions and thus very fast and small:

- Fl::event_button()
- Fl::event_clicks()
- Fl::event_dx()
- Fl::event_dy()
- Fl::event_inside()
- Fl::event_is_click()
- Fl::event_key()
- Fl::event_length()
- Fl::event_state()
- Fl::event_text()
- Fl::event_x()
- Fl::event_x_root()
- Fl::event_y()
- Fl::event_y_root()
- Fl::get_key()
- Fl::get_mouse()
- Fl::test_shortcut()

1.9.10 Event Propagation

Widgets receive events via the virtual handle( ) function. The argument indicates the type of event that can be handled. The widget must indicate if it handled the event by returning 1. FLTK will then remove the event and wait for further events from the host. If the widget's handle function returns 0, FLTK may redistribute the event based on a few rules.

Most events are sent directly to the handle( ) method of the Fl_Window that the window system says they belong to. The window (actually the Fl_Group that Fl_Window is a subclass of) is responsible for sending the events on to any child widgets. To make the Fl_Group code somewhat easier, FLTK sends some events (FL_DRAG, FL←_RELEASE, FL_KEYBOARD, FL_SHORTCUT, FL_UNFOCUS, and FL_LEAVE) directly to leaf widgets. These procedures control those leaf widgets:

- Fl::add_handler()
- Fl::belowmouse()
- Fl::focus()
- Fl::grab()
• Fl::modal()
• Fl::pushed()
• Fl::release() (deprecated, see Fl::grab(0))
• Fl_Widget::take_focus()

FLTK propagates events along the widget hierarchy depending on the kind of event and the status of the UI. Some events are injected directly into the widgets, others may be resent as new events to a different group of receivers.

Mouse click events are first sent to the window that caused them. The window then forwards the event down the hierarchy until it reaches the widget that is below the click position. If that widget uses the given event, the widget is marked “pushed” and will receive all following mouse motion (FL_DRAG) events until the mouse button is released.

Mouse motion (FL_MOVE) events are sent to the Fl::belowmouse() widget, i.e. the widget that returned 1 on the last FL_ENTER event.

Mouse wheel events are sent to the window that caused the event. The window propagates the event down the tree, first to the widget that is below the mouse pointer, and if that does not succeed, to all other widgets in the group. This ensures that scroll widgets work as expected with the widget furthest down in the hierarchy getting the first opportunity to use the wheel event, but also giving scroll bars, that are not directly below the mouse a chance.

Keyboard events are sent directly to the widget that has keyboard focus. If the focused widget rejects the event, it is resent as a shortcut event, first to the top-most window, then to the widget below the mouse pointer, propagating up the hierarchy to all its parents. Those send the event also to all widgets that are not below the mouse pointer. Now if that did not work out, the shortcut is sent to all registered shortcut handlers.

If we are still unsuccessful, the event handler flips the case of the shortcut letter and starts over. Finally, if the key is “escape”, FLTK sends a close event to the top-most window.

All other events are pretty much sent right away to the window that created the event.

Widgets can "grab" events. The grabbing window gets all events exclusively, but usually by the same rules as described above.

Windows can also request exclusivity in event handling by making the window modal.

### 1.9.11 FLTK Compose-Character Sequences

The character composition done by Fl_Input widget requires that you call the Fl::compose() function if you are writing your own text editor widget.

Currently, all characters made by single key strokes with or without modifier keys, or by system-defined character compose sequences (that can involve dead keys or a compose key) can be input. You should call Fl::compose() in case any enhancements to this processing are done in the future. The interface has been designed to handle arbitrary UTF-8 encoded text.

The following methods are provided for character composition:

• Fl::compose()
• Fl::compose_reset()

Under Mac OS X, FLTK "previews" partially composed sequences.
1.10 Adding and Extending Widgets

This chapter describes how to add your own widgets or extend existing widgets in FLTK.

1.10.1 Subclassing

New widgets are created by subclassing an existing FLTK widget, typically Fl_Widget for controls and Fl_Group for composite widgets.

A control widget typically interacts with the user to receive and/or display a value of some sort.

A composite widget holds a list of child widgets and handles moving, sizing, showing, or hiding them as needed. Fl_Group is the main composite widget class in FLTK, and all of the other composite widgets (Fl_Pack, Fl_Scroll, Fl_Tabs, Fl_Tile, Fl_Window, Fl_Flex, Fl_Grid, etc.) are subclasses of it.

You can also subclass other existing widgets to provide a different look or user-interface. For example, the button widgets are all subclasses of Fl_Button since they all interact with the user via a mouse button click. The only difference is the code that draws the face of the button.

1.10.2 Making a Subclass of Fl_Widget

Your subclasses can directly descend from Fl_Widget or any subclass of Fl_Widget. Fl_Widget has only four virtual methods, and overriding some or all of these may be necessary.

1.10.3 The Constructor

The constructor should have the following arguments:
MyClass(int x, int y, int w, int h, const char *label = 0);

This will allow the class to be used in FLUID without problems.

The constructor must call the constructor for the base class and pass the same arguments:
MyClass::MyClass(int x, int y, int w, int h, const char *label)
    : Fl_Widget(x, y, w, h, label) {
        // do initialization stuff...
    }

Fl_Widget's protected constructor sets x(), y(), w(), h(), and label() to the passed values and initializes the other instance variables to:
type(0);
box(FL_NO_BOX);
color(FL_BACKGROUND_COLOR);
selection_color(FL_BACKGROUND_COLOR);
labeltype(FL_NORMAL_LABEL);
labelstyle(FL_NORMAL_STYLE);
labelsize(FL_NORMAL_SIZE);
labelcolor(FL_FOREGROUND_COLOR);
align(FL_ALIGN_CENTER);
callback(default_callback,0);
flags(ACTIVE|VISIBLE);
image(0);
deimage(0);
1.10.4 Protected Methods of Fl_Widget

The following methods are provided for subclasses to use:

- clear_visible()
- damage()
- draw_box()
- draw_focus()
- draw_label()
- set_flag()
- set_visible()
- test_shortcut()
- type()

```cpp
void Fl_Widget::damage(uchar mask)
void Fl_Widget::damage(uchar mask, int x, int y, int w, int h)
uchar Fl_Widget::damage()
```

The first form indicates that a partial update of the object is needed. The bits in mask are OR’d into `damage()`. Your `draw()` routine can examine these bits to limit what it is drawing. The public method `Fl_Widget::redraw()` simply does `Fl_Widget::damage(FL_DAMAGE_ALL)`, but the implementation of your widget can call the public `damage(n)`.

The second form indicates that a region is damaged. If only these calls are done in a window (no calls to `damage(n)` then FLTK will clip to the union of all these calls before drawing anything. This can greatly speed up incremental displays. The mask bits are OR’d into `damage()` unless this is a `Fl_Window` widget.

The third form returns the bitwise-OR of all `damage(n)` calls done since the last `draw()`.

When redrawing your widgets you should look at the damage bits to see what parts of your widget need redrawing. The `handle()` method can then set individual damage bits to limit the amount of drawing that needs to be done:

```cpp
MyClass::handle(int event) {
    ...
    if (change_to_part1) damage(1);
    if (change_to_part2) damage(2);
    if (change_to_part3) damage(4);
}
```

```cpp
MyClass::draw() {
    if (damage() & FL_DAMAGE_ALL) {
        ... draw frame/box and other static stuff ...
    }
    if (damage() & (FL_DAMAGE_ALL | 1)) draw_part1();
    if (damage() & (FL_DAMAGE_ALL | 2)) draw_part2();
    if (damage() & (FL_DAMAGE_ALL | 4)) draw_part3();
}
```

**Todo** Clarify `Fl_Window::damage(uchar)` handling - seems confused/wrong? ORing value doesn’t match setting behavior in `Fl_Widget.h`!

```cpp
void Fl_Widget::draw_box() const
void Fl_Widget::draw_box(Fl_Boxtype t, Fl_Color c) const
```
The first form draws this widget's `box()`, using the dimensions of the widget. The second form uses `t` as the box type and `c` as the color for the box.

```cpp
void Fl_Widget::draw_focus()
void Fl_Widget::draw_focus(Fl_Boxtype t, int x, int y, int w, int h) const
```

Draws a focus box inside the widget's bounding box. The second form allows you to specify a different bounding box.

```cpp
void Fl_Widget::draw_label() const
void Fl_Widget::draw_label(int x, int y, int w, int h) const
void Fl_Widget::draw_label(int x, int y, int w, int h, Fl_Align align) const
```

The first form is the usual function for a `draw()` method to call to draw the widget's label. It does not draw the label if it is supposed to be outside the box (on the assumption that the enclosing group will draw those labels).

The second form uses the passed bounding box instead of the widget's bounding box. This is useful so "centered" labels are aligned with some feature, like a moving slider.

The third form draws the label anywhere. It acts as though `FL_ALIGN_INSIDE` has been forced on so the label will appear inside the passed bounding box. This is designed for parent groups to draw labels with.

```cpp
void Fl_Widget::set_flag(int c)
```

Calling `set_flag(SHORTCUT_LABEL)` modifies the behavior of `draw_label()` so that `&` characters cause an underscore to be printed under the next letter.

```cpp
void Fl_Widget::set_visible()
void Fl_Widget::clear_visible()
```

Fast inline versions of `Fl_Widget::hide()` and `Fl_Widget::show()`. These do not send the `FL_HIDE` and `FL_SHOW` events to the widget.

```cpp
int Fl_Widget::test_shortcut()
static int Fl_Widget::test_shortcut(const char *s)
```

The first version tests `Fl_Widget::label()` against the current event (which should be a `FL_SHORTCUT` event). If the label contains a `&` character and the character after it matches the keypress, this returns true. This returns false if the `SHORTCUT_LABEL` flag is off, if the label is `NULL`, or does not have a `&` character in it, or if the keypress does not match the character.
The second version lets you do this test against an arbitrary string.

uchar Fl_Widget::type() const
void Fl_Widget::type(uchar t)

The property Fl_Widget::type() can return an arbitrary 8-bit identifier, and can be set with the protected method type(uchar t). This value had to be provided for Forms compatibility, but you can use it for any purpose you want. Try to keep the value less than 100 to not interfere with reserved values.

FLTK does not use RTTI (Run Time Typing Information) to enhance portability. But this may change in the near future if RTTI becomes standard everywhere.

If you don’t have RTTI you can use the clumsy FLTK mechanism, by having type() use a unique value. These unique values must be greater than the symbol FL_RESERVED_TYPE (which is 100) and less than FL_WINDOW (unless you make a subclass of Fl_Window). Look through the header files for FL_RESERVED_TYPE to find an unused number. If you make a subclass of Fl_Window you must use FL_WINDOW + n (where n must be in the range 1 to 7).

### 1.10.5 Handling Events

The virtual method Fl_Widget::handle(int event) is called to handle each event passed to the widget. It can:

- Change the state of the widget.
- Call Fl_Widget::redraw() if the widget needs to be redisplayed.
- Call Fl_Widget::damage(uchar c) if the widget needs a partial-update (assuming you provide support for this in your draw() method).
- Call Fl_Widget::do_callback() if a callback should be generated.
- Call Fl_Widget::handle() on child widgets.

Events are identified by the integer argument. Other information about the most recent event is stored in static locations and acquired by calling the Fl::event_∗() methods. This information remains valid until another event is handled.

Here is a sample handle() method for a widget that acts as a pushbutton and also accepts the keystroke ‘x’ to cause the callback:

```c
int MyClass::handle(int event) {
  switch(event) {
    case FL_PUSH:     
      highlight = 1;
      redraw();
      return 1;
    case FL_DRAG: {
      int t = Fl::event_inside(this);
      if (t != highlight) {
        highlight = t;
        redraw();
      }
    } return 1;
    case FL_RELEASE: 
      return 1;
  }
}
```
if (highlight) {
    highlight = 0;
    redraw();
    do_callback();
    // never do anything after a callback, as the callback
    // may delete the widget!
}
return 1;

case FL_SHORTCUT:
    if (Fl::event_key() == 'x') {
        do_callback();
        return 1;
    }
    return 0;
default:
    return Fl_Widget::handle(event);
}

You must return non-zero if your handle() method uses the event. If you return zero, the parent widget will try
sending the event to another widget.

For debugging purposes, event numbers can be printed as their actual event names using the fl_eventnames[] array,
e.g.:

```
#include <FL/names.h> // defines fl_eventnames[]
[..]
int MyClass::handle(int e) {
    printf("Event was %s (%d)\n", fl_eventnames[e], e); // e.g. "Event was FL_PUSH (1)"
   [..]
```

### 1.10.6 Drawing the Widget

The draw() virtual method is called when FLTK wants you to redraw your widget. It will be called if and only if
damage() is non-zero, and damage() will be cleared to zero after it returns. The draw() method should be
declared protected so that it can't be called from non-drawing code.

The damage() value contains the bitwise-OR of all the damage(n) calls to this widget since it was last drawn.
This can be used for minimal update, by only redrawing the parts whose bits are set. FLTK will turn on the FL_DAMAGE_ALL bit if it thinks the entire widget must be redrawn, e.g. for an expose event.

Expose events (and the damage(mask,x,y,w,h) function described above) will cause draw() to be called
with FLTK's clipping turned on. You can greatly speed up redrawing in some cases by testing fl_not_clipped(x,y,w,h) or fl_clip_box() and skipping invisible parts.

Besides the protected methods described above, FLTK provides a large number of basic drawing functions, which
are described in the chapter Drawing Things in FLTK.

### 1.10.7 Resizing the Widget

The resize(x,y,w,h) method is called when the widget is being resized or moved. The arguments are the
new position, width, and height. x(), y(), w(), and h() still remain the old size. You must call resize() on
your base class with the same arguments to get the widget size to actually change.

This should not call redraw(), at least if only the x() and y() change. This is because composite widgets like Fl_Scroll may have a more efficient way of drawing the new position.
1.10.8 Making a Composite Widget

A "composite" widget contains one or more "child" widgets. To make a composite widget you should subclass Fl_Group. It is possible to make a composite object that is not a subclass of Fl_Group, but you'll have to duplicate the code in Fl_Group anyways.

Instances of the child widgets may be included in the parent:

```cpp
class MyClass : public Fl_Group {
   Fl_Button the_button;
   Fl_Slider the_slider;
   ...
};
```

The constructor has to initialize these instances. They are automatically added to the group, since the Fl_Group constructor does Fl_Group::begin(). Don't forget to call Fl_Group::end() or use the Fl_End pseudo-class:

```cpp
MyClass::MyClass(int x, int y, int w, int h) :
   Fl_Group(x, y, w, h),
   the_button(x + 5, y + 5, 100, 20),
   the_slider(x, y + 50, w, 20)
{
   ...(you could add dynamically created child widgets here)...
   end(); // don't forget to do this!
}
```

The child widgets need callbacks. These will be called with a pointer to the children, but the widget itself may be found in the parent() pointer of the child. Usually these callbacks can be static private methods, with a matching private method:

```cpp
void MyClass::static_slider_cb(Fl_Widget* v, void *) { // static method
   ((MyClass*)(v->parent())->slider_cb();
}
void MyClass::slider_cb() { // normal method
   use(the_slider->value());
}
```

If you make the handle() method, you can quickly pass all the events to the children using the Fl_Group::handle() method. You don't need to override handle() if your composite widget does nothing other than pass events to the children:

```cpp
int MyClass::handle(int event) {
   if (Fl_Group::handle(event)) return 1;
   // handle events that children don't want ...
}
```

If you override draw() you need to draw all the children. If redraw() or damage() is called on a child, damage(FL_DAMAGE_CHILD) is done to the group, so this bit of damage() can be used to indicate that a child needs to be drawn. It is fastest if you avoid drawing anything else in this case:

```cpp
int MyClass::draw() {
   Fl_Widget *const* a = array();
   if (damage() == FL_DAMAGE_CHILD) { // only redraw some children
      for (int i = children(); i--; a++) update_child(**a);
   } else { // total redraw
      // draw background graphics ...
      // now draw all the children atop the background:
      for (int i = children_; i--; a++) { // draw children...
         draw_child(**a);
         draw_outside_label(**a); // you may not need to do this
      }
   }
}
```

Fl_Group provides some protected methods to make drawing easier:

- draw_child()
- draw_children()
- draw_outside_label()
- update_child()

```cpp
void Fl_Group::draw_child(Fl_Widget &widget) const
```
This will force the child’s `damage()` bits all to one and call `draw()` on it, then clear the `damage()`. You should call this on all children if a total redraw of your widget is requested, or if you draw something (like a background box) that damages the child. Nothing is done if the child is not `visible()` or if it is clipped.

```cpp
void Fl_Group::draw_children()
```

A convenience function that draws all children of the group. This is useful if you derived a widget from `Fl_Group` and want to draw a special border or background. You can call `draw_children()` from the derived `draw()` method after drawing the box, border, or background.

```cpp
void Fl_Group::draw_outside_label(const Fl_Widget &widget) const
```

Draw the labels that are not drawn by `draw_label()`. If you want more control over the label positions you might want to call `child->draw_label(x, y, w, h, a)`.

```cpp
void Fl_Group::update_child(Fl_Widget& widget) const
```

Draws the child only if its `damage()` is non-zero. You should call this on all the children if your own damage is equal to `FL_DAMAGE_CHILD`. Nothing is done if the child is not `visible()` or if it is clipped.

### 1.10.9 Cut and Paste Support

FLTK provides routines to cut and paste UTF-8 encoded text between applications:

- `Fl::copy()`
- `Fl::paste()`
- `Fl::selection()`
- `Fl::selection_owner()`

It is also possible to copy and paste image data between applications:

- `Fl_Copy_Surface`
- `Fl::clipboard_contains()`
- `Fl::paste()`

It may be possible to cut/paste other kinds of data by using `Fl::add_handler()`. Note that handling events beyond those provided by FLTK may be operating system specific. See Operating System Issues for more details.
1.10.10 Drag And Drop Support

FLTK provides routines to drag and drop UTF-8 encoded text between applications:

Drag’n’drop operations are initiated by copying data to the clipboard and calling the function Fl::dnd().

Drop attempts are handled via the following events, already described under Drag and Drop Events in a previous chapter:

- FL_DND_ENTER
- FL_DND_DRAG
- FL_DND_LEAVE
- FL_DND_RELEASE
- FL_PASTE

1.10.11 Making a subclass of Fl_Window

You may want your widget to be a subclass of Fl_Window, Fl_Double_Window, or Fl_Gl_Window. This can be useful if your widget wants to occupy an entire window, and can also be used to take advantage of system-provided clipping, or to work with a library that expects a system window ID to indicate where to draw.

Subclassing Fl_Window is almost exactly like subclassing Fl_Group, and in fact you can easily switch a subclass back and forth. Watch out for the following differences:

1. Fl_Window is a subclass of Fl_Group so make sure your constructor calls end() unless you actually want children added to your window.
2. When handling events and drawing, the upper-left corner is at 0,0, not x(),y() as in other Fl_Widget’s. For instance, to draw a box around the widget, call draw_box(0,0,w(),h()), rather than draw←
   box(x(),y(),w(),h()).

You may also want to subclass Fl_Window in order to get access to different visuals or to change other attributes of the windows. See the Operating System Issues chapter for more information.

1.11 Using OpenGL

This chapter discusses using FLTK for your OpenGL applications.

1.11.1 Using OpenGL in FLTK

The easiest way to make an OpenGL display is to subclass Fl_Gl_Window. Your subclass must implement a draw() method which uses OpenGL calls to draw the display. Your main program should call redraw() when the display needs to change, and (somewhat later) FLTK will call draw().

With a bit of care you can also use OpenGL to draw into normal FLTK windows (see Using OpenGL in Normal FLTK Windows below). This allows you to use Gouraud shading for drawing your widgets. To do this you use the gl_start() and gl_finish() functions around your OpenGL code.

You must include FLTK’s <FL/gl.h> header file. It will include the file <GL/gl.h> (on macOS: <OpenGL/gl.h>), define some extra drawing functions provided by FLTK, and include the <windows.h> header file needed by Windows applications.

Some simple coding rules (see OpenGL and support of HighDPI displays) allow to write cross-platform code that will support OpenGL run on HighDPI displays (including the 'retina' displays of Apple hardware).
1.11.2 Making a Subclass of Fl_Gl_Window

To make a subclass of Fl_Gl_Window, you must provide:

- A class definition.
- A `draw()` method.
- A `handle()` method if you need to receive input from the user.

If your subclass provides static controls in the window, they must be redrawn whenever the FL_DAMAGE_ALL bit is set in the value returned by `damage()`. For double-buffered windows you will need to surround the drawing code with the following code to make sure that both buffers are redrawn:

```c
#ifndef MESA
glDrawBuffer(GL_FRONT_AND_BACK);
#endif // !MESA
... draw stuff here ...
#ifndef MESA
glDrawBuffer(GL_BACK);
#endif // !MESA
```

**Note:**
If you are using the Mesa graphics library, the call to `glDrawBuffer()` is not required and will slow down drawing considerably. The preprocessor instructions shown above will optimize your code based upon the graphics library used.

1.11.2.1 Defining the Subclass

To define the subclass you just subclass the Fl_Gl_Window class:

```c
class MyWindow : public Fl_Gl_Window {
protected:
    void draw();
    int handle(int);
public:
    MyWindow(int X, int Y, int W, int H, const char *L)
        : Fl_Gl_Window(X, Y, W, H, L) {}
};
```

The `draw()` and `handle()` methods are described below. Like any widget, you can include additional private and public data in your class (such as scene graph information, etc.)

1.11.2.2 The `draw()` Method

The `draw()` method is where you actually do your OpenGL drawing:

```c
void MyWindow::draw() {
    if (!valid()) {
        ... set up projection, viewport, etc ...  
        ... window size is in w() and h()...
        ... valid() is turned on by FLTK after draw() returns
    }
    ... draw ...
}
```
1.11.2.3 The handle() Method

The `handle()` method handles mouse and keyboard events for the window:

```cpp
int MyWindow::handle(int event) {
    switch(event) {
    case FL_PUSH:
        // mouse down event ...
        return 1;
    case FL_DRAG:
        // mouse moved while down event ...
        return 1;
    case FL_RELEASE:
        // mouse up event ...
        return 1;
    case FL_FOCUS :
        case FL_UNFOCUS :
            // Return 1 if you want keyboard events, 0 otherwise
            return 1;
    case FL_KEYBOARD:
        // keypress, key is in Fl::event_key(), ascii in Fl::event_text()
        return 1 if you understand/use the keyboard event, 0 otherwise...
        return 1;
    case FL_SHORTCUT:
        // shortcut, key is in Fl::event_key(), ascii in Fl::event_text()
        return 1 if you understand/use the shortcut event, 0 otherwise...
        return 1;
    default:
        // pass other events to the base class...
        return Fl_Gl_Window::handle(event);
    }
}
```

When `handle()` is called, the OpenGL context is not set up! If your display changes, you should call `redraw()` and let `draw()` do the work. Don't call any OpenGL drawing functions from inside `handle()`!

You can call some OpenGL stuff like hit detection and texture loading functions by doing:

```cpp
case FL_PUSH:
    make_current(); // make OpenGL context current
    if (!valid()) {
        ... set up projection exactly the same as draw ...

        valid(1); // stop it from doing this next time
    }
    ... ok to call NON-DRAWING OpenGL code here, such as hit detection, loading textures, etc...
```

Your main program can now create one of your windows by doing `new MyWindow(...)`.

You can also use your new window class in FLUID by:

1. Putting your class definition in a `MyWindow.H` file.
2. Creating a `Fl_Box` widget in FLUID.
3. In the widget panel fill in the "class" field with `MyWindow`. This will make FLUID produce constructors for your new class.
4. In the "Extra Code" field put `#include "MyWindow.H"`, so that the FLUID output file will compile.

You must put `glwindow->show()` in your main code after calling `show()` on the window containing the OpenGL window.
1.11.3 OpenGL and support of HighDPI displays

HighDPI displays (including the so-called 'retina' displays of Apple hardware) are supported by FLTK in such a way that 1 unit of an FLTK quantity (say, the value given by `Fl_Gl_Window::w()` corresponds to more than 1 pixel on the display. Conversely, when a program specifies the width and height of the OpenGL viewport, it is necessary to use an API that returns quantities expressed in pixels. That can be done as follows:

```cpp
Fl_Gl_Window *glw = ...;
glViewport(0, 0, glw->pixel_w(), glw->pixel_h());
```

which makes use of the `Fl_Gl_Window::pixel_w()` and `Fl_Gl_Window::pixel_h()` methods giving the size in pixels of an `Fl_Gl_Window` that is potentially mapped to a HighDPI display. Method `Fl_Gl_Window::pixels_per_unit()` can also be useful in this context.

Note
A further coding rule is necessary to properly support retina displays and OpenGL under macOS (see OpenGL and 'retina' displays)

1.11.4 Using OpenGL in Normal FLTK Windows

Note
Drawing both with OpenGL and Quartz in a normal FLTK window is not possible with the macOS platform. This technique is therefore not useful under macOS because it permits nothing more than what is possible with class `Fl_Gl_Window`.

You can put OpenGL code into the `draw()` method, as described in Drawing the Widget in the previous chapter, or into the code for a boxtype or other places with some care.

Most importantly, before you show any windows, including those that don't have OpenGL drawing, you must initialize FLTK so that it knows it is going to use OpenGL. You may use any of the symbols described for `Fl_Gl_Window::mode()` to describe how you intend to use OpenGL:

```cpp
Fl::gl_visual(FL_RGB);
```

You can then put OpenGL drawing code anywhere you can draw normally by surrounding it with `gl_start()` and `gl_finish()` to set up, and later release, an OpenGL context with an orthographic projection so that 0,0 is the lower-left corner of the window and each pixel is one unit. The current clipping is reproduced with OpenGL `glScissor()` commands. These functions also synchronize the OpenGL graphics stream with the drawing done by other X, Windows, or FLTK functions.

```cpp
gl_start();
... put your OpenGL code here ...
gl_finish();
```

The same context is reused each time. If your code changes the projection transformation or anything else you should use `glPushMatrix()` and `glPopMatrix()` functions to put the state back before calling `gl_finish()`.

You may want to use `Fl_Window::current() -> h()` to get the drawable height so that you can flip the Y coordinates.

Unfortunately, there are a bunch of limitations you must adhere to for maximum portability:

- You must choose a default visual with `Fl::gl_visual()`.
- You cannot pass `FL_DOUBLE` to `Fl::gl_visual()`.
- You cannot use `Fl_Double_Window` or `Fl_Overlay_Window`.

Do not call `gl_start()` or `gl_finish()` when drawing into an `Fl_Gl_Window`!
1.11.5 Using FLTK widgets in OpenGL Windows

FLTK widgets can be added to Fl_Gl_Window just as they would be added to Fl_Window. They are rendered as an overlay over the user defined OpenGL graphics using 'fl_..' graphics calls that are implemented in GL.

Fl_Gl_Window does not add subsequent widgets as children by default as Fl_Window does. Call myGlWindow->begin() after creating the GL window to automatically add following widgets. Remember to call myGlWindow->end().

```cpp
class My_Gl_Window : public Fl_Gl_Window {
...
  void draw();
...};
...
myGlWindow = new My_Gl_Window(0, 0, 500, 500);
myGlWindow->begin();
myButton = new Fl_Button(10, 10, 120, 24, "Hello!");
myGlWindow->end();
...

void My_Gl_Window::draw() {
  // ... user GL drawing code
  Fl_Gl_Window::draw(); // Draw FLTK child widgets.
}
```

Users can draw into the overlay by using GL graphics calls as well as all fl_... graphics calls from the "Drawing Fast Shapes" section.

```cpp
void My_Gl_Window::draw() {
  // ... user GL drawing code
  Fl_Gl_Window::draw_begin(); // Set up 1:1 projection
  Fl_Window::draw(); // Draw FLTK children
  fl_color(FL_RED);
  fl_rect(10, 10, 100, 100);
  Fl_Gl_Window::draw_end(); // Restore GL state
}
```

Widgets can be drawn with transparencies by assigning an alpha value to a colormap entry and using that color in the widget.

```cpp
Fl::set_color(FL_FREE_COLOR, 255, 255, 0, 127); // 50% transparent yellow
myGlWindow = new My_Gl_Window(0, 0, 500, 500);
myGlWindow->begin();
myButton = new Fl_Button(10, 10, 120, 24, "Hello!");
myButton->box(FL_BORDER_BOX);
myButton->color(FL_FREE_COLOR);
myGlWindow->end();
```

Transparencies can also be set directly when drawing. This can be used to create custom box types and RGB overlay drawings with an alpha channel.

```cpp
fl_color(0, 255, 0, 127); // 50% transparent green
fl_rectf(10, 10, 100, 100);
fl_color(FL_RED); // back to opaque red
fl_rect(20, 20, 80, 80);
```

1.11.6 OpenGL Drawing Functions

FLTK provides some useful OpenGL drawing functions. They can be freely mixed with any OpenGL calls, and are defined by including `<FL/gl.h>` which you should include instead of the OpenGL header `<GL/gl.h>`.

```cpp
void gl_color(Fl_Color)

Sets the current OpenGL color to a FLTK color. For color-index modes it will use fl_xpixel(c), which is only right if this window uses the default colormap!

void gl_rect(int x, int y, int w, int h)
void gl_rectf(int x, int y, int w, int h)
```
Outlines or fills a rectangle with the current color. If Fl_Gl_Window::ortho() has been called, then the rectangle will exactly fill the pixel rectangle passed.

```c
void gl_font(Fl_Font fontid, int size)
```

Sets the current OpenGL font to the same font you get by calling fl_font().

```c
int gl_height()
int gl_descent()
float gl_width(const char *s)
float gl_width(const char *s, int n)
float gl_width(uchar c)
```

Returns information about the current OpenGL font.

```c
void gl_draw(const char *s)
void gl_draw(const char *s, int n)
```

Draws a nul-terminated string or an array of $n$ characters in the current OpenGL font at the current raster position.

```c
void gl_draw(const char *s, int x, int y)
void gl_draw(const char *s, int n, int x, int y)
void gl_draw(const char *s, float x, float y)
void gl_draw(const char *s, int n, float x, float y)
```

Draws a nul-terminated string or an array of $n$ characters in the current OpenGL font at the given position.

```c
void gl_draw(const char *s, int x, int y, int w, int h, Fl_Align)
```

Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to \^X, and aligned with the edges or center. Exactly the same output as fl_draw().

### 1.11.7 Speeding up OpenGL

Performance of Fl_Gl_Window may be improved on some types of OpenGL implementations, in particular MESA and other software emulators, by setting the GL_SWAP_TYPE environment variable. This variable declares what is in the backbuffer after you do a swapbuffers.

- `setenv GL_SWAP_TYPE COPY`

  This indicates that the back buffer is copied to the front buffer, and still contains its old data. This is true of many hardware implementations. Setting this will speed up emulation of overlays, and widgets that can do partial update can take advantage of this as `damage()` will not be cleared to -1.

- `setenv GL_SWAP_TYPE NODAMAGE`

  This indicates that nothing changes the back buffer except drawing into it. This is true of MESA and Win32 software emulation and perhaps some hardware emulation on systems with lots of memory.

- All other values for GL_SWAP_TYPE, and not setting the variable, cause FLTK to assume that the back buffer must be completely redrawn after a swap.

This is easily tested by running the gl_overlay demo program and seeing if the display is correct when you drag another window over it or if you drag the window off the screen and back on. You have to exit and run the program again for it to see any changes to the environment variable.
1.11.8 Using OpenGL Optimizer with FLTK

OpenGL Optimizer is a scene graph toolkit for OpenGL available from Silicon Graphics for IRIX and Microsoft Windows. It allows you to view large scenes without writing a lot of OpenGL code.

OptimizerWindow Class Definition

To use OpenGL Optimizer with FLTK you'll need to create a subclass of Fl_Gl_Widget that includes several state variables:

class OptimizerWindow : public Fl_Gl_Window {
    csContext *context_; // Initialized to 0 and set by draw()...
    csDrawAction *draw_action_; // Draw action...
    csGroup *scene_; // Scene to draw...
    csCamara *camera_; //Viewport for scene...

    void draw();

    public:
        OptimizerWindow(int X, int Y, int W, int H, const char *L)
            : Fl_Gl_Window(X, Y, W, H, L) {
            context_ = (csContext *)0;
            draw_action_ = (csDrawAction *)0;
            scene_ = (csGroup *)0;
            camera_ = (csCamera *)0;
        }

        void scene(csGroup *g) { scene_ = g; redraw(); }
        void camera(csCamera *c) {
            camera_ = c;
            if (context_) { draw_action_->setCamera(camera_);
                camera_->draw(draw_action_);
                redraw();
            }
        }
};

The camera() Method

The camera() method sets the camera (projection and viewpoint) to use when drawing the scene. The scene is redrawn after this call.

The draw() Method
The `draw()` method performs the needed initialization and does the actual drawing:

```cpp
void OptimizerWindow::draw() {
    if (!context_) {
        // This is the first time we've been asked to draw; create the
        // Optimizer context for the scene...
        #ifdef _WIN32
            context_ = new csContext((HDC)fl_getHDC());
            context_->ref();
            context_->makeCurrent((HDC)fl_getHDC());
        #else
            context_ = new csContext(fl_display, fl_visual);
            context_->ref();
            context_->makeCurrent(fl_display, fl_window);
        #endif // _WIN32
        ... perform other context setup as desired ...
        // Then create the draw action to handle drawing things...
        draw_action_ = new csDrawAction;
        if (camera_) {
            draw_action_->setCamera(camera_);
            camera_->draw(draw_action_);
        }
    } else {
        #ifdef _WIN32
            context_->makeCurrent((HDC)fl_getHDC());
        #else
            context_->makeCurrent(fl_display, fl_window);
        #endif // _WIN32
    }
    if (!valid()) {
        // Update the viewport for this context...
        context_->setViewport(0, 0, w(), h());
    }
    // Clear the window...
    context_->clear(csContext::COLOR_CLEAR | csContext::DEPTH_CLEAR,
                    0.0f, // Red
                    0.0f, // Green
                    0.0f, // Blue
                    1.0f); // Alpha
    // Then draw the scene (if any)...
    if (scene_)
        draw_action_->apply(scene_);
}
```

The `scene()` method sets the scene to be drawn. The scene is a collection of 3D objects in a `csGroup`. The scene is redrawn after this call.

### 1.11.9 Using OpenGL 3.0 (or higher versions)

The examples subdirectory contains OpenGL3test.cxx, a toy program showing how to use OpenGL 3.0 (or higher versions) with FLTK in a cross-platform fashion. It contains also OpenGL3-glut-test.cxx which shows how to use FLTK’s GLUT compatibility and OpenGL 3.

To access OpenGL 3.0 (or higher versions), use the `FL_OPENGL3` flag when calling `Fl_Gl_Window::mode(int a)` or `glutInitDisplayMode()`.

On the Windows and Linux platforms, FLTK creates contexts implementing the highest OpenGL version supported by the hardware. Such contexts may also be compatible with lower OpenGL versions. Access to functions from OpenGL versions above 1.1 requires to load function pointers at runtime on these platforms. FLTK recommends to use the GLEW library to perform this. It is therefore necessary to install the GLEW library (see below).

On the macOS platform, MacOS 10.7 or above is required; GLEW is possible but not necessary. FLTK creates contexts for OpenGL versions 1 and 2 without the `FL_OPENGL3` flag and for OpenGL versions 3.2 and above (but not below) with it.
GLEW installation (Linux and Windows platforms)

FLTK needs a header file, GL/glew.h, and a library, libGLEW.* or equivalent, to support OpenGL 3 and above.

These can be obtained for most Linux distributions by installing package libglew-dev.

For the Windows platform:

- the header and a Visual Studio static library (glew32.lib) can be downloaded from http://glew.sourceforge.net/;
- a MinGW-style static library (libglew32.a) can be built from source (same web site) with the make command. Alternatively, pre-built files are available for these architectures:
  - x86: download files glew.h and libglew32.a;
  - x86_64: install GLEW as an MSYS2 package with command: pacman -S mingw-w64-x86_64-glew

Source-level changes for OpenGL 3:

- Put this in all OpenGL-using source files (instead of, or before if needed, #include <FL/gl.h>, and before #include <FL/glut.h> if you use GLUT):
  #if defined(__APPLE__)
  # include <OpenGL/gl3.h> // defines OpenGL 3.0+ functions
  #else
  # if defined(_WIN32)
  # define GLEW_STATIC 1
  # endif
  # include <GL/glew.h>
  #endif

- Add the FL_OPENGL3 flag when calling Fl_Gl_Window::mode(int a) or glutInitDisplayMode().

- Put this in the handle(int event) member function of the first to be created among your Fl_Gl-Window-derived classes:
  #ifndef __APPLE__
  static int first = 1;
  if (first && event == FL_SHOW && shown()) {
    first = 0;
    make_current();
    glewInit(); // defines pters to functions of OpenGL V 1.2 and above
  }
  #endif

- Alternatively, if you use GLUT, put
  #ifndef __APPLE__
  glewInit(); // defines pters to functions of OpenGL V 1.2 and above
  #endif

after the first glutCreateWindow() call.

If GLEW is installed on the Mac OS development platform, it is possible to use the same code for all platforms, with one exception: put

#ifdef __APPLE__
glewExperimental = GL_TRUE;
#endif

before the glewinit() call.

Testing for success of the glewinit() call

Testing whether the glewinit() call is successful is to be done as follows:

#include <FL/Fl.H> // for Fl::warning()
#ifdef __APPLE__
  # if defined(_WIN32)
  # define GLEW_STATIC 1
  # endif
  # include <GL/glew.h>

GLenum err = glewInit(); // defines pters to functions of OpenGL V 1.2 and above
#ifdef FLTK_USE_WAYLAND
  // glewInit returns GLEW_ERROR_NO_GLX_DISPLAY with Wayland
  if (Fl::gl_display() && err == GLEW_ERROR_NO_GLX_DISPLAY) err = GLEW_OK;
#endif
#if (err != GLEW_OK) Fl::warning("glewInit() failed returning \%u", err);
#endif // ! __APPLE__
Changes in the build process

Link with libGLEW.so (with X11 or Wayland), libglew32.a (with MinGW) or glew32.lib (with MS Visual Studio); no change is needed on the Mac OS platform.

1.12 Programming with FLUID

This chapter shows how to use the Fast Light User-Interface Designer ("FLUID") to create your GUIs.

Subchapters:

- What is FLUID?
- Running FLUID Under UNIX
- Running FLUID Under Microsoft Windows
- Compiling .fl Files
- A Short Tutorial
- FLUID Reference
- FLUID Templates
- Internationalization with FLUID
- Known Limitations
- Keyboard Shortcuts
- Licenses

1.12.1 What is FLUID?

The Fast Light User Interface Designer, or FLUID, is a graphical editor that is used to produce FLTK source code. FLUID edits and saves its state in .fl files. These files are text, and you can (with care) edit them in a text editor, perhaps to get some special effects. The .fl file format is explained in detail in fluid/README_fl.txt.

FLUID can "compile" the .fl file into a .cxx and a .h file. The .cxx file defines all the objects from the .fl file and the .h file declares all the global ones. FLUID also supports localization (Internationalization) of label strings and tooltips using message files and the GNU gettext or POSIX catgets interfaces.

A simple program can be made by putting all your code (including a `main()` function) into the .fl file and thus making the .cxx file a single source file to compile. Most programs are more complex than this, so you write other .cxx files that call the FLUID functions. These .cxx files must #include the .h file or they can #include the .cxx file so it still appears to be a single source file.

![Figure 1.28 FLUID organization](image)

Figure 1.28 FLUID organization
Normally the FLUID file defines one or more functions or classes which output C++ code. Each function defines one or more FLTK windows and all the widgets that go inside those windows.

Widgets created by FLUID are either "named", "complex named" or "unnamed". A named widget has a legal C++ variable identifier as its name (i.e. only alphanumeric and underscore). In this case FLUID defines a global variable or class member that will point at the widget after the function defining it is called. A complex named object has punctuation such as ' . ' or '->' or any other symbols in its name. In this case FLUID assigns a pointer to the widget to the name, but does not attempt to declare it. This can be used to get the widgets into structures. An unnamed widget has a blank name and no pointer is stored.

Widgets may either call a named callback function that you write in another source file, or you can supply a small piece of C++ source and FLUID will write a private callback function into the .cxx file.

1.12.2 Running FLUID Under UNIX

To run FLUID under UNIX, type:

```
fluid filename.fl &
```

to edit the .fl file filename.fl. If the file does not exist you will get an error pop-up, but if you dismiss it you will be editing a blank file of that name. You can run FLUID without any name, in which case you will be editing an unnamed blank setup (but you can use save-as to write it to a file).

You can provide any of the standard FLTK switches before the filename:

- `-display hostin.n`
- `-geometry WxH+X+Y`
- `-title windowtitle`
- `-name classname`
- `-iconic`
- `-fg color`
- `-bg color`
- `-bg2 color`
- `-scheme schemename`

Changing the colors may be useful to see what your interface will look at if the user calls it with the same switches. Similarly, using `-scheme plastic` will show how the interface will look using the "plastic" scheme.

In the current version, if you don't put FLUID into the background with ' & ' then you will be able to abort FLUID by typing CTRL-C on the terminal. It will exit immediately, losing any changes.

1.12.3 Running FLUID Under Microsoft Windows

To run FLUID under Windows, double-click on the FLUID.exe file. You can also run FLUID from the Command Prompt window. FLUID always runs in the background under Windows.

1.12.4 Compiling .fl Files

FLUID can also be called as a command-line "compiler" to create the .cxx and .h file from a .fl file. To do this type:

```
fluid -c filename.fl
```

This is the same as the menu 'File/Write Code...'. It will read the filename.fl file and write filename.cxx and filename.h. Any leading directory on filename.fl will be stripped, so they are always written to the current directory. If there are any errors reading or writing the files, FLUID will print the error and exit with a non-zero code. You can use the following lines in a makefile to automate the creation of the source and header files:

```
my_panels.h my_panels.cxx: my_panels.fl
fluid -c my_panels.fl
```
1.12 Programming with FLUID

Most versions of make support rules that cause .fl files to be compiled:

```
.SUFFIXES: .fl .cxx .h
.fl.h .fl.cxx:
  fluid -c $<
```

If you use
```
fluid -cs filename.fl
```
FLUID will also write the "strings" for internationalization in file 'filename.txt' (menu: ‘File/Write Strings...’).

Finally there is another option which is useful for program developers who have many .fl files and want to upgrade them to the current FLUID version. FLUID will read the filename.fl file, save it, and exit immediately. This writes the file with current syntax and options and the current FLTK version in the header of the file. Use
```
fluid -u filename.fl
```
to 'upgrade' filename.fl. You may combine this with '-c' or '-cs'.

Note

All these commands overwrite existing files w/o warning. You should particularly take care when running ‘fluid
-u’ since this overwrites the original .fl source file.

1.12.5 A Short Tutorial

FLUID is an amazingly powerful little program. However, this power comes at a price as it is not always obvious how to accomplish seemingly simple tasks with it. This tutorial will show you how to generate a complete user interface class with FLUID that is used for the CubeView program provided with FLTK.

![Figure 1.29 CubeView demo](image)

The window is of class CubeViewUI, and is completely generated by FLUID, including class member functions. The central display of the cube is a separate subclass of Fl_Gl_Window called CubeView. CubeViewUI manages CubeView using callbacks from the various sliders and rollers to manipulate the viewing angle and zoom of CubeView.

At the completion of this tutorial you will (hopefully) understand how to:
1. Use FLUID to create a complete user interface class, including constructor and any member functions necessary.

2. Use FLUID to set callback member functions of custom widget classes.

3. Subclass an Fl_Gl_Window to suit your purposes.

1.12.5.1 The CubeView Class

The CubeView class is a subclass of Fl_Gl_Window. It has methods for setting the zoom, the x and y pan, and the rotation angle about the x and y axes.

You can safely skip this section as long as you realize that CubeView is a subclass of Fl_Gl_Window and will respond to calls from CubeViewUI, generated by FLUID.

The CubeView Class Definition

Here is the CubeView class definition, as given by its header file "test/CubeView.h":

```cpp
#include <FL/Fl.H>
#include <FL/Fl_Gl_Window.H>
#include <FL/gl.h>

class CubeView : public Fl_Gl_Window {
public:
    CubeView(int x, int y, int w, int h, const char *l = 0);
    // This value determines the scaling factor used to draw the cube.
    double size;
    /* Set the rotation about the vertical (y) axis.
       This function is called by the horizontal roller in
       CubeViewUI and the initialize button in CubeViewUI.
       */
    void v_angle(double angle) { vAng = angle; }
    // Return the rotation about the vertical (y) axis.
    double v_angle() const { return vAng; }
    /* Set the rotation about the horizontal (x) axis.
       This function is called by the vertical roller in
       CubeViewUI and the initialize button in CubeViewUI.
       */
    void h_angle(double angle) { hAng = angle; }
    // The rotation about the horizontal (x) axis.
    double h_angle() const { return hAng; }
    /* Sets the x shift of the cube view camera.
       This function is called by the slider in CubeViewUI
       and the initialize button in CubeViewUI.
       */
    void panx(double x) { xshift = x; }
    /* Sets the y shift of the cube view camera.
       This function is called by the slider in CubeViewUI
       and the initialize button in CubeViewUI.
       */
    void pany(double y) { yshift = y; }
    /* The widget class draw() override.
       The draw() function initializes Gl for another round of
       drawing, then calls specialized functions for drawing each
       of the entities displayed in the cube view.
       */
    void draw();

    // Additional member functions for zoom, pan, and rotation

    // Additional member variables for size, rotation angles, and shifts

};
```

Generated by Doxygen
private:
    /* Draw the cube boundaries. 
     * Draw the faces of the cube using the boxv[] vertices, 
     * using GL_LINE_LOOP for the faces. 
     */
    void drawCube();

    double vAng, hAng;
    double xshift, yshift;

    float boxv0[3]; float boxv1[3];
    float boxv2[3]; float boxv3[3];
    float boxv4[3]; float boxv5[3];
    float boxv6[3]; float boxv7[3];
};

The CubeView Class Implementation

Here is the CubeView implementation. It is very similar to the "CubeView" demo included with FLTK.

#include "CubeView.h"
#include <math.h>

CubeView::CubeView(int x, int y, int w, int h, const char *l)
    : Fl_Gl_Window(x, y, w, h, l)
    { 
    Fl::use_high_res_GL(1);
    vAng = 0.0;
    hAng = 0.0;
    size = 10.0;
    xshift = 0.0;
    yshift = 0.0;

    /* The cube definition. These are the vertices of a unit cube 
     * centered on the origin. */

    boxv0[0] = -0.5; boxv0[1] = -0.5; boxv0[2] = -0.5;
    boxv1[0] = 0.5; boxv1[1] = -0.5; boxv1[2] = -0.5;
    boxv2[0] = 0.5; boxv2[1] = 0.5; boxv2[2] = -0.5;
    boxv3[0] = -0.5; boxv3[1] = 0.5; boxv3[2] = -0.5;
    boxv4[0] = -0.5; boxv4[1] = -0.5; boxv4[2] = 0.5;
    boxv5[0] = 0.5; boxv5[1] = -0.5; boxv5[2] = 0.5;
    boxv6[0] = 0.5; boxv6[1] = 0.5; boxv6[2] = 0.5;
    boxv7[0] = -0.5; boxv7[1] = 0.5; boxv7[2] = 0.5;
}

void CubeView::drawCube() {
    /* Draw a colored cube */
    #define ALPHA 0.5
    glBegin(GL_QUADS);
    glColor4f(0.0, 0.0, 1.0, ALPHA);
    glVertex3fv(boxv0);
    glVertex3fv(boxv1);
    glVertex3fv(boxv2);
    glVertex3fv(boxv3);
    glColor4f(1.0, 1.0, 0.0, ALPHA);
    glVertex3fv(boxv0);
    glVertex3fv(boxv4);
    glVertex3fv(boxv5);
    glVertex3fv(boxv1);
    glColor4f(0.0, 1.0, 1.0, ALPHA);
    glVertex3fv(boxv2);
    glVertex3fv(boxv6);
    glVertex3fv(boxv7);
    glVertex3fv(boxv3);
    glColor4f(1.0, 0.0, 0.0, ALPHA);
    glVertex3fv(boxv4);
    glVertex3fv(boxv5);
    glVertex3fv(boxv6);
    glVertex3fv(boxv7);
    glColor4f(1.0, 0.0, 1.0, ALPHA);
    glVertex3fv(boxv0);
    glEnd();
}
glVertex3fv(boxv3);
glVertex3fv(boxv7);
glVertex3fv(boxv4);

glColor4f(0.0, 1.0, 0.0, ALPHA);
glVertex3fv(boxv1);
glVertex3fv(boxv5);
glVertex3fv(boxv6);
glVertex3fv(boxv2);
glEnd();

glColor3f(1.0, 1.0, 1.0);

void CubeView::draw() {
  if (!valid()) {
    glLoadIdentity();
    glViewport(0, 0, pixel_w(), pixel_h());
    glOrtho(-10, 10, -10, 10, -20050, 10000);
    glEnable(GL_BLEND);
    glBlendFunc(GL_SRC_ALPHA, GL_ONE_MINUS_SRC_ALPHA);
  }
  glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT);
  glPushMatrix();
  glTranslatef((GLfloat)xshift, (GLfloat)yshift, 0);
  glRotatef((GLfloat)hAng, 0, 1, 0);
  glRotatef((GLfloat)vAng, 1, 0, 0);
  glScalef(float(size), float(size), float(size));
  drawCube();
  glPopMatrix();
}

1.12.5.2 The CubeViewUI Class

We will completely construct a window to display and control the CubeView defined in the previous section using FLUID.
Defining the CubeViewUI Class

Once you have started FLUID, the first step in defining a class is to create a new class within FLUID using the New->Code->Class menu item. Name the class "CubeViewUI" and leave the subclass blank. We do not need any inheritance for this window. You should see the new class declaration in the FLUID browser window.

![FLUID file for CubeView](image)

Figure 1.30 FLUID file for CubeView

Adding the Class Constructor

Click on the CubeViewUI class in the FLUID window and add a new method by selecting New->Code->Function/Method. The name of the function will also be CubeViewUI. FLUID will understand that this will be the constructor for the class and will generate the appropriate code. Make sure you declare the constructor public.

Then add a window to the CubeViewUI class. Highlight the name of the constructor in the FLUID browser window and click on New->Group->Window. In a similar manner add the following to the CubeViewUI constructor:

- A horizontal roller named hrot
- A vertical roller named vrot
- A horizontal slider named xpan
- A vertical slider named ypan
- A horizontal value slider named zoom

None of these additions need be public. And they shouldn't be unless you plan to expose them as part of the interface for CubeViewUI.

When you are finished you should have something like this:
We will talk about the `show()` method that is highlighted shortly.

Adding the CubeView Widget

What we have is nice, but does little to show our cube. We have already defined the CubeView class and we would like to show it within the CubeViewUI.

The CubeView class inherits the `FL_Gl_Window` class, which is created in the same way as an `Fl_Box` widget. Use `New->Other->Box` to add a square box to the main window. This will be no ordinary box, however.

The Box properties window will appear. The key to letting CubeViewUI display CubeView is to enter CubeView in the **Class**: text entry box. This tells FLUID that it is not an `Fl_Box`, but a similar widget with the same constructor.

In the **Extra Code**: field enter `#include "CubeView.h"

This `#include` is important, as we have just included CubeView as a member of CubeViewUI, so any public CubeView methods are now available to CubeViewUI.
Defining the Callbacks

Each of the widgets we defined before adding CubeView can have callbacks that call CubeView methods. You can call an external function or put a short amount of code in the Callback field of the widget panel. For example, the callback for the ypan slider is:

```c
cube->pany(((Fl_Slider *)o)->value());
cube->redraw();
```

We call `cube->redraw()` after changing the value to update the CubeView window. CubeView could easily be modified to do this, but it is nice to keep this exposed. In the case where you may want to do more than one view change only redrawing once saves a lot of time.

There is no reason to wait until after you have added CubeView to enter these callbacks. FLUID assumes you are smart enough not to refer to members or functions that don't exist.

Adding a Class Method

You can add class methods within FLUID that have nothing to do with the GUI. As an example add a show function so that CubeViewUI can actually appear on the screen.

Make sure the top level CubeViewUI is selected and select New->Code->Function/Method. Just use the name `show()`. We don't need a return value here, and since we will not be adding any widgets to this method FLUID will assign it a return type of `void`. 

---

Figure 1.32 CubeView methods
Once the new method has been added, highlight its name and select **New-&gt;Code-&gt;Code**. Enter the method’s code in the code window.

1.12.5.3 Adding Constructor Initialization Code

If you need to add code to initialize a class, for example setting initial values of the horizontal and vertical angles in the CubeView, you can simply highlight the constructor and select **New-&gt;Code-&gt;Code**. Add any required code.

1.12.5.4 Generating the Code

Now that we have completely defined the CubeViewUI, we have to generate the code. There is one last trick to ensure this all works. Open the preferences dialog from **Edit-&gt;Preferences**.

At the bottom of the preferences dialog box is the key: "**Include Header from Code**". Select that option and set your desired file extensions and you are in business. You can include the CubeViewUI.h (or whatever extension you prefer) as you would any other C++ class.

1.12.6 FLUID Reference

The following sections describe each of the windows in FLUID.

1.12.6.1 The Widget Browser

The main window shows a menu bar and a scrolling browser of all the defined widgets. The name of the *.fl* file being edited is shown in the window title.

The widgets are stored in a hierarchy. You can open and close a level by clicking the “triangle” at the left of a widget. The leftmost widgets are the **parents**, and all the widgets listed below them are their **children**. Parents don’t have to have any children.
The top level of the hierarchy is composed of functions and classes. Each of these will produce a single C++ public function or class in the output .cxx file. Calling the function or instantiating the class will create all of the child widgets.

The second level of the hierarchy contains the windows. Each of these produces an instance of class Fl_Window.

Below that are either widgets (subclasses of Fl_Widget) or groups of widgets (including other groups). Plain groups are for layout, navigation, and resize purposes. Tab groups provide the well-known file-card tab interface.

Widgets are shown in the browser by either their name (such as "main_panel" in the example), or by their type and label (such as "Button "the green").

You select widgets by clicking on their names, which highlights them (you can also select widgets from any displayed window). You can select many widgets by dragging the mouse across them, or by using Shift+Click to toggle them on and off. To select no widgets, click in the blank area under the last widget. Note that hidden children may be selected even when there is no visual indication of this.

You open widgets by double-clicking on them, or (to open several widgets you have picked) by typing the F1 key. A control panel will appear so you can change the widget(s).

1.12.6.2 Menu Items

The menu bar at the top is duplicated as a pop-up menu on any displayed window. The shortcuts for all the menu items work in any window. The menu items are:

File/Open... (Ctrl+o)

Discards the current editing session and reads in a different .fl file. You are asked for confirmation if you have changed the current file.

FLUID can also read .fd files produced by the Forms and XForms "fdesign" programs. It is best to File/→Merge them instead of opening them. FLUID does not understand everything in a .fd file, and will print a warning message on the controlling terminal for all data it does not understand. You will probably need to edit the resulting setup to fix these errors. Be careful not to save the file without changing the name, as FLUID will write over the .fd file with its own format, which fdesign cannot read!

File/Insert... (Ctrl+i)

Inserts the contents of another .fl file, without changing the name of the current .fl file. All the functions (even if they have the same names as the current ones) are added, and you will have to use cut/paste to put the widgets where you want.
File/Save (Ctrl+s)

Writes the current data to the .fl file. If the file is unnamed then FLUID will ask for a filename.

File/Save As... (Ctrl+Shift+S)

Asks for a new filename and saves the file.

File/Save A Copy...

Save a copy of the .fl data to a different file.

File/Revert...

Revert the .fl data to a previously saved state.

File/New From Template...

Create a new user interface design from a previously saved template. This can be useful for including a predefined enterprise copyright message for projects, or for managing boilerplate code for repeating project code.

File/Save As Template...

Save the current project as a starting point for future projects.

File/Print... (Ctrl-P)
Generate a printout containing all currently open windows within your project.

**File/Write Code (Ctrl+Shift+C)**

“Compiles” the data into a `.cxx` and `.h` file. These are exactly the same as the files you get when you run FLUID with the `-c` switch.

The output file names are the same as the `.fl` file, with the leading directory and trailing ".fl" stripped, and ".h" or ".cxx" appended.

**File/Write Strings (Ctrl+Shift+W)**

Writes a message file for all of the text labels defined in the current file.

The output file name is the same as the `.fl` file, with the leading directory and trailing ".fl" stripped, and ".txt", ".po", or ".msg" appended depending on the Internationalization Mode.

**File/Quit (Ctrl+q)**

Exits FLUID. You are asked for confirmation if you have changed the current file.

**Edit/Undo (Ctrl+z) and Redo (Shift+Ctrl+z)**

FLUID saves the project state for undo and redo operations after every major change.

**Edit/Cut (Ctrl+x)**
Deletes the selected widgets and all of their children. These are saved to a "clipboard" file and can be pasted back into any FLUID window.

**Edit/Copy (Ctrl+c)**

Copies the selected widgets and all of their children to the "clipboard" file.

**Edit/Paste (Ctrl+v)**

Pastes the widgets from the clipboard file.

If the widget is a window, it is added to whatever function is selected, or contained in the current selection.

If the widget is a normal widget, it is added to whatever window or group is selected. If none is, it is added to the window or group that is the parent of the current selection.

To avoid confusion, it is best to select exactly one widget before doing a paste.

Cut/paste is the only way to change the parent of a widget.

**Edit/Select All (Ctrl+a)**

Selects all widgets in the same group as the current selection.

If they are all selected already then this selects all widgets in that group's parent. Repeatedly typing Ctrl+a will select larger and larger groups of widgets until everything is selected.

**Edit/Properties... (F1 or double click)**
Displays the current widget in the attributes panel. If the widget is a window and it is not visible then the window is shown instead.

Edit/Sort

Sorts the selected widgets into left to right, top to bottom order. You need to do this to make navigation keys in FLTK work correctly. You may then fine-tune the sorting with "Earlier" and "Later". This does not affect the positions of windows or functions.

Edit/Earlier (F2)

Moves all of the selected widgets one earlier in order among the children of their parent (if possible). This will affect navigation order, and if the widgets overlap it will affect how they draw, as the later widget is drawn on top of the earlier one. You can also use this to reorder functions, classes, and windows within functions.

Edit/Later (F3)

Moves all of the selected widgets one later in order among the children of their parent (if possible).

Edit/Group (F7)

Creates a new Fl_Group and make all the currently selected widgets children of it.

Edit/Ungroup (F8)

Deletes the parent group if all the children of a group are selected.

Edit/Show or Hide Overlays (Ctrl+Shift+O)
Toggles the display of the red overlays off, without changing the selection. This makes it easier to see box borders and how the layout looks. The overlays will be forced back on if you change the selection.

**Edit/Show or Hide Guides (Ctrl+Shift+G)**

Guides can be used to arrange a widget layout easily and consistently. They indicating preferred widget positions and sizes with user definable margins, grids, and gap sizes. See the "Layout" tab in the "Settings" dialog.

This menu item enables and disable guides and the snapping action when dragging widgets and their borders.

**Edit/Show or Hide Restricted (Ctrl+Shift+R)**

It is recommended to ensure that user interface elements within FLTK do not exceed the size of their container group or overlap with each other. By activating this button, a hatch pattern is enabled, visually highlighting areas where restricted or undefined behavior may occur.

**Edit/Show or Hide Widget Bin (Alt+B)**

The widget bin provides quick access to all widget types supported by FLUID. Layouts can be created by clicking on elements in the widget bin, or by dragging them from the bin to their position within the layout. This button shows or hides the widget bin.

**Edit/Show or Hide Source Code (Shift+Alt+S)**

This button shows or hides the source code preview window. Any change to the layout or code in the layout editors can be previewed and verified immediately in the Code View window.

**Edit/Settings... (Alt+p)**
Displays the FLUID settings panel. The settings panel contains tabs for general FLUID settings, project setting, layout preferences, custom shell commands, and the internationalisation settings for GNU Gettext and POSIX `catgets`.

Under the "Project" tab you control the extensions or names of the files that are generated by FLUID. If you check the "Include Header from Code" button the code file will include the header file automatically.

Under the "Locale" tab are the internationalization options, described later in this chapter.

![FLUID General Settings Tab](image.png)

Figure 1.34 FLUID General Settings Tab
New/Code/Function

Creates a new C function. You will be asked for a name for the function. This name should be a legal C++ function template, without the return type. You can pass arguments which can be referred to by code you type into the individual widgets.

If the function contains any unnamed windows, it will be declared as returning an \texttt{FL\_Window} pointer. The unnamed window will be returned from it (more than one unnamed window is useless). If the function contains only named windows, it will be declared as returning nothing (\texttt{void}).

It is possible to make the \texttt{.cxx} output be a self-contained program that can be compiled and executed. This is done by deleting the function name so \texttt{main(argc, argv)} is used. The function will call \texttt{show()} on all the windows it creates and then call \texttt{Fl::run().} This can also be used to test resize behavior or other parts of the user interface.

You can change the function name by double-clicking on the function.
Creates a new Fl_Window widget. The window is added to the currently selected function, or to the function containing the currently selected item. The window will appear, sized to 100x100. You can resize it to whatever size you require.

The widget panel will also appear and is described later in this chapter.

New/...

All other items on the New menu are subclasses of Fl_Widget. Creating them will add them to the currently selected group or window, or the group or window containing the currently selected widget. The initial dimensions and position are chosen by copying the current widget, if possible.

When you create the widget you will get the widget's control panel, which is described later in this chapter.

Layout/Align/...

Align all selected widgets to the first widget in the selection.

Layout/Space Evenly/...

Space all selected widgets evenly inside the selected space. Widgets will be sorted from first to last.

Layout/Make Same Size/...

Make all selected widgets the same size as the first selected widget.

Layout/Center in Group/...
Center all selected widgets relative to their parent widget

Layout/Grid and Size Settings... (Ctrl+g)

Displays the grid settings panel.

This panel controls dimensions that all widgets snap to when you move and resize them, and for the "snap" which is how far a widget has to be dragged from its original position to actually change.

Layout preferences are defined using margins to parent groups and window, gaps between widget, and/or by overlaying a grid over a group or window. A layout comes as a suite of three presets, one for the main application window, one for dialog boxes, and one for toolboxes.

FLUID comes with two include layout suites. FLTK was used to design FLUID and other included apps, and Grid is a more rigid grid layout. Users can add more suites, import and export them, and include them into their .fl project files.
1.12 Programming with FLUID

Figure 1.36 FLUID Layout/Grid Settings Window

Shell/Execute Command... (Alt+x)

Displays the shell command panel. The shell command is commonly used to run a 'make' script to compile the FLTK output.
Shell/Execute Again (Alt+g)

Run the shell command again.

Help/Repid development with FLUID

Shows this chapter of the manual.

Help/FLTK Programmers Manual

Shows the contents page of the manual.

Help/About FLUID

Pops up a panel showing the version of FLUID.

1.12.6.3 The Widget Panel

When you double-click on a widget or a set of widgets you will get the "widget attribute panel".

When you change attributes using this panel, the changes are reflected immediately in the window. It is useful to hit the "Hide Overlays" button (or type Ctrl+Shift+O) to hide the red overlay so you can see the widgets more accurately, especially when setting the box type.

If you have several widgets selected, they may have different values for the fields. In this case the value for one of the widgets is shown. But if you change this value, all of the selected widgets are changed to the new value.

Hitting "OK" makes the changes permanent. Selecting a different widget also makes the changes permanent. FLUID checks for simple syntax errors such as mismatched parenthesis in any code before saving any text.
1.12 Programming with FLUID

1.12.7 GUI Attributes

Not all fields in the Widget attributes dialog will be visible for all types of widgets.

Label (text field)

String to print next to or inside the button. You can put newlines into the string to make multiple lines. The easiest way is by typing Ctrl+j.

Symbols can be added to the label using the at sign (@).

Label (pull down menu)

How to draw the label. Normal, shadowed, engraved, and embossed change the appearance of the text.
Image

The active image for the widget. Click on the **Browse...** button to pick an image file using the file chooser.

Inactive

The inactive image for the widget. Click on the **Browse...** button to pick an image file using the file chooser.

Alignment (buttons)

Where to draw the label. The arrows put it on that side of the widget, you can combine them to put it in the corner. The "box" button puts the label inside the widget, rather than outside.

The **clip** button clips the label to the widget box, the **wrap** button wraps any text in the label, and the **text image** button puts the text over the image instead of under the image.

Position (text fields)

The position fields show the current position and size of the widget box. Enter new values to move and/or resize a widget.

These fields understand basic math and variables. Appending +10 to the **X** coordinate will move a widget 10 units to the right without having to reenter the value. Entering the formula **w+3** in the **Width** field will widen all selected Widgets by 3 units. The formula **py+i*20** in the **Y** field will order all selected widgets vertically in their group by increments of 20 units.

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>zero based counter of selected widgets</td>
</tr>
<tr>
<td>x, y, w, h</td>
<td>position and size of the current widget</td>
</tr>
<tr>
<td>px, py, pw, ph</td>
<td>dimensions of the parent widget</td>
</tr>
<tr>
<td>sx, sy, sw, sh</td>
<td>dimensions of the previous sibling</td>
</tr>
<tr>
<td>ex, ey, ew, eh</td>
<td>bounding box of all children</td>
</tr>
</tbody>
</table>
Values (text fields)

The values and limits of the current widget. Depending on the type of widget, some or all of these fields may be inactive.

Shortcut

The shortcut key to activate the widget. Click on the shortcut button and press any key sequence to set the shortcut.

Attributes (buttons)

The **Visible** button controls whether the widget is visible (on) or hidden (off) initially. Don't change this for windows or for the immediate children of a Tabs group.

The **Active** button controls whether the widget is activated (on) or deactivated (off) initially. Most widgets appear greyed out when deactivated.

The **Resizable** button controls whether the window is resizeable. In addition all the size changes of a window or group will go "into" the resizable child. If you have a large data display surrounded by buttons, you probably want that data area to be resizable. You can get more complex behavior by making invisible boxes the resizable widget, or by using hierarchies of groups. Unfortunately the only way to test it is to compile the program. Resizing the FLUID window is *not* the same as what will happen in the user program.

The **Hotspot** button causes the parent window to be positioned with that widget centered on the mouse. This position is determined *when the FLUID function is called*, so you should call it immediately before showing the window. If you want the window to hide and then reappear at a new position, you should have your program set the hotspot itself just before `show()`.

The **Border** button turns the window manager border on or off. On most window managers you will have to close the window and reopen it to see the effect.
X Class (text field)

The string typed into here is passed to the X window manager as the class. This can change the icon or window decorations. On most (all?) window managers you will have to close the window and reopen it to see the effect.

![Figure 1.38 The FLUID widget Style attributes](image)

1.12.7.1 Style Attributes

Label Font (pulldown menu)

Font to draw the label in. Ignored by symbols, bitmaps, and pixmaps. Your program can change the actual font used by these “slots” in case you want some font other than the 16 provided.

Label Size (pulldown menu)

Pixel size (height) for the font to draw the label in. Ignored by symbols, bitmaps, and pixmaps. To see the result without dismissing the panel, type the new number and then Tab.
Label Color (button)

Color to draw the label. Ignored by pixmaps (bitmaps, however, do use this color as the foreground color).

Box (pulldown menu)

The boxtype to draw as a background for the widget.

Many widgets will work, and draw faster, with a "frame" instead of a "box". A frame does not draw the colored interior, leaving whatever was already there visible. Be careful, as FLUID may draw this ok but the real program may leave unwanted stuff inside the widget.

If a window is filled with child widgets, you can speed up redrawing by changing the window's box type to "NO_BOX". FLUID will display a checkerboard for any areas that are not colored in by boxes. Note that this checkerboard is not drawn by the resulting program. Instead random garbage will be displayed.

Down Box (pulldown menu)

The boxtype to draw when a button is pressed or for some parts of other widgets like scrollbars and valuators.

Color (button)

The color to draw the box with.

Select Color (button)

Some widgets will use this color for certain parts. FLUID does not always show the result of this: this is the color buttons draw in when pushed down, and the color of input fields when they have the focus.
Text Font, Size, and Color

Some widgets display text, such as input fields, pull-down menus, and browsers.

![FLUID widget C++ attributes](image)

**Figure 1.39 The FLUID widget C++ attributes**

### 1.12.7.2 C++ Attributes

#### Class

This is how you use your own subclasses of `Fl_Widget`. Whatever identifier you type in here will be the class that is instantiated.

In addition, no `#include` header file is put in the `.h` file. You must provide a `#include` line as the first line of the "Extra Code" which declares your subclass.

The class must be similar to the class you are spoofing. It does not have to be a subclass. It is sometimes useful to change this to another FLTK class. For windows you can select either `Single` or `Double` in the drop-down box right to the "Class:" field to get a normal window (`Fl_Window`) or a double-buffered window (`Fl_Double_Window`), respectively.
Type (upper-right pulldown menu)

Some classes have subtypes that modify their appearance or behavior. You pick the subtype off of this menu.

Name (text field)

Name of a variable to declare, and to store a pointer to this widget into. This variable will be of type "<class>∗". If the name is blank then no variable is created.

You can name several widgets with "name[0]", "name[1]", "name[2]", etc. This will cause FLUID to declare an array of pointers. The array is big enough that the highest number found can be stored. All widgets in the array must be the same type.

Public (button)

Controls whether the widget is publicly accessible. When embedding widgets in a C++ class, this controls whether the widget is public or private in the class. Otherwise it controls whether the widget is declared static or global (extern).

Extra Code (text fields)

These four fields let you type in literal lines of code to dump into the .h or .cxx files.

If the text starts with a # or the word extern then FLUID thinks this is an "include" line, and it is written to the .h file. If the same include line occurs several times then only one copy is written.

All other lines are "code" lines. The current widget is pointed to by the local variable o. The window being constructed is pointed to by the local variable w. You can also access any arguments passed to the function here, and any named widgets that are before this one.
FLUID will check for matching parenthesis, braces, and quotes, but does not do much other error checking. Be careful here, as it may be hard to figure out what widget is producing an error in the compiler. If you need more than four lines you probably should call a function in your own .cxx code.

Callback (text field)

This can either be the name of a function, or a small snippet of code. If you enter anything other than letters, numbers, and the underscore then FLUID treats it as code.

A name refers to a function in your own code. It must be declared as `void name(<class>*, void*)`.

A code snippet is inserted into a static function in the .cxx output file. The function prototype is `void name(class *o, void *v)` so that you can refer to the widget as `o` and the `user_data()` as `v`. FLUID will check for matching parenthesis, braces, and quotes, but does not do much other error checking. Be careful here, as it may be hard to figure out what widget is producing an error in the compiler.

If the callback is blank then no callback is set.

User Data (text field)

This is a value for the `user_data()` of the widget. If blank the default value of zero is used. This can be any piece of C code that can be cast to a void pointer.

Type (text field)

The `void*` in the callback function prototypes is replaced with this. You may want to use `long` for old XForms code. Be warned that anything other than `void*` is not guaranteed to work! However on most architectures other pointer types are ok, and `long` is usually ok, too.

When (pulldown menu)

When to do the callback. This can be Never, Changed, Release, or Enter Key. The value of Enter Key is only useful for text input fields.

There are other rare but useful values for the when() field that are not in the menu. You should use the extra code fields to put these values in.

No Change (button)

The No Change button means the callback is done on the matching event even if the data is not changed.
1.12.8 Selecting and Moving Widgets

Double-clicking a window name in the browser will display it, if not displayed yet. From this display you can select widgets, sets of widgets, and move or resize them. To close a window either double-click it or type ESC.

To select a widget, click it. To select several widgets drag a rectangle around them. Holding down shift will toggle the selection of the widgets instead.

You cannot pick hidden widgets. You also cannot choose some widgets if they are completely overlapped by later widgets. Use the browser to select these widgets.

The selected widgets are shown with a red "overlay" line around them. You can move the widgets by dragging this box. Or you can resize them by dragging the outer edges and corners. Hold down the Alt key while dragging the mouse to defeat the snap-to-grid effect for fine positioning.

If there is a tab box displayed you can change which child is visible by clicking on the file tabs. The child you pick is selected.

The arrow, tab, and shift+tab keys "navigate" the selection. Left, right, tab, or shift+tab move to the next or previous widgets in the hierarchy. Hit the right arrow enough and you will select every widget in the window. Up/down widgets move to the previous/next widgets that overlap horizontally. If the navigation does not seem to work you probably need to "Sort" the widgets. This is important if you have input fields, as FLTK uses the same rules when using arrow keys to move between input fields.

To "open" a widget, double click it. To open several widgets select them and then type F1 or pick "Edit/Open" off the pop-up menu.

Type Ctrl+o to temporarily toggle the overlay off without changing the selection, so you can see the widget borders.

You can resize the window by using the window manager border controls. FLTK will attempt to round the window size to the nearest multiple of the grid size and makes it big enough to contain all the widgets (it does this using illegal X methods, so it is possible it will barf with some window managers!). Notice that the actual window in your program may not be resizable, and if it is, the effect on child widgets may be different.

The panel for the window (which you get by double-clicking it) is almost identical to the panel for any other Fl_Widget. There are three extra items:

1.12.9 Image Labels

The contents of the image files in the Image and Inactive text fields are written to the .cxx file. If many widgets share the same image then only one copy is written. Since the image data is embedded in the generated source code, you need only distribute the C++ code and not the image files themselves.

However, the filenames are stored in the .fl file so you will need the image files as well to read the .fl file. Filenames are relative to the location of the .fl file and not necessarily the current directory. We recommend you either put the images in the same directory as the .fl file, or use absolute path names.

Notes for All Image Types

FLUID runs using the default visual of your X server. This may be 8 bits, which will give you dithered images. You may get better results in your actual program by adding the code "Fl::visual(FL_RGB)" to your code right before the first window is displayed.
All widgets with the same image on them share the same code and source X pixmap. Thus once you have put an image on a widget, it is nearly free to put the same image on many other widgets.

If you edit an image at the same time you are using it in FLUID, the only way to convince FLUID to read the image file again is to remove the image from all widgets that are using it or re-load the .fl file.

Don't rely on how FLTK crops images that are outside the widget, as this may change in future versions! The cropping of inside labels will probably be unchanged.

To more accurately place images, make a new "box" widget and put the image in that as the label.

**XBM (X Bitmap) Files**

FLUID reads X bitmap files which use C source code to define a bitmap. Sometimes they are stored with the ".h" or ".bm" extension rather than the standard ".xbm" extension.

FLUID writes code to construct an Fl_Bitmap image and use it to label the widget. The '1' bits in the bitmap are drawn using the label color of the widget. You can change this color in the FLUID widget attributes panel. The '0' bits are transparent.

The program "bitmap" on the X distribution does an adequate job of editing bitmaps.

**XPM (X Pixmap) Files**

FLUID reads X pixmap files as used by the libxpm library. These files use C source code to define a pixmap. The filenames usually have the ".xpm" extension.

FLUID writes code to construct an Fl_Pixmap image and use it to label the widget. The label color of the widget is ignored, even for 2-color images that could be a bitmap. XPM files can mark a single color as being transparent, and FLTK uses this information to generate a transparency mask for the image.
We have not found any good editors for small iconic pictures. For pixmaps we have used XPaint and the KDE icon editor.

**BMP Files**

FLUID reads Windows BMP image files which are often used in Windows applications for icons. FLUID converts BMP files into (modified) XPM format and uses an Fl_BMP_Image image to label the widget. Transparency is handled the same as for XPM files. All image data is uncompressed when written to the source file, so the code may be much bigger than the .bmp file.

**GIF Files**

FLUID reads GIF image files which are often used in HTML documents to make icons. FLUID converts GIF files into (modified) XPM format and uses an Fl_GIF_Image image to label the widget. Transparency is handled the same as for XPM files. All image data is uncompressed when written to the source file, so the code may be much bigger than the .gif file. Only the first image of an animated GIF file is used.

**JPEG Files**

If FLTK is compiled with JPEG support, FLUID can read JPEG image files which are often used for digital photos. FLUID uses an Fl_JPEG_Image image to label the widget, and writes uncompressed RGB or grayscale data to the source file.

**PNG (Portable Network Graphics) Files**

If FLTK is compiled with PNG support, FLUID can read PNG image files which are often used in HTML documents. FLUID uses a Fl_PNG_Image image to label the widget, and writes uncompressed RGB or grayscale data to the source file. PNG images can provide a full alpha channel for partial transparency, and FLTK supports this as best as possible on each platform.
1.12.10 FLUID Templates

Fluid can store a number of project templates. Project templates are great for storing often used boilerplate code for fast access. A common use would be projects with readily prepared copyright messages.

A sample template for FLTK projects is included with Fluid.

Choose "File > New From Template..." to create a new project based on a template file. In the template dialog, select one of the existing templates. All occurrences of the word "@INSTANCE@" in the template are replaced with the text in the "Instance" field. To create the new project click "New".

To add your current project as a new template, choose "File > Save As Template...", fill in a name, and click "Save".

To delete a template, open the template dialog using "New from Template" or "Save As Template", then select any existing template, and click "Delete Template".

1.12.11 Internationalization with FLUID

FLUID supports internationalization (I18N for short) of label strings and tooltips used by widgets. The GNU gettext option also supports deferred translation of statically initialised menu item labels. The preferences window (Ctrl+p) provides access to the I18N options.

1.12.11.1 I18N Methods

FLUID supports three methods of I18N: none, GNU gettext, and POSIX catgets. The "none" method is the default and just passes the label strings as-is to the widget constructors.

The "GNU gettext" method uses GNU gettext (or a similar text-based I18N library) to retrieve a localized string before calling the widget constructor.

The "POSIX catgets" method uses the POSIX catgets function to retrieve a numbered message from a message catalog before calling the widget constructor.
1.12.11.2 Using GNU gettext for I18N

FLUID’s code support for GNU gettext is limited to calling a function or macro to retrieve the localized label; you still need to call setlocale() and textdomain() or bindtextdomain() to select the appropriate language and message file.

To use GNU gettext for I18N, open the preferences window and choose “GNU gettext” from the **Use**: chooser. Four new input fields will then appear to control the include file and function/macro names to use when retrieving localized label strings in dynamic allocation and static initialisation.

![FLUID Settings](image)

**Figure 1.40 Internationalization using GNU gettext**

The **#include** field controls the header file to include for I18N; by default this is `<libintl.h>`, the standard I18N file for GNU gettext.

If the **Conditional**: field contains a macro name, i18n will only be compiled into the product if this macro is defined. The build system should define the macro only if all required headers and libraries are available. If the macro is not defined, no headers are included and _gettext_ passes text through untranslated.

The **Function**: field controls the function (or macro) that will retrieve the localized message; by default the _gettext_ function will be called.

The **Static Function**: field names a macro that will mark static text fields for extraction with the _xgettext_ tool. The default macro name is _gettext_noop_ and will be defined as `#define gettext_noop(text) text` right after the **#include** statement. Fluid will do its best to call _gettext_ on static texts later, after the textdomain was set by the user.

- GNU gettext special cases

1.12.11.3 Using POSIX catgets for I18N

FLUID’s code support for POSIX catgets allows you to use a global message file for all interfaces or a file specific to each .fl file; you still need to call setlocale() to select the appropriate language.
To use POSIX catgets for I18N, open the preferences window and choose "POSIX catgets" from the Use: chooser. Three new input fields will then appear to control the include file, catalog file, and set number for retrieving the localized label strings.

![FLUID Settings](image)

**Figure 1.41 Internationalization using POSIX catgets**

The `#include` field controls the header file to include for I18N; by default this is `<nl_types.h>`, the standard I18N file for POSIX catgets.

The **File:** field controls the name of the catalog file variable to use when retrieving localized messages; by default the file field is empty which forces a local (static) catalog file to be used for all of the windows defined in your `.fl` file.

The **Set:** field controls the set number in the catalog file. The default set is 1 and rarely needs to be changed.

### 1.12.12 Known Limitations

Declaration Blocks can be used to temporarily block out already designed code using `#if 0` and `#endif` type construction. This will effectively avoid compilation of blocks of code. However, static code and data generated by this segment (menu items, images, include statements, etc.) will still be generated and likely cause compile-time warnings.

### 1.12.13 Keyboard Shortcuts

On Apple computers, use the Apple Command key instead of Ctrl.

<table>

### 1.12.14 Licenses

FLUID uses graphical images based on the Zendesk Garden Stroke icon set: [https://github.com/zendeskgarden](https://github.com/zendeskgarden). Garden Stroke is licensed under the Apache License, Version 2.0: [https://www.apache.org/licenses/LICENSE-2.0.html](https://www.apache.org/licenses/LICENSE-2.0.html).
1.13 FLTK Runtime Options

In this chapter, we will cover how to access and alter settings for applications created using FLTK, both as an administrator and as a regular user.

Subchapters:

- Runtime Options
- Obtaining Current Settings
- Administrative Tool
- List of Options

1.13.1 Runtime Options

FLTK keeps track of various aspects of the user interface in a system-wide database. Users have the ability to set their own preferences and override default or system settings. For instance, FLTK will display a dotted rectangle around the widget with current focus. This might not be desirable for users who do not use keyboard navigation and do not need the rectangle. This can be turned off by setting the OPTION_VISIBLE_FOCUS option to 'off' for that user, which will disable the focus rectangle in all FLTK-based applications.

1.13.2 Obtaining Current Settings

Options are kept in preference files using the signature `Fl_Preferences::CORE_SYSTEM, "fltk.org", "fltk"` for system-wide settings and `Fl_Preferences::CORE_USER, "fltk.org", "fltk"` for individual users. They can be accessed by using the function `bool Fl::option(Fl_Option opt)`. If an application needs to temporarily override user or system settings, it can use the function `void option(Fl_Option opt, bool val)`.

To make changes to options permanently, FLTK provides an administrative tool called fltk-options.

1.13.3 Administrative Tool

`fltk-options` is a hybrid app that is part of FLTK and can be installed on the target system. It includes an up-to-date man page.
When fltk-options is called without any command-line arguments, it opens in interactive mode and provides a user interface to view and alter all system and current user options.

Starting the tool from a shell, the command-line options \texttt{-S} and \texttt{-U} can be used to display or change system or user options. On MS-Windows, \texttt{fltk-options} is also available as \texttt{fltk-options-cmd.exe}.

### 1.13.4 List of Options

Calling \texttt{fltk-options --help} gives a list of all available commands, and options and their values. \texttt{fltk-options --help OPTION} prints more detailed information for \texttt{OPTION} if available. In interactive mode, tooltips provide this additional information.

A full list of options can be found in the manual at \texttt{Fl::Fl_Option}.

### 1.14 Advanced FLTK

This chapter explains advanced programming and design topics that will help you to get the most out of FLTK.

#### 1.14.1 Multithreading

FLTK can be used to implement a GUI for a multithreaded application but, as with multithreaded programming generally, there are some concepts and caveats that must be kept in mind.

Key amongst these is that, for many of the target platforms on which FLTK is supported, only the \texttt{main()} thread of the process is permitted to handle system events, create or destroy windows and open or close windows. Further, only the \texttt{main()} thread of the process can safely write to the display.

To support this in a portable way, all FLTK \texttt{draw()} methods are executed in the \texttt{main()} thread. A worker thread may update the state of an existing widget, but it may not do any rendering directly, nor create or destroy a window.\footnote{A special case exists for \texttt{Fl_Gl_Window} where it can, with suitable precautions, be possible to safely render to an existing GL context from a worker thread.}
Creating portable threads

We do not provide a threading interface as part of the library. A simple example showing how threads can be implemented, for all supported platforms, can be found in `test/threads.h` and `test/threads.cxx`.

FLTK has been used with a variety of thread interfaces, so if the simple example shown in `test/threads.cxx` does not cover your needs, you might want to select a third-party library that provides the features you require.

1.14.2 FLTK multithread locking - Fl::lock() and Fl::unlock()

In a multithreaded program, drawing of widgets (in the `main()` thread) happens asynchronously to widgets being updated by worker threads, so no drawing can occur safely whilst a widget is being modified (and no widget should be modified whilst drawing is in progress).

FLTK supports multithreaded applications using a locking mechanism internally. This allows a worker thread to lock the rendering context, preventing any drawing from taking place, whilst it changes the value of its widget.

Note

The converse is also true; whilst a worker thread holds the lock, the `main()` thread may not be able to process any drawing requests, nor service any events. So a worker thread that holds the FLTK lock must contrive to do so for the shortest time possible or it could impair operation of the application.

The lock operates broadly as follows.

Using the FLTK library, the `main()` thread holds the lock whenever it is processing events or redrawing the display. It acquires (locks) and releases (unlocks) the FLTK lock automatically and no "user intervention" is required. Indeed, a function that runs in the context of the `main()` thread ideally should not acquire / release the FLTK lock explicitly. (Though note that the lock calls are recursive, so calling `Fl::lock()` from a thread that already holds the lock, including the `main()` thread, is benign. The only constraint is that every call to `Fl::lock()` must be balanced by a corresponding call to `Fl::unlock()` to ensure the lock count is preserved.)

The `main()` thread must call `Fl::lock()` once before any windows are shown, to enable the internal lock (it is "off" by default since it is not useful in single-threaded applications) but thereafter the `main()` thread lock is managed by the library internally.

A worker thread, when it wants to alter the value of a widget, can acquire the lock using `Fl::lock()`, update the widget, then release the lock using `Fl::unlock()`. Acquiring the lock ensures that the worker thread can update the widget, without any risk that the `main()` thread will attempt to redraw the widget whilst it is being updated.

Note that acquiring the lock is a blocking action; the worker thread will stall for as long as it takes to acquire the lock. If the `main()` thread is engaged in some complex drawing operation this may block the worker thread for a long time, effectively serializing what ought to be parallel operations. (This frequently comes as a surprise to coders less familiar with multithreaded programming issues; see the discussion of "lockless programming" later for strategies for managing this.)

To incorporate the locking mechanism in the library, FLTK must be compiled with `--enable-threads` set during the `configure` process. IDE-based versions of FLTK are automatically compiled with the locking mechanism incorporated if possible. Since version 1.3, the `configure` script that builds the FLTK library also sets `--enable-threads` by default.
1.14 Advanced FLTK

1.14.3 Simple multithreaded examples using Fl::lock

In `main()`, call `Fl::lock()` once before `Fl::run()` or `Fl::wait()` to enable the lock and start the runtime multithreading support for your program. All callbacks and derived functions like `handle()` and `draw()` will now be properly locked.

This might look something like this:

```c
int main(int argc, char **argv) {
    /* Create your windows and widgets here */
    Fl::lock(); /* "start" the FLTK lock mechanism */
    /* show your window */
    main_win->show(argc, argv);
    /* start your worker threads */
    ... start threads ...
    /* Run the FLTK main loop */
    int result = Fl::run();
    /* terminate any pending worker threads */
    ... stop threads ...
    return result;
}
```

You can start as many threads as you like. From within a thread (other than the `main()` thread) FLTK calls must be wrapped with calls to `Fl::lock()` and `Fl::unlock()`:

```c
void my_thread(void) {
    while (thread_still_running) {
        /* do thread work */
        /* compute new values for widgets */
        ...
        Fl::lock(); // acquire the lock
        my_widget->update(values);
        Fl::unlock(); // release the lock; allow other threads to access FLTK again
        Fl::awake(); // use Fl::awake() to signal main thread to refresh the GUI
    }
}
```

Note

To trigger a refresh of the GUI from a worker thread, the worker code should call `Fl::awake()`

Using `Fl::awake` thread messages

You can send messages from worker threads to the `main()` thread using `Fl::awake(void* message)`. If using this thread message interface, your `main()` might look like this:

```c
int main(int argc, char **argv) {
    /* Create your windows and widgets here */
    Fl::lock(); /* "start" the FLTK lock mechanism */
    /* show your window */
    main_win->show(argc, argv);
    /* start your worker threads */
    ... start threads ...
    /* Run the FLTK loop and process thread messages */
    while (Fl::wait() > 0) {
        if ((next_message = Fl::thread_message()) != NULL) {
            /* process your data, update widgets, etc. */
            ...
        }
    }
    /* terminate any pending worker threads */
    ... stop threads ...
    return 0;
}
```

Your worker threads can send messages to the `main()` thread using `Fl::awake(void* message)`:

```c
void *msg; // "msg" is a pointer to your message
Fl::awake(msg); // send "msg" to main thread
```

A message can be anything you like. The `main()` thread can retrieve the message by calling `Fl::thread_message()`.
**Using Fl::awake callback messages**

You can also request that the `main()` thread call a function on behalf of the worker thread by using `Fl::awake(Fl_Awake_Handler cb, void* userdata)`.

The `main()` thread will execute the callback "as soon as possible" when next processing the pending events. This can be used by a worker thread to perform operations (for example showing or hiding windows) that are prohibited in a worker thread.

```c
void do_something_cb(void *userdata) {
    // Will run in the context of the main thread
    ... do_stuff ...
}
```

```c
// running in worker thread
void *data; // "data" is a pointer to your user data
Fl::awake(do_something_cb, data); // call to execute cb in main thread
```

**Note**

The `main()` thread will execute the Fl_Awake_Handler callback `do_something_cb` asynchronously to the worker thread, at some short but indeterminate time after the worker thread registers the request. When it executes the Fl_Awake_Handler callback, the `main()` thread will use the contents of `*userdata` at the time of execution, not necessarily the contents that `*userdata` had at the time that the worker thread posted the callback request. The worker thread should therefore contrive not to alter the contents of `*userdata` once it posts the callback, since the worker thread does not know when the `main()` thread will consume that data. It is often useful that `userdata` point to a struct, one member of which the `main()` thread can modify to indicate that it has consumed the data, thereby allowing the worker thread to re-use or update `userdata`.

**Warning**

The mechanisms used to deliver `Fl::awake(void* message)` and `Fl::awake(Fl_Awake_Handler cb, void* userdata)` events to the `main()` thread can interact in unexpected ways on some platforms. Therefore, for reliable operation, it is advised that a program use either `Fl::awake(Fl_Awake_Handler cb, void* userdata)` or `Fl::awake(void* message)`, but that they never be intermixed. Calling `Fl::awake()` with no parameters should be safe in either case.

If you have to choose between using the `Fl::awake(void* message)` and `Fl::awake(Fl_Awake_Handler cb, void* userdata)` mechanisms and don't know which to choose, then try the `Fl::awake(Fl_Awake_Handler cb, void* userdata)` method first as it tends to be more powerful in general.

### 1.14.4 FLTK multithreaded "lockless programming"

The simple multithreaded examples shown above, using the FLTK lock, work well for many cases where multiple threads are required. However, when that model is extended to more complex programs, it often produces results that the developer did not anticipate.

A typical case might go something like this. A developer creates a program to process a huge data set. The program has a `main()` thread and 7 worker threads and is targeted to run on an 8-core computer. When it runs, the program divides the data between the 7 worker threads, and as they process their share of the data, each thread updates its portion of the GUI with the results, locking and unlocking as they do so.

But when this program runs, it is much slower than expected and the developer finds that only one of the eight CPU cores seems to be utilised, despite there being 8 threads in the program. What happened?
The threads in the program all run as expected, but they end up being serialized (that is, not able to run in parallel) because they all depend on the single FLTK lock. Acquiring (and releasing) that lock has an associated cost, and is a blocking action if the lock is already held by any other worker thread or by the main() thread.

If the worker threads are acquiring the lock "too often", then the lock will always be held somewhere and every attempt by any other thread (even main()) to lock will cause that other thread (including main()) to block. And blocking main() also blocks event handling, display refresh...

As a result, only one thread will be running at any given time, and the multithreaded program is effectively reduced to being a (complicated and somewhat less efficient) single thread program.

A "solution" is for the worker threads to lock "less often", such that they do not block each other or the main() thread. But judging what constitutes locking "too often" for any given configuration, and hence will block, is a very tricky question. What works well on one machine, with a given graphics card and CPU configuration may behave very differently on another target machine.

There are "interesting" variations on this theme, too: for example it is possible that a "faulty" multithreaded program such as described above will work adequately on a single-core machine (where all threads are inherently serialized anyway and so are less likely to block each other) but then stall or even deadlock in unexpected ways on a multicore machine when the threads do interfere with each other. (I have seen this - it really happens.)

The "better" solution is to avoid using the FLTK lock so far as possible. Instead, the code should be designed so that the worker threads do not update the GUI themselves and therefore never need to acquire the FLTK lock. This would be FLTK multithreaded "lockless programming".

There are a number of ways this can be achieved (or at least approximated) in practice but the most direct approach is for the worker threads to make use of the Fl::awake(Fl_Awake_Handler cb, void* userdata) method so that GUI updates can all run in the context of the main() thread, alleviating the need for the worker thread to ever lock. The onus is then on the worker threads to manage the userdata so that it is delivered safely to the main() thread, but there are many ways that can be done.

Note
Using Fl::awake is not, strictly speaking, entirely "lockless" since the awake handler mechanism incorporates resource locking internally to protect the queue of pending awake messages. These resource locks are held transiently and generally do not trigger the pathological blocking issues described here.

However, aside from using Fl::awake, there are many other ways that a "lockless" design can be implemented, including message passing, various forms of IPC, etc.

If you need high performing multithreaded programming, then take some time to study the options and understand the advantages and disadvantages of each; we can't even begin to scratch the surface of this huge topic here!

And of course occasional, sparse, use of the FLTK lock from worker threads will do no harm; it is "excessive" locking (whatever that might be) that triggers the failing behaviour.

It is always a Good Idea to update the GUI at the lowest rate that is acceptable when processing bulk data (or indeed, in all cases!) Updating at a few frames per second is probably adequate for providing feedback during a long calculation. At the upper limit, anything faster than the frame rate of your monitor and the updates will never even be displayed; why waste CPU computing pixels that you will never show?
1.14.5 FLTK multithreaded Constraints

FLTK supports multiple platforms, some of which allow only the \texttt{main()} thread to handle system events and open or close windows. The safe thing to do is to adhere to the following rules for threads on all operating systems:

- Don't \texttt{show()} or \texttt{hide()} anything that contains \texttt{Fl_Window} based widgets from a worker thread. This includes any windows, dialogs, file choosers, subwindows or widgets using \texttt{Fl_Gl_Window}. Note that this constraint also applies to non-window widgets that have tooltips, since the tooltip will contain a \texttt{Fl_Window} object. The safe and portable approach is \textbf{never} to call \texttt{show()} or \texttt{hide()} on any widget from the context of a worker thread. Instead you can use the \texttt{Fl_Awake_Handler} variant of \texttt{Fl::awake()} to request the \texttt{main()} thread to create, destroy, show or hide the widget on behalf of the worker thread.

- Don't call \texttt{Fl::run()}, \texttt{Fl::wait()}, \texttt{Fl::flush()}, \texttt{Fl::check()} or any related methods that will handle system messages from a worker thread

- Don't intermix use of \texttt{Fl::awake(Fl_Awake_Handler cb, void* userdata)} and \texttt{Fl::awake(void* message)} calls in the same program as they may interact unpredictably on some platforms; choose one or other style of \texttt{Fl::awake(<thing>)} mechanism and use that. (Intermixing calls to \texttt{Fl::awake()} should be safe with either however.)

- Starting with FLTK 1.4, it's possible to start (or cancel) a timer from a worker thread under the condition that the call to \texttt{Fl::add_timeout} (or \texttt{Fl::remove_timeout}) is wrapped in \texttt{Fl::lock()} and \texttt{Fl::unlock()}.

- Don't change window decorations or titles from a worker thread

- The \texttt{make_current()} method will probably not work well for regular windows, but should always work for a \texttt{Fl_Gl_Window} to allow for high speed rendering on graphics cards with multiple pipelines. Managing thread-safe access to the GL pipelines is left as an exercise for the reader! (And may be target specific...)

See also: \texttt{Fl::lock()}, \texttt{Fl::unlock()}, \texttt{Fl::awake()}, \texttt{Fl::awake(Fl_Awake_Handler cb, void* userdata)}, \texttt{Fl::awake(void* message)}, \texttt{Fl::thread_message()}.

1.15 Unicode and UTF-8 Support

This chapter explains how FLTK handles international text via Unicode and UTF-8.

Unicode support was added to FLTK starting with version 1.3.0 and is still incomplete but mostly functional. This chapter is Work in Progress, reflecting the current state of Unicode support.
1.15.1 About Unicode, ISO 10646 and UTF-8

The summary of Unicode, ISO 10646 and UTF-8 given below is deliberately brief and provides just enough information for the rest of this chapter.

For further information, please see:

- https://unicode.org
- https://iso.org
- https://www.cl.cam.ac.uk/~mgk25/unicode.html

The Unicode Standard

The Unicode Standard was originally developed by a consortium of mainly US computer manufacturers and developers of multi-lingual software. It has now become a de-facto standard for character encoding and is supported by most of the major computing companies in the world.

Before Unicode, many different systems, on different platforms, had been developed for encoding characters for different languages, but no single encoding could satisfy all languages. Unicode provides access to over 130,000 characters used in all the major languages written today, and is independent of platform and language.

Unicode also provides higher-level concepts needed for text processing and typographic publishing systems, such as algorithms for sorting and comparing text, composite character and text rendering, right-to-left and bi-directional text handling.

Note

There are currently no plans to add this extra functionality to FLTK.

ISO 10646

The International Organisation for Standardization (ISO) had also been trying to develop a single unified character set. Although both ISO and the Unicode Consortium continue to publish their own standards, they have agreed to coordinate their work so that specific versions of the Unicode and ISO 10646 standards are compatible with each other.

The international standard ISO 10646 defines the Universal Character Set (UCS) which contains the characters required for almost all known languages. The standard also defines three different implementation levels specifying how these characters can be combined.
Note

There are currently no plans for handling the different implementation levels or the combining characters in FLTK.

In UCS, characters have a unique numerical code and an official name, and are usually shown using 'U+' and the code in hexadecimal, e.g. U+0041 is the "Latin capital letter A". The UCS characters U+0000 to U+007F correspond to US-ASCII, and U+0000 to U+00FF correspond to ISO 8859-1 (Latin1).

ISO 10646 was originally designed to handle a 31-bit character set from U+00000000 to U+7FFFFFFF, but the current idea is that 21 bits will be sufficient for all future needs, giving characters up to U+10FFFF. The complete character set is sub-divided into planes. Plane 0, also known as the Basic Multilingual Plane (BMP), ranges from U+0000 to U+FFFFD and consists of the most commonly used characters from previous encoding standards. Other planes contain characters for specialist applications.

Todo  FLTK 1.3 and later supports the full Unicode range (21 bits), but there are a few exceptions, for instance binary shortcut values in menus (Fl_Shortcut) can only be used with characters from the BMP (16 bits). This may be extended in a future FLTK version.

The UCS also defines various methods of encoding characters as a sequence of bytes. UCS-2 encodes Unicode characters into two bytes, which is wasteful if you are only dealing with ASCII or Latin1 text, and insufficient if you need characters above U+00FFFF. UCS-4 uses four bytes, which lets it handle higher characters, but this is even more wasteful for ASCII or Latin1.

UTF-8

The Unicode standard defines various UCS Transformation Formats (UTF). UTF-16 and UTF-32 are based on units of two and four bytes. UCS characters requiring more than 16 bits are encoded using "surrogate pairs" in UTF-16.

UTF-8 encodes all Unicode characters into variable length sequences of bytes. Unicode characters in the 7-bit ASCII range map to the same value and are represented as a single byte, making the transformation to Unicode quick and easy.

All UCS characters above U+007F are encoded as a sequence of several bytes. The top bits of the first byte are set to show the length of the byte sequence, and subsequent bytes are always in the range 0x80 to 0xBF. This combination provides some level of synchronisation and error detection.
Note

This table contains theoretical values outside the valid Unicode range (U+000000 - U+10FFFF). Such values can only be returned by conversion functions for illegal input values (see Illegal Unicode and UTF-8 Sequences).

Moving from ASCII encoding to Unicode will allow all new FLTK applications to be easily internationalized and used all over the world. By choosing UTF-8 encoding, FLTK remains largely source-code compatible to previous iterations of the library.

1.15.2 Unicode in FLTK

Todo Work through the code and this documentation to harmonize the [OksiD] and [fltk2] functions.

FLTK will be entirely converted to Unicode using UTF-8 encoding. If a different encoding is required by the underlying operating system, FLTK will convert the string as needed.

It is important to note that the initial implementation of Unicode and UTF-8 in FLTK involves three important areas:

- provision of Unicode character tables and some simple related functions;
- conversion of char* variables and function parameters from single byte per character representation to UTF-8 variable length sequences;
- modifications to the display font interface to accept general Unicode character or UCS code numbers instead of just ASCII or Latin1 characters.

The current implementation of Unicode / UTF-8 in FLTK will impose the following limitations:

- An implementation note in the [OksiD] code says that all functions are LIMITED to 24 bit Unicode values, but also says that only 16 bits are really used under linux and win32. [Can we verify this?]
- The [fltk2] fl_utf8encode() and fl_utf8decode() functions are designed to handle Unicode characters in the range U+000000 to U+10FFFF inclusive, which covers all UTF-16 characters, as specified in RFC 3629. Note that the user must first convert UTF-16 surrogate pairs to UCS.
- FLTK will only handle single characters, so composed characters consisting of a base character and floating accent characters will be treated as multiple characters.
- FLTK will only compare or sort strings on a byte by byte basis and not on a general Unicode character basis.
- FLTK will not handle right-to-left or bi-directional text.

Todo Verify 16/24 bit Unicode limit for different character sets? OksiD's code appears limited to 16-bit whereas the FLTK2 code appears to handle a wider set. What about illegal characters? See comments in fl_utf8fromwc() and fl_utf8toUtf16().
1.15.3 Illegal Unicode and UTF-8 Sequences

Three pre-processor variables are defined in the source code [1] that determine how fl_utf8decode() handles illegal UTF-8 sequences:

- if ERRORS_TO_CP1252 is set to 1 (the default), fl_utf8decode() will assume that a byte sequence starting with a byte in the range 0x80 to 0x9f represents a Microsoft CP1252 character, and will return the value of an equivalent UCS character. Otherwise, it will be processed as an illegal byte value as described below.

- if STRICT_RFC3629 is set to 1 (not the default!) then UTF-8 sequences that correspond to illegal UCS values are treated as errors. Illegal UCS values include those above U+10FFFF, or corresponding to UTF-16 surrogate pairs. Illegal byte values are handled as described below.

- if ERRORS_TO_ISO8859_1 is set to 1 (the default), the illegal byte value is returned unchanged, otherwise 0xFFFD, the Unicode REPLACEMENT CHARACTER, is returned instead.

[1] Since FLTK 1.3.4 you may set these three pre-processor variables on your compile command line with -D"variable=value" (value: 0 or 1) to avoid editing the source code.

fl_utf8encode() is less strict, and only generates the UTF-8 sequence for 0xFFFD, the Unicode REPLACEMENT CHARACTER, if it is asked to encode a UCS value above U+10FFFF.

Many of the [fltk2] functions below use fl_utf8decode() and fl_utf8encode() in their own implementation, and are therefore somewhat protected from bad UTF-8 sequences.

The [OksiD] fl_utf8len() function assumes that the byte it is passed is the first byte in a UTF-8 sequence, and returns the length of the sequence. Trailing bytes in a UTF-8 sequence will return -1.

- **WARNING:** fl_utf8len() can not distinguish between single bytes representing Microsoft CP1252 characters 0x80-0x9f and those forming part of a valid UTF-8 sequence. You are strongly advised not to use fl_utf8len() in your own code unless you know that the byte sequence contains only valid UTF-8 sequences.

- **WARNING:** Some of the [OksiD] functions below still use fl_utf8len() in their implementations. These may need further validation.

Please see the individual function description for further details about error handling and return values.

1.15.4 FLTK Unicode and UTF-8 Functions

This section provides a brief overview of the functions. For more details, consult the main text for each function via its link.

```
int fl_utf8locale() FLTK2

fl_utf8locale() returns true if the "locale" seems to indicate that UTF-8 encoding is used.

It is highly recommended that you change your system so this does return true!

int fl_utf8test(const char *src, unsigned len) FLTK2
```

Generated by Doxygen
1.15 Unicode and UTF-8 Support

`fl_utf8test()` examines the first `len` bytes of `src`. It returns 0 if there are any illegal UTF-8 sequences; 1 if `src` contains plain ASCII or if `len` is zero; or 2, 3 or 4 to indicate the range of Unicode characters found.

```c
int fl_utf_nb_char(const unsigned char *buf, int len) OksiD
```

Returns the number of UTF-8 characters in the first `len` bytes of `buf`.

```c
int fl_unichar_to_utf8_size(Fl_Unichar)
int fl_utf8bytes(unsigned ucs)
```

Returns the number of bytes needed to encode `ucs` in UTF-8.

```c
int fl_utf8len(char c) OksiD
```

If `c` is a valid first byte of a UTF-8 encoded character sequence, `fl_utf8len()` will return the number of bytes in that sequence. It returns -1 if `c` is not a valid first byte.

```c
unsigned int fl_nonspacing(unsigned int ucs) OksiD
```

Returns true if `ucs` is a non-spacing character.

```c
const char* fl_utf8back(const char *p, const char *start, const char *end) FLTK2
const char* fl_utf8fwd(const char *p, const char *start, const char *end) FLTK2
```

If `p` already points to the start of a UTF-8 character sequence, these functions will return `p`. Otherwise `fl_utf8back()` searches backwards from `p` and `fl_utf8fwd()` searches forwards from `p`, within the `start` and `end` limits, looking for the start of a UTF-8 character.

```c
unsigned int fl_utf8decode(const char *p, const char *end, int *len) FLTK2
int fl_utf8encode(unsigned ucs, char *buf) FLTK2
```

`fl_utf8decode()` attempts to decode the UTF-8 character that starts at `p` and may not extend past `end`. It returns the Unicode value, and the length of the UTF-8 character sequence is returned via the `len` argument. `fl_utf8encode()` writes the UTF-8 encoding of `ucs` into `buf` and returns the number of bytes in the sequence. See the main documentation for the treatment of illegal Unicode and UTF-8 sequences.

```c
unsigned int fl_utf8froma(char *dst, unsigned dstlen, const char *src, unsigned srclen) FLTK2
unsigned int fl_utf8toa(const char *src, unsigned srclen, char *dst, unsigned dstlen) FLTK2
```

Generated by Doxygen
fl_utf8froma() converts a character string containing single bytes per character (i.e. ASCII or ISO-8859-1) into UTF-8. If the src string contains only ASCII characters, the return value will be the same as srclen.

fl_utf8toa() converts a string containing UTF-8 characters into single byte characters. UTF-8 characters that do not correspond to ASCII or ISO-8859-1 characters below 0xFF are replaced with '?'.

Both functions return the number of bytes that would be written, not counting the null terminator. dstlen provides a means of limiting the number of bytes written, so setting dstlen to zero is a means of measuring how much storage would be needed before doing the real conversion.

char* fl_utf2mbcs(const char *src) OksiD

converts a UTF-8 string to a local multi-byte character string. [More info required here!]

unsigned int fl_utf8fromwc(char *dst, unsigned dstlen, const wchar_t *src, unsigned srclen) FLTK2
unsigned int fl_utf8towc(const char *src, unsigned srclen, wchar_t *dst, unsigned dstlen) FLTK2
unsigned int fl_utf8toUtf16(const char *src, unsigned srclen, unsigned short *dst, unsigned dstlen) FLTK2

These routines convert between UTF-8 and wchar_t or "wide character" strings. The difficulty lies in the fact that sizeof(wchar_t) is 2 on Windows and 4 on Linux and most other systems. Therefore some "wide characters" on Windows may be represented as "surrogate pairs" of more than one wchar_t.

fl_utf8fromwc() converts from a "wide character" string to UTF-8. Note that srclen is the number of wchar_t elements in the source string and on Windows this might be larger than the number of characters. dstlen specifies the maximum number of bytes to copy, including the null terminator.

fl_utf8towc() converts a UTF-8 string into a "wide character" string. Note that on Windows, some "wide characters" might result in "surrogate pairs" and therefore the return value might be more than the number of characters. dstlen specifies the maximum number of wchar_t elements to copy, including a zero terminating element. [Is this all worded correctly?]

fl_utf8toUtf16() converts a UTF-8 string into a "wide character" string using UTF-16 encoding to handle the "surrogate pairs" on Windows. dstlen specifies the maximum number of wchar_t elements to copy, including a zero terminating element. [Is this all worded correctly?]
These routines all return the number of elements that would be required for a full conversion of the \texttt{src} string, including the zero terminator. Therefore setting \texttt{dstlen} to zero is a way of measuring how much storage would be needed before doing the real conversion.

\begin{verbatim}
unsigned int fl_utf8from_mb(char *dst, unsigned dstlen, const char *src, unsigned srclen) FLTK2
unsigned int fl_utf8to_mb(const char *src, unsigned srclen, char *dst, unsigned dstlen) FLTK2
\end{verbatim}

These functions convert between UTF-8 and the locale-specific multi-byte encodings used on some systems for filenames, etc. If \texttt{fl_utf8locale()} returns true, these functions don't do anything useful. [Is this all worded correctly?]

\begin{verbatim}
int fl_tolower(unsigned int ucs) OksiD
int fl_toupper(unsigned int ucs) OksiD
int fl_utf_tolower(const unsigned char *str, int len, char *buf) OksiD
int fl_utf_toupper(const unsigned char *str, int len, char *buf) OksiD
\end{verbatim}

\texttt{fl_tolower()} and \texttt{fl_toupper()} convert a single Unicode character from upper to lower case, and vice versa. \texttt{fl_utf_tolower()} and \texttt{fl_utf_toupper()} convert a string of bytes, some of which may be multi-byte UTF-8 encodings of Unicode characters, from upper to lower case, and vice versa.

Warning: to be safe, \texttt{buf} length must be at least \texttt{3*len} [for 16-bit Unicode]

\begin{verbatim}
int fl_utf_strcasecmp(const char *s1, const char *s2) OksiD
int fl_utf_strncasecmp(const char *s1, const char *s2, int n) OksiD
\end{verbatim}

\texttt{fl_utf_strcasecmp()} is a UTF-8 aware string comparison function that converts the strings to lower case Unicode as part of the comparison. \texttt{fl_utf_strncasecmp()} only compares the first \texttt{n} characters [bytes?]

1.15.5 FLTK Unicode Versions of System Calls

\begin{itemize}
  \item int \texttt{fl_access(const char* f, int mode)} OksiD
  \item int \texttt{fl_chmod(const char* f, int mode)} OksiD
  \item int \texttt{fl_execvp(const char* file, char* const* argv)} OksiD
  \item FILE\* \texttt{fl_fopen(const char* f, const char* mode)} OksiD
  \item char\* \texttt{fl_getcwd(char* buf, int maxlen)} OksiD
  \item char\* \texttt{fl_getenv(const char* name)} OksiD
  \item char \texttt{fl_make_path(const char* path)} - returns char? OksiD
  \item void \texttt{fl_make_path_for_file(const char* path)} OksiD
\end{itemize}
• int fl_mkdir(const char * f, int mode) OksiD
• int fl_open(const char * f, int o, ...) OksiD
• int fl_rename(const char * f, const char * t) OksiD
• int fl_rmdir(const char * f) OksiD
• int fl_stat(const char * path, struct stat * buffer) OksiD
• int fl_system(const char * f) OksiD
• int fl_unlink(const char * f) OksiD

TODO:

• more doc on unicode, add links
• write something about filename encoding on OS X...
• explain the fl_utf8… commands
• explain issues with Fl_Preferences

1.16 Constants and Enumerations

Note
This file is not actively maintained any more, but is left here as a reference, until the doxygen documentation is completed.

See also

FL/Enumerations.H.

This appendix lists the enumerations provided in the `<FL/Enumerations.H>` header file, organized by section. Constants whose value are zero are marked with "(0)", this is often useful to know when programming.

1.16.1 Version Numbers

The FLTK version number is stored in a number of compile-time constants:

• FL_MAJOR_VERSION - The major release number, currently 1
• FL_MINOR_VERSION - The minor release number, currently 4
• FL_PATCH_VERSION - The patch release number, currently 0
• FL_VERSION - [Deprecated] A combined floating-point version number for the major, minor, and patch re-lease numbers, currently 1.0400
• FL_API_VERSION - A combined integer version number for the major, minor, and patch release numbers, currently 10400 (use this instead of FL_VERSION, if possible)
• FL_ABI_VERSION - A combined integer version number for the application binary interface (ABI) major, minor, and patch release numbers, currently 10400 (default)

Note
The ABI version (FL_ABI_VERSION) is usually constant throughout one major/minor release version, for in-stance 10300 if FL_API_VERSION is 10304. Hence the ABI is constant if only the patch version is changed. You can change this with configure or CMake though if you want the latest enhancements (called “ABI fea-tures”, see CHANGES).
1.16.2 Events

Events are identified by an FL_Event enumeration value. The following events are currently defined:

- **FL_NO_EVENT** - No event (or an event fltk does not understand) occurred (0).
- **FL_PUSH** - A mouse button was pushed.
- **FL_RELEASE** - A mouse button was released.
- **FL_ENTER** - The mouse pointer entered a widget.
- **FL_LEAVE** - The mouse pointer left a widget.
- **FL_DRAG** - The mouse pointer was moved with a button pressed.
- **FL_FOCUS** - A widget should receive keyboard focus.
- **FL_UNFOCUS** - A widget loses keyboard focus.
- **FL_KEYBOARD** - A key was pressed.
- **FL_CLOSE** - A window was closed.
- **FL_MOVE** - The mouse pointer was moved with no buttons pressed.
- **FL_SHORTCUT** - The user pressed a shortcut key.
- **FL_DEACTIVATE** - The widget has been deactivated.
- **FL_ACTIVATE** - The widget has been activated.
- **FL_HIDE** - The widget has been hidden.
- **FL_SHOW** - The widget has been shown.
- **FL_PASTE** - The widget should paste the contents of the clipboard.
- **FL_SELECTIONCLEAR** - The widget should clear any selections made for the clipboard.
- **FL_MOUSEWHEEL** - The horizontal or vertical mousewheel was turned.
- **FL_DND_ENTER** - The mouse pointer entered a widget dragging data.
- **FL_DND_DRAG** - The mouse pointer was moved dragging data.
- **FL_DND_LEAVE** - The mouse pointer left a widget still dragging data.
- **FL_DND_RELEASE** - Dragged data is about to be dropped.
- **FL_SCREEN_CONFIGURATION_CHANGED** - The screen configuration (number, positions) was changed.
- **FL_FULLSCREEN** - The fullscreen state of the window has changed.

1.16.3 Callback "When" Conditions

The following constants determine when a callback is performed:

- **FL_WHEN_NEVER** - Never call the callback (0).
- **FL_WHEN_CHANGED** - Do the callback only when the widget value changes.
- **FL_WHEN_NOT_CHANGED** - Do the callback whenever the user interacts with the widget.
- **FL_WHEN_RELEASE** - Do the callback when the button or key is released and the value changes.
- **FL_WHEN_ENTER_KEY** - Do the callback when the user presses the ENTER key and the value changes.
- **FL_WHEN_RELEASE_ALWAYS** - Do the callback when the button or key is released, even if the value doesn't change.
- **FL_WHEN_ENTER_KEY_ALWAYS** - Do the callback when the user presses the ENTER key, even if the value doesn't change.
1.16.4 Fl::event_button() Values

The following constants define the button numbers for FL_PUSH and FL_RELEASE events:

- FL_LEFT_MOUSE - the left mouse button
- FL_MIDDLE_MOUSE - the middle mouse button
- FL_RIGHT_MOUSE - the right mouse button

1.16.5 Fl::event_key() Values

The following constants define the non-ASCII keys on the keyboard for FL_KEYBOARD and FL_SHORTCUT events:

- FL_Button - A mouse button; use \texttt{Fl\_Button} + n for mouse button n.
- FL_BackSpace - The backspace key.
- FL_Tab - The tab key.
- FL_Enter - The enter key.
- FL_Pause - The pause key.
- FL_Scroll\_Lock - The scroll lock key.
- FL_Escape - The escape key.
- FL_Home - The home key.
- FL_Left - The left arrow key.
- FL_Up - The up arrow key.
- FL_Right - The right arrow key.
- FL_Down - The down arrow key.
- FL_Page\_Up - The page-up key.
- FL_Page\_Down - The page-down key.
- FL_End - The end key.
- FL_Print - The print (or print-screen) key.
- FL_Insert - The insert key.
- FL_Menu - The menu key.
- FL_Num\_Lock - The num lock key.
- FL_KP - One of the keypad numbers or keys; use \texttt{Fl\_KP} + 'n' for number n and, say, \texttt{Fl\_KP} + '*'.
- FL_KP\_Enter - The enter key on the keypad.
- FL_F - One of the function keys; use \texttt{Fl\_F} + n for function key n.
- FL_Shift\_L - The lefthand shift key.
- FL_Shift\_R - The righthand shift key.
- FL_Control\_L - The lefthand control key.
• FL_Control_R - The righthand control key.
• FL_Caps_Lock - The caps lock key.
• FL_Meta_L - The left meta/Windows key.
• FL_Meta_R - The right meta/Windows key.
• FL_Alt_L - The left alt key.
• FL_Alt_R - The right alt key.
• FL_Delete - The delete key.

### 1.16.6 Fl::event_state() Values

The following constants define bits in the Fl::event_state() value:

• FL_SHIFT - One of the shift keys is down.
• FL_CAPS_LOCK - The caps lock is on.
• FL_CTRL - One of the ctrl keys is down.
• FL_ALT - One of the alt keys is down.
• FL_NUM_LOCK - The num lock is on.
• FL_META - One of the meta/Windows keys is down.
• FL_COMMAND - An alias for FL_CTRL on Windows, X11 and Wayland, or FL_META on MacOS X.
• FL_CONTROL - An alias for FL_META on Windows, X11 and Wayland, or FL_CTRL on MacOS X.
• FL_SCROLL_LOCK - The scroll lock is on.
• FL_BUTTON1 - Mouse button 1 is pushed.
• FL_BUTTON2 - Mouse button 2 is pushed.
• FL_BUTTON3 - Mouse button 3 is pushed.
• FL BUTTONS - Any mouse button is pushed.
• FL_BUTTON(n) - Mouse button n (where n > 0) is pushed.

### 1.16.7 Alignment Values

The following constants define bits that can be used with Fl_Widget::align() to control the positioning of the label:

• FL_ALIGN_CENTER - The label is centered (0).
• FL_ALIGN_TOP - The label is top-aligned.
• FL_ALIGN_BOTTOM - The label is bottom-aligned.
• FL_ALIGN_LEFT - The label is left-aligned.
• FL_ALIGN_RIGHT - The label is right-aligned.
• FL_ALIGN_CLIP - The label is clipped to the widget.
• FL_ALIGN_WRAP - The label text is wrapped as needed.

• FL_ALIGN_TOP_LEFT - The label appears at the top of the widget, aligned to the left.

• FL_ALIGN_TOP_RIGHT - The label appears at the top of the widget, aligned to the right.

• FL_ALIGN_BOTTOM_LEFT - The label appears at the bottom of the widget, aligned to the left.

• FL_ALIGN_BOTTOM_RIGHT - The label appears at the bottom of the widget, aligned to the right.

• FL_ALIGN_LEFT_TOP - The label appears to the left of the widget, aligned at the top. Outside labels only.

• FL_ALIGN_RIGHT_TOP - The label appears to the right of the widget, aligned at the top. Outside labels only.

• FL_ALIGN_LEFT_BOTTOM - The label appears to the left of the widget, aligned at the bottom. Outside labels only.

• FL_ALIGN_RIGHT_BOTTOM - The label appears to the right of the widget, aligned at the bottom. Outside labels only.

• FL_ALIGN_INSIDE - 'or' this with other values to put label inside the widget.

• FL_ALIGN_TEXT_OVER_IMAGE - Label text will appear above the image.

• FL_ALIGN_IMAGE_OVER_TEXT - Label text will be below the image.

• FL_ALIGN_IMAGE_NEXT_TO_TEXT - The image will appear to the left of the text.

• FL_ALIGN_TEXT_NEXT_TO_IMAGE - The image will appear to the right of the text.

• FL_ALIGN_IMAGE_BACKDROP - The image will be used as a background for the widget.

1.16.8 Fonts

The following constants define the standard FLTK fonts:

• FL_HELVETICA - Helvetica (or Arial) normal (0).

• FL_HELVETICA_BOLD - Helvetica (or Arial) bold.

• FL_HELVETICA_ITALIC - Helvetica (or Arial) oblique.

• FL_HELVETICA_BOLD_ITALIC - Helvetica (or Arial) bold-oblique.

• FL_COURIER - Courier normal.

• FL_COURIER_BOLD - Courier bold.

• FL_COURIER_ITALIC - Courier italic.

• FL_COURIER_BOLD_ITALIC - Courier bold-italic.

• FL_TIMES - Times roman.

• FL_TIMES_BOLD - Times bold.

• FL_TIMES_ITALIC - Times italic.

• FL_TIMES_BOLD_ITALIC - Times bold-italic.

• FL_SYMBOL - Standard symbol font.

• FL_SCREEN - Default monospaced screen font.

• FL_SCREEN_BOLD - Default monospaced bold screen font.

• FL_ZAPF_DINGBATS - Zapf-dingbats font.
1.16.9 Colors

The Fl_Color enumeration type holds a FLTK color value. Colors are either 8-bit indexes into a virtual colormap or 24-bit RGB color values. Color indices occupy the lower 8 bits of the value, while RGB colors occupy the upper 24 bits, for a byte organization of RGBI.

1.16.9.1 Color Constants

Constants are defined for the user-defined foreground and background colors, as well as specific colors and the start of the grayscale ramp and color cube in the virtual colormap. Inline functions are provided to retrieve specific grayscale, color cube, or RGB color values.

The following color constants can be used to access the user-defined colors:

- FL_BACKGROUND_COLOR - the default background color
- FL_BACKGROUND2_COLOR - the default background color for text, list, and valuator widgets
- FL_FOREGROUND_COLOR - the default foreground color (0) used for labels and text
- FL_INACTIVE_COLOR - the inactive foreground color
- FL_SELECTION_COLOR - the default selection/highlight color

The following color constants can be used to access the colors from the FLTK standard color cube:

- FL_BLACK
- FL_BLUE
- FL_CYAN
- FL_DARK_BLUE
- FL_DARK_CYAN
- FL_DARK_GREEN
- FL_DARK_MAGENTA
- FL_DARK_RED
- FL_DARK_YELLOW
- FL_GREEN
- FL_MAGENTA
- FL_RED
- FL_WHITE
- FL_YELLOW

The following are named values within the standard grayscale:

- FL_GRAY0
- FL_DARK3
The inline methods for getting a grayscale, color cube, or RGB color value are described in the Colors section of the Drawing Things in FLTK chapter.

### 1.16.10 Cursors

The following constants define the mouse cursors that are available in FLTK. The double-headed arrows are bitmaps provided by FLTK on X, the others are provided by system-defined cursors.

- FL_CURSOR_DEFAULT - the default cursor, usually an arrow (0)
- FL_CURSOR_ARROW - an arrow pointer
- FL_CURSOR_CROSS - crosshair
- FL_CURSOR_WAIT - watch or hourglass
- FL_CURSOR_INSERT - I-beam
- FL_CURSOR_HAND - hand (uparrow on Windows)
- FL_CURSOR_HELP - question mark
- FL_CURSOR_MOVE - 4-pointed arrow
- FL_CURSOR_NS - up/down arrow
- FL_CURSOR_WE - left/right arrow
- FL_CURSOR_NWSE - diagonal arrow
- FL_CURSOR_NESW - diagonal arrow
- FL_CURSOR_NONE - invisible

### 1.16.11 FD "When" Conditions

- FL_READ - Call the callback when there is data to be read.
- FL_WRITE - Call the callback when data can be written without blocking.
- FL_EXCEPT - Call the callback if an exception occurs on the file.
1.16.12 Damage Masks

The following damage mask bits are used by the standard FLTK widgets:

- FL_DAMAGE_CHILD - A child needs to be redrawn.
- FL_DAMAGE_EXPOSE - The window was exposed.
- FL_DAMAGE_SCROLL - The Fl_Scroll widget was scrolled.
- FL_DAMAGE_OVERLAY - The overlay planes need to be redrawn.
- FL_DAMAGE_USER1 - First user-defined damage bit.
- FL_DAMAGE_USER2 - Second user-defined damage bit.
- FL_DAMAGE_ALL - Everything needs to be redrawn.

1.17 GLUT Compatibility

This appendix describes the GLUT compatibility header file supplied with FLTK.

FLTK's GLUT compatibility is based on the original GLUT 3.7 and the follow-on FreeGLUT 2.4.0 libraries.

1.17.1 Using the GLUT Compatibility Header File

You should be able to compile existing GLUT source code by including `<FL/glut.H>` instead of `<GL/glut.h>`. This can be done by editing the source, by changing the -I switches to the compiler, or by providing a symbolic link from GL/glut.h to FL/glut.H.

All files calling GLUT procedures must be compiled with C++. You may have to alter them slightly to get them to compile without warnings, and you may have to rename them to get make to use the C++ compiler.

You must link with the FLTK library. Most of FL/glut.H is inline functions. You should take a look at it (and maybe at test/ glpuzzle.cxx in the FLTK source) if you are having trouble porting your GLUT program.

This has been tested with most of the demo programs that come with the GLUT and FreeGLUT distributions.

1.17.2 Known Problems

The following functions and/or arguments to functions are missing, and you will have to replace them or comment them out for your code to compile:

- glutGet (GLUT_ELAPSED_TIME)
- glutGet (GLUT_SCREEN_HEIGHT_MM)
- glutGet (GLUT_SCREEN_WIDTH_MM)
- glutGet (GLUT_WINDOW_NUM_CHILDREN)
- glutInitDisplayMode (GLUT_LUMINANCE)
- glutKeyboardUpFunc (void (*callback)(unsigned char, int x, int y))
• glutLayerGet(GLUT_HAS_OVERLAY)
• glutLayerGet(GLUT_LAYER_IN_USE)
• glutPushWindow()
• glutSetColor(), glutGetColor(), glutCopyColormap()
• glutVideoResize() missing.
• glutWarpPointer()
• glutWindowStatusFunc()
• Spaceball, buttonbox, dials, and tablet functions

Most of the symbols/enumerations have different values than GLUT uses. This will break code that relies on the actual values. The only symbols guaranteed to have the same values are true/false pairs like GLUT_DOWN and GLUT_UP, mouse buttons GLUT_LEFT_BUTTON, GLUT_MIDDLE_BUTTON, GLUT_RIGHT_BUTTON, and GLUT_KEY_F1 thru GLUT_KEY_F12.

The strings passed as menu labels are not copied.

glutPostRedisplay() does not work if called from inside a display function. You must use glutIdleFunc() if you want your display to update continuously.

glutSwapBuffers() does not work from inside a display function. This is on purpose, because FLTK swaps the buffers for you.

glutUseLayer() does not work well, and should only be used to initialize transformations inside a resize callback. You should redraw overlays by using glutOverlayDisplayFunc().

Overlays are cleared before the overlay display function is called. glutLayerGet(GLUT_OVERLAY_DAMAGE) always returns true for compatibility with some GLUT overlay programs. You must rewrite your code so that gl_color() is used to choose colors in an overlay, or you will get random overlay colors.

glutSetCursor(GLUT_CURSOR_FULL_CROSSHAIR) just results in a small crosshair.

The fonts used by glutBitmapCharacter() and glutBitmapWidth() may be different.

glutInit(argc, argv) will consume different switches than GLUT does. It accepts the switches recognized by Fl::args(), and will accept any abbreviation of these switches (such as "-di" for "-display").

### 1.17.3 Mixing GLUT and FLTK Code

You can make your GLUT window a child of a Fl_Window with the following scheme. The biggest trick is that GLUT insists on a call to show() the window at the point it is created, which means the Fl_Window parent window must already be shown.

- Don't call glutInit().
- Create your Fl_Window, and any FLTK widgets. Leave a blank area in the window for your GLUT window.
- show() the Fl_Window. Perhaps call show(argc, argv).
- Call window->begin() so that the GLUT window will be automatically added to it.
- Use glutInitWindowSize() and glutInitWindowPosition() to set the location in the parent window to put the GLUT window.
- Put your GLUT code next. It probably does not need many changes. Call window->end() immediately after the glutCreateWindow()!
- You can call either glutMainLoop(), Fl::run(), or loop calling Fl::wait() to run the program.
1.17.4 class Fl_Glut_Window

1.17.4.1 Class Hierarchy

Fl_Gl_Window
    +----Fl_Glut_Window

1.17.4.2 Include Files

#include <FL/glut.H>

1.17.4.3 Description

Each GLUT window is an instance of this class. You may find it useful to manipulate instances directly rather than
use GLUT window id's. These may be created without opening the display, and thus can fit better into FLTK's
method of creating windows.

The current GLUT window is available in the global variable glut_window.

new Fl_Glut_Window(...) is the same as glutCreateWindow() except it does not show() the
window or make the window current.

window->make_current() is the same as glutSetWindow(number). If the window has not had
show() called on it yet, some functions that assume an OpenGL context will not work. If you do show() the
window, call make_current() again to set the context.

∼Fl_Glut_Window() is the same as glutDestroyWindow().

1.17.4.4 Members

The Fl_Glut_Window class contains several public members that can be altered directly:

<table>
<thead>
<tr>
<th>member</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>display</td>
<td>A pointer to the function to call to draw the normal planes.</td>
</tr>
<tr>
<td>entry</td>
<td>A pointer to the function to call when the mouse moves into or out of the window.</td>
</tr>
<tr>
<td>keyboard</td>
<td>A pointer to the function to call when a regular key is pressed.</td>
</tr>
<tr>
<td>menu[3]</td>
<td>The menu to post when one of the mouse buttons is pressed.</td>
</tr>
<tr>
<td>mouse</td>
<td>A pointer to the function to call when a button is pressed or released.</td>
</tr>
<tr>
<td>motion</td>
<td>A pointer to the function to call when the mouse is moved with a button down.</td>
</tr>
<tr>
<td>overlaydisplay</td>
<td>A pointer to the function to call to draw the overlay planes.</td>
</tr>
<tr>
<td>passivemotion</td>
<td>A pointer to the function to call when the mouse is moved with no buttons down.</td>
</tr>
<tr>
<td>reshape</td>
<td>A pointer to the function to call when the window is resized.</td>
</tr>
<tr>
<td>special</td>
<td>A pointer to the function to call when a special key is pressed.</td>
</tr>
<tr>
<td>visibility</td>
<td>A pointer to the function to call when the window is iconified or restored (made visible.)</td>
</tr>
</tbody>
</table>
1.17.4.5 Methods

\texttt{Fl\_Glut\_Window::Fl\_Glut\_Window(int x, int y, int w, int h, const char \ast title = 0)}
\texttt{Fl\_Glut\_Window::Fl\_Glut\_Window(int w, int h, const char \ast title = 0)}

The first constructor takes 4 int arguments to create the window with a preset position and size. The second constructor with 2 arguments will create the window with a preset size, but the window manager will choose the position according to its own whims.

\texttt{virtual Fl\_Glut\_Window::\textasciitilde Fl\_Glut\_Window()}

Destroys the GLUT window.

\texttt{void Fl\_Glut\_Window::make\_current()}

Switches all drawing functions to the GLUT window.

1.18 Forms Compatibility

This appendix describes the Forms compatibility included with FLTK.

\begin{center}
\textbf{Warning: The Forms compatibility is deprecated and no longer maintained since FLTK 1.3.0 and is likely to be removed completely in FLTK 1.4 or 1.5}
\end{center}

1.18.1 Importing Forms Layout Files

\texttt{FLUID} can read the \texttt{.fd} files put out by all versions of Forms and XForms fdesign. However, it will mangle them a bit, but it prints a warning message about anything it does not understand. \texttt{FLUID} cannot write fdesign files, so you should save to a new name so you don't write over the old one.

You will need to edit your main code considerably to get it to link with the output from \texttt{FLUID}. If you are not interested in this you may have more immediate luck with the forms compatibility header, \texttt{<FL/forms.H>}.

1.18.2 Using the Compatibility Header File

You should be able to compile existing Forms or XForms source code by changing the include directory switch to your compiler so that the \texttt{forms.h} file supplied with FLTK is included. The \texttt{forms.h} file simply pulls in \texttt{<FL/forms.H>} so you don't need to change your source code. Take a look at \texttt{<FL/forms.H>} to see how it works, but the basic trick is lots of inline functions. Most of the XForms demo programs work without changes.
You will also have to compile your Forms or XForms program using a C++ compiler. The FLTK library does not provide C bindings or header files.

Although FLTK was designed to be compatible with the GL Forms library (version 0.3 or so), XForms has bloated severely and its interface is X-specific. Therefore, XForms compatibility is no longer a goal of FLTK. Compatibility was limited to things that were free, or that would add code that would not be linked in if the feature is unused, or that was not X-specific.

To use any new features of FLTK, you should rewrite your code to not use the inline functions and instead use "pure" FLTK. This will make it a lot cleaner and make it easier to figure out how to call the FLTK functions. Unfortunately this conversion is harder than expected and even Digital Domain's inhouse code still uses forms.h a lot.

1.18.3 Problems You Will Encounter

Many parts of XForms use X-specific structures like XEvent in their interface. I did not emulate these! Unfortunately these features (such as the "canvas" widget) are needed by most large programs. You will need to rewrite these to use FLTK subclasses.

Fl_Free widgets emulate the old Forms "free" widget. It may be useful for porting programs that change the handle() function on widgets, but you will still need to rewrite things.

Fl_Timer widgets are provided to emulate the XForms timer. These work, but are quite inefficient and inaccurate compared to using Fl::add_timeout().

All instance variables are hidden. If you directly refer to the x, y, w, h, label, or other fields of your Forms widgets you will have to add empty parenthesis after each reference. The easiest way to do this is to globally replace "->x" with "->x()", etc. Replace "boxtpe" with "box()".

const char* arguments to most FLTK methods are simply stored, while Forms would strdup() the passed string. This is most noticeable with the label of widgets. Your program must always pass static data such as a string constant or malloc'd buffer to label(). If you are using labels to display program output you may want to try the Fl_Output widget.

The default fonts and sizes are matched to the older GL version of Forms, so all labels will draw somewhat larger than an XForms program does.

fdesign outputs a setting of a "fdui" instance variable to the main window. I did not emulate this because I wanted all instance variables to be hidden. You can store the same information in the user_data() field of a window. To do this, search through the fdesign output for all occurrences of "->fdui" and edit to use "->user_data()" instead. This will require casts and is not trivial.

The prototype for the functions passed to fl_add_timeout() and fl_set_idle_callback() callback are different.

All the following XForms calls are missing:

- FL_REVISION, fl_library_version()
- FL_RETURN_DBLCLICK (use Fl::event_clicks())
- fl_add_signal_callback()
- fl_set_form_atactivate() fl_set_form_atdeactivate()
- fl_set_form_property()
- fl_set_app_mainform(), fl_get_app_mainform()
- `fl_set_form_minsize()`, `fl_set_form_maxsize()`
- `fl_set_form_event_cmask()`, `fl_get_form_event_cmask()`
- `fl_set_form_dblbuffer()`, `fl_set_object_dblbuffer()` (use an `Fl_Double_Window` instead)
- `fl_adjust_form_size()`
- `fl_register_raw_callback()`
- `fl_set_object_bw()`, `fl_set_border_width()`
- `fl_set_object_resize()`, `fl_set_object_gravity()`
- `fl_set_object_shortcutkey()`
- `fl_set_object_automatic()`
- `fl_get_object_bbox()` (maybe FLTK should do this)
- `fl_set_object_prehandler()`, `fl_set_object_posthandler()`
- `fl_enumerate_fonts()`
- **Most drawing functions**
  - `fl_set_coordunit()` (FLTK uses pixels all the time)
  - `fl_ringbell()`
  - `fl_gettime()`
  - `fl_win*()` (all these functions)
  - `fl_initialize(argc,argv,x,y,z)` ignores last 3 arguments
  - `fl_read_bitmapfile()`, `fl_read_pixmapfile()`
  - `fl_addto_browser_chars()`
  - `FL_MENU_BUTTON` just draws normally
  - `fl_set_bitmapbutton_file()`, `fl_set_pixmapbutton_file()`
- **FL_CANVAS objects**
  - `FL_DIGITAL_CLOCK` (comes out analog)
  - `fl_create_bitmap_cursor()`, `fl_set_cursor_color()`
  - `fl_set_dial_angles()`
  - `fl_show_oneliner()`
  - `fl_set_choice_shortcut(a,b,c)`
- **command log**
  - Only some of file selector is emulated
  - `FL_DATE_INPUT`
  - `fl_pup*()` (all these functions)
- **textbox object** (should be easy but I had no sample programs)
- **xyplot object**
1.18 Forms Compatibility

1.18.4 Additional Notes

These notes were written for porting programs written with the older IRISGL version of Forms. Most of these problems are the same ones encountered when going from old Forms to XForms:

Does Not Run In Background

The IRISGL library always forked when you created the first window, unless "foreground()" was called. FLTK acts like "foreground()" is called all the time. If you really want the fork behavior do "if (fork()) exit(0)" right at the start of your program.

You Cannot Use IRISGL Windows or fl_queue

If a Forms (not XForms) program if you wanted your own window for displaying things you would create a IRISGL window and draw in it, periodically calling Forms to check if the user hit buttons on the panels. If the user did things to the IRISGL window, you would find this out by having the value FL_EVENT returned from the call to Forms.

None of this works with FLTK. Nor will it compile, the necessary calls are not in the interface.

You have to make a subclass of Fl_Gl_Window and write a draw() method and handle() method. This may require anywhere from a trivial to a major rewrite.

If you draw into the overlay planes you will have to also write a draw_overlay() method and call redraw_overlay() on the OpenGL window.

One easy way to hack your program so it works is to make the draw() and handle() methods on your window set some static variables, storing what event happened. Then in the main loop of your program, call Fl::wait() and then check these variables, acting on them as though they are events read from fl_queue.

You Must Use OpenGL to Draw Everything

The file <FL/gl.h> defines replacements for a lot of IRISGL calls, translating them to OpenGL. There are much better translators available that you might want to investigate.

You Cannot Make Forms Subclasses

Programs that call fl_make_object or directly setting the handle routine will not compile. You have to rewrite them to use a subclass of Fl_Widget. It is important to note that the handle() method is not exactly the same as the handle() function of Forms. Where a Forms handle() returned non-zero, your handle() must call do_callback(). And your handle() must return non-zero if it "understood" the event.

An attempt has been made to emulate the "free" widget. This appears to work quite well. It may be quicker to modify your subclass into a "free" widget, since the "handle" functions match.

If your subclass draws into the overlay you are in trouble and will have to rewrite things a lot.

You Cannot Use <device.h>

If you have written your own "free" widgets you will probably get a lot of errors about "getvaluator". You should substitute:
Anything else in getvaluator and you are on your own...

Font Numbers Are Different

The "style" numbers have been changed because I wanted to insert bold-italic versions of the normal fonts. If you use Times, Courier, or Bookman to display any text you will get a different font out of FLTK. If you are really desperate to fix this use the following code:

```c
fl_font_name(3,"*courier-medium-r-no*"),
fl_font_name(4,"*courier-bold-r-no*"),
fl_font_name(5,"*courier-medium-o-no*"),
fl_font_name(6,"*times-medium-r-no*"),
fl_font_name(7,"*times-bold-r-no*"),
fl_font_name(8,"*times-medium-i-no*"),
fl_font_name(9,"*bookman-light-r-no*"),
fl_font_name(10,"*bookman-demi-r-no*"),
fl_font_name(11,"*bookman-light-i-no*"),
```

1.19 Operating System Issues

This appendix describes the operating system specific interfaces in FLTK:

- Accessing the OS Interfaces
- The Wayland/X11 hybrid library
- The UNIX (X11) Interface
- The Windows Interface
- The Apple OS X Interface
- The Wayland Interface

1.19.1 Accessing the OS Interfaces

All programs that need to access the operating system specific interfaces must include the following header file:

```c
#include <FL/platform.H>
```

This header file will define the appropriate interface for your environment. The pages that follow describe the functionality that is provided for each operating system.

Note

These definitions used to be in FL/x.H up to FLTK 1.3.x. Usage of FL/x.H is deprecated since FLTK 1.4.0. You should replace all references of FL/x.H with FL/platform.H if your target is FLTK 1.4 or later. FL/x.H will be retained for backwards compatibility for some releases but will be removed in a later (not yet specified) FLTK release.
1.19 Operating System Issues

WARNING:
The interfaces provided by this header file may change radically in new FLTK releases. Use them only when an existing generic FLTK interface is not sufficient.

1.19.2 The Wayland/X11 hybrid library

By default, the FLTK library is, under Linux and Unix, a Wayland/X11 hybrid which can run FLTK-based apps as Wayland clients or as X11 clients. The choice between running an app as a Wayland or an X11 client is done as follows, when the app runs function `fl_open_display()` (that function can be called explicitly by the app or implicitly by FLTK, for example the first time an `Fl_Window` is show()'):

- if the app contains a global boolean variable named `fl_disable_wayland` and this variable is true, X11 is used;
- if environment variable `FLTK_BACKEND` is not defined, Wayland is used if a Wayland compositor is available, otherwise X11 is used;
- if `$FLTK_BACKEND` equals "wayland", the library makes the app a Wayland client, and stops with error if no Wayland compositor is available;
- if `$FLTK_BACKEND` equals "x11", the library makes the app an X11 client even if a Wayland compositor is available.

The first condition listed above is meant to facilitate conversion of code written for FLTK 1.3.x and containing X11-specific code; add this single statement anywhere in the app's source code:

```c
FL_EXPORT bool fl_disable_wayland = true;
```

and the app will always run as an X11 client.

After function `fl_open_display()` has been called, exactly one of the functions `fl_wl_display()` and `fl_x11_display()` returns a non-NULL value. When the former function does, the app runs as a Wayland client, and Wayland-specific functions and symbols described below (The Wayland Interface) can be used, whereas X11-specific functions and symbols cannot. Otherwise, the app runs as an X11 client, and only X11-specific functions and symbols below (The UNIX (X11) Interface) can be used.

Because a single app can be expected to run either Wayland or X11, it's necessary to use distinct names for global variables and functions in the X11- and the Wayland-specific source code.

Non-default configurations of the FLTK library under Linux/Unix are described in file README.Wayland.txt.

1.19.3 The UNIX (X11) Interface

Cross-platform applications should bracket X11-specific source code between `#if defined(FLTK_USE_X11) / #endif` and should ensure function `fl_x11_display()` returns non-NULL before calling X11-specific functions and using X11-specific symbols.

The UNIX interface provides access to the X Window System state information and data structures.
1.19.3.1 Handling Other X Events

void Fl::add_handler(int (∗f)(int))

Installs a function to parse unrecognized events. If FLTK cannot figure out what to do with an event, it calls each of these functions (most recent first) until one of them returns non-zero. If none of them returns non-zero then the event is ignored.

FLTK calls this for any X events it does not recognize, or X events with a window ID that FLTK does not recognize. You can look at the X event in the fl_xevent variable.

The argument is the FLTK event type that was not handled, or zero for unrecognized X events. These handlers are also called for global shortcuts and some other events that the widget they were passed to did not handle, for example FL_SHORTCUT.

extern XEvent ∗fl_xevent

This variable contains the most recent X event.

extern ulong fl_event_time

This variable contains the time stamp from the most recent X event that reported it; not all events do. Many X calls like cut and paste need this value.

Window fl_xid(const Fl_Window ∗)

Returns the XID for a window, or zero if not shown().

Deprecated Kept for compatibility with FLTK versions before 1.4. Use preferentially fl_x11_xid(const Fl_Window ∗) with versions 1.4 and above.

Fl_Window ∗fl_find(ulong xid)

Returns the Fl_Window that corresponds to the given XID, or NULL if not found. This function uses a cache so it is slightly faster than iterating through the windows yourself.

Deprecated Kept for compatibility with FLTK versions before 1.4. Use preferentially fl_x11_find(Window) with versions 1.4 and above.

int fl_handle(const XEvent &)

This call allows you to supply the X events to FLTK, which may allow FLTK to cooperate with another toolkit or library. The return value is non-zero if FLTK understood the event. If the window does not belong to FLTK and the add_handler() functions all return 0, this function will return false.

Besides feeding events your code should call Fl::flush() periodically so that FLTK redraws its windows.

This function will call the callback functions. It will not return until they complete. In particular, if a callback pops up a modal window by calling fl_ask(), for instance, it will not return until the modal function returns.
1.19.3.2 Drawing using Xlib

The following global variables are set before Fl_Widget::draw() is called, or by Fl_Window::make_current():

```c
extern Display *fl_display; // for compatibility with previous FLTK versions
extern Display *fl_x11_display(); // preferred access starting with FLTK 1.4
extern Window fl_window;
extern GC fl_gc; // for compatibility with previous FLTK versions
extern GC fl_x11_gc(); // preferred access starting with FLTK 1.4
extern int fl_screen;
extern XVisualInfo *fl_visual;
extern Colormap fl_colormap;
```

You must use them to produce Xlib calls. Don’t attempt to change them. A typical X drawing call is written like this:

```c
XDrawSomething(fl_display, fl_window, fl_gc, ...);
```

Other information such as the position or size of the X window can be found by looking at Fl_Window::current(), which returns a pointer to the Fl_Window being drawn.

```c
unsigned long fl_xpixel(Fl_Color i)
unsigned long fl_xpixel(uchar r, uchar g, uchar b)
```

Returns the X pixel number used to draw the given FLTK color index or RGB color. This is the X pixel that fl_color() would use.

```c
int fl_parse_color(const char *p, uchar &r, uchar &g, uchar &b)
```

Convert a name into the red, green, and blue values of a color by parsing the X11 color names. On other systems, fl_parse_color() can only convert names in hexadecimal encoding, for example #ff8083.

```c
extern XFontStruct *fl_xftfont
```

Points to the font selected by the most recent fl_font(). This is not necessarily the current font of fl_gc, which is not set until fl_draw() is called. If FLTK was compiled with Xt support, fl_xftfont will usually be 0 and fl_xftfont will contain a pointer to the XftFont structure instead.

```c
extern void *fl_xftfont
```

If FLTK was compiled with Xt support enabled, fl_xftfont points to the xft font selected by the most recent fl_font(). Otherwise it will be 0. fl_xftfont should be cast to XftFont*.

1.19.3.3 Changing the Display, Screen, or X Visual

FLTK uses only a single display, screen, X visual, and X colormap. This greatly simplifies its internal structure and makes it much smaller and faster. You can change which it uses by setting global variables before the first Fl_Window::show() is called. You may also want to call Fl::visual(), which is a portable interface to get a full color and/or double buffered visual.

```c
int Fl::display(const char *)
```
Set which X display to use. This actually does `putenv("DISPLAY=...")` so that child programs will display on the same screen if called with `exec()`. This must be done before the display is opened. This call is provided under MacOS and Windows but it has no effect.

```c
extern Display *fl_display
```

The open X display. This is needed as an argument to most Xlib calls. Don't attempt to change it! This is `NULL` before the display is opened.

```c
void fl_open_display()
```

Opens the display. Does nothing if it is already open. This will make sure `fl_display` is non-zero. You should call this if you wish to do X calls and there is a chance that your code will be called before the first `show()` of a window.

This may call `Fl::abort()` if there is an error opening the display.

```c
void fl_x11_use_display(Display *d)
```

Directs FLTK to use a pre-established X11 connection.

```c
void fl_close_display()
```

This closes the X connection. You do not need to call this to exit, and in fact it is faster to not do so! It may be useful to call this if you want your program to continue without the X connection. You cannot open the display again, and probably cannot call any FLTK functions.

```c
extern int fl_screen
```

Which screen number to use. This is set by `fl_open_display()` to the default screen. You can change it by setting this to a different value immediately afterwards. It can also be set by changing the last number in the `Fl::display()` string to "host:0.#".

```c
extern XVisualInfo *fl_visual
```
```c
extern Colormap fl_colormap
```

The visual and colormap that FLTK will use for all windows. These are set by `fl_open_display()` to the default visual and colormap. You can change them before calling `show()` on the first window. Typical code for changing the default visual is:

```c
Fl::args(argc, argv); // do this first so $DISPLAY is set
fl_open_display();
fl_visual = find_a_good_visual(fl_display, fl_screen);
if (!fl_visual) Fl::abort("No good visual");
fl_colormap = make_a_colormap(fl_display, fl_visual->visual, fl_visual->depth);
// it is now ok to show() windows:
window->show(argc, argv);
```
1.19 Operating System Issues

1.19.3.4 Using a Subclass of Fl_Window for Special X Stuff

FLTK can manage an X window on a different screen, visual and/or colormap, you just can’t use FLTK’s drawing routines to draw into it. But you can write your own draw() method that uses Xlib (and/or OpenGL) calls only.

FLTK can also manage XID’s provided by other libraries or programs, and call those libraries when the window needs to be redrawn.

To do this, you need to make a subclass of Fl_Window and override some of these virtual functions:

virtual void Fl_Window::show()

If the window is already shown() this must cause it to be raised, this can usually be done by calling Fl_Window::show(). If not shown() your implementation must call either Fl_X::set_xid() or Fl_X::make_xid().

An example:

```c
void MyWindow::show() {
  if (shown()) {Fl_Window::show(); return;} // you must do this!
  fl_open_display(); // necessary if this is first window
  // we only calculate the necessary visual colormap once:
  static XVisualInfo *visual;
  static colormap;
  if (!visual) {
    visual = figure_out_visual();
    colormap = XCreateColormap(fl_display, RootWindow(fl_display,fl_screen),
      vis->visual, AllocNone);
  }
  Fl_X::make_xid(this, visual, colormap);
}
```

Fl_X *Fl_X::set_xid(Fl_Window*, Window xid)

Allocate a hidden class called an Fl_X, put the XID into it, and set a pointer to it from the Fl_Window. This causes Fl_Window::shown() to return true.

void Fl_X::make_xid(Fl_Window*, XVisualInfo* = fl_visual, Colormap = fl_colormap)

This static method does the most onerous parts of creating an X window, including setting the label, resize limitations, etc. It then does Fl_X::set_xid() with this new window and maps the window.

virtual void Fl_Window::flush()

This virtual function is called by Fl::flush() to update the window. For FLTK’s own windows it does this by setting the global variables fl_window and fl_gc and then calling the draw() method. For your own windows you might just want to put all the drawing code in here.
The X region that is a combination of all damage() calls done so far is in Fl_X::flx(this)->region. If NULL then you should redraw the entire window. The undocumented function fl_clip_region(←XRegion) will initialize the FLTK clip stack with a region or NULL for no clipping. You must set region to NULL afterwards as fl_clip_region() will own and delete it when done.

If damage() & FL_DAMAGE_EXPOSE then only X expose events have happened. This may be useful if you have an undamaged image (such as a backing buffer) around.

Here is a sample where an undamaged image is kept somewhere:
void MyWindow::flush() {  
  fl_clip_region(Fl_X::flx(this)->region);  
  Fl_X::flx(this)->region = 0;  
  if (damage() != 2) {... draw things into backing store ...}  
  ... copy backing store to window ...  
}

Note
For compatibility with FLTK versions before 1.4, member function Fl_X::flx(Fl_Window*) can also be written Fl_X::i(Fl_Window*).

virtual void Fl_Window::hide()

Destroy the window server copy of the window. Usually you will destroy contexts, pixmaps, or other resources used by the window, and then call Fl_Window::hide() to get rid of the main window identified by xid(). If you override this, you must also override the destructor as shown:
void MyWindow::hide() {  
  if (mypixmap) {  
    XFreePixmap(fl_display,mypixmap);  
    mypixmap = 0;  
  }  
  Fl_Window::hide(); // you must call this  
}

virtual void Fl_Window::~Fl_Window()  

Because of the way C++ works, if you override hide() you must override the destructor as well (otherwise only the base class hide() is called):
MyWindow::~MyWindow() {  
  hide();  
}

Note
Access to the Fl_X hidden class requires to #define FL_INTERNALS before compilation.
1.19.3.5 Setting the Icon of a Window

FLTK recommends to set window icons using these platform-independent methods: \texttt{Fl\_Window::icon(const Fl\_RGB\_Image *)} and \texttt{Fl\_Window::icons(const Fl\_RGB\_Image *[], int)}. See also methods setting default window icons \texttt{Fl\_Window::default\_icon(const Fl\_RGB\_Image *)} and \texttt{Fl\_Window::default\_icons(const Fl\_RGB\_Image *[], int)}.

FLTK on X11 also supports, for backward compatibility, use of the deprecated method \texttt{Fl\_Window::icon(const void *)} as follows:

Sets the icon for the window to the passed pointer. You will need to cast the icon \texttt{Pixmap} to a \texttt{char *} when calling this method. To set a monochrome icon using a bitmap compiled with your application use:

```c
#include "icon.xbm"

fl_open_display(); // needed if display has not been previously opened

Pixmap p = XCreateBitmapFromData(fl_display, DefaultRootWindow(fl_display),
   icon_bits, icon_width, icon_height);

window->icon((const void*)p);
```

To use a multi-colored icon, the XPM format and library should be used as follows:

```c
#include <X11/xpm.h>
#include "icon.xpm"

fl_open_display(); // needed if display has not been previously opened

Pixmap p, mask;

XpmCreatePixmapFromData(fl_display, DefaultRootWindow(fl_display),
   icon_xpm, &p, &mask, NULL);

window->icon((const void *)p);
```

When using the Xpm library, be sure to include it in the list of libraries that are used to link the application (usually ".\texttt{Xpm}"").

\begin{note}
You must call \texttt{Fl\_Window::show(int argc, char** argv)} for the icon to be used. The \texttt{Fl\_Window::show()} method does not bind the icon to the window.
\end{note}

Any window icon must be set with the above methods before the window is shown.

1.19.3.6 X Resources

When the \texttt{Fl\_Window::show(int argc, char** argv)} method is called, FLTK looks for the following X resources:

- \texttt{background} - The default background color for widgets (color).
- \texttt{dndTextOps} - The default setting for drag and drop text operations (boolean).
- \texttt{foreground} - The default foreground (label) color for widgets (color).
- \texttt{scheme} - The default scheme to use (string).
• `selectBackground` - The default selection color for menus, etc. (color).

• `Text.background` - The default background color for text fields (color).

• `tooltips` - The default setting for tooltips (boolean).

• `visibleFocus` - The default setting for visible keyboard focus on non-text widgets (boolean).

Resources associated with the first window's `Fl_Window::xclass()` string are queried first, or if no class has been specified then the class "fltk" is used (e.g. `fltk.background`). If no match is found, a global search is done (e.g. `∗background`).

1.19.3.7 Display Scaling Factor

FLTK uses the value of the Xft.dpi resource divided by 96. to initialize the display scaling factor. That is also what is done by the gnome and KDE desktops.

1.19.4 The Windows Interface

Cross-platform applications should bracket Windows-specific source code between `#ifdef _WIN32` / `#endif`.

The Windows interface provides access to the Windows GDI state information and data structures.

1.19.4.1 Using filenames with non-ASCII characters

In FLTK, all strings, including filenames, are UTF-8 encoded. The utility functions `fl_fopen()` and `fl_open()` allow to open files potentially having non-ASCII names in a cross-platform fashion, whereas the standard fopen()/open() functions fail to do so.

1.19.4.2 Responding to WM_QUIT

FLTK will intercept WM_QUIT messages that are directed towards the thread that runs the main loop. These are converted to SIGTERM signals via `raise()`. This allows you to deal with outside termination requests with the same code on both Windows and UNIX systems. Other processes can send this message via `PostThreadMessage()` in order to request, rather than force your application to terminate.
1.19 Operating System Issues

1.19.4.3 Handling Other Windows API Messages

By default a single WNDCLASSX called “FLTK” is created. All Fl_Window’s are of this class unless you use Fl_Window::xclass(). The window class is created the first time Fl_Window::show() is called.

You can probably combine FLTK with other libraries that make their own window classes. The easiest way is to call Fl::wait(), as it will call DispatchMessage() for all messages to the other windows. If necessary you can let the other library take over as long as it calls DispatchMessage(), but you will have to arrange for the function Fl::flush() to be called regularly so that widgets are updated, timeouts are handled, and the idle functions are called.

extern MSG fl_msg

This variable contains the most recent message read by GetMessage(), which is called by Fl::wait(). This may not be the most recent message sent to an FLTK window, because silly Windows calls the handle procedures directly for some events (sigh).

void Fl::add_handler(int (*f)(int))

Installs a function to parse unrecognized messages sent to FLTK windows. If FLTK cannot figure out what to do with a message, it calls each of these functions (most recent first) until one of them returns non-zero. The argument passed to the functions is the FLTK event that was not handled or zero for unknown messages. If all the handlers return zero then FLTK calls DefWindowProc().

HWND fl_xid(const Fl_Window *)

Returns the window handle for a Fl_Window, or zero if not shown().

Fl_Window *fl_find(HWND xid)

Returns the Fl_Window that corresponds to the given window handle, or NULL if not found. This function uses a cache so it is slightly faster than iterating through the windows yourself.

1.19.4.4 Drawing Things Using the Windows GDI

When the virtual function Fl_Widget::draw() is called, FLTK stores all the extra arguments you need to make a proper GDI call in some global variables:

extern HINSTANCE fl_display; // for compatibility with previous FLTK versions
extern HINSTANCE fl_win32_display(); // preferred access starting with FLTK 1.4
extern HWND fl_window;
extern HDC fl_gc; // for compatibility with previous FLTK versions
extern HDC fl_win32_gc(); // preferred access starting with FLTK 1.4
COLORREF fl_RGB();
HPEN fl_pen();
HBRUSH fl_brush();

These global variables are set before Fl_Widget::draw() is called, or by Fl_Window::make_current(). You can refer to them when needed to produce GDI calls, but don’t attempt to change them. The functions return GDI objects for the current color set by fl_color() and are created as needed and cached. A typical GDI drawing call is written like this:

DrawSomething(fl_gc, ..., fl_brush());

It may also be useful to refer to Fl_Window::current() to get the window’s size or position.
1.19.4.5 HighDPI support

FLTK apps for the Windows platform are by default "Per-monitor DPI-aware V2". This means that any window automatically adjusts its physical size in relation to the scaling factor of the display where it maps. This also means that all drawings (e.g., text, lines, images) take advantage of the full resolution of the display in use. FLTK apps may also use the manifest mechanism to declare their level of DPI awareness. The FLTK library adapts to the DPI awareness level set in the app's manifest, which can be lower than the default level if the manifest sets it so.

1.19.4.6 Display Scaling Factor

FLTK uses the value given by function GetDpiForMonitor() divided by 96. to initialize the scaling factor of each display in the system. This matches the value of "Change the size of text, apps and other items" found in section “System” subsection “Display” of Windows settings.

1.19.4.7 Setting the Icon of a Window

FLTK recommends to set window icons using these platform-independent methods: Fl_Window::icon(const Fl_RGB_Image *) and Fl_Window::icons(const Fl_RGB_Image *[ ], int). See also methods setting default window icons Fl_Window::default_icon(const Fl_RGB_Image *) and Fl_Window::default_icons(const Fl_RGB_Image *[ ], int).

FLTK on Windows also supports, for backward compatibility, use of the deprecated method Fl_Window::icon(const void *) as follows:
Set the icon for the window to the passed pointer. You will need to cast the HICON handle to a char* when calling this method. To set the icon using an icon resource compiled with your application use:

```
window->icon((const void *)LoadIcon(fl_display, MAKEINTRESOURCE(IDI_ICON)));
```

You can also use the LoadImage() and related functions to load specific resolutions or create the icon from bitmap data.

NOTE:
You must call Fl_Window::show(int argc, char **argv) for the icon to be used. The Fl_Window::show() method does not bind the icon to the window.

Any window icon must be set with the above methods before the window is shown.

1.19.4.8 How to Not Get a MSDOS Console Window

Windows has a really stupid mode switch stored in the executables that controls whether or not to make a console window.

To always get a console window you simply create a console application (the "/SUBSYSTEM:CONSOLE" option for the linker). For a GUI-only application create a Windows application (the="/SUBSYSTEM:WINDOWS" option for the linker).

FLTK includes a WinMain() function that calls the ANSI standard main() entry point for you. This function creates a console window when you use the debug version of the library.

Windows applications without a console cannot write to stdout or stderr, even if they are run from a console window. Any output is silently thrown away. Additionally, Windows applications are run in the background by the console, although you can use "start /wait program" to run them in the foreground.
1.19 Operating System Issues

1.19.4.9 Known Windows Bugs and Problems

The following is a list of known bugs and problems in the Windows version of FLTK:

- If a program is deactivated, `Fl::wait()` does not return until it is activated again, even though many events are delivered to the program. This can cause idle background processes to stop unexpectedly. This also happens while the user is dragging or resizing windows or otherwise holding the mouse down. We were forced to remove most of the efficiency FLTK uses for redrawing in order to get windows to update while being moved. This is a design error in Windows and probably impossible to get around.

- `Fl_Gl_Window::can_do_overlay()` returns true until the first time it attempts to draw an overlay, and then correctly returns whether or not there is overlay hardware.

- `SetCapture` (used by `Fl::grab()`) doesn’t work, and the main window title bar turns gray while menus are popped up.

- Compilation with gcc 3.4.4 and `-Os` exposes an optimisation bug in gcc. The symptom is that when drawing filled circles only the perimeter is drawn. This can for instance be seen in the symbols demo. Other optimisation options such as -O2 and -O3 seem to work OK. More details can be found in STR#1656

1.19.5 The Apple OS X Interface

Cross-platform applications should bracket macOS-specific source code between `#if defined(__APPLE__) && !defined(FLTK_USE_X11) / #endif`. FLTK supports Apple OS X using the Apple Cocoa library. Older versions of MacOS are no longer supported.

Control, Option, and Command Modifier Keys

FLTK maps the Mac ‘control’ key to `FL_CTRL`, the ‘option’ key to `FL_ALT` and the ‘Apple’ key to `FL_META`. Furthermore, `FL_COMMAND` designates the ‘Apple’ key on Mac OS X and the ‘control’ key on other platforms. Keyboard events return the key name in `Fl::event_key()` and the keystroke translation in `Fl::event_text()`. For example, typing Option-Y on a Mac US keyboard will set `FL_ALT` in `Fl::event_state()`, set `Fl::event_key()` to ‘y’ and return the Yen symbol in `Fl::event_text()`.

Right Click simulation with Ctrl Click

The Apple HIG guidelines indicate applications should support ‘Ctrl Click’ to simulate ‘Right Click’ for e.g. context menus, so users with one-button mice and one-click trackpads can still access right-click features. However, paraphrasing Manolo’s comment on the fltk.coredev newsgroup:

- FLTK does /not/ support Ctrl-Click == Right Click itself because Mac OS X event processing doesn’t support this at the system level: the system reports left-clicks with the ctrl modifier when the user ctrl-clicks, and OS X system preferences don’t allow changing this behavior. Therefore, applications must handle simulation of Right Click with Ctrl Click in the application code.
Ian MacArthur provided the following handle() method code snippet showing an example of how to do this:

```c
    case FL_PUSH:
    |
    int btn = Fl::event_button();
    ifndef __APPLE__
    int ev_state = Fl::event_state();
    endif
    /
    // Context menu can be called up in one of two ways: -
    // 1 - right click, as normally used on Windows and Linux
    // 2 - Ctrl + left click, as sometimes used on Mac
    //
    ifndef __APPLE__
    // On apple, check right click, and ctrl+left click
    if ((btn == FL_RIGHT_MOUSE) || (ev_state == (FL_CTRL | FL_BUTTON1)))
    else
    // On other platforms, only check right click as ctrl+left is used for selections
    if (btn == FL_RIGHT_MOUSE)
    endif
    |
    // Did we right click on the object?..
```

There is a thread about this subject on fltk.coredev (Aug 1-14, 2014) entitled “[RFC] Right click emulation for one button mouse on Mac”.

Apple “Quit” Event

When the user presses Cmd-Q or requests a termination of the application, FLTK sends an FL_CLOSE event to all open windows. If any window remains open, the termination request aborts. If all windows close, the application’s event loop terminates, that is, Fl::run() returns. The application can then follow FLTK’s normal termination path executing cleanup code that may be programmed after termination of the event loop, and returning from main(). Function Fl::program_should_quit() allows to detect whether the event loop terminated because of a program termination request.

Apple “Open” Event

Whenever the user drops a file onto an application icon, OS X generates an Apple Event of the type “Open”. You can have FLTK notify you of an Open event by calling the fl_open_callback() function.

```c
    void fl_open_display()
```

Opens the display. Does nothing if it is already open. You should call this if you wish to do Cocoa or Quartz calls and there is a chance that your code will be called before the first show() of a window.

```c
    Window fl_xid(const Fl_Window *)
```

Returns the window reference for an Fl_Window, or NULL if the window has not been shown. This reference is a pointer to an instance of the subclass FLWindow of Cocoa’s NSWindow class.

```c
    Fl_Window *fl_find(Window xid)
```

Generated by Doxygen
Returns the Fl_Window that corresponds to the given window reference, or NULL if not found.

void fl_mac_set_about( Fl_Callback ∗cb, void ∗user_data, int shortcut)

Attaches the callback cb to the "About myprog" item of the system application menu. cb will be called with NULL first argument and user_data second argument. This MacOS-specific function is deprecated in FLTK 1.4 and replaced by Fl_Sys_Menu_Bar::about(Fl_Callback ∗cb, void ∗data) which is cross-platform.

Fl_Sys_Menu_Bar class

The Fl_Sys_Menu_Bar class allows to build menu bars that, on Mac OS X, are placed in the system menu bar (at top-left of display), and, on other platforms, at a user-chosen location of a user-chosen window.

1.19.5.1 Setting the icon of an application

• First, create a .icns file containing several copies of your icon of decreasing sizes. This can be done using the Preview application or the Icon Composer application available in "Graphics Tools for Xcode". To create a high resolution icon file, it is necessary to use the iconutil command-line utility.

• Put your .icns file in the Resources subdirectory of your application bundle.

• Add these two lines to the Info.plist file of your application bundle

  <key>CFBundleIconFile</key>
  <string>foo.icns</string>

replacing foo by your application name. If you use Xcode, just add your .icns file to your application target.

1.19.5.2 Drawing Things Using Quartz

All code inside Fl_Widget::draw() is expected to call Quartz drawing functions. The Quartz coordinate system is flipped to match FLTK's coordinate system. The origin for all drawing is in the top left corner of the enclosing Fl_Window. The function fl_mac_gc() returns the appropriate Quartz 2D drawing environment (of type CGContextRef). For compatibility with previous FLTK versions, deprecated global variable fl_gc gives the same value.

Include FL/platform.H to declare the fl_mac_gc() function (or the fl_gc variable).

1.19.5.3 Internationalization

All FLTK programs contain an application menu with, e.g., the About xxx, Hide xxx, and Quit xxx items. This menu can be internationalized/localized by any of two means.

• using the Fl_Mac_App_Menu class.

• using the standard Mac OS X localization procedure. Create a language-specific .lproj directory (e.g., German.lproj) in the Resources subdirectory of the application bundle. Create therein a Localizable.strings file that translates all menu items to this language. The German Localizable.strings file, for example, contains:

    "About %@" = "Über %@";
    "Print Front Window"="Frontfenster drucken";
    "Services" = "Dienste";
    "Hide %@"="%0 ausblenden";
    "Hide Others"="Andere ausblenden";
    "Show All"="Alle einblenden";
    "Quit %@"="%0 beenden";

Set "Print Front Window" = ""; therein so the application menu doesn't show a "Print Front Window" item. To localize the application name itself, create a file InfoPlist.strings in each .lproj directory and put CFBundleName = "localized name"; in each such file.
1.19.5.4 OpenGL and ’retina’ displays

It is possible to have OpenGL produce graphics at the high pixel resolution allowed by the so-called ‘retina’ displays present on recent Apple hardware. For this, call

```cpp
Fl::use_high_res_GL(1);
```

before any `Fl_Gl_Window` is shown. Also, adapt your `Fl_Gl_Window::draw()` and `Fl_Gl_Window::draw_overlay()` methods replacing

```cpp
glViewport(0, 0, w(), h());
```

by

```cpp
glViewport(0, 0, pixel_w(), pixel_h());
```

making use of the `Fl_Gl_Window::pixel_w()` and `Fl_Gl_Window::pixel_h()` methods that return the width and height of the GL scene in pixels: if the `Fl_Gl_Window` is mapped on a retina display, these methods return twice as much as reported by `Fl_Widget::w()` and `Fl_Widget::h()`; if it’s mapped on a regular display, they return the same values as `w()` and `h()`. These methods dynamically change their values if the window is moved into/out from a retina display. If `Fl::use_high_res_GL(1)` is not called, all `Fl_Gl_Window`'s are drawn at low resolution. These methods are useful on all platforms because `Fl_Gl_Window::w()` and `Fl_Gl_Window::h()` don't return, on HighDPI displays, the quantities in pixels necessary to OpenGL functions.

The `Fl_Gl_Window::pixels_per_unit()` method is useful when the OpenGL code depends on the pixel dimension of the GL scene. This occurs, e.g., if a window's handle() method uses `Fl::event_x()` and `Fl::event_y()` whose returned values should be multiplied by `Fl_Gl_Window::pixels_per_unit()` to obtain the adequate pixel units. This method may also be useful, for example, to adjust the width of a line in a high resolution GL scene.

1.19.5.5 Fl_Double_Window

OS X double-buffers all windows automatically. On OS X, `Fl_Window` and `Fl_Double_Window` are handled internally in the same way.

1.19.5.6 Mac File System Specifics

Resource Forks

FLTK does not access the resource fork of an application. However, a minimal resource fork must be created for OS X applications. Starting with OS X 10.6, resource forks are no longer needed.

Caution (OS X 10.2 and older):

When using UNIX commands to copy or move executables, OS X will NOT copy any resource forks! For copying and moving use `CpMac` and `MvMac` respectively. For creating a tar archive, all executables need to be stripped from their Resource Fork before packing, e.g. "DeRez fluid > fluid.r". After unpacking the Resource Fork needs to be reattached, e.g. "Rez fluid.r -o fluid".
It is advisable to use the Finder for moving and copying and Mac archiving tools like Sit for distribution as they will handle the Resource Fork correctly.

**Mac File Paths**

FLTK uses UTF-8-encoded UNIX-style filenames and paths.

See also

**Mac OS X-specific symbols**

### 1.19.6 The Wayland Interface

Cross-platform applications should bracket Wayland-specific source code between 

```c
#ifdef FLTK_USE_WAYLAND
    ...
#endif
```

and should ensure function `fl_wl_display()` returns non-NULL before calling Wayland-specific functions and using Wayland-specific symbols.

```c
extern struct wl_display *fl_wl_display();
```

After `fl_open_display()` has run, function `fl_wl_display()` returns a pointer to the struct `wl_display` representing the connection between the application and Wayland. For example, `wl_display_get_fd(fl_wl_display())` gives the file descriptor one can use to communicate with the Wayland compositor according to the Wayland protocol.

```c
struct wl_window *fl_wl_xid(const Fl_Window *)
```

Returns a pointer to an FLTK-defined structure holding Wayland-related data created when a window gets show()'n, or NULL if not show()'n.

```c
Fl_Window *fl_wl_find(struct wl_window * wld_win)
```

Returns the Fl_Window that corresponds to the given Window, or NULL if not found.

```c
struct wl_surface *fl_wl_surface(struct wl_window *wld_win)
```

Returns a pointer to the struct `wl_surface` corresponding to a show()'n top-level window or subwindow.

```c
cairo_t *fl_wl_gc()
```

Drawing natively to a Wayland window: Within an overridden `Fl_Widget::draw()` method, or after a call to `Fl_Window::make_current()`, it's possible to draw using the Cairo library. Function `fl_wl_gc()` returns the adequate `cairo_t` value. Regular FLTK coordinates, with top-left origin, are to be used. All FLTK-defined drawing functions (e.g., `fl_rect()`, `fl_draw()`) can be used too.

```c
void fl_close_display()
```

This closes the Wayland connection. You do not need to call this to exit. It may be useful to call this if you want your program to continue without the Wayland connection. You cannot open the display again, and cannot call any FLTK functions.

See also

**wayland.H** for all functions specific of the Wayland platform.
1.19.6.1 HiDPI display support

FLTK Wayland apps automatically scale according to the Wayland-defined, integer-valued scale factor. On a HiDPI display, it's enough to set this factor to 2 for any FLTK app to be drawn using twice as many pixels and thus to be as readable as it is on a regular display. With the gnome and KDE-plasma desktops, that is achieved in the "Settings" section of the "Displays" application, selecting 200 % for the "Scale" parameter. In addition to this, FLTK apps can also be scaled up or down typing ctrl/+/-/0/ and with the FLTK_SCALING_FACTOR environment variable.

1.19.6.2 Window icons

Standard FLTK functions Fl_Window::icon(const Fl_RGB_Image*), Fl_Window::icons(const Fl_RGB_Image*, int), Fl_Window::default_icon(const Fl_RGB_Image*) and Fl_Window::default_icons(const Fl_RGB_Image*, int) have no effect on the Wayland platform. The equivalent of a call to Fl_Window::default_icon(const Fl_RGB_Image*) to set the application-specific window icon can be obtained as follows, using FLTK's editor app as an example:

• create a text file named editor.desktop containing:

```
[Desktop Entry]
Version=1.0
Type=Application
Name=Editor
Name[fr]=Editeur
Comment=FLTK editor
Exec=editor %F
Icon=/path/to/icon/file/editor.svg
MimeType=text/plain
```

• The Name= line therein determines the string displayed when the app runs.

• Optionally, one or more Name[locale]= lines can be used to set locale-specific app names.

• The Icon= line accepts also .png files.

• Put this file in /usr/local/share/applications/ so it's available to all system users or in $ HOME/.local/share/applications/ so it's available to a single user.

1.19.6.3 Window titlebars

Wayland supports both client-side window decoration (CSD), where client applications are responsible for drawing window titlebars, and server-side window decoration (SSD), where the Wayland compositor itself draws window titlebars. Among 4 tested Wayland compositors, Mutter (gnome's compositor) and Weston use CSD mode whereas the KWin and Sway compositors use SSD mode. When running in CSD mode, FLTK uses a library called libdecor to draw titlebars. The libdecor library has been conceived to use various plug-in's to draw titlebars in various fashions intended to match any desktop's preferred titlebar style. FLTK supports drawing titlebars with any libdecor plug-in via an environment variable called LIBDECOR_PLUGIN_DIR which can be given the name of a directory containing the desired plug-in. When LIBDECOR_PLUGIN_DIR is not defined, or points to a directory that doesn't contain a libdecor plug-in, FLTK uses its built-in plug-in to draw titlebars. That is the most common situation, until libdecor plug-in's become available for popular UNIX desktops.

1.20 Migrating Code from FLTK 1.3 to 1.4

This appendix describes the differences between FLTK 1.3.x and FLTK 1.4.x functions and classes and potential requirements to change source code.

We also explain how code can be made compatible so it can be compiled by both FLTK 1.3.x and 1.4.x.

If you need to migrate your code from prior FLTK versions to FLTK 1.4, then you should first consult the relevant appendices in the FLTK 1.3 online documentation or by downloading the FLTK 1.3 documentation. See https://www.fltk.org/doc-1.3/index.html and/or https://www.fltk.org/software.php, respectively.
1.20 Migrating Code from FLTK 1.3 to 1.4

1.20.1 Changes in Header Files

We strive to include only necessary header files in the public headers of the FLTK library to reduce dependencies and hence compile times.

We try to avoid including system header files as far as possible. Known exceptions are `<stdio.h>` where file system structures and functions are visible in the public API, for instance `FILE*`, and sometimes essential header files like `<stdlib.h>` and/or `<stddef.h>`. Some required system headers may be included in platform specific header files like `<FL/platform.H>` or `<FL/platform_types.h>`.

In earlier versions (1.3.x) some of the public FLTK headers included some not strictly required system headers by accident.

The consequence for building user programs with FLTK 1.4 is that if you require a system or FLTK header in your user program that you don't `#include` explicitly but which has been included by FLTK 1.3.x your FLTK 1.3 program may issue compiler errors or warnings about missing header files or missing declarations when compiled with FLTK 1.4.

This is not a fault of FLTK 1.4 but a fault of the source code that did not include all required headers.

In FLTK 1.4 inclusion of `<FL/Fl.H>` is no longer a strict requirement as it was required and documented in FLTK 1.3.x. In FLTK 1.4 you may still need to `#include <FL/Fl.H>` if you are using enumerations or methods of class `Fl` like `Fl::run()` but there are exceptions where this header is included by other FLTK headers, like `Fl_Window.H` and other subclasses.

Suggested solution: include all FLTK and system header files your source code requires explicitly and don't rely on FLTK headers to include a particular header file. If you want your code to be as much as possible compatible with FLTK 1.3.x, then you should `#include <FL/Fl.H>` as required by 1.3.x.

You don't need to include headers of base classes - this is done by all FLTK headers as required. Besides that you need to include some support headers if you use FLTK functions like `fl_choice()` and others. This is described in the function's documentation (if a required header is missing in the docs this is a bug).

If you follow these rules your program will be compatible with both FLTK 1.3.x and FLTK 1.4.x as long as you use only functions and classes defined in FLTK 1.3.

1.20.2 Fl_Preferences

Starting with FLTK 1.3, preference databases are expected to be in UTF-8 encoding. Previous databases were stored in the current character set or code page which renders them incompatible for text entries using international characters.

Starting with FLTK 1.4, searching a valid path to store the preference files has changed slightly. Please see `Fl_Preferences::Fl_Preferences(Root, const char*, const char*)` for details.

On Unix/Linux platforms new FLTK preference files are stored using the `XDG Base Directory Specification` which means in essence that user preference files are stored in the user's home directory under the subdirectory `.config`, i.e. in `$HOME/.config/ftlk.org/` rather than `$HOME/.fltk/ftlk.org/`. Existing preference files are still found and used, hence this new location is optional.

You may want to move the preference files from their old locations to their new locations as documented in `Fl_Preferences::Fl_Preferences(Root, const char*, const char*)`.

New `Fl_Preferences` types `Fl_Preferences::USER_L`, `Fl_Preferences::SYSTEM_L` and some more combinations with "_L" suffix have been defined to make preference files independent of the current locale. This is particularly important for floating point data which is stored in text form with varying decimal separator depending on the locale (either '.' or ','). You may want to change your program to use these new constants instead of those without the "_L" suffix. For more information see the documentation of `Fl_Preferences`.
1.20.3 Fl::add_timeout and friends

Since FLTK 1.4.0 internal timeout handling has been unified across platforms. This ensures equal timeout handling, improved accuracy of Fl::repeat_timeout(), and easier maintenance (less potential for errors).

This will very likely not affect user code, however there is one subtle exception on macOS and Windows: in FLTK 1.3.x these platforms used system timers to schedule timeouts. Since FLTK 1.4.0 all platforms use the same internal timer management that was previously only used on Unix/Linux/X11. The consequence of this change is that the FLTK event loop needs to be executed to trigger timeout events, i.e. you must either call Fl::wait() repeatedly or start the event loop with Fl::run().

Code that did not execute the event loop and relied on the system timers has never been cross platform compatible, i.e. it wouldn't work on Unix/Linux. An example would be code that opened a splash window, scheduled a timeout with Fl::add_timeout(), and waited for the timer event w/o running the FLTK event loop. Such code must be modified to execute Fl::run() and/or use Fl::wait().

1.20.4 New FL_OVERRIDE Macro

FLTK 1.4 defines a new macro FL_OVERRIDE as "override" if a recent C++ standard (C++11 or higher) is used to compile your code.

This macro is currently defined in FL/Fl_attr.h but this may change in a future release. It is enough to `#include <FL/Fl.H>` to enable this macro.

Unfortunately Visual Studio does not define a meaningful value of __cplusplus to detect the C++ standard. Hence we use the Visual Studio version (2015 or higher) to decide whether we can define FL_OVERRIDE or not.

The FL_OVERRIDE macro is used to decorate declarations of overridden virtual methods in subclasses. Example code from FL/Fl_Window.H:

```
int handle(int) FL_OVERRIDE;
void resize(int X, int Y, int W, int H) FL_OVERRIDE;
Fl_Window * as_window() FL_OVERRIDE { return this; }
```

The FL_OVERRIDE macro translates to 'override' on newer compilers and to an empty string for older compilers.

We recommend to add this to your overridden virtual methods in subclasses derived from FLTK base classes (widgets) and to compile with C++ standard C++11 or higher to enable the compiler to detect some errors if methods are not overridden correctly.

You don't need to declare the overridden methods 'virtual' if you use FL_OVERRIDE or the keyword override.

Hint: For the GCC and clang compilers you can enable the warning '-Wsuggest-override' to detect where you may (want to) add the FL_OVERRIDE macro.

1.20.5 Fl::Image::copy() 'const'

Since FLTK 1.4.0 the virtual method Fl::Image::copy() has been declared 'const' so read-only ('const') images can be copied w/o casts.

This will very likely not affect user code. However, if you derived your own class from any of the Fl_∗_Image variants and you override Your_Image::copy() then you must declare this 'const' as well, i.e. you must add the keyword 'const' to the declaration of copy() in your header file and in the implementation.

We suggest to add the new FL_OVERRIDE macro or the keyword 'override' (see above) to your own overridden method declarations to enable the compiler to detect such incompatibilities.

Code example in header file:
```
class Your_Image {
    // ...
    Fl_Image *copy() const FL_OVERRIDE;
    Fl_Image *copy(int w, int h) const FL_OVERRIDE;
};
```

Note the 'const' attribute and the FL_OVERRIDE macro.
1.21 Software License

December 11, 2001

The FLTK library and included programs are provided under the terms of the GNU Library General Public License (LGPL) with the following exceptions:

1. Modifications to the FLTK configure script, config header file, and makefiles by themselves to support a specific platform do not constitute a modified or derivative work.

   The authors do request that such modifications be contributed to the FLTK project - send all contributions through the "Software Trouble Report" on the following page:  https://www.fltk.org/bugs.php

2. Widgets that are subclassed from FLTK widgets do not constitute a derivative work.

3. Static linking of applications and widgets to the FLTK library does not constitute a derivative work and does not require the author to provide source code for the application or widget, use the shared FLTK libraries, or link their applications or widgets against a user-supplied version of FLTK.

   If you link the application or widget to a modified version of FLTK, then the changes to FLTK must be provided under the terms of the LGPL in sections 1, 2, and 4.

4. You do not have to provide a copy of the FLTK license with programs that are linked to the FLTK library, nor do you have to identify the FLTK license in your program or documentation as required by section 6 of the LGPL.

   However, programs must still identify their use of FLTK. The following example statement can be included in user documentation to satisfy this requirement:

   [program/widget] is based in part on the work of the FLTK project ( https://www.fltk.org ).

GNU LIBRARY GENERAL PUBLIC LICENSE

Version 2, June 1991
Copyright (C) 1991 Free Software Foundation, Inc.
59 Temple Place - Suite 330, Boston, MA 02111-1307, USA
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.
[This is the first released version of the library GPL. It is numbered 2 because it goes with version 2 of the ordinary GPL.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software–to make sure the software is free for all its users.
This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.
When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link a program with the library, you must provide complete object files to the recipients so that they can relink them with the library, after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright the library, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the library.

Also, for each distributor's protection, we want to make certain that everyone understands that there is no warranty for this free library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don't assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".) "Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete
source code means all the source code for all modules it contains, plus any associated interface definition files, plus
the scripts used to control compilation and installation of the library.
Activities other than copying, distribution and modification are not covered by this License; they are outside its
scope. The act of running a program using the Library is not restricted, and output from such a program is covered
only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing
it). Whether that is true depends on what the Library does and what the program that uses the Library does.
1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any
medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice
and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty;
and distribute a copy of this License along with the Library.
You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection
in exchange for a fee.
2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library,
and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet
all of these conditions:
a) The modified work must itself be a software library.
b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of
any change.
c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this
License.
d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program
that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good
faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates,
and performs whatever part of its purpose remains meaningful.
(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent
of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this
function must be optional: if the application does not supply it, the square root function must still compute square
roots.)
These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from
the Library, and can be reasonably considered independent and separate works in themselves, then this License,
and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute
the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on
the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and
every part regardless of who wrote it.
Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather,
the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.
In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on
the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this
License.
3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given
copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the
ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the
ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not
make any other change in these notices.
Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License
applies to all subsequent copies and derivative works made from that copy.
This option is useful when you wish to copy part of the code of the Library into a program that is not a library.
4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or
executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete
corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2
above on a medium customarily used for software interchange.
If distribution of object code is made by offering access to copy from a designated place, then offering equivalent
access to copy the source code from the same place satisfies the requirement to distribute the source code, even
though third parties are not compelled to copy the source along with the object code.
5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by
being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative
work of the Library, and therefore falls outside the scope of this License.
However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the
Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy. For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives
a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.
1.22 Example Source Code

The FLTK distribution contains over 60 sample applications written in, or ported to, FLTK.

If the FLTK archive you received does not contain either an 'examples' or 'test' directory, you can download the complete FLTK distribution from https://www.fltk.org/software.php.

Most of the example programs were created while testing a group of widgets. They are not meant to be great achievements in clean C++ programming, but merely a test platform to verify the functionality of the FLTK library. Note that extra example programs are also available in an additional 'examples' directory, but these are NOT built automatically when you build FLTK, unlike those in the 'test' directory shown below.

1.22.1 Example Applications: Overview

<table>

</tbody>
</table>

1.22.1.1 adjuster

adjuster shows a nifty little widget for quickly setting values in a great range.

1.22.1.2 animated

animated shows a window with an animated square that shows drawing with transparency (alpha channel).

1.22.1.3 arc

The arc demo explains how to derive your own widget to generate some custom drawings. The sample drawings use the matrix based arc drawing for some fun effects.

1.22.1.4 ask

ask shows some of FLTK's standard dialog boxes. Click the correct answers or you may end up in a loop, or you may end up in a loop, or you... .

1.22.1.5 bitmap

This simple test shows the use of a single color bitmap as a label for a box widget. Bitmaps are stored in the X11 `.bmp' file format and can be part of the source code.

Generated by Doxygen
1.22.1.6  blocks

A wonderful and addictive game that shows the usage of FLTK timers, graphics, and how to implement sound on all platforms. blocks is also a good example for the Mac OS X specific bundle format.

1.22.1.7  boxtype

boxtype gives an overview of readily available boxes and frames in FLTK. More types can be added by the application programmer. When using themes, FLTK shuffles boxtypes around to give your program a new look.

1.22.1.8  browser

browser shows the capabilities of the Fl_Browser widget. Important features tested are loading of files, line formatting, and correct positioning of the browser data window.

1.22.1.9  button

The button test is a simple demo of push-buttons and callbacks.

1.22.1.10  buttons

buttons shows a sample of FLTK button types.

1.22.1.11  cairo_test

cairo_test shows a sample of drawing with Cairo in an Fl_Cairo_Window. This program can only be built if FLTK was configured with Cairo support.

1.22.1.12  checkers

Written by Steve Poulsen in early 1979, checkers shows how to convert a VT100 text-terminal based program into a neat application with a graphical UI. Check out the code that drags the pieces, and how the pieces are drawn by layering. Then tell me how to beat the computer at Checkers.

1.22.1.13  clock

The clock demo shows two analog clocks. The innards of the Fl_Clock widget are pretty interesting, explaining the use of timeouts and matrix based drawing.

1.22.1.14  colbrowser

colbrowser runs only on X11 systems. It reads /usr/lib/X11/rgb.txt to show the color representation of every text entry in the file. This is beautiful, but only moderately useful unless your UI is written in Motif.

1.22.1.15  color_chooser

The color_chooser gives a short demo of FLTK's palette based color chooser and of the RGB based color wheel.
1.22.1.16  cube

The cube demo shows the speed of OpenGL. It also tests the ability to render two OpenGL buffers into a single window, and shows OpenGL text.

1.22.1.17  CubeView

CubeView shows how to create a UI containing OpenGL with Fluid.

1.22.1.18  cursor

The cursor demo shows all mouse cursor shapes that come standard with FLTK. The fgcolor and bgcolor sliders work only on few systems (some version of Irix for example).

1.22.1.19  curve

curve draws a nice Bézier curve into a custom widget. The points option for splines is not supported on all platforms.

1.22.1.20  demo

This tool allows quick access to all programs in the test directory. demo is based on the visuals of the IrixGL demo program. The menu tree can be changed by editing test/demo.menu.

1.22.1.21  device

Exercises the Fl_Image_Surface, Fl_Copy_Surface, and Fl_Printer classes to draw to an Fl_Image object, copy graphical data to the clipboard, and for print support.

Note

The clipboard.cxx program of the 'examples' directory is a clipboard watching application that continuously displays the textual or graphical content of the system clipboard (a.k.a pasteboard on Mac OS X) exercising Fl::paste().

1.22.1.22  doublebuffer

The doublebuffer demo shows the difference between a single buffered window, which may flicker during a slow redraw, and a double buffered window, which never flickers, but uses twice the amount of RAM. Some modern OS's double buffer all windows automatically to allow transparency and shadows on the desktop. FLTK is smart enough to not triple buffer a window in that case.

1.22.1.23  editor

FLTK has two very different text input widgets. Fl_Input and derived classes are rather light weight, however Fl_Text_Editor is a complete port of nedit (with permission). The editor test is almost a full application, showing custom syntax highlighting and dialog creation.

1.22.1.24  fast_slow

fast_slow shows how an application can use the Fl_Widget::when() setting to receive different kinds of callbacks.
1.22 Example Source Code

1.22.1.25 file_chooser

The standard FLTK file_chooser is the result of many iterations, trying to find a middle ground between a complex browser and a fast light implementation.

1.22.1.26 fonts

fonts shows all available text fonts on the host system. If your machine still has some pixmap based fonts, the supported sizes will be shown in bold face. Only the first 256 fonts will be listed.

1.22.1.27 forms

forms is an XForms program with very few changes. Search for "ftk" to find all changes necessary to port to ftk. This demo shows the different boxtypes. Note that some boxtypes are not appropriate for some objects.

1.22.1.28 fractals

fractals shows how to mix OpenGL, Glut and FLTK code. FLTK supports a rather large subset of Glut, so that many Glut applications compile just fine.

1.22.1.29 fullscreen

This demo shows how to do many of the window manipulations that are popular for games. You can toggle the border on/off, switch between single- and double-buffered rendering, and take over the entire screen. More information in the source code.

1.22.1.30 gl_overlay

gl_overlay shows OpenGL overlay plane rendering. If no hardware overlay plane is available, FLTK will simulate it for you.

1.22.1.31 glpuzzle

The glpuzzle test shows how most Glut source code compiles easily under FLTK.

1.22.1.32 hello

hello: Hello, World. Need I say more? Well, maybe. This tiny demo shows how little is needed to get a functioning application running with FLTK. Quite impressive, I'd say.

1.22.1.33 help_dialog

help_dialog displays the built-in FLTK help browser. The Fl_Help_Dialog understands a subset of html and renders various image formats. This widget makes it easy to provide help pages to the user without depending on the operating system's html browser.

1.22.1.34 icon

icon demonstrates how an application icon can be set from an image. This icon should be displayed in the window bar (label), in the task bar, and in the task switcher (Windows: Alt-Tab). This feature is platform specific, hence it is possible that you can't see the icon. On Unix/Linux (X11) this can even depend on the Window Manager (WM).
1.22.1.35 iconize

_iconize_ demonstrates the effect of the window functions hide(), iconize(), and show().

1.22.1.36 image

The _image_ demo shows how an image can be created on the fly. This generated image contains an alpha (transparency) channel which lets previous renderings 'shine through', either via true transparency or by using screen door transparency (pixelation).

1.22.1.37 inactive

_inactive_ tests the correct rendering of inactive widgets. To see the inactive version of images, you can check out the pixmap or image test.

1.22.1.38 input

This tool shows and tests different types of text input fields based on _Fl_Input_. The _input_ program also tests various settings of _Fl_Input::when().

1.22.1.39 input_choice

_input_choice_ tests the latest addition to FLTK1, a text input field with an attached pulldown menu. Windows users will recognize similarities to the 'ComboBox'. _input_choice_ starts up in 'plastic' scheme, but the traditional scheme is also supported.

1.22.1.40 keyboard

FLTK unifies keyboard events for all platforms. The _keyboard_ test can be used to check the return values of _Fl::event_key()_ and _Fl::event_text()_. It is also great to see the modifier buttons and the scroll wheel at work. Quit this application by closing the window. The ESC key will not work.

1.22.1.41 label

Every FLTK widget can have a label attached to it. The _label_ demo shows alignment, clipping, and wrapping of text labels. Labels can contain symbols at the start and end of the text, like _@FLTK_ or _@circle uh-huh @square_.

1.22.1.42 line_style

Advanced line drawing can be tested with _line_style_. Not all platforms support all line styles.

1.22.1.43 list_visuals

This little app finds all available pixel formats for the current X11 screen. But since you are now an FLTK user, you don’t have to worry about any of this.

1.22.1.44 mandelbrot

_mandelbrot_ shows two advanced topics in one test. It creates grayscale images on the fly, updating them via the _idle_ callback system. This is one of the few occasions where the _idle_ callback is very useful by giving all available processor time to the application without blocking the UI or other apps.
1.22 Example Source Code

1.22.1.45 menubar

The menubar tests many aspects of FLTK's popup menu system. Among the features are radio buttons, menus taller than the screen, arbitrary sub menu depth, and global shortcuts.

1.22.1.46 message

message pops up a few of FLTK's standard message boxes.

1.22.1.47 minimum

The minimum test program verifies that the update regions are set correctly. In a real life application, the trail would be avoided by choosing a smaller label or by setting label clipping differently.

1.22.1.48 native-filechooser

The native-filechooser program invokes the platform specific file chooser, if available (see Fl_Native_File_Chooser widget).

1.22.1.49 navigation

navigation demonstrates how the text cursor moves from text field to text field when using the arrow keys, tab, and shift-tab.

1.22.1.50 offscreen

offscreen shows how to draw into an offscreen image and display the offscreen image in the program window.

1.22.1.51 output

output shows the difference between the single line and multi line mode of the Fl_Output widget. Fonts can be selected from the FLTK standard list of fonts.

1.22.1.52 overlay

The overlay test app shows how easy an FLTK window can be layered to display cursor and manipulator style elements. This example derives a new class from Fl_Overlay_Window and provides a new function to draw custom overlays.

1.22.1.53 pack

The pack test program demonstrates the resizing and repositioning of children of the Fl_Pack group. Putting an Fl_Pack into an Fl_Scroll is a useful way to create a browser for large sets of data.

1.22.1.54 pixmap

This simple test shows the use of a LUT based pixmap as a label for a box widget. Pixmaps are stored in the X11 `.xpm' file format and can be part of the source code. Pixmaps support one transparent color.
1.22.1.55  pixmap_browser

 pixmap_browser  tests the shared-image interface. When using the same image multiple times, Fl_Shared_Image will keep it only once in memory.

1.22.1.56  preferences

 I do have my preferences in the morning, but sometimes I just can't remember a thing. This is where the Fl_Preferences come in handy. They remember any kind of data between program launches.

1.22.1.57  radio

 The radio tool was created entirely with fluid. It shows some of the available button types and tests radio button behavior.

1.22.1.58  resizebox

 resizebox  shows some possible ways of FLTK's automatic resize behavior.

1.22.1.59  rotated_text

 rotated_text  shows how text can be rotated, i.e. drawn in any given angle. This demo is device specific, for instance it works under X11 only if configured with Xft.

1.22.1.60  resize

 The resize demo tests size and position functions with the given window manager.

1.22.1.61  scroll

 scroll  shows how to scroll an area of widgets, one of them being a slow custom drawing. Fl_Scroll uses clipping and smart window area copying to improve redraw speed. The buttons at the bottom of the window control decoration rendering and updates.

1.22.1.62  shape

 shape  is a very minimal demo that shows how to create your own OpenGL rendering widget. Now that you know that, go ahead and write that flight simulator you always dreamt of.

1.22.1.63  subwindow

 The subwindow demo tests messaging and drawing between the main window and 'true' sub windows. A sub window is different to a group by resetting the FLTK coordinate system to 0, 0 in the top left corner. On Win32 and X11, subwindows have their own operating system specific handle.

1.22.1.64  sudoku

 Another highly addictive game - don't play it, I warned you. The implementation shows how to create application icons, how to deal with OS specifics, and how to generate sound.
1.22.1.65 symbols

symbols are a speciality of FLTK. These little vector drawings can be integrated into labels. They scale and rotate, and with a little patience, you can define your own. The rotation number refers to 45 degree rotations if you were looking at a numeric keypad (2 is down, 6 is right, etc.).

1.22.1.66 table

The table demo shows the features of the Fl_Table widget.

1.22.1.67 tabs

The tabs tool was created with fluid. It tests correct hiding and redisplaying of tabs, navigation across tabs, resize behavior, and no unneeded redrawing of invisible widgets.

The tabs application shows the Fl_Tabs widget on the left and the Fl_Wizard widget on the right side for direct comparison of these two panel management widgets.

1.22.1.68 threads

FLTK can be used in a multithreading environment. There are some limitations, mostly due to the underlying operating system. threads shows how to use Fl::lock(), Fl::unlock(), and Fl::awake() in secondary threads to keep FLTK happy. Although locking works on all platforms, this demo is not available on every machine.

1.22.1.69 tile

The tile tool shows a nice way of using Fl_Tile. To test correct resizing of subwindows, the widget for region 1 is created from an Fl_Window class.

1.22.1.70 tiled_image

The tiled_image demo uses a small image as the background for a window by repeating it over the full size of the widget. The window is resizable and shows how the image gets repeated.

1.22.1.71 tree

The tree demo shows the features of the Fl_Tree widget.

1.22.1.72 twowin

The twowin program tests focus transfer from one window to another window.

1.22.1.73 unitests

unitests exercises all of FLTK’s drawing features (e.g., text, lines, circles, images), as well as scrollbars and schemes.

1.22.1.74 utf8

utf8 shows all fonts available to the platform that runs it, and how each font draws each of the Unicode code points ranging between U+0020 and U+FFFF.
1.22.1.75 valuators

valuators shows all of FLTK's nifty widgets to change numeric values.

1.22.1.76 windowfocus

windowfocus shows a very special case when a new window is shown while the focus stays in the original window.

1.22.1.77 fluid

fluid is not only a big test program, but also a very useful visual UI designer. Many parts of fluid were created using fluid. See the Fluid Tutorial for more details.

1.22.2 Example Applications: Images

This chapter contains a few selected images of the test and example applications listed above. It is not meant to be complete or a full reference. The reason some images are included here is to show how the display should look when running the example programs.

1.22.2.1 cairo_test

The cairo_test demo program shows three shiny buttons drawn with Cairo in an Fl_Cairo_Window.

![Figure 1.43 Buttons drawn with Cairo](image)

1.22.2.2 icon
The **icon** program lets you set the program icon from an image (here an **FL_RGB_Image**).

![Green icon](image1.png)

**Figure 1.44 Green icon (Windows 10)**

### 1.22.2.3 unittests

Select "drawing images" in the browser at the left side to see the image drawing example:

![Image drawing example](image2.png)

**Figure 1.45 Image Drawing**

### 1.23 FAQ (Frequently Asked Questions)

A list of frequently asked questions about FLTK. This appendix describes various frequently asked questions regarding FLTK.

- Where do I start learning FLTK?
- How do I make a box with text?
- Can I use FLTK to make closed-source commercial applications?
- Hitting the 'Escape' key closes windows - how do I prevent this?
1.23.1 Where do I start learning FLTK?

It is assumed you know C++, which is the language all FLTK programs are written in, including FLTK itself. If you like reading manuals to work your way into things, a good start is the FLTK documentation's Introduction to FLTK. Under the FLTK Basics section there's an example 'hello world' program that includes a line-by-line description. If you like looking at simple code first to pique your interest, and then read up from there, start with the example programs in the test/ and examples/ directory that is included with the source code. A good place to start is the 'hello world' program in test/hello.cxx. Also do a google search for "FLTK example programs". "Erco's Cheat Page" is one that shows many simple examples of how to do specific things. If you like to run example programs and look for ones that are like yours and then read them, download and build FLTK from the source, then run the test/demo program. Also, go into the 'examples/' directory and run 'make', then run some of those programs. If you prefer watching TV to reading books and code, google search for "FLTK video tutorials" which has some introductory examples of how to write FLTK programs in C++ and build them.

1.23.2 How do I make a box with text?

The 'hello world' program shows how to make a box with text. All widgets have labels, so picking a simple widget like Fl_Box and setting its label() and using align() to align the label and labelfont() to set the font, and labelsize() to set the size, you can get text just how you want. Labels are not selectable though; if you want selectable text, you can use Fl_Output or Fl_Multiline_Output for simple text that doesn't include scrollbars. For more complex text that might want scrollbars and multiple colors/fonts, use either Fl_Text_Display which handles plain text, or Fl_Help_View which handles simple HTML formatted text.

1.23.3 Can I use FLTK to make closed-source commercial applications?

Yes. The FLTK Software License is standard LGPL, but also includes a special clause ("exception") to allow for static linking. Specifically:

3. Static linking of applications and widgets to the FLTK library does not constitute a derivative work and does not require the author to provide source code for the application or widget, use the shared FLTK libraries, or link their applications or widgets against a user-supplied version of FLTK.

If you link the application or widget to a modified version of FLTK, then the changes to FLTK must be provided under the terms of the LGPL in sections 1, 2, and 4.

4. You do not have to provide a copy of the FLTK license with programs that are linked to the FLTK library, nor do you have to identify the FLTK license in your program or documentation as required by section 6 of the LGPL.

However, programs must still identify their use of FLTK. The following example statement can be included in user documentation to satisfy this requirement:

[program/widget] is based in part on the work of the FLTK project (https://www.fltk.org).

1.23.4 Hitting the 'Escape' key closes windows - how do I prevent this?

[From FLTK article #378]

1. FLTK has a "global event handler" that makes Escape try to close the window, the same as clicking the close box. To disable this everywhere you can install your own that pretends it wants the escape key and thus stops the default one from seeing it (this may not be what you want, see below about the callbacks):

```c
static int my_handler(int event) {
    if (event == FL_SHORTCUT) return 1; // eat all shortcut keys
    return 0;
}
```
1. Attempts to close a window (both clicking the close box or typing Escape) call that window's callback. The default version of the callback does hide(). To make the window not close or otherwise do something different you replace the callback. To make the main window exit the program:

```c
void my_callback(Fl_Widget*, void*) {
    exit(0);
}
main_window->callback(my_callback);
```

If you don't want Escape to close the main window and exit you can check for and ignore it. This is better than replacing the global handler because Escape will still close pop-up windows:

```c
if (Fl::event() == FL_SHORTCUT && Fl::event_key() == FL_Escape)
    return; // ignore Escape
exit(0);
```

The reason for calling a window callback can also be found using using the `Fl::callback_reason()` method:

```c
if (Fl::callback_reason() == FL_REASON_CANCELLED)
    return; // ignore that the user pressed the Escape key
if (Fl::callback_reason() == FL_REASON_CLOSED)
    save_and_exit(); // user clicked the Close button in the window decoration
exit(0); // fallback for other callback reasons
```

It is very common to ask for confirmation before exiting, this can be done with:

```c
if (fl_choice("Are you sure you want to quit?",
    "continue", "quit", NULL))
    exit(0);
```
Chapter 2

FI_Terminal Technical Documentation

This chapter covers the vt100/xterm style "escape codes" used by FI_Terminal for cursor positioning, text colors, and other display screen control features such as full or partial screen clearing, up/down scrolling, character insert/delete, etc.

2.1 The Escape Codes FI_Terminal Supports

These are the escape codes FI_Terminal actually supports, and is not the 'complete' list that e.g. xterm supports. Most of the important stuff has been implemented, but esoteric features (such as scroll regions) has not.

Features will be added as the widget matures.

--- The CSI (Control Sequence Introducer, or "ESC[") ---

<table>
<thead>
<tr>

NOTE: Acrophabetic!
2.3 Fl_Terminal Design Document

When I started this project, I identified the key concepts needed to implement Fl_Terminal:

- Draw and manage multiline Unicode text in FLTK
- Allow per-character colors and attributes
- Efficient screen buffer to handle "scrollback history"
- Efficient scrolling with vertical scrollbar for even large screen history
- Mouse selection for copy/paste
- Escape code management to implement VT100 style / ANSI escape codes.

A class was created for each character, since characters can be either ASCII or Utf8 encoded byte sequences. This class is called Utf8Char, and handles the character, its fg and bg color, and any attributes like dim, bold, italic, etc. For managing the screen, after various experiments, I decided a ring buffer was the best way to manage things, the ring split in two:

- 'screen history' which is where lines scrolled off the top are saved
- 'display screen' displayed to the user at all times, and where the cursor lives

Scrolling the display, either by scrollbar or by new text causing the display to scroll up one line, would simply change an 'offset' index# of where in the ring buffer the top of the screen is, automatically moving the top line into the history, all without moving memory around.

In fact the only time screen memory is moved around is during these infrequent operations:

- during scrolling "down"
- character insert/delete operations within a line
- changing the display size
- changing the history size

So a class "RingBuffer" is defined to manage the ring, and accessing its various parts, either as the entire entity ring, just the history, or just the display.

These three concepts, "ring", "history" and "display" are given abbreviated names in the RingBuffer class's API:

```
NOTE: Abbreviations "hist" and "disp"

"history" may be abbreviated as "hist", and "display" as "disp" in both this text and the source code. 4 character names are used so they line up cleanly in the source, e.g.

    ring_rows()    ring_cols()
    hist_rows()    hist_cols()
    disp_rows()    disp_cols()

4 characters
```

These concepts were able to fit into C++ classes:

**Utf8Char**

Each character on the screen is a "Utf8Char" which can manage the UTF-8 encoding of any character as one or more bytes. Also in that class is a byte for an attribute (underline, bold, etc), and two integers for fg/bg color.
RingBuffer

The RingBuffer class keeps track of the buffer itself, a single array of Utf8Chars called "ring_chars" whose width is ring_cols() and whose height is ring_rows().

The "top" part of the ring is the history, whose width is hist_cols() and whose height is hist_rows(). hist_use_rows() is used to define what part of the history is currently in use.

The "bottom" part of the ring is the display, whose width is disp_cols() and whose height is disp_rows().

An index number called "offset" points to where in the ring buffer the top of the ring currently is. This index changes each time the screen is scrolled, and affects both where the top of the display is, and where the top of the history is.

The memory layout of the Utf8Char character array is:

```
ring_chars[]:
```

```
<table>
<thead>
<tr>
<th>History</th>
<th>hist_rows</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><em>v</em></td>
</tr>
<tr>
<td>Display</td>
<td>disp_rows</td>
</tr>
<tr>
<td></td>
<td><em>v</em></td>
</tr>
</tbody>
</table>
```

|<----------------->|

ring_cols  
hist_cols  
disp_cols

So it's basically a single continuous array of Utf8Char instances where any character can generally be accessed by index# using the formula:

```
ring_chars[ (row*ring_cols)+col ]
```

...where 'row' is the desired row, 'col' is the desired column, and 'ring_cols' is how many columns "wide" the buffer is.

The "offset" index affects that formula as an extra row offset, and the resulting index is then clamped within the range of the ring buffer using modulus.

Methods are used to allow direct access to the characters in the buffer that automatically handle the offset and modulus formulas, namely:

```
u8c_ring_row(row,col)  // access the entire ring by row/col
u8c_hist_row(row,col)  // access just the history buffer
u8c_disp_row(row,col)  // access just the display buffer
```

A key concept is the use of the simple 'offset' index integer to allow the starting point of the history and display to be moved around to implement 'text scrolling', such as when crlf at the screen bottom causes a 'scroll up'.

This is simply an "index offset" integer applied to the hist and disp indexes when drawing the display. So after scrolling two lines up, the offset is just increased by 2, redefining where the top of the history and display are, e.g.

```
Offset is 0:

Display

History

Offset now 2:

Display

History

Display
```

This 'offset' trivially implements "text scrolling", avoiding having to physically move memory around. Just the 'offset' changes, the text remains where it is in memory.
This also makes it appear the top line in the display is ‘scrolled up’ into the bottom of the scrollback ‘history'.
If the offset exceeds the size of the ring buffer, it simply wraps around back to the beginning of the buffer with a modulo.
Indexes into the display and history are also modulo their respective rows, e.g.

```
act_ring_index = (hist_rows + disp_row + offset - scrollbar_pos) % ring_rows;
```

This way indexes for ranges can run beyond the bottom of the ring, and automatically wrap around the ring, e.g.

```
> 2
3  Display
4  <-- offset points here
```

```
deep
index
wraps
```

```
0  Display
1  <-- ring_rows points to end of ring
2 :
3 :
4  disp_row(5) -> 4 :.................:
```

The dotted lines show where the display would be if not for the fact it extends beyond the bottom of the ring buffer (due to the current offset), and therefore wraps up to the top of the ring.
So to find a particular row in the display, in this case a 5 line display whose lines lie between 0 and 4, some simple math calculates the row position into the ring:

```
act_ring_index = (hist_rows + offset + disp_row + ring_rows) % ring_rows;
```

An additional bit of math makes sure if a negative result occurs, that negative value works relative to the end of the ring, e.g.

```
if (act_ring_index < 0) act_ring_index = ring_rows + act_ring_index;
```

This guarantees the act_ring_index is within the ring buffer's address space, with all offsets applied.
The math that implements this can be found in the u8c_xxxx_row() methods, where "xxxx" is one of the concept regions "ring", "hist" or "disp":

```
Utf8Char *u8c;
u8c = u8c_ring_row(rrow);  // address within ring, rrow can be 0..(ring_rows-1)
u8c = u8c_hist_row(hrow);  // address within hist, hrow can be 0..(hist_rows-1)
u8c = u8c_disp_row(drow);  // address within disp, drow can be 0..(disp_rows-1)
```

The small bit of math is only involved whenever a new row address is needed, so in a display that's 80x25, to walk all the characters in the screen, the math above would only be called 25 times, once for each row, and each column in the row is just a simple integer offset:

```
for ( int row=0; row<disp_rows(); row++ ) { // walk rows: disp_rows = 25
    Utf8Char *u8c = u8c_disp_row(row);  // get first char in display 'row'
    for ( int col=0; col<disp_cols(); col++ ) { // walk cols: disp_cols = 80
        u8c[col].do_something(); // work with the char at row/col
    }
}
```

So to recap, the concepts here are:

- The ring buffer itself, a linear array that is conceptually split into a 2 dimensional array of rows and columns whose height and width are:

  ```
  ring_rows -- how many rows in the entire ring buffer
  ring_cols -- how many columns in the ring buffer
  nchars   -- total chars in ring, e.g. (ring_rows * ring_cols)
  ```
• The "history" within the ring. For simplicity this is thought of as starting relative to the top of the ring buffer, occupying ring buffer rows:

\[ 0 .. \text{hist}_\text{rows}() - 1 \]

• The "display", or "disp", within the ring, just after the "history". It occupies the ring buffer rows:

\[ \text{hist}_\text{rows}() .. \text{hist}_\text{rows}() + \text{disp}_\text{rows}() - 1 \]

..or similarly:

\[ (\text{hist}_\text{rows}) .. (\text{ring}_\text{rows} - 1) \]

The following convenience methods provide access to the start and end indexes within the ring buffer for each entity:

- Entire ring ring\_srow() – start row index of the ring buffer (always 0)
- ring\_erow() – end row index of the ring buffer
- "history" part of ring hist\_srow() – start row index of the screen history
- hist\_erow() – end row index of the screen history
- "display" part of ring disp\_srow() – start row index of the display
- disp\_erow() – end row index of the display

The values returned by these are as described above. For the hist\_xxx() and disp\_xxx() methods the 'offset' included into the forumula. (For this reason hist\_srow() won't always be zero the way ring\_srow() is, due to the 'offset')

The values returned by these methods can all be passed to the u8c\_ring\_row() function to access the actual character buffer's contents.

• An "offset" used to move the "history" and "display" around within the ring buffer to implement the "text scrolling" concept. The offset is applied when new characters are added to the buffer, and during drawing to find where the display actually is within the ring.

• The "scrollbar", which only is used when redrawing the screen the user sees, and is simply an additional offset to all the above, where a scrollbar value of zero (the scrollbar tab at the bottom) shows the display rows, and as the scrollbar values increase as the user moves the scrollbar tab upwards, +1 per line, this is subtracted from the normal starting index to let the user work their way backwards into the scrollback history. Again, negative numbers wrap around within the ring buffer automatically.

The ring buffer allows new content to simply be appended to the ring buffer, and the index# for the start of the display and start of scrollback history are simply incremented. So the next time the display is "drawn", it starts at a different position in the ring. This makes scrolling content at high speed trivial, without memory moves. It also makes the concept of "scrolling" with the scrollbar simple as well, simply being an extra index offset applied during drawing.

Mouse Selection

Dragging the mouse across the screen should highlight the text, allowing the user to extend the selection either beyond or before the point started. Extending the drag to the top of the screen should automatically 'scroll up' to select more lines in the scrollback history, or below the bottom to do the opposite.

The mouse selection is implemented as a class to keep track of the start/end row/col positions of the selection, and other details such as a flag indicating if a selection has been made, what color the fg/bg text should appear when text is selected, and methods that allow setting and extending the selection, clearing the selection, and "scrolling" the selection, to ensure the row/col indexes adjust correctly to track when the screen or scrollbar is scrolled.

Redraw Timer

Knowing when to redraw is tricky with a terminal, because sometimes high volumes of input will come in asynchronously, so in that case we need to determine when to redraw the screen to show the new content; too quickly will cause the screen to spend more time redrawing itself, preventing new input from being added. Too slowly, the user won't see new information appear in a timely manner.

To solve this, a rate timer is used to prevent too many redraws:

• When new data comes in, a 1/10 sec timer is started and a modify flag is set.
• redraw() is NOT called yet, allowing more data to continue to arrive quickly
- When the 1/10th second timer fires, the callback checks the modify flag:
  - if set, calls redraw(), resets the modify to 0, and calls Fl::repeat_timeout() to repeat the callback in another 1/10th sec.
  - if clear, no new data came in, so DISABLE the timer, done.

In this way, redraws don't happen more than 10x per second, and redraw() is called only when there's new content to see.

The redraw rate can be set by the user application using the Fl_Terminal::redraw_rate(), 0.10 being the default. Some terminal operations necessarily call redraw() directly, such as interactive mouse selection, or during user scrolling the terminal's scrollbar, where it's important there's no delay in what the user sees while interacting directly with the widget.

Development of the FLTK library

- The Wayland backend for its developer
- Developer info for bundled libs
- Developer Information

4.1 The Wayland backend for its developer

This chapter describes how the Wayland backend of FLTK works from a developer's viewpoint.

4.1.1 Introduction to Wayland

Wayland usage involves communication via a Unix domain socket between a client application and another process called the Wayland compositor which creates, moves, resizes and draws windows on the display. Diverse Wayland compositors exist. They can follow rather diverse logics. For example, FreeBSD offers Sway which is a tiling compositor where the display is always entirely filled with whatever resizable windows are mapped at any given time. Compositors follow either the client-side decoration (CSD) rule where client apps draw window titlebars, or the server-side decoration (SSD) rule where the compositor draws titlebars. FLTK supports both CSD and SSD compositors. It uses a library called libdecor charged of determining whether a CSD or a SSD compositor is active, and of drawing titlebars in the first case.

Wayland is divided in various protocols that a given compositor may or may not support, although they all support the core protocol. Each protocol adds functionality not available in the core protocol. Wayland Explorer lists all protocols. The core protocol allows a client app to discover what protocols the connected compositor supports. Protocols can be stable, which means they have a defined API that will not change but can be expanded, or unstable. For example, mapping a window on a display is not done by the core protocol but by the xdg shell protocol which is stable. The names of symbols used by unstable protocols always begin with letter ‘z’. For example, FLTK uses unstable protocol Text input to support CJK input methods; its symbol names begin with zwp_text_input_v3.

Wayland makes intensive use of the listener mechanism. A listener is a small array of pointers to FLTK-defined callback functions associated to a Wayland-defined object; Wayland calls these functions when defined events occur (more at Listeners below).

Wayland differs noticeably from X11 in that rendering is left to clients: Wayland provides no drawing API. Instead, Wayland provides objects of type struct wl_buffer which encapsulate a memory array of pixel values shared between the client and the compositor. The client app is expected to draw to that memory buffer with whatever means it chooses, and to instruct the compositor to map those pixels to the display when the drawing is complete. The Wayland platform of FLTK draws with the Cairo library to Fl_Window’s and Fl_Image_Surface’s, and with OpenGL to Fl_Gl_Window’s.

Wayland differs also from X11 in that the position of a window in the display is completely hidden to the client app. This prevents function Fl_Window::position() from having any effect on a top-level window. Wayland also prevents a client app from knowing whether a window is minimized: Fl_Window::show() has no effect on a minimized window. Subwindows can be positioned as usual relatively to their parent window. Wayland allows to create popup windows positioned relatively to a previously mapped other window. This allows FLTK to position adequately menu and tooltip windows (see Menu windows and other popups). FLTK uses also popups for the small,
yellow windows that display the new scale factor value when it’s changed: these are created as short-lived popups centered above `Fl::first_window()`.

Wayland uses a trick of its own to handle lists of linked records. It defines type `struct wl_list` and a few macros (`wl_list_init()`, `wl_list_for_each()`, `wl_list_insert()`, `wl_list_for_each_safe()`, `wl_list_remove()`) to manage linked lists. Records put in these lists must contain a member variable of type `struct wl_list` used to link records together and often named ‘link’. Access to such a list is possible memorizing a value of type `struct wl_list` computed by macro `wl_list_init()`. Macro `wl_list_for_each(arg1, arg2, arg3)` allows to run through all list elements with:

- `arg1` is a pointer variable of the type of elements of the linked list;
- `arg2` is the address of a variable of type `struct wl_list` identifying the targeted list;
- `arg3` is the name of the member variable of these elements used to link them together.

For example, `wl_list_for_each()` can be used as follows to scan the linked list of all displays of the system (see `Fl_Wayland_Screen_Driver::output()`):

```c
Fl_Wayland_Screen_Driver *scr_driver = (Fl_Wayland_Screen_Driver*)Fl::screen_driver();
wl_list_for_each(output, &(scr_driver->outputs), link) {
  // ... work with output, an item of the linked list of all displays in the system ...
}
```

Overall, and ignoring for now OpenGL usage, FLTK interacts with Wayland as follows:

- When opening the display: FLTK calls `Fl::add_fd()` in `FL_READ` mode to associate a callback function to the socket connecting the client and the compositor.
- Client to compositor: FLTK calls C functions of the `libwayland-client.so`, `libwayland-cursor.so` and `libxkbcommon.so` shared libraries and of the libdecor library. These send suitable messages to the compositor writing to the socket. The names of these functions begin with `wl_*`, `xkb_*` or `libdecor_*`.
- Compositor to client: the callback function runs when there are data to read in the socket; it calls `wl_*display_dispatch()` which interprets the read data and calls corresponding listeners.

The core protocol defines also a number of mostly opaque structures whose names begin with `wl_*`. The names of symbols and types defined by the other protocols FLTK uses begin with `xdg_*`, `zwp_text_input_v3`, `zxdg_toplevel_decoration`, `gtk_shell1_` and `gtk_surface1_`. FLTK defines a few structures holding Wayland-related data. The names of FLTK-defined structures don’t begin with `wl_*`. For example, `struct wld_window` (see `wld_window`) is used to store all Wayland-specific data associated to a mapped `Fl_Window`.

### 4.1.2 Building libfltk as a Wayland client

Classes `Fl_Wayland_Window_Driver`, `Fl_Wayland_Screen_Driver`, `Fl_Wayland_Graphics_Driver`, `Fl_Wayland_Copy_Surface_Driver`, `Fl_Wayland_Image_Surface_Driver`, `Fl_Wayland_Gl_Window_Driver` and file `fl_wayland_platform_init.cxx` contain all the Wayland-specific code of the FLTK library. This code is located at `src/drivers/Wayland/` in the FLTK source tree. A single C++ source file generally contains all the code of a given class. The code related to copy, paste and drag-and-drop operations, however, is gathered in file `fl_wayland_clipboard_dnd.cxx` and contains a few member functions of class `Fl_Wayland_Screen_Driver`. Furthermore, class `Fl_Unix_System_Driver` is used by both the Wayland and the X11 FLTK platforms. File `FL/fl_config.h` defines preprocessor variables `FLTK_USE_WAYLAND` and `FLTK_USE_CAIRO`.

The public C API to Wayland, xkb, EGL and libdecor libraries are obtained with:

```c
#include <wayland-client.h>
#include <wayland-cursor.h>
#include <xkbcommon/xkbcommon.h>
#include <xkbcommon/xkbcommon-compose.h>
#include <linux/input.h> // for BTN_LEFT, BTN_RIGHT, BTN_MIDDLE
#include "./libdecor/src/libdecor.h"
#include "./libdecor/src/libdecor-plugin.h"
#if HAVE_GL
  # include <wayland-eegl.h>
  # include <EGL/egl.h>
#endif // HAVE_GL
```

as necessary.

File `README.Wayland.txt` details what software packages are needed on Debian-based, Fedora and FreeBSD systems for FLTK to use Wayland. Wayland protocols are packaged as XML files accompanied by a utility program, `wayland-scanner`, able to generate a header file and a necessary glue C source file from a given XML file. For
example, for FLTK to use the XDG shell protocol, these commands are run at build time to generate a .c file that will be compiled into libfltk and a header file that FLTK code will include:

```bash
PROTOCOLS=`pkg-config --variable=pkgdatadir wayland-protocols`
wayland-scanner private-code $PROTOCOLS/stable/xdg-shell/xdg-shell.xml xdg-shell-protocol.c
wayland-scanner client-header $PROTOCOLS/stable/xdg-shell/xdg-shell.xml xdg-shell-client-protocol.h
```

Similar operations are performed for FLTK to use protocols XDG decoration, Text input and GTK Shell.

### 4.1.3 The hybrid Wayland/X11 platform

The Wayland platform of FLTK is normally a two-legged hybrid able to use either Wayland or X11 and to choose between these possibilities at run-time, without any change to the client application. The Wayland/X11 hybrid is essentially a version of the FLTK library containing both all Wayland-specific and all X11-specific code. That’s reflected in file FL/fl_config.h which defines both FLTK_USE_WAYLAND and FLTK_USE_X11. This creates the constraint that Wayland and X11 cannot use the same type name for different purposes or the same symbol name. That is why function fl_xid(const Fl_Window *) is deprecated in FLTK 1.4 and replaced by fl_wl_xid() for Wayland and fl_x11_xid() for X11. Also, global variable Window fl_window is not used by the Wayland platform which instead uses static struct wld_window *Fl_Wayland_Window_Driver:: wld_window.

The FLTK library contains also a short source file, fl_wayland_platform_init.cxx, that determines, at startup time, whether the app will run as a Wayland or as an X11 client. Function attempt_wayland() therein performs this choice as follows:

- if the app defines a global bool variable called fl_disable_wayland and this variable is true, the X11 leg is chosen;
- if environment variable FLTK_BACKEND is defined to string "wayland", the Wayland leg is chosen;
- if environment variable FLTK_BACKEND is defined to string "x11", the X11 leg is chosen;
- otherwise, a connection to a Wayland compositor is attempted; if it’s successful, the Wayland leg is chosen; if it’s not, the X11 leg is chosen.

The first condition listed above is meant to facilitate transition to FLTK 1.4 of source code written for FLTK 1.3 and containing X11-specific code: it’s enough to put

```c
FL_EXPORT bool fl_disable_wayland = true;
```

anywhere in the source code, for the app to run with 1.4, using the x11 leg of the hybrid platform, without any other change in the source code nor to the application’s environment.

In special situations, such as with embedded systems equipped with the Wayland software but lacking the X11 library, it’s possible to build the FLTK library such as it contains only the Wayland backend. This is achieved building FLTK with cmake -DOPTION_WAYLAND_ONLY=on or with configure -disable-x11. In that case, FL/fl_config.h does not define FLTK_USE_X11.

The rest of this chapter describes what happens when the Wayland leg has been chosen.

### 4.1.4 Listeners

A Wayland ‘listener’ is a small array of pointers to FLTK-defined callback functions associated to a Wayland-defined object: Wayland calls these functions when defined events occur, and transmits relevant information to the client app as parameters of these calls. Each listener is associated to its corresponding Wayland object, usually right after the object’s creation, by a call to a specific Wayland function named following the form `wl_XXX_add_listener()`.

For example, this code:

```c
struct wl_surface_listener surface_listener = {
    .surface_enter = surface_enter,
    .surface_leave = surface_leave,
};
```

creates a Wayland object of type `struct wl_surface`, and associates it with a 2-member listener called `surface_listener`. After this, Wayland is expected to call the 2 listener members, `surface_enter` or `surface_leave`, each time my wl_surface will enter or leave, respectively, a display. The arguments of these calls, not detailed here, allow the member functions to identify which surface enters or leaves which display.
The `wl_surface_add_listener()` call above also associates `ptor_to_data` to my wl_surface as user data. The `wl_surface` object's "user data" can be obtained later calling function `wl_surface_get_listener()`.

Wayland function `wl_proxy_get_listener()` returns a pointer to a Wayland object's listener provided that object is transmitted cast to type `struct wl_proxy *`. This gives a handy way to distinguish FLTK-created Wayland objects from objects of other origin: the listener of an FLTK-created object is a known FLTK listener. For example, function `Fl_Wayland_Window_Driver::surface_to_window()` uses this possibility calling `wl_proxy_get_listener( (struct wl_proxy *)wl_surface )` for any object of type `struct wl_surface`: if that object was created as in the example above, this call returns a pointer to FLTK's `surface_listener` static variable.

### 4.1.5 Opening a Wayland connection

Establishing a Wayland connection requires environment variable `XDG_RUNTIME_DIR` to be defined and to point to a directory containing a socket connected to a Wayland compositor. This variable is usually set by the login procedure of Wayland-friendly desktops. The name of the Wayland socket is determined as follows:

- the client may call `Fl::display(const char *display_name)` before `fl_open_display()` runs or use the `-display` command line argument and transmit there the socket name;
- environment variable `NAYLAND_DISPLAY` can be defined to the socket name;
- otherwise, "wayland-0" is used.

What socket is selected determines what compositor will be used by the client application. Function `Fl_Wayland_Screen_Driver::open_display_platform()` establishes the connection to the Wayland socket identified above calling `wl_display_connect(NULL)`, which returns a `struct wl_display *` display pointer or NULL in case of failure. Such NULL return is the hint that allows the FLTK display opening procedure of the Wayland/X11 hybrid to recognize when Wayland access is not possible and to fallback to X11. Then, function `wl_registry_add_listener()` associates a 2-member listener, whose 1st member, `registry_handle_global()`, will be called by Wayland a number of times to indicate each time a protocol supported by the compositor or a system feature such as displays and keyboards. This code allows to run the client until all calls to `registry_handle_global()` have occurred:

```c
static void sync_done(void *data, struct wl_callback *cb, uint32_t time) {
    *(struct wl_callback **)data = NULL;
    wl_callback_destroy(cb);
}

static const struct wl_callback_listener sync_listener = {
    sync_done,
};

struct wl_callback *registry_cb = wl_display_sync(wl_display);
while (registry_cb) wl_display_dispatch(wl_display);
```

A pointer to an object of type `struct wl_callback` created by function `wl_display_sync()` is assigned to variable `registry_cb`. Then a 1-member listener is attached to this object. Wayland will run this listener's member function, `sync_done()`, after all calls to `registry_handle_global()` have occurred. Function `sync_done()` sets to null variable `registry_cb` and destroys the `wl_callback`. Finally, function `wl_display_dispatch()` is called as long as variable `registry_cb` is not null. This makes Wayland process all its pending requests until `sync_done()` runs.

The prototype of function `registry_handle_global()` is:

```c
static void registry_handle_global(void *user_data, struct wl_registry *wl_registry,
                                    const char *interface, uint32_t version)
```

Each time Wayland calls `registry_handle_global()`, `interface` and `version` give the name and version of a component or feature of the Wayland system. It's necessary to call each time function `wl_registry_bind()` which returns a pointer to a Wayland structure that will be the client's access point to the corresponding Wayland protocol or system feature. If that object was created as in the example above, this call returns a pointer to FLTK's `surface_listener` static variable.

Wayland calls `registry_handle_global()` with its parameter `interface` equals to "wl_output" once for each screen connected to the system. Each time, an object of type `struct wl_output` is created, to which a 4-

member listener is associated by function \texttt{wl_output_add_listener()}. The 3rd member of this 4-function listener, \texttt{output\_done()}, runs after all initialization steps of the screen have completed and turns to true member done of a record of type struct \texttt{Fl\_Wayland\_Screen\_Driver::output} associated to the screen. Function \texttt{sync\_done()} mentioned above therefore also calls \texttt{wl\_display\_dispatch()} until the done member of all \texttt{Fl\_Wayland\_Screen\_Driver::output} records are true. Overall, after return from function \texttt{sync\_done()}, FLTK has been made aware of all possible protocols and features of its connected Wayland compositor, and has initialized all screens of the system.

Finally, function \texttt{wl\_display\_get\_fd()} is called to obtain the file descriptor of the Wayland socket and a call to \texttt{Fl::add\_fd()} makes FLTK listen to this descriptor in \texttt{FL\_READ} mode and associates function \texttt{wayland\_socket\_callback()} from file \texttt{Fl\_Wayland\_Screen\_Driver.cxx} with it. This function calls \texttt{wl\_display\_dispatch()} which reads and interprets data available from the file descriptor, and calls corresponding listeners. The \texttt{wl\_display\_dispatch()} call is repeated as long as data are available for reading.

The event loop is run by function \texttt{Fl\_Unix\_System\_Driver::wait()} which is used by both the Wayland and X11 FLTK backends. Among various tasks, this function waits for data on all file descriptors FLTK is listening. Overall, the event loop of the Wayland backend is nearly exactly the same that as used by the X11 backend. The Wayland backend differs only in the callback function handling data read from the Wayland connection socket, and in overridden functions \texttt{Fl\_Wayland\_Screen\_Driver::poll\_or\_select}, \texttt{Fl\_Wayland\_Screen\_Driver::poll\_or\_select\_with\_delay()} and \texttt{Fl\_Wayland\_Screen\_Driver::poll\_or\_select\_with\_delay()}.

\subsection{4.1.6 Wayland windows and surfaces}

Wayland defines objects called surfaces of type struct \texttt{wl\_surface}. A Wayland surface "has a rectangular area which may be displayed on zero or more displays, present buffers, receive user input, and define a local coordinate system". In other words, surface is the name Wayland uses for a window. Buffers allow the client app to draw to surfaces (see Wayland buffers). FLTK creates a surface each time an \texttt{Fl\_Window} is show()’n calling function \texttt{wl\_compositor\_create\_surface()}. Static member function \texttt{Fl\_Wayland\_Window\_Driver::surface\_to\_window(struct \texttt{struct} \texttt{wl\_surface} * \texttt{surface})} gives the \texttt{Fl\_Window} of the surface given as argument. FLTK recognizes 4 distinct kinds of surfaces named DECORATED, UNFRAMED, POPUP and SUBWINDOW. DECORATED are toplevel windows with a titlebar. UNFRAMED have no titlebar. POPUP correspond to menus and tooltips, SUBWINDOW to an Fl\_Window embedded in another Fl\_Window. Function \texttt{Fl\_Wayland\_Window\_Driver::makeWindow()} creates all these surfaces, creates for each a record of type struct \texttt{wld\_window} (see \texttt{wld\_window}), and stores the window kind in member variable kind of this record. Member variable xid of the window’s Fl\_X record stores the adress of this record.

Except for SUBWINDOW’s, each surface needs a Wayland object of type struct \texttt{xdg\_surface} used to make it become a mapped window and stored in member \texttt{xdg\_surface} of the window’s \texttt{wld\_window} record. For DECORATED windows, this object is created inside libdecor and transmitted to FLTK by function \texttt{libdecor\_frame\_get\_xdg\_surface()} for UNFRAMED and POPUP windows, it’s created by function \texttt{xdg\_wm\_base\_get\_xdg\_surface()}. Finally, each surface is also associated to one more Wayland object whose type varies with the window’s kind. These explain this part of the \texttt{wld\_window} record:

\begin{verbatim}
union {
  struct libdecor_frame *frame; // created for DECORATED by libdecor_decorate()
  struct wl_subsurface *subsurface; // created for SUBWINDOW by wl_subcompositor_get_subsurface()
  struct xdg_popup *xdg_popup; // created for POPUP by xdg_surface_get_popup()
  struct xdg_toplevel *xdg_toplevel; // created for UNFRAMED by xdg_surface_get_toplevel()
};
\end{verbatim}

Except for SUBWINDOW’s, each surface is associated to a ‘configure’ function that Wayland calls one or more times when the window is going to be mapped on the display. The ‘configure’ function of DECORATED surfaces is \texttt{handle\_configure()} which is the 1st member of a 4-member listener named \texttt{libdecor\_frame\_configure()} associated to a decorated window when it’s created calling \texttt{libdecor\_decorate()}. Finally, a call to \texttt{libdecor\_frame\_map()} triggers the process of mapping the newly created DECORATED surface on a display. Wayland calls \texttt{handle\_configure()} twice during this process. The first \texttt{handle\_configure()} run allows to set the window’s \texttt{xdg\_surface} object which is returned by function \texttt{libdecor\_frame\_get\_xdg\_surface()} for UNFRAMED and POPUP surfaces, it’s created by function \texttt{xdg\_surface\_configure()} and \texttt{xdg\_toplevel\_configure()} and \texttt{popup\_configure()}. The mapping process of these surfaces is triggered by a call to \texttt{wl\_surface\_commit()}. These ‘configure’ functions transmit effective window size information to FLTK. Also, they are where the window’s \texttt{Fl\_Window\_Driver::wait\_for\_}...
expose_value member variable is set to 0 to indicate that the window has been mapped to display. **Caution**: there are some small differences between how and when the various Wayland compositors call handle_configure().

When a decorated window changes size, whatever the cause of it, Wayland calls handle_configure() which sets member variable Fl_Wayland_Window_Driver::in_handle_configure to true and calls the window's virtual resize() function which ultimately runs Fl_Wayland_Window_Driver::resize() which calls Fl_Group::resize() to perform FLTK's resize operations and Fl_Wayland_Graphics_Driver::buffer_release() to delete the existing window buffer that's not adequate for the new window size. At the end of the run of handle_configure(), in_handle_configure is set back to false. When the window size change is caused by the app itself calling the window's resize() function, Fl_Wayland_Window_Driver::resize() is false. This allows Fl_Wayland_Window_Driver::resize() to detect that Wayland needs be informed of the desired size change, which gets done by a call to libdecor_frame_commit(). Wayland later calls handle_configure() and events described above unfold.

Wayland generally does not provide a way to control where the compositor should map a window in the system displays. Nevertheless, for multi-display systems, Wayland allows to control on what display should the compositor map a fullscreen window. That is done inside function handle_configure() which calls libdecor_frame_set_fullscreen() for DECORATED windows and inside function xdg_toplevel_set_fullscreen() which calls xdg_toplevel_set_fullscreen() for UNFRAMED. The struct wl_output pointer for the targeted display is transmitted as 2nd argument of these calls.

### 4.1.7 Menu windows and other popups

Menu windows, tiny menu title windows, and tooltip windows are implemented using Wayland's popup mechanism which allows to position a popup window relatively to a previously mapped window, itself a popup or another kind of window, with the restriction that any popup must overlap or at least touch that other window. Member function Fl_Wayland_Window_Driver::makeWindow calls member function Fl_Wayland_Window_Driver::process_menu_or_tooltip to create all popups.

This function gets called after FLTK has computed using a given algorithm the desired (x,y) position of the popup window's top-left corner, using coordinates centered on the top-left corner of the toplevel window from which the popup originates. This algorithm is able to prevent popups from being positioned beyond the screen borders under the assumption that the position of a toplevel window inside a screen is known. While this assumption holds for other platforms, it does not for the Wayland platform. The FLTK code for the Wayland platform therefore modifies the algorithm that FLTK uses to compute the position of menu windows. The key information used by this algorithm is obtained by member function Fl_Window::menu_window_area which computes the coordinates of the rectangle where menu windows are allowed to be positioned. Under other platforms, this function just returns the origin and size of the work area of the screen in use. In contrast, the Wayland platform handles two situations differently:

- For menu windows that are not taller than the display in use, the Wayland-overridden member function Fl_Wayland_Window_Driver::menu_window_area returns large negative origin and large width and height values. This lets the standard FLTK algorithm position the menu relatively to its window of origin without concern about screen limits, and relies on Wayland's constraint mechanism described below to prevent the menu from going beyond these limits, without FLTK having to know where they are.

- Menu windows taller than the screen where they are mapped need special handling described in detail in a comment above the source code of function Fl_Wayland_Window_Driver::process_menu_or_tooltip.

Function Fl_Wayland_Window_Driver::process_menu_or_tooltip first computes origin_win, pointer to the Fl_Window relatively to which the popup is to be positioned. Window origin_win is the parent menu window when the popup is a sub-menu; it’s the tiny window title when the popup is a menu with a title; otherwise, it’s the window containing the point of origin of the popup. An object of type struct xdg_positioner created by function xdg_wm_base_create_positioner() is used to express the rules that will determine the popup position relatively to origin_win as follows:

- Function xdg_positioner_set_anchor_rect() determines a rectangle in origin_win relatively to which the popup is to be positioned. When the popup to be created is a menu window spawned by an Fl_Menu_Bar, that rectangle is the full area of the menu title window. Otherwise, that rectangle is an adequately located point.

- Function xdg_positioner_set_size() sets the popup size.
The \texttt{xdg_positioner_set_anchor} function \texttt{(positioner, XDG\_POSITIONER\_ANCHOR\_BOTTOM\_LEFT);} and \texttt{xdg_positioner_set_gravity} \texttt{(positioner, XDG\_POSITIONER\_GRAVITY\_BOTTOM\_RIGHT);} calls position the popup so that its top-left corner is initially below and at right of the bottom-left corner of the
\texttt{origin\_win}’s anchor rectangle.

The call to \texttt{xdg_positioner_set_offset()} further changes the popup vertical position.

The call to \texttt{xdg_positioner_set_constraint_adjustment()} uses constraint flags \texttt{XDG\_POSITIONER\_CONSTRAINT\_ADJUSTMENT\_SLIDE\_X} and \texttt{XDG\_POSITIONER\_CONSTRAINT\_ADJUSTMENT\_SLIDE\_Y} which mean that the compositor will move the popup horizontally and vertically if its initial position would make it expand beyond the edges of the screen. Furthermore, flag \texttt{XDG\_POSITIONER\_CONSTRAINT\_ADJUSTMENT\_SLIDE\_Y} is added when the popup is a menu window spawned by an \texttt{Fl\_Menu\_Bar}; this has the popup flipped above the \texttt{Fl\_Menu\_Bar} if there's not enough screen room below it for the popup.

Finally, a call to function \texttt{xdg\_surface\_get\_popup()} creates the popup accounting for position rules listed above. The positioner is then deleted by \texttt{xdg\_positioner\_destroy()}, a listener is associated to the popup surface with \texttt{xdg\_popup\_add\_listener()}, and a call to \texttt{wl\_surface\_commit()} triggers the mapping of the popup on the display.

Overall, the expected coordinates of the top-left corner of the popup relatively to \texttt{origin\_win} are \texttt{popup\_x, popup\_y}. They are memorized in a record of FLTK-defined type \texttt{struct win\_positioner} that’s associated to the popup listener. When the compositor maps the popup, function \texttt{popup\_configure}, the first element of the popup listener, runs and receives as arguments the coordinates of the popup top left and its size. These values account for the positioning constraints of the popup which may have moved it to avoid screen borders. This function can therefore detect whether constraints applied have modified the effective popup location in comparison to the expected coordinates which are available as member variables of the \texttt{struct win\_positioner} record mentioned above. That's key to the handling by FLTK of full menu windows.

Groups of popups containing a menutitle, the associated menuwindow, and optionally a submenu window and that don’t belong to an \texttt{Fl\_Menu\_Bar} are mapped in a different order: the menuwindow is mapped first, and the menutitle is mapped second above it as a child popup. Function \texttt{Fl\_Window\_Driver::is\_floating\_title()} detects when such a menutitle is created, static member variable \texttt{previous\_floating\_title} is assigned the value of this menutitle, and the menutitle is mapped only after the menuwindow has been mapped, as a child of it. This positions better the popup group in the display relatively to where the popup was created.

### 4.1.8 Fl\_Wayland\_Graphics\_Driver and Fl\_Cairo\_Graphics\_Driver

The Wayland platform of FLTK uses an \texttt{Fl\_Wayland\_Graphics\_Driver} object for all its on-screen drawing operations. This object is created by function \texttt{Fl\_Graphics\_Driver::new\_Main\_Graphics\_Driver()} called by \texttt{Fl\_Display\_Device::display\_device()} when the library opens the display. New \texttt{Fl\_Wayland\_Graphics\_Driver} objects are also created for each \texttt{Fl\_Image\_Surface} and each \texttt{Fl\_Copy\_Surface} used, and deleted when these objects are deleted. Class \texttt{Fl\_Wayland\_Graphics\_Driver} derives from class \texttt{Fl\_Cairo\_Graphics\_Driver} which implements all the FLTK drawing API for a Cairo surface. Function \texttt{Fl\_Wayland\_Graphics\_Driver::init()} creates the Cairo surface used by each \texttt{Fl\_Wayland\_Graphics\_Driver} object by calling \texttt{cairo\_image\_surface\_create\_for\_data()} for the window’s or offscreen’s draw buffer (see below).

Class \texttt{Fl\_Cairo\_Graphics\_Driver} is also used by the X11 leg of the hybrid Wayland-X11 platform because this leg draws to the display with an \texttt{Fl\_X11\_Cairo\_Graphics\_Driver} object which derives from class \texttt{Fl\_Cairo\_Graphics\_Driver}. Finally, \texttt{Fl\_Cairo\_Graphics\_Driver} is also used, in the form of an object from its derived class \texttt{Fl\_PostScript\_Graphics\_Driver}, when the hybrid Wayland-X11 platform draws PostScript, or when the classic X11 platform uses Pango and draws PostScript. This happens when classes \texttt{Fl\_PostScript\_File\_Device} and \texttt{Fl\_Printer} are used.

### 4.1.9 Wayland buffers

Wayland uses buffers, objects of type \texttt{struct wl\_buffer}, to draw to surfaces. In principle, one or more buffers can be associated to a surface, and functions \texttt{wl\_surface\_attach()} and \texttt{wl\_surface\_commit()} are called to first attach one such buffer to the surface and then inform the compositor to map this buffer’s graphics content on the display. Wayland buffers can use various memory layouts. FLTK uses \texttt{WL\_SHM\_FORMAT\_ARGB8888}, which is the same layout as what Cairo calls \texttt{CAIRO\_FORMAT\_ARGB32}.
FLTK calls function `Fl_Wayland_Window_Driver::make_current()` before drawing to any `Fl_Window`. Member buffer of this `Fl_Window`'s struct `wld_window` (see `wld_window`) is NULL when the window has just been created or resized. In that case, FLTK calls `Fl_Wayland_Graphics_Driver::create_wld_buffer()` which returns a pointer to a struct `wld_buffer` containing

- a Wayland buffer, member `wl_buffer`;  
- a Cairo image surface, created by a call to `Fl_Wayland_Graphics_Driver::cairo_init()`.

Each of these two objects encapsulates a byte array of the same size and the same memory layout destined to contain the `Fl_Window`'s graphics. The Cairo image surface object is where FLTK draws. The Wayland buffer is what Wayland maps on the display. FLTK copies the Cairo surface's byte array to the Wayland buffer's byte array before beginning the mapping operation. If `width` and `height` are a window's dimensions in pixels,

```c
int stride = cairo_format_stride_for_width(CAIRO_FORMAT_ARGB32, width);
int size = stride * height;
```

give size, the common size of both byte arrays.

The effective creation of the `wl_buffer` object is delayed until function `Fl_Wayland_Graphics_Driver::buffer_commit()` gets called. Section Buffer factories below details how FLTK creates `wl_buffer` objects.

The `struct Fl_Wayland_Graphics_Driver::wld_buffer` (see `wld_buffer`) contains a pointer to the byte array of the Cairo image surface (member `draw_buffer.buffer`), information about the Wayland buffer (members `wl_buffer` and `data`), the common size of the Cairo surface's and Wayland buffer's byte arrays (member `draw_buffer.data_size`), and other information. A pointer to this struct `Fl_Wayland_Graphics_Driver::wld_buffer` is memorized as `member_buffer` of the `Fl_Window`'s `wld_window`. All drawing operations to the `Fl_Window` then modify the content of the Cairo image surface.

Function `Fl_Wayland_Window_Driver::flush()` is in charge of sending FLTK graphics data to the display. That is done by calling function `Fl_Wayland_Graphics_Driver::buffer_commit()` which creates the `struct wl_buffer` object calling `create_shm_buffer()` if that was not done before, copies the byte array of the Cairo surface to the Wayland buffer's starting memory address, and calls functions `wl_surface_attach()` and `wl_surface_commit()`. Before calling `Fl_Window::flush()`, FLTK has computed a damaged region. If that region is not null, `Fl_Wayland_Graphics_Driver::buffer_commit()` copies only the damaged parts of the Cairo surface to the Wayland buffer and calls function `wl_surface_damage_buffer()` for these parts to inform the compositor of what parts of the surface need its attention.

### Throttling redraw operations

An important detail here is that FLTK uses Wayland's synchronization mechanism to make sure the surface's `wl_buffer` is not changed while the compositor is using it and to refrain from calling `wl_surface_commit()` more frequently than the system can process it. This 2-step mechanism works as follows:

- `Fl_Wayland_Graphics_Driver::buffer_commit()` first calls function `wl_surface_frame()` to obtain a pointer to a `struct wl_callback` object and stores it as member `frame_cb` of the surface's `wl_window`. Then it calls `wl_callback_add_listener()` to associate this object to the FLTK-defined, callback function `surface_frame_done()`. It next calls `wl_surface_commit()`. Together, these 3 calls instruct Wayland to start mapping the buffer content to the display and to call `surface_frame_done()` later, when it will have become ready for another mapping operation.

- Later, `surface_frame_done()` runs and destroys the `wl_callback` object by function `wl_callback_destroy()` and sets member `frame_cb` to `NULL`.

Member variable `draw_buffer_needs_commit` of the `wl_buffer` is also important in this mechanism: it informs FLTK that the graphics buffer has changed and needs being committed. This variable is turned `true` every time a graphics operation changes the buffer content and turned `false` when the buffer gets committed.

This procedure ensures that FLTK never changes the surface’s Wayland buffer while it’s being used by the compositor and never calls `wl_surface_commit()` before Wayland gets ready for a new commit because `Fl_Wayland_Window_Driver::flush()` calls `Fl_Wayland_Graphics_Driver::buffer_commit()` only if `frame_cb` is `NULL`. If it’s not `NULL`, the exact content of function `surface_frame_done()` is:

```c
static void surface_frame_done(void *data, struct wl_callback *cb, uint32_t time) {
  struct wld_window *window = (struct wld_window *)data;
  wl_callback_destroy(cb);
  window->frame_cb = NULL;
  if (window->buffer && window->buffer->draw_buffer_needs_commit) {
    static void surface_frame_done(void *data, struct wl_callback *cb, uint32_t time) {
      struct wld_window *window = (struct wld_window *)data;
      wl_callback_destroy(cb);
      window->frame_cb = NULL;
      if (window->buffer && window->buffer->draw_buffer_needs_commit) {  
```
4.1 The Wayland backend for its developer

has the effect that when the mapping operation eventually completes, Wayland runs `surface_frame_done()`, which calls anew `Fl_Wayland_Graphics_Driver::buffer_commit()` if the buffer's `draw_buffer←_needs_commit` member is true. The net result is that the screen shows the most recent surface content.

This synchronization mechanism is also used when performing an interactive window resize operation. During such operation, the compositor informs the client an interactive resize is being performed and sends window resize commands at high rate (~60 Hz) to the client via the socket. Libdecor turns on flag `LIBDECOR_WINDOW←_STATE_RESIZING` to inform the client, and runs function `handle_configure()` for each received resize command. Before calling `Fl_Group::resize()` and later `Fl_Window::draw()`, `handle_configure()` tests whether `window→frame_cb` is NULL. When it's not because a previous resize operation is being performed, the current resize command is skipped. At the end of the interactive resize, flag `LIBDECOR_WINDOW_STATE_RESIZING` is off and Wayland sends a final resize command which is not skipped. Overall, this ensures the client program resizes its window as frequently as it can without falling behind resize commands sent by the compositor.

To account for a bug in Mutter (issue #878), the `window→frame_cb` object is not created when a toplevel window is being resized and is entirely covered by one subwindow.

Progressive window drawing

FLTK supports progressive drawing when an app calls function `Fl_Window::make_current()` at any time and then calls the FLTK drawing API. This is made possible in function `Fl_Wayland_Window_Driver::make←current()` with

```c
// to support progressive drawing
if ( (!Fl_Wayland_Window_Driver::in_flush_) && window->buffer && (!window->frame_cb) && window->buffer->draw_buffer_needs_commit && (!wait_for_expose_value) ) {
  Fl_Wayland_Graphics_Driver::buffer_commit(window);
}
```

Thus, `buffer_commit()` runs only when `frame_cb` is NULL. If an app rapidly performs calls to `Fl_Window::make_current()` and to drawing functions, FLTK will copy `draw_buffer` to the Wayland buffer and instruct Wayland to map it to the display when `frame_cb` is NULL which means that the compositor is ready to start performing a mapping operation. This occurs when the progressive drawing operation begins. Later, `frame_cb` is generally found non NULL when `Fl_Wayland_Window_Driver::make_current()` runs because the compositor is busy processing the previous Wayland buffer. When the compositor has completed this processing, the client app runs `surface_frame_done()` which, provided member variable `draw_buffer←_needs_commit` is true, calls `Fl_Wayland_Graphics_Driver::buffer_commit()`. This makes the compositor map the Wayland buffer in its new, more advanced, state.

An example of progressive drawing is given by FLTK's mandelbrot test app. When set to fullscreen, this app can be seen to progressively fill its window from top to bottom by blocks of lines, each block appearing when the compositor is ready to map a new buffer. When the compositor is not ready, the app does not block but continues computing and drawing in memory but not on display more lines of the desired Mandelbrot graph.

Wayland buffer deletion

Each `wl_buffer` record contains boolean member `in_use` which is set to `true` just before the buffer gets committed, and boolean member `released` which is set to `true` when FLTK no longer needs the buffer and calls `Fl_Wayland_Graphics_Driver::buffer_release()`. FLTK's buffer-creating function, `Fl_Wayland_Graphics_Driver::create_shm_buffer()`, attaches a 1-member listener to each buffer which Wayland calls after a commit operation to indicate the client is allowed to re-use the buffer. This listener's member function, `buffer_release_listener()`, turns to false member `in_use` of the buffer's `wl_buffer` record.

Since the two events 'FLTK no longer needs the buffer' and 'the client is allowed to re-use the buffer' can arrive in any order, FLTK deletes the `struct wl_buffer` object by running `do_buffer_release()` only after both events happened, that is, when `in_use` is false and `released` is true. That's why function `do_buffer←_release()` is called by both functions `Fl_Wayland_Graphics_Driver::buffer_release()` and `buffer_release_listener()`.

4.1.10 Buffer factories

Wayland names `buffer factory` a software procedure that constructs objects of type `struct wl_buffer` for use by a client application. FLTK creates a `wl_buffer` object each time an `Fl_Window` is mapped on a display or
resized. That’s done by member function Fl_Wayland_Graphics_Driver::create_shm_buffer() which follows this 3-step procedure to create a "buffer factory" for FLTK and to construct Wayland buffers from it:

- Libdecor function os_createAnonymousFile(off_t size) creates an adequate file and mmap’s it. This file lives in RAM because it is created by function memfd_create(). FLTK sets this file size to 10 MB unless the size of the buffer to be created is larger; in that case the anonymous file is sized to twice the buffer size.

- Wayland function wl_shm_create_pool() shares this mmap’ed memory with the Wayland compositor and returns an object of type struct wl_shm_pool which encapsulates this memory. A record of type struct Fl_Wayland_Graphics_Driver::wld_buffer data is created and associated to the newly created wl_shm_pool by wl_shm_pool_set_user_data(). This record stores the starting address (pool_memory) and size (pool_size) of the pool’s encapsulated memory. The record also contains member buffers of type struct wl_list which stores the access point to the linked list of wl_buffer objects that will be created from the wl_shm_pool.

- A variable named chunk_offset represents the offset within the pool’s shared memory available for the buffer being constructed. It equals 0 when the pool has just been created and is updated as detailed below when one or more buffers have been previously created from the pool. A record of type struct Fl_Wayland_Graphics_Driver::wld_buffer is created. This record will contain (member wld_buffer) the address of a wl_buffer object that’s created by function wl_shm_pool_create<buffer>(). This wl_buffer object encapsulates a section of a given size of the pool’s shared memory beginning at offset chunk_offset in it. Quantity pool_memory + chunk_offset is therefore the address of the beginning of the mmap’ed memory section encapsulated by this wl_buffer. Member shm_pool of the newly constructed Fl_Wayland_Graphics_Driver::wld_buffer object is set to the address of the current wl_shm_pool object. This record is added to the head of the linked list of current pool’s buffers by a call to wl_list_insert(). At that point, a struct Fl_Wayland_Graphics_Driver::wld_buffer record part of the linked list of all such records corresponding to wl_buffer objects created from the same wl_shm_pool object, and member shm_pool of this record gives the address of this wl_shm_pool. When a new struct Fl_Wayland_Graphics_Driver::wld_buffer record is to be created,

\[
\text{struct } \text{wld_shm_pool_data} \ast \text{pool_data} =
\text{(struct wld_shm_pool_data *)wl_shm_pool_get_user_data(pool)};
\text{struct Fl_Wayland_Graphics_Driver::wld_buffer } \ast \text{record = wi_container_of(pool_data->buffers.next, record}, \text{link};
\text{int chunk_offset = ((char*)record->data - pool_data->pool_memory) + record->data_size};
\]

gives the offset within the current pool’s mmap’ed memory available for a new wl_buffer. Macro wi_container_of() gives the address of a record belonging to a linked list of records of the same type.

A window’s wl_buffer is re-filled by graphics data and committed each time the window gets redrawn, and is set to be destroyed by function Fl_Wayland_Graphics_Driver::buffer_release() when Fl_Window::hide() runs or the window is resized. When the wl_buffer is no longer in use, function do_buffer_release() gets called as explained above. It destroys the wl_buffer with wl_buffer destroy(), and removes the corresponding Fl_Wayland_Graphics_Driver::wld_buffer record from the linked list of buffers from the same wl_shm_pool. Since new Fl_Wayland_Graphics_Driver::wld_buffer records are added at the head of the linked list, and since the record at the head of this list is used to compute the offset within the pool’s mmap’ed memory available for a new wl_buffer, destruction of the last created wl_buffer allows to re-use the destroyed buffer’s pool’s memory for a new wl_buffer. When function do_buffer_release() finds the list of buffers from a given pool empty, two situations can occur. 1) This pool is the current pool. Its mmap’ed memory will be re-used from offset 0 to create future wl_buffer objects. 2) This pool is not current. It gets destroyed with wl_shm_pool_destroy(), the pool’s mmap’ed memory is munmap’ed, and the pool’s associated struct wl_shm_pool data is freed. In situation 1) above, the next wl_buffer to be created can need more memory than the current pool’s memory size. If so, the current pool gets destroyed and replaced by a new, larger pool.

If the sum of chunk_offset plus the buffer size is larger than the current pool’s size when function create<shm_buffer>() is called, chunk_offset is reset to 0, and a new wl_shm_pool object is created and used by FLTK’s "buffer factory". This mechanism allows to access new mmap’ed memory when chunk_offset reaches the end of the previous mmap’ed section.

Wayland uses also wl_buffer objects to support cursors. FLTK uses the "buffer factory" described here when creating custom cursors (see custom-cursor) with function Fl_Wayland_Window_Driver::set<cursor(const Fl_RGB_Image *, ...) which calls create<shm_buffer>() via set<cursor<4args(), custom_offscreen() and create<wl_buffer>(). In contrast, standard shaped-cursors
(e.g., FL_CURSOR_INSERT) use their own "buffer factory" inside Wayland functions such as `wl_cursor_theme_get_cursor()`. Therefore, the fact that the `wl_buffer` objects behind standard cursors are never destroyed doesn't prevent disused `struct wl_shm_pool` objects from being freed because those buffers come from a distinct "buffer factory". The "buffer factory" described here is also used by function `offscreen_from_text()` when displaying dragged text in a DnD operation.

### 4.1.11 Displays and HighDPI support

Wayland uses the concept of seat of type `struct wl_seat` which encompasses displays, a keyboard, a mouse, and a trackpad. Although Wayland may be in principle able to deal with several seats, FLTK's Wayland platform is conceived for one seat only. That seat may contain one or more displays, which Wayland calls outputs, of type `struct wl_output`.

As written above, function `registry_handle_global()` discovers the available seat at startup time. This function also associates a listener to each display connected to the system by calling function `wl_output_add_listener()`. This listener's member functions run at program startup when Wayland discovers its displays (see Opening a Wayland connection). Member `output_mode` runs also when the display is resized and member `output_scale` also when the Wayland scale factor (see below) is changed. FLTK defines type `struct Fl_Wayland_Screen_Driver::output` to store display size and scaling information. One such record is created for each display. These records are put in a `struct wl_list` accessible from member outputs of the single `Fl_Wayland_Screen_Driver` object.

FLTK uses 2 distinct scaling parameters for each display:

- **`int wld_scale;`**. This member variable of the `struct Fl_Wayland_Screen_Driver::output` record typically equals 1 for standard, and 2 for HighDPI displays. The effect of value `n` of variable `wld_scale` is that `n` Wayland graphics unit represents a block of `nxn` pixels. Another effect is that drawing a buffer for a surface of size `WxH` units contains `W * n * H * n * 4` bytes. Member function `output_scale()` mentioned above sets this value for each system's display at startup time. Member function `Fl_Wayland_Screen_Driver::buffer_commit()` informs the Wayland compositor of the value of `wld_scale` calling `wl_surface_set_buffer_scale()` which is enough to make FLTK apps HighDPI-aware. Under the gnome and KDE desktops, this parameter is visible in the "Settings" app, "Displays" section, "Scale" parameter which is 200% on HighDPI displays.

- **`float gui_scale;`**. This other member variable is where FLTK's own GUI scaling mechanism with `ctrl+//-/0` keystrokes and with environment variable `FLTK_SCALING_FACTOR` operates: when FLTK is scaled at 150%, `gui_scale` is assigned value 1.5. Function `Fl_Wayland_Screen_Driver::scale(int n, float f)` assigns value `f` to the `gui_scale` member variable of display # `n`. This variable is used by function `Fl_Wayland_Window_Driver::make_current()` when it calls `Fl_Wayland_Screen_Driver::set_buffer()` that scales the graphics driver by this factor with `cairo_scale()`.

Overall, an FLTK object, say an `Fl_Window`, of size `WxH` FLTK units occupies `int(W * gui_scale) * wld_scale x int(H * gui_scale) * wld_scale` pixels on the display.

When an `Fl_Window` is to be show()'n, `Fl_Wayland_Window_Driver::makeWindow()` creates a `struct wl_surface` with `wl_compositor_create_surface()` and associates it calling `wl_surface_add_listener()` with a 2-member listener called `surface_listener` charged of managing as follows the list of displays where this `wl_surface` will map. The `Fl_Window` possesses an initially empty linked list of displays accessible at member outputs of the window's `wld_window` record. When the `Fl_Window`, or more exactly its associated `struct wl_surface` is mapped on a display, member `surface_enter()` of `surface_listener` runs. This function adds the display where the surface belongs to the end of the linked list of displays for this surface. When a surface is dragged or enlarged across the edge of a display in a multi-display system and expands on a second display, `surface_enter()` runs again, and this surface's list of displays contains 2 items. When a surface leaves a display, member `surface_leave()` of `surface_listener` runs. It removes that display from the surface's list of displays. Each time the first item of a surface's list of displays changes, function `change_scale()` is called and applies that display's `gui_scale` value to that surface calling `Fl_Window_Driver::screen_num(int)` When a window is unmapped by function `Fl_Wayland_Window_Driver::hide()`, the surface's list of displays is emptied.
Fractional scaling

The KWin compositor, and gnome too if specially set, allow to use fractional scaling that can take intermediate values between 100% and 200%. Wayland implements this rendering all *wl_surface*’s as if the scaling was at 200%, and downsizing them to the desired fractional scale value at the compositing stage. Seen from FLTK, everything runs as when *wld_scale* = 2.

These commands make gnome accept fractional scaling, and turn that off:

- `gsettings set org.gnome.mutter experimental-features "["scale-monitor-framebuffer"]"`
- `gsettings reset org.gnome.mutter experimental-features`

### 4.1.12 Mouse and trackpad handling

FLTK receives information about mouse and pointer events via a ‘listener’ made up of 5 pointers to functions which Wayland calls when events listed in table below occur. These functions receive from Wayland enough information in their parameters to generate corresponding FLTK events, that is, calls to `Fl::handle(int event_type, Fl_Window *)`.

<table>
<thead>
<tr>
<th>listener function</th>
<th>called by Wayland when</th>
<th>resulting FLTK events</th>
</tr>
</thead>
<tbody>
<tr>
<td>pointer_enter</td>
<td>pointer enters a window</td>
<td>FL_ENTER</td>
</tr>
<tr>
<td>pointer_leave</td>
<td>pointer leaves a window</td>
<td>FL_LEAVE</td>
</tr>
<tr>
<td>pointer_motion</td>
<td>pointer moves inside a window</td>
<td>FL_MOVE</td>
</tr>
<tr>
<td>pointer_button</td>
<td>state of mouse buttons changes</td>
<td>FL_PUSH, FL_RELEASE</td>
</tr>
<tr>
<td>pointer_axis</td>
<td>trackpad is moved vertically or horizontally</td>
<td>FL_MOUSEWHEEL</td>
</tr>
</tbody>
</table>

**pointer_listener** is installed by a call to function *wl_pointer_add_listener()* made by function `seat_capabilities()` which is itself another ‘listener’ made up of 2 function pointers

```c
static struct wl_seat_listener seat_listener = {
  seat_capabilities,
  seat_name
};
```

installed by a call to function *wl_seat_add_listener()* made by function `registry_handle_global()` when it receives a "wl_seat" interface.

### Handling middle mouse button clicks on window titlebars

The gnome desktop, via its *gnome-tweaks* application, allows to determine what happens when a middle mouse button click occurs on a window titlebar. To obey this setting, FLTK implements part of the GTK Shell protocol as follows. Mutter, gnome’s Wayland compositor, declares its support of the GTK Shell protocol calling `registry_handle_global()` with its interface argument equal to "gtk_shell1". FLTK initializes then a static global variable `gtk_shell` of type `struct gtk_shell1 *`. Member functions of **pointer_listener** mentioned above run for all mouse events on all *wl_surface* objects. The table above describes what these functions do for mouse events on FLTK-created *wl_surface* objects. But they also run for the libdecor-created *wl_surface* objects corresponding to window titlebars. Thus, member function `pointer_enter()` runs when the mouse enters a titlebar. It calls `Fl_Wayland::Screen_Driver::event_coords_from_surface()` which calls `Fl_Wayland_Window_Driver::surface_to_window()` which, as mentioned above, can distinguish FLTK-created from non FLTK-created *wl_surface* objects. This allows `pointer_enter()` to identify the entered surface as a titlebar and to assign static global variable `gtk_shell_surface` with the titlebar’s *wl_surface* when the mouse enters a titlebar.

Similarly, member function `pointer_leave()` sets `gtk_shell_surface` to NULL when the mouse leaves this titlebar. When there’s a click on a titlebar, member function `pointer_button()` runs this code

```c
if (gtk_shell_surface && state == WL_POINTER_BUTTON_STATE_PRESSED && button == BTN_MIDDLE) {
  struct gtk_surface1 *gtk_surface = gtk_shell1_get_gtk_surface(gtk_shell, gtk_shell_surface);
  gtk_surface1_titlebar_gesture(gtk_surface, serial, seat->wl_seat, GTK_SURFACE1_GESTURE_MIDDLE_CLICK);
  gtk_surface1_release(gtk_surface);
  return;
}
```

which ensures that what *gnome-tweaks* has assigned to middle-click events is executed. At this point, FLTK obeys what libdecor decides for right-click (display the window menu) and double-click (maximize the window) events on titlebars which may diverge from *gnome-tweaks* settings.
4.1.13 Wayland cursors

Wayland defines types struct \texttt{wl\_cursor} and struct \texttt{wl\_cursor\_theme} to hold cursor-related data. FLTK uses function \texttt{init\_cursors()} from file \texttt{Fl\_Wayland\_Screen\_Driver.cxx} to obtain the 'cursor theme' name using function \texttt{libdecor\_get\_cursor\_settings()} of library libdecor. Function \texttt{wl\_cursor\_theme\_load()} then returns a pointer to an object of type struct \texttt{wl\_cursor\_theme} stored in member variable \texttt{cursor\_theme} of the \texttt{Fl\_Wayland\_Screen\_Driver\::seat} record. Function \texttt{init\_cursors()} is itself called by a 'listener' called \texttt{seat\_capabilities()} installed when function \texttt{registry\_handle\_global()} receives a "wl\_seat" interface, at program startup. It is also called when the value of the Wayland scaling factor changes: \texttt{output\_done()} calls \texttt{try\_update\_cursor()} calls \texttt{init\_cursors()}. Function \texttt{output\_done()} belongs to a 'listener' installed when function \texttt{registry\_handle\_global()} receives a "wl\_output" interface.

Each time \texttt{Fl\_Window\::cursor(Fl\_Cursor)} runs, FLTK calls \texttt{Fl\_Wayland\_Window\_Driver\::set\_cursor(Fl\_Cursor)} which calls \texttt{wl\_cursor\_theme\_get\_cursor()} to set the current cursor shape to one of the standard shapes from the \texttt{Fl\_Cursor} enumeration. This Wayland function selects a cursor shape based on the current \texttt{wl\_cursor\_theme} object and a cursor name and returns a pointer to a struct \texttt{wl\_cursor}. Under the gnome desktop, cursor names are the files of directory /usr/share/icons/\texttt{XXXX}/cursors/ where \texttt{XXXX} is the 'gnome cursor theme' (default= Adwaita). For example, what FLTK calls \texttt{FL\_CURSOR\_INSERT} corresponds to file xterm therein. The full correspondence between \texttt{Fl\_Cursor} values and names of files therein is found in function \texttt{Fl\_Wayland\_Window\_Driver\::set\_cursor(Fl\_Cursor)}.

FLTK stores in member variable \texttt{default\_cursor} of the \texttt{Fl\_Wayland\_Screen\_Driver\::seat} record a pointer to the currently used \texttt{wl\_cursor} object, and the current \texttt{Fl\_Cursor} value in member \texttt{standard\_cursor} of the \texttt{Fl\_Wayland\_Window\_Driver} object.

Finally, function \texttt{do\_set\_cursor()} of file \texttt{Fl\_Wayland\_Screen\_Driver.cxx} makes the system pointer use the current \texttt{wl\_cursor} object to draw its shape on screen. That's done with a call to \texttt{wl\_pointer\_set\_cursor()} and a few other functions.

Custom cursor shapes

To support custom cursors, FLTK presently uses a non-public type, struct \texttt{cursor\_image}, defined in file \texttt{Fl\_Wayland\_Window\_Driver.cxx} as follows:

\begin{verbatim}
struct cursor_image {
  struct wl\_cursor\_image\_image;
  struct wl\_cursor\_theme\_theme;
  struct wl\_buffer\ 
    buffer;
  int offset;
};
\end{verbatim}

This definition has been copied to the FLTK source code from file \texttt{wayland\_cursor\_c} of the Wayland project source code because it's not accessible via Wayland header files. It shows that a pointer to a \texttt{cursor\_image} object can also be viewed as a pointer to the embedded struct \texttt{wl\_cursor\_image\_object}, this one being part of the public Wayland API. It also shows that a struct \texttt{cursor\_image\_object} has an associated struct \texttt{wl\_buffer\_object} used to contain the cursor's graphics.

Function \texttt{Fl\_Wayland\_Window\_Driver\::set\_cursor(const Fl\_RGB\_Image \*rgb, int hotx, int hoty)} gives FLTK support of custom cursor shapes. It calls \texttt{Fl\_Wayland\_Window\_Driver\::set\_cursor\_4args()} that creates a \texttt{cursor\_image\_object}, allocates the corresponding \texttt{wl\_buffer\_object} by a call to \texttt{Fl\_Wayland\_Graphics\_Driver\::create\_shm\_buffer()} via \texttt{create\_wl\_buffer()} and \texttt{create\_wl\_buffer()} and draws the cursor shape into that buffer using the offscreen-drawing method of FLTK.

The public type struct \texttt{wl\_cursor} is essentially an array of \texttt{wl\_cursor\_image\_object}s and a name:

\begin{verbatim}
struct wl\_cursor {
  unsigned int image\_count;
  struct wl\_cursor\_image \*images;
  char \*name;
};
\end{verbatim}

Function \texttt{Fl\_Wayland\_Window\_Driver\::set\_cursor\_4args()} also creates a struct \texttt{wl\_cursor} object containing a single \texttt{wl\_cursor\_image\_object}, which is in fact the \texttt{cursor\_image}. Finally, a struct \texttt{custom\_cursor\_object} (see \texttt{wl\_window}) is allocated and used to memorize the struct \texttt{wl\_cursor} and the cursor's image and hotspot. A pointer to this struct \texttt{custom\_cursor\_object} is stored in member \texttt{custom\_cursor\_object} of the window's \texttt{wl\_window}.

Function \texttt{Fl\_Wayland\_Window\_Driver\::set\_cursor\_4args()} is also called when a window with a custom cursor is moved between distinct displays or when a display is rescaled to adapt the cursor size to the new display's scale factor.

Member function \texttt{Fl\_Wayland\_Window\_Driver\::delete\_cursor\_object()} is used to delete any custom curs-
sor shape. This occurs when a window associated to a custom cursor is un-mapped and when such a window gets associated to a standard cursor or to a new custom cursor.

### 4.1.14 Keyboard support

The "Mouse handling" section above mentioned function `seat_capabilities()` that Wayland calls when the app discovers its "seat". Presence of flag `WL_SEAT_CAPABILITY_KEYBOARD` in argument `capabilities` of this function indicates that a keyboard is available. In that case, a call to `wl_seat_get_keyboard()` returns a pointer stored in member `wl_keyboard` of the `Fl_Wayland_Screen_Driver::seat` object, and a call to `wl_keyboard_add_listener()` installs a 6-member listener of type `struct wl_keyboard_listener`.

These 6 FLTK-defined, callback functions are used as follows.

Function `wl_keyboard_keymap()` runs when the app starts and also if the keyboard layout is changed during run-time. It allows initialization of access to this keyboard. Noticeably, member `xkb_state` of type `struct xkb_state` of the current `Fl_Wayland_Screen_Driver::seat` record is adequately initialized.

Functions `wl_keyboard_enter()` and `wl_keyboard_leave()`, called when focus enters and leaves a surface, send `FL_FOCUS` and `FL_UNFOCUS` events to the `Fl_Window` object corresponding to this surface.

Function `wl_keyboard_key()` runs each time a keyboard key is pressed or released. Its argument `key`, to which 8 must be added, provides the keycode via function `xkb_state_key_get_one_sym()` and then the corresponding text via function `xkb_state_key_get_utf8()` which is put in `Fl::e_text`. Then, a few calls to functions whose name begin with `xkb_` are necessary to support dead and compose keys.

Finally a call to `Fl::handle()` sends an `FL_KEYDOWN` or `FL_KEYUP` event to the appropriate `Fl_Window`.

Also, function `wl_keyboard_modifiers()` runs when a modifier key (e.g., shift, control) is pressed or released. Calls to functions `xkb_state_update_mask()` and `xkb_state_mod_name_is_active()` allow FLTK to set `Fl::e_state` adequately.

Function `wl_keyboard_repeat_info()` does not run, for now, because this would require version 4 of the `wl_keyboard` object which is at version 2 in all tested Wayland compositors.

### 4.1.15 Support of text input methods

When the connected Wayland compositor supports text input methods, function `registry_handle_global()` gets called with its interface argument equal to `zwp_text_input_manager_v3_global()`.

The following call to `wl_registry_bind()` returns a pointer to type `struct zwp_text_input_manager_v3` that is stored as member `text_input_base` of the `Fl_Wayland_Screen_Driver::seat` object.

Later, when function `seat_capabilities()` runs, `text_input_base` is found not NULL, which triggers a call to function `zwp_text_input_manager_v3_get_text_input()` returning a value of type `struct text_input_base` * and stored as member `text_input` of the `Fl_Wayland_Screen_Driver::seat` object.

Next, a call to `zwp_text_input_v3_add_listener()` associates this `text_input` with a 6-member listener of type `struct text_input_v3_listener`. These 6 FLTK-defined, callback functions are used as follows.

Functions `text_input_preedit_string()` and `text_input_commit_string()` are called when the text input method asks the client app to insert 'marked' text or regular text, respectively. Complex text input often begins by inserting temporary text which is said to be 'marked' before replacing it with the text that will stay in the document. FLTK underlines marked text to distinguish it from regular text.

Functions `text_input_delete_surrounding_text()` and `text_input_done()` have no effect at present, without this preventing input methods that have been tested with FLTK from working satisfactorily.

It's necessary to inform text input methods of the current location of the insertion point in the active surface. This information allows them to map their auxiliary windows next to the insertion point, where they are expected to appear. The flow of information on this topic is as follows:

- The two FLTK widgets supporting text input, `Fl_Input_` and `Fl_Text_Display`, transmit to FLTK the window coordinates of the bottom of the current insertion point and the line height each time they change calling function `Fl_set_spot()`.
• `fl_set_spot()` calls the platform override of virtual member function `Fl_Screen_Driver::set_spot()`. Under Wayland, this just calls `Fl_Wayland_Screen_Driver::insertion_point_location(int x, int y, int height)` which calls `zwp_text_input_v3_set_cursor_rectangle()` to inform the text input method about the surface position and size of the insertion point and also memorizes this information in static member variables of class `Fl_Wayland_Screen_Driver`.

• Callback function `text_input_enter()` calls `Fl_Wayland_Screen_Driver::insertion_point_location(int *x, int *y, int *height)` which gives it the stored position information, and then calls `zwp_text_input_v3_set_cursor_rectangle()` to inform the text input method about the position of the insertion point.

### 4.1.16 Interface with libdecor

FLTK uses a library called *libdecor* to determine whether the Wayland compositor uses CSD or SSD mode, and also to draw window titlebars when in CSD mode (see *libdecor*). *Libdecor* is conceived to be present in a shared library linked to the Wayland client application which itself, and if the running Wayland compositor uses CSD mode, loads another shared library intended to draw titlebars in a way that best matches the Desktop. As of late 2023, libdecor is at version 0.2.0 and contains two titlebar-drawing plugins:

- `libdecor-gtk` intended for the Gnome desktop;
- `libdecor-cairo` for other situations.

Because `libdecor` is not yet in major Linux packages, or only at version 0.1.x, FLTK bundles the most recent source code of `libdecor` and its plugins. This code is included in libfltk. FLTK uses `libdecor-gtk` when software package `libgtk-3-dev` is present in the build system, and `libdecor-cairo` otherwise.

As of late 2023, libdecor version 0.2.0 is available in very recent Linux distributions in packages `libdecor-0-dev` and `libdecor-0-plugin-1-gtk`. If they are installed on the build system, preprocessor variable `USE_SYSTEM_LIBDECOR` 1 is defined and points to the name of a directory, this directory is searched for a potential `libdecor` plugin in the form of a shared library; if one is found, FLTK and their plugins are loaded at run-time from shared libraries.

Whatever the value of `OPTION_USE_SYSTEM_LIBDECOR`, FLTK and libdecor use environment variable `LIBDECOR_PLUGIN_DIR` as follows: if this variable is defined and points to the name of a directory, this directory is searched for a potential `libdecor` plugin in the form of a shared library; if one is found, FLTK and `libdecor` load it and use it.

The `libdecor` source code bundled in FLTK is identical to that of the `libdecor` repository. Nevertheless, FLTK uses this code with some minor changes. For example, except if `USE_SYSTEM_LIBDECOR` is 1, FLTK needs to modify function `libdecor_new()` charged of loading the plugin, to make it use the plugin code that is included in libfltk if none is found as a dynamic library. This is done as follows in file `libdecor/build/fl_libdecor.c`:

```c
#include "libdecor_new.orig"
#include ".//src/libdecor.c"
#undef libdecor_new

void libdecor_new() { // FLTK rewrite of this function
  .......
}
```

FLTK compiles file `fl_libdecor.c` which includes `libdecor.c` to the effect that all of the `libdecor` code becomes part of libfltk except that function `libdecor_new()` is substituted by its FLTK rewrite, without file `libdecor.c` being modified at all. This trick is also used to modify function `libdecor_frame_set_minimized()` to bypass a bug in the Weston compositor before version 10. Similarly, FLTK compiles file `fl_libdecor-plugins.c` which includes either `libdecor-gtk.c` or `libdecor-cairo.c` to the effect that the desired plugin becomes part of libfltk.

To support function `Fl_Widget_Surface::draw_decorated_window()` that draws a mapped window and its titlebar, FLTK needs to perform two operations: 1) identify what plugin is operating, and 2) call a function that is specific of that plugin and that returns the pixels of the drawn titlebar.

FLTK performs operation 1) above using its function `get_libdecor_plugin_description()` of file `fl_libdecor-plugins.c` that returns a human readable string describing the running plugin. Each plugin puts
its own string in member description of a record of type struct libdecor_plugin_description. Although this type is public in header file libdecor-plugin.h, accessing the symbol defined by the plugin to store a pointer to a value of this type is complicated for a reason and solved by a method detailed in a comment before function get_libdecor_plugin_description().

Operation 2) above is done by FLTK-defined function fl_libdecor_titlebar_buffer() from file fl-_libdecor-plugins.c. This function calls get_libdecor_plugin_description() seen above to get the running plugin’s descriptive string. That is "GTK3 plugin" with libdecor-gtk. FLTK function gtk_titlebar_buffer() is then called, and returns a pointer to the start of a byte buffer containing the titlebar graphics. That is, again, not possible with the public libdecor API. Therefore, FLTK copies to fl_libdecor-plugins.c the definitions of several types given in libdecor-gtk.c or libdecor-cairo.c such as type struct border_component.

4.1.17 Copy/Paste/Drag-n-Drop

FLTK follows the procedure that is very well described in item "Wayland clipboard and drag & drop" of the Documentation resources. All corresponding source code is in file src/drivers/Wayland/fl_wayland-_clipboard_dnd.cxx.

This part of the Fl_Wayland_Screen_Driver::seat record stores pointers to Wayland objects used for clipboard and D-n-D operations:

struct wl_data_device_manager *data_device_manager;
struct wl_data_device *data_device;
struct wl_data_source *data_source;

FLTK can copy or paste plain UTF-8 text or image data to/from the clipboard. Images are copied to the clipboard as image/bmp mime type. Images in image/bmp or image/png mime types from the clipboard can be pasted to FLTK apps.

Files dropped are received one pathname per line, with no ‘\n’ after the last pathname.

4.1.18 EGL as support for OpenGL

Wayland uses EGL™ to interface OpenGL with the underlying native platform window system. OpenGL-using FLTK apps are therefore linked to libwayland-egl.so and libEGL.so in addition to libGL.so and libGLU.so.

EGL is initialized calling member function Fl_Wayland_GL_Window_Driver::init() once, the first time the Fl_Wayland_GL_Window_Driver c’tor runs. That is done with calls to eglGetDisplay(), eglInit(), and eglBindAPI().

Member function Fl_Wayland_GL_Window_Driver::find() calls eglChooseConfig() to filter the set of GL configurations that match the Fl_Gl_Window’s mode(), and puts in the returned Fl_Gl_Object the first matching configuration. The filtering gets done with bits EGL_WINDOW_BIT, to support the creation of window surfaces, and EGL_OPENGL_BIT, to support the creation of OpenGL contexts.

EGL needs 2 more objects created for each Fl_Gl_Window. They have types struct wl_eegl_window and EGSurface, and are created by member function Fl_Wayland_GL_Window_Driver::make_eegl_window() which runs at the beginning of Fl_Gl_Window::make_current(). The first argument of the call to wl_eegl_window_create() therein has type struct wl_surface * and is what connects EGL with the targeted Wayland window.

EGL creates with eglCreateContext() an object of type EGLContext via member function Fl_Wayland_GL_Window_Driver::create gl_context() called by Fl_Gl_Window::make_current(). Types EGLContext and GLContext are 2 names for the same object. The call to eglCreateContext() is made asking for a GL context of version at least 2. This does not prevent from obtaining contexts of higher versions, namely above 3.2, which are compatible with version 2 (the so-called compatibility profile) under all tested Linux systems.

FLTK function Fl_Gl_Window::make_current() calls overridden function Fl_Wayland_Gl_Window_Driver::set_gl_context() which calls EGL function eglMakeCurrent() when the cached context changes.

FLTK calls function Fl_Wayland_GL_Window_Driver::swap_buffers() each time it wants a GL context to be sent to the display. This function contains some pure GL code to emulate an overlay buffer to support Fl_Gl_Window objects overriding their draw_overlay() member function. Then, it calls function eglSwapBuffers().

The overridden Fl_Wayland_GL_Window_Driver::resize() function is implemented with calls to wl_eegl_window_get_attached_size() and wl_eegl_window_resize().

Generated by Doxygen
4.1 The Wayland backend for its developer

Class Fl_Wayland_GL_Plugin exists to allow libfltk to call functions from libfltk_gl, libwayland-egl.so or libEGL.so and without having libfltk force linking any FLTK app with these GL-related libraries. For example, Fl_Wayland_Window_Driver::flush() needs to call Fl_Gl_Window::valid(0).

4.1.19 FLTK-defined, Wayland-specific types

struct wld_window

Defined in Fl_Wayland_Window_Driver.H. One such record is created for each shown()’n Fl_Window by Fl_Wayland_Window_Driver::makeWindow(). Function fl_wl_xid(Fl_Window *) returns a pointer to the struct wld_window of its argument.

struct wld_window {
    Fl_Window *fl_win;
    struct wl_list outputs; // linked list of displays where part or whole of window maps
    struct wl_surface *wl_surface; // the window’s surface
    struct wl_callback *frame_cb; // non-NULL until Wayland can process new surface commit
    struct Fl_Wayland_Graphics_Driver::wld_buffer *buffer; // see wld_buffer
    struct xdg_surface *xdg_surface; // the window’s surface
    enum Fl_Wayland_Window_Driver::kind kind; // DECORATED or POPUP or SUBWINDOW or UNFRAMED
    union {
        struct libdecor_frame *frame; // for DECORATED windows
        struct wl_subsurface *subsurface; // for SUBWINDOW windows
        struct xdg_popup *xdg_popup; // for POPUP windows
        struct xdg_toplevel *xdg_toplevel; // for UNFRAMED windows
    };
    struct custom_cursor_ {
        struct wl_cursor *wl_cursor;
        const Fl_RGB_Image *rgb;
        int hotx, hoty;
    } *custom_cursor; // non-null when using custom cursor
    int configured_width; // used when negotiating window size with the compositor
    int configured_height;
    int floating_width; // helps restoring size after un-maximizing
    int floating_height;
    int state; // indicates whether window is fullscreen, maximized. Used otherwise for POPUPs
    bool covered; // specially for Mutter and issue #878
};

struct Fl_Wayland_Graphics_Driver::draw_buffer

Defined in file Fl_Wayland_Graphics_Driver.H. One such record is created when an Fl_Image_Surface object is created. One such record is also embedded inside each struct Fl_Wayland_Graphics_Driver::wld_buffer record (see wld_buffer).

struct Fl_Wayland_Graphics_Driver::draw_buffer {
    unsigned char *buffer; // address of the beginning of the Cairo image surface’s byte array
    cairo_t *cairo_; // used when drawing to the Cairo image surface
    size_t data_size; // of buffer and wl_buffer, in bytes
    int stride; // bytes per line
    int width; // in pixels
};

FLTK gives offscreen buffers the platform-dependent type Fl_Offscreen which is in fact member cairo_ of struct Fl_Wayland_Graphics_Driver::draw_buffer. Thus, a variable with type Fl_Offscreen needs be cast to type cairo_t*. Static member function struct draw_buffer *offscreen_← buffer(Fl_Offscreen) of class Fl_Wayland_Graphics_Driver returns the draw_buffer record corresponding to an Fl_Offscreen value.

struct Fl_Wayland_Graphics_Driver::wld_buffer

Defined in file Fl_Wayland_Graphics_Driver.H. One such record is created by Fl_Wayland_Graphics_Driver::create_wld_buffer() when an Fl_Window is show()’n or resized, when a custom
cursor shape is created, or when text is dragged.

```c
struct Fl_Wayland_Graphics_Driver::wld_buffer {
    struct draw_buffer draw_buffer; // see draw_buffer
    struct wl_list link; // links all buffers from the same wl_shm_pool
    struct wl_buffer *wl_buffer; // the Wayland buffer
    void *data; // address of the beginning of the Wayland buffer's byte array
    struct wl_shm_pool *shm_pool; // pter to wl_shm_pool from which this wl_buffer comes
    bool draw_buffer_needs_commit; // true when draw_buffer has been modified but not yet committed
    bool in_use; // true while being committed
    bool released; // true after buffer_release() was called
};
```

```c
struct Fl_Wayland_Screen_Driver::output

Defined in Fl_Wayland_Screen_Driver.H. One such record is created for each display of the system by function registry_handle_global() when it receives a "wl_output" interface. These records are kept in a linked list of them all, and an identifier of this linked list is stored in member outputs of the unique Fl_Wayland_Screen_Driver object FLTK uses. Thus, Fl_Wayland_Screen_Driver *scr_driver = (Fl_Wayland_Screen_Driver*)Fl::screen_driver();
struct wl_list list_of_all_displays = scr_driver->outputs;
gives access, the Wayland way, to the linked list of displays in the system.

```c
struct Fl_Wayland_Screen_Driver::output { // one record for each display
    uint32_t id; // an identifier of the display
    int x, y; // logical position of the top-left of display
    int width; // nber of horizontal pixels
    int height; // nber of vertical pixels
    float dpi; // at this point, always 96.
    struct wl_output *wl_output; // the Wayland object for this display
    int wld_scale; // Wayland scale factor
    float gui_scale; // FLTK scale factor
    bool done; // true means record members have been initialized
    struct wl_list link; // links these records together
};
```

It's possible to get the FLTK-defined record associated to a display from the Wayland-associated object for the same display, say struct wl_output *wl_output, by this call: (struct Fl_Wayland_Screen_Driver::output *)wl_output_get_user_data(wl_output).

```c
struct Fl_Wayland_Screen_Driver::seat

Defined in file Fl_Wayland_Screen_Driver.H. One record is created by function registry_handle_global() when it receives a "wl_seat" or wl_data_device_manager_interface.name interface. A pointer to this struct is stored in member seat of the client's unique Fl_Wayland_Screen_Driver object.

```c
struct Fl_Wayland_Screen_Driver::seat {
    struct wl_seat *wl_seat;
    struct wl_pointer *wl_pointer;
    struct wl_keyboard *wl_keyboard;
    uint32_t keyboard_enter_serial;
    struct wl_surface *keyboard_surface;
    struct wl_list pointer_outputs;
    struct wl_cursor_theme *cursor_theme;
    struct wl_cursor *default_cursor;
    struct wl_surface *cursor_surface;
    struct wl_surface *pointer_focus;
    int pointer_scale;
    uint32_t serial;
    uint32_t pointer_enter_serial;
    struct wl_data_device_manager *data_device_manager;
    struct wl_data_device *data_device;
    struct wl_data_source *data_source;
    struct xkb_state *xkb_state;
};
```
struct xkb_context *xkb_context;
struct xkb_keymap *xkb_keymap;
struct xkb_compose_state *xkb_compose_state;
char *name;
struct zwp_text_input_v3 *text_input;
};

4.1.20 Documentation resources

| The Wayland book | Extensive introduction to Wayland programming written by the author of the sway compositor, unfortunately unachieved. |
| Wayland Explorer | Documentation of all Wayland protocols, both stable and unstable. A language-independent syntax is used which makes function names usable from C or C++ not always obvious. Some useful functions seem undocumented here for an unclear reason. |
| Wayland clipboard and drag & drop | Detailed explanation of how clipboard and drag-and-drop work under Wayland. |
| Wayland and input methods | Blog article introducing to the issue of text input methods under Wayland. |
| Input Method Hub | Entry page for input method support giving newcomers a first understanding of what input methods are and how they are implemented in Wayland. |

4.2 Developer info for bundled libs

This chapter details the procedure to update the libraries which are bundled inside FLTK.

4.2.1 Introduction

This file is mainly intended for FLTK developers and contains information about the current versions of all bundled libraries and about how to upgrade these bundled libraries.

Starting with FLTK 1.4.0 the bundled libraries jpeg, png, and zlib use "symbol prefixing" with the prefix 'fltk_' for all external symbols to distinguish the bundled libraries from existing system libraries and to avoid runtime errors.

User code compiled correctly with the header files provided by the bundled image libraries need not be changed. The nanosvg library is not affected.

4.2.2 Current status

Current versions of bundled libraries (as of December 5, 2023):

<table>
<thead>
<tr>
<th>Library</th>
<th>Version/git commit</th>
<th>Release date</th>
<th>FLTK Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>jpeg</td>
<td>jpeg-9e</td>
<td>2022-01-16</td>
<td>1.4.0</td>
</tr>

Generated by Doxygen
Development of the FLTK library

---

   See also git tag 'fltk_yyyy-mm-dd' where yyyy-mm-dd == "Release date"
   and file nanosvg/README.txt.

General information:

FLTK does not include the entire library distributions. We only provide the source files necessary to build the FLTK library and some README and/or CHANGELOG files. There are no test programs or other contributed files. We use our own build files, hence a few files MUST NOT be upgraded when the library source files are upgraded. We strive to keep changes to the library source files as small as possible. Patching library code to work with FLTK should be a rare exception. Symbol prefixing with prefix 'fltk_' is one such exception to the rule.

If patches are necessary all changes in the library files should be marked with "FLTK" in a comment so a developer who upgrades the library later is aware of changes in the source code for FLTK. Look for 'FLTK' and/or 'fltk_' to find the differences.

Additional comments should be added to show the rationale, i.e. why a particular change was necessary. If applicable, add a reference to a Software Trouble Report, GitHub Issue or Pull Request (PR) like “STR 3456”, “Issue #123”, or "PR #234”.

4.2.3 How to update the bundled libraries

It is generally advisable to use a graphical merge program. I’m using ‘meld’ under Linux, but YMMV.

Do not add any source files unless they are required to build the library.

Some config header files may be pre-generated in the FLTK sources. These header files should be left untouched, but it may be necessary to update these files if new items were added to the new library version. In this case the new header should be pre-generated on a Linux system with default options unless otherwise mentioned below for a specific library. Currently there are no known exceptions.

Merging source files:

Please check if some source and header files contain "FLTK" comments and/or 'fltk_' symbol prefixing to be aware of necessary merges. It is also good to download the distribution tar ball or Git source files of the previous version and to run a (graphical) diff or merge tool on the previous version and the bundled version of FLTK to see the “previous” differences.

Files that were not patched in previous versions should be copied to the new version w/o changes. Files that had FLTK specific patches must be merged manually. FLTK patches should be verified (if still necessary) and should be kept in the new source files.

Source and header files that have been added in the new library version should be added in FLTK as well if they are necessary to build the library. A simple "trial and error" should be sufficient to find files that need to be added. Added files must be added to FLTK’s build files as well, usually to both ‘Makefile’ and ‘CMakeLists.txt’ to be used in configure/make and in CMake based builds, respectively.

Upgrade order:

There is only one dependency between all bundled libraries: libpng depends on zlib. Hence zlib should be upgraded first, then all other libs can be upgraded in arbitrary order.

Tests after merge:

Tests should be done on as many platforms as possible, both with autotools (configure/make) and CMake. Windows (Visual Studio) and macOS (Xcode) builds need CMake to generate the IDE files.

Upgrade notes for specific libraries:

The following chapters contain informations about specific files and how they are upgraded. Since the changes in all bundled libraries are not known in advance this information may change in the future. Please verify that no other changes are necessary.

---

Generated by Doxygen
4.2.4 zlib:

Website: [https://zlib.net/](https://zlib.net/)
Download: See website and follow links.
Repository: git clone [https://github.com/madler/zlib.git](https://github.com/madler/zlib.git)

Zlib should be upgraded first because libpng depends on zlib.

Download the latest zlib sources, `cd` to `/path/to/zlib` and run

```
$ ./configure --zprefix
```

This creates the header file `zconf.h` with definitions to enable the standard `z_` symbol prefix.

Unfortunately zlib requires patching some source and header files to convert this `z_` prefix to `fltk_z_` to be more specific. As of this writing (Nov. 2021) three files need symbol prefix patches:

- `gzread.c`
- `zconf.h`
- `zlib.h`

You may want to compare these files and/or the previous version to find out which changes are required. The general rule is to change all occurrences of `z_` to `fltk_z_` but there are exceptions.

The following files need special handling:

- `CMakeLists.txt`: Keep FLTK version, update manually if necessary.
- `Makefile`: Same as `CMakeLists.txt`
- `gzread.c`: Merge changes (see above, manual merge recommended).
- `zconf.h`: Merge changes (see above, manual merge recommended).
- `zlib.h`: Merge changes (see above, manual merge recommended).
- `makedepend`: Keep this file.

Run `make depend` in the zlib folder on a Linux system after the upgrade to update this file.

4.2.5 png:

Website: [http://libpng.org/pub/png/libpng.html](http://libpng.org/pub/png/libpng.html)
Download: See website and follow links.
Repository: git clone [https://git.code.sf.net/p/libpng/code libpng](https://git.code.sf.net/p/libpng/code)

Libpng should be upgraded after zlib because it depends on zlib.

Download the latest libpng sources, `cd` to `/path/to/libpng` and run

```
$ ./configure --with-libpng-prefix=fltk_
$ make
```

This creates the header files `pnglibconf.h` and `pngprefix.h` with the `fltk_` symbol prefix.

The following files need special handling:

- `CMakeLists.txt`: Keep FLTK version, update manually if necessary.
- `Makefile`: Same as `CMakeLists.txt`
- `pnglibconf.h`: Generate on a Linux system and merge (see above).
- `pngprefix.h`: Generate on a Linux system and merge (see above).
- `makedepend`: Keep this file.
- `png.c`: Keep a change labelled with "FLTK"
- `pngerror.c`: Keep two changes labelled with "FLTK"

Run `make depend` in the png folder on a Linux system after the upgrade to update this file.
4.2.6 jpeg:

Website:  https://ijg.org/
Download: See website and follow links.
Repository: N/A

Download the latest jpeg-xy sources on a Linux (or Unix) system, `cd` to /path-to/jpeg-xy and run
$ ./configure
$ make [-jN]

This builds the library and should create the static library file `.libs/libjpeg.a'.

Execute the following command to extract the libjpeg symbol names used to build the 'prefixed' libfltk_jpeg library:
$ nm --extern-only --defined-only .libs/libjpeg.a | awk '{print $3}' \
| sed '/^$/d' | sort -u | awk '{print "#define "$1 "fltk_"$1}'}
> fltk_jpeg_prefix.h

This creates the header file 'fltk_jpeg_prefix.h' with the '# define' statements using the 'fltk_' symbol prefix.

The following files need special handling:

- CMakeLists.txt: Keep FLTK version, update manually if necessary.
- Makefile: Same as CMakeLists.txt.
- fltk_jpeg_prefix.h: Generate on a Linux system and merge (see above).
- jconfig.h: keep changes flagged with
  /* FLTK */
  Note: more to come...
- makedepend: Keep this file.

Run 'make depend' in the jpeg folder on a Linux system after the upgrade to update this file.

4.2.7 nanosvg:

Website:  https://github.com/memononen/nanosvg
Download: See website and follow links.
Repository: git clone https://github.com/memononen/nanosvg.git
FLTK Fork: git clone https://github.com/fltk/nanosvg.git

FLTK has its own GitHub fork of the original repository (see above).

The intention is to update this fork from time to time so the FLTK specific patches are up-to-date with the original library. Hopefully the FLTK patches will be accepted upstream at some time in the future so we no longer need our own patches. AlbrechtS, 04 Feb 2018.

Update (Feb 22, 2021): The upstream library is officially no longer maintained (see README.md) although updates appear from time to time.

Use this fork (branch 'fltk') to get the nanosvg library with FLTK specific patches:
$ git clone https://github.com/fltk/nanosvg.git nanosvg-fltk
$ cd nanosvg-fltk
$ git checkout fltk
$ cd src
$ cp nanosvg.h nanosvgrast.h /path/to/fltk-1.4/nanosvg/

This library does not have its own build files since it is a header-only library. The headers are included in FLTK where necessary.

The following files need special handling:
- nanosvg.h: Merge or download from FLTK's fork (see above).
- nanosvgrast.h: Merge or download from FLTK's fork (see above).

Maintaining branch 'fltk' in FLTK's fork of nanosvg (fltk/nanosvg):

Only maintainers with write access on fltk/nanosvg can do this. Others can fork our fltk/nanosvg fork in their own GitHub account and either open a PR on fltk/nanosvg or tell us about their changes in fltk.development.

Use something similar to the following commands to update FLTK's fork of nanosvg to the latest version. Commands are only examples, you may need to change more or less, depending on the outstanding updates.

Step 1: clone the fltk/nanosvg fork, set the remote 'upstream', and update the 'master' branch:
$ cd /to/your/dev/dir
$ git clone https://github.com/fltk/nanosvg.git nanosvg-fltk
$ cd nanosvg-fltk
$ git remote add upstream https://github.com/memononen/nanosvg
$ git checkout master
$ git pull upstream master
Note: the 'master' branch must never be changed, i.e. it must always be the same as 'upstream/master'. Never commit your own (FLTK specific) changes to branch 'master'.

Step 2: rebase branch 'fltk' on the new master (upstream/master), fix potential conflicts, and tag the new branch. It is important to keep the individual FLTK specific patches intact (one commit per patch) because this will preserve the history and the committer and make it easier to skip single patches when they are accepted upstream.

$ git checkout fltk
$ git rebase upstream/master

At this point you may need to fix conflicts! Do whatever is necessary to update the branch 'fltk'. Now 'git tag' the 'fltk' branch for later reference. Hint: use 'git show <any-older-tag-name>' to see its contents. I like to write a summary of commits in the tag comment.

$ git tag -a fltk_yyyy-mm-dd fltk

Replace 'yyyy-mm-dd' with the current date and add a comment when asked for it (your editor will open an empty file).

Step 3: at this point it is recommended to copy the changed header files to your working copy of the FLTK library and test the changes. If anything is wrong, go back, fix the bugs and change the git tag (delete and create a new one).

Step 4: push the new branch 'fltk' and the tag to the fltk/nanosvg repository:

$ git push -f origin fltk
$ git push origin fltk_yyyy-mm-dd

Step 5: copy the changed files to your working copy of the FLTK repository (if not done already), update this file accordingly, and commit/push the update to the fltk/fltk repository.

4.2.8 libdecor:

Website: https://gitlab.freedesktop.org/libdecor/libdecor
Download: See website and follow links.
Repository: git clone https://gitlab.freedesktop.org/libdecor/libdecor.git

libdecor is used by the Wayland/X11 hybrid platform to draw window titlebars when FLTK apps run as Wayland clients and the running Wayland compositor uses client-side decoration. In the future, when libdecor will have made its way into Linux packages, FLTK will use the system version of libdecor. libdecor will remain as an FLTK bundle to support Linux configurations where the libdecor package is not available or not installed.

FLTK uses libdecor source files without any modification. This part of the libdecor source tree is copied to directory libdecor/ of the FLTK source tree:

    LICENSE
    README.md
    src/ ... and files below except meson.build files

Furthermore, directory libdecor/build/ of the FLTK source tree does not originate from the libdecor source tree but contains 3 FLTK-created files. File build/Makefile may need changes if a libdecor update adds or renames source files.

4.3 Developer Information

This chapter describes FLTK development and documentation.

Example

```c
/** \file
 * Fl_Clock, Fl_Clock_Output widgets. */

/**
 * Fl_Clock_Output
 * \brief This widget can be used to display a program-supplied time.
 * The time shown on the clock is not updated. To display the current time,
 * use Fl_Clock instead.

 * \image html clock.png
 * \image latex clock.png " width=10cm
 * \image html round_clock.png
 * \image latex clock.png " width=10cm
```
Development of the FLTK library

** Returns the displayed time.
Returns the time in seconds since the UNIX epoch (January 1, 1970).

```cpp
ulong value() const {return value_;
```

** Set the displayed time.
Set the time in seconds since the UNIX epoch (January 1, 1970).

```cpp
void Fl_Clock_Output::value(ulong v) {
    ...
}
```

** Create an Fl_Clock widget using the given position, size, and label string.
The default boxtype is Fl_NO_BOX.

```cpp
Fl_Clock::Fl_Clock(int X, int Y, int W, int H, const char *L) :
    Fl_Clock_Output(X, Y, W, H, L) {
```

** Create an Fl_Clock widget using the given boxtype, position, size, and
label string.

```cpp
Fl_Clock::Fl_Clock(uchar t, int X, int Y, int W, int H, const char *L) :
    Fl_Clock_Output(X, Y, W, H, L) {
    type(t);
    box(t==FL_ROUND_CLOCK ? FL_NO_BOX : FL_UP_BOX);
```

Note

From Duncan: (will be removed later, just for now as a reminder)
I've just added comments for the fl_color_chooser() functions, and in order to keep them and the general Function Reference information for them together, I created a new doxygen group, and used \ingroup in the three comment blocks. This creates a new Modules page (which may not be what we want) with links to it from the File Members and Fl_Color_Chooser.H pages. It needs a bit more experimentation on my part unless someone already knows how this should be handled. (Maybe we can add it to a functions.dox file that defines a functions group and do that for all of the function documentation?)

** Update**: the trick is not to create duplicate entries in a new group, but to move the function information into the doxygen comments for the class, and use the navigation links provided. Simply using \relatesalso as the first doxygen command in the function's comment puts it in the appropriate place. There is no need to have \defgroup and \ingroup as well, and indeed they don't work. So, to summarize:

** Gizmo.H **

```cpp
/** 
    \class Gizmo
    A gizmo that does everything
    */

    class Gizmo { etc
    }

    extern int popup_gizmo(...);
```

** Gizmo.cxx **

```cpp
/** \relatesalso Gizmo
    Pops up a gizmo dialog with a Gizmo in it
    */

    int popup_gizmo(...);
```
4.3 Developer Information

Comments Within Doxygen Comment Blocks

You can use HTML comment statements to embed comments in doxygen comment blocks. These comments will not be visible in the generated document.

<!-- *** This *** is *** invisible *** -->

This will be visible again.

The following text is a developer comment.

This will be shown as:

The following text is a developer comment.

Different Headlines

You can use HTML tags `<H1> ... <H4>` for headlines with different sizes. As of doxygen 1.8.x there must not be more than three spaces at the beginning of the line for this to work. Currently (doxygen 1.8.6) there seems to be no difference in the font sizes of `<H3>` and `<H4>` in the pdf output, whereas the html output uses different font sizes.

```
<H1>Headline in big text (H1)</H1>
<H2>Headline in big text (H2)</H2>
<H3>Headline in big text (H3)</H3>
<H4>Headline in big text (H4)</H4>
```

Headline in big text (H1)

Headline in big text (H2)

Headline in big text (H3)

Headline in big text (H4)

4.3.1 Non-ASCII Characters

Doxygen understands many HTML quoting characters like ", &uuml;, &ccedil; ı, but not all HTML quoting characters.

This will appear in the document:

For further informations about HTML quoting characters see

http://www.doxygen.org/manual/htmlcmds.html

Alternatively you can use UTF-8 encoding within Doxygen comments.

4.3.2 Document Structure

- \page creates a named page
- \section creates a named section within that page
- \subsection creates a named subsection within the current section
- \subsubsection creates a named subsubsection within the current subsection

All these statements take a "name" as their first argument, and a title as their second argument. The title can contain spaces.

The page, section, and subsection titles are formatted in blue color and a size like "<H1>" , "<H2>" , and "<H3>" , and "<H4>" , respectively.

By FLTK documentation convention, a file like this one with a doxygen documentation chapter has the name "<chapter>.dox". The \page statement at the top of the page is "\page <chapter> This is the title". Sections within a documentation page must be called "<chapter> _ <section>" , where "<chapter>" is the name part of the file, and "<section>" is a unique section name within the page that can be referenced in links. The same for subsections and subsubsections.

These doxygen page and section commands work only in special documentation chapters, not within normal source or header documentation blocks. However, links from normal (e.g. class) documentation to documentation sections do work.

Generated by Doxygen
4.3.3 Creating Links

Links to other documents and external links can be embedded with

- doxygen \ref links to other doxygen \page, \section, \subsection and \anchor locations
- HTML links without markup - doxygen creates "http://..." links automatically
- standard, non-Doxygen, HTML links
  - see chapter \ref unicode creates a link to the named chapter unicode that has been created with a \\page statement.
  - For further informations about quoting see http://www.doxygen.org/manual/htmlcmds.html
  - see <a href="https://www.fltk.org/">FLTK Library</a> creates a standard HTML link

appears as:

- see chapter Unicode and UTF-8 Support creates a link to the named chapter unicode that has been created with a \page statement.
- For further informations about quoting see http://www.doxygen.org/manual/htmlcmds.html
- see FLTK Library creates a standard HTML link

4.3.4 Paragraph Layout

There is no real need to use HTML <P> and </P> tags within the text to tell doxygen to start or stop a paragraph. In most cases, when doxygen encounters a blank line or some, but not all, \commands in the text it knows that it has reached the start or end of a paragraph. Doxygen also offers the \par command for special paragraph handling. It can be used to provide a paragraph title and also to indent a paragraph. Unfortunately \par won't do what you expect if you want to have doxygen links and sometimes html tags don't work either.

\par Normal Paragraph with title
This paragraph will have a title, but because there is a blank line between the \par and the text, it will have the normal layout.

\par Indented Paragraph with title
This paragraph will also have a title, but because there is no blank line between the \par and the text, it will be indented.

\par It is also possible to have an indented paragraph without title.
This is how you indent subsequent paragraphs.

\par No link to Fl_Widget::draw()
Note that the paragraph title is treated as plain text.
Doxygen type links will not work.
HTML characters and tags may or may not work.

Fl_Widget::draw() links and &quot;html&quot; tags work<br>
\par
Use a single line ending with <br> for complicated paragraph titles.

The above code produces the following paragraphs:
Normal Paragraph with title

This paragraph will have a title, but because there is a blank line between the `par` and the text, it will have the normal layout.

Indented Paragraph with title

This paragraph will also have a title, but because there is no blank line between the `par` and the text, it will be indented.

It is also possible to have an indented paragraph without title. This is how you indent subsequent paragraphs.

No link to Fl_Widget::draw()

Note that the paragraph title is treated as plain text. Doxygen type links will not work. HTML characters and tags may or may not work.

Fl_Widget::draw() links and "html" tags work

Use a single line ending with `<br>` for complicated paragraph titles.

4.3.5 Navigation Elements

Each introduction (tutorial) page ends with navigation elements. These elements must only be included in the html documentation, therefore they must be separated with `htmlonly` and `endhtmlonly`.

The following code gives the navigation bar at the bottom of this page:

\htmlonly
<br>
<table summary="navigation bar" width="100%" border="0">
<tr>
<td width="45%" align="LEFT">
<a class="el" href="migration_1_4.html">
[Prev]
Migrating Code from FLTK 1.3 to 1.4</a></td>
<td width="10%" align="CENTER">
<a class="el" href="index.html">
[Index]</a></td>
<td width="45%" align="RIGHT">
<a class="el" href="license.html">
[Next]
Software License</a></td>
</tr>
</table>
\endhtmlonly
Chapter 5

Todo List

Page Adding and Extending Widgets

Clarify Fl_Window::damage(uchar) handling - seems confused/wrong? ORing value doesn't match setting behavior in Fl_Widget.H!

Member Fl::now (double offset=0)

Fl::system_driver()->gettime() was implemented for the Forms library and has a limited resolution (on Windows: milliseconds). On POSIX platforms it uses gettimeofday() with microsecond resolution. A new function could use a better resolution on Windows with its multimedia timers which requires a new dependency: winmm.lib (dll). This could be a future improvement, maybe set as a build option or generally (requires Win95 or 98?).

Member Fl_Browser___::scrollbar_width () const

This method should eventually be removed in 1.4+

Member Fl_Browser___::scrollbar_width (int width)

This method should eventually be removed in 1.4+

Class Fl_Chart

Refactor Fl_Chart::type() information.

Member Fl_File_Input::errorcolor (Fl_Color c)

Remove Fl_File_Input::errorcolor(Fl_Color) in FLTK 1.5.0 or higher.

Member Fl_File_Input::errorcolor () const

Remove Fl_File_Input::errorcolor() in FLTK 1.5.0 or higher.

Member fl_filename_list (const char ∗d, struct dirent ∗∗∗l, Fl_File_Sort_F ∗s=fl_numericsort)

should support returning OS error messages

Class Fl_Grid

This (relative group coordinates of nested groups of Fl_Grid) needs explanation and maybe an example.

Member Fl_Grid::clear_layout ()

Fl_Grid::clear() needs to be implemented as documented above!

Member Fl_Grid::debug (int level=127)

Add more information about cells and children.

Control output by using level.

Member Fl_Grid::Fl_Grid (int X, int Y, int W, int H, const char ∗L=0)

More documentation of Fl_Grid constructor?

Member Fl_Grid::layout ()

Document when and why to call layout() w/o args. See Fl_Flex::layout()

Member Fl_Grid::layout (int rows, int cols, int margin=-1, int gap=-1)

Document when and why to call layout() w/o args. See Fl_Flex::layout()
Member **Fl_Group::delete_child** (int n)
Reimplementation of Fl_Group::delete_child(int) in more FLTK subclasses. This is not yet complete.

Member **fl_height** (int font, int size)
In the future, when the XFT issues are resolved, this function should simply return the 'size' value.

Member **Fl_Help_View::find** (const char ∗s, int p=0)
complex HTML entities for Unicode code points > 0x80 are currently treated like one byte (not character!) and do not (yet) match correctly ("&lt;" matches "<" but "&egrave;" doesn't match "é", and "ö" doesn't match "ö")

Member **Fl_Input_::handle_mouse** (int, int, int, int keepmark=0)
Add comment and parameters

Member **Fl_Input_::handletext** (int e, int, int, int, int)
Add comment and parameters

Struct **Fl_Label**
There is an aspiration that the Fl_Label type will become a widget by itself. That way we will be avoiding a lot of code duplication by handling labels in a similar fashion to widgets containing text. We also provide an easy interface for very complex labels, containing html or vector graphics. However, this re-factoring is not in place in this release.

Member **Fl_Menu_::add** (const char ∗s, int shortcut, Fl_Callback ∗, void ∗=0, int=0)
Raw integer shortcut needs examples. Dependent on responses to https://www.fltk.org/newsgroups.php?g=fltk.coredev+v:10086 and results of STR#2344

Class **Fl_Native_File_Chooser**
Improve documentation about selection of native file choosers on X11/Wayland.

Member **Fl_Shortcut**
Discuss and decide whether we can "shift" these special keyboard flags to the upper byte to enable full 21-bit Unicode characters (U+0000 .. U+10FFFF) plus the keyboard indicator bits as this was originally intended. This would be possible if we could rely on all programs being coded with symbolic names and not hard coded bit values.

Member **Fl_Terminal::scrollbar**
Support scrollbar_left/right() - See Fl_Browser_::scrollbar docs

Member **Fl_Text_Display::extend_range_for_styles** (int ∗start, int ∗end)
Unicode?

Member **Fl_Text_Display::handle_vline** (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const
we need to handle hidden hyphens and tabs here!
we handle all styles and selections
we must provide code to get pixel positions of the middle of a character as well

Member **Fl_Text_Display::overstrike** (const char ∗text)
Unicode? Find out exactly what we do here and simplify.

Member **Fl_Text_Display::position_to_linecol** (int pos, int ∗lineNum, int ∗column) const
a column number makes little sense in the UTF-8/variable font width environment. We will have to further define what exactly we want to return. Please check the functions that call this particular function.

Member **Fl_Text_Display::scroll** (int topLineNum, int horizOffset)
Column numbers make little sense here.

Member **Fl_Text_Display::scrollbar_width** (int width)
This method should eventually be removed

Member **Fl_Text_Display::scrollbar_width()** const
This method should be removed.
Member `Fl_Text_Display::shortcut (int s)`

FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!

Member `Fl_Text_Display::shortcut () const`

FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!

Member `Fl_Text_Display::wrapped_column (int row, int column) const`

What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function TextDXYToUnconstrainedPosition does not exist (nedit port?)

Unicode?

Member `Fl_Text_Display::wrapped_row (int row) const`

What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function TextDXYToUnconstrainedPosition does not exist (nedit port?)

Member `Fl_Tiled_Image::Fl_Tiled_Image (Fl_Image ∗i, int W=0, int H=0)`

Fix Fl_Tiled_Image as background image for widgets and windows and fix the implementation of Fl::scheme(const char ∗).

Member `Fl_Tree::handle (int e) FL_OVERRIDE`

add Fl_Widget_Tracker (see Fl_Browser_.cxx::handle())

Member `Fl_Tree::is_scrollbar (Fl_Widget ∗w)`

should be const

Member `Fl_Tree::show_self ()`

should be const

Member `Fl_Window::show () FL_OVERRIDE`

Check if we can remove resetting the current group in a later FLTK version (after 1.3.x). This may break "already broken" programs though if they rely on this "feature".

Page FLTK Basics

This section needs a major rework. Add a chapter "Building FLTK with CMake".

Page Handling Events

Add details on how to detect repeating keys, since on some X servers a repeating key will generate both FL←KEYUP and FL_KEYDOWN, such that to tell if a key is held, you need Fl::event_key(int) to detect if the key is being held down during FL_KEYUP or not.

Page Unicode and UTF-8 Support

Verify 16/24 bit Unicode limit for different character sets? OksiD's code appears limited to 16-bit whereas the FLTK2 code appears to handle a wider set. What about illegal characters? See comments in fl_utf8fromwc() and fl_ut8toUtf16().

Work through the code and this documentation to harmonize the [OksiD] and [fltk2] functions.

FLTK 1.3 and later supports the full Unicode range (21 bits), but there are a few exceptions, for instance binary shortcut values in menus (Fl_Shortcut) can only be used with characters from the BMP (16 bits). This may be extended in a future FLTK version.
Chapter 6

Deprecated List

Member Fl::release ()
Use Fl::grab(0) instead.

Member Fl::set_idle (FI_Old_Idle_Handler cb)
This method is obsolete - use the add_idle() method instead.

Member Fl::version ()
Use int Fl::api_version() instead.

Member fl_ask (const char ∗fmt,...)
fl_ask() is deprecated since it uses "Yes" and "No" for the buttons which does not conform to the current FLTK Human Interface Guidelines. Use fl_choice() with the appropriate verbs instead.

Member Fl_Browser::::position () const
"in 1.4.0 - use vposition() instead"

Member Fl_Browser::::position (int pos)
"in 1.4.0 - use vposition(pos) instead"

Member Fl_Browser::::scrollbar_width () const
Use scrollbar_size() instead.

Member Fl_Browser::::scrollbar_width (int width)
Use scrollbar_size() instead.

Member fl_clip (int x, int y, int w, int h)
Please use fl_push_clip(int x, int y, int w, int h) instead. fl_clip(int, int, int, int) will be removed in FLTK 1.5.

Member Fl_File_Input::::errorcolor () const
Will be removed in FLTK 1.5.0 or higher.

Member Fl_File_Input::::errorcolor (Fl_Color c)
Will be removed in FLTK 1.5.0 or higher.

Member fl_find (Window xid)
Kept in the X11, Windows, and macOS platforms for compatibility with FLTK versions before 1.4. Please use fl_x11_find(Window), fl_wl_find(struct wid_window*), fl_win32_find(HWND) or fl_mac_find(FLWindow*) with FLTK 1.4.0 and above.

Member Fl_GIF_Image::::GIF Image (const char ∗imagename, const unsigned char ∗data)
Please use Fl_GIF_Image(const char ∗imagename, const unsigned char ∗data, const size_t length) instead.

Member Fl_Group::::focus (Fl_Widget ∗W)
This is for backwards compatibility only. You should use W->take_focus() instead.

Member Fl_Group::::sizes ()
Deprecate since 1.4.0. Please use bounds() instead.
Member `Fl_Image::draw_scaled` (int X, int Y, int W, int H)
   Only for API compatibility with FLTK 1.3.4.

Member `Fl_Image::label (Fl_Menu_Item ∗m)`
   Please use `Fl_Menu_Item::image()` instead.

Member `Fl_Image::label (Fl_Widget ∗w)`
   Please use `Fl_Widget::image()` or `Fl_Widget::deimage()` instead.

Member `Fl_Image_Surface::highres_image ()`
   Use `image()` instead.

Member `Fl_Input::position (int p)`
   "in 1.4.0 - use insert_position(p) instead"

Member `Fl_Input::position (int p, int m)`
   "in 1.4.0 - use insert_position(p, m) or Fl_Widget::position(x, y) instead"

Member `Fl_Input::position () const`
   "in 1.4.0 - use insert_position() instead"

Member `Fl_Menu_Item::check ()`
   Please use `Fl_Menu_Item::set()` instead. This method will be removed in FLTK 1.5.0 or later.

Member `Fl_Menu_Item::checked () const`
   Please use `Fl_Menu_Item::value()` instead. This method will be removed in FLTK 1.5.0 or later.

Member `Fl_Menu_Item::uncheck ()`
   Please use `Fl_Menu_Item::clear()` instead. This method will be removed in FLTK 1.5.0 or later.

Member `Fl_Multi_Label::label (Fl_Menu_Item ∗m)`
   since 1.4.0: please use `Fl_Menu_Item::label(Fl_Multi_Label ∗)`

Member `Fl_Preferences::Fl_Preferences (const char ∗path, const char ∗vendor, const char ∗application)`
   "in 1.4.0 - use Fl_Preferences(path, vendor, application, flags) instead"

Member `Fl_Text_Display::scrollbar_width (int width)`
   Use `scrollbar_size()` instead.

Member `Fl_Text_Display::scrollbar_width () const`
   Use `scrollbar_size()` instead.

Member `Fl_Text_Selection::position (int ∗startpos, int ∗endpos) const`
   "in 1.4.0 - use selected(startpos, endpos) instead"

Member `Fl_Tile::position (int oldx, int oldy, int newx, int newy)`
   "in 1.4.0 - use move_intersection(p) instead"

Member `Fl_Tree::first_visible ()`
   in 1.3.3 ABI – use `first_visible_item()` instead.

Member `Fl_Tree::item_clicked (Fl_Tree_Item ∗val)`
   in 1.3.3 ABI – use `callback_item()` instead.

Member `Fl_Tree::item_clicked ()`
   in 1.3.3 ABI – use `callback_item()` instead.

Member `Fl_Tree::last_visible ()`
   in 1.3.3 – use `last_visible_item()` instead.
**Member Fl_Tree_Item::Fl_Tree_Item (const Fl_Tree_Prefs &prefs)**

in 1.3.3 ABI – you must use Fl_Tree_Item(Fl_Tree+) for proper horizontal scrollbar behavior.

**Member Fl_Tree_Item::next_displayed (Fl_Tree_Prefs &prefs)**

in 1.3.3 for confusing name, use next_visible() instead

**Member Fl_Tree_Item::prev_displayed (Fl_Tree_Prefs &prefs)**

in 1.3.3 for confusing name, use prev_visible()

**Member FL_VERSION**

This double version number is retained for compatibility with existing program code. New code should use int FL_API_VERSION instead. FL_VERSION is deprecated because comparisons of floating point values may fail due to rounding errors. However, there are currently no plans to remove this deprecated constant.

**Member Fl_Widget::color2 (unsigned a)**

Use selection_color(unsigned) instead.

**Member Fl_Widget::color2 () const**

Use selection_color() instead.

**Member Fl_Window::free_position ()**

please use force_position(0) instead

**Member Fl_Window::icon () const**

in 1.3.3

**Member Fl_Window::icon (const void *ic)**

in 1.3.3 in favor of platform-independent methods Fl_Window::icon(const Fl_RGB_Image *icon) and Fl_Window::icons(const Fl_RGB_Image *icons[], int count).

**Page Operating System Issues**

Kept for compatibility with FLTK versions before 1.4. Use preferentially fl_x11_xid(const Fl_Window *) with versions 1.4 and above.

Kept for compatibility with FLTK versions before 1.4. Use preferentially fl_x11_find(Window) with versions 1.4 and above.
Chapter 7

Topic Index

7.1 Topics

Here is a list of all topics with brief descriptions:

- Callback Function Typedefs .......................................................... 265
- Windows handling functions ......................................................... 266
- Events handling functions ............................................................. 268
- Selection & Clipboard functions ................................................... 282
- Screen functions ........................................................................ 287
- Color & Font functions ............................................................... 292
- Drawing functions ..................................................................... 306
- Multithreading support functions ................................................ 338
- Safe widget deletion support functions ...................................... 340
- Cairo Support Functions and Classes .......................................... 342
- Unicode and UTF-8 functions ..................................................... 345
- String handling functions .......................................................... 361
- Mac OS X-specific symbols ......................................................... 361
- Common Dialog Classes and Functions ........................................ 363
- The gtk_shell1 interface ............................................................. 377
- The gtk_surface1 interface ......................................................... 378
- File names and URI utility functions .......................................... 378
Chapter 8

Hierarchical Index

8.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

- Fl_Grid::Cell .................................................. 387
- Fl_Terminal::CharStyle .................................... 387
- Fl_GIF_Image::GIF_FRAME::CPAL .......................... 388
- Fl_Terminal::Cursor ......................................... 388
- Fl_Preferences::Entry ........................................ 389
- Fl_Terminal::EscapeSeq .................................... 389
- Fl ................................................................. 390
- Fl_Cairo_State ............................................... 529
- Fl_Callback_User_Data ..................................... 543
- FL_CHART_ENTRY .............................................. 557
- Fl_End ......................................................... 663
- Fl_File_Chooser ............................................. 682
- Fl_File_Icon .................................................. 689
- Fl_Gl_Choice .................................................. 784
- Fl_Glut_Bitmap_Font ....................................... 805
- Fl_Glut_StrokeChar ......................................... 806
- Fl_Glut_StrokeFont .......................................... 806
- Fl_Glut_StrokeStrip ......................................... 806
- Fl_Glut_StrokeVertex ....................................... 806
- Fl_Help_Block ............................................... 862
- Fl_Help_Dialog ............................................... 863
- Fl_Help_Font_Stack ......................................... 865
- Fl_Help_Font_Style .......................................... 865
- Fl_Help_Link .................................................. 866
- Fl_Help_Target ............................................... 866
- Fl_Image ......................................................... 932
  - Fl_Bitmap .................................................. 444
    - Fl_XBM_Image ........................................... 1949
  - Fl_Pixmap ................................................ 1192
    - Fl_GIF_Image ........................................... 779
      - Fl_Anim_GIF_Image ..................................... 429
    - Fl_XPM_Image ........................................... 1952
  - Fl_RGB_Image ............................................. 1308
  - Fl_BMP_Image ............................................. 450
    - Fl_ICO_Image ........................................... 928
  - Fl_JPEG_Image ............................................ 1009
  - Fl_PNG_Image ............................................. 1204
  - Fl_PNM_Image ............................................. 1208
  - Fl_SVG_Image ............................................. 1480
  - Fl_Shared_Image ......................................... 1401

Chapter 9

Class Index

9.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

- Fl_Grid::Cell
- Fl_Terminal::CharStyle
- Fl_GIF_Image::GIF_FRAME::CPAL
- Fl_Terminal::Cursor
- Fl_Preferences::Entry
- Fl_Terminal::EscapeSeq

The Fl is the FLTK global (static) class containing state information and global methods for the current application.

- Fl_Adjuster
  - Was stolen from Prisms, and has proven to be very useful for values that need a large dynamic range.

- Fl_Anim_GIF_Image
  - Supports loading, caching, and drawing of animated Compuserve GIF℠ images.

- Fl_Bitmap
  - Supports caching and drawing of mono-color (bitmap) images.

- Fl_BMP_Image
  - Supports loading, caching, and drawing of Windows Bitmap (BMP) image files.

- Fl_Box
  - This widget simply draws its box, and possibly its label.

- Fl_Browser
  - Displays a scrolling list of text lines, and manages all the storage for the text.

- Fl_Browser
  - This is the base class for browsers.

- Fl_Button
  - Buttons generate callbacks when they are clicked by the user.

- Fl_Cairo_State
  - Contains all the necessary info on the current cairo context.

- Fl_Cairo_Window
  - This defines an FLTK window with Cairo support.

- Fl_Callback_User_Data
  - A class prototype that allows for additional data in callbacks.

- Fl_Chart
  - Fl_Chart displays simple charts.

- FL_CHART_ENTRY
  - For internal use only.

- Fl_Check_Browser
  - Displays a scrolling list of text lines that may be selected and/or checked by the user.

- Fl_Check_Button
  - A button with a "checkmark" to show its status.

Generated by Doxygen
Fl_Choice
A button that is used to pop up a menu .................................................. 580

Fl_Clock
This widget provides a round analog clock display .................................... 592

Fl_Clock_Output
This widget can be used to display a program-supplied time ....................... 601

Fl_Color_Chooser
Standard RGB color chooser ................................................................. 611

Fl_Copy_Surface
Supports copying of graphical data to the clipboard .................................. 623

Fl_Counter
Controls a single floating point value with button (or keyboard) arrows ........ 627

Fl_Device_Plugin
This plugin socket allows the integration of new device drivers for special window or screen types 638

Fl_Dial
Circular dial to control a single floating point value ............................... 639

Fl_Display_Device
The computer's display ........................................................................... 648

Fl_Double_Window
The Fl_Double_Window provides a double-buffered window ....................... 650

Fl_End
This is a dummy class that allows you to end a Fl_Group in a constructor list of a class: 663

Fl_EPS_File_Surface
Encapsulated PostScript drawing surface .................................................. 664

Fl_File_Browser
Displays a list of filenames, optionally with file-specific icons .................... 667

Fl_File_Chooser
Displays a standard file selection dialog that supports various selection modes 682

Fl_File_Icon
Manages icon images that can be used as labels in other widgets and as icons in the FileBrowser widget ................................. 689

Fl_File_Input
This widget displays a pathname in a text input field ............................... 694

Fl_Fill_Dial
Draws a dial with a filled arc ................................................................. 706

Fl_Fill_Slider
Widget that draws a filled horizontal slider, useful as a progress or value meter 714

Fl_Flex
Fl_Flex is a container (layout) widget for one row or one column of widgets .......... 722

Fl_Float_Input
Subclass of Fl_Input that only allows the user to type floating point numbers (sign, digits, decimal point, more digits, 'E' or 'e', sign, digits) 740

Fl_FormsBitmap
Forms compatibility Bitmap Image Widget ............................................ 750

Fl_FormsPixmap
Forms pixmap drawing routines ........................................................... 757

Fl_FormsText
............................................................... 764

Fl_Free
Emulation of the Forms "free" widget ..................................................... 771

Fl_GIF_Image
Supports loading, caching, and drawing of Compuserve GIF^SM^ images .......... 779

Fl_GL_Choice
............................................................... 784

Fl_GL_Window
Sets things up so OpenGL works ......................................................... 785

Fl_Gl_Choice
............................................................... 784

Fl_Gl_Window
Sets things up so OpenGL works ......................................................... 785

Fl_Gl_Choice
............................................................... 784

Fl_Gl_Window
Sets things up so OpenGL works ......................................................... 785

Fl_Glut_Bitmap_Font
Fltk glut font/size attributes used in the glutXXX functions .................... 805

Fl_Glut_StrokeChar
............................................................... 806

Fl_Glut_StrokeFont
............................................................... 806

Generated by Doxygen
**Fl_Glut_StrokeStrip**

GLUT is emulated using this window class and these static variables (plus several more static variables hidden in glut_compatibility.cxx):

**Fl_Glut_StrokeVertex**

**Fl_Glut_Window**

**Fl_Grid**

Fl_Grid is a container (layout) widget with multiple columns and rows.

**Fl_Group**

FLTK container widget.

**Fl_Help_Block**

Definition of a link for the html viewer.

**Fl_Help_Dialog**

Displays a standard help dialog window using the Fl_Help_View widget.

**Fl_Help_Font_Stack**

Fl_Help_View font stack element definition.

**Fl_Help_Font_Style**

Fl_Help_Font_Stack.

**Fl_Help_Link**

Definition of a link for the html viewer.

**Fl_Help_Target**

Fl_Help_Target structure.

**Fl_Help_View**

Displays HTML text.

**Fl_Hold_Browser**

The Fl_Hold_Browser is a subclass of Fl_Browser which lets the user select a single item, or no items by clicking on the empty space.

**Fl_Hor_Fill_Slider**

Single thumb tab slider.

**Fl_Hor_Nice_Slider**

Horizontal Slider class.

**Fl_Hor_Slider**

Horizontal Slider class.

**Fl_ICO_Image**

Supports loading, caching, and drawing of Windows icon (.ico) files.

**Fl_Image**

Base class for image caching, scaling and drawing.

**Fl_Image_Reader**

Directs all graphics requests to an Fl_Image.

**Fl_Input**

This is the FLTK text input widget.

**Fl_Input_Choice**

A combination of the input widget and a menu button.

**Fl_Int_Input**

Subclass of Fl_Input that only allows the user to type decimal digits (or hex numbers of the form 0xaff).

**Fl_JPEG_Image**

Supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images.

**Fl_Label**

This struct stores all information for a text or mixed graphics label.

**Fl_Light_Button**

This subclass displays the "on" state by turning on a light, rather than drawing pushed in.

**Fl_Line_Dial**

Base class of all widgets that have a menu in FLTK.

<tr>
<td>Fl_Table_Row</td>
<td>A table with row selection capabilities</td>
<td>1529</td>
</tr>
<tr>
<td>Fl_Tabs</td>
<td>Container widget that displays a set of tabs, with each tab representing a different child widget</td>
<td>1544</td>
</tr>
</tbody>
</table>
FL_Terminal
Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control

FL_Text_Buffer
This class manages Unicode text displayed in one or more FL_Text_Display widgets

FL_Text_Display
Rich text display widget

FL_Text_Editor
This is the FLTK text editor widget

FL_Text_Selection
This is an internal class for FL_Text_Buffer to manage text selections

FL_Tile
Lets you resize its children by dragging the border between them

FL_Text_Buffer
This class manages Unicode text displayed in one or more FL_Text_Display widgets

FL_Terminal
Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control

FL_Text_Display
Rich text display widget

FL_Text_Editor
This is the FLTK text editor widget

FL_Text_Selection
This is an internal class for FL_Text_Buffer to manage text selections

FL_Tile
Lets you resize its children by dragging the border between them

FL_Timeout
The internal class FL_Timeout handles all timeout related functions

FL_Timer
This is provided only to emulate the Forms Timer widget

FL_Toggle_Button
The toggle button is a push button that needs to be clicked once to toggle on, and one more time
to toggle off

FL_Tooltip
Tooltip support for all FLTK widgets

FL_Tree
Tree widget

FL_Tree_Item
Tree widget item

FL_Tree_Item_Array
Manages an array of FL_Tree_Item pointers

FL_Tree_Prefs
Tree widget's preferences

FL_Valuator
Controls a single floating-point value and provides a consistent interface to set the value, range,
and step, and insures that callbacks are done the same for every object

FL_Value_Input
Displays a numeric value

FL_Value_Output
Displays a floating point value

FL_Value_Slider
FL_Slider widget with a box displaying the current value

FL_Widget
FL_Widget is the base class for all widgets in FLTK

FL_Widget_Surface
A surface on which any FLTK widget can be drawn

FL_Widget_Tracker
This class should be used to control safe widget deletion

FL_WINDOW
This widget produces an actual window

FL_Wizard
This widget is based off the FL_Tabs widget, but instead of displaying tabs it only changes "tabs"
under program control

FL_XBM_Image
Supports loading, caching, and drawing of X Bitmap (XBM) bitmap files

FL_XColor

FL_XPM_Image
Supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency

FL_GIF_Image::GIF_FRAME

gtk_shell1_listener

Generated by Doxygen
9.1 Class List

- `gtk_surface1_listener` .............................................. 1956
- `Fl_ICO_Image::IconDirEntry`
  Windows ICONDIRENTRY structure
  1956
- `Fl_Text_Editor::Key_Binding`
  Simple linked list item associating a key/state to a function 1957
- `Fl_Terminal::Margin` ............................................. 1957
- `Fl_Preferences::Name`
  'Name' provides a simple method to create numerical or more complex procedural names for
  entries and groups on the fly ................................. 1957
- `Fl_Preferences::Node` .......................................... 1958
- `Fl_Paged_Device::page_format`
  Width, height and name of a page format .......................... 1959
- `Fl_Terminal::PartialUtf8Buf` .................................... 1960
- `Fl_Terminal::RingBuffer` ....................................... 1960
- `Fl_Preferences::RootNode` ...................................... 1961
- `Fl_Scroll::ScrollInfo`
  Structure to manage scrollbar and widget interior sizes .......... 1961
- `Fl_Terminal::Selection` ........................................ 1962
- `Fl_Tile::Size_Range` .......................................... 1962
- `Fl_Text_Display::Style_Table_Entry`
  This structure associates the color, font, and font size of a string to draw with an attribute mask
  matching attr .............................................. 1963
- `Fl_Terminal::Utf8Char` ......................................... 1963

File Index

10.1 File List

Here is a list of all documented files with brief descriptions:

- **Enumerations.H**
  This file contains type definitions and general enumerations .................................. 1965
- **filename.H**
  File names and URI utility functions ............................................................... 1998
- **Fl.H**
  Fl static class ................................................................................................. 2000
- **Fl_Adjuster.H** .............................................................................................. 2008
- **Fl_Anim_GIF_Image.H** .................................................................................... 2009
- **fl_ask.H**
  API for common dialogs ..................................................................................... 2010
- **fl_attr.h**
  This file defines compiler-specific macros ......................................................... 2014
- **Fl_Bitmap.H** .................................................................................................. 2016
- **Fl_BMP_Image.H** ............................................................................................. 2017
- **Fl_Box.H**
  Fl_Box widget ....................................................................................................... 2018
- **Fl_Browser.H** .................................................................................................. 2018
- **Fl_Browser_.H** .................................................................................................. 2020
- **Fl_Button.H** ..................................................................................................... 2022
- **Fl_Cairo.H**
  Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland) ................................................................. 2023
- **Fl_Cairo_Window.H**
  Fl_Cairo_Window, an FLTK window incorporating a Cairo draw callback ............... 2024
- **fl_callback_macros.H**
  This file provides macros for easy function and method callbacks with multiple type safe arguments ................................................................. 2025
- **fl_casts.H** ........................................................................................................ 2034
- **Fl_Chart.H**
  Fl_Chart widget .................................................................................................... 2034
- **Fl_Check_Browser.H** ....................................................................................... 2036
- **Fl_Check_Button.H** .......................................................................................... 2037
- **Fl_choice.H** ...................................................................................................... 2038
- **Fl_Clock.H** ....................................................................................................... 2038
- **Fl_Color_Chooser.H**
  Fl_Color_Chooser widget .................................................................................... 2039
- **fl_config.h** ....................................................................................................... 2041
- **Fl_Copy_Surface.H** ......................................................................................... 2042
- **Fl_Counter.H** ................................................................................................... 2043

Topic Documentation

11.1 Callback Function Typedefs

Typedefs defined in `<FL/Fl.H>` for callback or handler functions passed as function parameters.

**Typedefs**

- `typedef void(Fl_Abort_Handler)(const char *format,...)`
  
  Signature of `set_abort` functions passed as parameters.

- `typedef int(Fl_Args_Handler)(int argc, char **argv, int &i)`
  
  Signature of `args` functions passed as parameters.

- `typedef void(Fl_Atclose_Handler)(Fl_Window *window, void *data)`
  
  Signature of `set_atclose` functions passed as parameters.

- `typedef void(Fl_Awake_Handler)(void *data)`
  
  Signature of some wakeup callback functions passed as parameters.

- `typedef void(Fl_Box_Draw_F)(int x, int y, int w, int h, Fl_Color color)`
  
  Signature of some box drawing functions passed as parameters.

- `typedef void(Fl_Clipboard_Notify_Handler)(int source, void *data)`
  
  Signature of `add_clipboard_notify` functions passed as parameters.

- `typedef int(Fl_Event_Dispatch)(int event, Fl_Window *w)`
  
  Signature of `event_dispatch` functions passed as parameters.

- `typedef int(Fl_Event_Handler)(int event)`
  
  Signature of `add_handler` functions passed as parameters.

- `typedef void(Fl_FD_Handler)(FL_SOCKET fd, void *data)`
  
  Signature of `add_fd` functions passed as parameters.

- `typedef void(Fl_Idle_Handler)(void *data)`
  
  Signature of `add_idle` callback functions passed as parameters.

- `typedef void(Fl_Timeout_Handler)(void *data)`
  
  Signature of timeout callback functions passed as parameters.
11.1.1 Detailed Description

Typedefs defined in `<FL/Fl.H>` for callback or handler functions passed as function parameters. FLTK uses callback functions as parameters for some function calls, e.g. to set up global event handlers (`Fl::add_handler()`), to add a timeout handler (`Fl::add_timeout()`), and many more. The typedefs defined in this group describe the function parameters used to set up or clear the callback functions and should also be referenced to define the callback function to handle such events in the user's code.

See also `Fl::add_handler()`, `Fl::add_timeout()`, `Fl::repeat_timeout()`, `Fl::remove_timeout()` and others

11.1.2 Typedef Documentation

11.1.2.1 `Fl_Event_Dispatch`

```c
typedef int(* Fl_Event_Dispatch) (int event, Fl_Window *w)
```

Signature of event_dispatch functions passed as parameters.

See also `Fl::event_dispatch(Fl_Event_Dispatch)`

11.1.2.2 `Fl_Timeout_Handler`

```c
typedef void(* Fl_Timeout_Handler) (void *data)
```

Signature of timeout callback functions passed as parameters. Please see `Fl::add_timeout()` for details.

11.2 Windows handling functions

Windows and standard dialogs handling declared in `<FL/Fl.H>`

Functions

- static void `Fl::default_atclose (Fl_Window *, void *)`
  
  Default callback for window widgets.

- static `Fl_Window * Fl::first_window ()`
  
  Returns the first top-level window in the list of shown() windows.

- static void `Fl::first_window (Fl_Window *)`
  
  Sets the window that is returned by `first_window()`.

- static `Fl_Window * Fl::grab ()`
  
  Returns the window that currently receives all events.

- static void `Fl::grab (Fl_Window *)`
  
  Selects the window to grab.

- static `Fl_Window * Fl::modal ()`
  
  Returns the top-most modal() window currently shown.

- static `Fl_Window * Fl::next_window (const Fl_Window *)`
  
  Returns the next top-level window in the list of shown() windows.

- static void `Fl::set_abort (Fl_Abort_Handler f)`
  
  For back compatibility, sets the void `Fl::fatal` handler callback.

- static void `Fl::set_atclose (Fl_Atclose_Handler f)`
  
  For back compatibility, sets the `Fl::atclose` handler callback.

Variables

- static void(* `Fl::atclose (Fl_Window *, void *)`)
  
  Back compatibility: default window callback handler.
11.2 Windows handling functions

11.2.1 Detailed Description
Windows and standard dialogs handling declared in `<FL/FL.H>`

11.2.2 Function Documentation

11.2.2.1 default_atclose()

```c
void Fl::default_atclose ( 
    Fl_Window * window, 
    void * v ) [static]
```

Default callback for window widgets.
It hides the window and then calls the default widget callback.

11.2.2.2 first_window [1/2]

```c
Fl_Window * Fl::first_window ( ) [static]
```

Returns the first top-level window in the list of shown() windows.
If a modal() window is shown this is the top-most modal window, otherwise it is the most recent window to get an event.

11.2.2.3 first_window [2/2]

```c
void Fl::first_window ( 
    Fl_Window * window ) [static]
```

Sets the window that is returned by first_window().
The window is removed from wherever it is in the list and inserted at the top. This is not done if Fl::modal() is on or if the window is not shown(). Because the first window is used to set the "parent" of modal windows, this is often useful.

11.2.2.4 grab [1/2]

```c
static Fl_Window * Fl::grab ( ) [inline], [static]
```

Returns the window that currently receives all events.

Optional returns
- The window that currently receives all events, or NULL if event grabbing is currently OFF.

11.2.2.5 grab [2/2]

```c
void Fl::grab ( 
    Fl_Window * win ) [static]
```

Selects the window to grab.
This is used when pop-up menu systems are active.
Send all events to the passed window no matter where the pointer or focus is (including in other programs). The window does not have to be shown(). This lets the handle() method of a "dummy" window override all event handling and allows you to map and unmap a complex set of windows (under both X and Windows some window must be mapped because the system interface needs a window id).
If grab() is on it will also affect show() of windows by doing system-specific operations (on X it turns on override-redirect). These are designed to make menus popup reliably and faster on the system.
To turn off grabbing do Fl::grab(0).
Be careful that your program does not enter an infinite loop while grab() is on. On X this will lock up your screen!
To avoid this potential lockup, all newer operating systems seem to limit mouse pointer grabbing to the time during which a mouse button is held down. Some OS's may not support grabbing at all.

11.2.2.6 modal()

```c
static Fl_Window * Fl::modal ( ) [inline], [static]
```

Returns the top-most modal() window currently shown.

Generated by Doxygen
This is the most recently shown() window with modal() true, or NULL if there are no modal() windows shown(). The modal() window has its handle() method called for all events, and no other windows will have handle() called (grab() overrides this).

### 11.2.2.7 next_window()

```c
Fl_Window * Fl::next_window (const Fl_Window * window ) [static]
```

Returns the next top-level window in the list of shown() windows. You can use this call to iterate through all the windows that are shown().

Parameters

- **window** must be shown and not NULL

### 11.2.2.8 set_atclose()

```c
static void Fl::set_atclose (Fl_Atclose_Handler f) [inline], [static]
```

For back compatibility, sets the Fl::atclose handler callback. You can now simply change the callback for the window instead.

See also

- `Fl_Window::callback(Fl_Callback*)`

### 11.2.3 Variable Documentation

#### 11.2.3.1 atclose

```c
void(* Fl::atclose)(Fl_Window *, void *)=default_atclose [static], [default]
```

Back compatibility: default window callback handler.

See also

- `Fl::set_atclose()`

### 11.3 Events handling functions

Fl class events handling API declared in `<FL/FL.H>`

**Functions**

- static void Fl::add_handler (Fl_Event_Handler h)
  
  Install a function to parse unrecognized events.

- static void Fl::add_system_handler (Fl_System_Handler h, void *data)
  
  Install a function to intercept system events.

- static Fl_Widget * Fl::belowmouse ()
  
  Gets the widget that is below the mouse.

- static void Fl::belowmouse (Fl_Widget *)
  
  Sets the widget that is below the mouse.

- static Fl_Callback_Reason Fl::callback_reason ()
  
  Give the reason for calling a callback.

- static int Fl::compose (int &del)
  
  Any text editing widget should call this for each FL_KEYBOARD event.

- static void Fl::compose_reset ()
  
  If the user moves the cursor, be sure to call Fl::compose_reset().
11.3 Events handling functions

- static void Fl::disable_im()
  
  Disables the system input methods facilities.

- static void Fl::enable_im()
  
  Enables the system input methods facilities.

- static int Fl::event()
  
  Returns the last event that was processed.

- static int Fl::event_alt()
  
  Returns non-zero if the Alt key is pressed.

- static int Fl::event_button()
  
  Gets which particular mouse button caused the current event.

- static int Fl::event_button1()
  
  Returns non-zero if mouse button 1 is currently held down.

- static int Fl::event_button2()
  
  Returns non-zero if button 2 is currently held down.

- static int Fl::event_button3()
  
  Returns non-zero if button 3 is currently held down.

- static int Fl::event_buttons()
  
  Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.

- static int Fl::event_clicks()
  
  Returns non-zero if we had a double click event.

- static void Fl::event_clicks(int i)
  
  Manually sets the number returned by Fl::event_clicks().

- static void * Fl::event_clipboard()
  
  During an FL_PASTE event of non-textual data, returns a pointer to the pasted data.

- static const char * Fl::event_clipboard_type()
  
  Returns the type of the pasted data during an FL_PASTE event.

- static int Fl::event_command()
  
  Returns non-zero if the FL_COMMAND key is pressed, either FL_CTRL or on OSX FL_META.

- static int Fl::event_ctrl()
  
  Returns non-zero if the Control key is pressed.

- static Fl::Event_Dispatch Fl::event_dispatch()
  
  Return the current event dispatch function.

- static void Fl::event_dispatch(Fl::Event_Dispatch d)
  
  Set a new event dispatch function.

- static int Fl::event_dx()
  
  Returns the current horizontal mouse scrolling associated with the FL_MOUSEWHEEL event.

- static int Fl::event_dy()
  
  Returns the current vertical mouse scrolling associated with the FL_MOUSEWHEEL event.

- static int Fl::event_inside(const Fl_Widget *)
  
  Returns whether or not the mouse event is inside a given child widget.

- static int Fl::event_inside(int, int, int, int)
  
  Returns whether or not the mouse event is inside the given rectangle.

- static int Fl::event_is_click()
  
  Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last FL_PUSH or FL_KEYBOARD event for it to be considered a "drag" rather than a "click".

- static void Fl::event_is_click(int i)
  
  Clears the value returned by Fl::event_is_click().

- static int Fl::event_key()
  
  Gets which key on the keyboard was last pushed.

- static int Fl::event_key(int key)
  
  Returns true if the given key was held down (or pressed) during the last event.
• static int Fl::event_length ()
  Returns the length of the text in Fl::event_text().

• static int Fl::event_original_key ()
  Returns the keycode of the last key event, regardless of the NumLock state.

• static int Fl::event_shift ()
  Returns non-zero if the Shift key is pressed.

• static int Fl::event_state ()
  Returns the keyboard and mouse button states of the last event.

• static int Fl::event_state (int mask)
  Returns non-zero if any of the passed event state bits are turned on.

• static const char * Fl::event_text ()
  Returns the text associated with the current event, including FL_PASTE or FL_DND_RELEASE events.

• static int Fl::event_x ()
  Returns the mouse position of the event relative to the Fl_Window it was passed to.

• static int Fl::event_x_root ()
  Returns the mouse position on the screen of the event.

• static int Fl::event_y ()
  Returns the mouse position of the event relative to the Fl_Window it was passed to.

• static int Fl::event_y_root ()
  Returns the mouse position on the screen of the event.

• static Fl_Widget * Fl::focus ()
  Gets the current Fl::focus() widget.

• static void Fl::focus (Fl_Widget *)
  Sets the widget that will receive FL_KEYBOARD events.

• static int Fl::get_key (int key)
  Returns true if the given key is held down now.

• static void Fl::get_mouse (int &, int &)
  Return where the mouse is on the screen by doing a round-trip query to the server.

• static int Fl::handle (int, Fl_Window *)
  Handle events from the window system.

• static int Fl::handle_ (int, Fl_Window *)
  Handle events from the window system.

• static Fl_Widget * Fl::pushed ()
  Gets the widget that is being pushed.

• static void Fl::pushed (Fl_Widget *)
  Sets the widget that is being pushed.

• static void Fl::remove_handler (Fl_Event_Handler h)
  Removes a previously added event handler.

• static void Fl::remove_system_handler (Fl_System_Handler h)
  Removes a previously added system event handler.

• static int Fl::test_shortcut (Fl_Shortcut)
  Tests the current event, which must be an FL_KEYBOARD or FL_SHORTCUT, against a shortcut value (described in Fl_Button).

Variables

• const char *const fl_callback_reason_names []
  This is an array of callback reason names you can use to convert font numbers into names.

• const char *const fl_eventnames []
  This is an array of event names you can use to convert event numbers into names.

• const char *const fl_fontnames []
  This is an array of font names you can use to convert font numbers into names.
11.3 Events handling functions

11.3.1 Detailed Description

FL class events handling API declared in `<FL/FL.H>`

11.3.2 Function Documentation

11.3.2.1 `add_handler()`

```c
void Fl::add_handler ( 
    Fl_Event_Handler ha ) [static]
```

Install a function to parse unrecognized events. If FLTK cannot figure out what to do with an event, it calls each of these functions (most recent first) until one of them returns non-zero. If none of them returns non-zero then the event is ignored. Events that cause this to be called are:

- FL_SHORTCUT events that are not recognized by any widget. This lets you provide global shortcut keys.
- FL_SCREEN_CONFIGURATION_CHANGED events. Under X11, this event requires the libXrandr.so shared library to be loadable at run-time and the X server to implement the RandR extension.
- FL_ZOOM_EVENT events.
- System events that FLTK does not recognize. See `fl_xevent`.
- Some other events when the widget FLTK selected returns zero from its `handle()` method. Exactly which ones may change in future versions, however.

See also

- `Fl::remove_handler(Fl_Event_Handler)`
- `Fl::event_dispatch(Fl_Event_Dispatch d)`
- `Fl::handle(int, Fl_Window*)`

11.3.2.2 `add_system_handler()`

```c
void Fl::add_system_handler ( 
    Fl_System_Handler ha, 
    void * data ) [static]
```

Install a function to intercept system events. FLTK calls each of these functions as soon as a new system event is received. The processing will stop at the first function to return non-zero. If all functions return zero then the event is passed on for normal handling by FLTK. Each function will be called with a pointer to the system event as the first argument and `data` as the second argument. The system event pointer will always be void *, but will point to different objects depending on the platform:

- X11: XEvent
- Windows: MSG
- OS X: NSEvent

Parameters

<table>
<thead>
<tr>
<th>ha</th>
<th>The event handler function to register</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>User data to include on each call</td>
</tr>
</tbody>
</table>

See also

- `Fl::remove_system_handler(Fl_System_Handler)`
11.3.2.3 **belowmouse()** [1/2]

```cpp
static Fl_Widget * Fl::belowmouse ( ) [inline], [static]
```

Gets the widget that is below the mouse.

See also

```cpp
belowmouse(Fl_Widget*)
```

11.3.2.4 **belowmouse()** [2/2]

```cpp
void Fl::belowmouse ( Fl_Widget * o ) [static]
```

Sets the widget that is below the mouse.

This is for highlighting buttons. It is not used to send FL_PUSH or FL_MOVE directly, for several obscure reasons, but those events typically go to this widget. This is also the first widget tried for FL_SHORTCUT events.

If you change the belowmouse widget, the previous one and all parents (that don't contain the new widget) are sent FL_LEAVE events. Changing this does not send FL_ENTER to this or any widget, because sending FL_ENTER is supposed to test if the widget wants the mouse (by it returning non-zero from handle()).

11.3.2.5 **callback_reason()**

```cpp
Fl_Callback_Reason Fl::callback_reason ( ) [static]
```

Give the reason for calling a callback.

Returns

the reason for the current callback

See also

```cpp
Fl_Widget::when(), Fl_Widget::do_callback(), Fl_Widget::callback()
```

11.3.2.6 **compose()**

```cpp
int Fl::compose ( int & del ) [static]
```

Any text editing widget should call this for each FL_KEYBOARD event.

Use of this function is very simple.

If **true** is returned, then it has modified the `Fl::event_text()` and `Fl::event_length()` to a set of bytes to insert (it may be of zero length!). It will also set the "del" parameter to the number of bytes to the left of the cursor to delete, this is used to delete the results of the previous call to `Fl::compose()`.

If **false** is returned, the keys should be treated as function keys, and del is set to zero. You could insert the text anyways, if you don't know what else to do.

Text editing widgets can preferentially call `fl_set_spot()` to indicate the window coordinates of the bottom of the current insertion point and the line height. This way, auxiliary windows that help choosing among alternative characters with some text input methods appear just below or above the insertion point. If widgets don't do that, such auxiliary windows appear at the widget's bottom.

On some platforms, text input can involve marked text, that is, temporary text replaced by other text during the input process. This occurs, e.g., under Wayland or macOS when using dead keys or when entering CJK characters. Text editing widgets should preferentially signal marked text, usually underlining it..Widgets can use `int Fl::compose_state after having called Fl::compose(int&)` to obtain the length in bytes of marked text that always finishes at the current insertion point. Widgets should also call void `fl_reset_spot()` when processing FL_UNFOCUS events. The `Fl_Input` and `Fl_Text_Editor` widgets underline marked text. If none of this is done by a user-defined text editing widget, text input will work, but will not signal to the user what text is marked.

Finally, text editing widgets should call `set_flag(MAC_USE_ACCENTS_MENU);` in their constructor if they want to use, on the macOS platform, the feature introduced with Mac OS 10.7 "Lion" where pressing and holding certain keys on the keyboard opens a diacritic marks popup window.
11.3 Events handling functions

Note

For compatibility with FLTK 1.3, text editing widgets can call `Fl::insertion_point_location(int x, int y, int height)` and `Fl::reset_marked_text()` only under the macOS platform to indicate/reset the coordinates of the current insertion point. This is deprecated in version 1.4 because redundant with the platform-independent `fl_set_spot()` and `fl_reset_spot()` functions.

11.3.2.7 compose_reset()

```cpp
void Fl::compose_reset ( ) [static]
```

If the user moves the cursor, be sure to call `Fl::compose_reset()`. The next call to `Fl::compose()` will start out in an initial state. In particular it will not set "del" to non-zero. This call is very fast so it is ok to call it many times and in many places.

11.3.2.8 disable_im()

```cpp
void Fl::disable_im ( ) [static]
```

Disables the system input methods facilities.

See also

```cpp
enable_im()
```

11.3.2.9 enable_im()

```cpp
void Fl::enable_im ( ) [static]
```

Enables the system input methods facilities. This is the default.

See also

```cpp
disable_im()
```

11.3.2.10 event()

```cpp
static int Fl::event ( ) [inline], [static]
```

Returns the last event that was processed. This can be used to determine if a callback is being done in response to a keypress, mouse click, etc.

11.3.2.11 event_button()

```cpp
static int Fl::event_button ( ) [inline], [static]
```

Gets which particular mouse button caused the current event. This returns garbage if the most recent event was not a FL_PUSH or FL_RELEASE event.

Return values

<table>
<thead>
<tr>
<th>FL_LEFT_MOUSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_MIDDLE_MOUSE</td>
</tr>
<tr>
<td>FL_RIGHT_MOUSE</td>
</tr>
</tbody>
</table>

See also

```cpp
Fl::event_buttons()
```

11.3.2.12 event_button1()

```cpp
static int Fl::event_button1 ( ) [inline], [static]
```
Returns non-zero if mouse button 1 is currently held down.
For more details, see Fl::event_buttons().

11.3.2.13  event_button2()

static int Fl::event_button2 ( ) [inline], [static]
Returns non-zero if button 2 is currently held down.
For more details, see Fl::event_buttons().

11.3.2.14  event_button3()

static int Fl::event_button3 ( ) [inline], [static]
Returns non-zero if button 3 is currently held down.
For more details, see Fl::event_buttons().

11.3.2.15  event_buttons()

static int Fl::event_buttons ( ) [inline], [static]
Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.
This function returns the button state at the time of the event. During an FL_RELEASE event, the state of the
released button will be 0. To find out, which button caused an FL_RELEASE event, you can use Fl::event_button()
instead.

Returns
a bit mask value like \{ FL_BUTTON1 | FL_BUTTON2 | FL_BUTTON3 \}

11.3.2.16  event_clicks() [1/2]

static int Fl::event_clicks ( ) [inline], [static]
Returns non-zero if we had a double click event.

Return values

| Non-zero | if the most recent FL_PUSH or FL_KEYBOARD was a "double click". |
| N-1      | for N clicks. A double click is counted if the same button is pressed again while event_is_click() is true. |

11.3.2.17  event_clicks() [2/2]

static void Fl::event_clicks (int i ) [inline], [static]
Manually sets the number returned by Fl::event_clicks().
This can be used to set it to zero so that later code does not think an item was double-clicked.

Parameters

| in     | i | corresponds to no double-click if 0, i+1 mouse clicks otherwise |

See also

int event_clicks()

11.3.2.18  event_clipboard()

static void * Fl::event_clipboard ( ) [inline], [static]
During an FL_PASTE event of non-textual data, returns a pointer to the pasted data.
The returned data is an Fl_RGB_Image * when the result of Fl::event_clipboard_type() is Fl::clipboard_image.
11.3 Events handling functions

11.3.2.19  event_clipboard_type()

static const char * Fl::event_clipboard_type () [inline], [static]
Returns the type of the pasted data during an FL_PASTE event.
This type can be Fl::clipboard_plain_text or Fl::clipboard_image.

11.3.2.20  event_dispatch()

void Fl::event_dispatch (      
   Fl_Event_Dispatch d ) [static]
Set a new event dispatch function.
The event dispatch function is called after native events are converted to FLTK events, but before they are handled by FLTK. If the dispatch function Fl_Event_Dispatch d is set, it is up to the dispatch function to call Fl::handle_(int, Fl_Window*) or to ignore the event.
The dispatch function itself must return 0 if it ignored the event, or non-zero if it used the event. If you call Fl::handle_(), then this will return the correct value.
The event dispatch can be used to handle exceptions in FLTK events and callbacks before they reach the native event handler:

```c
int myHandler(int e, Fl_Window *w) {  
   try {  
      return Fl::handle_(e, w);  
   } catch (...) {  
      ...  
   }  
}

main() {  
   Fl::event_dispatch(myHandler);  
   Fl::run();  
}
```

Parameters

| d | new dispatch function, or NULL |

See also

Fl::add_handler(Fl_Event_Handler)
Fl::handle(int, Fl_Window*)
Fl::handle_(int, Fl_Window*)

11.3.2.21  event_dx()

static int Fl::event_dx ( ) [inline], [static]
Returns the current horizontal mouse scrolling associated with the FL_MOUSEWHEEL event.
Right is positive.

11.3.2.22  event_dy()

static int Fl::event_dy ( ) [inline], [static]
Returns the current vertical mouse scrolling associated with the FL_MOUSEWHEEL event.
Down is positive.

11.3.2.23  event_inside() [1/2]

int Fl::event_inside (      
   const Fl_Widget * o ) [static]
Returns whether or not the mouse event is inside a given child widget.
Returns non-zero if the current Fl::event_x() and Fl::event_y() put it inside the given child widget's bounding box.
This method can only be used to check whether the mouse event is inside a child widget of the window that handles the event, and there must not be an intermediate subwindow (i.e. the widget must not be inside a subwindow of the current window). However, it is valid if the widget is inside a nested Fl_Group.
You must not use it with the window itself as the \o argument in a window's handle() method.

**Note**

The mentioned restrictions are necessary, because this method does not transform coordinates of child widgets, and thus the given widget \o must be within the same window that is handling the current event. Otherwise the results are undefined.

You should always call this rather than doing your own comparison so you are consistent about edge effects.

**See also**

Fl::event_inside(int, int, int)

**Parameters**

- in \o child widget to be tested

**Returns**

non-zero, if mouse event is inside the widget

### 11.3.2.24 event_inside() [2/2]

```c
int Fl::event_inside ( int xx,
                  int yy,
                  int ww,
                  int hh ) [static]
```

Returns whether or not the mouse event is inside the given rectangle. Returns non-zero if the current Fl::event_x() and Fl::event_y() put it inside the given arbitrary bounding box. You should always call this rather than doing your own comparison so you are consistent about edge effects. To find out, whether the event is inside a child widget of the current window, you can use Fl::event_inside(const Fl_Widget *).

**Parameters**

- in xx,yy,ww,hh bounding box

**Returns**

non-zero, if mouse event is inside

### 11.3.2.25 event_is_click() [1/2]

```c
static int Fl::event_is_click () [inline], [static]
```

Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last FL_PUSH or FL_KEYBOARD event for it to be considered a "drag" rather than a "click". You can test this on FL_DRAG, FL_RELEASE, and FL_MOVE events.

### 11.3.2.26 event_is_click() [2/2]

```c
static void Fl::event_is_click ( int i ) [inline], [static]
```

Clears the value returned by Fl::event_is_click(). Useful to prevent the next click from being counted as a double-click or to make a popup menu pick an item with a single click. Don't pass non-zero to this.
11.3 Events handling functions

11.3.2.27  **event_key()** [1/2]

```c
static int Fl::event_key ( ) [inline], [static]
```

Gets which key on the keyboard was last pushed. The returned integer ‘key code’ is not necessarily a text equivalent for the keystroke. For instance: if someone presses ‘5’ on the numeric keypad with numlock on, Fl::event_key() may return the ‘key code’ for this key, and NOT the character ‘5’. To always get the ‘5’, use Fl::event_text() instead.

Returns

an integer ‘key code’, or 0 if the last event was not a key press or release.

See also

int event_key(int), event_text(), compose(int&).

11.3.2.28  **event_key()** [2/2]

```c
int Fl::event_key ( int key ) [static]
```

Returns true if the given **key** was held down (or pressed) **during** the last event. This is constant until the next event is read from the server.

Fl::get_key(int) returns true if the given key is held down **now**. Under X this requires a round-trip to the server and is **much** slower than Fl::event_key(int).

Keys are identified by the **unshifted** values. FLTK defines a set of symbols that should work on most modern machines for every key on the keyboard:

- All keys on the main keyboard producing a printable ASCII character use the value of that ASCII character (as though shift, ctrl, and caps lock were not on). The space bar is 32.
- All keys on the numeric keypad producing a printable ASCII character use the value of that ASCII character plus FL_KP (e.g., FL_KP + '4', FL_KP + '/'). The highest possible value is FL_KP_Last so you can range-check to see if something is on the keypad.
- All numbered function keys use the number on the function key plus FL_F. The highest possible number is FL_F_Last, so you can range-check a value.
- Buttons on the mouse are considered keys, and use the button number (where the left button is 1) plus FL_Button.
- All other keys on the keypad have a symbol: FL_Escape, FL_BackSpace, FL_Tab, FL_Enter, FL_Print, FL←Scroll_Lock, FL_Pause, FL_Insert, FL_Home, FL_Page_Up, FL_Delete, FL_End, FL_Page_Down, FL_Left, FL_Up, FL_Right, FL_Down, FL_Iso_Key, FL_Shift_L, FL_Shift_R, FL_Control_L, FL_Control_R, FL_Caps←Lock, FL_Alt_L, FL_Alt_R, FL_Meta_L, FL_Meta_R, FL_Menu, FL_Num_Lock, FL_KP_Enter. Be careful not to confuse these with the very similar, but all-caps, symbols used by Fl::event_state().

On X Fl::get_key(FL_Button+n) does not work.
On Windows Fl::get_key(FL_KP_Enter) and Fl::event_key(FL_KP_Enter) do not work.

11.3.2.29  **event_length()**

```c
static int Fl::event_length ( ) [inline], [static]
```

Returns the length of the text in Fl::event_text(). There will always be a nul at this position in the text. However there may be a nul before that if the keystroke translates to a nul character or you paste a nul character.

11.3.2.30  **event_original_key()**

```c
static int Fl::event_original_key ( ) [inline], [static]
```

Returns the keycode of the last key event, regardless of the NumLock state. If NumLock is deactivated, FLTK translates events from the numeric keypad into the corresponding arrow key events. **event_key()** returns the translated key code, whereas **event_original_key()** returns the keycode before NumLock translation.

Generated by Doxygen
11.3.2.31  event_state() [1/2]

static int Fl::event_state ( ) [inline], [static]
Returns the keyboard and mouse button states of the last event.
This is a bitfield of what shift states were on and what mouse buttons were held down during the most recent event.
The legal event state bits are:

- FL_SHIFT
- FL_CAPS_LOCK
- FL_CTRL
- FL_ALT
- FL_NUM_LOCK
- FL_META
- FL_SCROLL_LOCK
- FL_BUTTON1
- FL_BUTTON2
- FL_BUTTON3

X servers do not agree on shift states, and FL_NUM_LOCK, FL_META, and FL_SCROLL_LOCK may not work.
The values were selected to match the XFree86 server on Linux. In addition there is a bug in the way X works so
that the shift state is not correctly reported until the first event after the shift key is pressed or released.

11.3.2.32  event_state() [2/2]

static int Fl::event_state (int mask) [inline], [static]
Returns non-zero if any of the passed event state bits are turned on.
Use mask to pass the event states you're interested in. The legal event state bits are defined in Fl::event_state().

11.3.2.33  event_text()

static const char * Fl::event_text ( ) [inline], [static]
Returns the text associated with the current event, including FL_PASTE or FL_DND_RELEASE events.
This can be used in response to FL_KEYUP, FL_KEYDOWN, FL_PASTE, and FL_DND_RELEASE.
When responding to FL_KEYUP/FL_KEYDOWN, use this function instead of Fl::event_key() to get the text equivalent of keystrokes suitable for inserting into strings and text widgets.
The returned string is guaranteed to be NULL terminated. However, see Fl::event_length() for the actual length of
the string, in case the string itself contains NULLs that are part of the text data.

Returns
A NULL terminated text string equivalent of the last keystroke.

11.3.2.34  event_x_root()

static int Fl::event_x_root ( ) [inline], [static]
Returns the mouse position on the screen of the event.
To find the absolute position of an Fl_Window on the screen, use the difference between event_x_root(),event_y_root() and
event_x(),event_y().

11.3.2.35  event_y_root()

static int Fl::event_y_root ( ) [inline], [static]
Returns the mouse position on the screen of the event.
To find the absolute position of an Fl_Window on the screen, use the difference between event_x_root(),event_y_root() and
event_x(),event_y().
11.3.2.36 focus() [1/2]

static Fl_Widget * Fl::focus ( ) [inline], [static]
Gets the current Fl::focus() widget.
See also

Fl::focus(Fl_Widget *)

11.3.2.37 focus() [2/2]

void Fl::focus ( Fl_Widget * o ) [static]
Sets the widget that will receive FL_KEYBOARD events.
Use this function inside the handle(int) member function of a widget of yours to give focus to the widget, for example when it receives the FL_FOCUS or the FL_PUSH event. Otherwise, use Fl_Widget::take_focus() to give focus to a widget;
If you change Fl::focus(), the previous widget and all parents (that don't contain the new widget) are sent FL←UNFOCUS events. Changing the focus does not send FL_FOCUS to this or any widget, because sending FL←FOCUS is supposed to test if the widget wants the focus (by it returning non-zero from handle()).
Widgets can set the NEEDS_KEYBOARD flag to indicate that a keyboard is essential for the widget to function. Touchscreen devices will be sent a request to show an on-screen keyboard if no hardware keyboard is connected.
See also

Fl_Widget::take_focus()
Fl_Widget::needs_keyboard() const
Fl_Widget::needs_keyboard(bool)

11.3.2.38 get_key()

int Fl::get_key ( int key ) [static]
Returns true if the given key is held down now.
Under X this requires a round-trip to the server and is much slower than Fl::event_key(int).
See also

event_key(int)

11.3.2.39 get_mouse()

void Fl::get_mouse ( int & x, int & y ) [static]
Return where the mouse is on the screen by doing a round-trip query to the server.
you should use Fl::event_x_root() and Fl::event_y_root() if possible, but this is necessary if you are not sure if a mouse event has been processed recently (such as to position your first window). If the display is not open, this will open it.

11.3.2.40 handle()

int Fl::handle ( int e, Fl_Window * window ) [static]
Handle events from the window system.
This is called from the native event dispatch after native events have been converted to FLTK notation. This function calls Fl::handle_(int, Fl_Window+) unless the user sets a dispatch function. If a user dispatch function is set, the user must make sure that Fl::handle_(i) is called, or the event will be ignored.
Parameters

<table>
<thead>
<tr>
<th>$e$</th>
<th>the event type ($FL::event_number()$ is not yet set)</th>
</tr>
</thead>
<tbody>
<tr>
<td>window</td>
<td>the window that caused this event</td>
</tr>
</tbody>
</table>

Returns

0 if the event was not handled

See also

$FL::add_handler(FL\_EventHandler)$

$FL::event\_dispatch(FL\_Event\_Dispatch)$

11.3.2.41 handle()

```c
int Fl::handle_ (  
    int $e$,  
    FL_Window * window ) [static]
```
Handle events from the window system.
This function is called from the native event dispatch, unless the user sets another dispatch function. In that case, the user dispatch function must decide when to call $FL::handle_\_\_ (int, FL\_Window*)$

Callbacks can set $FL\_REASON\_CLOSED$ and $FL\_REASON\_CANCELLED$.

Parameters

<table>
<thead>
<tr>
<th>$e$</th>
<th>the event type ($FL::event_number()$ is not yet set)</th>
</tr>
</thead>
<tbody>
<tr>
<td>window</td>
<td>the window that caused this event</td>
</tr>
</tbody>
</table>

Returns

0 if the event was not handled

See also

$FL::event\_dispatch(FL\_Event\_Dispatch)$

11.3.2.42 pushed() [1/2]

```c
static FL_Widget * Fl::pushed ( ) [inline], [static]
```
Gets the widget that is being pushed.

See also

void pushed(FL_Widget*)

11.3.2.43 pushed() [2/2]

```c
void Fl::pushed (  
    FL_Widget * o ) [static]
```
Sets the widget that is being pushed.

$FL\_DRAG$ or $FL\_RELEASE$ (and any more $FL\_PUSH$) events will be sent to this widget.
If you change the pushed widget, the previous one and all parents (that don’t contain the new widget) are sent $FL\_RELEASE$ events. Changing this does not send $FL\_PUSH$ to this or any widget, because sending $FL\_PUSH$ is supposed to test if the widget wants the mouse (by it returning non-zero from $handle()$).
11.3 Events handling functions

### 11.3.2.44 remove_handler()

```c
void Fl::remove_handler ( 
   Fl_Event_Handler ha ) [static]
```

Removes a previously added event handler.

See also

`Fl::handle(int, Fl_Winodw*)`

### 11.3.2.45 remove_system_handler()

```c
void Fl::remove_system_handler ( 
   Fl_System_Handler ha ) [static]
```

Removes a previously added system event handler.

**Parameters**

- `ha` The event handler function to remove

See also

`Fl::add_system_handler(Fl_System_Handler)`

### 11.3.2.46 test_shortcut()

```c
int Fl::test_shortcut ( 
   Fl_Shortcut shortcut ) [static]
```

Tests the current event, which must be an FL_KEYBOARD or FL_SHORTCUT, against a shortcut value (described in Fl_Button).

Not to be confused with Fl_Widget::test_shortcut().

**Returns**

non-zero if there is a match.

### 11.3.3 Variable Documentation

#### 11.3.3.1 fl_callback_reason_names

```c
const char * const fl_callback_reason_names[]
```

**Initial value:**

```c
= [ 
   "FL_REASON_UNKNOWN", 
   "FL_REASON_SELECTED", 
   "FL_REASON_DESELECTED", 
   "FL_REASON_RESELECTED", 
   "FL_REASON_OPENED", 
   "FL_REASON_CLOSED", 
   "FL_REASON_DRAGGED", 
   "FL_REASON_CANCELLED", 
   "FL_REASON_CHANGED", 
   "FL_REASON_GOT_FOCUS", 
   "FL_REASON_LOST_FOCUS", 
   "FL_REASON_RELEASED", 
   "FL_REASON_ENTER_KEY", 
   NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL, 
   NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL, 
   "FL_REASON_USER", "FL_REASON_USER+1", "FL_REASON_USER+2", "FL_REASON_USER+3", 
]}
```

This is an array of callback reason names you can use to convert font numbers into names.

The array gets defined inline wherever your '#include <FL/names.h>' appears.
11.3.3.2 fl_eventnames

const char* const fl_eventnames[]

This is an array of event names you can use to convert event numbers into names. The array gets defined inline wherever your `#include <FL/names.h>` appears.

Example:

```c
#include <FL/names.h> // array will be defined here
int MyClass::handle(int e) {
    printf("Event was %s (%d)\n", fl_eventnames[e], e);
    // ..resulting output might be e.g. "Event was FL_PUSH (1)"..
    [...]}
```

11.3.3.3 fl_fontnames

const char* const fl_fontnames[]

Initial value:

```
{ "FL_HELVETICA", 
  "FL_HELVETICA_BOLD", 
  "FL_HELVETICA_ITALIC", 
  "FL_HELVETICA_BOLD_ITALIC", 
  "FL_COURIER", 
  "FL_COURIER_BOLD", 
  "FL_COURIER_ITALIC", 
  "FL_COURIER_BOLD_ITALIC", 
  "FL_TIMES", 
  "FL_TIMES_BOLD", 
  "FL_TIMES_ITALIC", 
  "FL_TIMES_BOLD_ITALIC", 
  "FL_SYMBOL", 
  "FL_SCREEN", 
  "FL_SCREEN_BOLD", 
  "FL_ZAPF_DINGBATS", }
```

This is an array of font names you can use to convert font numbers into names. The array gets defined inline wherever your `#include <FL/names.h>` appears.

Example:

```c
#include <FL/names.h> // array will be defined here
int MyClass::my_callback(Fl_Widget *w, void*) {
    int fnum = w->labelfont();
    // Resulting output might be e.g. "Label’s font is FL_HELVETICA (0)"
    printf("Label’s font is %s (%d)\n", fl_fontnames[fnum], fnum);
    // ..resulting output might be e.g. "Label’s font is FL_HELVETICA (0)"..
    [...]}
```

11.4 Selection & Clipboard functions

FLTK global copy/cut/paste functions declared in `<FL/Fl.H>`

Functions

- static void Fl::add_clipboard_notify (Fl_Clipboard_Notify_Handler h, void *data=0)
  
  FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard.

- static int Fl::clipboard_contains (const char *type)
  
  Returns non 0 if the clipboard contains data matching `type`.

- static void Fl::copy (const char *stuff, int len, int destination=0, const char *type=Fl::clipboard_plain_text)
  
  Copies the data pointed to by `stuff` to the selection buffer (`destination` is 0), the clipboard (`destination` is 1), or both (`destination` is 2).

- static int Fl::dnd ()
  
  Initiate a Drag And Drop operation.

- static void Fl::paste (Fl_Widget &receiver)
  
  Backward compatibility only.

- static void Fl::paste (Fl_Widget &receiver, int source, const char *type=Fl::clipboard_plain_text)
  
  Pastes the data from the selection buffer (`source` is 0) or the clipboard (`source` is 1) into `receiver`.

- static void Fl::remove_clipboard_notify (Fl_Clipboard_Notify_Handler h)
Stop calling the specified callback when there are changes to the selection buffer or the clipboard.

- `static void Fl::selection (Fl_Widget &owner, const char *, int len)`
  Changes the current selection.

- `static Fl_Widget * Fl::selection_owner ()`
  back-compatibility only: Gets the widget owning the current selection

- `static void Fl::selection_owner(Fl_Widget *)`
  Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.

- `static int Fl::selection_to_clipboard ()`
  Returns the current selection_to_clipboard mode.

- `static void Fl::selection_to_clipboard (int mode)`
  Copies selections on X11 directly to the clipboard if enabled.

**Variables**

- `static char const *const Fl::clipboard_image = "image"`
  Denotes image data.

- `static char const *const Fl::clipboard_plain_text = "text/plain"`
  Denotes plain textual data.

11.4.1 Detailed Description

FLTK global copy/cut/paste functions declared in `<FL/Fl.H>`

11.4.2 Function Documentation

11.4.2.1 add_clipboard_notify()

```c

void Fl::add_clipboard_notify (  
    Fl_Clipboard_Notify_Handler h,  
    void * data = 0 )  
```

FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard. The source argument indicates which of the two has changed. Only changes by other applications are reported. Example:

```c

void clip_callback(int source, void *data) {  
    if ( source == 0 ) printf("CLIP CALLBACK: selection buffer changed\n");  
    if ( source == 1 ) printf("CLIP CALLBACK: clipboard changed\n");
}  

int main() {  
    Fl::add_clipboard_notify(clip_callback);  
    \[
}
```

**Note**

Some systems require polling to monitor the clipboard and may therefore have some delay in detecting changes.

11.4.2.2 clipboard_contains()

```c

int Fl::clipboard_contains (  
    const char * type )  
```

Returns non 0 if the clipboard contains data matching `type`. The clipboard can contain both text and image data; in that situation this function returns non 0 to both requests. This function is not meant to check whether the clipboard is empty. This function does not allow to query the selection buffer because FLTK allows to copy/paste non-textual data only from/to the clipboard.
11.4.2.3 copy()

`void Fl::copy(
    const char * stuff,
    int len,
    int destination = 0,
    const char * type = Fl::clipboard_plain_text ) [static]`

Copies the data pointed to by `stuff` to the selection buffer (`destination` is 0), the clipboard (`destination` is 1), or both (`destination` is 2).

Copying to both is only relevant on X11, on other platforms it maps to the clipboard (1). `len` is the number of relevant bytes in `stuff`. `type` is always `Fl::clipboard_plain_text`. The selection buffer is used for middle-mouse pastes and for drag-and-drop selections. The clipboard is used for traditional copy/cut/paste operations.

**Note**

This function is, at present, intended only to copy UTF-8 encoded textual data. To copy graphical data, use the `Fl_Copy_Surface` class. The `type` argument may allow in the future to copy other kinds of data. Copies data to the selection buffer, the clipboard, or both.

The `destination` can be:

- 0: selection buffer (see note below)
- 1: clipboard
- 2: both

The selection buffer exists only on the X11 platform and is used for middle-mouse pastes and for drag-and-drop selections. The clipboard is used for traditional copy/cut/paste operations. On all other platforms the selection buffer (`destination = 0`) is mapped to the clipboard, i.e. on platforms other than X11 all `destination` are equivalent and the data is always copied to the clipboard.

**Note**

Please see `Fl::section_to_clipboard()` to enable duplication of the selection buffer to the clipboard on X11, i.e. if `destination = 0` (selection buffer) and `Fl::section_to_clipboard()` is enabled, then the data is copied to both the selection buffer and the clipboard. This makes the X11 behavior similar to other platforms but keeps the selection buffer for X11 specific inter process communication.

`type` should always be `Fl::clipboard_plain_text` which is the default. Other values are ignored and reserved for future extensions.

**Note**

This function is, at present, intended only to copy UTF-8 encoded textual data. To copy graphical data, use the `Fl_Copy_Surface` class. The `type` argument may allow to copy other kinds of data in the future.

**Parameters**

- **in** `stuff` text data to be copied
- **in** `len` the number of relevant bytes in `stuff`
- **in** `destination` 0 = selection, 1 = clipboard, 2 = both (see description)
- **in** `type` usually plain text (see description)
11.4.2.4  

**dnd()**

```c
int Fl::dnd ( ) [static]
```

Initiate a Drag And Drop operation.

The selection buffer should be filled with relevant data before calling this method. FLTK will then initiate the system wide drag and drop handling. Dropped data will be marked as text.

Create a selection first using: Fl::copy(const char *stuff, int len, 0)

11.4.2.5  

**paste() [1/2]**

```c
void Fl::paste ( Fl_Widget & receiver ) [static]
```

Backward compatibility only.

This calls Fl::paste(receiver, 0);

See also

Fl::paste(Fl_Widget &receiver, int clipboard, const char* type)

11.4.2.6  

**paste() [2/2]**

```c
void Fl::paste ( Fl_Widget & receiver, int source, const char *type = Fl::clipboard_plain_text ) [static]
```

Pastes the data from the selection buffer (source is 0) or the clipboard (source is 1) into receiver.

The selection buffer (source is 0) is used for middle-mouse pastes and for drag-and-drop selections. The clipboard (source is 1) is used for copy/cut/paste operations.

If source is 1, the optional type argument indicates what type of data is requested from the clipboard. At present, Fl::clipboard_plain_text (requesting text data) and Fl::clipboard_image (requesting image data) are possible. Set things up so the handle function of the receiver widget will be called with an FL_PASTE event some time in the future if the clipboard does contain data of the requested type.

The handle function of receiver can process the FL_PASTE event as follows:

- If the receiver widget is known to only receive text data, the text string from the specified source is in Fl::event_text() with UTF-8 encoding, and the number of bytes is in Fl::event_length(). If Fl::paste() gets called during the drop step of a files-drag-and-drop operation, Fl::event_text() contains a list of filenames (see Drag and Drop Events).
- If the receiver widget can potentially receive non-text data, use Fl::event_clipboard_type() to determine what sort of data is being sent. If Fl::event_clipboard_type() returns Fl::event_clipboard_plain_text, proceed as above. It it returns Fl::event_clipboard_image, the pointer returned by Fl::event_clipboard() can be safely cast to type Fl_RGB_Image * to obtain a pointer to the pasted image. If receiver accepts the clipboard image, receiver.handle() should return 1 and the application should take ownership of this image (that is, delete it after use). Conversely, if receiver.handle() returns 0, the application must not use the image.

The receiver should be prepared to be called directly by this, or for it to happen later, or possibly not at all. This allows the window system to take as long as necessary to retrieve the paste buffer (or even to screw up completely) without complex and error-prone synchronization code in FLTK.

Platform details for image data:

- Unix/Linux platform: Clipboard images in PNG or BMP formats are recognized. Requires linking with the fltk_images library.
- Windows platform: Both bitmap and vectorial (Enhanced metafile) data from clipboard can be pasted as image data.
- Mac OS X platform: Both bitmap (TIFF) and vectorial (PDF) data from clipboard can be pasted as image data.
11.4.2.7 selection()

```cpp
void Fl::selection ( 
    Fl_Widget & owner,  
    const char * text, 
    int len ) [static]
```

Changes the current selection. The block of text is copied to an internal buffer by FLTK (be careful if doing this in response to an FL_PASTE as this may be the same buffer returned by event_text()). The selection_owner() widget is set to the passed owner.

11.4.2.8 selection_owner() [1/2]

```cpp
static Fl_Widget * Fl::selection_owner ( ) [inline], [static]
```

back-compatibility only: Gets the widget owning the current selection

See also

```cpp
Fl_Widget* selection_owner(Fl_Widget*)
```

11.4.2.9 selection_owner() [2/2]

```cpp
void Fl::selection_owner ( Fl_Widget * owner ) [static]
```

Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection. FL_SELECTIONCLEAR is sent to the previous selection owner, if any. Copying the buffer every time the selection is changed is obviously wasteful, especially for large selections. An interface will probably be added in a future version to allow the selection to be made by a callback function. The current interface will be emulated on top of this.

11.4.2.10 selection_to_clipboard() [1/2]

```cpp
static int Fl::selection_to_clipboard ( ) [inline], [static]
```

Returns the current selection_to_clipboard mode.

See also

```cpp
void selection_to_clipboard(int)
```

11.4.2.11 selection_to_clipboard() [2/2]

```cpp
static void Fl::selection_to_clipboard ( 
    int mode ) [inline], [static]
```

Copies selections on X11 directly to the clipboard if enabled. This method can be called on all platforms. Other platforms than X11 are not affected by this feature. If this is switched on (mode = 1), Fl::copy() copies all data to the clipboard regardless of its destination argument. If the destination is 0 (selection buffer) data is copied to both the selection buffer and the clipboard. Drag and drop is also affected since drag-and-drop data is copied to the selection buffer. You can use this to make the experience of data selection and copying more like that on other platforms (Windows, macOS, and even Wayland). The default operation mode is the standard X11 behavior (disabled).

Note

This feature is experimental and enabling it may have unexpected side effects. It is your own responsibility if you enable it.

Since

1.4.0
Parameters

| in  | mode | 1 = enable selection_to_clipboard, 0 = disable selection_to_clipboard |

See also

copy(const char *, int, int, const char *)

## 11.5 Screen functions

Fl global screen functions declared in `<FL/Fl.H>`.

### Functions

- static int Fl::h ()
  - Returns the height in pixels of the main screen work area.
- static void Fl::keyboard_screen_scaling (int value)
  - Controls the possibility to scale all windows by ctrl/+/-/0/ or cmd/+/-/0/.
- static int Fl::screen_count ()
  - Gets the total count of available screens.
- static void Fl::screen_dpi (float &h, float &v, int n=0)
  - Gets the screen resolution in dots-per-inch for the given screen.
- static int Fl::screen_num (int x, int y)
  - Gets the screen number of a screen that contains the specified screen position x, y.
- static int Fl::screen_num (int x, int y, int w, int h)
  - Gets the screen number for the screen which intersects the most with the rectangle defined by x, y, w, h.
- static float Fl::screen_scale (int n)
  - Current value of the GUI scaling factor for screen number n (n [0, Fl::screen_count()-1])
- static void Fl::screen_scale (int n, float factor)
  - Sets the value of the GUI scaling factor for screen number n (n [0, Fl::screen_count()-1]).
- static int Fl::screen_scaling_supported ()
  - See if scaling factors are supported by this platform.
- static void Fl::screen_work_area (int &X, int &Y, int &W, int &H)
  - Gets the bounding box of the work area of the screen that contains the mouse pointer.
- static void Fl::screen_work_area (int &X, int &Y, int &W, int &H, int mx, int my)
  - Gets the bounding box of the work area of a screen that contains the specified screen position mx, my.
- static void Fl::screen_work_area (int &X, int &Y, int &W, int &H, int n)
  - Gets the bounding box of the work area of the given screen.
- static void Fl::screen_xywh (int &X, int &Y, int &W, int &H)
  - Gets the bounding box of a screen that contains the mouse pointer.
- static void Fl::screen_xywh (int &X, int &Y, int &W, int &H, int mx, int my)
  - Gets the bounding box of a screen that contains the specified screen position mx, my.
- static void Fl::screen_xywh (int &X, int &Y, int &W, int &H, int mx, int my, int mw, int mh)
  - Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by mx, my, mw, mh.
- static void Fl::screen_xywh (int &X, int &Y, int &W, int &H, int n)
  - Gets the screen bounding rect for the given screen.
- static int Fl::w ()
  - Returns the width in pixels of the main screen work area.
- static int Fl::x ()
  - Returns the leftmost x coordinate of the main screen work area.
- static int Fl::y ()
  - Returns the topmost y coordinate of the main screen work area.
11.5.1 Detailed Description

FL global screen functions declared in `<FL/Fl.H>`. FLTK supports high-DPI screens using a screen scaling factor. The scaling factor is initialized by the library to a value based on information obtained from the OS. If this initial value is not satisfactory, the `FLTK_SCALING_FACTOR` environment variable can be set to a value FLTK will multiply to the OS-given value. The 2 variants of functions `Fl::screen_scale()` allow to programmatically get and set scaling factor values. The scaling factor value can be further changed at runtime by typing ctrl/+/-/0/ (cmd/+/-/0/ under macOS). FLTK sends the `FL_ZOOM_EVENT` when the factor value is changed, to which a callback can be associated with `Fl::add_handler()`. By default, FLTK displays the new scaling factor value in a yellow, transient window. This can be changed with option `Fl::OPTION_SHOW_SCALING`.

11.5.2 Function Documentation

11.5.2.1 keyboard_screen_scaling()

```cpp
void Fl::keyboard_screen_scaling ( int value ) [static]
```

Controls the possibility to scale all windows by ctrl/+/-/0/ or cmd/+/-/0/.
This function should be called before `fl_open_display()` runs. If it is not called, the default is to handle these keys for window scaling.

**Note**
This function can currently only be used to switch the internal handler off, i.e. `value` must be 0 (zero) - all other values result in undefined behavior and are reserved for future extension.

**Parameters**

| value | 0 to stop recognition of ctrl/+/-/0/ (or cmd/+/-/0/ under macOS) keys as window scaling. |

11.5.2.2 screen_count()

```cpp
int Fl::screen_count ( ) [static]
```

Gets the total count of available screens.

**Note**
Screen numbers range from 0 to `Fl::screen_count()-1` in the FLTK API.

11.5.2.3 screen_dpi()

```cpp
void Fl::screen_dpi ( float & h, float & v, int n = 0 ) [static]
```

Gets the screen resolution in dots-per-inch for the given screen.

**Parameters**

| `out` | `h,v` | horizontal and vertical resolution |
| `in`  | `n`   | the screen number (0 to `Fl::screen_count()-1`) |
11.5 Screen functions

See also

```c
void screen_xywh(int &x, int &y, int &w, int &h, int mx, int my)
```

11.5.2.4 screen_num() [1/2]

```c
int Fl::screen_num ( int x, int y ) [static]
```

Gets the screen number of a screen that contains the specified screen position \( x, y \).

**Parameters**

- **\( x, y \)**: the absolute screen position

**Returns**

a screen number \([0, Fl::screen_count()-1]\)

**Attention**

When the running system contains screens with different scaling factor values, this API may become ambiguous because a given value pair \((x, y)\) may belong to distinct screens. In that situation, other APIs should be preferred, e.g., \( Fl\_Window::screen_num() \) and \( Fl::screen_scale(int) \).

11.5.2.5 screen_num() [2/2]

```c
int Fl::screen_num ( int x, int y, int w, int h ) [static]
```

Gets the screen number for the screen which intersects the most with the rectangle defined by \( x, y, w, h \).

**Parameters**

- **\( x, y, w, h \)**: the rectangle to search for intersection with

**Returns**

a screen number \([0, Fl::screen_count()-1]\)

11.5.2.6 screen_scale()

```c
void Fl::screen_scale ( int n, float factor ) [static]
```

Sets the value of the GUI scaling factor for screen number \( n \) \((n \in [0, Fl::screen_count()-1])\).

Also sets the scale factor value of all windows mapped to screen number \( n \), if any.

11.5.2.7 screen_scaling_supported()

```c
int Fl::screen_scaling_supported ( ) [static]
```

See if scaling factors are supported by this platform.
Returns
0 if scaling factors are not supported by this platform, 1 if a single scaling factor value is shared by all screens,
2 if each screen can have its own scaling factor value.

See also
Fl::screen_scale(int)

11.5.2.8 screen_work_area() [1/3]

```c
void Fl::screen_work_area (  
    int & X,  
    int & Y,  
    int & W,  
    int & H ) [static]
```

Gets the bounding box of the work area of the screen that contains the mouse pointer.

Parameters
- **out X,Y,W,H** the work area bounding box

See also
```
void screen_work_area(int &x, int &y, int &w, int &h, int mx, int my)
```

11.5.2.9 screen_work_area() [2/3]

```c
void Fl::screen_work_area (  
    int & X,  
    int & Y,  
    int & W,  
    int & H,  
    int mx,  
    int my ) [static]
```

Gets the bounding box of the work area of a screen that contains the specified screen position mx, my.

Parameters
- **out X,Y,W,H** the work area bounding box
- **in mx,my** the absolute screen position

11.5.2.10 screen_work_area() [3/3]

```c
void Fl::screen_work_area (  
    int & X,  
    int & Y,  
    int & W,  
    int & H,  
    int n ) [static]
```

Gets the bounding box of the work area of the given screen.

Parameters
- **out X,Y,W,H** the work area bounding box
- **in n** the screen number (0 to Fl::screen_count() - 1)
11.5 Screen functions

See also

```c
void screen_xywh(int &x, int &y, int &w, int &h, int mx, int my)
```

Note

Like all quantities accessible via public APIs of FLTK, values of $X, Y, W, H$ are given in FLTK units, that is, in drawing units divided by the scaling factor of screen $n$.

11.5.2.11 screen_xywh() [1/4]

```c
void Fl::screen_xywh(
    int & X, 
    int & Y, 
    int & W, 
    int & H ); [static]
```

Gets the bounding box of a screen that contains the mouse pointer.

Parameters

| out  | X, Y, W, H | the corresponding screen bounding box |

See also

```c
void screen_xywh(int &x, int &y, int &w, int &h, int mx, int my)
```

11.5.2.12 screen_xywh() [2/4]

```c
void Fl::screen_xywh(
    int & X, 
    int & Y, 
    int & W, 
    int & H, 
    int mx, 
    int my ); [static]
```

Gets the bounding box of a screen that contains the specified screen position $mx, my$.

Parameters

| out  | X, Y, W, H | the corresponding screen bounding box |
| in   | mx, my     | the absolute screen position          |

11.5.2.13 screen_xywh() [3/4]

```c
void Fl::screen_xywh(
    int & X, 
    int & Y, 
    int & W, 
    int & H, 
    int mx, 
    int my, 
    int mw, 
    int mh ); [static]
```

Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by $mx, my, mw, mh$. 

Generated by Doxygen
Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>X, Y, W, H</th>
<th>the corresponding screen bounding box</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>mx, my, mw, mh</td>
<td>the rectangle to search for intersection with</td>
</tr>
</tbody>
</table>

See also

void screen_xywh(int &X, int &Y, int &W, int &H, int n)

11.5.2.14 screen_xywh() [4/4]

void Fl::screen_xywh (  
    int & X,  
    int & Y,  
    int & W,  
    int & H,  
    int n ) [static]

Gets the screen bounding rect for the given screen.
Under Windows, Mac OS X, and X11 + the Gnome desktop, screen #0 contains the menubar/taskbar

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>X, Y, W, H</th>
<th>the corresponding screen bounding box</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>n</td>
<td>the screen number (0 to Fl::screen_count() - 1)</td>
</tr>
</tbody>
</table>

Note

Like all quantities accessible via public APIs of FLTK, values of X,Y,W,H are given in FLTK units, that is, in
drawing units divided by the scaling factor of screen n.

See also

void screen_xywh(int &x, int &y, int &w, int &h, int mx, int my)

11.6 Color & Font functions

fl global color, font functions.

Functions

• Fl_Color fl_color ()  
  Return the last fl_color() that was set.
• void fl_color (Fl_Color c)  
  Set the color for all subsequent drawing operations.
• void fl_color (int c)  
  for back compatibility - use fl_color(Fl_Color c) instead
• void fl_color (uchar r, uchar g, uchar b)  
  Set the color for all subsequent drawing operations.
• Fl_Color fl_color_average (Fl_Color color1, Fl_Color color2, float weight)  
  Returns the weighted average color between the two given colors.
• Fl_Color fl_contrast (Fl_Color fg, Fl_Color bg, Fl_Fontsize fs, int context)  
  Returns a color that contrasts with the background color.
• void fl_contrast_function (Fl_Contrast_Function *f)  
  Register a custom contrast function.
11.6 Color & Font functions

- **int fl_contrast_level ()**
  
  Get the contrast level (sensitivity) of the \texttt{fl_contrast()} method.

- **void \texttt{fl_contrast_level} (int level)**
  
  Set the contrast level (sensitivity) of the \texttt{fl_contrast()} method.

- **int fl_contrast_mode ()**
  
  Return the current contrast algorithm (mode).

- **void \texttt{fl_contrast_mode} (int mode)**
  
  Set the contrast algorithm (mode).

- **int fl_descent ()**
  
  Return the recommended distance above the bottom of a \texttt{fl_height()} tall box to draw the text at so it looks centered vertically in that box.

- **\texttt{Fl_Font fl_font ()}**
  
  Return the face set by the most recent call to \texttt{fl_font()}.  

- **void \texttt{fl_font} (\texttt{Fl_Font face}, \texttt{Fl_Fontsize fsize})**
  
  Sets the current font, which is then used in various drawing routines.

- **int \texttt{fl_height ()}**
  
  Return the recommended minimum line spacing for the current font.

- **int \texttt{fl_height} (int font, int size)**
  
  This function returns the actual height of the specified font and size.

- **\texttt{Fl_Color fl_inactive} (\texttt{Fl_Color c})**
  
  Returns the inactive, dimmed version of the given color.

- **const char ∗ \texttt{fl_latin1_to_local} (const char ∗t, int n=-1)**
  
  Convert text from Windows/X11 latin1 character set to local encoding.

- **double \texttt{fl_lightness} (\texttt{Fl_Color color})**
  
  Return the perceived lightness of a color.

- **const char ∗ \texttt{fl_local_to_latin1} (const char ∗t, int n=-1)**
  
  Convert text from local encoding to Windows/X11 latin1 character set.

- **const char ∗ \texttt{fl_local_to_mac_roman} (const char ∗t, int n=-1)**
  
  Convert text from local encoding to Mac Roman character set.

- **double \texttt{fl_luminance} (\texttt{Fl_Color color})**
  
  Return the raw / physical luminance of a color.

- **const char ∗ \texttt{fl_mac_roman_to_local} (const char ∗t, int n=-1)**
  
  Convert text from Mac Roman character set to local encoding.

- **\texttt{Fl_Color fl_show_colormap} (\texttt{Fl_Color oldcol})**
  
  Pops up a window to let the user pick a colormap entry.

- **\texttt{Fl_Fontsize fl_size ()}**
  
  Return the size set by the most recent call to \texttt{fl_font()}.  

- **void \texttt{fl_text_extents} (const char ∗, int &dx, int &dy, int &w, int &h)**
  
  Determine the minimum pixel dimensions of a nul-terminated string using the current \texttt{fl_font()}.  

- **void \texttt{fl_text_extents} (const char ∗t, int n, int &dx, int &dy, int &w, int &h)**
  
  Determine the minimum pixel dimensions of a sequence of \texttt{n} characters (bytes) using the current \texttt{fl_font()}.  

- **double \texttt{fl_width} (const char ∗t)**
  
  Return the typographical width of a nul-terminated string using the current font face and size.

- **double \texttt{fl_width} (const char ∗t, int n)**
  
  Return the typographical width of a sequence of \texttt{n} characters using the current font face and size.

- **double \texttt{fl_width} (unsigned int c)**
  
  Return the typographical width of a single character using the current font face and size.

- **static void \texttt{Fl::free_color} (\texttt{Fl_Color i}, int overlay=0)**
  
  Frees the specified color from the colormap, if applicable.

- **static unsigned \texttt{Fl::get_color} (\texttt{Fl_Color i})**
  
  Returns the RGB value(s) for the given FLTK color index.
• static void Fl::get_color (Fl_Color i, uchar &red, uchar &green, uchar &blue)
   
   Returns the RGB value(s) for the given FLTK color index.

• static void Fl::get_color (Fl_Color i, uchar &red, uchar &green, uchar &blue, uchar &alpha)
   
   Returns the RGBA value(s) for the given FLTK color index.

• static const char * Fl::get_font (Fl_Font)
   
   Gets the string for this face.

• static const char * Fl::get_font_name (Fl_Font, int *attributes=0)
   
   Get a human-readable string describing the family of this face.

• static int Fl::get_font_sizes (Fl_Font, int *sizep)
   
   Return an array of sizes in sizep.

• static void Fl::set_color (Fl_Color i, uchar, uchar, uchar)
   
   Sets an entry in the fl_color index table.

• static void Fl::set_color (Fl_Color, uchar, uchar, uchar, uchar)
   
   Sets an entry in the fl_color index table.

• static void Fl::set_font (Fl_Font, const char *)
   
   Changes a face.

• static void Fl::set_font (Fl_Font, Fl_Font)
   
   Copies one face to another.

• static Fl_Font Fl::set_fonts (const char * =0)
   
   FLTK will open the display, and add every fonts on the server to the face table.

11.6.1 Detailed Description

Fl global color, font functions.
These functions are declared in `<FL/Fl.H>` or `<FL/fl_draw.H>`.

11.6.2 Function Documentation

11.6.2.1 fl_color() [1/3]

Fl_Color fl_color () [inline]

Return the last fl_color() that was set.
This can be used for state save/restore.

11.6.2.2 fl_color() [2/3]

void fl_color ( Fl_Color c ) [inline]

Set the color for all subsequent drawing operations.
For color-mapped displays, a color cell will be allocated out of fl_colormap the first time you use a color. If the colormap fills up then a least-squares algorithm is used to find the closest color. If no valid graphical context (fl_gc) is available, the foreground is not set for the current window.

Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>c</td>
<td>color</td>
</tr>
</tbody>
</table>

11.6.2.3 fl_color() [3/3]

void fl_color ( uchar r,
    uchar g,
uchar b ) [inline]

Set the color for all subsequent drawing operations.
The closest possible match to the RGB color is used. The RGB color is used directly on TrueColor displays. For
colormap visuals the nearest index in the gray ramp or color cube is used. If no valid graphical context (fl_gc) is
available, the foreground is not set for the current window.

Parameters

| in | r,g,b | color components |

11.6.2.4 fl_color_average()

Fl_Color fl_color_average ( Fl_Color color1,
                        Fl_Color color2,
                        float weight )

Returns the weighted average color between the two given colors.
The red, green and blue values are averages using the following formula:

\[
\text{color} = \text{color1} \times \text{weight} + \text{color2} \times (1 - \text{weight})
\]

Thus, a weight value of 1.0 will return the first color, while a value of 0.0 will return the second color.

Parameters

| in | color1,color2 | boundary colors |
|    | weight         | weighting factor |

11.6.2.5 fl_contrast()

Fl_Color fl_contrast ( Fl_Color fg,
                     Fl_Color bg,
                     Fl_Fontsize fs,
                     int context )

Returns a color that contrasts with the background color.
This will be the foreground color if it contrasts sufficiently with the background color. Otherwise, returns FL_WHITE
or FL_BLACK depending on which color provides the best contrast.

FLTK 1.4.0 uses a different default contrast function than earlier releases (1.3.x) but you can use the old "legacy"
contrast function by calling

fl_contrast_mode(FL_CONTRAST_LEGACY);
early in your main program.

Note

It is a known issue that static initialization using fl_contrast() may already have been executed before you
call this function in main(). You should be aware of this and, if necessary, write your own (static) contrast
initialization function. This should rarely be necessary.

You can change the behavior of fl_contrast() in several ways:

- Change the "level" (sensitivity) for contrast calculation, see fl_contrast_level(). Valid levels are 0 - 100, the
default "medium" value is 50. If you raise the level above 50 the overall contrast will generally be higher, i.e.
the required contrast to return the foreground color is raised and therefore the calculated color will switch
"earlier" to either black or white. In other words, using the following values:

  - 0 will always use the foreground color
  - 50 will use the default, unmodified algorithm
  - 100 will always use black or white
values larger than 50 may yield slightly better results. Changing the level is particularly useful and intended for the "legacy mode" to improve the results partially. Values slightly above 50 (50 - 70) will likely return the best results (50 is the default, as used in FLTK 1.3.x).

Note

Different contrast modes (algorithms) can use their own values and defaults of fl_contrast_level().

• Change the used contrast calculation function. You can either use the old (FLTK 1.3.x) function or use the better but slower function based on the CIELAB (L*a*b*) color model, or you can define your own custom contrast function if you need even better contrast results.

The following contrast functions are available:

• FL_CONTRAST_LEGACY, the old FLTK 1.3.x compatible function. This is the fastest function (using integer arithmetic) but it provides worse results in border cases. You may want to use this on embedded or otherwise CPU constrained systems or if you need strict backwards compatibility. For slightly better results you may utilize the new fl_contrast_level(int) function (since 1.4.0) to increase the contrast sensitivity. This will provide slightly better results than FLTK 1.3.x and earlier but we recommend to use the new default function:

• FL_CONTRAST_CIELAB, based on the CIELAB (L*a*b*) color model. This function is superior regarding the visual contrast perception but may be slower. This is the default since FLTK 1.4.0.

• FL_CONTRAST_CUSTOM, your own contrast calculation function.

In the future we may provide even more (and superior) contrast algorithms.

The new parameters fs and context (since 1.4.0) are defined for future extensions and are currently not used. Default values are 0.

Note

These new optional parameters must be provided in the custom contrast function which is the reason why they are added now. In the future we may use the fontsize to adjust the calculated contrast, and users defining their own contrast functions may use them in their functions.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>fg</th>
<th>foreground (text) color</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>bg</td>
<td>background color</td>
</tr>
<tr>
<td>in</td>
<td>fs</td>
<td>font size (optional, default = 0 == undefined)</td>
</tr>
<tr>
<td>in</td>
<td>context</td>
<td>graphical context (optional, default = 0 == text)</td>
</tr>
</tbody>
</table>

Returns

contrasting color: fg, FL_BLACK, or FL_WHITE

See also

fl_contrast_level(int)
fl_contrast_mode(int)
fl_contrast_function()
Your custom contrast function must provide the signature

```cpp
FL_Color my_contrast_function(FL_Color fg, FL_Color bg, Fl_Fontsize fs, int context)
```

The arguments are the same as for the full `fl_contrast()` function since FLTK 1.4. You can use the supplied fontsize `fs` to modify the result. Depending on the caller the `fs` parameter can be 0 (default) or a valid fontsize. The `context` parameter is not yet used and will always be 0 unless included in a call to `fl_contrast()`. The value 0 should be interpreted as text. In the future the `context` argument will be used to supply a different context than text (small icons, large icons, etc.). The exact usage is not yet specified.

Your function may also use `fl_contrast_level()` to modify the result accordingly.

Since

1.4.0

See also

- `fl_contrast_mode(int)`
- `fl_contrast_level(int)`
- `fl_contrast()`

### 11.6.2.7 fl_contrast_level() [1/2]

```cpp
int fl_contrast_level ( )
```

Get the contrast level (sensitivity) of the `fl_contrast()` method.

This returns the level of the currently selected contrast mode.

Returns

The current contrast level.

- `fl_contrast_level(int level)`
- `fl_contrast_mode(int mode)`

Since

1.4.0

### 11.6.2.8 fl_contrast_level() [2/2]

```cpp
void fl_contrast_level ( int level )
```

Set the contrast level (sensitivity) of the `fl_contrast()` method.

This can be used to tune the legacy `fl_contrast()` function to achieve slightly better results. The default value is defined per contrast mode (see below). Values between 50 and 70 are recommended but you can raise it up to 100. Lower values than 50 are probably not useful.

The contrast level affects not only the legacy (1.3.x) `fl_contrast()` function but also the new CIELAB contrast mode which is the default since FLTK 1.4.0.

Other contrast modes are currently not affected by the contrast level.

You may use the contrast level if you define your own custom contrast function in mode `FL_CONTRAST_CUSTOM`.

Note

All contrast modes store their own contrast level because the behavior is slightly different. You must change the contrast mode `fl_contrast_mode()` **before** you set or get the contrast level.

The default contrast level is

- 50 in mode `FL_CONTRAST_LEGACY` (compatible with FLTK 1.3.x)
- 55 in mode `FL_CONTRAST_CIELAB`
• 0 (undefined) for all other modes

See the description of `fl_contrast_mode(int mode)` for more information about the contrast level per mode.

Example:
```
fl_contrast_mode(FL_CONTRAST_LEGACY);
fl_contrast_level(65);
```

A level greater than 50 (probably best in the range 50 to 70) may achieve better results of the legacy `fl_contrast()` function in some border cases of low contrast between foreground and background colors but we recommend to use the new default algorithm `FL_CONTRAST_CIELAB` unless you need strict backwards compatibility or use a CPU constrained embedded system.

Parameters

| in | level | valid range is 0 to 100 |

Since

1.4.0

11.6.2.9  `fl_contrast_mode()` [1/2]

```cpp
int fl_contrast_mode()
```

Return the current contrast algorithm (mode).

Returns

Contrast algorithm (mode).

Since

1.4.0

See also

`fl_contrast_mode(int)`

11.6.2.10  `fl_contrast_mode()` [2/2]

```cpp
void fl_contrast_mode(int mode)
```

Set the contrast algorithm (mode).

You can use one of

• FL_CONTRAST_NONE (not recommended: returns the foreground color)
• FL_CONTRAST_LEGACY (same as in FLTK 1.3.x)
• FL_CONTRAST_CIELAB (default since FLTK 1.4.0)
• FL_CONTRAST_CUSTOM (you must define your own contrast algorithm)

If you set FL_CONTRAST_CUSTOM you must also register your custom contrast function by calling `fl_contrast_function()`.

You may set the contrast level `fl_contrast_level(int)` after setting the contrast mode. This affects the contrast algorithm as described below:

• FL_CONTRAST_LEGACY: default level is 50 which is compatible with FLTK 1.3.x and older. This mode is no longer the default and is not recommended because it doesn't take human contrast perception into account and doesn't properly handle sRGB color values. You may get better contrasts if you set the level higher than 50. Values in the range 50 to 70 may be useful. Higher values result in higher contrast, i.e. the algorithm switches “earlier” to black or white mode.
• FL_CONTRAST_CIELAB: default level is 55 which appears to be a good value. The higher the level is, the more contrast is to be expected. Values in the range below 55 accept lower contrast and values above 55 switch “earlier” to black or white. Values between 45 and 65 may yield usable contrast experience.
11.6 Color & Font functions

Parameters

\[ \text{in } \text{mode} \quad \text{if invalid, FL\_CONTRAST\_CIELAB will be selected} \]

Since

1.4.0

See also

\begin{verbatim}
fl_contrast_function(Fl_ContrastFunction *)
fl_contrast_level(int)
\end{verbatim}

11.6.2.11 fl_font() [1/2]

\begin{verbatim}
Fl_Font fl_font () \{inline\}
\end{verbatim}

Return the face set by the most recent call to fl_font(). This can be used to save/restore the font.

11.6.2.12 fl_font() [2/2]

\begin{verbatim}
void fl_font ( Fl_Font face, Fl_Fontsize fsize )
\end{verbatim}

Sets the current font, which is then used in various drawing routines. You may call this outside a draw context if necessary to measure text, for instance by calling fl_width(), fl_measure(), or fl_text_extents(), but on X this will open the display.

The font is identified by a face and a size. The size of the font is measured in pixels and not "points". Lines should be spaced \texttt{size} pixels apart or more.

11.6.2.13 fl_height() [1/2]

\begin{verbatim}
int fl_height () \{inline\}
\end{verbatim}

Return the recommended minimum line spacing for the current font. You can also use the value of \texttt{size} passed to fl_font().

11.6.2.14 fl_height() [2/2]

\begin{verbatim}
int fl_height ( int font, int size )
\end{verbatim}

This function returns the actual height of the specified font and size. Normally the font height should always be 'size', but with the advent of XFT, there are (currently) complexities that seem to only be solved by asking the font what its actual font height is. (See STR#2115)

This function was originally undocumented in 1.1.x, and was used only by Fl_Text_Display. We're now documenting it in 1.3.x so that apps that need precise height info can get it with this function.

Returns

the height of the font in pixels.

\textbf{Todo} In the future, when the XFT issues are resolved, this function should simply return the 'size' value.

11.6.2.15 fl_latin1_to_local()

\begin{verbatim}
const char * fl_latin1_to_local ( const char * t, int n = -1 )
\end{verbatim}

Convert text from Windows/X11 latin1 character set to local encoding.
11.6.2.16  fl_lightness()

double fl_lightness ( 
    Fl_Color color )

Return the perceived lightness of a color.
This function calculates the perceived lightness of Fl_Color color.
The returned lightness value $L*$ according to the CIELAB ($L^*a^*b^*$) color model is almost linear with respect to human perception. It is in the range 0 (black) to 100 (white).
The result values of two colors can be compared directly and the difference is their perceived contrast.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>color</th>
<th>Fl_Color value</th>
</tr>
</thead>
</table>

Returns

perceived lightness (0 .. 100)

Since

1.4.0

11.6.2.17  fl_local_to_latin1()

const char* fl_local_to_latin1 ( 
    const char* t, 
    int n = -1 )

Convert text from local encoding to Windows/X11 latin1 character set.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>t</th>
<th>character string (local encoding)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>n</td>
<td>optional number of characters (bytes) to convert (default is all)</td>
</tr>
</tbody>
</table>

Returns

pointer to internal buffer containing converted characters

11.6.2.18  fl_local_to_mac_roman()

const char* fl_local_to_mac_roman ( 
    const char* t, 
    int n = -1 )

Convert text from local encoding to Mac Roman character set.
11.6 Color & Font functions

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>t</th>
<th>character string (local encoding)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>n</td>
<td>optional number of characters to convert (default is all)</td>
</tr>
</tbody>
</table>

Returns

pointer to internal buffer containing converted characters

11.6.2.19  fl_luminance()

double fl_luminance ( 
    Fl_Color color )

Return the raw / physical luminance of a color.
This function calculates the physical luminance of Fl_Color color.
The returned luminance value (aka \(Y\)) is the physical luminance of the Fl_Color color.
The result is in the range 0.0 (black) to 1.0 (white).

Note

This is probably not what you want if you are interested in perceived contrast or lightness calculation because
the luminance \(Y\) is not linear with respect to human perception.

See fl_lightness(Fl_Color) for a function that returns the perceived lightness of a color which can be used directly
for contrast calculation.

Parameters

| in | color | Fl_Color value |

Returns

Raw (physical) luminance (0.0 .. 1.0)

Since

1.4.0

See also

fl_lightness(Fl_Color)

11.6.2.20  fl_mac_roman_to_local()

const char * fl_mac_roman_to_local ( 
    const char * t, 
    int n = -1 )

Convert text from Mac Roman character set to local encoding.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>t</th>
<th>character string (Mac Roman encoding)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>n</td>
<td>optional number of characters to convert (default is all)</td>
</tr>
</tbody>
</table>
Returns

pointer to internal buffer containing converted characters

11.6.21  fl_show_colormap()

\texttt{Fl\_Color fl\_show\_colormap (}
\texttt{    Fl\_Color \textit{oldcol} )}

Pops up a window to let the user pick a colormap entry.

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{fl_show_colormap.png}
\caption{fl\_show\_colormap}
\end{figure}

Parameters

\begin{tabular}{|c|c|}
\hline
\textbf{in} & \textit{oldcol} & color to be highlighted when grid is shown. \\
\hline
\end{tabular}

Return values

\begin{tabular}{|c|c|}
\hline
\textit{Fl\_Color} & value of the chosen colormap entry. \\
\hline
\end{tabular}

See also

\texttt{Fl\_Color\_Chooser}

11.6.22  fl\_size()

\texttt{Fl\_Fontsize fl\_size ( ) [inline]}

Return the size set by the most recent call to \texttt{fl\_font()}. This can be used to save/restore the font.
11.6.2.23  fl_text_extents()  [1/2]

void fl_text_extents (  
    const char * c,  
    int & dx,  
    int & dy,  
    int & w,  
    int & h  
)  

Determine the minimum pixel dimensions of a nul-terminated string using the current fl_font().
Usage: given a string "txt" drawn using fl_draw(txt, x, y) you would determine its pixel extents on the display using
fl_text_extents(txt, dx, dy, wo, ho) such that a bounding box that exactly fits around the text could be drawn with
fl_rect(x+dx, y+dy, wo, ho). Note the dx, dy values hold the offset of the first "colored in" pixel of the string, from the
draw origin.
Note the desired font and font size must be set with fl_font() before calling this function.
This differs slightly from fl_measure() in that the dx/dy values are also returned.
No FLTK symbol expansion will be performed.
Example use:
int dx,dy,W,H;
fl_font(FL_HELVETICA, 12); // set font face+size first
fl_text_extents("Some text", dx, dy, W, H); // get width and height of string
printf("text's width=%d, height=%d
", W, H);

11.6.2.24  fl_text_extents()  [2/2]

void fl_text_extents (  
    const char * t,  
    int n,  
    int & dx,  
    int & dy,  
    int & w,  
    int & h   
)  [inline]  

Determine the minimum pixel dimensions of a sequence of n characters (bytes) using the current fl_font().
Note
The string length is measured in bytes, not (UTF-8) characters.
See also
    fl_text_extents(const char*, int& dx, int& dy, int& w, int& h)

11.6.2.25  fl_width()  

double fl_width (  
    unsigned int c  
)  [inline]  

Return the typographical width of a single character using the current font face and size.
Note
If a valid fl_gc is NOT found then it uses the first window gc, or the screen gc if no fltk window is available
when called.

11.6.2.26  free_color()  

void Fl::free_color (  
    Fl_Color i,  
    int overlay = 0    
)  [static]  

Frees the specified color from the colormap, if applicable.
If overlay is non-zero then the color is freed from the overlay colormap.
### 11.6.2.27 \texttt{get\_color()} [1/3]

```c
unsigned Fl::get\_color ( Fl\_Color i ) [static]
```

Returns the RGB value(s) for the given FLTK color index. This form returns the RGB values packed in a 32-bit unsigned integer with the red value in the upper 8 bits, the green value in the next 8 bits, and the blue value in bits 8-15. The lower 8 bits will always be 0.

### 11.6.2.28 \texttt{get\_color()} [2/3]

```c
void Fl::get\_color ( Fl\_Color i,
                     uchar \& red,
                     uchar \& green,
                     uchar \& blue ) [static]
```

Returns the RGB value(s) for the given FLTK color index. This form returns the red, green, and blue values separately in referenced variables.

See also

```c
unsigned get\_color(Fl\_Color c)
```

### 11.6.2.29 \texttt{get\_color()} [3/3]

```c
void Fl::get\_color ( Fl\_Color i,
                     uchar \& red,
                     uchar \& green,
                     uchar \& blue,
                     uchar \& alpha ) [static]
```

Returns the RGBA value(s) for the given FLTK color index. This form returns the red, green, blue, and alpha values separately in referenced variables.

See also

```c
unsigned get\_color(Fl\_Color c)
```

### 11.6.30 \texttt{get\_font()} 

```c
const char \* Fl::get\_font ( Fl\_Font fnum ) [static]
```

Gets the string for this face. This string is different for each face. Under X this value is passed to XListFonts to get all the sizes of this face.

### 11.6.31 \texttt{get\_font\_name()}

```c
const char \* Fl::get\_font\_name ( Fl\_Font fnum,
                                   int \* attributes = 0 ) [static]
```

Get a human-readable string describing the family of this face. This is useful if you are presenting a choice to the user. There is no guarantee that each face has a different name. The return value points to a static buffer that is overwritten each call. The integer pointed to by \texttt{attributes} (if the pointer is not zero) is set to zero, FL\_BOLD or FL\_ITALIC or FL\_BOLD | FL\_ITALIC. To locate a “family” of fonts, search forward and back for a set with non-zero attributes, these faces along with the face with a zero attribute before them constitute a family.

### 11.6.32 \texttt{get\_font\_sizes()}

```c
int Fl::get\_font\_sizes ( Fl\_Font fnum,
                          int \& sizep ) [static]
```

Generated by Doxygen
Return an array of sizes in `sizep`. The return value is the length of this array. The sizes are sorted from smallest to largest and indicate what sizes can be given to `fl_font()` that will be matched exactly (`fl_font()` will pick the closest size for other sizes). A zero in the first location of the array indicates a scalable font, where any size works, although the array may list sizes that work “better” than others. Warning: the returned array points at a static buffer that is overwritten each call. Under X this will open the display.

### 11.6.2.33 set_color() [1/3]

```c
void Fl::set_color ( 
  Fl_Color i, 
  unsigned c ) [static]
```

Sets an entry in the `fl_color` index table.
You can set it to any 8-bit RGB color. The color is not allocated until `fl_color(i)` is used.

### 11.6.2.34 set_color() [2/3]

```c
void Fl::set_color ( 
  Fl_Color i, 
  uchar red, 
  uchar green, 
  uchar blue ) [static]
```

Sets an entry in the `fl_color` index table.
You can set it to any 8-bit RGB color. The color is not allocated until `fl_color(i)` is used.

### 11.6.2.35 set_color() [3/3]

```c
void Fl::set_color ( 
  Fl_Color i, 
  uchar red, 
  uchar green, 
  uchar blue, 
  uchar alpha ) [static]
```

Sets an entry in the `fl_color` index table.
You can set it to any 8-bit RGBA color.

**Note**

The color transparency is effective under the Wayland, hybrid Wayland/X11 and macOS platforms, whereas it has no effect under the X11 and Windows platforms. It's also effective for widgets added to an `Fl_Gl_Window`.

**Version**

1.4

### 11.6.2.36 set_font()

```c
void Fl::set_font ( 
  Fl_Font fnum, 
  const char * name ) [static]
```

Changes a face.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fnum</code></td>
<td>The font number to be assigned a new face</td>
</tr>
<tr>
<td><code>name</code></td>
<td>Name of the font to assign. The string pointer is simply stored, the string is not copied, so the string must be in static memory. The exact name to be used depends on the platform :</td>
</tr>
</tbody>
</table>
• Windows, X11, Xft: use the family name prefixed by one character to indicate the desired font variant. Characters ' ', 'I', 'B', 'P' denote plain, italic, bold, and bold-italic variants, respectively. For example, string "IGabriola" is to be used to denote the "Gabriola italic" font. The "Oblique" suffix, in whatever case, is to be treated as "italic", that is, prefix the family name with 'I'.

• Other platforms, i.e., X11 + Pango, Wayland, macOS: use the full font name as returned by function Fl::get_font_name() or as listed by applications test/fonts or test/utf8. No prefix is to be added.

11.6.2.37 set_fonts()

Fl_Font Fl::set_fonts (const char *xstarname = 0) [static]

FLTK will open the display, and add every fonts on the server to the face table. It will attempt to put "families" of faces together, so that the normal one is first, followed by bold, italic, and bold italic. The only argument to this function is somewhat obsolete since FLTK and most underlying operating systems move to support Unicode. For completeness, following is the original documentation and a few updates:

On X11, the optional argument is a string to describe the set of fonts to add. Passing NULL will select only fonts that have the ISO8859-1 character set (and are thus usable by normal text). Passing "-*" will select all fonts with any encoding as long as they have normal X font names with dashes in them. Passing "*" will list every font that exists (on X this may produce some strange output). Other values may be useful but are system dependent.

With the Xft option on Linux, this parameter is ignored.

With Windows, NULL selects fonts with ANSI_CHARSET encoding and non-NULL selects all fonts. On macOS, this parameter is ignored.

The return value is how many faces are in the table after this is done.

11.7 Drawing functions

FLTK global graphics and GUI drawing functions.

Enumerations

• enum {
  FL_SOLID = 0, FL_DASH = 1, FL_DOT = 2, FL_DASHDOT = 3,
  FL_DASHDOTDOT = 4, FL_CAP_FLAT = 0x100, FL_CAP_ROUND = 0x200, FL_CAP_SQUARE = 0x300,
  FL_JOIN_MITER = 0x1000, FL_JOIN_ROUND = 0x2000, FL_JOIN_BEVEL = 0x3000
}

Functions

• int fl_add_symbol (const char *name, void(*drawit)(Fl_Color), int scalable)
  Adds a symbol to the system.

• int fl_antialias ()
  Return whether line drawings are currently antialiased.

• void fl_antialias (int state)
  Turn antialiased line drawings ON or OFF, if supported by platform.

• void fl_arc (double x, double y, double r, double start, double end)
  Add a series of points to the current path on the arc of a circle.

• void fl_arc (int x, int y, int w, int h, double a1, double a2)
  Draw ellipse sections using integer coordinates.

• void fl_begin_complex_polygon ()
  Start drawing a complex filled polygon.

• void fl_begin_line ()
  Start drawing a list of lines.

• void fl_begin_loop ()
  Start drawing a closed sequence of lines.

• void fl_begin_offscreen (Fl_Offscreen ctx)
Send all subsequent drawing commands to this offscreen buffer.

- **void fl_begin_points ()**
  Start drawing a list of points.

- **void fl_begin_polygon ()**
  Start drawing a convex filled polygon.

- **char fl_can_do_alpha_blending ()**
  Check whether platform supports true alpha blending for RGBA images.

- **Fl_RGB_Image * fl_capture_window (Fl_Window *win, int x, int y, int w, int h)**
  Captures the content of a rectangular zone of a mapped window.

- **void fl_chord (int x, int y, int w, int h, double a1, double a2)**
  *fl_chord declaration is a place holder - the function does not yet exist*

- **void fl_circle (double x, double y, double r)**
  *fl_circle(x,y,r) is equivalent to fl_arc(x,y,r,0,360), but may be faster.*

- **void fl_clip (int x, int y, int w, int h)**
  Intersect the current clip region with a rectangle and push this new region onto the stack (deprecated).

- **int fl_clip_box (int x, int y, int w, int h, int &X, int &Y , int &W, int &H)**
  Intersect a rectangle with the current clip region and return the bounding box of the result.

- **Fl_Region fl_clip_region ()**
  Return the current clipping region.

- **void fl_clip_region (Fl_Region r)**
  Replace the top of the clipping stack with a clipping region of any shape.

- **void fl_copy_offscreen (int x, int y, int w, int h, Fl_Offscreen pixmap, int srcx, int srcy)**
  Copy a rectangular area of the given offscreen buffer into the current drawing destination.

- **Fl_Offscreen fl_create_offscreen (int w, int h)**
  Creation of an offscreen graphics buffer.

- **void fl_cursor (Fl_Cursor)**
  Sets the cursor for the current window to the specified shape and colors.

- **void fl_cursor (Fl_Cursor, Fl_Color fg, Fl_Color bg=FL_WHITE)**
  Add a series of points on a Bézier curve to the path.

- **void fl_curve (double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)**
  Add a series of points on a Bézier curve to the path.

- **void fl_delete_offscreen (Fl_Offscreen ctx)**
  Deletion of an offscreen graphics buffer.

- **void fl_draw (const char *str, int n, int x, int y)**
  Draws starting at the given x, y location a UTF-8 string of length n bytes.

- **void fl_draw (const char *str, int x, int y)**
  Draws a nul-terminated UTF-8 string starting at the given x, y location.

- **void fl_draw (const char *str, int x, int y, int w, int h, Fl_Align align, Fl_Image *img=0, int draw_symbols=1)**
  Fancy string drawing function which is used to draw all the labels.

- **void fl_draw (const char *str, int x, int y, int w, int h, Fl_Align align, Fl_Image *img=0, int draw_symbols=1)**
  The same as fl_draw(const char *,int,int,int,Fl_Align,Fl_Image *,int) with the addition of the *callthis* parameter, which is a pointer to a text drawing function such as fl_draw(const char *, int, int, int) to do the real work.

- **void fl_draw (int angle, const char *str, int n, int x, int y)**
  Draws at the given x, y location a UTF-8 string of length n bytes rotating angle degrees counter-clockwise.

- **void fl_draw (int angle, const char *str, int x, int y)**
  Draws a nul-terminated UTF-8 string starting at the given x, y location and rotating angle degrees counter-clockwise.

- **void fl_draw_arrow (Fl_Rect bb, Fl_Arrow_Type t, Fl_Orientation o, Fl_Color color)**
  Draws an "arrow like" GUI element for the selected scheme.

- **void fl_draw_box (Fl_Boxtype, int x, int y, int w, int h, Fl_Color)**
  Draws a box using given type, position, size and color.
Draw a check mark inside the given bounding box.

- **void fl_draw_circle (int x, int y, int d, Fl_Color color)**
  Draw a potentially small, filled circle using a given color.

- **void fl_draw_image (const uchar *buf, int X, int Y, int W, int H, int D=3, int L=0)**
  Draw an 8-bit per color RGB or luminance image.

- **void fl_draw_image (Fl_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=3)**
  Draw an image using a callback function to generate image data.

- **void fl_draw_image_mono (const uchar *buf, int X, int Y, int W, int H, int D=1, int L=0)**
  Draw a gray-scale (1 channel) image.

- **void fl_draw_image_mono (Fl_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=1)**
  Draw a gray-scale image using a callback function to generate image data.

- **int fl_draw_pixmap (const char *const *data, int x, int y, Fl_Color bg=FL_GRAY)**
  Draw XPM image data, with the top-left corner at the given position.

- **int fl_draw_pixmap (char *const *data, int x, int y, Fl_Color bg=FL_GRAY)**
  Draw XPM image data, with the top-left corner at the given position.

- **void fl_draw_radio (int x, int y, int d, Fl_Color color)**
  Draw a round check mark (circle) of a radio button.

- **int fl_draw_symbol (const char *label, int x, int y, int w, int h, Fl_Color)**
  Draw the named symbol in the given rectangle using the given color.

- **void fl_end_complex_polygon ()**
  End complex filled polygon, and draw.

- **void fl_end_line ()**
  End list of lines, and draw.

- **void fl_end_loop ()**
  End closed sequence of lines, and draw.

- **void fl_end_offscreen ()**
  Quit sending drawing commands to the current offscreen buffer.

- **void fl_end_points ()**
  End list of points, and draw.

- **void fl_end_polygon ()**
  End convex filled polygon, and draw.

- **const char * fl_expand_text (const char *from, char *buf, int maxbuf, double maxw, int &n, double &width, int wrap, int draw_symbols=0)**
  Copy from to buf, replacing control characters with ^X.

- **void fl_focus_rect (int x, int y, int w, int h)**
  Draw a dotted rectangle, used to indicate keyboard focus on a widget.

- **void fl_frame (const char *s, int x, int y, int w, int h)**
  Draws a series of line segments around the given box.

- **void fl_frame2 (const char *s, int x, int y, int w, int h)**
  Draws a series of line segments around the given box.

- **void fl_gap ()**
  Separate loops of the path.

- **void fl_line (int x, int y, int x1, int y1)**
  Draw a line from (x,y) to (x1,y1)

- **void fl_line (int x, int y, int x1, int y1, int x2, int y2)**
  Draw a line from (x,y) to (x1,y1) and another from (x1,y1) to (x2,y2)

- **void fl_line_style (int style, int width=0, char *dashes=0)**
  Set how to draw lines (the “pen”).

- **void fl_load_identity ()**
  Set the transformation matrix to identity.

- **void fl_load_matrix (double a, double b, double c, double d, double x, double y)**
11.7 Drawing functions

Set the current transformation matrix.

- void fl_loop (int x, int y, int x1, int y1, int x2, int y2)
  Outline a 3-sided polygon with lines.

- void fl_loop (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
  Outline a 4-sided polygon with lines.

- void fl_measure (const char *str, int &x, int &y, int draw_symbols=1)
  Measure how wide and tall the string will be when printed by the fl_draw() function with align parameter.

- int fl_measure_pixmap (char *const *data, int &w, int &h)
  Get the dimensions of a pixmap.

- int fl_measure_pixmap (const char *const *cdata, int &w, int &h)
  Get the dimensions of a pixmap.

- void fl_mult_matrix (double a, double b, double c, double d, double x, double y)
  Concatenate another transformation onto the current one.

- int fl_not_clipped (int x, int y, int w, int h)
  Does the rectangle intersect the current clip region?

- unsigned int fl_old_shortcut (const char *s)
  Emulation of XForms named shortcuts.

- void fl_overlay_clear ()
  Erase a selection rectangle without drawing a new one.

- void fl_overlay_rect (int x, int y, int w, int h)
  Draw a transient dotted selection rectangle.

- float fl_override_scale ()
  Removes any GUI scaling factor in subsequent drawing operations.

- void fl_pie (int x, int y, int w, int h, double a1, double a2)
  Draw filled ellipse sections using integer coordinates.

- void fl_point (int x, int y)
  Draw a single pixel at the given coordinates.

- void fl_polygon (int x, int y, int x1, int y1, int x2, int y2)
  Fill a 3-sided polygon.

- void fl_polygon (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
  Fill a 4-sided polygon.

- void fl_pop_clip ()
  Restore the previous clip region.

- void fl_pop_matrix ()
  Restore the current transformation matrix from the stack.

- void fl_push_clip (int x, int y, int w, int h)
  Intersect the current clip region with a rectangle and push this new region onto the stack.

- void fl_push_matrix ()
  Save the current transformation matrix on the stack.

- void fl_push_no_clip ()
  Push an empty clip region onto the stack so nothing will be clipped.

- uchar * fl_read_image (uchar *p, int X, int Y, int W, int H, int alpha=0)
  Reads an RGB(A) image from the current window or off-screen buffer.

- void fl_rect (Fl_Rect r)
  Draw a border inside the given bounding box.

- void fl_rect (int x, int y, int w, int h)
  Draw a border inside the given bounding box.

- void fl_rect (int x, int y, int w, int h, Fl_Color c)
  Draw with passed color a border inside the given bounding box.

- void fl_rectf (Fl_Rect bb, uchar r, uchar g, uchar b)
  Color a rectangle with "exactly" the passed r, g, b color.
• void **fl_rectf** (Fl_Rect r)
  Color with current color a rectangle that exactly fills the given bounding box.
• void **fl_rectf** (Fl_Rect r, Fl_Color c)
  Color with passed color a rectangle that exactly fills the given bounding box.
• void **fl_rectf** (int x, int y, int w, int h)
  Color with current color a rectangle that exactly fills the given bounding box.
• void **fl_rectf** (int x, int y, int w, int h, Fl_Color c)
  Color with passed color a rectangle that exactly fills the given bounding box.
• void **fl_rectf** (int x, int y, int w, int h, uchar r, uchar g, uchar b)
  Color a rectangle with "exactly" the passed r, g, b color.
• void **fl_rescale_offscreen** (Fl_Offscreen &ctx)
  Adapts an offscreen buffer to a changed value of the scale factor.
• void **fl_reset_spot** (void)
  Resets marked text.
• void **fl_restore_clip** ()
  Undo any clobbering of the clip region done by your program.
• void **fl_restore_scale** (float s)
  Restores the GUI scaling factor and the clipping region in subsequent drawing operations.
• void **fl_rotate** (double d)
  Concatenate rotation transformation onto the current one.
• void **fl_rounded_rect** (int x, int y, int w, int h, int r)
  Draw a rounded border inside the given bounding box.
• void **fl_rounded_rectf** (int x, int y, int w, int h, int r)
  Color with current color a rounded rectangle that exactly fills the given bounding box.
• void **fl_rtl_draw** (const char * str, int n, int x, int y)
  Draw a UTF-8 string of length n bytes right to left starting at the given x, y location.
• void **fl_scale** (double x)
  Concatenate scaling transformation onto the current one.
• void **fl_scale** (double x, double y)
  Concatenate scaling transformation onto the current one.
• void **fl_scroll** (int X, int Y, int W, int H, int dx, int dy, void(*draw_area)(void *, int, int, int), void *data)
  Scroll a rectangle and draw the newly exposed portions.
• void **fl_set_spot** (int font, int size, int X, int Y, int W, int H, Fl_Window *win=0)
  Inform text input methods about the current text insertion cursor.
• void **fl_set_status** (int X, int Y, int W, int H)
  Related to text input methods under X11.
• const char * **fl_shortcut_label** (unsigned int shortcut)
  Get a human-readable string from a shortcut value.
• const char * **fl_shortcut_label** (unsigned int shortcut, const char **eom)
  Get a human-readable string from a shortcut value.
• double **fl_transform_dx** (double x, double y)
  Transform distance using current transformation matrix.
• double **fl_transform_dy** (double x, double y)
  Transform distance using current transformation matrix.
• double **fl_transform_x** (double x, double y)
  Transform coordinate using the current transformation matrix.
• double **fl_transform_y** (double x, double y)
  Transform coordinate using the current transformation matrix.
• void **fl_transformed_vertex** (double xf, double yf)
  Add coordinate pair to the vertex list without further transformations.
• void **fl_translate** (double x, double y)
11.7 Drawing functions

Concatenate translation transformation onto the current one.

- void fl_vertex (double x, double y)
  
  Add a single vertex to the current path.

- void fl_xline (int x, int y, int x1)
  
  Draw a horizontal line from (x,y) to (x1,y).

- void fl_yxline (int x, int y, int x1, int y2)
  
  Draw a horizontal line from (x,y) to (x1,y), then vertical from (x1,y) to (x1,y2).

- void fl_yxline (int x, int y, int x1, int y2, int x3)
  
  Draw a horizontal line from (x,y) to (x1,y), then a vertical from (x1,y) to (x1,y2) and then another horizontal from (x1,y2) to (x3,y2).

- void fl_yxline (int x, int y, int y1)
  
  Draw a vertical line from (x,y) to (x,y1)

- void fl_yxline (int x, int y, int y1, int x2)
  
  Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1).

- void fl_yxline (int x, int y, int y1, int x2, int y3)
  
  Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1), then another vertical from (x2,y1) to (x2,y3).

11.7.1 Detailed Description

FLTK global graphics and GUI drawing functions. These functions are declared in `<FL/fl_draw.H>`, and in `<FL/platform.H>` for offscreen buffer-related ones.

11.7.2 Enumeration Type Documentation

11.7.2.1 anonymous enum

11.7.3 Function Documentation

11.7.3.1 fl_add_symbol()

```c
int fl_add_symbol (  
  const char * name,  
  void(*)(Fl_Color) drawit,  
  int scalable )
```

Adds a symbol to the system.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>name</th>
<th>name of symbol (without the &quot;@&quot;)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>drawit</td>
<td>function to draw symbol</td>
</tr>
<tr>
<td>in</td>
<td>scalable</td>
<td>set to 1 if drawit uses scalable vector drawing</td>
</tr>
</tbody>
</table>

Returns

1 on success, 0 on failure

### 11.7.3.2 fl_antialias()

```c
void fl_antialias ( int state ) [inline]
```

Turn antialiased line drawings ON or OFF, if supported by platform. Currently, only the Windows platform allows to change whether line drawings are antialiased. Turning it OFF may accelerate heavy drawing operations.

### 11.7.3.3 fl_arc() [1/2]

```c
void fl_arc ( double x, double y, double r, double start, double end ) [inline]
```

Add a series of points to the current path on the arc of a circle. You can get elliptical paths by using scale and rotate before calling fl_arc().

#### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x,y,r</th>
<th>center and radius of circular arc</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>start,end</td>
<td>angles of start and end of arc measured in degrees counter-clockwise from 3 o'clock. If end is less than start then it draws the arc in a clockwise direction.</td>
</tr>
</tbody>
</table>

![Figure 11.2 fl_arc(x,y,r,a1,a2)](image_url)

Examples:

// Draw an arc of points
fl_begin_points();
fl_arc(100.0, 100.0, 50.0, 0.0, 180.0);
fl_end_points();

// Draw arc with a line
11.7 Drawing functions

11.7.3.4 \texttt{fl\_arc()} [2/2]

```c
void fl\_arc (int \_x, int \_y, int \_w, int \_h, double \_a1, double \_a2) [inline]
```

Draw ellipse sections using integer coordinates. These functions match the rather limited circle drawing code provided by X and Windows. The advantage over using \texttt{fl\_arc} with floating point coordinates is that they are faster because they often use the hardware, and they draw much nicer small circles, since the small sizes are often hard-coded bitmaps.

If a complete circle is drawn it will fit inside the passed bounding box. The two angles are measured in degrees counter-clockwise from 3 o'clock and are the starting and ending angle of the arc, \( \_a2 \) must be greater or equal to \( \_a1 \).

\texttt{fl\_arc()} draws a series of lines to approximate the arc. Notice that the integer version of \texttt{fl\_arc()} has a different number of arguments than the double version \texttt{fl\_arc(double \_x, double \_y, double \_r, double \_start, double \_end)}.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{x,y,w,h}</td>
<td>bounding box of complete circle</td>
</tr>
<tr>
<td>\texttt{a1,a2}</td>
<td>start and end angles of arc measured in degrees counter-clockwise from 3 o'clock. ( _a2 ) must be greater than or equal to ( _a1 ).</td>
</tr>
</tbody>
</table>

11.7.3.5 \texttt{fl\_begin\_complex\_polygon()}

```c
void fl\_begin\_complex\_polygon ( ) [inline]
```

Start drawing a complex filled polygon. The polygon may be concave, may have holes in it, or may be several disconnected pieces. Call \texttt{fl\_gap()} to separate loops of the path.

To outline the polygon, use \texttt{fl\_begin\_loop()} and replace each \texttt{fl\_gap()} with \texttt{fl\_end\_loop();fl\_begin\_loop()} pairs.

Note

For portability, you should only draw polygons that appear the same whether "even/odd" or "non-zero" winding rules are used to fill them. Holes should be drawn in the opposite direction to the outside loop.

Figure 11.3 \texttt{fl\_pie()} and \texttt{fl\_arc()}

Generated by Doxygen
11.7.3.6  fl_begin_offscreen()

void fl_begin_offscreen (  
                   Fl_Offscreen  ctx  )  
Send all subsequent drawing commands to this offscreen buffer.

Parameters

ctx  the offscreen buffer.

Note

The ctx argument must have been created by fl_create_offscreen().

11.7.3.7  fl_begin_points()

void fl_begin_points ( )  [inline]  
Start drawing a list of points.
Points are added to the list with fl_vertex().

11.7.3.8  fl_can_do_alpha_blending()

cchar fl_can_do_alpha_blending ( )  [inline]  
Check whether platform supports true alpha blending for RGBA images.

Returns

1 if true alpha blending supported by platform
0 not supported so FLTK will use screen door transparency

11.7.3.9  fl_capture_window()

Fl_RGB_Image ∗ fl_capture_window (  
                   Fl_Window ∗  win,  
                   int  x,  
                   int  y,  
                   int  w,  
                   int  h  )  
Captures the content of a rectangular zone of a mapped window.

Parameters

<table>
<thead>
<tr>
<th>win</th>
<th>a mapped Fl_Window (derived types including Fl_Gl_Window are also possible)</th>
</tr>
</thead>
<tbody>
<tr>
<td>x,y,w,h</td>
<td>window area to be captured. Intersecting sub-windows are captured too.</td>
</tr>
</tbody>
</table>

Returns

The captured pixels as an Fl_RGB_Image. The raw and drawing sizes of the image can differ. Returns NULL when capture was not successful. The image depth may differ between platforms.

Version

1.4

11.7.3.10  fl_circle()

void fl_circle (  
                   double  x,  
                   }
}
double y,
    double r } [inline]

fl_circle(x,y,r) is equivalent to fl_arc(x,y,r,0,360), but may be faster.

Parameters

| in | x,y,r | center and radius of circle |

Note

fl_circle() is best used as part of the Drawing Complex Shapes API, that is, flanked by fl_begin_XXX() and fl_end_XXX() calls where XXX can be 'loop' or 'polygon' to draw, respectively a circle or a disk. Transformation functions (e.g., fl_scale(double, double)) can be also used for fl_circle() to draw empty of filled ellipses. It must be the only thing in the path: if you want a circle as part of a complex polygon you must use fl_arc(). Nevertheless, fl_circle() can also be used by itself to draw circles.

11.7.3.11 fl_clip()

void fl_clip {
    int x,
    int y,
    int w,
    int h ) [inline]

Intersect the current clip region with a rectangle and push this new region onto the stack (deprecated).

Parameters

| in | x,y,w,h | position and size |

Deprecated Please use fl_push_clip(int x, int y, int w, int h) instead. fl_clip(int, int, int, int) will be removed in FLTK 1.5.

11.7.3.12 fl_clip_box()

int fl_clip_box (   int x,
    int y,
    int w,
    int h,
    int & X,
    int & Y,
    int & W,
    int & H ) [inline]

Intersect a rectangle with the current clip region and return the bounding box of the result.

Returns non-zero if the resulting rectangle is different to the original. The given rectangle (x, y, w, h) should be entirely inside its window, otherwise the result may be unexpected, i.e. this function may not clip the rectangle to the window coordinates and size. In particular x and y should not be negative.

The resulting bounding box can be used to limit the necessary drawing to this rectangle.

Example:

```cpp
void MyGroup::draw() {
    int X = 0, Y = 0, W = 0, H = 0;
    int ret = fl_clip_box(x(), y(), w(), h(), X, Y, W, H);
    if (ret == 0) { // entire group is visible (not clipped)
        // full drawing code here
    } else { // parts of this group are clipped
        // partial drawing code here (uses X, Y, W, and H to test)
    }
}
```
and \( h \) are set to zero if the rectangle is completely outside the clipping region. In this case \( x \) and \( y \) are undefined and should not be used. Possible values are \( (0, 0) \), \( (x, y) \), or anything else (platform dependent).

**Note**

This function is platform-dependent. If the given rectangle is not entirely inside the window, the results are not guaranteed to be the same on all platforms.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>x, y, w, h</th>
<th>position and size of rectangle</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>X, Y, W, H</td>
<td>position and size of resulting bounding box.</td>
</tr>
</tbody>
</table>

**Returns**

Non-zero if the resulting rectangle is different to the original.

**See also**

fl_not_clipped()

### 11.7.3.13 fl_clip_region() [1/2]

**FlRegion** fl_clip_region () [inline]

Return the current clipping region.

**Note**

This function is mostly intended for internal use by the FLTK library when drawing to the display. Its return value can be always NULL if the current drawing surface is not the display.

### 11.7.3.14 fl_clip_region() [2/2]

void fl_clip_region (FlRegion r) [inline]

Replace the top of the clipping stack with a clipping region of any shape. FlRegion is an operating system specific type.

**Note**

This function is mostly intended for internal use by the FLTK library when drawing to the display. Its effect can be null if the current drawing surface is not the display.

**Parameters**

| in | r | clipping region |

### 11.7.3.15 fl_copy_offscreen()

void fl_copy_offscreen (int x, int y, int w, int h, Fl_Offscreen pixmap, int srcx,
11.7 Drawing functions

Copy a rectangular area of the given offscreen buffer into the current drawing destination.

Parameters

<table>
<thead>
<tr>
<th>x,y</th>
<th>position where to draw the copied rectangle</th>
</tr>
</thead>
<tbody>
<tr>
<td>w,h</td>
<td>size of the copied rectangle</td>
</tr>
<tr>
<td>pixmap</td>
<td>offscreen buffer containing the rectangle to copy</td>
</tr>
<tr>
<td>srcx,srcy</td>
<td>origin in offscreen buffer of rectangle to copy</td>
</tr>
</tbody>
</table>

### 11.7.3.16 fl_create_offscreen()

```c
Fl_Offscreen fl_create_offscreen (  
  int w,  
  int h )
```

Creation of an offscreen graphics buffer.

Parameters

| w,h  | width and height in FLTK units of the buffer. |

Returns

the created graphics buffer.

The pixel size of the created graphics buffer is equal to the number of pixels in an area of the screen containing the current window sized at w,h FLTK units. This pixel size varies with the value of the scale factor of this screen.

Note

Work with the fl_XXX_offscreen() functions is equivalent to work with an Fl_Image_Surface object, as follows:

<table>
<thead>
<tr>
<th>Fl_Offscreen-based approach</th>
<th>Fl_Image_Surface-based approach</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fl_Offscreen off = fl_create_offscreen(w, h)</td>
<td>Fl_Image_Surface *surface = new Fl_Image_Surface(w, h, 1)</td>
</tr>
<tr>
<td>fl_begin_offscreen(off)</td>
<td>Fl_Surface_Device::push_current(surface)</td>
</tr>
<tr>
<td>fl_end_offscreen()</td>
<td>Fl_Surface_Device::pop_current()</td>
</tr>
<tr>
<td>fl_copy_offscreen(x,y,w,h, off, sx,sy)</td>
<td>fl_copy_offscreen(x,y,w,h, surface-&gt;offscreen(), sx,sy)</td>
</tr>
<tr>
<td>fl_rescale_offscreen(off)</td>
<td>surface-&gt;rescale()</td>
</tr>
<tr>
<td>fl_delete_offscreen(off)</td>
<td>delete surface</td>
</tr>
</tbody>
</table>

### 11.7.3.17 fl_cursor()

```c
void fl_cursor (  
  Fl_Cursor c )
```

Sets the cursor for the current window to the specified shape and colors.

The cursors are defined in the `<FL/Enumerations.H>` header file.

### 11.7.3.18 fl_curve()

```c
void fl_curve (  
  double X0,  
  double Y0,  
  double X1,  
  double Y1,  
  ...  
)```
double X2,
double Y2,
double X3,
double Y3) [inline]

Add a series of points on a Bézier curve to the path.
The curve ends (and two of the points) are at X0,Y0 and X3,Y3.

### Parameters

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X0,Y0</td>
<td>curve start point</td>
</tr>
<tr>
<td>X1,Y1</td>
<td>curve control point</td>
</tr>
<tr>
<td>X2,Y2</td>
<td>curve control point</td>
</tr>
<tr>
<td>X3,Y3</td>
<td>curve end point</td>
</tr>
</tbody>
</table>

#### 11.7.3.19 fl_delete_offscreen()

```c
void fl_delete_offscreen (  
  Fl_Offscreen ctx  )
```

Deletion of an offscreen graphics buffer.

**Parameters**

| ctx    | the buffer to be deleted. |

**Note**

The `ctx` argument must have been created by `fl_create_offscreen()`.

#### 11.7.3.20 fl_draw() [1/4]

```c
void fl_draw (  
  const char * str,  
  int x,  
  int y  )
```

Draw a null-terminated UTF-8 string starting at the given `x`, `y` location.

Text is aligned to the left and to the baseline of the font. To align to the bottom, subtract `fl_descent()` from `y`. To align to the top, subtract `fl_descent()` and add `fl_height()`. This version of `fl_draw` provides direct access to the text drawing function of the underlying OS. It does not apply any special handling to control characters.

#### 11.7.3.21 fl_draw() [2/4]

```c
void fl_draw (  
  const char * str,  
  int x,  
  int y,  
  int w,  
  int h,  
  Fl_Align align,  
  Fl_Image * img,  
  int draw_symbols  )
```

Fancy string drawing function which is used to draw all the labels.

The string is formatted and aligned inside the passed box. Handles 't' and 'n', expands all other control characters to '^X', and aligns inside or against the edges of the box. See `Fl_Widget::align()` for values of `align`. The value `FL_ALIGN_INSIDE` is ignored, as this function always prints inside the box. If `img` is provided and is not `NULL`, the image is drawn above or below the text as specified by the `align` value. The `draw_symbols` argument specifies whether or not to look for symbol names starting with the '@' character.
11.7 Drawing functions

11.7.3.22 fl_draw() [3/4]

```c
void fl_draw (  
    int angle,  
    const char * str,  
    int n,  
    int x,  
    int y ) [inline]
```

Draw at the given x, y location a UTF-8 string of length n bytes rotating angle degrees counter-clockwise.

**Note**

When using X11 (Unix, Linux, Cygwin et al.) this needs Xft to work. Under plain X11 (w/o Xft) rotated text is not supported by FLTK. A warning will be issued to stderr at runtime (only once) if you use this method with an angle other than 0.

11.7.3.23 fl_draw() [4/4]

```c
void fl_draw (  
    int angle,  
    const char * str,  
    int x,  
    int y)
```

Draw a nul-terminated UTF-8 string starting at the given x, y location and rotating angle degrees counter-clockwise.

This version of fl_draw provides direct access to the text drawing function of the underlying OS and is supported by all fltk platforms except X11 without Xft.

11.7.3.24 fl_draw_arrow()

```c
void fl_draw_arrow (  
    Fl_Rect r,  
    Fl_Arrow_Type t,  
    Fl_Orientation o,  
    Fl_Color col )
```

Draw an "arrow like" GUI element for the selected scheme.

In the future this function should be integrated in Fl_Scheme as a virtual method, i.e. it would call a method like ...

```c
Fl_Scheme::current()->draw_arrow(r, t, o, col);
```

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>r</th>
<th>bounding box</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>t</td>
<td>arrow type</td>
</tr>
<tr>
<td>in</td>
<td>o</td>
<td>orientation</td>
</tr>
<tr>
<td>in</td>
<td>col</td>
<td>arrow color</td>
</tr>
</tbody>
</table>

Since

1.4.0

11.7.3.25 fl_draw_box()

```c
void fl_draw_box (  
    Fl_Boxtype t,  
    int x,  
    int y,  
    int w,  
    int h,  
    Fl_Color c )
```
Draws a box using given type, position, size and color.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>t</th>
<th>box type</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x,y,w,h</td>
<td>position and size</td>
</tr>
<tr>
<td>in</td>
<td>c</td>
<td>color</td>
</tr>
</tbody>
</table>

### 11.7.3.26 fl_draw_check()

```c
void fl_draw_check (
    Fl_Rect bb,
    Fl_Color col )
```

Draw a check mark inside the given bounding box.

The check mark is allowed to fill the entire box but the algorithm used makes sure that a 1-pixel border is kept free if the box is large enough. You need to calculate margins for box borders etc. yourself.

The check mark size is limited (minimum and maximum size) and the check mark is always centered in the given box.

**Note**

If the box is too small (bad GUI design) the check mark will be drawn over the box borders. This is intentional for better user experience. Otherwise users might not be able to recognize if a box is checked.

The size limits are implementation details and may be changed at any time.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>bb</th>
<th>rectangle that defines the bounding box</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>col</td>
<td>Fl_Color to draw the check mark</td>
</tr>
</tbody>
</table>

Since

1.4.0

### 11.7.3.27 fl_draw_circle()

```c
void fl_draw_circle ( 
    int x, 
    int y, 
    int d, 
    Fl_Color color )
```

Draw a potentially small, filled circle using a given color.

This function draws a filled circle bounded by rectangle (x, y, d, d) using color color

This function is the same as fl_pie(x, y, d, d, 0, 360) except with some systems that don't draw small circles well. In that situation, the circle diameter d is converted from FLTK units to pixels and this function approximates a filled circle by drawing several filled rectangles if the converted diameter is 6 pixels.

The current drawing color fl_color() is preserved across the call.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>x,y</th>
<th>coordinates of top left of the bounding box</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>d</td>
<td>diameter == width and height of the bounding box in FLTK units</td>
</tr>
<tr>
<td>in</td>
<td>color</td>
<td>the color used to draw the circle</td>
</tr>
</tbody>
</table>
11.7 Drawing functions

Since 1.4.0

11.7.3.28 fl_draw_image() [1/2]

void fl_draw_image (  
    const uchar * buf,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 3,  
    int L = 0 ) [inline]

Draw an 8-bit per color RGB or luminance image.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>buf</th>
<th>points at the &quot;r&quot; data of the top-left pixel. Color data must be in r,g,b order. Luminance data is only one gray byte.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X,Y</td>
<td>position where to put top-left corner of image</td>
</tr>
<tr>
<td>in</td>
<td>W,H</td>
<td>size of the image</td>
</tr>
<tr>
<td>in</td>
<td>D</td>
<td>delta to add to the pointer between pixels. It may be any value greater than or equal to 1, or it can be negative to flip the image horizontally</td>
</tr>
<tr>
<td>in</td>
<td>L</td>
<td>delta to add to the pointer between lines (if 0 is passed it uses W * D), and may be larger than W * D to crop data, or negative to flip the image vertically</td>
</tr>
</tbody>
</table>

It is highly recommended that you put the following code before the first show() of any window in your program to get rid of the dithering if possible:

```c
Fl::visual(Fl_RGB);
```

Gray scale (1-channel) images may be drawn. This is done if abs(D) is less than 3, or by calling fl_draw_image_mono(). Only one 8-bit sample is used for each pixel, and on screens with different numbers of bits for red, green, and blue only gray colors are used. Setting D greater than 1 will let you display one channel of a color image.

Note:

The X version does not support all possible visuals. If FLTK cannot draw the image in the current visual it will abort. FLTK supports any visual of 8 bits or less, and all common TrueColor visuals up to 32 bits.

11.7.3.29 fl_draw_image() [2/2]

void fl_draw_image (  
    Fl_Draw_Image_Cb cb,  
    void * data,  
    int X,  
    int Y,  
    int W,  
    int H,  
    int D = 3 ) [inline]

Draw an image using a callback function to generate image data.

You can generate the image as it is being drawn, or do arbitrary decompression of stored data, provided it can be decompressed to individual scan lines.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>cb</th>
<th>callback function to generate scan line data</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>data</td>
<td>user data passed to callback function</td>
</tr>
</tbody>
</table>
Parameters

| in | X,Y | screen position of top left pixel |
| in | W,H | image width and height |
| in | D  | data size per pixel in bytes (must be greater than 0) |

See also

`fl_draw_image(const uchar * buf, int X, int Y, int W, int H, int D, int L)`

The callback function `cb` is called with the `void *data` user data pointer to allow access to a structure of information about the image, and the x, y, and w of the scan line desired from the image. 0,0 is the upper-left corner of the image, not x, y. A pointer to a buffer to put the data into is passed. You must copy w pixels from scanline y, starting at pixel x, to this buffer.

Due to cropping, less than the whole image may be requested. So x may be greater than zero, the first y may be greater than zero, and w may be less than W. The buffer is long enough to store the entire W * D pixels, this is for convenience with some decompression schemes where you must decompress the entire line at once: decompress it into the buffer, and then if x is not zero, copy the data over so the x'th pixel is at the start of the buffer.

You can assume the y's will be consecutive, except the first one may be greater than zero. If D is 4 or more, you must fill in the unused bytes with zero.

### 11.7.3.30 fl_draw_image_mono() [1/2]

```c
void fl_draw_image_mono ( 
    const uchar * buf, 
    int X, 
    int Y, 
    int W, 
    int H, 
    int D = 1, 
    int L = 0 ) [inline]
```

Draw a gray-scale (1 channel) image.

See also

`fl_draw_image(const uchar * buf, int X, int Y, int W, int H, int D, int L)`

### 11.7.3.31 fl_draw_image_mono() [2/2]

```c
void fl_draw_image_mono ( 
    Fl_Draw_Image_Cb cb, 
    void * data, 
    int X, 
    int Y, 
    int W, 
    int H, 
    int D = 1 ) [inline]
```

Draw a gray-scale image using a callback function to generate image data.

See also

`fl_draw_image(Fl_Draw_Image_Cb cb, void * data, int X, int Y, int W, int H, int D)`

### 11.7.3.32 fl_draw_pixmap() [1/2]

```c
int fl_draw_pixmap ( 
    char *const * data, 
    int x, 
    int y, 
    Fl_Color bg = FL_GRAY ) [inline]
```

Draw XPM image data, with the top-left corner at the given position.
11.7 Drawing functions

See also

fl_draw_pixmap(const char* const* data, int x, int y, Fl_Color bg)

11.7.3.33 fl_draw_pixmap() [2/2]

int fl_draw_pixmap (  
    const char *const * data,  
    int x,  
    int y,  
    Fl_Color bg = FL_GRAY  )

Draw XPM image data, with the top-left corner at the given position.  
The image is dithered on 8-bit displays so you won't lose color space for programs displaying both images and pixmaps.

Parameters

| in  | data          | pointer to XPM image data |
| in  | x,y           | position of top-left corner |
| in  | bg            | background color |

Returns

0 if there was any error decoding the XPM data.

11.7.3.34 fl_draw_radio()

void fl_draw_radio (  
    int x,  
    int y,  
    int d,  
    Fl_Color color  )

Draw a round check mark (circle) of a radio button.  
This draws only the round "radio button mark", it does not draw the (also typically round) box of the radio button.  
Call this only if the radio button is ON.  
This method draws a scheme specific "circle" with a particular light effect if the scheme is gtk+. For all other schemes this function draws a simple, small circle.  
The color must be chosen by the caller so it has enough contrast with the background.  
The bounding box of the circle is the rectangle (x, y, d, d).  
The current drawing color fl_color() is preserved across the call.

Parameters

| in  | x,y   | coordinates of top left of the bounding box |
| in  | d     | diameter == width and height of the bounding box in FLTK units |
| in  | color | the base color used to draw the circle |

Since

1.4.0

11.7.3.35 fl_draw_symbol()

int fl_draw_symbol (  
    const char * label,  
    int x,  

Generated by Doxygen
int y,
int w,
int h,
Fl_Color col
)
Draw the named symbol in the given rectangle using the given color.

Parameters

<table>
<thead>
<tr>
<th>in label</th>
<th>name of symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>in x,y</td>
<td>position of symbol</td>
</tr>
<tr>
<td>in w,h</td>
<td>size of symbol</td>
</tr>
<tr>
<td>in col</td>
<td>color of symbox</td>
</tr>
</tbody>
</table>

Returns

1 on success, 0 on failure

11.7.3.36 fl_expand_text()

const char * fl_expand_text (  
    const char * from,
    char * buf,
    int maxbuf,
    double maxw,
    int & n,
    double & width,
    int wrap,
    int draw_symbols )

Copy from to buf, replacing control characters with ^X. Stop at a newline or if maxbuf characters written to buffer. Also word-wrap if width exceeds maxw. Returns a pointer to the start of the next line of characters. Sets n to the number of characters put into the buffer. Sets width to the width of the string in the current font.

11.7.3.37 fl_focus_rect()

void fl_focus_rect (  
    int x,
    int y,
    int w,
    int h ) [inline]

Draw a dotted rectangle, used to indicate keyboard focus on a widget. This method draws the rectangle in the current color and independent of the Fl::visible_focus() option. You may need to set the current color with fl_color() before you call this.

11.7.3.38 fl_frame()

void fl_frame (  
    const char * s,
    int x,
    int y,
    int w,
    int h )

Draws a series of line segments around the given box. The string s must contain groups of 4 letters which specify one of 24 standard grayscale values, where 'A' is black and 'X' is white. The order of each set of 4 characters is: top, left, bottom, right. The result of calling fl_frame() with a string that is not a multiple of 4 characters in length is undefined. The only difference between this function and fl_frame2() is the order of the line segments.
11.7 Drawing functions

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>s</td>
</tr>
<tr>
<td>in</td>
<td>x,y,w,h</td>
</tr>
</tbody>
</table>

11.7.3.39 fl_frame2()

```c
void fl_frame2 ( const char * s, int x, int y, int w, int h )
```

Draws a series of line segments around the given box. The string `s` must contain groups of 4 letters which specify one of 24 standard grayscale values, where 'A' is black and 'X' is white. The order of each set of 4 characters is: bottom, right, top, left. The result of calling `fl_frame2()` with a string that is not a multiple of 4 characters in length is undefined. The only difference between this function and `fl_frame()` is the order of the line segments.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>s</td>
</tr>
<tr>
<td>in</td>
<td>x,y,w,h</td>
</tr>
</tbody>
</table>

11.7.3.40 fl_gap()

```c
void fl_gap ( ) [inline]
```

Separate loops of the path. It is unnecessary but harmless to call `fl_gap()` before the first vertex, after the last vertex, or several times in a row.

11.7.3.41 fl_line_style()

```c
void fl_line_style ( int style, int width = 0, char * dashes = 0 ) [inline]
```

Set how to draw lines (the "pen"). If you change this it is your responsibility to set it back to the default using `fl_line_style(0)`.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>style</td>
</tr>
<tr>
<td>in</td>
<td>width</td>
</tr>
<tr>
<td>in</td>
<td>dashes</td>
</tr>
</tbody>
</table>
Note
Because of how line styles are implemented on Win32 systems, you must set the line style after setting the
drawing color. If you set the color after the line style you will lose the line style settings.
The dashes array does not work under the (unsupported!) operating systems Windows 95, 98 or Me, since
those operating systems do not support complex line styles.

11.7.3.42 fl_load_matrix()

void fl_load_matrix (  
  double a,  
  double b,  
  double c,  
  double d,  
  double x,  
  double y ) [inline]

Set the current transformation matrix.

Parameters

| in | a, b, c, d, x, y | transformation matrix elements |

11.7.3.43 fl_measure()

void fl_measure (  
  const char * str,  
  int & w,  
  int & h,  
  int draw_symbols )

Measure how wide and tall the string will be when printed by the fl_draw() function with align parameter.
If the incoming w is non-zero it will wrap to that width.
The current font is used to do the width/height calculations, so unless its value is known at the time fl_measure() is
called, it is advised to first set the current font with fl_font(). With event-driven GUI programming you can never be
sure which widget was exposed and redrawn last, nor which font it used. If you have not called fl_font() explicitly in
your own code, the width and height may be set to unexpected values, even zero!
Note: In the general use case, it’s a common error to forget to set w to 0 before calling fl_measure() when wrap
behavior isn’t needed.

Parameters

| in | str | nul-terminated string |
| out | w, h | width and height of string in current font |
| in | draw_symbols | non-zero to enable @symbol handling [default=1] |

// Example: Common use case for fl_measure()
const char *s = "This is a test";  // initialize to zero before calling fl_measure()
fl_font(FL_HELVETICA, 14);  // set current font face/size to be used for measuring
fl_measure(s, w, h);  // returns pixel width/height of string in current font

11.7.3.44 fl_measure_pixmap() [1/2]

int fl_measure_pixmap (  
  char *const * data,  
  int & w,  
  int & h )

Get the dimensions of a pixmap.
An XPM image contains the dimensions in its data. This function returns the width and height.
11.7 Drawing functions

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>data</th>
<th>pointer to XPM image data.</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>w,h</td>
<td>width and height of image</td>
</tr>
</tbody>
</table>

Returns

- non-zero if the dimensions were parsed OK
- 0 if there were any problems

11.7.3.45 fl_measure_pixmap() [2/2]

```c
int fl_measure_pixmap (const char * const * cdata, int & w, int & h )
```

Get the dimensions of a pixmap.

See also

fl_measure_pixmap(char * const * data, int &w, int &h)

11.7.3.46 fl_mult_matrix()

```c
void fl_mult_matrix (double a, double b, double c, double d, double x, double y ) [inline]
```

Concatenate another transformation onto the current one.

Parameters

| in | a,b,c,d,x,y     | transformation matrix elements such that \( X' = aX + cY + x \) and \( Y' = bX + dY + y \) |

11.7.3.47 fl_not_clipped()

```c
int fl_not_clipped (int x, int y, int w, int h ) [inline]
```

Does the rectangle intersect the current clip region?

Parameters

| in | x,y,w,h     | position and size of rectangle |

Returns

- non-zero if any of the rectangle intersects the current clip region. If this returns 0 you don't have to draw the object.
328 Topic Documentation

Note

Under X this returns 2 if the rectangle is partially clipped and 1 if it is entirely inside the clip region.

See also

fl_clip_box()

11.7.3.48 fl_oldShortcut()

unsigned int fl_oldShortcut (const char * s )

Emulation of XForms named shortcuts.

Converts ASCII shortcut specifications (eg. "^c") into the FLTK integer equivalent (eg. FL_CTRL+’c’)

These ASCII characters are used to specify the various keyboard modifier keys:

- # - Alt
- + - Shift
- ^ - Control
- ! - Meta
- @ - Command (Ctrl on linux/win, Meta on OSX)

These special characters can be combined to form chords of modifier keys. (See 'Remarks' below)

After the optional modifier key prefixes listed above, one can either specify a single keyboard character to use as the shortcut, or a numeric sequence in hex, decimal or octal.

Examples:

- "c" -- Uses ‘c’ as the shortcut
- "#c" -- Same as FL_ALT|FL_CTRL+’c’
- "@c" -- Same as FL_COMMAND|’c’ (see FL_COMMAND for platform specific behavior)
- "0x63" -- Same as "c" (hex 63==’c’)
- "99" -- Same as "c" (dec 99==’c’)
- "0143" -- Same as "c" (octal 0143==’c’)
- "^0x63" -- Same as (FL_CTRL|’c’), or (FL_CTRL|0x63)
- "^99" -- Same as (FL_CTRL|’c’), or (FL_CTRL|99)
- "^0143" -- Same as (FL_CTRL|’c’), or (FL_CTRL|0143)

Remarks

Due to XForms legacy, there are some odd things to consider when using the modifier characters.

(1) You can use the special modifier keys for chords only if the modifiers are provided in this order: #, +, ^, !, @. Other ordering can yield undefined results.

So for instance, Ctrl-Alt-c must be specified as "#^c" (and not "^#c"), due to the above ordering rule.

(2) If you want to make a shortcut that uses one of the special modifier characters (as the character being modified), then to avoid confusion, specify the numeric equivalent, e.g.

<table>
<thead>
<tr>
<th>If you want..</th>
<th>Then use..</th>
</tr>
</thead>
<tbody>
<tr>
<td>’#’ as the shortcut..</td>
<td>&quot;0x23&quot; (instead of just &quot;#&quot;)</td>
</tr>
<tr>
<td>’+’ as the shortcut..</td>
<td>&quot;0x2b&quot; (instead of just &quot;+&quot;)</td>
</tr>
<tr>
<td>’^’ as the shortcut..</td>
<td>&quot;0x5e&quot; (instead of just &quot;^&quot;)</td>
</tr>
<tr>
<td>Alt-+ as the shortcut..</td>
<td>&quot;#0x2b&quot; (instead of &quot;+&quot;)</td>
</tr>
<tr>
<td>Alt-^ as the shortcut..</td>
<td>&quot;#0x5e&quot; (instead of &quot;^&quot;)</td>
</tr>
</tbody>
</table>

As a general rule that's easy to remember, unless the shortcut key to be modified is a single alpha-numeric character [A-Z,a-z,0-9], it's probably best to use the numeric equivalents.

Don't fix these silly legacy issues in a future release. Nobody is using this anymore.
11.7.3.49 fl_overlay_clear()

void fl_overlay_clear ( )
Erase a selection rectangle without drawing a new one.

See also

fl_overlay_rect(int x, int y, int w, int h)

11.7.3.50 fl_overlay_rect()

void fl_overlay_rect ( )
  int x,
  int y,
  int w,
  int h )

Draw a transient dotted selection rectangle.
This function saves the current screen content and then draws a dotted selection rectangle into the front screen
buffer. If another selection rectangle was drawn earlier, the previous screen graphics are restored first.
To clear the selection rectangle, call fl_overlay_clear().
The typical (and only) use for this function is to draw a selection rectangle during a mouse drag event sequence
without having to redraw the entire content of the widget.

Your event handle should look similar to this (also see test/mandelbrot.cxx):

int MyWidget::handle(int event) {
  static int ix, iy;
  switch (event) {
    case FL_PUSH:
      ix = Fl::event_x(); iy = Fl::event_y();
      return 1;
    case FL_DRAG:
      this->make_current();
      fl_overlay_rect(ix, iy, ix-Fl::event_x(), iy-Fl::event_y());
      return 1;
    case FL_RELEASE:
      this->make_current();
      fl_overlay_clear();
      // select the element under the rectangle
      return 1;
    }
  return MySuperWidget::handle(event);
}

Note

Between drawing an overlay rect and clearing it, the content of the widget must not change.

fl_overlay_rect() and fl_overlay_clear() should be called when the actual event occurs, and not within My-
Widget::draw().

fl_overlay_rect() and fl_overlay_clear() should not be mixed with Fl_Overlay_Window. Fl_Overlay_Window
provides an entirely different way of drawing selection outlines and is not limited to rectangles.

Parameters

x,y,w,h  position and size of the overlay rectangle.

See also

fl_overlay_clear()

11.7.3.51 fl_override_scale()

float fl_override_scale ( )

Removes any GUI scaling factor in subsequent drawing operations.
This must be matched by a later call to fl_restore_scale(). This function can be used to transiently perform drawing
operations that are not rescaled by the current value of the GUI scaling factor. The resulting drawing context has no
clipping region.

Returns

The GUI scaling factor value that was in place when the function started.

### 11.7.3.52 \texttt{fl\_pie()}

```c
void fl_pie (  
    int x,  
    int y,  
    int w,  
    int h,  
    double a1,  
    double a2 ) [inline]
```

Draw filled ellipse sections using integer coordinates.

Like \texttt{fl\_arc()}, but \texttt{fl\_pie()} draws a filled-in pie slice. This slice may extend outside the line drawn by \texttt{fl\_arc()}; to avoid this use \texttt{w - 1} and \texttt{h - 1}.

#### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x,y,w,h</th>
<th>bounding box of complete circle</th>
</tr>
</thead>
</table>
| in          | a1,a2  | start and end angles of arc measured in degrees counter-clockwise from 3 o'clock. \( a_2 \) must be greater than or equal to \( a_1 \).

![Figure 11.4 fl\_pie() and fl\_arc()](image)

### 11.7.3.53 \texttt{fl\_polygon() [1/2]}

```c
void fl_polygon (  
    int x,  
    int y,  
    int x1,  
    int y1,  
    int x2,  
    int y2 ) [inline]
```

Fill a 3-sided polygon.

The polygon must be convex.

### 11.7.3.54 \texttt{fl\_polygon() [2/2]}

```c
void fl_polygon (  
    int x,  
    int y,  
    int x1,  
    int y1,  
    int x2,  
    int y2,
```
11.7 Drawing functions

```c
int x3,
int y3) [inline]
```

Fill a 4-sided polygon. The polygon must be convex.

11.7.3.55 fl_pop_clip()

```c
void fl_pop_clip ( ) [inline]
```

Restore the previous clip region. You must call `fl_pop_clip()` once for every time you call `fl_push_clip()`. Unpredictable results may occur if the clip stack is not empty when you return to FLTK.

11.7.3.56 fl_push_clip()

```c
void fl_push_clip ( 
    int x,
    int y,
    int w,
    int h ) [inline]
```

Intersect the current clip region with a rectangle and push this new region onto the stack.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x,y,w,h</th>
<th>position and size</th>
</tr>
</thead>
</table>

11.7.3.57 fl_push_matrix()

```c
void fl_push_matrix ( ) [inline]
```

Save the current transformation matrix on the stack. The maximum depth of the stack is 32.

11.7.3.58 fl_read_image()

```c
uchar * fl_read_image ( 
    uchar * p,
    int X,
    int Y,
    int w,
    int h,
    int alpha )
```

Reads an RGB(A) image from the current window or off-screen buffer.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>p</th>
<th>pixel buffer, or NULL to allocate one</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X,Y</td>
<td>position of top-left of image to read</td>
</tr>
<tr>
<td>in</td>
<td>w,h</td>
<td>width and height of image to read</td>
</tr>
<tr>
<td>in</td>
<td>alpha</td>
<td>alpha value for image (0 for none)</td>
</tr>
</tbody>
</table>

Returns

pointer to pixel buffer, or NULL if allocation failed.

The `p` argument points to a buffer that can hold the image and must be at least `w*h*3` bytes when reading RGB images, or `w*h*4` bytes when reading RGBA images. If NULL, `fl_read_image()` will create an array of the proper size which can be freed using `delete[]`. The `alpha` parameter controls whether an alpha channel is created and the value that is placed in the alpha channel. If 0, no alpha channel is generated.
See also

\texttt{fl\_capture\_window()}

11.7.3.59 \texttt{fl\_rect() [1/3]}

void fl\_rect (\texttt{Fl\_Rect r}) [inline]

Draw a border \textit{inside} the given bounding box.
This is the same as \texttt{fl\_rect(int x, int y, int w, int h)} but with \texttt{Fl\_Rect r} as input argument.

11.7.3.60 \texttt{fl\_rect() [2/3]}

void fl\_rect (int x, int y, int w, int h) [inline]

Draw a border \textit{inside} the given bounding box.
This function is meant for quick drawing of simple boxes. The behavior is undefined for line widths that are not 1.

11.7.3.61 \texttt{fl\_rect() [3/3]}

void fl\_rect (int x, int y, int w, int h, \texttt{Fl\_Color c}) [inline]

Draw with passed color a border \textit{inside} the given bounding box.

Warning

The current color is changed to \texttt{c} upon return.

11.7.3.62 \texttt{fl\_rectf() [1/4]}

void fl\_rectf (\texttt{Fl\_Rect bb, uchar r, uchar g, uchar b}) [inline]

Color a rectangle with “exactly” the passed \texttt{r, g, b} color.
This is the same as \texttt{fl\_rectf(int x, int y, int w, int h, uchar r, uchar g, uchar b)} but with \texttt{Fl\_Rect bb} (bounding box) as argument instead of \texttt{(x, y, w, h)}.

See also

\texttt{fl\_rectf(int x, int y, int w, int h, uchar r, uchar g, uchar b)}

11.7.3.63 \texttt{fl\_rectf() [2/4]}

void fl\_rectf (\texttt{Fl\_Rect r, Fl\_Color c}) [inline]

Color with passed color a rectangle that exactly fills the given bounding box.

Warning

The current color is changed to \texttt{c} upon return.
11.7.3.64 fl_rectf() [3/4]

```c
void fl_rectf (  
   int x,
   int y,
   int w,
   int h,
   Fl_Color c ) [inline]
```

Color with passed color a rectangle that exactly fills the given bounding box.

Warning

The current color is changed to c upon return.

11.7.3.65 fl_rectf() [4/4]

```c
void fl_rectf (  
   int x,
   int y,
   int w,
   int h,
   uchar r,
   uchar g,
   uchar b ) [inline]
```

Color a rectangle with “exactly” the passed r,g,b color.

On screens with less than 24 bits of color this is done by drawing a solid-colored block using fl_draw_image() so that the correct color shade is produced. On other screens, the current color is changed to fl_color(r,g,b) upon return.

11.7.3.66 fl_rescale_offscreen()

```c
void fl_rescale_offscreen (  
   Fl_Offscreen & ctx)
```

Adapts an offscreen buffer to a changed value of the scale factor.

The ctx argument must have been created by fl_create_offscreen() and the calling context must not be between fl_begin_offscreen() and fl_end_offscreen(). The graphical content of the offscreen is preserved. The current scale factor value is given by Fl_Graphics_Driver::default_driver().scale().

Version

1.4

11.7.3.67 fl_reset_spot()

```c
void fl_reset_spot (  
   void )
```

Resets marked text.

In many languages, typing a character can involve multiple keystrokes. For example, the Ä can be composed of two dots (¨) on top of the character, followed by the letter A (on a Mac with U.S. keyboard, you’d type Alt-U, Shift-A). To inform the user that the dots may be followed by another character, the ¨ is underlined). Call this function if character composition needs to be aborted for some reason. One such example would be the text input widget losing focus.

11.7.3.68 fl_restore_scale()

```c
void fl_restore_scale (  
   float s )
```

Restores the GUI scaling factor and the clipping region in subsequent drawing operations.
### 11.7.3.69 fl_rotate()

```c
void fl_rotate (double d) [inline]
```

Concatenate rotation transformation onto the current one.

**Parameters**

- **d** - rotation angle, counter-clockwise in degrees (not radians)

---

### 11.7.3.70 fl_rounded_rect()

```c
void fl_rounded_rect (int x, int y, int w, int h, int r) [inline]
```

Draw a rounded border inside the given bounding box.

The radius code is optimized for speed and works best for values between 5 and 15 units.

---

### 11.7.3.71 fl_rounded_rectf()

```c
void fl_rounded_rectf (int x, int y, int w, int h, int r) [inline]
```

Color with current color a rounded rectangle that exactly fills the given bounding box.

The radius code is optimized for speed and works best for values between 5 and 15 units.

---

### 11.7.3.72 fl_scale() [1/2]

```c
void fl_scale (double x) [inline]
```

Concatenate scaling transformation onto the current one.

**Parameters**

- **x** - scale factor in both x-direction and y-direction

---

### 11.7.3.73 fl_scale() [2/2]

```c
void fl_scale (double x, double y) [inline]
```

Concatenate scaling transformation onto the current one.

**Parameters**

- **x, y** - scale factors in x-direction and y-direction
11.7 Drawing functions

11.7.3.74 fl_scroll()

```c
void fl_scroll (  
    int X,  
    int Y,  
    int W,  
    int H,  
    int dx,  
    int dy,  
    void(*)(void *, int, int, int, int) draw_area,  
    void * data )
```

Scroll a rectangle and draw the newly exposed portions.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X,Y</td>
<td>position of top-left of rectangle</td>
</tr>
<tr>
<td>W,H</td>
<td>size of rectangle</td>
</tr>
<tr>
<td>dx,dy</td>
<td>pixel offsets for shifting rectangle</td>
</tr>
<tr>
<td>draw_area</td>
<td>callback function to draw rectangular areas</td>
</tr>
<tr>
<td>data</td>
<td>pointer to user data for callback The contents of the rectangular area is first shifted by dx and dy pixels. The draw_area callback is then called for every newly exposed rectangular area.</td>
</tr>
</tbody>
</table>

11.7.3.75 fl_set_spot()

```c
void fl_set_spot (  
    int font,  
    int size,  
    int Y,  
    int W,  
    int H,  
    Fl_Window * win = 0 )
```

Inform text input methods about the current text insertion cursor.

**Parameters**

<table>
<thead>
<tr>
<th>font</th>
<th>Size of the current font.</th>
</tr>
</thead>
<tbody>
<tr>
<td>size</td>
<td>Position of the bottom of the current text insertion cursor.</td>
</tr>
<tr>
<td>X,Y</td>
<td>Width and height of the current text insertion cursor.</td>
</tr>
<tr>
<td>win</td>
<td>Points to the Fl_Window object containing the current text widget, or NULL.</td>
</tr>
</tbody>
</table>

11.7.3.76 fl_set_status()

```c
void fl_set_status (  
    int X,  
    int Y,  
    int W,  
    int H )
```

Related to text input methods under X11.

This function is presently used only by the utf8 test application and only for the X11 platform. This function is apparently not indispensable for text input to work correctly as suggested by other apps that don't use it (e.g., editor).
11.7.3.77  fl_shortcut_label() [1/2]

const char * fl_shortcut_label (  
    unsigned int shortcut  )  

Get a human-readable string from a shortcut value.
Unparse a shortcut value as used by Fl_Button or Fl_Menu_Item into a human-readable string like "Alt+N". This  
only works if the shortcut is a character key or a numbered function key. If the shortcut is zero then an empty string  
is returned. The return value points at a static buffer that is overwritten with each call.  
Since  
FLTK 1.3.4 modifier key names can be localized, but key names can not yet be localized. This may be added  
to a future FLTK version.  
Modifier key names (human-readable shortcut names) can be defined with the following global const char * pointer  
variables:  
• fl_local_ctrl => name of FL_CTRL  
• fl_local_alt => name of FL_ALT  
• fl_local_shift => name of FL_SHIFT  
• fl_local_meta => name of FL_META  
fl_local_ctrl = "Strg";  // German for "Ctrl"  
fl_local_shift = "Umschalt";  // German for "Shift"  

Note  
Due to random static initialization order this should always be done from code in main() or called by main()  
as opposed to static initialization since the default strings in the FLTK library are set by static initializers.  
Otherwise this might result in the wrong order so FLTK's internal initialization overwrites your strings.  
The shortcut name will be constructed by adding all modifier names in the order defined above plus the name of the  
key. A '+' character is added to each modifier name unless it has a trailing '\' or a trailing '+'.  
Example:  
Ctrl+Alt+Shift+Meta+F12  
The default values for modifier key names are as given above for all platforms except macOS. macOS uses graphical  
characters that represent the typical macOS modifier names in menus, e.g. cloverleaf, saucepan, etc. You may,  
however, redefine macOS modifier names as well.  
Parameters  

| in   | shortcut | the integer value containing the ASCII character or extended keystroke plus modifiers |

Returns  
a pointer to a static buffer containing human readable text for the shortcut  

11.7.3.78  fl_shortcut_label() [2/2]

const char * fl_shortcut_label (  
    unsigned int shortcut,  
    const char ** eom  )  

Get a human-readable string from a shortcut value.  
Parameters  

| in   | shortcut | the integer value containing the ASCII character or extended keystroke plus modifiers |
| in   | eom      | if this pointer is set, it will receive a pointer to the end of the modifier text |
Returns

a pointer to a static buffer containing human readable text for the shortcut

See also

fl_shortcut_label(unsigned int shortcut)

11.7.3.79  fl_transform_dx()

double fl_transform_dx (  
    double x,  
    double y)  [inline]

Transform distance using current transformation matrix.

Parameters

| in  | x, y | coordinate |

11.7.3.80  fl_transform_dy()

double fl_transform_dy (  
    double x,  
    double y)  [inline]

Transform distance using current transformation matrix.

Parameters

| in  | x, y | coordinate |

11.7.3.81  fl_transform_x()

double fl_transform_x (  
    double x,  
    double y)  [inline]

Transform coordinate using the current transformation matrix.

Parameters

| in  | x, y | coordinate |

11.7.3.82  fl_transform_y()

double fl_transform_y (  
    double x,  
    double y)  [inline]

Transform coordinate using the current transformation matrix.

Parameters

| in  | x, y | coordinate |
11.7.3.83 fl_transformed_vertex()

```c
void fl_transformed_vertex (  
    double xf,  
    double yf ) [inline]
```

Add coordinate pair to the vertex list without further transformations.

**Parameters**

- `in` `xf, yf` transformed coordinate

11.7.3.84 fl_translate()

```c
void fl_translate (  
    double x,  
    double y  ) [inline]
```

Concatenate translation transformation onto the current one.

**Parameters**

- `in` `x, y` translation factor in x-direction and y-direction

11.7.3.85 fl_vertex()

```c
void fl_vertex (  
    double x,  
    double y  ) [inline]
```

Add a single vertex to the current path.

**Parameters**

- `in` `x, y` coordinate

11.8 Multithreading support functions

fl multithreading support functions declared in `<FL/Fl.H>`

**Functions**

- `static int Fl::awake (Fl_Awake_Handler cb, void *message=0)`  
  See void awake(void *message=0).
- `static void Fl::awake (void *message=0)`  
  Sends a message pointer to the main thread, causing any pending Fl::wait() call to terminate so that the main thread can retrieve the message and any pending redraws can be processed.
- `static int Fl::lock ()`  
  The lock() method blocks the current thread until it can safely access FLTK widgets and data.
- `static void * Fl::thread_message ()`  
  The thread_message() method returns the last message that was sent from a child by the awake() method.
- `static void Fl::unlock ()`  
  The unlock() method releases the lock that was set using the lock() method.

11.8.1 Detailed Description

fl multithreading support functions declared in `<FL/Fl.H>`
11.8.2 Function Documentation

11.8.2.1 awake() [1/2]

```c
int Fl::awake (  
    Fl_Awake_Handler func,  
    void * data = 0 ) [static]
```

See void awake(void * message=0).

Let the main thread know an update is pending and have it call a specific function.

Registers a function that will be called by the main thread during the next message handling cycle. Returns 0 if the callback function was registered, and -1 if registration failed. Over a thousand awake callbacks can be registered simultaneously.

See also

- Fl::awake(void * message=0)

11.8.2.2 awake() [2/2]

```c
void Fl::awake (  
    void * msg = 0 ) [static]
```

Sends a message pointer to the main thread, causing any pending Fl::wait() call to terminate so that the main thread can retrieve the message and any pending redraws can be processed.

Multiple calls to Fl::awake() will queue multiple pointers for the main thread to process, up to a system-defined (typically several thousand) depth. The default message handler saves the last message which can be accessed using the Fl::thread_message() function.

In the context of a threaded application, a call to Fl::awake() with no argument will trigger event loop handling in the main thread. Since it is not possible to call Fl::flush() from a subsidiary thread, Fl::awake() is the best (and only, really) substitute.

It's not necessary to wrap calls to any form of Fl::awake() by Fl::lock() and Fl::unlock(). Nevertheless, the early, single call to Fl::lock() used to initialize threading support is necessary.

Function Fl::awake() in all its forms is typically called by worker threads, but it can be used safely by the main thread too, as a means to break the event loop.

See also

- Multithreading

11.8.2.3 lock()

```c
int Fl::lock ( ) [static]
```

The lock() method blocks the current thread until it can safely access FLTK widgets and data.

Child threads should call this method prior to updating any widgets or accessing data. The main thread must call lock() to initialize the threading support in FLTK. lock() will return non-zero if threading is not available on the platform.

Child threads must call unlock() when they are done accessing FLTK.

When the wait() method is waiting for input or timeouts, child threads are given access to FLTK. Similarly, when the main thread needs to do processing, it will wait until all child threads have called unlock() before processing additional data.

Returns

- 0 if threading is available on the platform; non-zero otherwise

See also: Multithreading

11.8.2.4 thread_message()

```c
void * Fl::thread_message ( ) [static]
```

The thread_message() method returns the last message that was sent from a child by the awake() method.

See also: Multithreading
11.8.2.5 unlock()

```cpp
void Fl::unlock ( ) [static]
```

The `unlock()` method releases the lock that was set using the `lock()` method. Child threads should call this method as soon as they are finished accessing FLTK.

See also: Multithreading

11.9 Safe widget deletion support functions

These functions, declared in `<FL/Fl.H>`, support deletion of widgets inside callbacks.

**Functions**

- static void `Fl::clear_widget_pointer (Fl_Widget const *w)`
  
  Clears a widget pointer in the watch list.

- static void `Fl::delete_widget (Fl_Widget *w)`
  
  Schedules a widget for deletion at the next call to the event loop.

- static void `Fl::do_widget_deletion ()`
  
  Deletes widgets previously scheduled for deletion.

- static void `Fl::release_widget_pointer (Fl_Widget *&w)`
  
  Removes a widget pointer from the watch list.

- static void `Fl::watch_widget_pointer (Fl_Widget *&w)`
  
  Adds a widget pointer to the widget watch list.

11.9.1 Detailed Description

These functions, declared in `<FL/Fl.H>`, support deletion of widgets inside callbacks. `Fl::delete_widget()` should be called when deleting widgets or complete widget trees (`Fl_Group`, `Fl_Window`, ...) inside callbacks.

The other functions are intended for internal use. The preferred way to use them is by using the helper class `Fl_Widget_Tracker`.

The following is to show how it works ...

There are three groups of related methods:

1. scheduled widget deletion

   - `Fl::delete_widget()` schedules widgets for deletion
   - `Fl::do_widget_deletion()` deletes all scheduled widgets

2. widget watch list ("smart pointers")

   - `Fl::watch_widget_pointer()` adds a widget pointer to the watch list
   - `Fl::release_widget_pointer()` removes a widget pointer from the watch list
   - `Fl::clear_widget_pointer()` clears a widget pointer *in* the watch list

3. the class `Fl_Widget_Tracker`:

   - the constructor calls `Fl::watch_widget_pointer()`
   - the destructor calls `Fl::release_widget_pointer()`
   - the access methods can be used to test, if a widget has been deleted

See also: `Fl_Widget_Tracker`. 
11.9 Safe widget deletion support functions

11.9.2 Function Documentation

11.9.2.1 clear_widget_pointer()

```c
void Fl::clear_widget_pointer ( Fl_Widget const * w ) [static]
```

Clears a widget pointer in the watch list. This is called when a widget is destroyed (by its destructor). You should never call this directly.

**Note**

Internal use only!

This method searches the widget watch list for pointers to the widget and clears each pointer that points to it. Widget pointers can be added to the widget watch list by calling Fl::watch_widget_pointer() or by using the helper class Fl_Widget_Tracker (recommended).

See also

Fl::watch_widget_pointer()
class Fl_Widget_Tracker

11.9.2.2 delete_widget()

```c
void Fl::delete_widget ( Fl_Widget * wi ) [static]
```

Schedules a widget for deletion at the next call to the event loop. Use this method to delete a widget inside a callback function.

To avoid early deletion of widgets, this function should be called toward the end of a callback and only after any call to the event loop (Fl::wait(), Fl::flush(), Fl::check(), fl_ask(), etc.). When deleting groups or windows, you must only delete the group or window widget and not the individual child widgets.

Since

FLTK 1.3.4 the widget will be hidden immediately, but the actual destruction will be delayed until the event loop is finished. Up to FLTK 1.3.3 windows wouldn't be hidden before the event loop was done, hence you had to hide() a window in your window close callback if you called Fl::delete_widget() to destroy (and hide) the window.

FLTK 1.3.0 it is not necessary to remove widgets from their parent groups or windows before calling this, because it will be done in the widget's destructor, but it is not a failure to do this nevertheless.

**Note**

In FLTK 1.1 you must remove widgets from their parent group (or window) before deleting them.

See also

Fl_Widget::~Fl_Widget()

11.9.2.3 do_widget_deletion()

```c
void Fl::do_widget_deletion ( ) [static]
```

Deletes widgets previously scheduled for deletion. This is for internal use only. You should never call this directly.

Fl::do_widget_deletion() is called from the FLTK event loop or whenever you call Fl::wait(). The previously scheduled widgets are deleted in the same order they were scheduled by calling Fl::delete_widget().

See also

Fl::delete_widget(Fl_Widget +wi)
11.9.2.4 release_widget_pointer()

```cpp
void Fl::release_widget_pointer ( 
    Fl_Widget *& w ) [static]
```
Releases a widget pointer from the watch list.
This is used to remove a widget pointer that has been added to the watch list with Fl::watch_widget_pointer(), when it is not needed anymore.

**Note**

Internal use only, please use class Fl_Widget_Tracker instead.

See also

Fl::watch_widget_pointer()

11.9.2.5 watch_widget_pointer()

```cpp
void Fl::watch_widget_pointer ( 
    Fl_Widget *& w ) [static]
```
Adds a widget pointer to the widget watch list.

**Note**

Internal use only, please use class Fl_Widget_Tracker instead.

This can be used, if it is possible that a widget might be deleted during a callback or similar function. The widget pointer must be added to the watch list before calling the callback. After the callback the widget pointer can be queried, if it is NULL. If it is NULL, then the widget has been deleted during the callback and must not be accessed anymore. If the widget pointer is not NULL, then the widget has not been deleted and can be accessed safely. After accessing the widget, the widget pointer must be released from the watch list by calling Fl::release_widget_pointer().

Example for a button that is clicked (from its handle() method):

```cpp
Fl_Widget *wp = this; // save 'this' in a pointer variable
Fl::watch_widget_pointer(wp); // add the pointer to the watch list
set_changed(); // set the changed flag
do_callback(); // call the callback
if (!wp) { // the widget has been deleted
    // DO NOT ACCESS THE DELETED WIDGET !
} else { // the widget still exists
    clear_changed(); // reset the changed flag
}
Fl::release_widget_pointer(wp); // remove the pointer from the watch list
```
This works, because all widgets call Fl::clear_widget_pointer() in their destructors.

See also

Fl::release_widget_pointer()  
Fl::clear_widget_pointer()

An easier and more convenient method to control widget deletion during callbacks is to use the class Fl_Widget_Tracker with a local (automatic) variable.

class Fl_Widget_Tracker

11.10 Cairo Support Functions and Classes

**Classes**

- class Fl_Cairo_State
  
  Contains all the necessary info on the current cairo context.

- class Fl_Cairo_Window
  
  This defines an FLTK window with Cairo support.
Functions

- static bool Fl::cairo_autolink_context ()
  Gets the current autolink mode for Cairo support.

- static void Fl::cairo_autolink_context (bool alink)
  When FLTK_HAVE_CAIRO is defined and cairo_autolink_context() is true, any current window dc is linked to a current Cairo context.

- static cairo_t * Fl::cairo_cc ()
  Gets the current Cairo context linked with a fltk window.

- static void Fl::cairo_cc (cairo_t *c, bool own=false)
  Sets the current Cairo context to c.

- static void Fl::cairo_flush (cairo_t *c)
  Flush Cairo drawings on Cairo context c.

- static cairo_t * Fl::cairo_make_current (Fl_Window *w)
  Provides a Cairo context for window w.

11.10.1 Detailed Description

11.10.2 Function Documentation

11.10.2.1 cairo_autolink_context() [1/2]

static bool Fl::cairo_autolink_context () [inline], [static]
Gets the current autolink mode for Cairo support.

Return values

| false | if no Cairo context autolink is made for each window. |
| true  | if any fltk window is attached a Cairo context when it is current. |

See also

void cairo_autolink_context(bool alink)

Note

Only available when configure has the –enable-cairo option

11.10.2.2 cairo_autolink_context() [2/2]

static void Fl::cairo_autolink_context (bool alink) [inline], [static]
When FLTK_HAVE_CAIRO is defined and cairo_autolink_context() is true, any current window dc is linked to a current Cairo context.

This is not the default, because it may not be necessary to add Cairo support to all fltk supported windows. When you wish to associate a Cairo context in this mode, you need to call explicitly in your draw() overridden method, Fl::cairo_make_current(Fl_Window *w). This will create a Cairo context only for this Window. Still in custom Cairo application it is possible to handle completely this process automatically by setting alink to true. In this last case, you don't need anymore to call Fl::cairo_make_current(). You can use Fl::cairo_cc() to get the current Cairo context anytime.

Note

Only available when configure has the –enable-cairo option
### 11.10.2.3 cairo_cc()

```cpp
class Fl
{
public:
  static void cairo_cc (cairo_t * c, bool own = false) [inline], [static]
}
```

Sets the current Cairo context to `c`. Set `own` to true if you want FLTK to handle this cc deletion.

**Note**

Only available when configure has the --enable-Cairo option.

### 11.10.2.4 cairo_flush()

```cpp
class Fl
{
public:
  static void cairo_flush (cairo_t * c) [inline], [static]
}
```

Flush Cairo drawings on Cairo context `c`. This is **required** on Windows if you use the Cairo context provided by the "Cairo autolink" option. Call this when all your drawings on the Cairo context are finished. This is maybe not necessary on other platforms than Windows but it does no harm if you call it always.

You don't need to use this if you use an `Fl_Cairo_Window` which does this automatically after the draw callback returns.

**Code example for "Cairo autolink" mode:**

In the overridden draw() method of your subclass of `Fl_Window` or any widget:

```cpp
cairo_t *cc = Fl::cairo_cc(); // get the "autolink" Cairo context
// ... your Cairo drawings are here ...
Fl::cairo_flush(cc); // flush Cairo drawings to the device
```

If you configure FLTK with '--enable-cairo' or CMake option 'OPTION_CAIRO' (i.e. without '--enable-cairoext' or CMake option 'OPTION_CAIROEXT') or if you don't enable the 'autolink' Cairo context you may do the equivalent to use Cairo drawings in an overridden draw() method of derived classes by using

```cpp
// get the Cairo context for the \c window
cairo_t *cc = Fl::cairo_make_current(window);
// ... your Cairo drawings are here ...
Fl::cairo_flush(cc); // flush Cairo drawings to the device
```

See also

- `Fl::cairo_autolink_context(bool)`
- `Fl::cairo_make_current(Fl_Window*)`;

### 11.10.2.5 cairo_make_current()

```cpp
cairo_t *Fl::cairo_make_current (Fl_Window * wi) [static]
```

Provides a Cairo context for window `wi`. This is needed in a draw() override if `Fl::cairo_autolink_context()` returns false, which is the default. The `cairo_make_current()` does not need to be freed as it is freed every time a new Cairo context is created. When the program terminates, a call to `Fl::cairo_make_current(0)` will destroy any residual context.

**Note**

A new Cairo context is not always re-created when this method is used. In particular, if the current graphical context and the current window didn't change between two calls, the previous gc is internally kept, thus optimizing the drawing performances. Also, after this call, `Fl::cairo_cc()` is adequately updated with this Cairo context.

Only available when configure has the --enable-cairo option

**Returns**

The valid cairo_t *cairo context associated to this window.
11.11 Unicode and UTF-8 functions

fl global Unicode and UTF-8 handling functions declared in `<FL/fl_utf8.h>`

**Macros**

- `#define ERRORS_TO_CP1252 1`
  
  Set to 1 to turn bad UTF-8 bytes in the 0x80-0x9f range into the Unicode index for Microsoft’s CP1252 character set.

- `#define ERRORS_TO_ISO8859_1 1`
  
  Set to 1 to turn bad UTF-8 bytes into ISO-8859-1.

- `#define NBC 0xFFFF + 1`

- `#define STRICT_RFC3629 0`
  
  A number of Unicode code points are in fact illegal and should not be produced by a UTF-8 converter.

**Functions**

- `int fl_access (const char *f, int mode)`
  
  Cross-platform function to test a files access() with a UTF-8 encoded name or value.

- `int fl_chdir (const char *path)`
  
  Cross-platform function to change the current working directory, given as a UTF-8 encoded string.

- `int fl_chmod (const char *f, int mode)`
  
  Cross-platform function to set a files mode() with a UTF-8 encoded name or value.

- `int fl_close_fd (int fd)`

- `int fl_execvp (const char *file, char **argv)`

- `FILE *fl_fopen (const char *f, const char *mode)`
  
  Cross-platform function to open files with a UTF-8 encoded name.

- `char *fl_getcwd (char *buf, int len)`
  
  Cross-platform function to get the current working directory as a UTF-8 encoded value.

- `char *fl_getenv (const char *v)`
  
  Cross-platform function to get environment variables with a UTF-8 encoded name or value.

- `char *fl_make_path (const char *path)`
  
  Cross-platform function to recursively create a path in the file system.

- `void fl_make_path_for_file (const char *path)`
  
  Cross-platform function to create a path for the file in the file system.

- `int fl_mtime (const char *f, int mode)`
  
  Cross-platform function to set a files modification time with a UTF-8 encoded name or value.

- `unsigned int fl_nonspacing (unsigned int ucs)`
  
  Returns true if the Unicode character `ucs` is non-spacing.

- `int fl_open (const char *fname, int oflags,...)`
  
  Cross-platform function to open files with a UTF-8 encoded name.

- `int fl_putenv (const char *var)`
  
  Cross-platform function to write environment variables with a UTF-8 encoded name or value.

- `int fl_rename (const char *f, const char *n)`
  
  Cross-platform function to rename a filesystem object using UTF-8 encoded names.
• int fl_rmdir (const char *f)
  Cross-platform function to remove a directory with a UTF-8 encoded name.

• int fl_stat (const char *f, struct stat *s)
  Cross-platform function to stat() a file using a UTF-8 encoded name or value.

• int fl_system (const char *cmd)
  Cross-platform function to run a system command with a UTF-8 encoded string.

• int fl_tolower (unsigned int ucs)
  Returns the Unicode lower case value of `ucs`.

• int fl_toupper (unsigned int ucs)
  Returns the Unicode upper case value of `ucs`.

• unsigned fl_ucs_to_Utf16 (const unsigned ucs, unsigned short *dst, const unsigned dstlen)
  Convert a single 32-bit Unicode codepoint into an array of 16-bit characters.

• int fl_unlink (const char *fname)
  Cross-platform function to unlink() (that is, delete) a file using a UTF-8 encoded filename.

• char * fl_utf2mbcs (const char *s)
  Converts UTF-8 string `s` to a local multi-byte character string.

• const char * fl_utf8back (const char *p, const char *start, const char *end)
  Move `p` backward until it points to the start of a UTF-8 character.

• int fl_utf8bytes (unsigned ucs)
  Return the number of bytes needed to encode the given UCS4 character in UTF-8.

• unsigned fl_utf8decode (const char *p, const char *end, int *len)
  Decode a single UTF-8 encoded character starting at `p`.

• int fl_utf8encode (unsigned ucs, char *buf)
  Write the UTF-8 encoding of `ucs` into `buf` and return the number of bytes written.

• unsigned fl_utf8from_mb (char *dst, unsigned dstlen, const char *src, unsigned srclen)
  Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK.

• unsigned fl_utf8froma (const char *src, unsigned srclen, char *dst, unsigned dstlen)
  Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.

• unsigned fl_utf8fromwc (char *dst, unsigned dstlen, const wchar_t *src, unsigned srclen)
  Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.

• const char * fl_utf8fwd (const char *p, const char *start, const char *end)
  Move `p` forward until it points to the start of a UTF-8 character.

• int fl_utf8fslen (char c)
  Returns the byte length of the UTF-8 sequence with first byte `c`, or -1 if `c` is not valid.

• int fl_utf8len1 (char c)
  Returns the byte length of the UTF-8 sequence with first byte `c`, or 1 if `c` is not valid.

• int fl_utf8locale ()
  Return true if the "locale" seems to indicate that UTF-8 encoding is used.

• int fl_utf8strlen (const char *text, int len)
  Return the length in bytes of a UTF-8 string.

• int fl_utf8test (const char *src, unsigned srclen)
  Examines the first `srclen` bytes in `src` and returns a verdict on whether it is UTF-8 or not.

• unsigned fl_utf8to_mb (const char *src, unsigned srclen, char *dst, unsigned dstlen)
  Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).

• unsigned fl_utf8toa (const char *src, unsigned srclen, char *dst, unsigned dstlen)
  Convert a UTF-8 sequence into an array of 1-byte characters.

• unsigned fl_utf8toUtf16 (const char *src, unsigned srclen, unsigned short *dst, unsigned dstlen)
  Convert a UTF-8 sequence into an array of 16-bit characters.

• unsigned fl_utf8lowc (const char *src, unsigned srclen, wchar_t *dst, unsigned dstlen)
  Converts a UTF-8 string into a wide character string.
11.11 Unicode and UTF-8 functions

- `int fl_utfNbChar (const unsigned char *buf, int len)`
  Returns the number of Unicode chars in the UTF-8 string.

- `int fl_utfStrcasecmp (const char *s1, const char *s2)`
  UTF-8 aware strcasecmp - converts to Unicode and tests.

- `int fl_utfStrncasecmp (const char *s1, const char *s2, int n)`
  UTF-8 aware strncasecmp - converts to lower case Unicode and tests.

- `int fl_utfToLower (const unsigned char *str, int len, char *buf)`
  Converts the string `str` to its lower case equivalent into `buf`.

- `int fl_utfToUpper (const unsigned char *str, int len, char *buf)`
  Converts the string `str` to its upper case equivalent into `buf`.

- `int fl_wcwidth (const char *src)`
  extended wrapper around `fl_wcwidth_(unsigned int ucs)` function.

- `int fl_wcwidth_(unsigned int ucs)`
  Wrapper to adapt Markus Kuhn's implementation of wcwidth() for FLTK.

11.11.1 Detailed Description

fl global Unicode and UTF-8 handling functions declared in `<FL/fl_utf8.h>`

11.11.2 Macro Definition Documentation

11.11.2.1 ERRORS_TO_CP1252

#define ERRORS_TO_CP1252 1
Set to 1 to turn bad UTF-8 bytes in the 0x80-0x9f range into the Unicode index for Microsoft's CP1252 character set.
You should also set ERRORS_TO_ISO8859_1. With this a huge amount of more available text (such as all web pages) are correctly converted to Unicode.

11.11.2.2 ERRORS_TO_ISO8859_1

#define ERRORS_TO_ISO8859_1 1
Set to 1 to turn bad UTF-8 bytes into ISO-8859-1.
If this is zero they are instead turned into the Unicode REPLACEMENT CHARACTER, of value 0xfffd. If this is on `fl_utf8decode()` will correctly map most (perhaps all) human-readable text that is in ISO-8859-1. This may allow you to completely ignore character sets in your code because virtually everything is either ISO-8859-1 or UTF-8.

11.11.2.3 STRICT_RFC3629

#define STRICT_RFC3629 0
A number of Unicode code points are in fact illegal and should not be produced by a UTF-8 converter.
Turn this on will replace the bytes in those encodings with errors. If you do this then converting arbitrary 16-bit data to UTF-8 and then back is not an identity, which will probably break a lot of software.

11.11.3 Function Documentation

11.11.3.1 fl_access()

    int fl_access (const char * f, int mode )

Cross-platform function to test a files access() with a UTF-8 encoded name or value.
This function is especially useful on the Windows platform where the standard access() function fails with UTF-8 encoded non-ASCII filenames.
Windows defines the mode values 0 for existence, 2 for writable, 4 for readable, and 6 of readable and writable. On other systems, the modes X_OK, W_OK, and R_OK are usually defined as 1, 2, and 4.
Upon successful completion, the value 0 is returned on all platforms.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>f</th>
<th>the UTF-8 encoded filename</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>mode</td>
<td>the mode to test</td>
</tr>
</tbody>
</table>

Returns

the return value of _waccess() on Windows or access() on other platforms.

11.11.3.2 fl_chdir()

```c
int fl_chdir (const char * path )
```

Cross-platform function to change the current working directory, given as a UTF-8 encoded string. This function is especially useful on the Windows platform where the standard _wchdir() function needs a path in UTF-16 encoding. The path is converted to a system specific encoding if necessary and the system specific chdir(converted←_path) function is called. The function returns 0 on success and -1 on error. Depending on the platform, errno may be set if an error occurs.

Note

The possible errno values are platform specific. Refer to the documentation of the platform specific chdir() function.

If the function is not implemented on a particular platform the default implementation returns -1 and errno is not set.

If the path is NULL the function returns -1, but errno is not changed. This is a convenience feature of fl_chdir() as opposed to chdir().

Parameters

| in  | path    | the target directory for chdir (may be NULL) |

Returns

0 if successful, -1 on error (errno may be set)

11.11.3.3 fl_chmod()

```c
int fl_chmod (const char * f, int mode )
```

Cross-platform function to set a files mode() with a UTF-8 encoded name or value. This function is especially useful on the Windows platform where the standard chmod() function fails with UTF-8 encoded non-ASCII filenames.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>f</th>
<th>the UTF-8 encoded filename</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>mode</td>
<td>the mode to set</td>
</tr>
</tbody>
</table>
11.11 Unicode and UTF-8 functions

Returns

the return value of _wchmod() on Windows or chmod() on other platforms.

11.11.3.4  fl_close_fd()

```c
int fl_close_fd (  
    int fd  
)
```

Cross-platform function to close a file descriptor.

Returns

0 in case of success, or -1 in case of error.

11.11.3.5  fl_fopen()

```c
FILE * fl_fopen (  
    const char * f,  
    const char * mode  
)
```

Cross-platform function to open files with a UTF-8 encoded name.
This function is especially useful on the Windows platform where the standard fopen() function fails with UTF-8 encoded non-ASCII filenames.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>f</strong></td>
<td>the UTF-8 encoded filename</td>
</tr>
<tr>
<td><strong>mode</strong></td>
<td>same as the second argument of the standard fopen() function</td>
</tr>
</tbody>
</table>

Returns

a FILE pointer upon successful completion, or NULL in case of error.

See also

fl_open().

11.11.3.6  fl_getcwd()

```c
char * fl_getcwd (  
    char * buf,  
    int len  
)
```

Cross-platform function to get the current working directory as a UTF-8 encoded value.
This function is especially useful on the Windows platform where the standard _wgetcwd() function returns UTF-16 encoded non-ASCII filenames.
If **buf** is NULL a buffer of size (len+1) is allocated, filled with the current working directory, and returned. In this case the buffer must be released by the caller with free() to prevent memory leaks.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>buf</strong></td>
<td>the buffer to populate (may be NULL)</td>
</tr>
<tr>
<td><strong>len</strong></td>
<td>the length of the buffer</td>
</tr>
</tbody>
</table>
Returns

the CWD encoded as UTF-8

### 11.11.3.7 fl getenv()

```c
char * fl_getenv ( const char * v )
```

Cross-platform function to get environment variables with a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where non-ASCII environment variables are encoded as wide characters. The returned value of the variable is encoded in UTF-8 as well.

On platforms other than Windows this function calls getenv directly. The return value is returned as-is.

The return value is a pointer to an implementation defined buffer:

- an internal buffer that is (re)allocated as needed (Windows) or
- the string in the environment itself (Unix, Linux, MacOS) or
- any other implementation (other platforms). This string must be considered read-only and must not be freed by the caller.

If the resultant string is to be used later it must be copied to a safe place. The next call to `fl_getenv()` or any other environment changes may overwrite the string.

**Note**

This function is not thread-safe.

**Parameters**

`v` the UTF-8 encoded environment variable

**Returns**

the environment variable in UTF-8 encoding, or NULL in case of error.

### 11.11.3.8 fl make_path()

```c
char fl_make_path ( const char * path )
```

Cross-platform function to recursively create a path in the file system.

This function creates a path in the file system by recursively creating all directories.

**Parameters**

`path` a Unix style (" forward slashes) absolute or relative pathname

**Returns**

1 if the path was created, 0 if creating the path failed at some point

### 11.11.3.9 fl make_path_for_file()

```c
void fl_make_path_for_file ( const char * path )
```

Cross-platform function to create a path for the file in the file system.

This function strips the filename from the given path and creates a path in the file system by recursively creating all directories.
11.11.3.10 \textbf{fl_mkdir()}

\begin{verbatim}
int fl_mkdir (  
    const char * f,  
    int mode  
)
\end{verbatim}

Cross-platform function to create a directory with a UTF-8 encoded name. This function is especially useful on the Windows platform where the standard \_wmkdir() function expects UTF-16 encoded non-ASCII filenames.

\textbf{Parameters}

\begin{tabular}{|c|c|}
\hline
in & \textit{f} & the UTF-8 encoded filename \\
\hline
in & \textit{mode} & the mode of the directory \\
\hline
\end{tabular}

\textbf{Returns}

the return value of \_wmkdir() on Windows or mkdir() on other platforms.

11.11.3.11 \textbf{fl_nonspacing()}

\begin{verbatim}
unsigned int fl_nonspacing (  
    unsigned int ucs  
)
\end{verbatim}

Returns true if the Unicode character \texttt{ucs} is non-spacing. Non-spacing characters in Unicode are typically combining marks like tilde (~), diaeresis (¨), or other marks that are added to a base character, for instance ‘a’ (base character) + ‘¨’ (combining mark) = ‘ä’ (German Umlaut).

\begin{itemize}
  \item http://unicode.org/glossary/#base_character
  \item http://unicode.org/glossary/#nonspacing_mark
  \item http://unicode.org/glossary/#combining_character
\end{itemize}

11.11.3.12 \textbf{fl_open()}

\begin{verbatim}
int fl_open (  
    const char * fname,  
    int oflags,  
    ...  
)
\end{verbatim}

Cross-platform function to open files with a UTF-8 encoded name. This function is especially useful on the Windows platform where the standard \texttt{open()} function fails with UTF-8 encoded non-ASCII filenames.

\textbf{Parameters}

\begin{tabular}{|c|c|}
\hline
in & \textit{fname} & the UTF-8 encoded filename \\
\hline
in & \textit{oflags} & other arguments are as in the standard \texttt{open()} function \\
\hline
\end{tabular}

\textbf{Returns}

a file descriptor upon successful completion, or -1 in case of error.

\textbf{See also}

\texttt{fl_fopen()}, \texttt{fl_open_ext()}, \texttt{fl_close_fd(int fd)}.

11.11.3.13 \textbf{fl_open_ext()}

\begin{verbatim}
int fl_open_ext (  
    const char * fname,  
    ...  
)
\end{verbatim}
Cross-platform function to open files with a UTF-8 encoded name.
In comparison with \texttt{fl_open()}, this function allows to control whether the file is opened in binary (a.k.a. untranslated) mode. This is especially useful on the Windows platform where files are by default opened in text (translated) mode.

### Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{int}</td>
<td>\texttt{fname}</td>
<td>the UTF-8 encoded filename</td>
</tr>
<tr>
<td>\texttt{int}</td>
<td>\texttt{binary}</td>
<td>if non-zero, the file is to be accessed in binary (a.k.a. untranslated) mode.</td>
</tr>
<tr>
<td>...</td>
<td>flags,...</td>
<td>these arguments are as in the standard open() function. Setting flags to zero opens the file for reading.</td>
</tr>
</tbody>
</table>

### Returns

A file descriptor upon successful completion, or -1 in case of error.

---

11.11.3.14 \texttt{fl_putenv()}

\begin{verbatim}
int fl_putenv (const char * var )
\end{verbatim}

Cross-platform function to write environment variables with a UTF-8 encoded name or value.
This function is especially useful on the Windows platform where non-ASCII environment variables are encoded as wide characters.
The given argument \texttt{var} must be encoded in UTF-8 in the form "name=value". The 'name' part must conform to platform dependent restrictions on environment variable names. The string given in \texttt{var} is copied and optionally converted to the required encoding for the platform. On platforms other than Windows this function calls putenv directly. The return value is zero on success and non-zero in case of error. The value in case of error is platform specific and returned as-is.

Note

The copied string is allocated on the heap and "lost" on some platforms, i.e. calling \texttt{fl_putenv()} to change environment variables frequently may cause memory leaks. There may be an option to avoid this in a future implementation.

This function is not thread-safe.

### Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{in}</td>
<td>\texttt{var}</td>
<td>the UTF-8 encoded environment variable 'name=value'</td>
</tr>
</tbody>
</table>

### Returns

0 on success, non-zero in case of error.

---

11.11.3.15 \texttt{fl_rename()}

\begin{verbatim}
int fl_rename (const char * f, const char * n )
\end{verbatim}

Cross-platform function to rename a filesystem object using UTF-8 encoded names.
This function is especially useful on the Windows platform where the standard \_wrename() function expects UTF-16 encoded non-ASCII filenames.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>f</th>
<th>the UTF-8 encoded filename to change</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>n</td>
<td>the new UTF-8 encoded filename to set</td>
</tr>
</tbody>
</table>

Returns

the return value of _wrename() on Windows or rename() on other platforms.

11.11.3.16 fl_rmdir()

```c
int fl_rmdir (const char * f)
```

Cross-platform function to remove a directory with a UTF-8 encoded name.
This function is especially useful on the Windows platform where the standard _wrmdir() function expects UTF-16
encoded non-ASCII filenames.

Parameters

| in  | f   | the UTF-8 encoded filename to remove |

Returns

the return value of _wrmdir() on Windows or rmdir() on other platforms.

11.11.3.17 fl_stat()

```c
int fl_stat (const char * f, struct stat * b)
```

Cross-platform function to stat() a file using a UTF-8 encoded name or value.
This function is especially useful on the Windows platform where the standard stat() function fails with UTF-8 en-
coded non-ASCII filenames.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>f</th>
<th>the UTF-8 encoded filename</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>b</td>
<td>the stat struct to populate</td>
</tr>
</tbody>
</table>

Returns

the return value of _wstat() on Windows or stat() on other platforms.

11.11.3.18 fl_system()

```c
int fl_system (const char * cmd)
```

Cross-platform function to run a system command with a UTF-8 encoded string.
This function is especially useful on the Windows platform where non-ASCII program (file) names must be encoded
as wide characters.
On platforms other than Windows this function calls system() directly.

Parameters

| in  | cmd | the UTF-8 encoded command string |

Generated by Doxygen
Returns

the return value of _wsystem() on Windows or system() on other platforms.

11.11.3.19 fl_ucs_to_Utf16()

unsigned fl_ucs_to_Utf16 (
    const unsigned ucs,
    unsigned short * dst,
    const unsigned dstlen )

Convert a single 32-bit Unicode codepoint into an array of 16-bit characters. These are used by some system calls, especially on Windows.

`ucs` is the value to convert.
`dst` points at an array to write, and `dstlen` is the number of locations in this array. At most `dstlen` words will be written, and a 0 terminating word will be added if `dstlen` is large enough. Thus this function will never overwrite the buffer and will attempt return a zero-terminated string if space permits. If `dstlen` is zero then `dst` can be set to NULL and no data is written, but the length is returned.

The return value is the number of 16-bit words that _would_ be written to `dst` if it is large enough, not counting any terminating zero.

If the return value is greater than `dstlen` it indicates truncation, you should then allocate a new array of size `return+1` and call this again.

Unicode characters in the range 0x10000 to 0x10ffff are converted to "surrogate pairs" which take two words each (in UTF-16 encoding). Typically, setting `dstlen` to 2 will ensure that any valid Unicode value can be converted, and setting `dstlen` to 3 or more will allow a NULL terminated sequence to be returned.

11.11.3.20 fl_unlink()

int fl_unlink (
    const char * fname )

Cross-platform function to unlink() (that is, delete) a file using a UTF-8 encoded filename. This function is especially useful on the Windows platform where the standard function expects UTF-16 encoded non-ASCII filenames.

Parameters

| fname | the filename to unlink |

Returns

the return value of _wunlink() on Windows or unlink() on other platforms.

11.11.3.21 fl_utf8back()

const char * fl_utf8back ( 
    const char * p,
    const char * start,
    const char * end )

Move `p` backward until it points to the start of a UTF-8 character.
If it already points at the start of one then it is returned unchanged. Any UTF-8 errors are treated as though each byte of the error is an individual character.
`start` is the start of the string and is used to limit the backwards search for the start of a UTF-8 character.
`end` is the end of the string and is assumed to be a break between characters. It is assumed to be greater than `p`.
If you wish to decrement a UTF-8 pointer, pass `p-1` to this.

11.11.3.22 fl_utf8bytes()

int fl_utf8bytes ( 
    unsigned ucs )

Generated by Doxygen
11.11 Unicode and UTF-8 functions

Return the number of bytes needed to encode the given UCS4 character in UTF-8. Returns number of bytes that utf8encode() will use to encode the character ucs.

Parameters

| in  | ucs | UCS4 encoded character |

Returns

number of bytes required

11.11.3.23 fl_utf8decode()

```c
unsigned fl_utf8decode {
    const char * p,
    const char * end,
    int * len }
```

Decode a single UTF-8 encoded character starting at p. The resulting Unicode value (in the range 0-0x10ffff) is returned, and len is set to the number of bytes in the UTF-8 encoding (adding len to p will point at the next character).

If p points at an illegal UTF-8 encoding, including one that would go past end, or where a code uses more bytes than necessary, then *(unsigned char *)p is translated as though it is in the Microsoft CP1252 character set and len is set to 1. Treating errors this way allows this to decode almost any ISO-8859-1 or CP1252 text that has been mistakenly placed where UTF-8 is expected, and has proven very useful.

If you want errors to be converted to error characters (as the standards recommend), adding a test to see if the length is unexpectedly 1 will work:

```c
if (*p & 0x80) { // what should be a multibyte encoding
    code = fl_utf8decode(p,end,len);
    if (len<2) code = 0xFFFD; // Turn errors into REPLACEMENT CHARACTER
    else { // handle the 1-byte UTF-8 encoding:
        code = *p;
        len = 1;
    }
}
```

Direct testing for the 1-byte case (as shown above) will also speed up the scanning of strings where the majority of characters are ASCII.

11.11.3.24 fl_utf8encode()

```c
int fl_utf8encode {
    unsigned ucs,
    char * buf }
```

Write the UTF-8 encoding of ucs into buf and return the number of bytes written. Up to 4 bytes may be written. If you know that ucs is less than 0x10000 then at most 3 bytes will be written. If you wish to speed this up, remember that anything less than 0x80 is written as a single byte.

If ucs is greater than 0x10ffff this is an illegal character according to RFC 3629. These are converted as though they are 0xFFFD (REPLACEMENT CHARACTER).

RFC 3629 also says many other values for ucs are illegal (in the range 0xd800 to 0xdfff, or ending with 0xfffe or 0xffff). However I encode these as though they are legal, so that utf8encode/fl_utf8decode will be the identity for all codes between 0 and 0x10ffff.

11.11.3.25 fl_utf8from_mb()

```c
unsigned fl_utf8from_mb {
    char * dst,
    unsigned dstlen,
    const char * src,
    unsigned srclen }
```

Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK. Up to dstlen bytes are written to dst, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to dstlen then if you malloc a new array of...
size n+1 you will have the space needed for the entire string. If dstlen is zero then nothing is written and this call just measures the storage space needed.

On Unix or on Windows when a UTF-8 locale is in effect, this does not change the data. You may also want to check if fl_utf8test() returns non-zero, so that the filesystem can store filenames in UTF-8 encoding regardless of the locale.

### 11.11.3.26 fl_utf8froma()

```c
unsigned fl_utf8froma (  
    char * dst,  
    unsigned dstlen,  
    const char * src,  
    unsigned srclen )
```

Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.

It is possible this should convert Microsoft's CP1252 to UTF-8 instead. This would translate the codes in the range 0x80-0x9f to different characters. Currently it does not do this.

Up to dstlen bytes are written to dst, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to dstlen then if you malloc a new array of size n+1 you will have the space needed for the entire string. If dstlen is zero then nothing is written and this call just measures the storage space needed.

srclen is the number of bytes in src to convert.

If the return value equals srclen then this indicates that no conversion is necessary, as only ASCII characters are in the string.

### 11.11.3.27 fl_utf8fromwc()

```c
unsigned fl_utf8fromwc (  
    char * dst,  
    unsigned dstlen,  
    const wchar_t * src,  
    unsigned srclen )
```

Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.

Up to dstlen bytes are written to dst, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to dstlen then if you malloc a new array of size n+1 you will have the space needed for the entire string. If dstlen is zero then nothing is written and this call just measures the storage space needed.

srclen is the number of words in src to convert. On Windows this is not necessarily the number of characters, due to there possibly being "surrogate pairs" in the UTF-16 encoding used. On Unix wchar_t is 32 bits and each location is a character.

On Unix if a src word is greater than 0x10ffff then this is an illegal character according to RFC 3629. These are converted as though they are 0xFFFD (REPLACEMENT CHARACTER). Characters in the range 0xd800 to 0xdfff, or ending with 0xfffe or 0xffff are also illegal according to RFC 3629. However I encode these as though they are legal, so that fl_utf8towc will return the original data.

On Windows "surrogate pairs" are converted to a single character and UTF-8 encoded (as 4 bytes). Mismatched halves of surrogate pairs are converted as though they are individual characters.

### 11.11.3.28 fl_utf8fwd()

```c
const char * fl_utf8fwd (  
    const char * p,  
    const char * start,  
    const char * end )
```

Move p forward until it points to the start of a UTF-8 character.

If it already points at the start of one then it is returned unchanged. Any UTF-8 errors are treated as though each byte of the error is an individual character.

start is the start of the string and is used to limit the backwards search for the start of a UTF-8 character. end is the end of the string and is assumed to be a break between characters. It is assumed to be greater than p.

This function is for moving a pointer that was jumped to the middle of a string, such as when doing a binary search for a position. You should use either this or fl_utf8back() depending on which direction your algorithm can handle
11.11 Unicode and UTF-8 functions

the pointer moving. Do not use this to scan strings, use fl_utf8decode() instead.

11.11.3.29 fl_utf8len()

```c
int fl_utf8len ( char c )
```

Returns the byte length of the UTF-8 sequence with first byte c, or -1 if c is not valid.
This function is helpful for finding faulty UTF-8 sequences.

See also

- fl_utf8len1

11.11.3.30 fl_utf8len1()

```c
int fl_utf8len1 ( char c )
```

Returns the byte length of the UTF-8 sequence with first byte c, or 1 if c is not valid.
This function can be used to scan faulty UTF-8 sequences, albeit ignoring invalid codes.

See also

- fl_utf8len

11.11.3.31 fl_utf8locale()

```c
int fl_utf8locale ( void )
```

Return true if the "locale" seems to indicate that UTF-8 encoding is used. If true the fl_utf8to_mb and fl_utf8from_mb don't do anything useful.

*It is highly recommended that you change your system so this does return true.* On Windows this is done by setting the "codepage" to CP_UTF8. On Unix this is done by setting $LC_CTYPE to a string containing the letters "utf" or "UTF" in it, or by deleting all $LC_∗ and $LANG environment variables. In the future it is likely that all non-Asian Unix systems will return true, due to the compatibility of UTF-8 with ISO-8859-1.

11.11.3.32 fl_utf8strlen()

```c
int fl_utf8strlen ( const char * text, int len )
```

Return the length in bytes of a UTF-8 string.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>text</code></td>
<td>encoded in UTF-8</td>
</tr>
<tr>
<td><code>len</code></td>
<td>number of Unicode characters, -1 to test until the end of text</td>
</tr>
</tbody>
</table>

Returns

number of bytes that make up the Unicode string

See also

- fl_utf_nb_char(const unsigned char *buf, int len)

11.11.3.33 fl_utf8test()

```c
int fl_utf8test ( const char * src, unsigned srclen )
```
Examines the first `src_len` bytes in `src` and returns a verdict on whether it is UTF-8 or not.

- Returns 0 if there is any illegal UTF-8 sequences, using the same rules as `fl_utf8decode()`. Note that some UCS values considered illegal by RFC 3629, such as 0xffff, are considered legal by this.
- Returns 1 if there are only single-byte characters (i.e., no bytes have the high bit set). This is legal UTF-8, but also indicates plain ASCII. It also returns 1 if `src_len` is zero.
- Returns 2 if there are only characters less than 0x800.
- Returns 3 if there are only characters less than 0x10000.
- Returns 4 if there are characters in the 0x10000 to 0x10ffff range.

Because there are many illegal sequences in UTF-8, it is almost impossible for a string in another encoding to be confused with UTF-8. This is very useful for transitioning Unix to UTF-8 filenames, you can simply test each filename with this to decide if it is UTF-8 or in the locale encoding. My hope is that if this is done we will be able to cleanly transition to a locale-less encoding.

### fl_utf8to_mb()

```c
unsigned fl_utf8to_mb (  
    const char * src,  
    unsigned src_len,  
    char * dst,  
    unsigned dst_len )
```

Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).

Unfortunately due to stupid design you will have to do this as needed for filenames. This is a bug on both Unix and Windows.

Up to `dst_len` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dst_len` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dst_len` is zero then nothing is written and this call just measures the storage space needed.

If `fl_utf8locale()` returns true then this does not change the data.

### fl_utf8toa()

```c
unsigned fl_utf8toa (  
    const char * src,  
    unsigned src_len,  
    char * dst,  
    unsigned dst_len )
```

Convert a UTF-8 sequence into an array of 1-byte characters.

If the UTF-8 decodes to a character greater than 0xff then it is replaced with '?'.

Errors in the UTF-8 sequence are converted as individual bytes, same as `fl_utf8decoder()` does. This allows ISO-8859-1 text mistakenly identified as UTF-8 to be printed correctly (and possibly CP1252 on Windows).

Up to `dst_len` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dst_len` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dst_len` is zero then nothing is written and this call just measures the storage space needed.

### fl_utf8toUtf16()

```c
unsigned fl_utf8toUtf16 (  
    const char * src,  
    unsigned src_len,  
    unsigned short * dst,  
    unsigned dst_len )
```

Convert a UTF-8 sequence into an array of 16-bit characters.
These are used by some system calls, especially on Windows.

**src** points at the UTF-8, and **srclen** is the number of bytes to convert.

**dst** points at an array to write, and **dstlen** is the number of locations in this array. At most **dstlen-1** words will be written there, plus a 0 terminating word. Thus this function will never overwrite the buffer and will always return a zero-terminated string. If **dstlen** is zero then **dst** can be null and no data is written, but the length is returned. The return value is the number of 16-bit words that would be written to **dst** if it were long enough, not counting the terminating zero. If the return value is greater or equal to **dstlen** it indicates truncation, you can then allocate a new array of size **return+1** and call this again.

Errors in the UTF-8 are converted as though each byte in the erroneous string is in the Microsoft CP1252 encoding. This allows ISO-8859-1 text mistakenly identified as UTF-8 to be printed correctly.

Unicode characters in the range 0x10000 to 0x10ffff are converted to "surrogate pairs" which take two words each (this is called UTF-16 encoding).

### 11.11.3.37 fl_utf8towc()

```c
unsigned fl_utf8towc (  
    const char * src,  
    unsigned srclen,  
    wchar_t * dst,  
    unsigned dstlen )  
```

Converts a UTF-8 string into a wide character string.

This function generates 32-bit wchar_t (e.g. "ucs4" as it were) except on Windows where it is equivalent to fl←utf8toUtf16 and returns UTF-16.

**src** points at the UTF-8, and **srclen** is the number of bytes to convert.

**dst** points at an array to write, and **dstlen** is the number of locations in this array. At most **dstlen-1** wchar_t will be written there, plus a 0 terminating wchar_t.

The return value is the number of wchar_t that would be written to **dst** if it were long enough, not counting the terminating zero. If the return value is greater or equal to **dstlen** it indicates truncation, you can then allocate a new array of size return+1 and call this again.

Notice that sizeof(wchar_t) is 2 on Windows and is 4 on Linux and most other systems. Where wchar_t is 16 bits, Unicode characters in the range 0x10000 to 0x10ffff are converted to "surrogate pairs" which take two words each (this is called UTF-16 encoding). If wchar_t is 32 bits this rather nasty problem is avoided.

Note that Windows includes Cygwin, i.e. compiled with Cygwin's POSIX layer (cygwin1.dll, –enable-cygwin), either native (GDI) or X11.

### 11.11.3.38 fl_utf_nb_char()

```c
int fl_utf_nb_char (  
    const unsigned char * buf,  
    int len )  
```

Returns the number of Unicode chars in the UTF-8 string.

See also

`fl_utf8strlen(const char *text, int len)`

### 11.11.3.39 fl_utf_strcasecmp()

```c
int fl_utf_strcasecmp (  
    const char * s1,  
    const char * s2 )  
```

UTF-8 aware strcasecmp - converts to Unicode and tests.

Returns

```
result of comparison
```

Return values

```
0 | if the strings are equal
```

Generated by Doxygen
Return values

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if s1 is greater than s2</td>
</tr>
<tr>
<td>-1</td>
<td>if s1 is less than s2</td>
</tr>
</tbody>
</table>

11.11.3.40  fl_utf_strncasecmp()

```c
int fl_utf_strncasecmp(  
    const char * s1,  
    const char * s2,  
    int n)
```

UTF-8 aware strncasecmp - converts to lower case Unicode and tests.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>s1,s2</td>
<td>the UTF-8 strings to compare</td>
</tr>
<tr>
<td>n</td>
<td>the maximum number of UTF-8 characters to compare</td>
</tr>
</tbody>
</table>

Returns

result of comparison

Return values

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the strings are equal</td>
</tr>
<tr>
<td>&gt;0</td>
<td>if s1 is greater than s2</td>
</tr>
<tr>
<td>&lt;0</td>
<td>if s1 is less than s2</td>
</tr>
</tbody>
</table>

11.11.3.41  fl_utf_tolower()

```c
int fl_utf_tolower(  
    const unsigned char * str,  
    int len,  
    char * buf)
```

Converts the string str to its lower case equivalent into buf.  
Warning: to be safe buf length must be at least 3 * len [for 16-bit Unicode]

11.11.3.42  fl_utf_toupper()

```c
int fl_utf_toupper(  
    const unsigned char * str,  
    int len,  
    char * buf)
```

Converts the string str to its upper case equivalent into buf.  
Warning: to be safe buf length must be at least 3 * len [for 16-bit Unicode]

11.11.3.43  fl_wcwidth()

```c
int fl_wcwidth(  
    const char * src)
```

extended wrapper around fl_wcwidth_(unsigned int ucs) function.

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>src</td>
</tr>
</tbody>
</table>
11.12 String handling functions

String handling functions declared in `<FL/fl_string_functions.h>`

**Functions**

- `char * fl_strdup (const char *s)`
  
  Cross platform interface to POSIX function `strdup()`.

11.12.1 Detailed Description

String handling functions declared in `<FL/fl_string_functions.h>`

11.12.2 Function Documentation

11.12.2.1 `fl_strdup()`

```c
char * fl_strdup (const char *s)
```

Cross platform interface to POSIX function `strdup()`.

The `fl_strdup()` function returns a pointer to a new string which is a duplicate of the string 's'. Memory for the new string is obtained with `malloc(3)`, and can be freed with `free(3)`.

Implementation:

- POSIX: `strdup()`
- WinAPI: `_strdup()`

11.13 Mac OS X-specific symbols

Mac OS X-specific symbols declared in `<FL/platform.H>`
Classes

- class Fl_Mac_App_Menu

Functions

- FLWindow * fl_mac_find (FLWindow *)
  
  Returns the FL_Window corresponding to the given macOS-specific window reference.

- CGContextRef fl_mac_gc ()
  
  Returns the macOS-specific graphics context for the current window.

- void fl_mac_set_about (Fl_Callback *cb, void *user_data, int shortcut=0)
  
  Attaches a callback to the "About myprog" item of the system application menu.

- FLWindow * fl_mac_xid (const Fl_Window *)
  
  Returns the macOS-specific window reference corresponding to the given FL_Window object.

- void fl_open_callback (void(*)(const char *))
  
  Register a function called for each file dropped onto an application icon.

Variables

- int fl_mac_os_version
  
  The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2).

11.13.1 Detailed Description

Mac OS X-specific symbols declared in `<FL/platform.H>`

See also

The Apple OS X Interface

11.13.2 Function Documentation

11.13.2.1 fl_mac_set_about()

void fl_mac_set_about (Fl_Callback *cb, void *user_data, int shortcut = 0)

Attaches a callback to the "About myprog" item of the system application menu.

For back-compatibility. Equivalent to Fl_Sys_Menu_Bar::about(Fl_Callback *cb, void *user_data).

11.13.2.2 fl_open_callback()

void fl_open_callback (void(*)(const char *))

Register a function called for each file dropped onto an application icon.

This function is effective only on the Mac OS X platform. `cb` will be called with a single Unix-style file name and path. If multiple files were dropped, `cb` will be called multiple times.

This function should be called before `fl_open_display()` is called, either directly or indirectly (this happens at the first `show()` of a window), to be effective for files dropped on the application icon at launch time. It can also be called at any point to change the function used to open dropped files. A call with a NULL argument, after a previous call, makes the app ignore files dropped later.

11.13.3 Variable Documentation

11.13.3.1 fl_mac_os_version

int fl_mac_os_version [extern]

The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2).

FLTK initializes this global variable before main() begins running. If the value is needed in a static initializer, a previous call to `Fl::system_driver()` makes sure `fl_mac_os_version` has been initialized.
11.14 Common Dialog Classes and Functions

Common dialog functions for file selection, message output, and more.

Files

- file fl_ask.cxx
  Utility functions for common dialogs.

Classes

- class Fl_Color_Chooser
  The Fl_Color_Chooser widget provides a standard RGB color chooser.

- class Fl_File_Chooser
  The Fl_File_Chooser widget displays a standard file selection dialog that supports various selection modes.

Functions

- void fl_alert (const char *fmt,...)
  Shows an alert message dialog box.

- int fl_ask (const char *fmt,...)
  Shows a dialog displaying the fmt message, this dialog features 2 yes/no buttons.

- void fl_beep (int type)
  Emits a system beep.

- int fl_choice (const char *fmt, const char *b0, const char *b1, const char *b2,...)
  Shows a dialog displaying the printf style fmt message.

- int fl_choice_n (const char *fmt, const char *b0, const char *b1, const char *b2,...)
  Shows a dialog displaying the printf style fmt message.

- int fl_color_chooser (const char *name, double &r, double &g, double &b, int cmode)
  Pops up a window to let the user pick an arbitrary RGB color.

- int fl_color_chooser (const char *name, uchar &r, uchar &g, uchar &b, int cmode)
  Pops up a window to let the user pick an arbitrary RGB color.

- char * fl_dir_chooser (const char *message, const char *fname, int relative)
  Shows a file chooser dialog and gets a directory.

- char * fl_file_chooser (const char *message, const char *pat, const char *fname, int relative)
  Shows a file chooser dialog and gets a filename.

- void fl_file_chooser_callback (void(*)(const char *))
  Set the file chooser callback.

- void fl_file_chooser_ok_label (const char *l)
  Set the "OK" button label.

- const char * fl_input (const char *fmt, const char *defstr,...)
  Shows an input dialog displaying the fmt message with variable arguments.

- const char * fl_input (int maxchar, const char *fmt, const char *defstr,...)
  Shows an input dialog displaying the fmt message with variable arguments.

- void fl_message (const char *fmt,...)
  Shows an information message dialog box.

- int fl_message_hotspot ()
  Gets whether or not to move the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer.

- void fl_message_hotspot (int enable)
  Sets whether or not to move the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer.
Gets the Fl_Box icon container of the current default dialog used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().

- **void fl_message_icon_label (const char *str)**
  Sets the icon label of the dialog window used in many common dialogs.

- **void fl_message_position (const int x, const int y, const int center)**
  Sets the preferred position for the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().

- **void fl_message_position (Fl_Widget *widget)**
  Sets the preferred position for the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().

- **int fl_message_position (int *x, int *y)**
  Gets the preferred position for the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().

- **void fl_message_title (const char *title)**
  Sets the title of the dialog window used in many common dialogs.

- **void fl_message_title_default (const char *title)**
  Sets the default title of the dialog window used in many common dialogs.

- **const char * fl_password (const char *fmt, const char *defstr,...)**
  Shows an input dialog displaying the fmt message with variable arguments.

- **const char * fl_password (int maxchar, const char *fmt, const char *defstr,...)**
  Shows an input dialog displaying the fmt message with variable arguments.

**Variables**

- **static void ( Fl::error ) (const char *,...) = Fl_System_Driver::error**
  FLTKit calls Fl::error() to output a normal error message.

- **static void ( Fl::fatal ) (const char *,...) = Fl_System_Driver::fatal**
  FLTKit calls Fl::fatal() to output a fatal error message.

- **const char * fl_cancel = "Cancel"**
  string pointer used in common dialogs, you can change it to another language

- **const char * fl_close = "Close"**
  string pointer used in common dialogs, you can change it to another language

- **Fl_Font fl_message_font_ = FL_HELVETICA**

- **Fl_Fontsize fl_message_size_ = -1**

- **const char * fl_no = "No"**
  string pointer used in common dialogs, you can change it to another language

- **const char * fl_ok = "OK"**
  string pointer used in common dialogs, you can change it to another language

- **const char * fl_yes = "Yes"**
  string pointer used in common dialogs, you can change it to another language

- **static void ( Fl::warning ) (const char *,...) = Fl_System_Driver::warning**
  FLTKit calls Fl::warning() to output a warning message.

### 11.14.1 Detailed Description

Common dialog functions for file selection, message output, and more.

### 11.14.2 Function Documentation

#### 11.14.2.1 fl_alert()

```cpp
void fl_alert ( 
    const char * fmt,
    ... 
)
```

Shows an alert message dialog box.

#include <FL/fl_ask.h>
11.14 Common Dialog Classes and Functions

Parameters

| in  | fmt | can be used as a sprintf-like format and variables for the message text |

11.14.2.2 fl_ask()

```c
int fl_ask (const char * fmt, ... )
```

Shows a dialog displaying the `fmt` message, this dialog features 2 yes/no buttons.

```c
#include <FL/fl_ask.H>
```

Parameters

| in  | fmt | can be used as a sprintf-like format and variables for the message text |

Return values

| 0   | if the no button is selected |
| 1   | if yes is selected |

**Deprecated** fl_ask() is deprecated since it uses "Yes" and "No" for the buttons which does not conform to the current FLTK Human Interface Guidelines. Use fl_choice() with the appropriate verbs instead.

11.14.2.3 fl_beep()

```c
void fl_beep ( int type )
```

Emits a system beep.

This function is platform specific. Depending on the input `type` a different sound may be played or the system speaker may beep with a different volume.

On X the system speaker is used which may not work at all on newer systems that don't have a speaker. Since 1.4.0 FL_BEEP_DEFAULT and other types honor the system or user settings whereas FL_BEEP_ERROR uses 100% volume. This may be changed in a future version.

On Wayland an ASCII BEL (0x07) is output to stderr.

On Windows the MessageBeep() function is used to play different sounds depending on the `type` argument.

On macOS the system beep function NSBeep() is used for FL_BEEP_DEFAULT and FL_BEEP_ERROR. Other types are ignored.

On other platforms the behavior is undefined and may change in the future.

Parameters

| in  | type | The beep type from the Fl_Beep enumeration (optional) |

```c
#include <FL/fl_ask.H>
```

11.14.2.4 fl_choice()

```c
int fl_choice (const char * fmt, const char * b0, const char * b1, const char * b2, ... )
```

Shows a dialog displaying the printf style `fmt` message.

Generated by Doxygen
This dialog features up to 3 customizable choice buttons which are specified in order of right-to-left in the dialog, e.g.

```c
#include <FL/fl_ask.H>

Three choices with printf() style formatting:

```c
int num_msgs = GetNumberOfMessages();
switch ( fl_choice("What to do with %d messages?", "Send", "Save", "Delete", num_msgs) ) {
  case 0: .. // Send
  case 1: .. // Save (default)
  case 2: .. // Delete
  ...
}
```

Three choice example:

```c
switch ( fl_choice("How many bedrooms?", "Zero", "One", "Two") ) {
  case 0: .. // "Zero"
  case 1: .. // "One" (default)
  case 2: .. // "Two"
}
```

Two choice example:

```c
switch ( fl_choice("Empty trash?", "Yes", "No", 0) ) {
  case 0: .. // Yes
  case 1: .. // No (default)
}
```

One choice example:

```c
fl_choice("All hope is lost.", "OK", 0, 0); // "OK" default
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fmt</code></td>
<td>can be used as an sprintf-like format and variables for the message text</td>
</tr>
<tr>
<td><code>b0</code></td>
<td>text label for right button 0</td>
</tr>
<tr>
<td><code>b1</code></td>
<td>text label for middle button 1 (can be 0)</td>
</tr>
<tr>
<td><code>b2</code></td>
<td>text label for left button 2 (can be 0)</td>
</tr>
</tbody>
</table>
Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>if the button with b0 text is pushed or the user pressed the Escape key or clicked the window close button</td>
</tr>
<tr>
<td>1</td>
<td>if the button with b1 text is pushed or the user pressed the Return key</td>
</tr>
<tr>
<td>2</td>
<td>if the button with b2 text is pushed</td>
</tr>
</tbody>
</table>

### 11.14.2.5 fl_choice_n()

```c
int fl_choice_n (const char *fmt, const char *b0, const char *b1, const char *b2, ...)
```

Shows a dialog displaying the printf style `fmt` message. This function is like `fl_choice()` but returns -1 if the dialog window was closed by pressing the Escape key or the window close button rather than pushing one of the dialog buttons.

See also

`fl_choice()`

#### Parameters

<table>
<thead>
<tr>
<th>In</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fmt</code></td>
<td>can be used as a sprintf-like format and variables for the message text</td>
</tr>
<tr>
<td><code>b0</code></td>
<td>text label for right button 0</td>
</tr>
<tr>
<td><code>b1</code></td>
<td>text label for middle button 1 (can be 0)</td>
</tr>
<tr>
<td><code>b2</code></td>
<td>text label for left button 2 (can be 0)</td>
</tr>
</tbody>
</table>

#### Return values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-3</td>
<td>reserved, FLTK 1.3 only: another dialog is still open (not possible in 1.4)</td>
</tr>
<tr>
<td>-2</td>
<td>if the dialog was closed by pushing the window close button</td>
</tr>
<tr>
<td>-1</td>
<td>if the dialog was closed by hitting Escape</td>
</tr>
<tr>
<td>0</td>
<td>if the button with b0 text is pushed</td>
</tr>
<tr>
<td>1</td>
<td>if the button with b1 text is pushed</td>
</tr>
<tr>
<td>2</td>
<td>if the button with b2 text is pushed</td>
</tr>
</tbody>
</table>

### 11.14.2.6 fl_color_chooser() [1/2]

```c
int fl_color_chooser (const char *name, double & r, double & g, double & b, int cmode ) [related]
```

Pops up a window to let the user pick an arbitrary RGB color.
Note

\#include <FL/Fl_Color_Chooser.H>

Figure 11.10 fl_color_chooser

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>name</th>
<th>Title label for the window</th>
</tr>
</thead>
<tbody>
<tr>
<td>in, out</td>
<td>r,g,b</td>
<td>Color components in the range 0.0 to 1.0.</td>
</tr>
<tr>
<td>in</td>
<td>cmode</td>
<td>Optional mode for color chooser. See mode(int). Default -1 if none (rgb mode).</td>
</tr>
</tbody>
</table>

Return values

| 1 | if user confirms the selection |
| 0 | if user cancels the dialog |

11.14.2.7 fl_color_chooser() [2/2]

```c
int fl_color_chooser (  
    const char * name,  
    uchar & r,  
    uchar & g,  
    uchar & b,  
    int cmode ) [related]
```

Pops up a window to let the user pick an arbitrary RGB color.
11.14 Common Dialog Classes and Functions

Note

```c
#include <FL/Fl_Color_Chooser.H>
```

![Figure 11.11 fl_color_chooser](image)

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>name</th>
<th>Title label for the window</th>
</tr>
</thead>
<tbody>
<tr>
<td>in, out</td>
<td>r,g,b</td>
<td>Color components in the range 0 to 255.</td>
</tr>
<tr>
<td>in</td>
<td>cmode</td>
<td>Optional mode for color chooser. See <code>mode(int)</code>. Default -1 if none (rgb mode).</td>
</tr>
</tbody>
</table>

**Return values**

| 1  | if user confirms the selection |
| 0  | if user cancels the dialog |

11.14.2.8  

```c
char * fl_dir_chooser ( const char * message, const char * fname, int relative ) [related]
```

Shows a file chooser dialog and gets a directory.

Note

```c
#include <FL/Fl_File_Chooser.H>
```

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>message</th>
<th>title bar text</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>fname</td>
<td>initial/default directory name</td>
</tr>
<tr>
<td>in</td>
<td>relative</td>
<td>0 for absolute path return, relative otherwise</td>
</tr>
</tbody>
</table>
Returns

the directory path string chosen by the user or NULL if user cancels.

11.14.2.9 fl_file_chooser()

char * fl_file_chooser (
    const char * message,
    const char * pat,
    const char * fname,
    int relative ) [related]

Shows a file chooser dialog and gets a filename.

Note

#include <FL/Fl_File_Chooser.H>

![Fl_File_Chooser Test](image)

Figure 11.12 Fl_File_Chooser

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in message</td>
<td>text in title bar</td>
</tr>
<tr>
<td>in pat</td>
<td>filename pattern filter</td>
</tr>
<tr>
<td>in fname</td>
<td>initial/default filename selection</td>
</tr>
<tr>
<td>in relative</td>
<td>0 for absolute path name, relative path name otherwise</td>
</tr>
</tbody>
</table>
Returns

the user selected filename, in absolute or relative format or NULL if user cancels

### 11.14.2.10 fl_file_chooser_callback()

```c
void fl_file_chooser_callback (  
  void(*)(const char *) cb ) [related]
```

Set the file chooser callback.

**Note**

```
#include <FL/Fl_File_Chooser.H>
```

### 11.14.2.11 fl_file_chooser_ok_label()

```c
void fl_file_chooser_ok_label (  
  const char * l ) [related]
```

Set the "OK" button label.

**Note**

```
#include <FL/Fl_File_Chooser.H>
```

### 11.14.2.12 fl_input() [1/2]

```c
const char * fl_input (  
  const char * fmt,  
  const char * defstr,  
  ... )
```

Shows an input dialog displaying the `fmt` message with variable arguments.

Returns the string in an internally allocated buffer that may be changed later. You **must** copy the string immediately after return from this method - at least before the next execution of the event loop.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fmt</code></td>
<td>can be used as a sprintf-like format and variables for the message text</td>
</tr>
<tr>
<td><code>defstr</code></td>
<td>defines the default returned string if no text is entered</td>
</tr>
</tbody>
</table>

Returns

the user string input if OK was pushed

**Return values**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>NULL</code></td>
<td>if Cancel was pushed or the window was closed by the user</td>
</tr>
</tbody>
</table>

### 11.14.2.13 fl_input() [2/2]

```c
const char * fl_input (  
  int maxchar,  
  const char * fmt,  
  const char * defstr,  
  ... )
```

Shows an input dialog displaying the `fmt` message with variable arguments.

This is the same as `const char * fl_input(const char *fmt, const char *defstr, ...)` except that it has an additional...
parameter to limit the number of characters the user can input. Returns the string in an internally allocated buffer that may be changed later. You must copy the string immediately after return from this method - at least before the next execution of the event loop.

```c
#include <FL/fl_ask.H>
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>maxchar</code></td>
<td>maximum number of characters the user can input (UTF-8 aware)</td>
</tr>
<tr>
<td><code>fmt</code></td>
<td>can be used as a sprintf-like format and variables for the message text</td>
</tr>
<tr>
<td><code>defstr</code></td>
<td>defines the default returned string if no text is entered</td>
</tr>
</tbody>
</table>

### Returns

the user string input if OK was pushed

### Return values

- `NULL` if Cancel was pushed or the window was closed by the user

---

### 11.14.2.14 fl_message()

```c
void fl_message (const char * fmt, ... )
```

Shows an information message dialog box.

```c
#include <FL/fl_ask.H>
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fmt</code></td>
<td>can be used as a sprintf-like format and variables for the message text</td>
</tr>
</tbody>
</table>

---

### 11.14.2.15 fl_message_hotspot() [1/2]

```c
int fl_message_hotspot { void }
```

Gets whether or not to move the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()` to follow the mouse pointer.

This is a permanent setting. It remains active and affects the window position unless overridden by an explicit positioning request by means of one of the `fl_message_position()` variants.

```c
#include <FL/fl_ask.H>
```

### Returns

- `0` if disabled, non-zero otherwise

### See also

- `void fl_message_hotspot(int)`
- `int fl_message_position(int *x, int *y)`
- `void fl_message_position(Fl_Widget *)`
- `fl_message_position()`

---

### 11.14.2.16 fl_message_hotspot() [2/2]

```c
void fl_message_hotspot (int enable)
```

---

Generated by Doxygen
Sets whether or not to move the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password() to follow the mouse pointer. The default is enabled, so that the default button is the hotspot and appears at the mouse position.

```c
#include <FL/fl_ask.H>
```

### Parameters

| enabled | non-zero enables hotspot behavior, 0 disables hotspot |

#### 11.14.2.17 fl_message_icon()

```c
FL_Widget * fl_message_icon ( )
```

Gets the Fl_Box icon container of the current default dialog used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().

The return value cannot be Null. The object pointed to is an Fl_Box widget. The returned pointer (Fl_Widget *) can be safely cast to an Fl_Box pointer.

**Note**

You can set some attributes of this default icon box. These attributes are sticky, i.e. they will be used in all subsequent common dialogs unless overridden by specific "one shot" variables. Setting any attribute except those mentioned below causes undefined behavior.

**Supported icon attributes:**

- box()
- labelfont()
- labelsize()
- color()
- labelcolor()
- image()
- align()

The icon size can not be changed. If you set an image() you should scale it to the available size, i.e. w() and h() of the icon box.

```c
#include <FL/fl_ask.H>
```

#### 11.14.2.18 fl_message_icon_label()

```c
void fl_message_icon_label ( const char * str )
```

Sets the icon label of the dialog window used in many common dialogs. This icon label will be used in the next call of one of the common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().

The label str is stored internally as a reference, it must be in scope until the dialog function (e.g. fl_choice) is called.

It applies only to the next call of one of the common dialogs and will be reset after that call so the next dialog will use its default label unless set again.

**Note**

This label string must be short, usually only one character so it fits in the icon box. You can use any valid UTF-8 character, e.g. the Euro sign ("€") which is three bytes in UTF-8 encoding.

```c
#include <FL/fl_ask.H>
```
11.14.2.19  fl_message_position()  [1/3]

void fl_message_position (const int x, const int y, const int center);

Sets the preferred position for the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().

The position set with this method overrides the hotspot setting, i.e. setting a position has higher priority than the hotspot mode set by fl_message_hotspot(int).

The preferred position set by any of the fl_message_position() variants affects only the next call of one of the common dialogs. The preferred position is reset to 0 (unset) as soon as the dialog is shown.

If the optional argument center is non-zero (true) the message box will be centered at the given coordinates rather than using the X/Y position as the window position (top left corner).

See also

int fl_message_position(int *x, int *y)

11.14.2.20  fl_message_position()  [2/3]

void fl_message_position (Fl_Widget *widget);

Sets the preferred position for the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().

The message box will be centered over the given widget or window extensions.

Everything else is like fl_message_position(int, int, int) with argument ‘center’ set to 1.

See also

int fl_message_position(int x, int y, int center)

11.14.2.21  fl_message_position()  [3/3]

int fl_message_position (int *x, int *y);

Gets the preferred position for the message box used in many common dialogs like fl_message(), fl_alert(), fl_ask(), fl_choice(), fl_input(), fl_password().

# include <FL/fl_ask.H>
The position set with this method overrides the hotspot setting, i.e. setting a position has higher priority than the hotspot mode set by `fl_message_hotspot(int)`.
The preferred position set by any of the `fl_message_position()` variants affects only the next call of one of the common dialogs. The preferred position is reset to 0 (unset) as soon as the dialog is shown.

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>x</th>
<th>Preferred X position, returns -1 if not set</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>y</td>
<td>Preferred Y position, returns -1 if not set</td>
</tr>
</tbody>
</table>

Returns

whether position is currently set or not

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>position is not set (hotspot may be enabled or not)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>position is set (window position)</td>
</tr>
<tr>
<td>2</td>
<td>position is set (message box centered)</td>
</tr>
</tbody>
</table>

See also

`fl_message_hotspot()`
`fl_message_hotspot(int)`
`fl_message_position(int, int)`
`fl_message_position(const int x, const int y, const int center)`
`fl_message_position(Fl_Widget *)`

### 11.14.2.22 fl_message_title()

```
void fl_message_title (const char *title)
```

Sets the title of the dialog window used in many common dialogs.

This window title will be used in the next call of one of the common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.

The title string is copied internally, so that you can use a local variable or free the string immediately after this call. It applies only to the next call of one of the common dialogs and will be reset to an empty title (the default for all dialogs) after that call.

```
#include <FL/fl_ask.H>
```

Parameters

| in | title | window label, string copied internally |

### 11.14.2.23 fl_message_title_default()

```
void fl_message_title_default (const char *title)
```

Sets the default title of the dialog window used in many common dialogs.

This window title will be used in all subsequent calls of one of the common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`, unless a specific title has been set with `fl_message_title(const char *title)`.

The default is no title. You can override the default title for a single dialog with `fl_message_title(const char *title)`.

The title string is copied internally, so that you can use a local variable or free the string immediately after this call.
#include <FL/fl_ask.H>

## Parameters

**in**  
`title`  
default window label, string copied internally

### 11.14.24  `fl_password()` [1/2]

```c
const char * fl_password {
    const char * fmt,
    const char * defstr,
    ... }
```

Shows an input dialog displaying the `fmt` message with variable arguments.  
Like `fl_input()` except the input text is not shown, "*" or similar replacement characters are displayed instead.

```c
#include <FL/fl_ask.H>
```

### Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fmt</code></td>
<td>can be used as an <code>sprintf</code>-like format and variables for the message text</td>
</tr>
<tr>
<td><code>defstr</code></td>
<td>defines the default returned string if no text is entered</td>
</tr>
</tbody>
</table>

### Returns

the user string input if OK was pushed

### Return values

`NULL` if Cancel was pushed or the window was closed by the user

### 11.14.25  `fl_password()` [2/2]

```c
const char * fl_password {
    int maxchar,
    const char * fmt,
    const char * defstr,
    ... }
```

Shows an input dialog displaying the `fmt` message with variable arguments.  
Like `fl_input()` except the input text is not shown, "*" or similar replacement characters are displayed instead.

```c
#include <FL/fl_ask.H>
```

### Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>maxchar</code></td>
<td>input length limit in chars, 0 = no limit</td>
</tr>
<tr>
<td><code>fmt</code></td>
<td>can be used as an <code>sprintf</code>-like format and variables for the message text</td>
</tr>
<tr>
<td><code>defstr</code></td>
<td>defines the default returned string if no text is entered</td>
</tr>
</tbody>
</table>

### Returns

the user string input if OK was pushed

### Return values

`NULL` if Cancel was pushed or the window was closed by the user
11.14.3  Variable Documentation

11.14.3.1  error

void(* Fl::error)(const char *format,...) = Fl_System_Driver::error [static]

FTLK calls Fl::error() to output a normal error message. The default version on
Windows displays the error message in a MessageBox window. The default version on all
other platforms prints the error message to stderr. You can override the behavior by setting
the function pointer to your own routine. Fl::error() means there is a recoverable error
such as the inability to read an image file. The default implementation returns after
displaying the message.

Note

#include <FL/Fl.H>

11.14.3.2  fatal

void(* Fl::fatal)(const char *format,...) = Fl_System_Driver::fatal [static]

FTLK calls Fl::fatal() to output a fatal error message. The default version on Windows
displays the error message in a MessageBox window. The default version on all other
platforms prints the error message to stderr. You can override the behavior by setting
the function pointer to your own routine. Fl::fatal() must not return, as FTLK is in an
unusable state, however your version may be able to use longjmp or an exception
to continue, as long as it does not call FTLK again. The default implementation exits with status 1 after
displaying the message.

Note

#include <FL/Fl.H>

11.14.3.3  warning

void(* Fl::warning)(const char *format,...) = Fl_System_Driver::warning [static]

FTLK calls Fl::warning() to output a warning message. The default version on Windows returns
without printing a warning message, because Windows programs normally
don't have stderr (a console window) enabled. The default version on all other platforms
prints the warning message to stderr. You can override the behavior by setting the function pointer
to your own routine. Fl::warning() means that there was a recoverable problem, the display may be messed up, but the user can probably
keep working - all X protocol errors call this, for example. The default implementation returns after displaying
the message.

Note

#include <FL/Fl.H>

11.15  The gtk_shell1 interface

11.16.1 Detailed Description

11.17 File names and URI utility functions

File names and URI functions defined in `<FL/filename.H>`

Macros

• #define FL_PATH_MAX 2048
  all path buffers should use this length

Typedefs

• typedef int() Fl_File_Sort_F(struct dirent **, struct dirent **)
  File sorting function.

Functions

• void fl_decode_uri (char *uri)
  Decodes a URL-encoded string.
• int fl_filename_absolute (char *to, int tolen, const char *from)
  Makes a filename absolute from a relative filename to the current working directory.
• int fl_filename_absolute (char *to, int tolen, const char *from, const char *cwd)
  Concatenate the absolute path base with from to form the new absolute path in to.
• int fl_filename_expand (char *to, int tolen, const char *from)
  Expands a filename containing shell variables and tilde (~).
• const char * fl_filename_ext (const char *buf)
  Gets the extension of a filename.
• void fl_filename_free_list (struct dirent ***, int n)
Free the list of filenames that is generated by \texttt{fl_filename_list(\)}.  

- \texttt{int fl_filename_isdir (const char ∗name)}
  Determines if a file exists and is a directory from its filename.
- \texttt{int fl_filename_list (const char ∗d, struct dirent **∗∗l, Fl_File_Sort_F ∗s=fl_numericsort)}
  Portable and const-correct wrapper for the \texttt{scandir()} function.
- \texttt{int fl_filename_match (const char ∗name, const char ∗∗pattern)}
  Checks if a string \(s\) matches a pattern \(p\).
- \texttt{const char ∗ fl_filename_name (const char ∗filename)}
  Gets the file name from a path.
- \texttt{int fl_filename_relative (char ∗to, int tolen, const char ∗from)}
  Makes a filename relative to the current working directory.
- \texttt{int fl_filename_relative (char ∗to, int tolen, const char ∗from, const char ∗cwd)}
  Makes a filename relative to any other directory.
- \texttt{char ∗ fl_filename_setext (char ∗to, int tolen, const char ∗ext)}
  Replaces the extension in \(buf\) of \(max\).
- \texttt{int fl_open_uri (const char ∗uri, char ∗msg, int msglen)}
  Opens the specified Uniform Resource Identifier (URI).

### 11.17.1 Detailed Description

File names and URI functions defined in <\texttt{FL/filename.H}>.

### 11.17.2 Typedef Documentation

#### 11.17.2.1 \texttt{Fl_File_Sort_F}

typedef int() Fl_File_Sort_F(struct dirent **, struct dirent **)

File sorting function.

See also

\texttt{fl_filename_list(\)}

### 11.17.3 Function Documentation

#### 11.17.3.1 \texttt{fl_decode_uri()}

\texttt{void fl_decode_uri (char ∗uri)}

Decodes a URL-encoded string.

In a Uniform Resource Identifier (URI), all non-ASCII bytes and several others (e.g., '<', ',', ') are URL-encoded using 3 bytes by "%XY" where XY is the hexadecimal value of the byte. This function decodes the URI restoring its original UTF-8 encoded content. Decoding is done in-place.

#### 11.17.3.2 \texttt{fl_filename_absolute() [1/2]}

\texttt{int fl_filename_absolute (char ∗to, int tolen, const char ∗from)}

Makes a filename absolute from a relative filename to the current working directory.

```c
#include <FL/filename.H>
[..]
fl_chdir("/var/tmp");
fl_filename_absolute(out, sizeof(out), ".foo.txt"); // out="/var/tmp/foo.txt"
f1_filename_absolute(out, sizeof(out), ".foo.txt"); // out="/var/tmp/foo.txt"
fl_filename_absolute(out, sizeof(out), ".log/messages"); // out="/var/log/messages"
```
380

Topic Documentation

Parameters

out
in
in

to

resulting absolute filename

tolen
from

size of the absolute filename buffer
relative filename

Returns
0 if no change, non zero otherwise

11.17.3.3

fl_filename_absolute() [2/2]

int fl_filename_absolute (
char ∗ to,
int tolen,
const char ∗ from,
const char ∗ base )

Concatenate the absolute path base with from to form the new absolute path in to.
#include <FL/filename.H>
char out[FL_PATH_MAX];
fl_filename_absolute(out, sizeof(out), "../foo.txt", "/var/tmp");
// out="/var/foo.txt"
fl_filename_absolute(out, sizeof(out), "../local/bin", "/usr/bin"); // out="/usr/local/bin"

Parameters

out
in
in
in

to

resulting absolute filename

tolen
from
base

size of the absolute filename buffer
relative filename
from is relative to this absolute file path

Returns
0 if no change, non zero otherwise

11.17.3.4

fl_filename_expand()

int fl_filename_expand (
char ∗ to,
int tolen,
const char ∗ from )

Expands a filename containing shell variables and tilde (∼).
Currently handles these variants:
"~username"
"~/file"
"$VARNAME"

// if ’username’ does not exist, result will be unchanged
// does NOT handle ${VARNAME}

Examples:
#include <FL/filename.H>
[..]
putenv("TMPDIR=/var/tmp");
fl_filename_expand(out, sizeof(out), "~fred/.cshrc");
fl_filename_expand(out, sizeof(out), "~/.cshrc");
fl_filename_expand(out, sizeof(out), "$TMPDIR/foo.txt");

// out="/usr/fred/.cshrc"
// out="/usr/<yourname>/.cshrc"
// out="/var/tmp/foo.txt"

Parameters

out
in
in

to

resulting expanded filename

tolen

size of the expanded filename buffer

from

filename containing shell variables

Generated by Doxygen


11.17 File names and URI utility functions

11.17.3.5  fl_filename_ext()

const char * fl_filename_ext (  
    const char * buf )

Gets the extension of a filename.

```c
#include <FL/filename.H>
const char * out;
out = fl_filename_ext("/some/path/foo.txt"); // result: ".txt"
out = fl_filename_ext("/some/path/foo"); // result: NULL
```

Parameters

- `buf` the filename to be parsed

Returns

- a pointer to the extension (including ".") if any or NULL otherwise

11.17.3.6  fl_filename_free_list()

void fl_filename_free_list (  
    struct dirent *** list,  
    int n )

Free the list of filenames that is generated by fl_filename_list().
Free everything that was allocated by a previous call to fl_filename_list(). Use the return values as parameters for this function.

Parameters

- `list` table containing the resulting directory listing
- `n` number of entries in the list

11.17.3.7  fl_filename_isdir()

int fl_filename_isdir (  
    const char * n )

Determines if a file exists and is a directory from its filename.

```c
#include <FL/filename.H>
fl_filename_isdir("/etc"); // returns non-zero
fl_filename_isdir("/etc/hosts"); // returns 0
```

Parameters

- `n` the filename to parse

Returns

- non zero if file exists and is a directory, zero otherwise

11.17.3.8  fl_filename_list()

int fl_filename_list (  
    const char * d,  
    const char * buf )

Returns

- 0 if no change, non zero otherwise
dirent *** list,
    Fl_File_Sort_F * sort )

Portable and const-correct wrapper for the scandir() function.
For each file in that directory a "dirent" structure is created. The only portable thing about a dirent is that dirent.
    d_name is the nul-terminated file name. A pointers array to these dirent's is created and a pointer to the array is
    returned in list. The number of entries is given as a return value. If there is an error reading the directory a number
    less than zero is returned, and errno has the reason; errno does not work under Windows.

Include:
    #include <FL/filename.H>

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>d</th>
<th>the name of the directory to list. It does not matter if it has a trailing slash.</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>list</td>
<td>table containing the resulting directory listing</td>
</tr>
<tr>
<td>in</td>
<td>sort</td>
<td>sorting functor:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• fl_alphasort: The files are sorted in ascending alphabetical order; upper and lowercase</td>
</tr>
<tr>
<td></td>
<td></td>
<td>letters are compared according to their ASCII ordering uppercase before lowercase.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• fl_casealphasort: The files are sorted in ascending alphabetical order; upper and lowercase</td>
</tr>
<tr>
<td></td>
<td></td>
<td>letters are compared equally case is not significant.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• fl_casenumeric sorter: The files are sorted in ascending &quot;alphanumeric&quot; order, where an</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attempt is made to put unpadded numbers in consecutive order; upper and lowercase</td>
</tr>
<tr>
<td></td>
<td></td>
<td>letters are compared equally case is not significant.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• fl_numeric sorter: The files are sorted in ascending &quot;alphanumeric&quot; order, where an</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attempt is made to put unpadded numbers in consecutive order; upper and lowercase</td>
</tr>
<tr>
<td></td>
<td></td>
<td>letters are compared according to their ASCII ordering - uppercase before lowercase.</td>
</tr>
</tbody>
</table>

Returns
    the number of entries if no error, a negative value otherwise.

Todo should support returning OS error messages

11.17.3.9 fl_filename_match()

int fl_filename_match (  
    const char * s,  
    const char * p  
)

Checks if a string s matches a pattern p.
The following syntax is used for the pattern:

• * matches any sequence of 0 or more characters.
• ? matches any single character.
• [set] matches any character in the set. Set can contain any single characters, or a-z to represent a range. To match ] or - they must be the first characters. To match ∧ or ! they must not be the first characters.
• [^set] or [iset] matches any character not in the set.
• {X|Y|Z} or (X,Y,Z) matches any one of the subexpressions literally.
• \x quotes the character x so it has no special meaning.
• x all other characters are matched "exactly" on a case-insensitive basis.

Notes:

• s and p are matched on a char/byte basis, not as UCS codepoints or UTF-8 sequences.
• [set] ranges must run from low to high, i.e. [a-z] and not [z-a]
• [set] comparison is case-sensitive, i.e. [a-z] won't match "A".
• \x only applies to the fl_filename_match special characters * [ 

Include:
#include <FL/filename.H>

Parameters

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>s</td>
</tr>
<tr>
<td>in</td>
<td>p</td>
</tr>
</tbody>
</table>

Returns

non zero if the string matches the pattern

11.17.3.10 fl_filename_name()

c const char * fl_filename_name (  
  const char * filename )

Gets the file name from a path.
Similar to basename(3), exceptions shown below.
#include <FL/filename.H>  
[.]  
const char *out;  
out = fl_filename_name("/usr/lib"); // out="lib"  
out = fl_filename_name("/usr/"); // out="" (basename(3) returns "usr" instead)  
out = fl_filename_name("/"); // out="" (basename(3) returns "/" instead)  
out = fl_filename_name("."); // out="."  
out = fl_filename_name(".."); // out=".."  

Returns

a pointer to the char after the last slash, or to filename if there is none.

11.17.3.11 fl_filename_relative() [1/2]

int fl_filename_relative (  
  char * to,  
  int tolen,  
  const char * from )

Makes a filename relative to the current working directory.
Return the from path made relative to the working directory, similar to C++17 std::filesystem::path←::lexically_relative. This function can also be called with a fourth argument for a user supplied base directory path.
These conversions are purely lexical. They do not check that the paths exist, do not follow symlinks, and do not access the filesystem at all.
Path arguments must be absolute (start at the root directory) and must not contain . or .. segments, or double separators. A single trailing separator is ok.
On Windows, path arguments must start with a drive name, e.g. c:\. Windows network paths and other special paths starting with a double separator are not supported (\cloud\drive\path, \?\, etc.). Separators can be \ and / and will be preserved. Newly created separators are always the forward slash /.
On Windows and macOS, the path segment tests are case insensitive.
If the path can not be generated, from path is copied into the to buffer and 0 is returned.
#include <FL/filename.H>  
[.]  
fl_chdir("/var/tmp/somedir"); // set cwd to /var/tmp/somedir  
[.]  
char out[FL_PATH_MAX];
fl_filename_relative(out, sizeof(out), "/var/tmp/somedir/foo.txt"); // out="foo.txt", return=1
fl_filename_relative(out, sizeof(out), "/var/tmp/foo.txt"); // out="../foo.txt", return=1
fl_filename_relative(out, sizeof(out), "foo.txt"); // out="foo.txt", return=0 (no change)
fl_filename_relative(out, sizeof(out), "./.foo.txt"); // out="../foo.txt", return=0 (no change)
fl_filename_relative(out, sizeof(out), "../..foo.txt"); // out="../foo.txt", return=0 (no change)

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>to</th>
<th>resulting relative filename</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>tolen</td>
<td>size of the relative filename buffer</td>
</tr>
<tr>
<td>in</td>
<td>from</td>
<td>absolute filename</td>
</tr>
</tbody>
</table>

Returns

0 if no change, non zero otherwise

See also

fl_filename_relative(char *, to, int tolen, const char *, from, const char *, base)

11.17.3.12 fl_filename_relative() [2/2]

int fl_filename_relative (  
    char * to,  
    int tolen,  
    const char * from,  
    const char * base )

Makes a filename relative to any other directory.

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>to</th>
<th>resulting relative filepath</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>tolen</td>
<td>size of the relative filename buffer</td>
</tr>
<tr>
<td>in</td>
<td>from</td>
<td>absolute filepath</td>
</tr>
<tr>
<td>in</td>
<td>base</td>
<td>generate filepath relative to this absolute filepath</td>
</tr>
</tbody>
</table>

Returns

0 if no change, non zero otherwise

See also

fl_filename_relative(char *, to, int tolen, const char *, from)

11.17.3.13 fl_filename_setext()

char * fl_filename_setext (  
    char * buf,  
    int buflen,  
    const char * ext )

Replaces the extension in buf of max.

size buflen with the extension in ext.
If there is no '.' in buf, ext is appended.
If ext is NULL, behaves as if it were an empty string ("").

Generated by Doxygen
11.17 File names and URI utility functions

Example

```c
#include <FL/filename.H>
[..]
char buf[FL_PATH_MAX] = "/path/myfile.cxx";
fl_filename_setext(buf, sizeof(buf), ".txt"); // buf[] becomes "/path/myfile.txt"
```

Returns

buf itself for calling convenience.

11.17.3.14 fl_open_uri()

```c
int fl_open_uri (const char ∗uri, char ∗msg, int msglen)
```

Opens the specified Uniform Resource Identifier (URI).

Uses an operating-system dependent program or interface. For URIs using the "ftp", "http", or "https" schemes, the system default web browser is used to open the URI, while "mailto" and "news" URIs are typically opened using the system default mail reader and "file" URIs are opened using the file system navigator.

On success, the (optional) msg buffer is filled with the command that was run to open the URI; on Windows, this will always be "open uri".

On failure, the msg buffer is filled with an English error message.

Note

Platform Specific Issues: Windows
With "file:" based URIs on Windows, you may encounter issues with anchors being ignored. Example: "file://c:/some/index.html#anchor" may open in the browser without the "#anchor" suffix. The behavior seems to vary across different Windows versions. Workaround: open a link to a separate html file that redirects to the desired "file:" URI.

Example

```c
#include <FL/filename.H>
[..]
char errmsg[512];
if ( !fl_open_uri("http://google.com/", errmsg, sizeof(errmsg)) ) {
    char warnmsg[768];
    sprintf(warnmsg, "Error: %s", errmsg);
    fl_alert(warnmsg);
}
```

Parameters

<table>
<thead>
<tr>
<th>uri</th>
<th>The URI to open</th>
</tr>
</thead>
<tbody>
<tr>
<td>msg</td>
<td>Optional buffer which contains the command or error message</td>
</tr>
<tr>
<td>msglen</td>
<td>Length of optional buffer</td>
</tr>
</tbody>
</table>

Returns

1 on success, 0 on failure

12.7  FL Class Reference

The FL is the FLTK global (static) class containing state information and global methods for the current application.

```cpp
#include <Fl.H>
```

### Public Types

- `enum FL_Option {
  OPTION_ARROW_FOCUS = 0,
  OPTION_VISIBLE_FOCUS,
  OPTION_DND_TEXT,
  OPTION_SHOW_TOOLTIPS,
  OPTION_FNFC_USES_GTK,
  OPTION_PRINTER_USES_GTK,
  OPTION_SHOW_SCALING,
  OPTION_FNFC_USES_ZENITY,
  OPTION_LAST
}`

Enumerator for global FLTK options.

### Static Public Member Functions

- `static int abi_check (const int val=FL_ABI_VERSION)`
  Returns whether the runtime library ABI version is correct.
- `static int abi_version ()`
  Returns the compiled-in value of the FL_ABI_VERSION constant.
- `static int add_awake_handler_ (Fl_Awake_Handler, void *)`
  Adds an awake handler for use in `awake()`.
- `static void add_check (Fl_Timeout_Handler, void *=0)`
  FLTK will call this callback just before it flushes the display and waits for events.
- `static void add_clipboard_notify (Fl_Clipboard_Notify_Handler h, void *=0)`
  FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard.
- `static void add_fd (int fd, Fl_FD_Handler cb, void *=0)`
  Adds file descriptor fd to listen to.
- `static void add_fd (int fd, int when, Fl_FD_Handler cb, void *=0)`
  Adds file descriptor fd to listen to.
- `static void add_handler (Fl_Event_Handler h)`
  Install a function to parse unrecognized events.
- `static void add_idle (Fl_Idle_Handler cb, void *=0)`
  Adds a callback function that is called every time by `Fl::wait()` and also makes it act as though the timeout is zero (this makes `Fl::wait()` return immediately, so if it is in a loop it is called repeatedly, and thus the idle function is called repeatedly).
- `static void add_system_handler (Fl_System_Handler h, void *=data)`
  Install a function to intercept system events.
- `static void add_timeout (double t, Fl_Timeout_Handler cb, void *=data=0)`
  Adds a one-shot timeout callback.
- `static int api_version ()`
  Returns the compiled-in value of the FL_API_VERSION constant.
- `static int arg (int argc, char **argv, int &i)`
  Parse a single switch from `argv`, starting at word `i`.
- `static void args (int argc, char **argv)`
  Parse all command line switches matching standard FLTK options only.
- `static void args (int argc, char **argv, int &i, Fl_Args_Handler cb=0)`
  Parse command line switches using the `cb` argument handler.
- `static int args_to_utf8 (int argc, char **&argv)`
  Convert Windows commandline arguments to UTF-8.
- `static int awake (Fl_Awake_Handler cb, void *=message=0)`
  See `void awake(void* message=0)`.
• static void awake (void *message=0)
  Sends a message pointer to the main thread, causing any pending Fl::wait() call to terminate so that the main thread can retrieve the message and any pending redraws can be processed.

• static void background (uchar, uchar, uchar)
  Changes fl_color(FL_BACKGROUND_COLOR) to the given color, and changes the gray ramp from 32 to 56 to black to white.

• static void background2 (uchar, uchar, uchar)
  Changes the alternative background color.

• static Fl_Widget * belowmouse ()
  Gets the widget that is below the mouse.

• static void belowmouse (Fl_Widget *)
  Sets the widget that is below the mouse.

• static int box_border_radius_max ()
  Get the maximum border radius of all "rounded" boxtypes in pixels.

• static void box_border_radius_max (int R)
  Set the maximum border radius of all "rounded" boxtypes in pixels.

• static Fl_Color box_color (Fl_Color)
  Gets the drawing color to be used for the background of a box.

• static int box_dh (Fl_Boxtype)
  Returns the height offset for the given boxtype.

• static int box_dw (Fl_Boxtype)
  Returns the width offset for the given boxtype.

• static int box_dx (Fl_Boxtype)
  Returns the X offset for the given boxtype.

• static int box_dy (Fl_Boxtype)
  Returns the Y offset for the given boxtype.

• static int box_shadow_width ()
  Get the box shadow width of all "shadow" boxtypes in pixels.

• static void box_shadow_width (int W)
  Set the box shadow width of all "shadow" boxtypes in pixels.

• static bool cairo_autolink_context ()
  Gets the current autolink mode for Cairo support.

• static void cairo_autolink_context (bool alink)
  When FLTK_HAVE_CAIRO is defined and cairo_autolink_context() is true, any current window dc is linked to a current Cairo context.

• static cairo_t * cairo_cc ()
  Gets the current Cairo context linked with a fltk window.

• static void cairo_cc (cairo_t *c, bool own=false)
  Sets the current Cairo context to c.

• static void cairo_flush (cairo_t *c)
  Flush Cairo drawings on Cairo context c.

• static cairo_t * cairo_make_current (Fl_Window *w)
  Provides a Cairo context for window wi.

• static Fl_Callback_Reason callback_reason ()
  Give the reason for calling a callback.

• static int check ()
  Same as Fl::wait(0).

• static void clear_widget_pointer (Fl_Widget const *w)
  Clears a widget pointer in the watch list.

• static int clipboard_contains (const char *type)
  Returns non 0 if the clipboard contains data matching type.
• static int compose (int &del)
      Any text editing widget should call this for each FL_KEYBOARD event.
• static void compose_reset ()
      If the user moves the cursor, be sure to call Fl::compose_reset()!
• static void copy (const char ∗stuff, int len, int destination=0, const char ∗type=Fl::clipboard_plain_text)
      Copies the data pointed to by stuff to the selection buffer (destination is 0), the clipboard (destination is 1), or both (destination is 2).
• static int damage ()
      If true then flush() will do something.
• static void damage (int d)
      If true then flush() will do something.
• static void default_atclose (Fl_Window ∗, void ∗)
      Default callback for window widgets.
• static void delete_widget (Fl_Widget ∗w)
      Schedules a widget for deletion at the next call to the event loop.
• static void disable_im ()
      Disables the system input methods facilities.
• static void display (const char ∗)
      Sets the X or Wayland display to use for all windows.
• static int dnd ()
      Initiate a Drag And Drop operation.
• static int dnd_text_ops ()
      Gets whether drag and drop text operations are supported.
• static void dnd_text_ops (int v)
      Sets whether drag and drop text operations are supported.
• static void do_widget_deletion ()
      Deletes widgets previously scheduled for deletion.
• static int draw_box_active ()
      Determines if the currently drawn box is active or inactive.
• static int draw_GL_text_with_textures ()
      returns whether whether OpenGL uses textures to draw all text.
• static void draw_GL_text_with_textures (int val)
      sets whether OpenGL uses textures to draw all text.
• static void enable_im ()
      Enables the system input methods facilities.
• static int event ()
      Returns the last event that was processed.
• static int event_alt ()
      Returns non-zero if the Alt key is pressed.
• static int event_button ()
      Gets which particular mouse button caused the current event.
• static int event_button1 ()
      Returns non-zero if mouse button 1 is currently held down.
• static int event_button2 ()
      Returns non-zero if button 2 is currently held down.
• static int event_button3 ()
      Returns non-zero if button 3 is currently held down.
• static int event_buttons ()
      Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.
• static int event_clicks ()
      Returns non zero if we had a double click event.
- static void event_clicks (int i)
  Manually sets the number returned by Fl::event_clicks().
- static void * event_clipboard ()
  During an FL_PASTE event of non-textual data, returns a pointer to the pasted data.
- static const char * event_clipboard_type ()
  Returns the type of the pasted data during an FL_PASTE event.
- static int event_command ()
  Returns non-zero if the FL_COMMAND key is pressed, either FL_CTRL or on OSX FL_META.
- static int event_ctrl ()
  Returns non-zero if the Control key is pressed.
- static Fl_Event_Dispatch event_dispatch ()
  Return the current event dispatch function.
- static void event_dispatch (Fl_Event_Dispatch d)
  Set a new event dispatch function.
- static int event_dx ()
  Returns the current horizontal mouse scrolling associated with the FL_MOUSEWHEEL event.
- static int event_dy ()
  Returns the current vertical mouse scrolling associated with the FL_MOUSEWHEEL event.
- static int event_inside (const Fl_Widget *)
  Returns whether or not the mouse event is inside a given child widget.
- static int event_inside (int, int, int, int)
  Returns whether or not the mouse event is inside the given rectangle.
- static int event_is_click ()
  Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last FL_PUSH or FL_KEYBOARD event for it to be considered a "drag" rather than a "click".
- static void event_is_click (int i)
  Clears the value returned by Fl::event_is_click().
- static int event_key ()
  Gets which key on the keyboard was last pushed.
- static int event_key (int key)
  Returns true if the given key was held down (or pressed) during the last event.
- static int event_length ()
  Returns the length of the text in Fl::event_text().
- static int event_original_key ()
  Returns the keycode of the last key event, regardless of the NumLock state.
- static int event_shift ()
  Returns non-zero if the Shift key is pressed.
- static int event_state ()
  Returns the keyboard and mouse button states of the last event.
- static int event_state (int mask)
  Returns non-zero if any of the passed event state bits are turned on.
- static const char * event_text ()
  Returns the text associated with the current event, including FL_PASTE or FL_DND_RELEASE events.
- static int event_x ()
  Returns the mouse position of the event relative to the Fl_Window it was passed to.
- static int event_x_root ()
  Returns the mouse position on the screen of the event.
- static int event_y ()
  Returns the mouse position of the event relative to the Fl_Window it was passed to.
- static int event_y_root ()
  Returns the mouse position on the screen of the event.
• static Fl_Window * first_window ()
  Returns the first top-level window in the list of shown() windows.
• static void first_window (Fl_Window *)
  Sets the window that is returned by first_window().
• static void flush ()
  Causes all the windows that need it to be redrawn and graphics forced out through the pipes.
• static Fl_Widget * focus ()
  Gets the current Fl::focus() widget.
• static void focus (Fl_Widget *)
  Sets the widget that will receive FL_KEYBOARD events.
• static void foreground (uchar, uchar, uchar)
  Changes fl_color(FL_FOREGROUND_COLOR).
• static void free_color (Fl_Color i, int overlay=0)
  Frees the specified color from the colormap, if applicable.
• static int get_awake_handler_ (Fl_Awake_Handler &, void *&)
  Gets the last stored awake handler for use in awake().
• static Fl_Box_Draw_F * get_boxtype (Fl_Boxtype)
  Gets the current box drawing function for the specified box type.
• static unsigned get_color (Fl_Color i)
  Returns the RGB value(s) for the given FLTK color index.
• static void get_color (Fl_Color i, uchar &red, uchar &green, uchar &blue)
  Returns the RGB value(s) for the given FLTK color index.
• static void get_color (Fl_Color i, uchar &red, uchar &green, uchar &blue, uchar &alpha)
  Returns the RGBA value(s) for the given FLTK color index.
• static const char * get_font (Fl_Font)
  Gets the string for this face.
• static const char * get_font_name (Fl_Font, int *attributes=0)
  Get a human-readable string describing the family of this face.
• static int get_font_sizes (Fl_Font, int *sizep)
  Return an array of sizes in sizep.
• static int get_key (int key)
  Returns true if the given key is held down now.
• static void get_mouse (int &, int &)
  Return where the mouse is on the screen by doing a round-trip query to the server.
• static void get_system_colors ()
  Read the user preference colors from the system and use them to call Fl::foreground(), Fl::background(), and Fl::background2().
• static int gl_visual (int, int *alist=0)
  This does the same thing as Fl::visual(int) but also requires OpenGL drawing to work.
• static Fl_Window * grab ()
  Returns the window that currently receives all events.
• static void grab (Fl_Window &win)
  See grab(Fl_Window+)
• static void grab (Fl_Window *)
  Selects the window to grab.
• static int h ()
  Returns the height in pixels of the main screen work area.
• static int handle (int, Fl_Window *)
  Handle events from the window system.
• static int handle_ (int, Fl_Window *)
  Handle events from the window system.
• static int **has_check** (Fl_Timeout_Handler, void ∗=0)
  
  Returns 1 if the check exists and has not been called yet, 0 otherwise.

• static int **has_idle** (Fl_Idle_Handler cb, void ∗data=0)

  Returns true if the specified idle callback is currently installed.

• static int **has_timeout** (Fl_Timeout_Handler cb, void ∗data=0)

  Returns true if the timeout exists and has not been called yet.

• static void hide_all_windows ()

  Hide all visible windows to make FLTK leave Fl::run().

• static int is_scheme (const char ∗name)

  Returns whether the current scheme is the given name.

• static void keyboard_screen_scaling (int value)

  Controls the possibility to scale all windows by ctrl/+/-/0/ or cmd/+/-/0/.

• static int lock ()

  The lock() method blocks the current thread until it can safely access FLTK widgets and data.

• static int menu_linespacing ()

  Gets the default line spacing used by menus.

• static void menu_linespacing (int H)

  Sets the default line spacing used by menus.

• static Fl_Window ∗modal ()

  Returns the top-most modal() window currently shown.

• static Fl_Window ∗next_window (const Fl_Window ∗)

  Returns the next top-level window in the list of shown() windows.

• static Fl_Timestamp now (double offset=0)

  Set a time stamp at this point in time with optional signed offset in seconds.

• static bool option (Fl_Option opt)

  FLTK library options management.

• static void option (Fl_Option opt, bool val)

  Override an option while the application is running.

• static void own_colormap ()

  Makes FLTK use its own colormap.

• static void paste (Fl_Widget &receiver)

  Backward compatibility only.

• static void paste (Fl_Widget &receiver, int source, const char ∗type=Fl::clipboard_plain_text)

  Pastes the data from the selection buffer (source is 0) or the clipboard (source is 1) into receiver.

• static int program_should_quit ()

  Returns non-zero when a request for program termination was received and accepted.

• static void program_should_quit (int should_i)

  Indicate to the FLTK library whether a program termination request was received and accepted.

• static Fl_Widget ∗pushed ()

  Gets the widget that is being pushed.

• static void pushed (Fl_Widget ∗)

  Sets the widget that is being pushed.

• static Fl_Widget ∗readqueue ()

  Reads the default callback queue and returns the first widget.

• static int ready ()

  This is similar to Fl::check() except this does not call Fl::flush() or any callbacks, which is useful if your program is in a state where such callbacks are illegal.

• static void redraw ()

  Redraws all widgets.

• static void release ()

  Releases the current grabbed window, equals grab(0).
• static void release_widget_pointer (Fl_Widget ∗&w)
  Releases a widget pointer from the watch list.
• static int reload_scheme ()
  Called internally when setting a new scheme according to scheme name.
• static void remove_check (Fl_Timeout_Handler, void ∗=0)
  Removes a check callback.
• static void remove_clipboard_notify (Fl_Clipboard_Notify_Handler h)
  Stop calling the specified callback when there are changes to the selection buffer or the clipboard.
• static void remove_fd (int)
  Removes a file descriptor handler.
• static void remove_fd (int, int when)
  Removes a file descriptor handler.
• static void remove_handler (Fl_Event_Handler h)
  Removes a previously added event handler.
• static void remove_idle (Fl_Idle_Handler cb, void ∗data=0)
  Removes the specified idle callback, if it is installed.
• static void remove_system_handler (Fl_System_Handler h)
  Removes a previously added system event handler.
• static void remove_timeout (Fl_Timeout_Handler cb, void ∗data=0)
  Removes a timeout callback from the timer queue.
• static void repeat_timeout (double t, Fl_Timeout_Handler cb, void ∗data=0)
  Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.
• static int run ()
  Calls Fl::wait() repeatedly as long as any windows are displayed.
• static void run_checks ()
• static void run_idle ()
• static const char ∗scheme ()
  See void scheme(const char ∗name)
• static int scheme (const char ∗name)
  Sets the current widget scheme.
• static int screen_count ()
  Gets the total count of available screens.
• static void screen_dpi (float &h, float &v, int n=0)
  Gets the screen resolution in dots-per-inch for the given screen.
• static Fl_Screen_Driver ∗screen_driver ()
  Returns a pointer to the unique Fl_Screen_Driver object of the platform.
• static int screen_num (int x, int y)
  Gets the screen number of a screen that contains the specified screen position x, y.
• static int screen_num (int x, int y, int w, int h)
  Gets the screen number for the screen which intersects the most with the rectangle defined by x, y, w, h.
• static float screen_scale (int n)
  Current value of the GUI scaling factor for screen number n (n [0 , Fl::screen_count()-1])
• static void screen_scale (int n, float factor)
  Sets the value of the GUI scaling factor for screen number n (n [0 , Fl::screen_count()-1]).
• static int screen_scaling_supported ()
  See if scaling factors are supported by this platform.
• static void screen_work_area (int &X, int &Y, int &W, int &H)
  Gets the bounding box of the screen that contains the mouse pointer.
• static void screen_work_area (int &X, int &Y, int &W, int &H, int mx, int my)
  Gets the bounding box of the work area of a screen that contains the specified screen position mx, my.
• static void screen_work_area (int &X, int &Y, int &W, int &H, int n)
**Gets the bounding box of the work area of the given screen.**

- static void `screen_xywh` (int &X, int &Y, int &W, int &H)

  * Gets the bounding box of a screen that contains the mouse pointer.

- static void `screen_xywh` (int &X, int &Y, int &W, int &H, int mx, int my)

  * Gets the bounding box of a screen that contains the specified screen position \(mx, my\).

- static void `screen_xywh` (int &X, int &Y, int &W, int &H, int mx, int my, int mw, int mh)

  * Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by \(mx, my, mw, mh\).

- static void `screen_xywh` (int &X, int &Y, int &W, int &H, int n)

  * Gets the screen bounding rect for the given screen.

- static int scrollbar_size ()

  * Gets the default scrollbar size used by Fl_Browser_, Fl_Help_View, Fl_Scroll, and Fl_Text_Display widgets.

- static void scrollbar_size (int W)

  * Sets the default scrollbar size that is used by the Fl_Browser_, Fl_Help_View, Fl_Scroll, and Fl_Text_Display widgets.

- static double `seconds_between` (Fl_Timestamp &back, Fl_Timestamp &further_back)

  * Return the time in seconds between two time stamps.

- static double `seconds_since` (Fl_Timestamp &then)

  * Return the time in seconds between now and a previously taken time stamp.

- static void `selection` (Fl_Widget &owner, const char *text, int len)

  * Changes the current selection.

- static Fl_Widget * `selection_owner` ()

  * back-compatibility only: Gets the widget owning the current selection

- static void `selection_owner` (Fl_Widget *)

  * Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.

- static int `selection_to_clipboard` ()

  * Returns the current selection to clipboard mode.

- static void `selection_to_clipboard` (int mode)

  * Copies selections on X11 directly to the clipboard if enabled.

- static void `set_abort` (Fl_Abort_Handler f)

  * For back compatibility, sets the void Fl::fatal handler callback.

- static void `set_atclose` (Fl_Atclose_Handler f)

  * For back compatibility, sets the Fl::atclose handler callback.

- static void `set_box_color` (Fl_Color)

  * Sets the drawing color for the box that is currently drawn.

- static void `set_boxtype` (Fl_Boxtype, Fl_Box_Draw_F *, uchar, uchar, uchar, uchar)

  * Copies the from boxtype.

- static void `set_boxtype` (Fl_Boxtype, Fl_Boxtype from)

  * Sets the function to call to draw a specific boxtype.

- static void `set_color` (Fl_Color, unsigned c)

  * Sets an entry in the fl_color index table.

- static void `set_color` (Fl_Color, uchar, uchar, uchar)

  * Sets an entry in the fl_color index table.

- static void `set_color` (Fl_Color, uchar, uchar, uchar, uchar)

  * Sets an entry in the fl_color index table.

- static void `set_font` (Fl_Font, const char *)

  * Changes a face.

- static void `set_font` (Fl_Font, Fl_Font)

  * Copies one face to another.

- static Fl_Font `set_fonts` (const char * = 0)

  * FLTK will open the display, and add every fonts on the server to the face table.

- static void `set_idle` (Fl_Old_Idle_Handler cb)
Sets an idle callback.

- **static void set_labeltype (Fl_Labeltype, Fl_Label_Draw_F *, Fl_Label_Measure_F *)**
  Sets the functions to call to draw and measure a specific labeltype.

- **static void set_labeltype (Fl_Labeltype, Fl_Labeltype from)**
  Sets the functions to call to draw and measure a specific labeltype.

- **static int system (const char *command)**
  Run a command line on the computer.

- **static Fl_System_Driver *system_driver ()**
  Returns a pointer to the unique Fl_System_Driver object of the platform.

- **static int test_shortcut (Fl_Shortcut)**
  Tests the current event, which must be an FL_KEYBOARD or FL_SHORTCUT, against a shortcut value (described in Fl_Button).

- **static void *thread_message ()**
  The thread_message() method returns the last message that was sent from a child by the awake() method.

- **static long ticks_between (Fl_Timestamp &back, Fl_Timestamp &further_back)**
  Return the time in ticks (60Hz) between two time stamps.

- **static long ticks_since (Fl_Timestamp &then)**
  Return the time in ticks (60Hz) between now and a previously taken time stamp.

- **static void unlock ()**
  The unlock() method releases the lock that was set using the lock() method.

- **static int use_high_res_GL ()**
  returns whether GL windows should be drawn at high resolution on Apple computers with retina displays.

- **static void use_high_res_GL (int val)**
  sets whether GL windows should be drawn at high resolution on Apple computers with retina displays.

- **static double version ()**
  Returns the compiled-in value of the FL_VERSION constant.

- **static int visible_focus ()**
  Gets or sets the visible keyboard focus on buttons and other non-text widgets.

- **static void visible_focus (int v)**
  Gets or sets the visible keyboard focus on buttons and other non-text widgets.

- **static int visual (int)**
  Selects a visual so that your graphics are drawn correctly.

- **static int w ()**
  Returns the width in pixels of the main screen work area.

- **static int wait ()**
  Waits until "something happens" and then returns.

- **static double wait (double time)**
  Waits a maximum of time_to_wait seconds or until "something happens".

- **static void watch_widget_pointer (Fl_Widget *&w)**
  Adds a widget pointer to the widget watch list.

- **static int x ()**
  Returns the leftmost x coordinate of the main screen work area.

- **static int y ()**
  Returns the topmost y coordinate of the main screen work area.
Static Public Attributes

- static void(* atclose)(Fl_Window *, void *)
  
  Back compatibility: default window callback handler.

- static char const * const clipboard_image = "image"
  
  Denotes image data.

- static char const * const clipboard_plain_text = "text/plain"
  
  Denotes plain textual data.

- static void(* error)(const char *, ...) = Fl_System_Driver::error
  
  FLTK calls Fl::error() to output a normal error message.

- static void(* fatal)(const char *, ...) = Fl_System_Driver::fatal
  
  FLTK calls Fl::fatal() to output a fatal error message.

- static const char * const help = helpmsg+13
  
  Usage string displayed if Fl::args() detects an invalid argument.

- static void(* idle)()
  
  The currently executing idle callback function: DO NOT USE THIS DIRECTLY!

- static void(* warning)(const char *, ...) = Fl_System_Driver::warning
  
  FLTK calls Fl::warning() to output a warning message.

Friends

- class Fl_System_Driver

12.7.1 Detailed Description

The Fl is the FLTK global (static) class containing state information and global methods for the current application.

12.7.2 Member Enumeration Documentation

12.7.2.1 Fl_Option

enum Fl::Fl_Option

Enumerator for global FLTK options.

These options can be set system wide, per user, or for the running application only.

### 12.7.3 Member Function Documentation

#### 12.7.3.1 abi_check()

```c
static int Fl::abi_check (
         const int val = FL_ABI_VERSION ) [inline], [static]
```

Returns whether the runtime library ABI version is correct. This enables you to check the ABI version of the linked FLTK library at runtime. Returns 1 (true) if the compiled ABI version (in the header files) and the linked library ABI version (used at runtime) are the same, 0 (false) otherwise. Argument `val` can be used to query a particular library ABI version. Use for instance 10303 to query if the runtime library is compatible with FLTK ABI version 1.3.3. This is rarely useful. The default `val` argument is FL_ABI_VERSION, which checks the version defined at configure time (i.e. in the header files at program compilation time) against the linked library version used at runtime. This is particularly useful if you linked with a shared object library, but it also concerns static linking.

See also

- Fl::abi_version()

#### 12.7.3.2 abi_version()

```c
int Fl::abi_version ( ) [static]
```

Returns the compiled-in value of the FL_ABI_VERSION constant. This is useful for checking the version of a shared library.

#### 12.7.3.3 add_check()

```c
void Fl::add_check ( Fl_Timeout_Handler cb,
         void * argp = 0 ) [static]
```

FLTK will call this callback just before it flushes the display and waits for events. This is different than an idle callback because it is only called once, then FLTK calls the system and tells it not to return until an event happens. This can be used by code that wants to monitor the application's state, such as to keep a display up to date. The advantage of using a check callback is that it is called only when no events are pending. If events are coming in quickly, whole blocks of them will be processed before this is called once. This can save significant time and avoid the application falling behind the events.

Sample code:

```c
bool state_changed; // anything that changes the display turns this on
void callback(void*) {
```
if (!state_changed) return;
state_changed = false;
do_expensive_calculation();
widget->redraw();
}

main() {
Fl::add_check{callback};
return Fl::run();
}

12.7.3.4 add_fd() [1/2]
void Fl::add_fd (  
int fd,
Fl_FD_Handler cb,
void * d = 0 ) [static]

Adds file descriptor fd to listen to.
See Fl::add_fd(int fd, int when, Fl_FD_Handler cb, void * = 0) for details

12.7.3.5 add_fd() [2/2]
void Fl::add_fd (  
int fd,
int when,
Fl_FD_Handler cb,
void * d = 0 ) [static]

Adds file descriptor fd to listen to.
When the fd becomes ready for reading Fl::wait() will call the callback and then return. The callback is passed the
fd and the arbitrary void* argument.
This version takes a when bitfield, with the bits FL_READ, FL_WRITE, and FL_EXCEPT defined, to indicate when
the callback should be done.
There can only be one callback of each type for a file descriptor. Fl::remove_fd() gets rid of all the callbacks for a
given file descriptor.
Under UNIX/Linux/macOS any file descriptor can be monitored (files, devices, pipes, sockets, etc.). Due to limita-
tions in Microsoft Windows, Windows applications can only monitor sockets.
Under macOS, Fl::add_fd() opens the display if that’s not been done before.

12.7.3.6 add_idle()
void Fl::add_idle (  
Fl_Idle_Handler cb,
void * data = 0 ) [static]

Adds a callback function that is called every time by Fl::wait() and also makes it act as though the timeout is zero
(this makes Fl::wait) return immediately, so if it is in a loop it is called repeatedly, and thus the idle function is called
repeatedly).
The idle function can be used to get background processing done.
You can have multiple idle callbacks. To remove an idle callback use Fl::remove_idle().
Fl::wait() and Fl::check() call idle callbacks, but Fl::ready() does not.
The idle callback can call any FLTK functions, including Fl::wait(), Fl::check(), and Fl::ready().
FLTK will not recursively call the idle callback.

12.7.3.7 add_timeout()
void Fl::add_timeout (  
double time,
Fl_Timeout_Handler cb,
void * data = 0 ) [static]

Adds a one-shot timeout callback.
The callback function cb will be called by Fl::wait() at time seconds after this function is called. The callback
function must have the signature Fl_Timeout_Handler. The optional data argument is passed to the callback
(default: NULL).
The timer is removed from the timer queue before the callback function is called. It is safe to reschedule the timeout inside the callback function.

You can have multiple timeout callbacks, even the same timeout callback with different timeout values and/or different data values. They are all considered different timer objects.

To remove a timeout while it is active (pending) use Fl::remove_timeout().

If you need more accurate, repeated timeouts, use Fl::repeat_timeout() to reschedule the subsequent timeouts. Please see Fl::repeat_timeout() for an example.

Since version 1.4, a timeout can be started from a child thread under the condition that the call to Fl::add_timeout is wrapped in Fl::lock() and Fl::unlock().

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>time</th>
<th>delta time in seconds until the timer expires</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>cb</td>
<td>callback function</td>
</tr>
<tr>
<td>in</td>
<td>data</td>
<td>optional user data (default: NULL)</td>
</tr>
</tbody>
</table>

Fl::has_timeout(Fl_Timeout_Handler cb, void *data)

12.7.3.8 api_version()

int Fl::api_version ( ) [static]

Returns the compiled-in value of the FL_API_VERSION constant.

This is useful for checking the version of a shared library.

12.7.3.9 arg()

int Fl::arg (int argc, char **argv, int &i) [static]

Parse a single switch from argv, starting at word i.

Returns the number of words eaten (1 or 2, or 0 if it is not recognized) and adds the same value to i.

This is the default argument handler used internally by Fl::args(...), but you can use this function if you prefer to step through the standard FLTK switches yourself.

All standard FLTK switches except -bg2 may be abbreviated to just one letter and case is ignored:

- -bg color or -background color
  Sets the background color using Fl::background().

- -bg2 color or -background2 color
  Sets the secondary background color using Fl::background2().

- -display host:n.n
  Sets the X display to use; this option is silently ignored under Windows and MacOS.

- -dnd and -nodnd
  Enables or disables drag and drop text operations using Fl::dnd_text_ops().

- -fg color or -foreground color
  Sets the foreground color using Fl::foreground().

- -geometry WxH+X+Y
  Sets the initial window position and size according to the standard X geometry string.
• -iconic
  Iconifies the window using Fl_Window::iconize().

• -kbd and -nokbd
  Enables or disables visible keyboard focus for non-text widgets using Fl::visible_focus().

• -name string
  Sets the window class using Fl_Window::xclass().

• -scheme string
  Sets the widget scheme using Fl::scheme().

• -title string
  Sets the window title using Fl_Window::label().

• -tooltips and -notooltips
  Enables or disables tooltips using Fl_Tooltip::enable().

Color values are commonly given as three digit or six digit hex numbers.

• The order of fg, bg, and bg2 in the command line does not matter

• There is no way at the moment to set the selection color.

• Setting the bg2 color also changes the fg color to have sufficient contrast

• Explicitly setting fg color overrides the bg2/contrast constraint.

• Setting the bg color will update the color lookup table for the gray ramp, so color index values can stay the same for all apps, it's just mapped to different RGB values.

• The calculation of the gray ramp is only based on the bg color, so there is no way at the moment to create an inverted (dark mode) ramp.

• Consequently, setting bg to black creates a an all-black ramp, setting a somewhat dark bg color creates a extremely dark ramp.

• Setting the bg has no influence on bg2 or fg.

If your program requires other switches in addition to the standard FLTK options, you will need to pass your own argument handler to Fl::args(int,char**,int&,Fl_Args_Handler) explicitly.

See also
fl_parse_color(const char* p, uchar& r, uchar& g, uchar& b) to see how color values can be defined

12.7.3.10  args() [1/2]

void Fl::args {
  int argc,
  char ** argv ) [static]
Parse all command line switches matching standard FLTK options only. It parses all the switches, and if any are not recognized it calls Fl::abort(Fl::help), i.e. unlike the long form, an unrecognized switch generates an error message and causes the program to exit.

12.7.3.11  args() [2/2]

int Fl::args {
  int argc,
  char ** argv,
  int & i,
  Fl_Args_Handler cb = 0 ) [static]
Parse command line switches using the cb argument handler.
Returns 0 on error, or the number of words processed.

FLTK provides this as an entirely optional command line switch parser. You don't have to call it if you don't want to. Everything it can do can be done with other calls to FLTK.

To use the switch parser, call Fl::args(...) near the start of your program. This does not open the display, instead switches that need the display open are stashed into static variables. Then you must display your first window by calling window->show(argc, argv), which will do anything stored in the static variables.

Providing an argument handler callback cb lets you define your own switches. It is called with the same argc and argv, and with i set to the index of the switch to be processed. The cb handler should return zero if the switch is unrecognized, and not change i. It should return non-zero to indicate the number of words processed if the switch is recognized, i.e. 1 for just the switch, and more than 1 for the switch plus associated parameters. i should be incremented by the same amount.

The cb handler is called before any other tests, so you can also override any standard FLTK switch (this is why FLTK can use very short switches instead of the long ones all other toolkits force you to use). See Fl::arg() for descriptions of the standard switches.

On return i is set to the index of the first non-switch. This is either:

- The first word that does not start with '-'.
- The word '-' (used by many programs to name stdin as a file)
- The first unrecognized switch (return value is 0).
- argc

The return value is i unless an unrecognized switch is found, in which case it is zero. If your program takes no arguments other than switches you should produce an error if the return value is less than argc.

A usage string is displayed if Fl::args() detects an invalid argument on the command-line. You can change the message by setting the Fl::help pointer.

A very simple command line parser can be found in examples/howto-parse-args.cxx

The simpler Fl::args(int argc, char **argv) form is useful if your program does not have command line switches of its own.

### 12.7.3.12 args_to_utf8()

```cpp
int Fl::args_to_utf8 ( int argc, char ***argv ) [static]
```

Convert Windows commandline arguments to UTF-8.

**Note**

This function does nothing on other (non-Windows) platforms, hence you may call it on all platforms or only on Windows by using platform specific code like `#ifdef _WIN32` etc. - it's your choice. Calling it on other platforms returns quickly w/o wasting much CPU time.

This function must be called on Windows platforms in main() before the array argv is used if your program uses any commandline argument strings (these should be UTF-8 encoded). This applies also to standard FLTK commandline arguments like "-name" (class name) and "-title" (window title in the title bar).

Unfortunately Windows neither provides commandline arguments in UTF-8 encoding nor as Windows "Wide Character" strings in the standard main() and/or the Windows specific WinMain() function.

On Windows platforms (no matter which build system) this function calls a Windows specific function to retrieve commandline arguments as Windows "Wide Character" strings, converts these strings to an internally allocated buffer (or multiple buffers) and returns the result in argv. For implementation details please refer to the source code; however these details may be changed in the future.

Note that argv is provided by reference so it can be overwritten.

In the recommended simple form the function overwrites the variable argv and allocates a new array of strings pointed to by argv. You may use this form on all platforms and it is as simple as adding one line to old programs to make them work with international (UTF-8) commandline arguments.

```cpp
int main(int argc, char **argv) {  
  Fl::args_to_utf8(argc, argv);  // add this line
  // ... use argc and argv, e.g. for commandline parsing
  window->show(argc, argv);
  return Fl::run();
}
```
For an example see `examples/howto-parse-args.cxx` in the FLTK sources.

If you want to retain the original `argc` and `argv` variables the following slightly longer and more complicated code works as well on all platforms.

```c
int main(int argc, char **argv)
{
    char **argvn = argv; // must copy argv to work on all platforms
    int argcn = Fl::args_to_utf8(argc, argvn);
    // ... use argcn and argvn, e.g. for commandline parsing
    window->show(argcn, argvn);
    return Fl::run();
}
```

**Parameters**

| in | argc | used only on non-Windows platforms |
| out | argv | modified only on Windows platforms |

**Returns**

argument count (always the same as argc)

Since

1.4.0

### 12.7.3.13 `background()`

```c
void Fl::background (uchar r, uchar g, uchar b) [static]
```

Changes `fl_color(FL_BACKGROUND_COLOR)` to the given color, and changes the gray ramp from 32 to 56 to black to white.

These are the colors used as backgrounds by almost all widgets and used to draw the edges of all the boxtypes.

### 12.7.3.14 `background2()`

```c
void Fl::background2 (uchar r, uchar g, uchar b) [static]
```

Changes the alternative background color.

This color is used as a background by `Fl_Input` and other text widgets.

This call may change `fl_color(FL_FOREGROUND_COLOR)` if it does not provide sufficient contrast to `FL_←BACKGROUND2_COLOR`.

### 12.7.3.15 `box_border_radius_max()` [1/2]

```c
static int Fl::box_border_radius_max ( ) [inline], [static]
```

Get the maximum border radius of all "rounded" boxtypes in pixels.

Since

1.4.0

### 12.7.3.16 `box_border_radius_max()` [2/2]

```c
static void Fl::box_border_radius_max (int R) [inline], [static]
```

Set the maximum border radius of all "rounded" boxtypes in pixels.

Must be at least 5, default = 15.
Note

This does **not** apply to the "round" boxtypes which have really round sides (i.e. composed of half circles) as opposed to "rounded" boxtypes that have only rounded corners with a straight border between corners.

The box border radius of "rounded" boxtypes is typically calculated as about 2/5 of the box height or width, whichever is smaller. The upper limit can be set by this method for all "rounded" boxtypes.

Since

1.4.0

### 12.7.3.17 box_color()

```cpp
Fl_Color Fl::box_color ( Fl_Color c ) [static]
```

Gets the drawing color to be used for the background of a box.

This method is only useful inside box drawing code. It returns the color to be used, either `fl_inactive(c)` if the widget is `!active_r()` or `c` otherwise.

### 12.7.3.18 box_dh()

```cpp
int Fl::box_dh ( Fl_Boxtype t ) [static]
```

Returns the height offset for the given boxtype.

See also

`box_dy()`.

### 12.7.3.19 box_dw()

```cpp
int Fl::box_dw ( Fl_Boxtype t ) [static]
```

Returns the width offset for the given boxtype.

See also

`box_dy()`.

### 12.7.3.20 box_dx()

```cpp
int Fl::box_dx ( Fl_Boxtype t ) [static]
```

Returns the X offset for the given boxtype.

See also

`box_dy()`.

### 12.7.3.21 box_dy()

```cpp
int Fl::box_dy ( Fl_Boxtype t ) [static]
```

Returns the Y offset for the given boxtype.

These functions return the offset values necessary for a given boxtype, useful for computing the area inside a box's borders, to prevent over drawing the borders.

For instance, in the case of a boxtype like `FL_DOWN_BOX` where the border width might be 2 pixels all around, the above functions would return 2, 2, 4, and 4 for `box_dx, box_dy, box_dw, and box_dh` respectively.

An example to compute the area inside a widget's box:

```cpp
int X = yourwidget->x() + Fl::box_dx(yourwidget->box());
```
int Y = yourwidget->y() + Fl::box_dy(yourwidget->box());
int W = yourwidget->w() - Fl::box_dw(yourwidget->box());
int H = yourwidget->h() - Fl::box_dh(yourwidget->box());

These functions are mainly useful in the draw() code for deriving custom widgets, where one wants to avoid drawing
over the widget's own border box().

12.7.3.22 box_shadow_width() [1/2]
static int Fl::box_shadow_width ( ) [inline], [static]
Get the box shadow width of all "shadow" boxtypes in pixels.
Since

1.4.0

12.7.3.23 box_shadow_width() [2/2]
static void Fl::box_shadow_width ( 
    int W ) [inline], [static]
Set the box shadow width of all "shadow" boxtypes in pixels.
Must be at least 1, default = 3. There is no upper limit.
Since

1.4.0

12.7.3.24 check()
int Fl::check ( ) [static]
Same as Fl::wait(0).
Calling this during a big calculation will keep the screen up to date and the interface responsive:
while (!calculation_done()) {
    calculate();
    Fl::check();
    if (user_hit_abort_button()) break;
}
This returns non-zero if any windows are displayed, and 0 if no windows are displayed (this is likely to change in
future versions of FLTK).

12.7.3.25 display()
void Fl::display ( 
    const char * d ) [static]
Sets the X or Wayland display to use for all windows.
This sets the environment variable $DISPLAY or $WAYLAND_DISPLAY to the passed string, so this only works
before you show() the first window or otherwise open the display.
This does nothing on other platforms.

12.7.3.26 dnd_text_ops() [1/2]
static int Fl::dnd_text_ops ( ) [inline], [static]
Gets whether drag and drop text operations are supported.
This returns whether selected text can be dragged from text fields or dragged within a text field as a cut/paste
shortcut.

12.7.3.27 dnd_text_ops() [2/2]
static void Fl::dnd_text_ops ( 
    int v ) [inline], [static]
Sets whether drag and drop text operations are supported.
This specifically affects whether selected text can be dragged from text fields or dragged within a text field as a
cut/paste shortcut.
12.7.3.28 draw_box_active()

int Fl::draw_box_active ( ) [static]
Determines if the currently drawn box is active or inactive.
If inactive, the box color should be changed to the inactive color.

See also
   Fl::box_color(Fl_Color c)

12.7.3.29 draw_GL_text_with_textures() [1/2]

static int Fl::draw_GL_text_with_textures ( ) [inline], [static]
returns whether OpenGL uses textures to draw all text.
Default is yes.

See also
   draw_GL_text_with_textures(int val)

Version
   1.4.0

12.7.3.30 draw_GL_text_with_textures() [2/2]

static void Fl::draw_GL_text_with_textures ( int val ) [inline], [static]
sets whether OpenGL uses textures to draw all text.
By default, FLTK draws OpenGL text using textures, if the necessary hardware support is available. Call Fl::
draw_GL_text_with_textures(0) once in your program before the first call to gl_font() to have FLTK
draw instead OpenGL text using a legacy, platform-dependent procedure. It's recommended not to deactivate
textures under the MacOS platform because the MacOS legacy procedure is extremely rudimentary.

Parameters

| val | use 0 to prevent FLTK from drawing GL text with textures |

See also
   gl_texture_pile_height(int max)

Version
   1.4.0

12.7.3.31 flush()

void Fl::flush ( ) [static]
Causes all the windows that need it to be redrawn and graphics forced out through the pipes.
This is what wait() does before looking for events.
Note: in multi-threaded applications you should only call Fl::flush() from the main thread. If a child thread needs to
triggleredraw event, it should instead call Fl::awake() to get the main thread to process the event queue.

12.7.3.32 get_system_colors()

void Fl::get_system_colors ( ) [static]
Read the user preference colors from the system and use them to call Fl::foreground(), Fl::background(), and
Fl::background2().
This is done by Fl_Window::show(argc,argv) before applying the -fg and -bg switches. On X this reads some common values from the Xdefaults database. KDE users can set these values by running the "krdb" program, and newer versions of KDE set this automatically if you check the "apply style to other X programs" switch in their control panel.

### 12.7.3.33 gl_visual()

```cpp
static int Fl::gl_visual (int, int∗ alist = 0) [static]
```

This does the same thing as Fl::visual(int) but also requires OpenGL drawing to work. This must be done if you want to draw in normal windows with OpenGL with gl_start() and gl_end(). It may be useful to call this so your X windows use the same visual as an Fl_Gl_Window, which on some servers will reduce colormap flashing.

See Fl_Gl_Window for a list of additional values for the argument.

### 12.7.3.34 has_timeout()

```cpp
int Fl::has_timeout (Fl_Timeout_Handler cb, void∗ data = 0) [static]
```

Returns true if the timeout exists and has not been called yet.
Both arguments cb and data must match with at least one timer in the queue of active timers to return true (1).

**Note**

It is a known inconsistency that Fl::has_timeout() does not use the data argument as a wildcard (match all) if it is zero (NULL) which Fl::remove_timeout() does. This is so for backwards compatibility with FLTK 1.3.x. Therefore using 0 (zero, NULL) as the timeout data value is discouraged unless you're sure that you don't need to use Fl::has_timeout(callback, (void ∗)0); or Fl::remove_timeout(callback, (void ∗)0);.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>cb</th>
<th>Timer callback</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>data</td>
<td>User data</td>
</tr>
</tbody>
</table>

**Returns**

whether the timer was found in the queue

**Return values**

<table>
<thead>
<tr>
<th>0</th>
<th>not found</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>found</td>
</tr>
</tbody>
</table>

### 12.7.3.35 hide_all_windows()

```cpp
void Fl::hide_all_windows ( ) [static]
```

Hide all visible windows to make FLTK leave Fl::run(). Fl::run() will run as long as there are visible windows. Call Fl::hide_all_windows() to hide (close) all currently shown (visible) windows, effectively terminating the Fl::run() loop.

See also

Fl::run()
Since

1.4.0

**12.7.3.36 is_scheme()**

static int Fl::is_scheme ( const char * name ) [inline], [static]

Returns whether the current scheme is the given name.
This is a fast inline convenience function to support scheme-specific code in widgets, e.g. in their draw() methods, if required.
Use a valid scheme name, not NULL (although NULL is allowed, this is not a useful argument - see below).
If Fl::scheme() has not been set or has been set to the default scheme ("none" or "base"), then this will always return 0 regardless of the argument, because Fl::scheme() is NULL in this case.

Note

The stored scheme name is always lowercase, and this method will do a case-sensitive compare, so you must provide a lowercase string to return the correct value. This is intentional for performance reasons.

Example:

```c
if (Fl::is_scheme("gtk+")) { your_code_here(); }
```

Parameters

| in name | lowercase string of requested scheme name. |

Returns

1 if the given scheme is active, 0 otherwise.

See also

Fl::scheme(const char *name)

**12.7.3.37 menu_linespacing() [1/2]**

int Fl::menu_linespacing ( ) [static]

Gets the default line spacing used by menus.

Returns

The default line spacing, in pixels.

**12.7.3.38 menu_linespacing() [2/2]**

void Fl::menu_linespacing ( int H ) [static]

Sets the default line spacing used by menus.
Default is 4.

Parameters

| in H | The new default line spacing between menu items, in pixels. |

**12.7.3.39 now()**

Fl_Timestamp Fl::now (  

Generated by Doxygen
Set a time stamp at this point in time with optional signed offset in seconds.
The time stamp is an opaque type and does not represent the time of day or some time and date in the calendar. It is used with `Fl::seconds_between()` and `Fl::seconds_since()` to measure elapsed time.
```cpp
Fl_Timestamp start = Fl::now();
// do something
double s = Fl::seconds_since(start);
printf("That operation took %g seconds\n", s);
```
Depending on the system the resolution may be milliseconds or microseconds. Under certain conditions (particularly on Windows) the value in member `sec` may wrap around and does not represent a real time (maybe runtime of the system). Function `seconds_since()` below uses this to subtract two timestamps which is always a correct delta time with milliseconds or microseconds resolution.

**Parameters**

| offset | optional signed offset in seconds added to the current time |

**Returns**

this moment in time offset by `offset` as an opaque time stamp

**Todo**

`Fl::system_driver()->gettime()` was implemented for the Forms library and has a limited resolution (on Windows: milliseconds). On POSIX platforms it uses `gettimeofday()` with microsecond resolution. A new function could use a better resolution on Windows with its multimedia timers which requires a new dependency: `winmm.lib` (dll). This could be a future improvement, maybe set as a build option or generally (requires Win95 or 98?).

**See also**

- `Fl::seconds_since(Fl_Timestamp& then)`
- `Fl::seconds_between(Fl_Timestamp& back, Fl_Timestamp& further_back)`
- `Fl::ticks_since(Fl_Timestamp& then)`
- `Fl::ticks_between(Fl_Timestamp& back, Fl_Timestamp& further_back)`

### 12.7.3.40 option() [1/2]

```cpp
bool Fl::option (Fl_Option opt) [static]
```

FTLK library options management.

This function needs to be documented in more detail. It can be used for more optional settings, such as using a native file chooser instead of the FLTK one wherever possible, disabling tooltips, disabling visible focus, disabling FLTK file chooser preview, etc.

There should be a command line option interface.

There should be an application that manages options system wide, per user, and per application.

**Example:**

```cpp
if ( Fl::option(Fl::OPTION_ARROW_FOCUS) )
  { ..on.. }
else
  { ..off.. }
```

**Note**

As of FLTK 1.3.0, options can be managed within fluid, using the menu `Edit/Global FLTK Settings`.

**Parameters**

| opt | which option |

Generated by Doxygen
Returns
true or false

See also
enum Fl::Fl_Option
Fl::option(Fl_Option, bool)

Since
FLTK 1.3.0

12.7.3.41 option() [2/2]

void Fl::option (  
    Fl_Option opt,  
    bool val ) [static]

Override an option while the application is running.
This function does not change any system or user settings.
Example:
Fl::option(Fl::OPTION_ARROW_FOCUS, true); // on
Fl::option(Fl::OPTION_ARROW_FOCUS, false); // off

Parameters

<table>
<thead>
<tr>
<th>opt</th>
<th>which option</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>set to true or false</td>
</tr>
</tbody>
</table>

See also
enum Fl::Fl_Option
bool Fl::option(Fl_Option)

12.7.3.42 own_colormap()

void Fl::own_colormap ( ) [static]
Makes FLTK use its own colormap.
This may make FLTK display better and will reduce conflicts with other programs that want lots of colors. However
the colors may flash as you move the cursor between windows.
This does nothing if the current visual is not colormapped.

12.7.3.43 program_should_quit() [1/2]

static int Fl::program_should_quit ( ) [inline], [static]
Returns non-zero when a request for program termination was received and accepted.
On the MacOS platform, the "Quit xxx" item of the application menu is such a request, that is considered ac-
cepted when all windows are closed. On other platforms, this function returns 0 until Fl::program_should←
quit(1) is called.

Version
1.4.0

12.7.3.44 program_should_quit() [2/2]

static void Fl::program_should_quit (  
    int should_i ) [inline], [static]
Indicate to the FLTK library whether a program termination request was received and accepted. A program may set this to 1, for example, while performing a platform-independent command asking the program to cleanly terminate, similarly to the "Quit xxx" item of the application menu under MacOS.

Version
1.4.0

12.7.3.45  readqueue()

Fl_Widget * Fl::readqueue ( ) [static]
Reads the default callback queue and returns the first widget.
All Fl_Widgets that don't have a callback defined use the default callback static Fl_Widget::default_callback() that puts a pointer to the widget in a queue. This method reads the oldest widget out of this queue.
The queue (FIFO) is limited (currently 20 items). If the queue overflows, the oldest entry (Fl_Widget *) is discarded. Relying on the default callback and reading the callback queue with Fl::readqueue() is not recommended. If you need a callback, you should set one with Fl_Widget::callback(Fl_Callback *, void *) or one of its variants.

See also
   Fl_Widget::callback()
   Fl_Widget::callback(Fl_Callback *, void *)
   Fl_Widget::default_callback()

12.7.3.46  ready()

int Fl::ready ( ) [static]
This is similar to Fl::check() except this does not call Fl::flush() or any callbacks, which is useful if your program is in a state where such callbacks are illegal.
This returns true if Fl::check() would do anything (it will continue to return true until you call Fl::check() or Fl::wait()).

while (!calculation_done()) {
   calculate();
   if (Fl::ready()) {
      do_expensive_cleanup();
      Fl::check();
      if (user_hit_abort_button()) break;
   }
}

12.7.3.47  release()

static void Fl::release ( ) [inline], [static]
Releases the current grabbed window, equals grab(0).

Deprecated  Use Fl::grab(0) instead.

See also
   grab(Fl_Window *)

12.7.3.48  reload_scheme()

int Fl::reload_scheme ( ) [static]
Called internally when setting a new scheme according to scheme name.
Loads or reloads the current scheme selection.

Returns
   Always 1 (this may change in the future)

See void Fl::scheme(const char *name)
remove_check()

```c
void Fl::remove_check (  
    Fl_Timeout_Handler cb,  
    void * argp = 0 ) [static]
```

Removes a check callback.
It is harmless to remove a check callback that no longer exists.

remove_timeout()

```c
void Fl::remove_timeout (  
    Fl_Timeout_Handler cb,  
    void * data = 0 ) [static]
```

Removes a timeout callback from the timer queue.
This method removes all matching timeouts, not just the first one. This may change in the future.
If the `data` argument is NULL (the default!) only the callback `cb` must match, i.e. all timer entries with this callback are removed.
It is harmless to remove a timeout callback that no longer exists.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cb</code></td>
<td>Timer callback to be removed (must match)</td>
</tr>
<tr>
<td><code>data</code></td>
<td>Wildcard if NULL (default), must match otherwise</td>
</tr>
</tbody>
</table>

repeat_timeout()

```c
void Fl::repeat_timeout (  
    double time,  
    Fl_Timeout_Handler cb,  
    void * data = 0 ) [static]
```

Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.
You should call this method only inside a timeout callback of the same or a logically related timer from whose expiration time the new timeout shall be scheduled. Otherwise the timing accuracy can't be improved and the exact behavior is undefined.
If you call this outside a timeout callback the behavior is the same as `Fl::add_timeout()`.

Example: The following code will print "TICK" each second on stdout with a fair degree of accuracy:

```c
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <stdio.h>

void callback(void *) {  
    printf("TICK\n");  
    Fl::repeat_timeout(1.0, callback); // retrigger timeout  
}

int main() {  
    Fl_Window win(100, 100);  
    win.show();  
    Fl::add_timeout(1.0, callback); // set up first timeout  
    return Fl::run();  
}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>time</code></td>
<td>delta time in seconds until the timer expires</td>
</tr>
<tr>
<td><code>cb</code></td>
<td>callback function</td>
</tr>
<tr>
<td><code>data</code></td>
<td>optional user data (default: NULL)</td>
</tr>
</tbody>
</table>

run()

```c
int Fl::run ( ) [static]
```

Generated by Doxygen
Calls Fl::wait() repeatedly as long as any windows are displayed. When all the windows are closed it returns zero (supposedly it would return non-zero on any errors, but FLTK calls exit directly for these). A normal program will end main() with return Fl::run();.

Note

Fl::run() and Fl::wait() (but not Fl::wait(double)) both return when all FLTK windows are closed. Therefore, a MacOS FLTK application possessing Fl_Sys_Menu_Bar items able to create new windows and expected to keep running without any open window cannot use these two functions. One solution is to run the event loop as follows:

```c
while (!Fl::program_should_quit()) Fl::wait(1e20);
```

12.7.3.53 scheme()

```c
int Fl::scheme (const char * s) [static]
```

Sets the current widget scheme. NULL will use the scheme defined in the FLTK_SCHEME environment variable or the scheme resource under X11. Otherwise, any of the following schemes can be used:

- "none" - This is the default look-n-feel which resembles old Windows (95/98/Me/NT/2000) and old GTK/KDE
- "base" - This is an alias for "none"
- "plastic" - This scheme is inspired by the Aqua user interface on macOS
- "gtk+" - This scheme is inspired by the Red Hat Bluecurve theme
- "gleam" - This scheme is inspired by the Clearlooks Glossy scheme. (Colin Jones and Edmanuel Torres).
- "oxy" - This is a subset of Dmitrij K's oxy scheme (STR 2675, 3477)

If the given scheme name is unknown, the default scheme will be used. Setting the scheme (name) is case insensitive, but the stored scheme name will always be lowercase and Fl::scheme() will return this lowercase name or NULL if no scheme or the default scheme ("none" or "base") was set.

Parameters

- in s Scheme name of NULL

Returns

Current scheme name or NULL

Return values

- NULL if the scheme has not been set or is the default scheme

See also

- Fl::is_scheme()

12.7.3.54 scrollbar_size() [1/2]

```c
int Fl::scrollbar_size () [static]
```

Gets the default scrollbar size used by Fl_Browser_, Fl_Help_View, Fl_Scroll, and Fl_Text_Display widgets.
Returns

The default size for widget scrollbars, in pixels.

12.7.3.55 scrollbar_size() [2/2]

void Fl::scrollbar_size {
    int W } [static]

Sets the default scrollbar size that is used by the Fl_Browser_, Fl_Help_View, Fl_Scroll, and Fl_Text_Display widgets.

Parameters

in W The new default size for widget scrollbars, in pixels.

12.7.3.56 seconds_between()

double Fl::seconds_between {
    Fl_Timestamp & back,
    Fl_Timestamp & further_back } [static]

Return the time in seconds between two time stamps.

Parameters

in back a previously taken time stamp
in further_back an even earlier time stamp

Returns

elapsed seconds and fractions of a second

See also

Fl::seconds_since(Fl_Timestamp& then)
Fl::now()

12.7.3.57 seconds_since()

double Fl::seconds_since {
    Fl_Timestamp & then } [static]

Return the time in seconds between now and a previously taken time stamp.

Parameters

in then a previously taken time stamp

Returns

elapsed seconds and fractions of a second

See also

Fl::seconds_between(Fl_Timestamp& back, Fl_Timestamp& further_back)
Fl::now()
Fl::distant_past()
12.7.3.58  set_box_color()

```c
void Fl::set_box_color (
    Fl_Color c ) [static]
```

Sets the drawing color for the box that is currently drawn. This method sets the current drawing color `fl_color()` depending on the widget's state to either `c` or `fl_inactive(c)`. It should be used whenever a box background is drawn in the box (type) drawing code instead of calling `fl_color(Fl_Color bg)` with the background color `bg`, usually `Fl_Widget::color()`. This method is only useful inside box drawing code. Whenever a box is drawn with one of the standard box drawing methods, a static variable is set depending on the widget's current state - if the widget is `!active_r()` then the internal variable is false (0), otherwise it is true (1). This is faster than calling `Fl_Widget::active_r()` because the state is cached.

See also

- `Fl::draw_box_active()`
- `Fl::box_color(Fl_Color)`

12.7.3.59  set_idle()

```c
static void Fl::set_idle (
    Fl_Old_Idle_Handler cb ) [inline], [static]
```

Sets an idle callback.

**Deprecated** This method is obsolete - use the `add_idle()` method instead.

12.7.3.60  ticks_between()

```c
long Fl::ticks_between (
    Fl_Timestamp & back,
    Fl_Timestamp & further_back ) [static]
```

Return the time in ticks (60Hz) between two time stamps.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>back</th>
<th>a previously taken time stamp</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>further_back</td>
<td>an even earlier time stamp</td>
</tr>
</tbody>
</table>

**Returns**

elapsed ticks in 60th of a second

See also

- `Fl::ticks_since(Fl_Timestamp& then)`
- `Fl::now()`

12.7.3.61  ticks_since()

```c
long Fl::ticks_since (
    Fl_Timestamp & then ) [static]
```

Return the time in ticks (60Hz) between now and a previously taken time stamp. Ticks are a convenient way to time animations 'per frame'. Even though modern computers use all kinds of screen refresh rates, 60Hz is a very good base for animation that is typically shown in user interface graphics.

**Parameters**

| in  | then         | a previously taken time stamp |

Generated by Doxygen
Class Documentation

Returns

elapsed ticks in 60th of a second

See also

Fl::ticks_between(Fl_Timestamp& back, Fl_Timestamp& further_back)
Fl::now()

12.7.3.62  use_high_res_GL() [1/2]

static int Fl::use_high_res_GL ( ) [inline], [static]
returns whether GL windows should be drawn at high resolution on Apple computers with retina displays.
Default is no.
Version

  1.3.4

12.7.3.63  use_high_res_GL() [2/2]

static void Fl::use_high_res_GL ( int val ) [inline], [static]
sets whether GL windows should be drawn at high resolution on Apple computers with retina displays
Version

  1.3.4

12.7.3.64  version()

double Fl::version ( ) [static]
Returns the compiled-in value of the FL_VERSION constant.
This is useful for checking the version of a shared library.

Deprecated  Use int Fl::api_version() instead.

12.7.3.65  visible_focus() [1/2]

static int Fl::visible_focus ( ) [inline], [static]
Gets or sets the visible keyboard focus on buttons and other non-text widgets.
The default mode is to enable keyboard focus for all widgets.

12.7.3.66  visible_focus() [2/2]

static void Fl::visible_focus ( int v ) [inline], [static]
Gets or sets the visible keyboard focus on buttons and other non-text widgets.
The default mode is to enable keyboard focus for all widgets.

12.7.3.67  visual()

int Fl::visual ( int flags ) [static]
Selects a visual so that your graphics are drawn correctly.
This is only allowed before you call show() on any windows. This does nothing if the default visual satisfies the
capabilities, or if no visual satisfies the capabilities, or on systems that don’t have such brain-dead notions.
Only the following combinations do anything useful:
12.7 Fl Class Reference

- Fl::visual(FL_RGB)
  Full true color (if there are several depths FLTK chooses the largest). Do this if you use fl_draw_image for much better (non-dithered) output.

- Fl::visual(FL_RGB8)
  Full color with at least 24 bits of color. FL_RGB will always pick this if available, but if not it will happily return a less-than-24 bit deep visual. This call fails if 24 bits are not available.

This returns true if the system has the capabilities by default or FLTK succeeded in turning them on. Your program will still work even if this returns false (it just won’t look as good).

12.7.3.68 wait() [1/2]

```c
int Fl::wait () [static]
```

Waits until "something happens" and then returns.
Call this repeatedly to "run" your program. You can also check what happened each time after this returns, which is quite useful for managing program state.
What this really does is call all idle callbacks, all elapsed timeouts, call Fl::flush() to get the screen to update, and then wait some time (zero if there are idle callbacks, the shortest of all pending timeouts, or infinity), for any events from the user or any Fl::add_fd() callbacks. It then handles the events and calls the callbacks and then returns.

Returns
non-zero if there are any visible windows - this may change in future versions of FLTK.

12.7.3.69 wait() [2/2]

```c
double Fl::wait ( double time_to_wait ) [static]
```

Waits a maximum of time_to_wait seconds or until "something happens".
See Fl::wait() for the description of operations performed when "something happens".

Returns
Always 1 on Windows. Otherwise, it is positive if an event or fd happens before the time elapsed. It is zero if nothing happens. It is negative if an error occurs (this will happen on X11 if a signal happens).

12.7.4 Member Data Documentation

12.7.4.1 help

```c
const char *const Fl::help = helpmsg+13 [static]
```

Usage string displayed if Fl::args() detects an invalid argument.
This may be changed to point to customized text at run-time.

12.7.4.2 idle

```c
void(* Fl::idle)() [static]
```

The currently executing idle callback function: DO NOT USE THIS DIRECTLY!
This is now used as part of a higher level system allowing multiple idle callback functions to be called.

See also
add_idle(), remove_idle()

12.8 Fl_Adjuster Class Reference

The Fl_Adjuster widget was stolen from Prisms, and has proven to be very useful for values that need a large dynamic range.

```cpp
#include <Fl_Adjuster.H>
```

Inheritance diagram for Fl_Adjuster:

```
Fl_Widget
    ↓
Fl_Valuator
    ↓
Fl_Adjuster
```

Public Member Functions

- **Fl_Adjuster** (int X, int Y, int W, int H, const char ∗l=0)
  
  Creates a new Fl_Adjuster widget using the given position, size, and label string.

- **int soft () const**
  
  If "soft" is turned on, the user is allowed to drag the value outside the range.

- **void soft (int s)**
  
  If "soft" is turned on, the user is allowed to drag the value outside the range.

Public Member Functions inherited from Fl_Valuator

- **void bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp** (double)
  
  Clamps the passed value to the valuator range.

- **virtual int format** (char ∗)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment** (double, int)
Adds \( n \) times the step value to the passed value.

- **double maximum () const**
  
  Gets the maximum value for the valuator.

- **void maximum (double a)**
  
  Sets the maximum value for the valuator.

- **double minimum () const**
  
  Gets the minimum value for the valuator.

- **void minimum (double a)**
  
  Sets the minimum value for the valuator.

- **void precision (int digits)**
  
  Sets the step value to \( 1.0 / 10^{digits} \).

- **void range (double a, double b)**
  
  Sets the minimum and maximum values for the valuator.

- **double round (double)**
  
  Round the passed value to the nearest step increment.

- **double step () const**
  
  Gets or sets the step value.

- **void step (double a, int b)**
  
  See double Fl_Valuator::step() const

- **void step (double s)**
  
  See double Fl_Valuator::step() const.

- **void step (int a)**
  
  See double Fl_Valuator::step() const

- **double value () const**
  
  Gets the floating point(double) value.

- **int value (double)**
  
  Sets the current value.

### Public Member Functions inherited from Fl_Widget

- **void _clear_fullscreen ()**
  
  Activates the widget.

- **void _set_fullscreen ()**
  
  Activates the widget.

- **unsigned int active () const**
  
  Returns whether the widget is active.

- **int active_r () const**
  
  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**
  
  Gets the label alignment.

- **void align (Fl_Align alignment)**
  
  Sets the label alignment.

- **long argument () const**
  
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**
  
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window * as_gl_window ()**
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual Fl_Gl_Window const * as_gl_window () const**

- **virtual Fl_Group * as_group ()**

- **virtual Fl_Group const * as_group () const**
• virtual Fl_Group const & as_group () const
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Window * & as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
  Sets the current label.
• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
Checks if this widget is a child of wgt.

- `int is_label_copied () const`  
  `Returns whether the current label was assigned with copy_label().`

- `const char ∗ label () const`  
  `Gets the current label text.`

- `void label (const char ∗text)`  
  `Sets the current label pointer.`

- `void label (Fl_Labeltype a, const char ∗b)`  
  `Shortcut to set the label text and type in one call.`

- `Fl_Color labelcolor () const`  
  `Gets the label color.`

- `void labelcolor (Fl_Color c)`  
  `Sets the label color.`

- `Fl_Font labelfont () const`  
  `Gets the font to use.`

- `void labelfont (Fl_Font f)`  
  `Sets the font to use.`

- `Fl_Fontsize labelsize () const`  
  `Gets the font size in pixels.`

- `void labelsize (Fl_Fontsize pix)`  
  `Sets the font size in pixels.`

- `Fl_Labeltype labeltype () const`  
  `Gets the label type.`

- `void labeltype (Fl_Labeltype a)`  
  `Sets the label type.`

- `void measure_label (int &ww, int &hh) const`  
  `Sets width ww and height hh accordingly with the label size.`

- `bool needs_keyboard () const`  
  `Returns whether this widget needs a keyboard.`

- `void needs_keyboard (bool needs)`  
  `Sets whether this widget needs a keyboard.`

- `unsigned int output () const`  
  `Returns if a widget is used for output only.`

- `Fl_Group ∗ parent () const`  
  `Returns a pointer to the parent widget.`

- `void parent (Fl_Group ∗p)`  
  `Internal use only - "for hacks only".`

- `void position (int X, int Y)`  
  `Repositions the window or widget.`

- `void redraw ()`  
  `Schedules the drawing of the widget.`

- `void redraw_label ()`  
  `Schedules the drawing of the label.`

- `virtual void resize (int x, int y, int w, int h)`  
  `Changes the size or position of the widget.`

- `Fl_Color selection_color () const`  
  `Gets the selection color.`

- `void selection_color (Fl_Color a)`  
  `Sets the selection color.`

- `void set_active ()`  
  `Marks the widget as active without sending events or changing focus.`
12.8 Fl_Adjuster Class Reference

- void set_changed ()
  Marks the value of the widget as changed.
- void set_output ()
  Sets a widget to output only.
- void set_visible ()
  Makes the widget visible.
- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
- int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
- void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void show ()
  Makes a widget visible.
- void size (int W, int H)
  Changes the size of the widget.
- int take_focus ()
  Gives the widget the keyboard focus.
- unsigned int takeevents () const
  Returns if the widget is able to take events.
- int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
- const char ∗ tooltip () const
  Gets the current tooltip text.
- void tooltip (const char ∗text)
  Sets the current tooltip text.
- Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.
- Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
- uchar type () const
  Gets the widget type.
- void type (uchar t)
  Sets the widget type.
- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void ∗ user_data () const
  Gets the user data for this widget.
- void user_data (Fl_Callback ∗v, bool auto_free)
  Sets the user data for this widget.
- void user_data (void ∗v)
  Sets the user data for this widget.
- unsigned int visible () const
  Returns whether a widget is visible.
- unsigned int visible_focus () const
  Checks if this widget has a visible focus.
- void visible_focus (int v)
  Modifies keyboard focus navigation.
- int visible_r () const
  Returns whether a widget and all its parents are visible.
- int w () const
Gets the widget width.

• **FL_When when ()** const
  Returns the conditions under which the callback is called.

• **void when (uchar i)**
  Sets the flags used to decide when a callback is called.

• **FL_Window * window ()** const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int x ()** const
  Gets the widget position in its window.

• **int y ()** const
  Gets the widget position in its window.

• **virtual ~FL_Widget ()**
  Destroys the widget.

**Protected Member Functions**

• **void draw ()** FL_OVERRIDE
  Draws the widget.

• **int handle (int)** FL_OVERRIDE
  Handles the specified event.

• **void value_damage ()** FL_OVERRIDE
  Asks for partial redraw.

**Protected Member Functions inherited from FL_Valuator**

• **FL_Valuator (int X, int Y , int W, int H, const char ∗L)**
  Creates a new FL_Valuator widget using the given position, size, and label string.

• **void handle_drag (double newvalue)**
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.

• **void handle_push ()**
  Stores the current value in the previous value.

• **void handle_release ()**
  Called after an FL_WHEN_RELEASE event is received and before the callback.

• **int horizontal ()** const
  Tells if the valuator is an FL_HORIZONTAL one.

• **double previous_value ()** const
  Gets the previous floating point value before an event changed it.

• **void set_value (double v)**
  Sets the current floating point value.

• **double softclamp (double)**
  Clamps the value, but accepts v if the previous value is not already out of range.

**Protected Member Functions inherited from FL_Widget**

• **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

• **void draw_backdrop ()** const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• **void draw_box ()** const
  Draws the widget box according its box style.

• **void draw_box (FL_Boxtype t, FL_Color c)** const
  Draws a box of type t, of color c at the widget's position and size.
• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type \( t \), of color \( c \) at the position \( X,Y \) and size \( W,H \).

• void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h) const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const
  
  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

• unsigned int **flags** () const
  
  Gets the widget flags mask.

• void **h** (int v)
  
  Internal use only.

• void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

• void **w** (int v)
  
  Internal use only.

• void **x** (int v)
  
  Internal use only.

• void **y** (int v)
  
  Internal use only.

### Additional Inherited Members

**Static Public Member Functions inherited from Fl_Widget**

• static void **default_callback** (Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don't set a callback.

• static unsigned int **label_shortcut** (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.

• static int **test_shortcut** (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text \( t \) contains the entered '&x' shortcut.

**Protected Types inherited from Fl_Widget**

• enum {
  
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
  }

  flags possible values enumeration.
12.8.1 Detailed Description

The Fl_Adjuster widget was stolen from Prisms, and has proven to be very useful for values that need a large dynamic range.

![Fl_Adjuster widget](image)

Figure 12.1 Fl_Adjuster

When you press a button and drag to the right the value increases. When you drag to the left it decreases. The largest button adjusts by $100 \times \text{step}()$, the next by $10 \times \text{step}()$ and that smallest button by $\text{step}()$. Clicking on the buttons increments by 10 times the amount dragging by a pixel does. Shift + click decrements by 10 times the amount.

12.8.2 Constructor & Destructor Documentation

12.8.2.1 Fl_Adjuster()

```cpp
Fl_Adjuster::Fl_Adjuster ( int X, int Y, int W, int H, const char * l = 0 )
```

Creates a new Fl_Adjuster widget using the given position, size, and label string. It looks best if one of the dimensions is 3 times the other. Inherited destructor destroys the Valuator.

12.8.3 Member Function Documentation

12.8.3.1 draw()

```cpp
void Fl_Adjuster::draw ( ) [protected], [virtual]
```

Draws the widget. Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead. Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own `draw()` method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.

12.8.3.2 handle()

```cpp
int Fl_Adjuster::handle ( int event ) [protected], [virtual]
```

Handles the specified event. You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

<table>
<thead>
<tr>
<th></th>
<th>event</th>
<th>the kind of event received</th>
</tr>
</thead>
</table>

Return values

<table>
<thead>
<tr>
<th></th>
<th>if the event was not used or understood</th>
<th>if the event was used and can be deleted</th>
</tr>
</thead>
</table>

See also

Fl_Event

Reimplemented from Fl_Widget.

12.8.3.3 soft() [1/2]

int Fl_Adjuster::soft ( ) const [inline]

If "soft" is turned on, the user is allowed to drag the value outside the range. If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

12.8.3.4 soft() [2/2]

void Fl_Adjuster::soft ( int s ) [inline]

If "soft" is turned on, the user is allowed to drag the value outside the range. If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

12.8.3.5 value_damage()

void Fl_Adjuster::value_damage ( ) [protected], [virtual]

Asks for partial redraw.

Reimplemented from Fl_Valuator.

The documentation for this class was generated from the following files:

- Fl_Adjuster.H
- Fl_Adjuster.cxx

12.9 Fl_Anim_GIF_Image Class Reference

The Fl_Anim_GIF_Image class supports loading, caching, and drawing of animated Compuserve GIF\textsuperscript{SM} images. Inheritance diagram for Fl_Anim_GIF_Image:
Public Types

- enum Flags {
  DONT_START = 1, DONT_RESIZE_CANVAS = 2, DONT_SET_AS_IMAGE = 4, OPTIMIZE_MEMORY = 8,
  LOG_FLAG = 64, DEBUG_FLAG = 128 }

  When opening an Fl_Anim_GIF_Image there are some options that can be passed in a flags value.

Public Member Functions

- Fl_Widget * canvas() const
  Gets the current widget, that is used to display the frame images.

- void canvas(Fl_Widget *canvas, unsigned short flags=0)
  Link the image back to a widget for automated animation.

- int canvas_h() const
  Return the height of the animation canvas.

- int canvas_w() const
  Return the width of the animation canvas.

- void color_average(Fl_Color c, float i) FL_OVERRIDE
  Applies a color average to all frames.

- Fl_Image * copy() const
  Copy and resize the animation frames.

- Fl_Image * copy(int W, int H) const FL_OVERRIDE
  Copy and resize the animation frames.

- int debug() const

- void delay(int frame, double delay)
  Set the delay of frame [0-frames()-1] in seconds.

- double delay(int frame_) const
  Return the delay of frame [0-frames()-1] in seconds.

- void desaturate() FL_OVERRIDE
  Desaturate to all frames of the animation.

- void draw(int x, int y, int w, int h, int cx=0, int cy=0) FL_OVERRIDE
  Draw the current frame of the animation.

- Fl_Anim_GIF_Image()
  Create an empty animated GIF image shell.

- Fl_Anim_GIF_Image(const char *filename, Fl_Widget *canvas=0, unsigned short flags=0)
  Load an animated GIF image from a file.

- Fl_Anim_GIF_Image(const char *imagename, const unsigned char *data, const size_t length, Fl_Widget *canvas=0, unsigned short flags=0)
  Load an animated GIF image from memory.

- int frame() const
  Return the current frame.

- void frame(int frame)
Set the current frame.

- `int frame_h(int frame) const`
  Return the frame dimensions of a frame.

- `bool frame_uncache() const`
  Return the active frame_uncache() setting.

- `void frame_uncache(bool uncache)`
  Use frame_uncache() to set or forbid frame image uncaching.

- `int frame_w(int frame) const`
  Return the frame dimensions of a frame.

- `int frame_x(int frame) const`
  Return the frame position of a frame.

- `int frame_y(int frame) const`
  Return the frame position of a frame.

- `int frames() const`
  Get the number of frames in the animation.

- `Fl_Image * image() const`
  Return the current frame image.

- `Fl_Image * image(int frame) const`
  Return the image of the given frame index.

- `bool is_animated() const`
  Check if this is a valid animation with more than one frame.

- `bool load(const char *name, const unsigned char *imgdata=NULL, size_t imglength=0)`
  Load an animation from a file or from a memory block.

- `const char * name() const`
  Return the name of the played file as specified in the constructor.

- `bool next()`
  Show the next frame if the animation is stopped.

- `bool playing() const`
  Return if the animation is currently running or stopped.

- `Fl_Anim_GIF_Image & resize(double scale)`
  Resizes the image to the specified size, replacing the current image.

- `Fl_Anim_GIF_Image & resize(int w, int h)`
  Resizes the image to the specified size, replacing the current image.

- `double speed() const`
  Get the animation speed factor.

- `void speed(double speed)`
  Set the animation speed factor.

- `bool start()`
  The start() method (re-)starts the playing of the frames.

- `bool stop()`
  The stop() method stops the playing of the frames.

- `void uncache() FL_OVERRIDE`
  Uncache all cached image data now.

- `bool valid() const`
  Check if animation is valid.

- `~Fl_Anim_GIF_Image() FL_OVERRIDE`
  Release the image and all cached data.
Public Member Functions inherited from Fl_GIF_Image

- **Fl_GIF_Image (const char *filename)**
  This constructor loads a GIF image from the given file.

- **Fl_GIF_Image (const char *imagename, const unsigned char *data)**
  This constructor loads a GIF image from memory (deprecated).

- **Fl_GIF_Image (const char *imagename, const unsigned char *data, const size_t length)**
  This constructor loads a GIF image from memory.

Public Member Functions inherited from Fl_Pixmap

- **int cache_h ()**
- **int cache_w ()**

- **void color_average (Fl_Color c, float i) FL_OVERRIDE**
  The color_average() method averages the colors in the image with the provided FLTK color value.

- **Fl_Pixmap (char *const *D)**
  The constructors create a new pixmap from the specified XPM data.

- **Fl_Pixmap (const char *const *D)**
  The constructors create a new pixmap from the specified XPM data.

- **Fl_Pixmap (const uchar *const *D)**
  The constructors create a new pixmap from the specified XPM data.

- **Fl_Pixmap (uchar *const *D)**
  The constructors create a new pixmap from the specified XPM data.

- **void label (Fl_Menu_Item *m) FL_OVERRIDE**
  This method is an obsolete way to set the image attribute of a menu item.

- **void label (Fl_Widget *w) FL_OVERRIDE**
  This method is an obsolete way to set the image attribute of a widget or menu item.

- **void uncache () FL_OVERRIDE**
  If the image has been cached for display, delete the cache data.

- **virtual ~Fl_Pixmap ()**
  The destructor frees all memory and server resources that are used by the pixmap.

Public Member Functions inherited from Fl_Image

- **virtual class Fl_Shared_Image * as_shared_image ()**
  Returns whether an image is an Fl_Shared_Image or not.

- **Fl_Pixmap (int X, int Y)**
  Draws the image to the current drawing surface with a bounding box.

- **void draw ()**
  The constructors create a new pixmap from the specified XPM data.

- **void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE**
  Creates a resized copy of the image.

- **void desaturate () FL_OVERRIDE**
  The desaturate() method converts an image to grayscale.

- **int count () const**
  Returns the number of data values associated with the image.

- **int d () const**
  Returns the image depth.

- **const char *const *data () const**
  Returns a pointer to the current image data array.
• int \texttt{data\_h} () const
  Returns the height of the image data.
• int \texttt{data\_w} () const
  Returns the width of the image data.
• void \texttt{draw}(int X, int Y)
  Draws the image to the current drawing surface.
• int \texttt{fail} () const
  Returns a value that is not 0 if there is currently no image available.
• \texttt{Fl\_Image}(int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.
• int \texttt{h} () const
  Returns the current image drawing height in FLTK units.
• void \texttt{inactive}()
  The \texttt{inactive()} method calls \texttt{color\_average(FL\_BACKGROUND\_COLOR, 0.33f)} to produce an image that appears grayed out.
• int \texttt{id} () const
  Returns the current line data size in bytes.
• virtual void \texttt{release}() 
  Releases an \texttt{Fl\_Image} - the same as \texttt{delete this}.
• virtual void \texttt{scale}(int width, int height, int proportional=1, int can\_expand=0)
  Sets the drawing size of the image.
• int \texttt{w} () const
  Returns the current image drawing width in FLTK units.
• virtual \texttt{\sim Fl\_Image}()
  The destructor is a virtual method that frees all memory used by the image.

Static Public Member Functions

• static int \texttt{frame\_count}(const char *name, const unsigned char *imgdata=NULL, size_t imglength=0)
  Get the number of frames in a GIF file or in a GIF compressed data block.

Static Public Member Functions inherited from \texttt{Fl\_GIF\_Image}

• static bool \texttt{is\_animated}(const char *name_)

Static Public Member Functions inherited from \texttt{Fl\_Image}

• static \texttt{Fl\_Labeltype\ define\_FL\_IMAGE\_LABEL}()
• static \texttt{Fl\_RGB\_Scaling\ RGB\_scaling}()
  Returns the currently used RGB image scaling method.
• static void \texttt{RGB\_scaling}(\texttt{Fl\_RGB\_Scaling})
  Sets the RGB image scaling method used for copy(int, int).
• static \texttt{Fl\_RGB\_Scaling\ scaling\_algorithm}()
  Gets what algorithm is used when resizing a source image to draw it.
• static void \texttt{scaling\_algorithm}(\texttt{Fl\_RGB\_Scaling} algorithm)
  Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes

• static bool \texttt{loop} = true
  The loop flag can be used to (dis-)allow loop count.
• static double \texttt{min\_delay} = 0.
  The \texttt{min\_delay} value can be used to set a minimum value for the frame delay for playback.
Static Public Attributes inherited from Fl_GIF_Image

- static bool animate = false
  
  Sets how the shared image core routine should treat animated GIF files.

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  
  True after fl_register_images() was called, false before.

Protected Member Functions

- void clear_frames ()
- bool next_frame ()
- void on_extension_data (Fl_GIF_Image::GIF_FRAME &f) FL_OVERRIDE
- void on_frame_data (Fl_GIF_Image::GIF_FRAME &f) FL_OVERRIDE
- void scale_frame ()
- void set_frame ()
- void set_frame (int frame)

Protected Member Functions inherited from Fl_GIF_Image

- Fl_GIF_Image ()
  
  The default constructor creates an empty GIF image.

- Fl_GIF_Image (const char ∗ filename, bool anim)
- Fl_GIF_Image (const char ∗ imagename, const unsigned char ∗ data, const size_t length, bool anim)
  
  The protected load() methods are used by Fl_Anim_GIF_Image to request loading of animated GIF's.

- void load (const char ∗ imagename, const unsigned char ∗ data, const size_t length, bool anim)
- void load_gif_ (class Fl_Image_Reader &rdr, bool anim=false)

Protected Member Functions inherited from Fl_Pixmap

- void measure ()

Protected Member Functions inherited from Fl_Image

- void d (int D)
  
  Sets the current image depth.

- void data (const char ∗ ∗ p, int c)
  
  Sets the current data pointer and count of pointers in the array.

- void draw_empty (int X, int Y)
  
  The protected draw_empty() draws a box with an X in it.

- int draw_scaled (int X, int Y, int W, int H)
  
  Draw the image to the current drawing surface rescaled to a given width and height.

- void h (int H)
  
  Sets the height of the image data.

- void Id (int LD)
  
  Sets the current line data size in bytes.

- void w (int W)
  
  Sets the width of the image data.

12.9.1 Detailed Description

The Fl_Anim_GIF_Image class supports loading, caching, and drawing of animated Compuserve GIF\textsuperscript{SM} images. The class loads all images contained in the file and animates them by cycling through them as defined by the delay times in the image file. The user must supply an FLTK widget as "container" in order to see the animation by specifying it in the constructor or later using the canvas() method.

12.9.2 Member Enumeration Documentation

12.9.2.1 Flags

enum Fl_Anim_GIF_Image::Flags

When opening an Fl_Anim_GIF_Image there are some options that can be passed in a flags value.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DONT_START</td>
<td>This flag indicates to the loader that it should not start the animation immediately after successful load, which is the default. It can be started later using the start() method.</td>
</tr>
<tr>
<td>DONT_RESIZE_CANVAS</td>
<td>This flag indicates to the loader that it should not resize the canvas widget of the animation to the dimensions of the animation, which is the default. Needed for special use cases.</td>
</tr>
<tr>
<td>DONT_SET_AS_IMAGE</td>
<td>This flag indicates to the loader that it should not set the animation as image() member of the canvas widget, which is the default. Needed for special use cases.</td>
</tr>
<tr>
<td>OPTIMIZE_MEMORY</td>
<td>Often frames change just a small area of the animation canvas. This flag indicates to the loader to try using less memory by storing frame data not as canvas-sized images but use the sizes defined in the GIF file. The drawbacks are higher cpu usage during playback and maybe minor artifacts when resized.</td>
</tr>
<tr>
<td>LOG_FLAG</td>
<td>This flag can be used to print informations about the decoding process to the console.</td>
</tr>
<tr>
<td>DEBUG_FLAG</td>
<td>This flag can be used to print even more informations about the decoding process to the console.</td>
</tr>
</tbody>
</table>

12.9.3 Constructor & Destructor Documentation

12.9.3.1 Fl_Anim_GIF_Image() [1/2]

Fl_Anim_GIF_Image::Fl_Anim_GIF_Image ( const char * filename, Fl_Widget * canvas = 0, unsigned short flags = 0 )

Load an animated GIF image from a file.
This constructor creates an animated image from a GIF-formatted file. Optionally it applies the \texttt{canvas()} method after successful load. If \texttt{DONT\_START} is not specified in the \texttt{flags} parameter it calls \texttt{start()} after successful load.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{filename}</td>
<td>path and name of GIF file in the file system</td>
</tr>
<tr>
<td>\texttt{canvas}</td>
<td>a widget that will show and animate the GIF, or NULL</td>
</tr>
<tr>
<td>\texttt{flags}</td>
<td>see Flags for details, or 0</td>
</tr>
</tbody>
</table>

Note

The GIF image must be decoupled from the canvas by calling \texttt{myGif->canvas(NULL)}; before deleting the canvas.

12.9.3.2 \texttt{Fl\_Anim\_GIF\_Image()} [2/2]

\texttt{Fl\_Anim\_GIF\_Image::Fl\_Anim\_GIF\_Image ( const char * \texttt{imagename},
const unsigned char * \texttt{data},
const size_t \texttt{length},
Fl\_Widget * \texttt{canvas} = 0,
unsigned short \texttt{flags} = 0 )}

Load an animated GIF image from memory.
This constructor creates an animated image from a GIF-formatted block in memory. Optionally it applies the \texttt{canvas()} method after successful load. If \texttt{DONT\_START} is not specified in the \texttt{flags} parameter it calls \texttt{start()} after successful load.
\texttt{imagename} can be NULL. If a name is given, the image is added to the list of shared images and will be available by that name.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{imagename}</td>
<td>a name given to this image or NULL</td>
</tr>
<tr>
<td>\texttt{data}</td>
<td>pointer to the start of the GIF image in memory</td>
</tr>
<tr>
<td>\texttt{length}</td>
<td>length of the GIF image in memory</td>
</tr>
<tr>
<td>\texttt{canvas}</td>
<td>a widget that will show and animate the GIF, or NULL</td>
</tr>
<tr>
<td>\texttt{flags}</td>
<td>see Flags for details, or 0</td>
</tr>
</tbody>
</table>

Note

The GIF image must be decoupled from the canvas by calling \texttt{myGif->canvas(NULL)}; before deleting the canvas.

12.9.3.3 \texttt{\~{}Fl\_Anim\_GIF\_Image()}

\texttt{Fl\_Anim\_GIF\_Image::\~{}Fl\_Anim\_GIF\_Image ( )}

Release the image and all cached data.
Also removes the animation timer.

12.9.4 Member Function Documentation

12.9.4.1 \texttt{canvas()} [1/2]

\texttt{Fl\_Widget * Fl\_Anim\_GIF\_Image::canvas ( ) const}

Gets the current widget, that is used to display the frame images.
Returns

a pointer to a widget

### 12.9.4.2 canvas() [2/2]

```cpp
void Fl_Anim_GIF_Image::canvas (  
    Fl_Widget * canvas,
    unsigned short flags = 0 )
```

Link the image back to a widget for automated animation.

This method sets current widget, that is used to display the frame images. The `flags` parameter specifies whether the canvas widget is resized to the animation dimensions and/or its `image()` method will be used to set the current frame image during animation.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>canvas</th>
<th>a pointer to the widget that will show the animation</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>flags</td>
<td>see Flags</td>
</tr>
</tbody>
</table>

**Note**

The GIF image must be decoupled from the canvas by calling `myGif->canvas(NULL);` before deleting the canvas.

### 12.9.4.3 canvas_h()

```cpp
int Fl_Anim_GIF_Image::canvas_h ( ) const
```

Return the height of the animation canvas.

**Returns**

the width in pixel units

### 12.9.4.4 canvas_w()

```cpp
int Fl_Anim_GIF_Image::canvas_w ( ) const
```

Return the width of the animation canvas.

**Returns**

the width in pixel units

### 12.9.4.5 color_average()

```cpp
void Fl_Anim_GIF_Image::color_average (  
    Fl_Color c,  
    float i ) [virtual]
```

Applies a color average to all frames.

The `color_average()` method averages the colors in the image with the provided FLTK color value.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>c</th>
<th>blend color</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>i</td>
<td>a value between 0.0 and 1.0 where 0 results in the blend color, and 1 returns the original image</td>
</tr>
</tbody>
</table>

Reimplemented from `Fl_Image`. 

Generated by Doxygen
12.9.4.6  copy()

```cpp
Fl_Image * Fl_Anim_GIF_Image::copy (  
  int W,  
  int H ) const [virtual]
```

Copy and resize the animation frames.
The virtual copy() method makes a copy of the animated image and resizes all of its frame images to \( W \times H \) using the current resize method.

**Parameters**

| in  | W,H | new size in FLTK pixel units |

**Returns**

the resized copy of the animation

Reimplemented from Fl_Image.

12.9.4.7  delay() [1/2]

```cpp
void Fl_Anim_GIF_Image::delay (  
  int frame,  
  double delay )
```

Set the delay of frame \([0:\text{frames} -1]\) in seconds.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>frame</th>
<th>index into frame list</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>delay</td>
<td>to next frame in seconds</td>
</tr>
</tbody>
</table>

12.9.4.8  delay() [2/2]

```cpp
double Fl_Anim_GIF_Image::delay (  
  int frame ) const
```

Return the delay of frame \([0:\text{frames} -1]\) in seconds.

**Parameters**

| in  | frame | index into frame list |

**Returns**

delay to next frame in seconds

12.9.4.9  desaturate()

```cpp
void Fl_Anim_GIF_Image::desaturate ( ) [virtual]
```

Desaturate to all frames of the animation.
Reimplemented from Fl_Image.

12.9.4.10  draw()

```cpp
void Fl_Anim_GIF_Image::draw (  
  int x,  
  int y,  
  int w,
```
12.9 Fl_Anim_GIF_Image Class Reference

Draw the current frame of the animation.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x,y,w,h</th>
<th>target rectangle</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>cx, cy</td>
<td>source offset</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Image.

12.9.4.11 frame() [1/2]

```cpp
int Fl_Anim_GIF_Image::frame ( ) const
```

Return the current frame.

Returns

the current frame index in the range for 0 to frames()-1.
-1 if the image has no frames.

12.9.4.12 frame() [2/2]

```cpp
void Fl_Anim_GIF_Image::frame ( int frame )
```

Set the current frame.

Parameters

| in   | frame | index into list of frames |

12.9.4.13 frame_count()

```cpp
int Fl_Anim_GIF_Image::frame_count ( const char * name, const unsigned char * imgdata = NULL, size_t imglength = 0 ) [static]
```

Get the number of frames in a GIF file or in a GIF compressed data block.

The static frame_count() method is just a convenience method for getting the number of images (frames) stored in a GIF file.

As this count is not readily available in the GIF header, the whole GIF file has be parsed (which is done here by using a temporary Fl_Anim_GIF_Image object for simplicity). So this call may be slow with large files.

If imgdata is NULL, the image will be read from the file. Otherwise, it will be read from memory.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>name</th>
<th>path and name of GIF file in the file system, ignored when reading from memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>imgdata</td>
<td>pointer to the start of the GIF image in memory, or NULL to read from a file</td>
</tr>
<tr>
<td>in</td>
<td>imglength</td>
<td>length of the GIF image in memory, or 0</td>
</tr>
</tbody>
</table>
Returns
the number of frames in the animation

12.9.4.14  frame_h()

int Fl_Anim_GIF_Image::frame_h (  
    int frame ) const

Return the frame dimensions of a frame.
Usefull only if loaded with 'optimize_mem' and the animation also has size optimized frames.

Parameters

    in frame index into frame list

Returns

height in FLTK pixle units

12.9.4.15  frame_uncache () [1/2]

bool Fl_Anim_GIF_Image::frame_uncache ( ) const

Return the active frame_uncache() setting.

Returns

true if caching is disabled

12.9.4.16  frame_uncache () [2/2]

void Fl_Anim_GIF_Image::frame_uncache (  
    bool uncache )

Use frame_uncache() to set or forbid frame image uncaching.
If frame uncaching is set, frame images are not offscreen cached for re-use and will be re-created every time they
are displayed. This saves a lot of memory on the expense of cpu usage and should be carefully considered. Per
default frame caching will be done.

Parameters

    in uncache true to disable caching

12.9.4.17  frame_w()

int Fl_Anim_GIF_Image::frame_w (  
    int frame ) const

Return the frame dimensions of a frame.
Usefull only if loaded with 'optimize_mem' and the animation also has size optimized frames.

Parameters

    in frame index into frame list

Returns

width in FLTK pixle units
12.9.4.18 frame_x()

int Fl_Anim_GIF_Image::frame_x (int frame) const

Return the frame position of a frame.
Usefull only if loaded with 'optimize_mem' and the animation also has size optimized frames.

Parameters

| in | frame | index into frame list |

Returns

x position in FLTK pixel units

12.9.4.19 frame_y()

int Fl_Anim_GIF_Image::frame_y (int frame) const

Return the frame position of a frame.
Usefull only if loaded with 'optimize_mem' and the animation also has size optimized frames.

Parameters

| in | frame | index into frame list |

Returns

y position in FLTK pixel units

12.9.4.20 frames()

int Fl_Anim_GIF_Image::frames () const

Get the number of frames in the animation.

Returns

the number of frames

12.9.4.21 image() [1/2]

Fl_Image * Fl_Anim_GIF_Image::image () const

Return the current frame image.

Returns

a pointer to the image or NULL if this is not an animation.

12.9.4.22 image() [2/2]

Fl_Image * Fl_Anim_GIF_Image::image (int frame_) const

Return the image of the given frame index.

Parameters

| in | frame | index into list of frames |

Generated by Doxygen
Returns

image data or NULL if the frame number is not valid.

12.9.4.23  is_animated()

bool Fl_Anim_GIF_Image::is_animated ( ) const
Check if this is a valid animation with more than one frame.
The is_animated() method is just a convenience method for testing the valid flag and the frame count being greater 1.

Returns

true if the animation is valid and has multiple frames.

12.9.4.24  load()

bool Fl_Anim_GIF_Image::load ( const char * name,
    const unsigned char * imgdata = NULL,
    size_t imglength = 0 )
Load an animation from a file or from a memory block.
The load() method is either used from the constructor to load the image from the given file, or to re-load an existing animation from another file.

Parameters

| in  | name | path and name of GIF file in the file system, or the image name when reading from memory |
| in  | imgdata | pointer to the start of the GIF image in memory, or NULL to read from a file |
| in  | imglength | length of the GIF image in memory, or 0 |

Returns

true if the animation loaded correctly

12.9.4.25  name()

const char * Fl_Anim_GIF_Image::name ( ) const
Return the name of the played file as specified in the constructor.
If read from a memory block, this returns the name of the animation.

Returns

pointer to a C string

12.9.4.26  next()

bool Fl_Anim_GIF_Image::next ( )
Show the next frame if the animation is stopped.

Returns

true if the animation has frames

12.9.4.27  on_extension_data()

void Fl_Anim_GIF_Image::on_extension_data ( Fl_GIF_Image::GIF_FRAME & f ) [protected], [virtual]
Reimplemented from Fl_GIF_Image.
12.9.4.28 **on_frame_data()**

```cpp
group Fl_Anim_GIF_Image

Fl_Anim_GIF_Image::on_frame_data (Fl_GIF_Image::GIF_FRAME & f) [protected], [virtual]
```

Reimplemented from Fl_GIF_Image.

12.9.4.29 **playing()**

```cpp
bool Fl_Anim_GIF_Image::playing () const [inline]
```

Return if the animation is currently running or stopped.

**Returns**

true if the animation is running

12.9.4.30 **resize()** [1/2]

```cpp
Fl_Anim_GIF_Image & Fl_Anim_GIF_Image::resize (double scale)
```

Resizes the image to the specified size, replacing the current image.

*If DONT_RESIZE_CANVAS is not set, the canvas widget will also be resized.*

**Parameters**

| in  | scale | rescale factor in relation to current size |

12.9.4.31 **resize()** [2/2]

```cpp
Fl_Anim_GIF_Image & Fl_Anim_GIF_Image::resize (int w, int h)
```

Resizes the image to the specified size, replacing the current image.

*If DONT_RESIZE_CANVAS is not set, the canvas widget will also be resized.*

**Parameters**

| in | w,h | new size of the animation frames |

12.9.4.32 **speed()** [1/2]

```cpp
double Fl_Anim_GIF_Image::speed () const
```

Get the animation speed factor.

**Returns**

the current speed factor

12.9.4.33 **speed()** [2/2]

```cpp
void Fl_Anim_GIF_Image::speed (double speed)
```

Set the animation speed factor.

The `speed()` method changes the playing speed to \( \text{speed} \times \text{original speed} \). E.g. to play at half speed call it with 0.5, for double speed with 2.

**Parameters**

| in | speed | floating point speed factor |
12.9.4.34 start()

bool Fl_Anim_GIF_Image::start ()
The start() method (re-)starts the playing of the frames.
Returns
true if the animation has frames

12.9.4.35 stop()

bool Fl_Anim_GIF_Image::stop ()
The stop() method stops the playing of the frames.
Returns
true if the animation has frames

12.9.4.36 uncache()

void Fl_Anim_GIF_Image::uncache () [virtual]
Uncache all cached image data now.
Re-implemented from Fl_Pixmap.
Reimplemented from Fl_Image.

12.9.4.37 valid()

bool Fl_Anim_GIF_Image::valid () const
Check if animation is valid.
Returns
true if the class has successfully loaded and the image has at least one frame.

12.9.5 Member Data Documentation

12.9.5.1 loop

bool Fl_Anim_GIF_Image::loop = true [static]
The loop flag can be used to (dis-)allow loop count.
If set (which is the default), the animation will be stopped after the number of repeats specified in the GIF file
(typically this count is set to 'forever' anyway). If cleared the animation will always be 'forever', regardless of what is
specified in the GIF file.

12.9.5.2 min_delay

double Fl_Anim_GIF_Image::min_delay = 0. [static]
The min_delay value can be used to set a minimum value for the frame delay for playback.
This is to prevent CPU hogs caused by images with very low delay rates. This is a global value for all
Fl_Anim_GIF_Image objects.
The documentation for this class was generated from the following files:
- Fl_Anim_GIF_Image.H
- Fl_Anim_GIF_Image.cxx

12.10 Fl_Bitmap Class Reference

The Fl_Bitmap class supports caching and drawing of mono-color (bitmap) images.
#include <Fl_Bitmap.H>
Inheritance diagram for Fl_Bitmap:
Public Member Functions

- int cache_h ()
- int cache_w ()
- Fl_Image * copy () const
- Fl_Image * copy (int W, int H) const FL_OVERRIDE
  Creates a resized copy of the image.
- void draw (int X, int Y)
- void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  Draws the image to the current drawing surface with a bounding box.
- Fl_Bitmap (const char * bits, int bits_length, int W, int H)
  The constructors create a new bitmap from the specified bitmap data.
- Fl_Bitmap (const char * bits, int W, int H)
  The constructors create a new bitmap from the specified bitmap data.
- Fl_Bitmap (const uchar * bits, int bits_length, int W, int H)
  The constructors create a new bitmap from the specified bitmap data.
- Fl_Bitmap (const uchar * bits, int W, int H)
  The constructors create a new bitmap from the specified bitmap data.
- void label (Fl_Menu_Item * m) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a menu item.
- void label (Fl_Widget * w) FL_OVERRIDE
  This method is an obsolete way to set the image attribute of a widget or menu item.
- void uncache () FL_OVERRIDE
  If the image has been cached for display, delete the cache data.
- virtual ~Fl_Bitmap ()
  The destructor frees all memory and server resources that are used by the bitmap.

Public Member Functions inherited from Fl_Image

- virtual class Fl_Shared_Image * as_shared_image ()
  Returns whether an image is an Fl_Shared_Image or not.
- virtual void color_average (Fl_Color c, float i)
  The color_average() method averages the colors in the image with the provided FLTK color value.
- Fl_Image * copy () const
  Creates a copy of the image in the same size.
- int count () const
  Returns the number of data values associated with the image.
- int d () const
  Returns the image depth.
- const char *const * data () const
  Returns a pointer to the current image data array.
- int data_h () const
  Returns the height of the image data.
- int data_w () const
  Returns the width of the image data.
Returns the width of the image data.

• virtual void desaturate ()
  The desaturate() method converts an image to grayscale.

• void draw (int X, int Y)
  Draws the image to the current drawing surface.

• int fail () const
  Returns a value that is not 0 if there is currently no image available.

• Fl_Image (int W, int H, int D)
  The constructor creates an empty image with the specified width, height, and depth.

• int h () const
  Returns the current image drawing height in FLTK units.

• void inactive ()
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

• int ld () const
  Returns the current line data size in bytes.

• virtual void release ()
  Releases an Fl_Image - the same as 'delete this'.

• virtual void scale (int width, int height, int proportional=1, int can_expand=0)
  Sets the drawing size of the image.

• int w () const
  Returns the current image drawing width in FLTK units.

• virtual ~Fl_Image ()
  The destructor is a virtual method that frees all memory used by the image.

Public Attributes

• int alloc_array
  Non-zero if array points to bitmap data allocated internally.

• const uchar * array
  pointer to raw bitmap data

Friends

• class Fl_Graphics_Driver

Additional Inherited Members

Static Public Member Functions inherited from Fl_Image

• static Fl_Labeltype define_FL_IMAGE_LABEL ()
• static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
• static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
• static Fl_RGB_Scaling scaling_algorithm ()
  Gets what algorithm is used when resizing a source image to draw it.
• static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.
12.10 Fl_Bitmap Class Reference

Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false
  
  True after fl_register_images() was called, false before.

Protected Member Functions inherited from Fl_Image

- void d (int D)
  
  Sets the current image depth.
- void data (const char *const *p, int c)
  
  Sets the current data pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled (int X, int Y, int W, int H)
  
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h (int H)
  
  Sets the height of the image data.
- void ld (int LD)
  
  Sets the current line data size in bytes.
- void w (int W)
  
  Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

12.10.1 Detailed Description

The Fl_Bitmap class supports caching and drawing of mono-color (bitmap) images. Images are drawn using the current color.

12.10.2 Constructor & Destructor Documentation

12.10.2.1 Fl_Bitmap() [1/4]

Fl_Bitmap::Fl_Bitmap ( const uchar * bits, int W, int H ) [inline]

The constructors create a new bitmap from the specified bitmap data.

See also

Fl_Bitmap(const uchar *bits, int bits_length, int W, int H)

12.10.2.2 Fl_Bitmap() [2/4]

Fl_Bitmap::Fl_Bitmap ( const char * bits, int W, int H ) [inline]

The constructors create a new bitmap from the specified bitmap data.
12.10.2.3 Fl_Bitmap()

Fl_Bitmap::Fl_Bitmap (  
    const uchar * bits,  
    int bits_length,    
    int W,              
    int H )

The constructors create a new bitmap from the specified bitmap data. If the provided array is too small to contain all the image data, the constructor will not generate the bitmap to avoid illegal memory read access and instead set data to NULL and ld to ERR_MEMORY_ACCESS.

Parameters

<table>
<thead>
<tr>
<th>bits</th>
<th>bitmap data, one pixel per bit, rows are rounded to the next byte</th>
</tr>
</thead>
<tbody>
<tr>
<td>bits_length</td>
<td>length of the bits array in bytes</td>
</tr>
<tr>
<td>W</td>
<td>image width in pixels</td>
</tr>
<tr>
<td>H</td>
<td>image height in pixels</td>
</tr>
</tbody>
</table>

See also

Fl_Bitmap(const char *bits, int bits_length, int W, int H), Fl_Bitmap(const uchar *bits, int W, int H)

12.10.2.4 Fl_Bitmap()

Fl_Bitmap::Fl_Bitmap (  
    const char * bits,  
    int bits_length,    
    int W,              
    int H )

The constructors create a new bitmap from the specified bitmap data. If the provided array is too small to contain all the image data, the constructor will not generate the bitmap to avoid illegal memory read access and instead set data to NULL and ld to ERR_MEMORY_ACCESS.

Parameters

<table>
<thead>
<tr>
<th>bits</th>
<th>bitmap data, one pixel per bit, rows are rounded to the next byte</th>
</tr>
</thead>
<tbody>
<tr>
<td>bits_length</td>
<td>length of the bits array in bytes</td>
</tr>
<tr>
<td>W</td>
<td>image width in pixels</td>
</tr>
<tr>
<td>H</td>
<td>image height in pixels</td>
</tr>
</tbody>
</table>

Fl_Bitmap(const char *bits, int bits_length, int W, int H), Fl_Bitmap(const uchar *bits, int W, int H)

12.10.3 Member Function Documentation

12.10.3.1 copy()

Fl_Image * Fl_Bitmap::copy (  
    int W,  
    int H ) const [virtual]

Creates a resized copy of the image.
The new image should be released when you are done with it.
Note: since FLTK 1.4.0 you can use Fl_Image::release() for all types of images (i.e. all subclasses of Fl_Image) instead of operator delete for Fl_Image's and Fl_Image::release() for Fl_Shared_Image's.
The new image data will be converted to the requested size. RGB images are resized using the algorithm set by Fl_Image::RGB_scaling().
For the new image the following equations are true:

- \( w() = \text{data}_w() = W \)
- \( h() = \text{data}_h() = H \)

Parameters

| in | \( W,H \) | Requested width and height of the new image |

Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of Fl_RGB_Image, Fl_SVG_Image, Fl_Pixmap, Fl_Bitmap, Fl_Tiled_Image, Fl_Anim_GIF_Image and Fl_Shared_Image. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an Fl_GIF_Image is an object of class Fl_Pixmap.

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from Fl_Image or any subclass your overridden methods of 'Fl_Image::copy() const' and 'Fl_Image::copy(int, int) const' must also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from Fl_Image.

12.10.3.2 draw()

```cpp
void Fl_Bitmap::draw (  
    int X,  
    int Y,  
    int W,  
    int H,  
    int cx = 0,  
    int cy = 0 ) [virtual]
```

Draws the image to the current drawing surface with a bounding box.
Arguments \( X,Y,W,H \) specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the \( cx \) and \( cy \) arguments.
In other words: `fl_push_clip(X,Y,W,H)` is applied, the image is drawn with its upper-left corner at \( X-cx,Y-cy \) and its own width and height, `fl_pop_clip()` is applied.
Reimplemented from Fl_Image.

12.10.3.3 label() [1/2]

```cpp
void Fl_Bitmap::label (  
    Fl_Menu_Item * m ) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

Deprecated Please use Fl_Menu_Item::image() instead.
Reimplemented from Fl_Image.

12.10.3.4 label() [2/2]

```cpp
void Fl_Bitmap::label (  
    Fl_Widget * widget ) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.
Deprecated Please use Fl_Widget::image() or Fl_Widget::deimage() instead.

Reimplemented from Fl_Image.

12.10.3.5 uncache()

void Fl_Bitmap::uncache () [virtual]
If the image has been cached for display, delete the cache data.
This allows you to change the data used for the image and then redraw it without recreating an image object.
Reimplemented from Fl_Image.

The documentation for this class was generated from the following files:

- Fl_Bitmap.H
- Fl_Bitmap.cxx

12.11 Fl_BMP_Image Class Reference

The Fl_BMP_Image class supports loading, caching, and drawing of Windows Bitmap (BMP) image files.

#include <Fl_BMP_Image.H>

Inheritance diagram for Fl_BMP_Image:

```
Fl_Image
   Fl_RGB_Image
   Fl_BMP_Image
   Fl_ICO_Image
```

Public Member Functions

- Fl_BMP_Image (const char *filename)
  This constructor loads the named BMP image from the given BMP filename.
- Fl_BMP_Image (const char *imagename, const unsigned char *data, const long length=-1)
  This constructor loads a BMP image from memory.

Public Member Functions inherited from Fl_RGB_Image

- virtual Fl_SVG_Image * as_svg_image ()
  Returns whether an image is an Fl_SVG_Image or not.
- int cache_h ()
- int cache_w ()
- void color_average (FL_Color c, float i) FL_OVERRIDE
  The color_average() method averages the colors in the image with the provided FLTK color value.
- Fl_Image * copy () const
- Fl_Image * copy (int W, int H) const FL_OVERRIDE
  Creates a resized copy of the image.
- void desaturate () FL_OVERRIDE
  The desaturate() method converts an image to grayscale.
- void draw (int X, int Y)
- void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  Draws the image to the current drawing surface with a bounding box.
• **Fl_RGB_Image (const Fl_Pixmap *pxm, Fl_Color bg=FL_GRAY)**
  The constructor creates a new RGBA image from the specified Fl_Pixmap.

• **Fl_RGB_Image (const uchar *bits, int bits_length, int W, int H, int D, int LD)**
  The constructor creates a new image from the specified data.

• **Fl_RGB_Image (const uchar *bits, int W, int H, int D=3, int LD=0)**
  The constructor creates a new image from the specified data.

• **void label (Fl_Menu_Item *m) FL_OVERRIDE**
  This method is an obsolete way to set the image attribute of a menu item.

• **void label (Fl_Widget *w) FL_OVERRIDE**
  This method is an obsolete way to set the image attribute of a widget or menu item.

• **virtual void normalize ()**
  Makes sure the object is fully initialized.

• **void uncache () FL_OVERRIDE**
  If the image has been cached for display, delete the cache data.

• **~Fl_RGB_Image () FL_OVERRIDE**
  The destructor frees all memory and server resources that are used by the image.

### Public Member Functions inherited from Fl_Image

• **virtual class Fl_Shared_Image * as_shared_image ()**
  Returns whether an image is an Fl_Shared_Image or not.

• **Fl_Image * copy () const**
  Creates a copy of the image in the same size.

• **int count () const**
  Returns the number of data values associated with the image.

• **int d () const**
  Returns the image depth.

• **const char * const * data () const**
  Returns a pointer to the current image data array.

• **int data_h () const**
  Returns the height of the image data.

• **int data_w () const**
  Returns the width of the image data.

• **void draw (int X, int Y)**
  Draws the image to the current drawing surface.

• **int fail () const**
  Returns a value that is not 0 if there is currently no image available.

• **Fl_Image (int W, int H, int D)**
  The constructor creates an empty image with the specified width, height, and depth.

• **int h () const**
  Returns the current image drawing height in FLTK units.

• **virtual void release ()**
  Releases an Fl_Image - the same as ‘delete this’.

• **virtual void scale (int width, int height, int proportional=1, int can_expand=0)**
  Sets the drawing size of the image.

• **int w () const**
  Returns the current image drawing width in FLTK units.

• **virtual ~Fl_Image ()**
  The destructor is a virtual method that frees all memory used by the image.
Protected Member Functions

• void load_bmp_(class Fl_Image_Reader &rdr, int ico_height=0, int ico_width=0)

Protected Member Functions inherited from Fl_Image

• void d (int D)
  Sets the current image depth.
• void data (const char * const *p, int c)
  Sets the current data pointer and count of pointers in the array.
• void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
• int draw_scaled (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
• void h (int H)
  Sets the height of the image data.
• void ld (int LD)
  Sets the current line data size in bytes.
• void w (int W)
  Sets the width of the image data.

Additional Inherited Members

Static Public Member Functions inherited from Fl_RGB_Image

• static size_t max_size ()
  Returns the maximum allowed image size in bytes when creating an Fl_RGB_Image object.
• static void max_size (size_t size)
  Sets the maximum allowed image size in bytes when creating an Fl_RGB_Image object.

Static Public Member Functions inherited from Fl_Image

• static Fl_Labeltype define_FL_IMAGE_LABEL ()
• static Fl_RGB_Scaling RGB_scaling ()
  Returns the currently used RGB image scaling method.
• static void RGB_scaling (Fl_RGB_Scaling)
  Sets the RGB image scaling method used for copy(int, int).
• static Fl_RGB_Scaling scaling_algorithm ()
  Gets what algorithm is used when resizing a source image to draw it.
• static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  Sets what algorithm is used when resizing a source image to draw it.

Public Attributes inherited from Fl_RGB_Image

• int alloc_array
  If non-zero, the object's data array is delete[]d when deleting the object.
• const uchar * array
  Points to the start of the object's data array.
**Static Public Attributes inherited from Fl_Image**

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false

  *True after fl_register_images() was called, false before.*

**Static Protected Member Functions inherited from Fl_Image**

- static void labeltype (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label *lo, int &lw, int &lh)

### 12.11 Detailed Description

The Fl_BMP_Image class supports loading, caching, and drawing of Windows Bitmap (BMP) image files.

### 12.11.2 Constructor & Destructor Documentation

#### 12.11.2.1 Fl_BMP_Image() [1/2]

Fl_BMP_Image::Fl_BMP_Image (const char * filename)

This constructor loads the named BMP image from the given BMP filename. The destructor frees all memory and server resources that are used by the image.

Use Fl_Image::fail() to check if Fl_BMP_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the BMP format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason.

**Parameters**

- **in** filename a full path and name pointing to a BMP file.

#### 12.11.2.2 Fl_BMP_Image() [2/2]

Fl_BMP_Image::Fl_BMP_Image (const char * imagename, const unsigned char * data, const long length = -1)

This constructor loads a BMP image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary data" chunks as a great way to add image data into the C++ source code. imagename can be NULL. If a name is given, the image is added to the list of shared images and will be available by that name.

The destructor frees all memory and server resources that are used by the image.

The (new and optional) third parameter length should be used so buffer overruns (i.e. truncated images) can be checked. See note below.

If length is not used

- it defaults to -1 (unlimited size)
- buffer overruns will not be checked.

See also

Fl_BMP_Image::Fl_BMP_Image(const char* imagename, const unsigned char* data, const long length = -1);
The optional parameter `length` is available since FLTK 1.4.0. Not using it is deprecated and old code should be modified to use it. This parameter will likely become mandatory in a future FLTK version.

Use `Fl_Image::fail()` to check if `Fl_BMP_Image` failed to load. `fail()` returns `ERR_FILE_ACCESS` if the image could not be read from memory, `ERR_FORMAT` if the BMP format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imagename</code></td>
<td>A name given to this image or NULL</td>
</tr>
<tr>
<td><code>data</code></td>
<td>Pointer to the start of the BMP image in memory.</td>
</tr>
<tr>
<td><code>length</code></td>
<td>Length of the BMP image in memory.</td>
</tr>
</tbody>
</table>

- `Fl_Shared_Image`

The documentation for this class was generated from the following files:

- `Fl_BMP_Image.h`
- `Fl_BMP_Image.cxx`

## 12.12 Fl_Box Class Reference

This widget simply draws its box, and possibly its label.

```c
#include <Fl_Box.h>
```

Inheritance diagram for `Fl_Box`:

```
Fl_Box
|___ Fl_Widget
```

### Public Member Functions

- **`Fl_Box`** ([`Fl_Boxtype` b, int X, int Y, int W, int H, const char *l])
  
  See `Fl_Box::Fl_Box(int x, int y, int w, int h, const char * = 0)`

- **`Fl_Box`** (int X, int Y, int W, int H, const char *l=0)

- **int handle (int)** FL_OVERRIDE

  Handles the specified event.

### Public Member Functions inherited from Fl_Widget

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void activate ()

  Activates the widget.

- unsigned int active () const

  Returns whether the widget is active.

- int active_r () const

  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const ∗ as_gl_window () const

• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const ∗ as_group () const

• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const ∗ as_window () const

• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
  Gets the current callback function for the widget.

• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reas  on reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
Makes a widget invisible.

- `FL_Image * image ()`
  Gets the image that is used as part of the widget label when in the active state.

- `const FL_Image * image () const`
  Gets the image that is used as part of the widget label when in the active state.

- `void image (FL_Image &img)`
  Sets the image to use as part of the widget label when in the active state.

- `void image (FL_Image * img)`
  Sets the image to use as part of the widget label when in the active state.

- `int image_bound () const`
  Returns whether the image is managed by the widget.

- `int inside (const Fl_Widget * wgt) const`
  Checks if this widget is a child of `wgt`.

- `int is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`
  Gets the current label text.

- `void label (const char * text)`
  Sets the current label pointer.

- `void label (FL_Labeltype a, const char * b)`
  Shortcut to set the label text and type in one call.

- `FL_Color labelcolor () const`
  Gets the label color.

- `void labelcolor (FL_Color c)`
  Sets the label color.

- `FL_Font labelfont () const`
  Gets the font to use.

- `void labelfont (FL_Font f)`
  Sets the font to use.

- `FL_Fontsize labelsize () const`
  Gets the font size in pixels.

- `void labelsize (FL_Fontsize pix)`
  Sets the font size in pixels.

- `FL_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (FL_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `FL_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (FL_Group * p)`
  Internal use only - "for hacks only".

- `void position (int X, int Y)`
  Repositions the window or widget.
• void **redraw** ()
  Schedules the drawing of the widget.

• void **redraw_label** ()
  Schedules the drawing of the label.

• virtual void **resize** (int x, int y, int w, int h)
  Changes the size or position of the widget.

• Fl_Color **selection_color** () const
  Gets the selection color.

• void **selection_color** (Fl_Color a)
  Sets the selection color.

• void **set_active** ()
  Marks the widget as active without sending events or changing focus.

• void **set_changed** ()
  Marks the value of the widget as changed.

• void **set_output** ()
  Sets a widget to output only.

• void **set_visible** ()
  Makes the widget visible.

• void **set_visible_focus** ()
  Enables keyboard focus navigation with this widget.

• int **shortcut_label** () const
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

• void **shortcut_label** (int value)
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

• virtual void **show** ()
  Makes a widget visible.

• void **size** (int W, int H)
  Changes the size of the widget.

• int **take_focus** ()
  Gives the widget the keyboard focus.

• unsigned int **takeevents** () const
  Returns if the widget is able to take events.

• int **test_shortcut** ()
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

• const char ∗ **tooltip** () const
  Gets the current tooltip text.

• void **tooltip** (const char ∗text)
  Sets the current tooltip text.

• Fl_Window ∗ **top_window** () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window ∗ **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar **type** () const
  Gets the widget type.

• void **type** (uchar t)
  Sets the widget type.

• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void ∗ **user_data** () const
  Gets the user data for this widget.

• void **user_data** (Fl_Callback_User_Data ∗v, bool auto_free)
Sets the user data for this widget.

- **void** `user_data (void ∗v)`
  Sets the user data for this widget.

- **unsigned int** `visible () const`
  Returns whether a widget is visible.

- **unsigned int** `visible_focus () const`
  Checks whether this widget has a visible focus.

- **void** `visible_focus (int v)`
  Modifies keyboard focus navigation.

- **int** `visible_r () const`
  Returns whether a widget and all its parents are visible.

- **int** `w () const`
  Gets the widget width.

- **Fl_When** `when () const`
  Returns the conditions under which the callback is called.

- **void** `when (uchar i)`
  Sets the flags used to decide when a callback is called.

- **Fl_Window ∗** `window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int** `x () const`
  Gets the widget position in its window.

- **int** `y () const`
  Gets the widget position in its window.

- **virtual** `~Fl_Widget ()`
  Destroys the widget.

Protected Member Functions

- **void** `draw () FL_OVERRIDE`
  Draws the widget.

Protected Member Functions inherited from Fl_Widget

- **void** `clear_flag (unsigned int c)`
  Clears a flag in the flags mask.

- **void** `draw_backdrop () const`
  If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.

- **void** `draw_box () const`
  Draws the widget box according its box style.

- **void** `draw_box (Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type `t`, of color `c` at the widget's position and size.

- **void** `draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type `t`, of color `c` at the position `X,Y` and size `W,H`.

- **void** `draw_focus () const`
  Draws a focus rectangle around the widget.

- **void** `draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  Draws a focus box for the widget at the given position and size.

- **void** `draw_label () const`
  Draws the widget's label at the defined label position.

- **void** `draw_label (int, int, int, int) const`
Draws the label in an arbitrary bounding box.

- **Fl_Widget**(int x, int y, int w, int h, const char ∗label=0L)
  
  Creates a widget at the given position and size.

- unsigned int **flags**() const
  
  Gets the widget flags mask.

- void **h**(int v)
  
  Internal use only.

- void **set_flag**(unsigned int c)
  
  Sets a flag in the flags mask.

- void **w**(int v)
  
  Internal use only.

- void **x**(int v)
  
  Internal use only.

- void **y**(int v)
  
  Internal use only.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

- static void **default_callback**(Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don’t set a callback.

- static unsigned int **label_shortcut**(const char ∗t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int **test_shortcut**(const char ∗t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

**Protected Types inherited from Fl_Widget**

- enum {
    INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
    FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
    OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
    MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
    GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
    NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
    MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31}

  flags possible values enumeration.

**12.12.1 Detailed Description**

This widget simply draws its box, and possibly its label. Putting it before some other widgets and making it big enough to surround them will let you draw a frame around them.
12.12.2 Constructor & Destructor Documentation

12.12.2.1 Fl_Box()

Fl_Box::Fl_Box (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ l = 0 )

- The first constructor sets box() to FL_NO_BOX, which means it is invisible. However such widgets are useful as placeholders or Fl_Group::resizable() values. To change the box to something visible, use box(n).

- The second form of the constructor sets the box to the specified box type.

The destructor removes the box.

12.12.3 Member Function Documentation

12.12.3.1 draw()

void Fl_Box::draw ( ) [protected], [virtual]

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.

12.12.3.2 handle()

int Fl_Box::handle (  
    int event ) [virtual]

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.

This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in | event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

Fl_Event

Reimplemented from Fl_Widget.
The documentation for this class was generated from the following files:

- Fl_Box.H
- Fl_Box.cxx

12.13 Fl_Browser Class Reference

The Fl_Browser widget displays a scrolling list of text lines, and manages all the storage for the text.

#include <Fl_Browser.H>

Public Types

- enum Fl_Line_Position { TOP, BOTTOM, MIDDLE }

  For internal use only?

Public Types inherited from Fl_Browser_

- enum{
  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7 }

  Values for has_scrollbar().

Public Member Functions

- void add (const char *newtext, void *d=0)
  Adds a new line to the end of the browser.
- void bottomline (int line)
  Scrolls the browser so the bottom item in the browser is showing the specified line.
- void clear ()
  Removes all the lines in the browser.
- char column_char () const
  Gets the current column separator character.
- void column_char (char c)
  Sets the column separator to c.
- const int * column_widths () const
  Gets the current column width array.
- void column_widths (const int *arr)
Sets the current array to `arr`.

- **void** `∗` **data** (int line) **const**
  
  Returns the user data() for specified line.

- **void** **data** (int line, void `∗`**d**)
  
  Sets the user data for specified line to `d`.

- **void** **display** (int line, int val=1)
  
  For back compatibility.

- **int** **displayed** (int line) **const**
  
  Returns non-zero if line has been scrolled to a position where it is being displayed.

- **Fl_Browser** (int X, int Y, int W, int H, const char `∗`**L=0**)
  
  The constructor makes an empty browser.

- **char** **format_char** () **const**
  
  Gets the current format code prefix character, which by default is '@'.

- **void** **format_char** (char c)
  
  Sets the current format code prefix character to `c`.

- **void** **hide** () **FL_OVERRIDE**
  
  Hides the entire Fl_Browser widget – opposite of show().

- **void** **hide** (int line)
  
  Makes line invisible, preventing selection by the user.

- **Fl_Image ∗** **icon** (int line) **const**
  
  Returns the icon currently defined for line.

- **void** **icon** (int line, Fl_Image `∗`**icon**)
  
  Set the image icon for line to the value `icon`.

- **void** **insert** (int line, const char `∗`**newtext**, void `∗`**d=0**)
  
  Insert a new entry whose label is `newtext` above given line, optional data `d`.

- **void** **lineposition** (int line, Fl_Line_Position pos)
  
  Updates the browser so that line is shown at position `pos`.

- **int** **load** (const char `∗`**filename**)
  
  Clears the browser and reads the file, adding each line from the file to the browser.

- **void** **make_visible** (int line)
  
  Make the item at the specified line visible().

- **void** **middleline** (int line)
  
  Scrolls the browser so the middle item in the browser is showing the specified line.

- **void** **move** (int to, int from)
  
  Line from is removed and reinserted at to.

- **void** **remove** (int line)
  
  Remove entry for given line number, making the browser one line shorter.

- **void** **remove_icon** (int line)
  
  Removes the icon for line.

- **void** **replace** (int a, const char `∗`**b**)
  
  For back compatibility only.

- **int** **select** (int line, int val=1)
  
  Sets the selection state of the item at line to the value `val`.

- **int** **selected** (int line) **const**
  
  Returns 1 if specified line is selected, 0 if not.

- **void** **show** () **FL_OVERRIDE**
  
  Shows the entire Fl_Browser widget – opposite of hide().

- **void** **show** (int line)
  
  Makes line visible, and available for selection by user.

- **int** **size** () **const**
  
  Returns how many lines are in the browser.
• void **size**(int W, int H)

  Swaps two browser lines a and b.

• const char * **text**(int line) const

  Returns the label text for the specified line.

• void **swap**(int a, int b)

  Swaps two browser lines a and b.

• const char * **text**(int line, const char *newtext)

  Sets the text for the specified line to newtext.

• **Fl_Fontsize** **textsize**() const

  Gets the default text size (in pixels) for the lines in the browser.

• void textsize (**Fl_Fontsize** newSize)

  Sets the default text size (in pixels) for the lines in the browser to newSize.

• int **topline**(int line) const

  Returns the line that is currently visible at the top of the browser.

• void topline (int line)

  Scrolls the browser so the top item in the browser is showing the specified line.

• int **value**(int line) const

  Returns the line number of the currently selected line, or 0 if none selected.

• void value (int line)

  Sets the browser’s value(), which selects the specified line.

• int **visible**(int line) const

  Returns non-zero if the specified line is visible, 0 if hidden.

• ~**Fl_Browser**()

  The destructor deletes all list items and destroys the browser.

**Public Member Functions inherited from Fl_Browser**

• int deselect (int docallbacks=0)

  Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

• void display (void *item)

  Displays the item, scrolling the list as necessary.

• int handle (int event) FL_OVERRIDE

  Handles the event within the normal widget bounding box.

• uchar has_scrollbar () const

  Returns the current scrollbar mode, see Fl_Browser::has_scrollbar(uchar)

• void has_scrollbar (uchar mode)

  Sets whether the widget should have scrollbars or not (default Fl_Browser::BOTH).

• int hposition () const

  Gets the horizontal scroll position of the list as a pixel position pos.

• void hposition (int)

  Sets the horizontal scroll position of the list to pixel position pos.

• int linespacing () const

  Return the height of additional spacing between browser lines.

• void linespacing (int pixels)

  Add some space between browser lines.

• int position () const

• void position (int pos)

• void position (int x, int y)

• void resize (int X, int Y, int W, int H) FL_OVERRIDE

  Repositions and/or resizes the browser.

• void scrollbar_left ()

  Moves the vertical scrollbar to the lefthand side of the list.
• void scrollbar_right ()
  Moves the vertical scrollbar to the right hand side of the list.

• int scrollbar_size () const
  Gets the current size of the scrollbars' troughs, in pixels.

• void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

• int scrollbar_width () const
  Returns the global value Fl::scrollbar_size().

• void scrollbar_width (int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

• int select (void ∗ item, int val=1, int docallbacks=0)
  Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.

• int select_only (void ∗ item, int docallbacks=0)
  Selects item and returns 1 if the state changed or 0 if it did not.

• void sort (int flags=0)
  Sort the items in the browser based on flags.

• Fl_Color textcolor () const
  Gets the default text color for the lines in the browser.

• void textcolor (Fl_Color col)
  Sets the default text color for the lines in the browser to color col.

• Fl_Font textfont () const
  Gets the default text font for the lines in the browser.

• void textfont (Fl_Font font)
  Sets the default text font for the lines in the browser to font.

• Fl_Fontsize textsize () const
  Gets the default text size (in pixels) for the lines in the browser.

• void textsize (Fl_Fontsize newSize)
  Sets the default text size (in pixels) for the lines in the browser to size.

• int vposition () const
  Gets the vertical scroll position of the list as a pixel position pos.

• void vposition (int pos)
  Sets the vertical scroll position of the list to pixel position pos.

Public Member Functions inherited from Fl_Group

• Fl_Widget ∗ & _ddfdesign_kludge ()
  This is for forms compatibility only.

• void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

• void add (Fl_Widget ∗&)
  See void Fl_Group::add(Fl_Widget &w)

• void addResizable (Fl_Widget &)
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget ∗ & & _ddfdesign_kludge ()
  This is for forms compatibility only.

• void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

• void add (Fl_Widget ∗&)
  See void Fl_Group::add(Fl_Widget &w)

• void addResizable (Fl_Widget &)
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget ∗ const + array () const
  Returns a pointer to the array of children.

• Fl_Group ∗ & as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• Fl_Group ∗ & as_group () FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

• Fl_Widget ∗ child (int n) const
Returns array()[n].  

- **int **`children`() const  
  Returns how many child widgets the group has.  
- **void **`clear`()  
  Deletes all child widgets from memory recursively.  
- **unsigned int** `clip_children`()  
  Returns the current clipping mode.  
- **void **`clip_children`(int c)  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.  
- **virtual int **`delete_child`(int n)  
  Removes the widget at index from the group and deletes it.  
- **void **`end`()  
  Exactly the same as current((this->parent()).  
- **int **`find`(const Fl_Widget &o) const  
  See int Fl_Group::find(const Fl_Widget *w) const.  
- **int **`find`(const Fl_Widget *) const  
  Searches the child array for the widget and returns the index.  
- **Fl_Group** (int, int, int, int, const char *=0)  
  Creates a new Fl_Group widget using the given position, size, and label string.  
- **void **`focus`(Fl_Widget *W)  
- **void **`forms_end`()  
  This is for forms compatibility only.  
- **int **`handle`(int) FL_OVERRIDE  
  Handles the specified event.  
- **void **`init_sizes`()  
  Resets the internal array of widget sizes and positions.  
- **void **`insert`(Fl_Widget &, int i)  
  The widget is removed from its current group (if any) and then inserted into this group.  
- **void **`insert`(Fl_Widget &, Fl_Widget *before)  
  This does insert(w, find(before)).  
- **void **`remove`(Fl_Widget &)  
  Removes a widget from the group but does not delete it.  
- **void **`remove`(Fl_Widget *o)  
  Removes the widget o from the group.  
- **void **`remove`(int index)  
  Removes the widget at index from the group but does not delete it.  
- **Fl_Widget **`resizable`() const  
  Returns the group’s resizable widget.  
- **void **`resizable`(Fl_Widget &o)  
  Sets the group’s resizable widget.  
- **void **`resizable`(Fl_Widget *)  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.  
- **void **`resize`(int, int, int, int) FL_OVERRIDE  
  Resizes the Fl_Group widget and all of its children.  
- **virtual ~Fl_Group()**  
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()

Generated by Doxygen
Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output ()**
  Sets a widget to accept input.

- **void clear_visible ()**
  Hides the widget.

- **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image * deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image * deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗widget, void ∗arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• Fl_Image ∗image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image ∗image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget ∗wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char ∗label () const
  Gets the current label text.
• void label (const char ∗text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char ∗b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &,int &,int &,int &)
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group ∗parent () const
Returns a pointer to the parent widget.

- **void** parent (*Fl_Group* *p*)
  
  Internal use only - "for hacks only".

- **void** position (int X, int Y)
  
  Repositions the window or widget.

- **void** redraw ()
  
  Schedules the drawing of the widget.

- **void** redraw_label ()
  
  Schedules the drawing of the label.

- **Fl_Color** selection_color () const
  
  Gets the selection color.

- **void** selection_color (*Fl_Color* a)
  
  Sets the selection color.

- **void** set_active ()
  
  Marks the widget as active without sending events or changing focus.

- **void** set_changed ()
  
  Marks the value of the widget as changed.

- **void** set_output ()
  
  Sets a widget to output only.

- **void** set_visible ()
  
  Makes the widget visible.

- **void** set_visible_focus ()
  
  Enables keyboard focus navigation with this widget.

- **int** shortcut_label () const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void** shortcut_label (int value)
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **void** size (int W, int H)
  
  Changes the size of the widget.

- **int** take_focus ()
  
  Gives the widget the keyboard focus.

- **unsigned int** takesevents () const
  
  Returns if the widget is able to take events.

- **int** test_shortcut ()
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char** * tooltip () const
  
  Gets the current tooltip text.

- **void** tooltip (const char *text)
  
  Sets the current tooltip text.

- **Fl_Window** * top_window () const
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window** * top_window_offset (int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar** type () const
  
  Gets the widget type.

- **void** type (uchar t)
  
  Sets the widget type.

- **int** use_accents_menu ()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void** * user_data () const
  
  Gets the user data for this widget.
• void **user_data** (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void **user_data** (void *v)
  Sets the user data for this widget.
• unsigned int **visible** () const
  Returns whether a widget is visible.
• unsigned int **visible_focus** () const
  Checks whether this widget has a visible focus.
• void **visible_focus** (int v)
  Modifies keyboard focus navigation.
• int **visible_r** () const
  Returns whether a widget and all its parents are visible.
• int **w** () const
  Gets the widget width.
• Fl_When **when** () const
  Returns the conditions under which the callback is called.
• void **when** (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * **window** () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int **x** () const
  Gets the widget position in its window.
• int **y** () const
  Gets the widget position in its window.
• virtual ~**Fl_Widget** ()
  Destroys the widget.

Protected Member Functions

• FL_BLINE * _remove (int line)
  Removes the item at the specified line.
• FL_BLINE * **find_line** (int line) const
  Returns the item for specified line.
• int **full_height** () const FL_OVERRIDE
  The height of the entire list of all visible() items in pixels.
• int **incr_height** () const FL_OVERRIDE
  The default ‘average’ item height (including inter-item spacing) in pixels.
• void **insert** (int line, FL_BLINE * item)
  Insert specified item above line.
• void * **item_at** (int line) const FL_OVERRIDE
  Return the item at specified line.
• void **item_draw** (void *item, int X, int Y, int W, int H) const FL_OVERRIDE
  Draws item at the position specified by XYWH.
• void **item_first** () const FL_OVERRIDE
  Returns the very first item in the list.
• int **item_height** (void *item) const FL_OVERRIDE
  Returns height of item in pixels.
• void **item_last** () const FL_OVERRIDE
  Returns the very last item in the list.
• void **item_next** (void *item) const FL_OVERRIDE
  Returns the next item after item.
• void *item_prev (void *item) const FL_OVERRIDE
  Returns the previous item before item.
• void item_select (void *item, int val) FL_OVERRIDE
  Change the selection state of item to the value val.
• int item_selected (void *item) const FL_OVERRIDE
  See if item is selected.
• void item_swap (void *a, void *b) FL_OVERRIDE
  Swap the items a and b.
• const char *item_text (void *item) const FL_OVERRIDE
  Returns the label text for item.
• int item_width (void *item) const FL_OVERRIDE
  Returns width of item in pixels.
• int lineno (void *item) const
  Returns line number corresponding to item, or zero if not found.
• void swap (FL_BLINE *a, FL_BLINE *b)
  Swap the two items a and b.

Protected Member Functions inherited from Fl_Browser_

• void bbox (int &X, int &Y, int &W, int &H) const
  Returns the bounding box for the interior of the list's display window, inside the scrollbars.
• void deleting (void *item)
  This method should be used when item is being deleted from the list.
• int displayed (void *item) const
  Returns non-zero if item has been scrolled to a position where it is being displayed.
• void draw () FL_OVERRIDE
  Draws the list within the normal widget bounding box.
• void *find_item (int ypos)
  This method returns the item under mouse y position ypos.
• Fl_Browser_ (int X, int Y, int W, int H, const char *L=0)
  The constructor makes an empty browser.
• virtual int full_width () const
  This method may be provided by the subclass to indicate the full width of the item list, in pixels.
• void inserting (void *a, void *b)
  This method should be used when an item is in the process of being inserted into the list.
• virtual int item_quick_height (void *item) const
  This method may be provided by the subclass to return the height of the item, in pixels.
• int leftedge () const
  This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.
• void new_list ()
  This method should be called when the list data is completely replaced or cleared.
• void redraw_line (void *item)
  This method should be called when the contents of item has changed, but not its height.
• void redraw_lines ()
  This method will cause the entire list to be redrawn.
• void replacing (void *a, void *b)
  This method should be used when item a is being replaced by item b.
• void *selection () const
  Returns the item currently selected, or NULL if there is no selection.
• void swapping (void *a, void *b)
  This method should be used when two items a and b are being swapped.
• void *top () const
  Returns the item that appears at the top of the list.
Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw () FL_OVERRIDE
  Draws the widget.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y , int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group
- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget
- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Public Attributes inherited from Fl_Browser_
- Fl_Scrollbar hscrollbar
  Horizontal scrollbar.
- Fl_Scrollbar scrollbar
  Vertical scrollbar.

Protected Types inherited from Fl_Widget
- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.
12.13.1 Detailed Description

The Fl_Browser widget displays a scrolling list of text lines, and manages all the storage for the text. This is not a text editor or spreadsheet! But it is useful for showing a vertical list of named objects to the user.

![Figure 12.2 Fl_Hold_Browser](image)

Each line in the browser is identified by number. The numbers start at one (this is so that zero can be reserved for “no line” in the selective browsers). Unless otherwise noted, the methods do not check to see if the passed line number is in range and legal. It must always be greater than zero and \(< size()\).

Each line contains a null-terminated string of text and a void * data pointer. The text string is displayed, the void * pointer can be used by the callbacks to reference the object the text describes.

The base class does nothing when the user clicks on it. The subclasses Fl_Select_Browser, Fl_Hold_Browser, and Fl_Multi_Browser react to user clicks to select lines in the browser and do callbacks.

The base class Fl_Browser provides the scrolling and selection mechanisms of this and all the subclasses, but the dimensions and appearance of each item are determined by the subclass. You can use Fl_Browser to display information other than text, or text that is dynamically produced from your own data structures. If you find that loading the browser is a lot of work or is inefficient, you may want to make a subclass of Fl_Browser.

Some common coding patterns used for working with Fl_Browser:

```c
// How to loop through all the items in the browser
for ( int t=1; t<browser->size(); t++ ) { // index 1 based..!
    printf("item %d, label="%s\n", t, browser->text(t));
}
```

Note: If you are subclassing Fl_Browser, it’s more efficient to use the protected methods item_first() and item_next(), since Fl_Browser internally uses linked lists to manage the browser’s items. For more info, see find_item(int).

12.13.2 Constructor & Destructor Documentation

12.13.2.1 Fl_Browser()

Fl_Browser::Fl_Browser {
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)

The constructor makes an empty browser.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X,Y,W,H</th>
<th>position and size.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>label string, may be NULL.</td>
</tr>
</tbody>
</table>
12.13.3  Member Function Documentation

12.13.3.1  _remove()

```c
FL_BLINE * Fl_Browser::_remove ( int line ) [protected]
```

Removes the item at the specified line.  Caveat: See efficiency note in find_line(). You must call redraw() to make any changes visible.

**Parameters**

- **in line**  The line number to be removed. (1 based) Must be in range!

**Returns**

Pointer to browser item that was removed (and is no longer valid).

See also

add(), insert(), remove(), swap(int, int), clear()

12.13.3.2  add()

```c
void Fl_Browser::add ( const char * newtext,
                        void * d = 0 )
```

Adds a new line to the end of the browser.  The text string newtext may contain format characters; see format_char() for details.  newtext is copied using the strdup() function, and can be NULL to make a blank line.  The optional void* argument d will be the data() for the new item.

**Parameters**

- **in newtext**  The label text used for the added item
- **in d**  Optional user data() for the item (0 if unspecified)

See also

add(), insert(), remove(), swap(int, int), clear()

12.13.3.3  bottomline()

```c
void Fl_Browser::bottomline ( int line ) [inline]
```

Scrolls the browser so the bottom item in the browser is showing the specified line.

**Parameters**

- **in line**  The line to be displayed at the bottom.

See also

topline(), middleline(), bottomline(), displayed(), lineposition()

12.13.3.4  clear()

```c
void Fl_Browser::clear ( )
```

Removes all the lines in the browser.

See also

add(), insert(), remove(), swap(int,int), clear()

12.13.3.5 column_char() [1/2]

char Fl_Browser::column_char ( ) const [inline]

Gets the current column separator character. The default is 't' (tab).

See also

column_char(), column_widths()

12.13.3.6 column_char() [2/2]

void Fl_Browser::column_char ( char c ) [inline]

Sets the column separator to c. This will only have an effect if you also set column_widths(). The default is 't' (tab).

See also

column_char(), column_widths()

12.13.3.7 column_widths() [1/2]

const int ∗ Fl_Browser::column_widths ( ) const [inline]

Gets the current column width array. This array is zero-terminated and specifies the widths in pixels of each column. The text is split at each column_char() and each part is formatted into its own column. After the last column any remaining text is formatted into the space between the last column and the right edge of the browser, even if the text contains instances of column_char() . The default value is a one-element array of just a zero, which means there are no columns.

Example:

```cpp
Fl_Browser ∗b = new Fl_Browser(...);
static int widths[] = { 50, 50, 50, 70, 70, 40, 70, 70, 70, 50, 0 }; // widths for each column
b->column_widths(widths); // assign array to widget
b->column_char('\t');    // use tab as the column character
b->add("USER	CPU	MEM	VSZ	RSS	TTY
STAT	TIME	COMMAND");
b->add("root
2888	0.0	0.0	1352	0
tty3
SW	Aug15
t0:00@b@f/sbin/mingetty tty3");
b->add("root
13115	0.0	0.0	1352	0
tty2	nAug30
t0:00@b@f/sbin/mingetty tty2");
...
```

See also

column_char(), column_widths()

12.13.3.8 column_widths() [2/2]

void Fl_Browser::column_widths ( const int ∗ arr ) [inline]

Sets the current array to arr. Make sure the last entry is zero.

See also

column_char(), column_widths()
### 12.13.3.9 data() [1/2]

```cpp
void * Fl_Browser::data ( int line ) const
```

Returns the user data() for specified line. Return value can be NULL if line is out of range or no user data() was defined. The parameter line is 1 based (1 will be the first item in the list).
Parameters

| in  | line  | The line number of the item whose data() is returned. (1 based) |

Returns

The user data pointer (can be NULL)

### 12.13.3.10 data() [2/2]

void Fl_Browser::data (  
    int line,  
    void * d  
)

Sets the user data for specified line to d. Does nothing if line is out of range.

Parameters

| in  | line | The line of the item whose data() is to be changed. (1 based) |
| in  | d    | The new data to be assigned to the item. (can be NULL) |

### 12.13.3.11 display()

void Fl_Browser::display (  
    int line,  
    int val = 1  
)

For back compatibility. This calls show(line) if val is true, and hide(line) otherwise. If val is not specified, the default is 1 (makes the line visible).

See also

show(int), hide(int), display(), visible(), make_visible()

### 12.13.3.12 displayed()

int Fl_Browser::displayed (  
    int line ) const  

Returns non-zero if line has been scrolled to a position where it is being displayed. Checks to see if the item’s vertical position is within the top and bottom edges of the display window. This does NOT take into account the hide()/show() status of the widget or item.

Parameters

| in  | line | The line to be checked |

Returns

1 if visible, 0 if not visible.
See also

topl ine(), middleline(), bottomline(), displayed(), lineposition()

12.13.3.13 find_line()

FL_BLINE * Fl_Browser::find_line (int line) const [protected]

Returns the item for specified line.

Note: This call is slow. It’s fine for e.g. responding to user clicks, but slow if called often, such as in a tight sorting loop. Finding an item ‘by line’ involves a linear lookup on the internal linked list. The performance hit can be significant if the browser’s contents is large, and the method is called often (e.g. during a sort). If you’re writing a subclass, use the protected methods item_first(), item_next(), etc. to access the internal linked list more efficiently.

Parameters

| in  | line          | The line number of the item to return. (1 based) |

Return values

<table>
<thead>
<tr>
<th>item</th>
<th>that was found.</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>if line is out of range.</td>
</tr>
</tbody>
</table>

See also

item_at(), find_line(), lineno()

12.13.3.14 format_char () [1/2]

c char Fl_Browser::format_char ( ) const [inline]

Gets the current format code prefix character, which by default is ‘@’.

A string of formatting codes at the start of each column are stripped off and used to modify how the rest of the line is printed:

- ’@.’ Print rest of line, don’t look for more ‘@’ signs
- ’@@’ Doubling the format character prints the format character once, followed by the rest of line
- ’@l’ Use a LARGE (24 point) font
- ’@m’ Use a medium large (18 point) font
- ’@s’ Use a small (11 point) font
- ’@b’ Use a bold font (adds FL_BOLD to font)
- ’@i’ Use an italic font (adds FL_ITALIC to font)
- ’@f’ or ’@t’ Use a fixed-pitch font (sets font to FL_COURIER)
- ’@c’ Center the line horizontally
- ’@r’ Right-justify the text
- ’@N’ Use fl_inactive_color() to draw the text
- ’@B0’, ’@B1’, ... ’@B255’ Fill the background with fl_color(n)
- ’@C0’, ’@C1’, ... ’@C255’ Use fl_color(n) to draw the text
- ’@F0’, ’@F1’, ... Use fl_font(n) to draw the text
• '@S1', '@S2', ... Use point size n to draw the text
• '@u' or '@_ Underline the text.
• '@-' draw an engraved line through the middle.

Notice that the '@.' command can be used to reliably terminate the parsing. To print a random string in a random color, use `sprintf("@C%d@.%s", color, string)` and it will work even if the string starts with a digit or has the format character in it.

12.13.3.15 format_char() [2/2]
void Fl_Browser::format_char (char c) [inline]
Sets the current format code prefix character to c.
The default prefix is '@'. Set the prefix to 0 to disable formatting.

See also
format_char() for list of '@' codes

12.13.3.16 full_height()
int Fl_Browser::full_height ( ) const [protected], [virtual]
The height of the entire list of all visible() items in pixels.
This returns the accumulated height of all the items in the browser that are not hidden with hide(), including items scrolled off screen.

Returns
The accumulated size of all the visible items in pixels.

See also
item_height(), item_width(), incr_height(), full_height()
Reimplemented from Fl_Browser_.

12.13.3.17 hide() [1/2]
void Fl_Browser::hide ( ) [inline], [virtual]
Hides the entire Fl_Browser widget – opposite of show().
Reimplemented from Fl_Widget.

12.13.3.18 hide() [2/2]
void Fl_Browser::hide (int line )
Makes line invisible, preventing selection by the user.
The line can still be selected under program control. This changes the full_height() if the state was changed. When a line is made invisible, lines below it are moved up in the display. redraw() is called automatically if a change occurred.

Parameters

| in | line | The line to be hidden. (1 based) |
See also

   show(int), hide(int), display(), visible(), make_visible()

12.13.3.19 icon() [1/2]

Fl_Image * Fl_Browser::icon ( int line ) const

Returns the icon currently defined for line. If no icon is defined, NULL is returned.

Parameters

   in   line  The line whose icon is returned.

Returns

   The icon defined, or NULL if none.

12.13.3.20 icon() [2/2]

void Fl_Browser::icon ( int line, Fl_Image * icon )

Set the image icon for line to the value icon. Caller is responsible for keeping the icon allocated. The line is automatically redrawn.

Parameters

   in   line  The line to be modified. If out of range, nothing is done.
   in   icon  The image icon to be assigned to the line. If NULL, any previous icon is removed.

12.13.3.21 incr_height()

int Fl_Browser::incr_height ( ) const [protected], [virtual]

The default 'average' item height (including inter-item spacing) in pixels. This currently returns textsizer() + 2.

Returns

   The value in pixels.

See also

   item_height(), item_width(), incr_height(), full_height()

Reimplemented from Fl_Browser_.

12.13.3.22 insert() [1/2]

void Fl_Browser::insert ( int line, const char * newtext, void * d = 0 )

Insert a new entry whose label is newtext above given line, optional data d. Text may contain format characters; see format_char() for details. newtext is copied using the strdup() function, and can be NULL to make a blank line. The optional void * argument d will be the data() of the new item.
12.13 Fl_Browser Class Reference

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>line</th>
<th>Line position for insert. (1 based)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If line &gt; size(), the entry will be added at the end.</td>
</tr>
<tr>
<td>in</td>
<td>newtext</td>
<td>The label text for the new line.</td>
</tr>
<tr>
<td>in</td>
<td>d</td>
<td>Optional pointer to user data to be associated with the new line.</td>
</tr>
</tbody>
</table>

12.13.3.23 insert() [2/2]

```c
void Fl_Browser::insert (  
    int line,  
    FL_BLINE * item ) [protected]
```

Insert specified item above line.  
If line > size() then the line is added to the end.  
Caveat: See efficiency note in find_line().

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>line</th>
<th>The new line will be inserted above this line (1 based).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>item</td>
<td>The item to be added.</td>
</tr>
</tbody>
</table>

12.13.3.24 item_at()

```c
void * Fl_Browser::item_at (  
    int line ) const [inline], [protected], [virtual]
```

Return the item at specified line.

Parameters

| in   | line    | The line of the item to return. (1 based) |

Returns

The item, or NULL if line out of range.

See also

- item_at(), find_line(), lineno()

Reimplemented from Fl_Browser_.

12.13.3.25 item_draw()

```c
void Fl_Browser::item_draw (  
    void * item,  
    int X,  
    int Y,  
    int W,  
    int H ) const [protected], [virtual]
```

Draws item at the position specified by X Y W H.  
The W and H values are used for clipping. Should only be called within the context of an FLTK draw().

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item to be drawn</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X,Y,W,H</td>
<td>position and size.</td>
</tr>
</tbody>
</table>
Implements `Fl_Browser_`.

### 12.13.3.26 item_first()

```cpp
void * Fl_Browser::item_first ( ) const [protected], [virtual]
```

Returns the very first item in the list.

**Example of use:**
```cpp
// Walk the browser from beginning to end
for ( void *i=item_first(); i; i=item_next(i) ) {
    printf("item label='\$s'\n", item_text(i));
}
```

**Returns**

The first item, or NULL if list is empty.

**See also**

- `item_first()`, `item_last()`, `item_next()`, `item_prev()`

Implements `Fl_Browser_`.

### 12.13.3.27 item_height()

```cpp
int Fl_Browser::item_height ( void * item ) const [protected], [virtual]
```

Returns height of `item` in pixels.

This takes into account embedded @ codes within the `text()` label.

**Parameters**

| in  | item | The item whose height is returned. |

**Returns**

The height of the item in pixels.

**See also**

- `item_height()`, `item_width()`,
- `incr_height()`, `full_height()`

Implements `Fl_Browser_`.

### 12.13.3.28 item_last()

```cpp
void * Fl_Browser::item_last ( ) const [protected], [virtual]
```

Returns the very last item in the list.

**Example of use:**
```cpp
// Walk the browser in reverse, from end to start
for ( void *i=item_last(); i; i=item_prev(i) ) {
    printf("item label='\$s'\n", item_text(i));
}
```

**Returns**

The last item, or NULL if list is empty.

**See also**

- `item_first()`, `item_last()`, `item_next()`, `item_prev()`

Reimplemented from `Fl_Browser_`. 

---

Generated by Doxygen
12.13.3.29  item_next()

void * Fl_Browser::item_next (  
    void * item ) const [protected], [virtual]

Returns the next item after item.

Parameters

| in  | item | The 'current' item |

Returns

The next item after item, or NULL if there are none after this one.

See also

item_first(), item_last(), item_next(), item_prev()

Implements Fl_Browser_.

12.13.3.30  item_prev()

void * Fl_Browser::item_prev (  
    void * item ) const [protected], [virtual]

Returns the previous item before item.

Parameters

| in  | item | The 'current' item |

Returns

The previous item before item, or NULL if there are none before this one.

See also

item_first(), item_last(), item_next(), item_prev()

Implements Fl_Browser_.

12.13.3.31  item_select()

void Fl_Browser::item_select (  
    void * item,  
    int val ) [protected], [virtual]

Change the selection state of item to the value val.

Parameters

| in  | item | The item to be changed. |
| in  | val  | The new selection state: 1 selects, 0 de-selects. |
See also

    select(), selected(), value(), item_select(), item_selected()

Reimplemented from Fl_Browser_.

12.13.3.32 item_selected()

int Fl_Browser::item_selected (  
    void * item ) const [protected], [virtual]

See if item is selected.

Parameters

| in  | item | The item whose selection state is to be checked. |

Returns

    1 if selected, 0 if not.

See also

    select(), selected(), value(), item_select(), item_selected()

Reimplemented from Fl_Browser_.

12.13.3.33 item_swap()

void Fl_Browser::item_swap (  
    void * a,  
    void * b ) [inline], [protected], [virtual]

Swap the items a and b.
You must call redraw() to make any changes visible.

Parameters

| in  | a,b | the items to be swapped. |

See also

    swap(int,int), item_swap()

Reimplemented from Fl_Browser_.

12.13.3.34 item_text()

const char * Fl_Browser::item_text (  
    void * item ) const [protected], [virtual]

Returns the label text for item.

Parameters

| in  | item | The item whose label text is returned. |

Returns

    The item's text string. (Can be NULL)

Reimplemented from Fl_Browser_.

---

Generated by Doxygen
12.13.3.35 item_width()

```c
int Fl_Browser::item_width (  
    void * item ) const [protected], [virtual]
```

Returns width of `item` in pixels. This takes into account embedded `@` codes within the `text()` label.

**Parameters**

| in | item | The item whose width is returned. |

**Returns**

The width of the item in pixels.

**See also**

`item_height()`, `item_width()`, `incr_height()`, `full_height()`

Implements `Fl_Browser_`.

12.13.3.36 lineno()

```c
int Fl_Browser::lineno (  
    void * item ) const [protected]
```

Returns line number corresponding to `item`, or zero if not found. Caveat: See efficiency note in `find_line()`.

**Parameters**

| in | item | The item to be found |

**Returns**

The line number of the item, or 0 if not found.

**See also**

`item_at()`, `find_line()`, `lineno()`

12.13.3.37 lineposition()

```c
void Fl_Browser::lineposition (  
    int line,  
    Fl_Line_Position pos)
```

Updates the browser so that `line` is shown at position `pos`.

**Parameters**

| in | line | line number. (1 based) |
| in | pos  | position. |

**See also**

`topline()`, `middleline()`, `bottomline()`
12.13.3.38  load()

int Fl_Browser::load ( const char * filename )

Clears the browser and reads the file, adding each line from the file to the browser.
If the filename is NULL or a zero-length string then this just clears the browser. This returns zero if there was any
error in opening or reading the file, in which case errno is set to the system error. The data() of each line is set to
NULL.

Parameters

- **filename** The filename to load

Returns

1 if OK, 0 on error (errno has reason)

See also

add()

12.13.3.39  make_visible()

void Fl_Browser::make_visible ( int line ) [inline]

Make the item at the specified line visible().
Functionally similar to show(int line). If line is out of range, redisplay top or bottom of list as appropriate.

Parameters

- **line** The line to be made visible.

See also

show(int), hide(int), display(), visible(), make_visible()

12.13.3.40  middleline()

void Fl_Browser::middleline ( int line ) [inline]

Scrolls the browser so the middle item in the browser is showing the specified line.

Parameters

- **line** The line to be displayed in the middle.

See also

topline(), middleline(), bottomline(), displayed(), lineposition()

12.13.3.41  move()

void Fl_Browser::move ( int to, int from )

Line from is removed and reinserted at to.
Note: to is calculated after line from gets removed.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>to</th>
<th>Destination line number (calculated after line from is removed)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>from</td>
<td>Line number of item to be moved</td>
</tr>
</tbody>
</table>

### 12.13.3.42 remove()

```cpp
void Fl_Browser::remove (int line)
```

Remove entry for given line number, making the browser one line shorter. You must call `redraw()` to make any changes visible.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>line</th>
<th>Line to be removed. (1 based)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If line is out of range, no action is taken.</td>
</tr>
</tbody>
</table>

See also

- `add()`, `insert()`, `remove()`, `swap(int,int)`, `clear()`

### 12.13.3.43 remove_icon()

```cpp
void Fl_Browser::remove_icon (int line)
```

Removes the icon for line.

It's ok to remove an icon if none has been defined.

**Parameters**

| in  | line     | The line whose icon is to be removed.                           |

### 12.13.3.44 select()

```cpp
int Fl_Browser::select (int line, int val = 1)
```

Sets the selection state of the item at line to the value val.

If val is not specified, the default is 1 (selects the item).

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>line</th>
<th>The line number of the item to be changed. (1 based)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>val</td>
<td>The new selection state (1=select, 0=de-select).</td>
</tr>
</tbody>
</table>

**Returns**

1 if the state changed, 0 if not.

See also

- `select()`, `selected()`, `value()`, `item_select()`, `item_selected()`
12.13.3.45 **selected()**

```cpp
int Fl_Browser::selected ( int line ) const
```

Returns 1 if specified `line` is selected, 0 if not.

**Parameters**

- `line` (1 based)

**Returns**

1 if item selected, 0 if not.

**See also**

- select(), selected(), value(), item_select(), item_selected()

12.13.3.46 **show() [1/2]**

```cpp
void Fl_Browser::show ( ) [inline], [virtual]
```

Shows the entire Fl_Browser widget – opposite of hide(). Reimplemented from Fl_Widget.

12.13.3.47 **show() [2/2]**

```cpp
void Fl_Browser::show ( int line )
```

Makes `line` visible, and available for selection by user. Opposite of hide(int). This changes the full_height() if the state was changed. redraw() is called automatically if a change occurred.

**Parameters**

- `line` (1 based)

**See also**

- show(int), hide(int), display(), visible(), make_visible()

12.13.3.48 **size()**

```cpp
int Fl_Browser::size ( ) const [inline]
```

Returns how many lines are in the browser. The last line number is equal to this. Returns 0 if browser is empty.

12.13.3.49 **swap() [1/2]**

```cpp
void Fl_Browser::swap ( FL_BLINE ∗ a, FL_BLINE ∗ b ) [protected]
```

Swap the two items `a` and `b`. Uses swapping() to ensure list updates correctly.

**Parameters**

- `a`, `b`
See also

\texttt{swap(int,int), item\_swap()}

\section*{12.13.3.50 \texttt{swap()} [2/2]}

\begin{verbatim}
void Fl_Browser::swap (  
    int a,  
    int b )
\end{verbatim}

Swaps two browser lines \texttt{a} and \texttt{b}. You must call \texttt{redraw()} to make any changes visible.

Parameters

\begin{itemize}
  \item \texttt{in \ a,b} \hspace{1em} The two lines to be swapped. (both 1 based)
\end{itemize}

See also \texttt{swap(int,int), item\_swap()}

\section*{12.13.3.51 \texttt{text()} [1/2]}

\begin{verbatim}
const char * Fl_Browser::text (  
    int line ) const
\end{verbatim}

Returns the label text for the specified \texttt{line}. Return value can be NULL if \texttt{line} is out of range or unset. The parameter \texttt{line} is 1 based.

Parameters

\begin{itemize}
  \item \texttt{in \ line} \hspace{1em} The line number of the item whose text is returned. (1 based)
\end{itemize}

Returns

The text string (can be NULL)

\section*{12.13.3.52 \texttt{text()} [2/2]}

\begin{verbatim}
void Fl_Browser::text (  
    int line,  
    const char * newtext )
\end{verbatim}

Sets the text for the specified \texttt{line} to \texttt{newtext}. Text may contain format characters; see \texttt{format\_char()} for details. \texttt{newtext} is copied using the \texttt{strdup()} function, and can be NULL to make a blank line. Does nothing if \texttt{line} is out of range.

Parameters

\begin{itemize}
  \item \texttt{in \ line} \hspace{1em} The line of the item whose text will be changed. (1 based)
  \item \texttt{in \ newtext} \hspace{1em} The new string to be assigned to the item.
\end{itemize}

\section*{12.13.3.53 \texttt{textsize()}}

\begin{verbatim}
void Fl_Browser::textsize (  
    Fl_Fontsize newSize )
\end{verbatim}

Sets the default text size (in pixels) for the lines in the browser to \texttt{newSize}.
This method recalculates all item heights and caches the total height internally for optimization of later item changes. This can be slow if there are many items in the browser. It returns immediately (w/o recalculation) if newSize equals the current textsize(). You may need to call redraw() to see the effect and to have the scrollbar positions recalculated. You should set the text size before populating the browser with items unless you really need to change the size later.

12.13.3.54 topline() [1/2]
int Fl_Browser::topline ( ) const
Returns the line that is currently visible at the top of the browser. If there is no vertical scrollbar then this will always return 1.

Returns
The lineno() of the top() of the browser.

12.13.3.55 topline() [2/2]
void Fl_Browser::topline ( int line ) [inline]
Scrolls the browser so the top item in the browser is showing the specified line.

Parameters

<table>
<thead>
<tr>
<th>In</th>
<th>line</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The line to be displayed at the top.</td>
</tr>
</tbody>
</table>

See also
toline(), middleline(), bottomline(), displayed(), lineposition()

12.13.3.56 value() [1/2]
int Fl_Browser::value ( ) const
Returns the line number of the currently selected line, or 0 if none selected.

Returns
The line number of current selection, or 0 if none selected.

See also
select(), selected(), value(), item_select(), item_selected()

12.13.3.57 value() [2/2]
void Fl_Browser::value ( int line ) [inline]
Sets the browser’s value(), which selects the specified line. This is the same as calling select(line).

See also
select(), selected(), value(), item_select(), item_selected()

12.13.3.58 visible()
int Fl_Browser::visible ( int line ) const
Returns non-zero if the specified line is visible, 0 if hidden. Use show(int), hide(int), or make_visible(int) to change an item’s visible state.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>The line in the browser to be tested. (1 based)</td>
</tr>
</tbody>
</table>

See also

- `show(int)`, `hide(int)`, `display()`, `visible()`, `make_visible()`

The documentation for this class was generated from the following files:

- `Fl_Browser.H`
- `Fl_Browser.cxx`
- `Fl_Browser_load.cxx`

### 12.14 Fl_Browser Class Reference

This is the base class for browsers.

```cpp
#include <Fl_Browser_.H>
```

Inheritance diagram for Fl_Browser_:

```
Fl_Widget
    └── Fl_Group
        └── Fl_Browser
            └── Fl_Browser
                ├── Fl_Browser
                │    └── Fl_Browser
                ├── Fl_Check_Browser
                └──...
```

#### Public Types

- `enum { HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4, HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7 }`

  Values for `has_scrollbar()`.

#### Public Member Functions

- `int deselect (int docallbacks=0)`
  
  Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

- `void display (void *item)`
  
  Displays the item, scrolling the list as necessary.

- `int handle (int event) FL_OVERRIDE`
  
  Handles the event within the normal widget bounding box.

- `uchar has_scrollbar () const`
  
  Returns the current scrollbar mode, see `Fl_Browser_::has_scrollbar(uchar)`

- `void has_scrollbar (uchar mode)`
  
  Sets whether the widget should have scrollbars or not (default `Fl_Browser_::BOTH`).

- `int hposition () const`
  
  Gets the horizontal scroll position of the list as a pixel position `pos`.

- `void hposition (int)`

Generated by Doxygen
Sets the horizontal scroll position of the list to pixel position \( \text{pos} \).

- **int linespacing () const**
  
  Return the height of additional spacing between browser lines.

- **void linespacing (int pixels)**
  
  Add some space between browser lines.

- **int position () const**

- **void position (int pos)**

- **void position (int \( x \), int \( y \))**

- **void resize (int \( X \), int \( Y \), int \( W \), int \( H \)) FL_OVERRIDE**
  
  Repositions and/or resizes the browser.

- **void scrollbar_left ()**
  
  Moves the vertical scrollbar to the lefthand side of the list.

- **void scrollbar_right ()**
  
  Moves the vertical scrollbar to the righthand side of the list.

- **int scrollbar_size () const**

- **void scrollbar_size (int new\( \text{Size} \))**
  
  Sets the pixel size of the scrollbars' troughs to new\( \text{Size} \), in pixels.

- **int scrollbar_width () const**
  
  Returns the global value Fl::scrollbar_size().

- **void scrollbar_width (int width)**
  
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

- **int select (void *\( \text{item} \), int val=1, int docallbacks=0)**
  
  Sets the selection state of \( \text{item} \) to \( \text{val} \), and returns 1 if the state changed or 0 if it did not.

- **int select_only (void *\( \text{item} \), int docallbacks=0)**
  
  Selects \( \text{item} \) and returns 1 if the state changed or 0 if it did not.

- **void sort (int flags=0)**
  
  Sort the items in the browser based on \( \text{flags} \).

- **Fl_Color textcolor () const**
  
  Gets the default text color for the lines in the browser.

- **void textcolor (Fl_Color \( \text{col} \))**
  
  Sets the default text color for the lines in the browser to \( \text{col} \).

- **Fl_Font textfont () const**
  
  Gets the default text font for the lines in the browser.

- **void textfont (Fl_Font \( \text{font} \))**
  
  Sets the default text font for the lines in the browser to \( \text{font} \).

- **Fl_Fontsize textsize () const**
  
  Gets the default text size (in pixels) for the lines in the browser.

- **void textsize (Fl_Fontsize new\( \text{Size} \))**
  
  Sets the default text size (in pixels) for the lines in the browser to \( \text{size} \).

- **int vposition () const**
  
  Gets the vertical scroll position (in pixels) for the lines in the browser.

- **void vposition (int \( \text{pos} \))**
  
  Sets the vertical scroll position of the list as a pixel position \( \text{pos} \).

- **void vposition (int \( \text{pos} \))**
  
  Sets the vertical scroll position of the list to pixel position \( \text{pos} \).
Public Member Functions inherited from Fl_Group

- Fl_Widget * _ddfdesign_kludge ()
  This is for forms compatibility only.
- void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
- void add (Fl_Widget *)
  See void Fl_Group::add(Fl_Widget &w)
- void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
- Fl_Widget *const * array () const
  Returns a pointer to the array of children.
- Fl_Group const * as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
- Fl_Widget * child (int n) const
  Returns array()[n].
- int children () const
  Returns how many child widgets the group has.
- void clear ()
  Deletes all child widgets from memory recursively.
- unsigned int clip_children ()
  Returns the current clipping mode.
- void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
- void end ()
  Exactly the same as current(this->parent()).
- int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
- int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
- Fl_Group (int, int, int, int, const char *)=0
  Creates a new Fl_Group widget using the given position, size, and label string.
- void focus (Fl_Widget *)
- void forms_end ()
  This is for forms compatibility only.
- int handle (int) FL_OVERRIDE
  Handles the specified event.
- void init_sizes ()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &, Fl_Widget *)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *)
Removes the widget from the group.

• void remove (int index)
  Removes the widget at index from the group but does not delete it.

• Fl_Widget ∗ resizable () const
  Returns the group’s resizable widget.

• void resizable (Fl_Widget &o)
  Sets the group’s resizable widget.

• void resizable (Fl_Widget ∗o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

• void resize (int, int, int, int) FL_OVERRID
  Resizes the Fl_Group widget and all of its children.

• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.

• unsigned int active () const
  Returns whether the widget is active.

• int active_r () const
  Returns whether the widget and all of its parents are active.

• Fl_Align align () const
  Gets the label alignment.

• void align (Fl_Align alignment)
  Sets the label alignment.

• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const ∗ as_gl_window () const
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void bind_image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.

• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype box () const
  Gets the box type of the widget.

• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

• Fl_Callback_p callback () const
Gets the current callback function for the widget.

- void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)
  Sets the current label.

- void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.
• **FL_Image * deimage ()**
  
  *Gets the image that is used as part of the widget label when in the inactive state.*

• **const FL_Image * deimage () const**
  
  *Gets the image that is used as part of the widget label when in the inactive state.*

• **void deimage (FL_Image &img)**
  
  *Sets the image to use as part of the widget label when in the inactive state.*

• **void deimage (FL_Image *img)**
  
  *Sets the image to use as part of the widget label when in the inactive state.*

• **int deimage_bound () const**
  
  *Returns whether the inactive image is managed by the widget.*

• **void do_callback (FI_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  *Calls the widget callback function with default arguments.*

• **void do_callback (FI_Widget *widget, long arg, FI_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  *Calls the widget callback function with arbitrary arguments.*

• **void do_callback (FI_Widget *widget, void *arg=0, FI_Callback_Reason reason=FL_REASON_UNKNOWN)**
  
  *Calls the widget callback function with arbitrary arguments.*

• **void draw_label (int, int, int, int, FI_Align) const**
  
  *Draws the label in an arbitrary bounding box with an arbitrary alignment.*

• **int h () const**
  
  *Gets the widget height.*

• **virtual void hide ()**
  
  *Makes a widget invisible.*

• **FL_Image * image ()**
  
  *Gets the image that is used as part of the widget label when in the active state.*

• **const FL_Image * image () const**
  
  *Gets the image that is used as part of the widget label when in the active state.*

• **void image (FL_Image &img)**
  
  *Sets the image to use as part of the widget label when in the active state.*

• **void image (FL_Image *img)**
  
  *Sets the image to use as part of the widget label when in the active state.*

• **int image_bound () const**
  
  *Returns whether the image is managed by the widget.*

• **int inside (const FL_Widget *wgt) const**
  
  *Checks if this widget is a child of wgt.*

• **int is_label_copied () const**
  
  *Returns whether the current label was assigned with copy_label().*

• **const char * label () const**
  
  *Gets the current label text.*

• **void label (const char *text)**
  
  *Sets the current label pointer.*

• **void label (FI_Labeltype a, const char *b)**
  
  *Shortcut to set the label text and type in one call.*

• **FL_Color labelcolor () const**
  
  *Gets the label color.*

• **void labelcolor (FL_Color c)**
  
  *Sets the label color.*

• **FL_Font labelfont () const**
  
  *Gets the font to use.*

• **void labelfont (FL_Font f)**
  
  *Sets the font to use.*

• **FI_Fontsize labelsize () const**
Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '§' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '§' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Widget * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Public Attributes

• Fl_Scrollbar hscrollbar
  Horizontal scrollbar.

• Fl_Scrollbar scrollbar
  Vertical scrollbar.
Protected Member Functions

- void **bbox** (int &X, int &Y, int &W, int &H) const
  
  Returns the bounding box for the interior of the list's display window, inside the scrollbars.

- void **deleting** (void *item)
  
  This method should be used when item is being deleted from the list.

- int **displayed** (void *item) const
  
  Returns non-zero if item has been scrolled to a position where it is being displayed.

- void **draw** () FL_OVERRIDE
  
  Draws the list within the normal widget bounding box.

- void *find_item (int ypos)
  
  This method returns the item under mouse y position ypos.

- **Fl_Browser_** (int X, int Y, int W, int H, const char *L=0)
  
  The constructor makes an empty browser.

- virtual int **full_height** () const
  
  This method may be provided by the subclass to indicate the full height of the item list, in pixels.

- virtual int **full_width** () const
  
  This method may be provided by the subclass to indicate the full width of the item list, in pixels.

- virtual int **incr_height** () const
  
  This method may be provided to return the average height of all items to be used for scrolling.

- void **inserting** (void *a, void *b)
  
  This method should be used when an item is in the process of being inserted into the list.

- virtual void *item_at (int index) const
  
  This method must be provided by the subclass to return the item for the specified index.

- virtual void **item_draw** (void *item, int X, int Y, int W, int H) const =0
  
  This method must be provided by the subclass to draw the item in the area indicated by X, Y, W, H.

- virtual void *item_first () const =0
  
  This method must be provided by the subclass to return the first item in the list.

- virtual int **item_height** (void *item) const =0
  
  This method must be provided by the subclass to return the height of item in pixels.

- virtual void *item_last () const
  
  This method must be provided by the subclass to return the last item in the list.

- virtual void *item_next (void *item) const =0
  
  This method must be provided by the subclass to return the item in the list after item.

- virtual void *item_prev (void *item) const =0
  
  This method must be provided by the subclass to return the item in the list before item.

- virtual int **item_quick_height** (void *item) const
  
  This method may be provided by the subclass to return the height of the item, in pixels.

- virtual void **item_select** (void *item, int val=1)
  
  This method must be implemented by the subclass if it supports multiple selections; sets the selection state to val for the item.

- virtual int **item_selected** (void *item) const
  
  This method must be implemented by the subclass if it supports multiple selections; returns the selection state for item.

- virtual void **item_swap** (void *a, void *b)
  
  This optional method should be provided by the subclass to efficiently swap browser items a and b, such as for sorting.

- virtual const char * **item_text** (void *item) const
  
  This optional method returns a string (label) that may be used for sorting.

- virtual int **item_width** (void *item) const =0
  
  This method must be provided by the subclass to return the width of the item in pixels.
This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

- **void new_list ()**
  This method should be called when the list data is completely replaced or cleared.

- **void redraw_line (void *item)**
  This method should be called when the contents of item has changed, but not its height.

- **void redraw_lines ()**
  This method will cause the entire list to be redrawn.

- **void replacing (void *a, void *b)**
  This method should be used when item a is being replaced by item b.

- **void *selection () const**
  Returns the item currently selected, or NULL if there is no selection.

- **void swapping (void *a, void *b)**
  This method should be used when two items a and b are being swapped.

- **void *top () const**
  Returns the item that appears at the top of the list.

Protected Member Functions inherited from Fl_Group

- **Fl_Rect *bounds ()**
  Returns the internal array of widget sizes and positions.

- **void draw () FL_OVERRIDE**
  Draws the widget.

- **void draw_child (Fl_Widget &widget) const**
  Forces a child to redraw.

- **void draw_children ()**
  Draws all children of the group.

- **void draw_outside_label (const Fl_Widget &widget) const**
  Parents normally call this to draw outside labels of child widgets.

- **virtual int on_insert (Fl_Widget *, int)**
  Allow derived groups to act when a widget is added as a child.

- **virtual int on_move (int, int)**
  Allow derived groups to act when a widget is moved within the group.

- **virtual void on_remove (int)**
  Allow derived groups to act when a child widget is removed from the group.

- **int *sizes ()**
  Returns the internal array of widget sizes and positions.

- **void update_child (Fl_Widget &widget) const**
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- **void clear_flag (unsigned int c)**
  Clears a flag in the flags mask.

- **void draw_backdrop () const**
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box () const**
  Draws the widget box according its box style.

- **void draw_box (Fl_Boxtype t, Fl_Color c) const**
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const**
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus () const**

Generated by Doxygen
**Draws a focus rectangle around the widget.**

- `void draw_focus(Fl_Widget t, int X, int Y, int W, int H) const`
  
  Draws a focus rectangle around the widget.

- `void draw_focus(Fl_Widget t, int x, int y, int w, int h, Fl_Color bg) const`
  
  Draws a focus box for the widget at the given position and size.

- `void draw_label() const`
  
  Draws the widget's label at the defined label position.

- `void draw_label(int, int, int, int) const`
  
  Draws the label in an arbitrary bounding box.

- `Fl_Widget(int x, int y, int w, int h, const char *label=0L)`
  
  Creates a widget at the given position and size.

- `unsigned int flags() const`
  
  Gets the widget flags mask.

- `void h(int v)`
  
  Internal use only.

- `void set_flag(unsigned int c)`
  
  Sets a flag in the flags mask.

- `void w(int v)`
  
  Internal use only.

- `void x(int v)`
  
  Internal use only.

- `void y(int v)`
  
  Internal use only.

### Additional Inherited Members

**Static Public Member Functions inherited from Fl_Group**

- `static Fl_Group * current()`
  
  Returns the currently active group.

- `static void current(Fl_Group *g)`
  
  Sets the current group.

**Static Public Member Functions inherited from Fl_Widget**

- `static void default_callback(Fl_Widget *widget, void *data)`
  
  The default callback for all widgets that don't set a callback.

- `static unsigned int label_shortcut(const char *t)`
  
  Returns the Unicode value of the '&x' shortcut in a given text.

- `static int test_shortcut(const char *t, const bool require_alt=false)`
  
  Returns true if the given text t contains the entered '&x' shortcut.

**Protected Types inherited from Fl_Widget**

- `enum {
  INACTIVE = 1<10, INVISIBLE = 1<11, OUTPUT = 1<12, NOBORDER = 1<13,
  FORCE_POSITION = 1<14, NON_MODAL = 1<15, SHORTCUT_LABEL = 1<16, CHANGED = 1<17,
  OVERRIDE = 1<18, VISIBLE_FOCUS = 1<19, COPIED_LABEL = 1<20, CLIP_CHILDREN = 1<21,
  MENU_WINDOW = 1<22,_TOOLTIP_WINDOW = 1<23, MODAL = 1<24, NO_OVERLAY = 1<25,
  GROUP_RELATIVE = 1<26, COPIED_TOOLTIP = 1<27, FULLSCREEN = 1<28, MAC_USE_ACCENTS_MENU = 1<29,
} Generated by Doxygen
NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
AUTO_DELETE_USER_DATA = 1<<23 ,
MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 \}

flags possible values enumeration.

12.14.1 Detailed Description

This is the base class for browsers. To be useful it must be subclassed and several virtual functions defined. The Forms-compatible browser and the file chooser's browser are subclassed off of this. This has been designed so that the subclass has complete control over the storage of the data, although because next() and prev() functions are used to index, it works best as a linked list or as a large block of characters in which the line breaks must be searched for. A great deal of work has been done so that the "height" of a data object does not need to be determined until it is drawn. This is useful if actually figuring out the size of an object requires accessing image data or doing stat() on a file or doing some other slow operation. Callbacks are called when the value changes with FL_REASON_CHANGED. If FL_WHEN_RELEASE is set, callbacks are called when the mouse button is released with FL_REASON_CHANGED or FL_REASON_RESELECTED if the selection did not change. If FL_WHEN_ENTER_KEY is set, callbacks are also called when key presses or double clicks change the selection.

Keyboard navigation of browser items

The keyboard navigation of browser items is only possible if visible_focus() is enabled. If disabled, the widget rejects keyboard focus; Tab and Shift-Tab focus navigation will skip the widget. In 'Select' and 'Normal' mode, the widget rejects keyboard focus; no navigation keys are supported (other than scrollbar positioning). In 'Hold' mode, the widget accepts keyboard focus, and Up/Down arrow keys can navigate the selected item. In 'Multi' mode, the widget accepts keyboard focus, and Up/Down arrow keys navigate the focus box; Space toggles the current item's selection, Enter selects only the current item (deselects all others). If Shift (or Ctrl) is combined with Up/Down arrow keys, the current item's selection state is extended to the next item. In this way one can extend a selection or de-selection.

12.14.2 Member Enumeration Documentation

12.14.2.1 anonymous enum

Anonymous enum bit flags for has_scrollbar().

Anonymous enum

Values for has_scrollbar().

Anonymous enum bit flags for has_scrollbar().

- bit 0: horizontal
- bit 1: vertical
- bit 2: 'always' (to be combined with bits 0 and 1)
- bit 3-31: reserved for future use

Enumerator

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HORIZONTAL</td>
<td>Only show horizontal scrollbar.</td>
</tr>
<tr>
<td>VERTICAL</td>
<td>Only show vertical scrollbar.</td>
</tr>
<tr>
<td>BOTH</td>
<td>Show both scrollbars. (default)</td>
</tr>
<tr>
<td>ALWAYS_ON</td>
<td>Specified scrollbar(s) should 'always' be shown (to be used with HORIZONTAL/VERTICAL)</td>
</tr>
<tr>
<td>HORIZONTAL_ALWAYS</td>
<td>Horizontal scrollbar always on.</td>
</tr>
<tr>
<td>VERTICAL_ALWAYS</td>
<td>Vertical scrollbar always on.</td>
</tr>
<tr>
<td>BOTH_ALWAYS</td>
<td>Both scrollbars always on.</td>
</tr>
</tbody>
</table>
### Constructor & Destructor Documentation

#### Fl_Browser_()

```cpp
Fl_Browser_::Fl_Browser_ ( 
    int X, 
    int Y, 
    int W, 
    int H, 
    const char ∗L = 0 ) [protected]
```

The constructor makes an empty browser.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>in</code></td>
<td><code>X,Y,W,H</code></td>
<td>position and size.</td>
</tr>
<tr>
<td><code>in</code></td>
<td><code>L</code></td>
<td>The label string, may be NULL.</td>
</tr>
</tbody>
</table>

### Member Function Documentation

#### bbox()

```cpp
void Fl_Browser_::bbox ( 
    int ∗X, 
    int ∗Y, 
    int ∗W, 
    int ∗H ) const [protected]
```

Returns the bounding box for the interior of the list's display window, inside the scrollbars.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>out</code></td>
<td><code>X,Y,W,H</code></td>
<td>The returned bounding box. (The original contents of these parameters are overwritten)</td>
</tr>
</tbody>
</table>

#### deleting()

```cpp
void Fl_Browser_::deleting ( 
    void ∗item ) [protected]
```

This method should be used when `item` is being deleted from the list.
It allows the `Fl_Browser_` to discard any cached data it has on the item. This method does not actually delete the item, but handles the follow up bookkeeping after the item has just been deleted.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>in</code></td>
<td><code>item</code></td>
<td>The item being deleted.</td>
</tr>
</tbody>
</table>

#### deselect()

```cpp
int Fl_Browser_::deselect ( 
    int docallbacks = 0 )
```

Deselects all items in the list and returns 1 if the state changed or 0 if it did not.
If the optional `docallbacks` parameter is non-zero, deselect tries to call the callback function for the widget.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>in</code></td>
<td><code>docallbacks</code></td>
<td>If non-zero, invokes widget callback if item changed. If 0, doesn't do callback (default).</td>
</tr>
</tbody>
</table>
12.14.4.4  display()

```cpp
void Fl_Browser_::display ( void * item )
```

Displays the item, scrolling the list as necessary.

**Parameters**

- **item**: The item to be displayed.

**See also**

- display(), displayed()

12.14.4.5  displayed()

```cpp
int Fl_Browser_::displayed ( void * item ) const [protected]
```

Returns non-zero if item has been scrolled to a position where it is being displayed. Checks to see if the item's vertical position is within the top and bottom edges of the display window. This does NOT take into account the hide()/show() status of the widget or item.

**Parameters**

- **item**: The item to check

**Returns**

1 if visible, 0 if not visible.

**See also**

- display(), displayed()

12.14.4.6  draw()

```cpp
void Fl_Browser_::draw ( void ) [protected], [virtual]
```

Draws the list within the normal widget bounding box. Implements Fl_Widget.

12.14.4.7  find_item()

```cpp
void * Fl_Browser_::find_item ( int ypos ) [protected]
```

This method returns the item under mouse y position ypos. NULL is returned if no item is displayed at that position.

**Parameters**

- **ypos**: The y position (eg. Fl::event_y()) to find an item under.

**Returns**

- The item, or NULL if not found
12.14.4.8 full_height()

```cpp
int Fl_Browser_::full_height ( ) const [protected], [virtual]
```

This method may be provided by the subclass to indicate the full height of the item list, in pixels. The default implementation computes the full height from the item heights. Includes the items that are scrolled off screen.

Returns

The height of the entire list, in pixels.

Reimplemented in `Fl_Browser`.

12.14.4.9 full_width()

```cpp
int Fl_Browser_::full_width ( ) const [protected], [virtual]
```

This method may be provided by the subclass to indicate the full width of the item list, in pixels. The default implementation computes the full width from the item widths.

Returns

The maximum width of all the items, in pixels.

12.14.4.10 handle()

```cpp
int Fl_Browser_::handle ( int event ) [virtual]
```

Handles the `event` within the normal widget bounding box.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>event</th>
<th>The event to process.</th>
</tr>
</thead>
</table>

Returns

1 if `event` was processed, 0 if not.

Reimplemented from `Fl_Widget`.
Reimplemented in `Fl_Check_Browser`.

12.14.4.11 has_scrollbar()

```cpp
void Fl_Browser_::has_scrollbar ( uchar mode ) [inline]
```

Sets whether the widget should have scrollbars or not (default `Fl_Browser_::BOTH`). By default you can scroll in both directions, and the scrollbars disappear if the data will fit in the widget. `has_scrollbar()` changes this based on the value of `mode`:

- 0 - No scrollbars.
- `Fl_Browser_::HORIZONTAL` - Only a horizontal scrollbar.
- `Fl_Browser_::VERTICAL` - Only a vertical scrollbar.
- `Fl_Browser_::BOTH` - The default is both scrollbars.
- `Fl_Browser_::HORIZONTAL_ALWAYS` - Horizontal scrollbar always on, vertical always off.
- `Fl_Browser_::VERTICAL_ALWAYS` - Vertical scrollbar always on, horizontal always off.
- `Fl_Browser_::BOTH_ALWAYS` - Both always on.
12.14.4.12 `hposition()` [1/2]

```c
int Fl_Browser_::hposition () const [inline]
```

Gets the horizontal scroll position of the list as a pixel position `pos`. The position returned is how many pixels of the list are scrolled off the left edge of the screen. Example: A position of '18' indicates the left 18 pixels of the list are scrolled off the left edge of the screen.

See also

```c
position(), hposition()
```

12.14.4.13 `hposition()` [2/2]

```c
void Fl_Browser_::hposition ( int pos )
```

Sets the horizontal scroll position of the list to pixel position `pos`. The position is how many pixels of the list are scrolled off the left edge of the screen. Example: A position of '18' scrolls the left 18 pixels of the list off the left edge of the screen.

Parameters

```c
pos
```

The horizontal position (in pixels) to scroll the browser to.

See also

```c
vposition(), hposition()
```

12.14.4.14 `incr_height()`

```c
int Fl_Browser_::incr_height ( ) const [protected], [virtual]
```

This method may be provided to return the average height of all items to be used for scrolling. The default implementation uses the height of the first item.

Returns

The average height of items, in pixels.

Reimplemented in `Fl_Browser`.

12.14.4.15 `inserting()`

```c
void Fl_Browser_::inserting ( void * a, void * b ) [protected]
```

This method should be used when an item is in the process of being inserted into the list. It allows the `Fl_Browser` to update its cache data as needed, scheduling a redraw for the affected lines. This method does not actually insert items, but handles the follow up bookkeeping after items have been inserted.

Parameters

```c
a
b
```

The starting item position

The new item being inserted

12.14.4.16 `item_at()`

```c
virtual void * Fl_Browser_::item_at ( int index ) const [inline], [protected], [virtual]
```

This method must be provided by the subclass to return the item for the specified `index`.
Parameters

- **in index** The index of the item to be returned.

Returns

- The item at the specified index.

Reimplemented in Fl_Check_Browser, and Fl_Browser.

### 12.14.4.17 item_draw()

```cpp
virtual void Fl_Browser_::item_draw ( 
    void * item,
    int X,
    int Y,
    int W,
    int H ) const [protected], [pure virtual]
```

This method must be provided by the subclass to draw the item in the area indicated by X, Y, W, H.
Implemented in Fl_Check_Browser, and Fl_Browser.

### 12.14.4.18 item_first()

```cpp
virtual void * Fl_Browser_::item_first ( ) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the first item in the list.

See also:
- item_first(), item_next(), item_last(), item_prev()  

Implemented in Fl_Browser, and Fl_Check_Browser.

### 12.14.4.19 item_height()

```cpp
virtual int Fl_Browser_::item_height ( 
    void * item ) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the height of item in pixels.
Allow for two additional pixels for the list selection box.

Parameters

- **in item** The item whose height is returned.

Returns

- The height of the specified item in pixels.

See also:
- item_height(), item_width(), item_quick_height()  

Implemented in Fl_Check_Browser, and Fl_Browser.

### 12.14.4.20 item_last()

```cpp
virtual void * Fl_Browser_::item_last ( ) const [inline], [protected], [virtual]
```

This method must be provided by the subclass to return the last item in the list.

See also:
- item_first(), item_next(), item_last(), item_prev()  

Reimplemented in Fl_Browser.
12.14.4.21 item_next()

virtual void * Fl_Browser_::item_next (  
    void * item ) const [protected], [pure virtual]  
This method must be provided by the subclass to return the item in the list after item.

See also

    item_first(), item_next(), item_last(), item_prev()

Implemented in Fl_Check_Browser, and Fl_Browser.

12.14.4.22 item_prev()

virtual void * Fl_Browser_::item_prev (  
    void * item ) const [protected], [pure virtual]  
This method must be provided by the subclass to return the item in the list before item.

See also

    item_first(), item_next(), item_last(), item_prev()

Implemented in Fl_Check_Browser, and Fl_Browser.

12.14.4.23 item_quick_height()

int Fl_Browser_::item_quick_height (  
    void * item ) const [protected], [virtual]  
This method may be provided by the subclass to return the height of the item, in pixels.  
Allow for two additional pixels for the list selection box. This method differs from item_height in that it is only called for selection and scrolling operations. The default implementation calls item_height.

Parameters

| in  | item | The item whose height to return. |

Returns

The height, in pixels.

12.14.4.24 item_select()

void Fl_Browser_::item_select (  
    void * item,  
    int val = 1 ) [protected], [virtual]  
This method must be implemented by the subclass if it supports multiple selections; sets the selection state to val for the item.

Sets the selection state for item, where optional val is 1 (select, the default) or 0 (de-select).

Parameters

| in  | item | The item to be selected |
| in  | val  | The optional selection state; 1=select, 0=de-select. The default is to select the item (1). |

Reimplemented in Fl_Check_Browser, and Fl_Browser.

12.14.4.25 item_selected()

int Fl_Browser_::item_selected (  

This method must be implemented by the subclass if it supports multiple selections; returns the selection state for
item.
The method should return 1 if item is selected, or 0 otherwise.

Parameters

| in  | item | The item to test. |

Reimplemented in Fl_Check_Browser, and Fl_Browser.

12.14.4.26 item_swap()

virtual void Fl_Browser_::item_swap (void * a, void * b) [inline], [protected], [virtual]

This optional method should be provided by the subclass to efficiently swap browser items a and b, such as for sorting.

Parameters

| in  | a,b | The two items to be swapped. |

Reimplemented in Fl_Browser, and Fl_Check_Browser.

12.14.4.27 item_text()

virtual const char * Fl_Browser_::item_text (void * item) const [inline], [protected], [virtual]

This optional method returns a string (label) that may be used for sorting.

Parameters

| in  | item | The item whose label text is returned. |

Returns

The item's text label. (Can be NULL if blank)

Reimplemented in Fl_Browser, and Fl_Check_Browser.

12.14.4.28 item_width()

virtual int Fl_Browser_::item_width (void * item) const [protected], [pure virtual]

This method must be provided by the subclass to return the width of the item in pixels.
Allow for two additional pixels for the list selection box.

Parameters

| in  | item | The item whose width is returned. |
Returns
The width of the item in pixels.

Implemented in Fl_Check_Browser, and Fl_Browser.

12.14.4.29 leftedge()

int Fl_Browser_::leftedge ( ) const [protected]
This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

Returns
The X position of the left edge of the list, in pixels.

See also
Fl_Browser_::bbox()

12.14.4.30 linespacing() [1/2]

int Fl_Browser_::linespacing ( ) const [inline]
Return the height of additional spacing between browser lines.

Returns
spacing height in pixel units.

12.14.4.31 linespacing() [2/2]

void Fl_Browser_::linespacing ( int pixels ) [inline]
Add some space between browser lines.

Parameters

| in   | pixels | number of additional pixels between lines |

12.14.4.32 new_list()

void Fl_Browser_::new_list ( ) [protected]
This method should be called when the list data is completely replaced or cleared. It informs the Fl_Browser_ widget that any cached information it has concerning the items is invalid. This method does not clear the list, it just handles the follow up bookkeeping after the list has been cleared.

12.14.4.33 position() [1/2]

int Fl_Browser_::position ( ) const [inline]

Deprecated "in 1.4.0 - use vposition() instead"

12.14.4.34 position() [2/2]

void Fl_Browser_::position ( int pos ) [inline]

Deprecated "in 1.4.0 - use vposition(pos) instead"
12.14.4.35 redraw_line()

```cpp
void Fl_Browser_::redraw_line ( void * item ) [protected]
```

This method should be called when the contents of item has changed, but not its height.

Parameters

- **in item** The item that needs to be redrawn.

See also

- `redraw_lines()`, `redraw_line()`

12.14.4.36 redraw_lines()

```cpp
void Fl_Browser_::redraw_lines ( ) [inline], [protected]
```

This method will cause the entire list to be redrawn.

See also

- `redraw_lines()`, `redraw_line()`

12.14.4.37 replacing()

```cpp
void Fl_Browser_::replacing ( void * a, void * b ) [protected]
```

This method should be used when item a is being replaced by item b. It allows the Fl_Browser_ to update its cache data as needed, schedules a redraw for the item being changed, and tries to maintain the selection. This method does not actually replace the item, but handles the follow up bookkeeping after the item has just been replaced.

Parameters

- **in a** Item being replaced
- **in b** Item to replace `a`

12.14.4.38 resize()

```cpp
void Fl_Browser_::resize ( int X, int Y, int W, int H ) [virtual]
```

Repositions and/or resizes the browser.

Parameters

- **in X,Y,W,H** The new position and size for the browser, in pixels.

Reimplemented from Fl_Widget.

12.14.4.39 scrollbar_left()

```cpp
void Fl_Browser_::scrollbar_left ( ) [inline]
```

Moves the vertical scrollbar to the lefthand side of the list.
For back compatibility.

12.14.40 scrollbar_right()
void Fl_Browser_::scrollbar_right ( ) [inline]
Moves the vertical scrollbar to the righthand side of the list.
For back compatibility.

12.14.41 scrollbar_size() [1/2]
int Fl_Browser_::scrollbar_size ( ) const [inline]
Gets the current size of the scrollbars' troughs, in pixels.
If this value is zero (default), this widget will use the Fl::scrollbar_size() value as the scrollbar's width.

Returns
Scrollbar size in pixels, or 0 if the global Fl::scrollbar_size() is being used.

See also
Fl::scrollbar_size(int)

12.14.42 scrollbar_size() [2/2]
void Fl_Browser_::scrollbar_size ( int newSize ) [inline]
Sets the pixel size of the scrollbars' troughs to newSize, in pixels.
Normally you should not need this method, and should use Fl::scrollbar_size(int) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.
Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.
Setting newSize to the special value of 0 causes the widget to track the global Fl::scrollbar_size(), which is the default.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>newSize</th>
<th>Sets the scrollbar size in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If 0 (default), scrollbar size tracks the global Fl::scrollbar_size()</td>
</tr>
</tbody>
</table>

See also
Fl::scrollbar_size()

12.14.43 scrollbar_width() [1/2]
int Fl_Browser_::scrollbar_width ( ) const [inline]
Returns the global value Fl::scrollbar_size().

Deprecated Use scrollbar_size() instead.
Todo This method should eventually be removed in 1.4+

12.14.44 scrollbar_width() [2/2]
void Fl_Browser_::scrollbar_width ( int width ) [inline]
Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

Deprecated Use scrollbar_size() instead.
Todo This method should eventually be removed in 1.4+
12.14.45 select()

```
int Fl_Browser_::select (  
    void * item,  
    int val = 1,  
    int docallbacks = 0 )  
```

Sets the selection state of `item` to `val`, and returns 1 if the state changed or 0 if it did not. If `docallbacks` is non-zero, select tries to call the callback function for the widget.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item whose selection state is to be changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>val</td>
<td>The new selection state (1=select, 0=de-select)</td>
</tr>
<tr>
<td>in</td>
<td>docallbacks</td>
<td>If non-zero, invokes widget callback if item changed. If 0, doesn't do callback (default).</td>
</tr>
</tbody>
</table>

Returns

1 if state was changed, 0 if not.

12.14.46 select_only()

```
int Fl_Browser_::select_only (  
    void * item,  
    int docallbacks = 0 )  
```

Selects `item` and returns 1 if the state changed or 0 if it did not. Any other items in the list are deselected.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>item</th>
<th>The item to select.</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>docallbacks</td>
<td>If non-zero, invokes widget callback if item changed. If 0, doesn't do callback (default).</td>
</tr>
</tbody>
</table>

12.14.47 selection()

```
void * Fl_Browser_::selection ( ) const [inline], [protected]  
```

Returns the item currently selected, or NULL if there is no selection. For multiple selection browsers this call returns the currently focused item, even if it is not selected. To find all selected items, call `Fl_Multi_Browser::selected()` for every item in question.

12.14.48 sort()

```
void Fl_Browser_::sort (  
    int flags = 0 )  
```

Sort the items in the browser based on `flags`. `item_swap(void*, void*)` and `item_text(void*)` must be implemented for this call.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>flags</th>
<th>FL_SORT_ASCENDING – sort in ascending order</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>FL_SORT_DESCENDING – sort in descending order</td>
<td>FL_SORT_CASEINSENSITIVE – add this to sort case-insensitively</td>
</tr>
<tr>
<td></td>
<td>Values other than the above will cause undefined behavior</td>
<td>Other flags may appear in the future.</td>
</tr>
</tbody>
</table>
12.14.49 swapping()

```cpp
void Fl_Browser_::swapping (  
  void ∗ a,  
  void ∗ b ) [protected]
```

This method should be used when two items \( a \) and \( b \) are being swapped.

It allows the `Fl_Browser_` to update its cache data as needed, schedules a redraw for the two items, and tries to maintain the current selection. This method does not actually swap items, but handles the follow up bookkeeping after items have been swapped.

**Parameters**

- **in \( a, b \)** Items being swapped.

12.14.50 textfont()

```cpp
Fl_Font Fl_Browser_::textfont ( ) const [inline]
```

Gets the default text font for the lines in the browser.

See also

- `textfont(), textsize(), textcolor()`

12.14.51 vposition() [1/2]

```cpp
int Fl_Browser_::vposition ( ) const [inline]
```

Gets the vertical scroll position of the list as a pixel position \( \text{pos} \).

The position returned is how many pixels of the list are scrolled off the top edge of the screen. Example: A position of '3' indicates the top 3 pixels of the list are scrolled off the top edge of the screen.

See also

- `position(), hposition()`

12.14.52 vposition() [2/2]

```cpp
void Fl_Browser_::vposition (  
  int ∗ pos )
```

Sets the vertical scroll position of the list to pixel position \( \text{pos} \).

The position is how many pixels of the list are scrolled off the top edge of the screen. Example: A position of '3' scrolls the top three pixels of the list off the top edge of the screen.

**Parameters**

- **in \( \text{pos} \)** The vertical position (in pixels) to scroll the browser to.

See also

- `vposition(), hposition()`

12.14.5 Member Data Documentation

12.14.5.1 hscrollbar

```cpp
Fl_Scrollbar Fl_Browser_::hscrollbar
```

Horizontal scrollbar.

Public, so that it can be accessed directly.
### 12.14.5.2 scrollbar

**Fl_Scrollbar Fl_Browser_::scrollbar**  
Vertical scrollbar.  
Public, so that it can be accessed directly.  
Use `scrollbar_left()` or `scrollbar_right()` to change what side the vertical scrollbar is drawn on.  
Use `scrollbar.align(int)` (see `Fl_Widget::align(Fl_Align)`) to change what side either of the scrollbars is drawn on.  
If the `FL_ALIGN_LEFT` bit is on, the vertical scrollbar is on the left. If the `FL_ALIGN_TOP` bit is on, the horizontal scrollbar is on the top. Note that only the alignment flags in scrollbar are considered. The flags in hscrollbar however are ignored.  
The documentation for this class was generated from the following files:

- `Fl_Browser_.H`
- `Fl_Browser_.cxx`

### 12.15 Fl_Button Class Reference

Buttons generate callbacks when they are clicked by the user.  
```
#include <Fl_Button.H>
```

Inheritance diagram for `Fl_Button`:

```
  Fl_Widget
   ^            ^
   |            |
  Fl_Button
   |            |
  Fl_Light_Button Fl_Radio_Button Fl_Repeat_Button Fl_Return_Button Fl_Shortcut_Button Fl_Toggle_Button
   |            |
  Fl_Check_Button Fl_Radio_Light_Button Fl_Round_Button Fl_Radio_Round_Button
```

#### Public Member Functions

- int `clear()`  
  *Same as `value(0)`.*
- uchar `compact()`  
  *Return true if buttons are rendered as compact buttons.*
- void `compact(uchar v)`  
  *Decide if buttons should be rendered in compact mode.*
- `Fl_Boxtype down_box()` const  
  *Returns the current down box type, which is drawn when `value()` is non-zero.*
- void `down_box(Fl_Boxtype b)`  
  *Sets the down box type.*
- `Fl_Color down_color()` const  
  *(for backwards compatibility)*
- void `down_color(unsigned c)`  
  *(for backwards compatibility)*
- `Fl_Button(int X, int Y, int W, int H, const char *L=0)`  
  *The constructor creates the button using the given position, size, and label.*
- int `handle(int)` **FL_OVERRIDE**  
  *Handles the specified event.*
- int `set()`  
  *Same as `value(1)`.*
- void `setonly()`  
  *Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).*
- int `shortcut()` const
Returns the current shortcut key for the button.

- void `shortcut` (const char ∗s)
  (for backwards compatibility)
- void `shortcut` (int s)
  Sets the shortcut key to s.
- char `value` () const
  Returns the current value of the button (0 or 1).
- int `value` (int v)
  Sets the current value of the button.

Public Member Functions inherited from Fl_Widget

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
  Activates the widget.
- unsigned int `active` () const
  Returns whether the widget is active.
- int `active_r` () const
  Returns whether the widget and all of its parents are active.
- Fl_Align `align` () const
  Gets the label alignment.
- void `align` (Fl_Align alignment)
  Sets the label alignment.
- long `argument` () const
  Gets the current user data (long) argument that is passed to the callback function.
- void `argument` (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗`as_gl_window` ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗`as_gl_window` () const
- virtual Fl_Group ∗`as_group` ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const ∗`as_group` () const
- virtual Fl_Window ∗`as_window` ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗`as_window` () const
- void `bind_deimage` (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.
- void `bind_deimage` (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void `bind_image` (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
- void `bind_image` (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype `box` () const
  Gets the box type of the widget.
- void `box` (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p `callback` () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
• void copy_label (const char *new_label)
  Sets the current label.
• void copy_tooltip (const char *text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image * deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound () const`
  Returns whether the inactive image is managed by the widget.

- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.

- `void do_callback (Fl_Widget *wgt, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- `void do_callback (Fl_Widget *wgt, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- `void draw_label (int, int, int, int, Fl_Align) const`
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h () const`
  Gets the widget height.

- `virtual void hide ()`
  Makes a widget invisible.

- `Fl_Image * image ()`
  Gets the image that is used as part of the widget label when in the active state.

- `const Fl_Image * image () const`
  Gets the image that is used as part of the widget label when in the active state.

- `void image (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the active state.

- `void image (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the active state.

- `int image_bound () const`
  Returns whether the image is managed by the widget.

- `int inside (const Fl_Widget *wgt) const`
  Checks if this widget is a child of `wgt`.

- `int is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`
  Gets the current label text.

- `void label (const char *text)`
  Sets the current label pointer.

- `void label (Fl_LabelType a, const char *b)`
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  Gets the label color.

- `void labelcolor (Fl_Color c)`
  Sets the label color.

- `Fl_Font labelfont () const`
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.

• Fl_Group * parent () const
  Returns a pointer to the parent widget.

• void parent (Fl_Group * p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  Gets the selection color.

• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.

• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
Returns if the widget is able to take events.

- `int test_shortcut ()`
  Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
  Gets the current tooltip text.

- `void tooltip (const char *text)`
  Sets the current tooltip text.

- `FL_Window * top_window () const`
  Returns a pointer to the top-level window for the widget.

- `FL_Window * top_window_offset (int &xoff, int &yoff) const`
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  Gets the widget type.

- `void type (uchar t)`
  Sets the widget type.

- `int use_accents_menu ()`
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void * user_data () const`
  Gets the user data for this widget.

- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
  Sets the user data for this widget.

- `void user_data (void *v)`
  Sets the user data for this widget.

- `unsigned int visible () const`
  Returns whether a widget is visible.

- `unsigned int visible_focus () const`
  Checks whether this widget has a visible focus.

- `void visible_focus (int v)`
  Modifies keyboard focus navigation.

- `int visible_r () const`
  Returns whether a widget and all its parents are visible.

- `int w () const`
  Gets the widget width.

- `Fl_When when () const`
  Returns the conditions under which the callback is called.

- `void when (uchar i)`
  Sets the flags used to decide when a callback is called.

- `FL_Window * window () const`
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x () const`
  Gets the widget position in its window.

- `int y () const`
  Gets the widget position in its window.

- `virtual ~Fl_Widget ()`
  Destroys the widget.

### Protected Member Functions

- `void draw () FL_OVERRIDE`
  Draws the widget.

- `void simulate_key_action ()`
Protected Member Functions inherited from Fl_Widget

- void **clear_flag** (unsigned int c)
  Clears a flag in the flags mask.
- void **draw_backdrop** () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
  Draws the widget box according its box style.
- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
  Draws a focus rectangle around the widget.
- void **draw_focus** (Fl_Boxtype t, int X, int Y , int W, int H) const
  Draws a focus rectangle around the widget.
- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
  Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)
  Creates a widget at the given position and size.
- unsigned int **flags** () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Static Protected Member Functions

- static void **key_release_timeout** (void ∗)

Static Protected Attributes

- static Fl_Widget_Tracker ∗ **key_release_tracker** = 0

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void **default_callback** (Fl_Widget ∗ widget, void ∗ data)
  The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char ∗ t)
  Returns the Unicode value of the '&'x' shortcut in a given text.
- static int **test_shortcut** (const char ∗ t, const bool require_alt=false)
  Returns true if the given text 't' contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

}

12.15.1 Detailed Description

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for type(uchar) and when(uchar). Buttons can also generate callbacks in response to FL_SHORTCUT events. The button can either have an explicit shortcut(int s) value or a letter shortcut can be indicated in the label() with an '&' character before it. For the label shortcut it does not matter if Alt is held down, but if you have an input field in the same window, the user will have to hold down the Alt key so that the input field does not eat the event first as an FL_KEYBOARD event.

See also

Fl_Widget::shortcut_label(int)

For an Fl_Button object, the type() call returns one of:

- FL_NORMAL_BUTTON (0): value() remains unchanged after button press.
- FL_TOGGLE_BUTTON: value() is inverted after button press.
- FL_RADIO_BUTTON: value() is set to 1 after button press, and all other buttons in the current group with type() == FL_RADIO_BUTTON are set to zero.

For an Fl_Button object, the following when() values are useful, the default being FL_WHEN_RELEASE:

- 0: The callback is not done, instead changed() is turned on.
- FL_WHEN_RELEASE: The callback is done after the user successfully clicks the button, or when a shortcut is typed. The reason is FL_REASON_RELEASED.
- FL_WHEN_CHANGED: The callback is done each time the value() changes (when the user pushes and releases the button, and as the mouse is dragged around in and out of the button). The reason is set to FL_REASON_CHANGED
- FL_WHEN_NOT_CHANGED: The callback is done when the mouse button is released, but the value did not changed. The reason is set to FL_REASON_SELECTED

12.15.2 Constructor & Destructor Documentation

12.15.2.1 Fl_Button()

Fl_Button::Fl_Button ( int X, int Y, int W, int H, const char * L = 0 )

Generated by Doxygen
The constructor creates the button using the given position, size, and label. The default box type is box(FL_UP_BOX).

You can control how the button is drawn when ON by setting down_box(). The default is FL_NO_BOX (0) which will select an appropriate box type using the normal (OFF) box type by using fl_down(box()). Derived classes may handle this differently.

A button may request callbacks with when() FL_WHEN_CHANGED, FL_WHEN_NOT_CHANGED, and FL_WHEN_RELEASE, triggering the callback reasons FL_REASON_CHANGED, FL_REASON_SELECTED, and FL_REASON_DESELECTED.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X,Y,W,H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

### 12.15.3 Member Function Documentation

#### 12.15.3.1 clear()

```cpp
int Fl_Button::clear () [inline]
```

Same as value(0).

See also

`value(int v)`

#### 12.15.3.2 compact() [1/2]

```cpp
uchar Fl_Button::compact () [inline]
```

Return true if buttons are rendered as compact buttons.

Returns

0 if compact mode is off, 1 if it is on

See also

`compact(bool)`

#### 12.15.3.3 compact() [2/2]

```cpp
void Fl_Button::compact ( uchar v )
```

Decide if buttons should be rendered in compact mode.

---

**Figure 12.4 compact button keypad using GTK+ Scheme**
In compact mode, the button's surrounding border is altered to visually signal that multiple buttons are functionally linked together. To ensure the correct rendering of buttons in compact mode, all buttons must be part of the same group, positioned close to each other, and aligned with the edges of the group. Any button outlines not in contact with the parent group's outline will be displayed as separators.

Parameters

| in | v | switch compact mode on (1) or off (0) |

### 12.15.3.4 down_box() [1/2]

```
Fl_Boxtype Fl_Button::down_box ( ) const [inline]
```

Returns the current down box type, which is drawn when `value()` is non-zero.

Return values

```
Fl_Boxtype
```

### 12.15.3.5 down_box() [2/2]

```
void Fl_Button::down_box ( Fl_Boxtype b ) [inline]
```

Sets the down box type.

The default value of 0 causes FLTK to figure out the correct matching down version of `box()`.

Some derived classes (e.g. `Fl_Round_Button` and `Fl_Light_Button` use `down_box()` for special purposes. See docs of these classes.

Parameters

| in | b | down box type |

### 12.15.3.6 draw()

```
void Fl_Button::draw ( ) [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

---

*Generated by Doxygen*
FL_Widget *s = &Scrollbar;  // scrollbar is an embedded Fl_Scrollbar
s->draw();              // calls Fl_Scrollbar::draw()

Implements Fl_Widget.
Reimplemented in Fl_Light_Button, Fl_Return_Button, and Fl_Shortcut_Button.

12.15.3.7 handle()

int Fl_Button::handle (int event) [virtual]

Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in event | the kind of event received |

Return values

| 0 | if the event was not used or understood |
| 1 | if the event was used and can be deleted |

See also

Fl_Event

Reimplemented from Fl_Widget.

Reimplemented in Fl_Light_Button, Fl_Repeat_Button, Fl_Return_Button, and Fl_Shortcut_Button.

12.15.3.8 set()

int Fl_Button::set ( ) [inline]

Same as value(1).

See also

value(int v)

12.15.3.9 shortcut() [1/2]

int Fl_Button::shortcut ( ) const [inline]

Returns the current shortcut key for the button.

Return values

| int | |

Generated by Doxygen
12.15.3.10  shortcut() [2/2]

void Fl_Button::shortcut ( int s ) [inline]

Sets the shortcut key to `s`.
Setting this overrides the use of `&` in the `label()`. The value is a bitwise OR of a key and a set of shift flags, for example: `FL_ALT | 'a'`, or `FL_ALT | (FL_F + 10)`, or just `'a'`. A value of 0 disables the shortcut.
The key can be any value returned by `Fl::event_key()`, but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.
The shift flags can be any set of values accepted by `Fl::event_state()`. If the bit is on, that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

Parameters

| in | s | bitwise OR of key and shift flags |

12.15.3.11  value()

int Fl_Button::value ( int v )

Sets the current value of the button.
A non-zero value sets the button to 1 (ON), and zero sets it to 0 (OFF).

Parameters

| in | v | button value |

See also

`set()`, `clear()`

The documentation for this class was generated from the following files:

- Fl_Button.H
- Fl_Button.cxx

12.16  Fl_Cairo_State Class Reference

Contains all the necessary info on the current cairo context.

```cpp
#include <Fl_Cairo.H>
```

Public Member Functions

- bool autolink () const
  
  Gets the autolink option. See `Fl::cairo_autolink_context(bool)`
- void autolink (bool b)
  
  Sets the autolink option, only available with `-enable-cairoext`.
- cairo_t * cc () const
  
  Gets the current cairo context.
- void cc (cairo_t *c, bool own=true)
  
  Sets the current cairo context.
- void * gc () const
  
  Gets the last gc attached to a cc.
- void gc (void *c)
  
  Sets the gc `c` to keep track on.
• void *window () const
  
  Gets the last window attached to a cc.
• void window (void *w)
  
  Sets the window \textit{w} to keep track on.

### 12.16.1 Detailed Description

Contains all the necessary info on the current cairo context.

A private internal & unique corresponding object is created to permit cairo context state handling while keeping it opaque. For internal use only.

Note

Only available when configure has the \texttt{--enable-cairo} or \texttt{--enable-cairoext} option or one or both of the CMake options \texttt{OPTION\_CAIRO} or \texttt{OPTION\_CAIROEXT} is set (ON)

### 12.16.2 Member Function Documentation

#### 12.16.2.1 cc()

```cpp
void Fl_Cairo_State::cc (cairo_t *c, bool own = true) [inline]
```

Sets the current cairo context.

\texttt{own} == \texttt{true} (the default) indicates that the cairo context \texttt{c} will be deleted by FLTK internally when another cc is set later.

\texttt{own} == \texttt{false} indicates cc deletion is handled externally by the user program.

The documentation for this class was generated from the following files:

- \texttt{Fl\_Cairo.H}
- \texttt{Fl\_Cairo.cxx}

### 12.17 Fl\_Cairo\_Window Class Reference

This defines an FLTK window with Cairo support.

#include <Fl_Cairo_Window.H>

Inheritance diagram for Fl\_Cairo\_Window:

```
  Fl_Widget
  |     |
  |     | Fl_Group
  |     |
  |     | Fl_Window
  |     |
  |     | Fl_Double_Window
  |     |
  |     | Fl_Cairo_Window
```

**Public Types**

- typedef void(\*cairo_draw_cb) (Fl_Cairo_Window *self, cairo_t *def)

  The Cairo draw callback prototype you need to implement.

**Public Types inherited from Fl\_Window**

- typedef struct HICON__ = HICON
Public Member Functions

- **Fl_Cairo_Window** (int W, int H, const char *L=0)
- **Fl_Cairo_Window** (int X, int Y, int W, int H, const char *L=0)
- void **set_draw_cb** (cairo_draw_cb cb)
  
  You must provide a draw callback that implements your Cairo rendering.

Public Member Functions inherited from Fl_Double_Window

- **Fl_Double_Window** * as_double_window () FL_OVERRIDE
  Return non-null if this is an Fl_Overlay_Window object.
- **Fl_Double_Window** (int W, int H, const char *l=0)
  Creates a new Fl_Double_Window widget using the given position, size, and label (title) string.
- **Fl_Double_Window** (int X, int Y, int W, int H, const char *l=0)
  See Fl_Double_Window::Fl_Double_Window(int w, int h, const char *label = 0)
- void **flush** () FL_OVERRIDE
  Forces the window to be drawn, this window is also made current and calls draw().
- void **hide** () FL_OVERRIDE
  Makes a widget invisible.
- void **resize** (int, int, int, int) FL_OVERRIDE
  Changes the size or position of the widget.
- void **show** () FL_OVERRIDE
  Makes a widget visible.
- void **show** (int a, char **b)
  Same as Fl_Window::show(int a, char **b)
- **~Fl_Double_Window** ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Window

- virtual class Fl_Overlay_Window * as_overlay_window ()
  Return non-null if this is an Fl_Overlay_Window object.
- **Fl_Window** const * as_window () const FL_OVERRIDE
- **Fl_Window** * as_window () FL_OVERRIDE
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- unsigned int **border** () const
  Returns whether the window possesses a border.
- void **border** (int b)
  Sets whether or not the window manager border is around the window.
- void **clear_border** ()
  Fast inline function to turn the window manager border off.
- void **clear_modal_states** ()
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
- void **copy_label** (const char *a)
  Sets the window titlebar label to a copy of a character string.
- void **cursor** (const Fl_RGB_Image *, int, int)
  Changes the cursor for this window using the provided image as cursor's shape.
- void **cursor** (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  For back compatibility only.
- void **cursor** (Fl_Cursor)
  Changes the cursor for this window.
- int **decorated_h** () const
Returns the window height including any window title bar and any frame added by the window manager.

- **int decorated_w () const**
  
  Returns the window width including any frame added by the window manager.

- **void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)**
  
  For back compatibility only.

- **void default_cursor (Fl_Cursor)**
  
  Sets the default window cursor.

- **void draw_backdrop ()**
  
  Draw the background image if one is set and is aligned inside.

- **Fl_Window (int w, int h, const char ∗title=0)**
  
  Creates a window from the given width \(w\), height \(h\), and \(title\).

- **Fl_Window (int x, int y, int w, int h, const char ∗title=0)**
  
  Creates a window from the given position \((x, y)\), size \((w, h)\) and \(title\).

- **void free_position ()**
  
  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.

- **void fullscreen ()**
  
  Makes the window completely fill one or more screens, without any window manager border visible.

- **unsigned int fullscreen_active () const**
  
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.

- **void fullscreen_off ()**
  
  Turns off any side effects of fullscreen()

- **void fullscreen_off (int X, int Y , int W, int H)**
  
  Turns off any side effects of fullscreen() and does resize(x,y,w,h).

- **void fullscreen_screens (int top, int bottom, int left, int right)**
  
  Sets which screens should be used when this window is in fullscreen mode.

- **int handle (int) FL_OVERRIDE**
  
  Handles the specified event.

- **void hide () FL_OVERRIDE**
  
  Removes the window from the screen.

- **void hotspot (const Fl_Widget &p, int offscreen=0)**
  
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot (const Fl_Widget ∗, int offscreen=0)**
  
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- **void hotspot (int x, int y, int offscreen=0)**
  
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- **const void ∗icon () const**
  
  Gets the current icon window target dependent data.

- **void icon (const Fl_RGB_Image ∗)**
  
  Sets or resets a single window icon.

- **void icon (const void ∗ic)**
  
  Platform-specific method to set the window icon usable on Windows and X11 only.

- **void iconize ()**
  
  Iconifies the window.

- **const char ∗iconlabel () const**
  
  See void Fl_Window::iconlabel(const char ∗)

- **void iconlabel (const char ∗)**
  
  Sets the icon label.

- **void icons (const Fl_RGB_Image ∗[ ], int)**
Sets the window icons.

- void **icons** (HICON big_icon, HICON small_icon)
  
  Sets the window icons using HICON handles (Windows platform only).

- const char * **label** () const
  
  See void Fl_Window::label(const char*)

- void **label** (const char *)
  
  Sets the window title bar label.

- void **label** (const char *label, const char *iconlabel)
  
  Sets the icon label.

- void **make_current** ()
  
  Sets things up so that the drawing functions in `<FL/fl_draw.H>` will go into this window.

- void **maximize** ()
  
  Maximizes a top-level window to its current screen.

- unsigned int **maximize_active** () const
  
  Returns whether the window is currently maximized.

- unsigned int **menu_window** () const
  
  Returns true if this window is a menu window.

- unsigned int **modal** () const
  
  Returns true if this window is modal.

- unsigned int **non_modal** () const
  
  Returns true if this window is modal or non-modal.

- fl_uintptr_t **os_id** ()
  
  Returns a platform-specific identification of a shown window, or 0 if not shown.

- unsigned int **override** () const
  
  Returns non zero if OVERRIDE flag is set, 0 otherwise.

- void **resize** (int X, int Y, int W, int H) FL_OVERRIDE
  
  Changes the size and position of the window.

- int **screen_num** ()
  
  The number of the screen containing the mapped window.

- void **screen_num** (int screen_num)
  
  Set the number of the screen where to map the window.

- void **set_menu_window** ()
  
  Marks the window as a menu window.

- void **set_modal** ()
  
  A "modal" window, when shown(), will prevent any events from being delivered to other windows in the same program,
  and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

- void **set_non_modal** ()
  
  A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a modal() one in that it remains on
  top, but it has no effect on event delivery.

- void **set OVERRIDE** ()
  
  Activates the flags NOBORDER|OVERRIDE.

- void **set_tooltip_window** ()
  
  Marks the window as a tooltip window.

- const Fl_Image * **shape** ()
  
  Returns the image controlling the window shape or NULL.

- void **shape** (const Fl_Image &b)
  
  Set the window's shape with an Fl_Image.

- void **shape** (const Fl_Image *img)
  
  Assigns a non-rectangular shape to the window.

- void **show** () FL_OVERRIDE
Puts the window on the screen.

- **void** **show**(int argc, char **argv)
  
Puts the window on the screen with **show()** and parses command-line arguments.

- **int** **shown()**
  
  Returns non-zero if **show()** has been called (but not **hide()**).

- **void** **size_range**(int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
  
  Sets the allowable range the user can resize this window to.

- **unsigned int** **tooltip_window()** const
  
  Returns true if this window is a tooltip window.

- **void** **un_maximize()**
  
  Returns a previously maximized top-level window to its previous size.

- **void** **wait_for_expose()**
  
  Waits for the window to be displayed after calling **show()**.

- **int** **x_root()** const
  
  Gets the x position of the window on the screen.

- **const char** **xclass()** const
  
  Returns the xclass for this window, or a default.

- **void** **xclass(const char *c)**
  
  Sets the xclass for this window.

- **int** **y_root()** const
  
  Gets the y position of the window on the screen.

- **virtual** ~**Fl_Window()**
  
  The destructor also deletes all the children.

**Public Member Functions inherited from Fl_Group**

- **Fl_Widget** *&&**_ddfdesign_kludge()**
  
  This is for forms compatibility only.

- **void** **add**(Fl_Widget &)
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void** **add**(Fl_Widget *o)
  
  See void Fl_Group::add(Fl_Widget &w)

- **void** **add_resizable**(Fl_Widget &o)
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget** *const* **array()** const
  
  Returns a pointer to the array of children.

- **Fl_Group** *const* **as_group()** const FL_OVERRIDE
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void** **begin()**
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget** *child**(int n) const
  
  Returns array()[n].

- **int** **children()** const
  
  Returns how many child widgets the group has.

- **void** **clear()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int** **clip_children()**
  
  Returns the current clipping mode.

- **void** **clip_children**(int c)
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
• void end ()
  Exactly the same as current(this->parent()).
• int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget ∗w) const.
• int find (const Fl_Widget ∗) const
  Searches the child array for the widget and returns the index.
• Fl_Group (int, int, int, int, const char ∗=0)
  Creates a new Fl_Group widget using the given position, size, and label string.
• void focus (Fl_Widget ∗W)
• void forms_end ()
  This is for forms compatibility only.
• void init_sizes ()
  Resets the internal array of widget sizes and positions.
• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
• void insert (Fl_Widget &o, Fl_Widget ∗before)
  This does insert(w, find(before)).
• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
• void remove (Fl_Widget ∗o)
  Removes the widget o from the group.
• void remove (int index)
  Removes the widget at index from the group but does not delete it.
• Fl_Widget ∗ resizable () const
  Returns the group's resizable widget.
• void resizable (Fl_Widget &o)
• void resizable (Fl_Widget ∗o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)

Generated by Doxygen
Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const ∗ as_gl_window () const

- void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  Gets the current callback function for the widget.

- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.

- **uchar damage () const**
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  Internal use only.

- **void deactivate ()**
  Deactivates the widget.

- **Fl_Image *deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image *deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  Gets the widget height.

- **Fl_Image *image ()**
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image *image () const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
Makes the widget visible.

- void **set_visible_focus** ()
  Enables keyboard focus navigation with this widget.

- int **shortcut_label** () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void **shortcut_label** (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- void **size** (int W, int H)
  Changes the size of the widget.

- int **take_focus** ()
  Gives the widget the keyboard focus.

- unsigned int **takesevents** () const
  Returns if the widget is able to take events.

- int **test_shortcut** ()
  Returns true if the widget's label contains the entered 'x' shortcut.

- const char ∗ **tooltip** () const
  Gets the current tooltip text.

- void **tooltip** (const char ∗text)
  Sets the current tooltip text.

- Fl_Window ∗ **top_window** () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window ∗ **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar **type** () const
  Gets the widget type.

- void **type** (uchar t)
  Sets the widget type.

- int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void ∗ **user_data** () const
  Gets the user data for this widget.

- void **user_data** (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

- void ∗ **user_data** (void ∗v)
  Sets the user data for this widget.

- unsigned int **visible** () const
  Returns whether a widget is visible.

- unsigned int **visible_focus** () const
  Checks whether this widget has a visible focus.

- void **visible_focus** (int v)
  Modifies keyboard focus navigation.

- int **visible_r** () const
  Returns whether a widget and all its parents are visible.

- int **w** () const
  Gets the widget width.

- Fl_When **when** () const
  Returns the conditions under which the callback is called.

- void **when** (uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window ∗ **window** () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Overloaded to provide Cairo callback support.

Protected Member Functions inherited from Fl_Window

• void default_size_range ()
  Protected method to calculate the default size range of a window.
• void draw () FL_OVERRIDE
  Draws the widget.
• int force_position () const
  Returns the internal state of the window's FORCE_POSITION flag.
• void force_position (int force)
  Sets an internal flag that tells FLTK and the window manager to honor position requests.
• void free_icons ()
  Deletes all icons previously attached to the window.
• int is_resizable ()
  Protected method to determine whether a window is resizable.

Protected Member Functions inherited from Fl_Group

• Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
• void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
• void draw_children ()
  Draws all children of the group.
• void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
• virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
• virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
• virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.
Protected Member Functions inherited from Fl_Widget

- void clear_flag(unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop() const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box() const
  Draws the widget box according its box style.
- void draw_box(Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus() const
  Draws a focus rectangle around the widget.
- void draw_focus(Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label() const
  Draws the widget's label at the defined label position.
- void draw_label(int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget(int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags() const
  Gets the widget flags mask.
- void h(int v)
  Internal use only.
- void set_flag(unsigned int c)
  Sets a flag in the flags mask.
- void w(int v)
  Internal use only.
- void x(int v)
  Internal use only.
- void y(int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Window

- static Fl_Window *current()
  Returns the last window that was made current.
- static void default_callback(Fl_Window *, void *)
  Back compatibility: Sets the default callback v for win to call on close event.
- static void default_icon(const Fl_RGB_Image *)
  Sets a single default window icon.
- static void default_icons(const Fl_RGB_Image [], int)
  Sets the default window icons.
- static void default_icons(HICON big_icon, HICON small_icon)
  Sets the default window icons (Windows platform only).
- static const char *default_xclass()
Returns the default xclass.
• static void default_xclass (const char *)

Sets the default window xclass.
• static bool is_a_rescale ()

Returns true when a window is being rescaled.
• static char show_next_window_iconic ()

Returns the static flag whether the next window should be opened iconified.
• static void show_next_window_iconic (char stat)

Sets a static flag whether the next window should be opened iconified.

Static Public Member Functions inherited from Fl_Group

• static Fl_Group * current ()

Returns the currently active group.
• static void current (Fl_Group *g)

Sets the current group.

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char *t)

Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int test_shortcut (const char *t, const bool require_alt=false)

Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
AUTO_DELETE_USER_DATA = 1<<23 ,
MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }

flags possible values enumeration.

Static Protected Attributes inherited from Fl_Window

• static Fl_Window * current_

Stores the last window that was made current.

12.17.1 Detailed Description
This defines an FLTK window with Cairo support.
This class overloads the virtual draw() method for you, so that the only thing you have to do is to provide your Cairo code. All Cairo context handling is achieved transparently.
The default coordinate system for Cairo drawing commands within Fl_Cairo_Window is FLTK’s coordinate system, where the x, y, w, h values are relative to the top/left corner of the Fl_Cairo_Window, as one would expect with regular FLTK drawing commands, e.g.: (0 x w-1), (0 y h-1). Example:
static void my_cairo_draw_cb(Fl_Cairo_Window *window, cairo_t *cr) {
    // Draw an "X"
    const double xmax = (window->w() - 1);
    const double ymax = (window->h() - 1);
    cairo_set_line_width(cr, 1.00); // line width for drawing
    cairo_set_source_rgb(cr, 1.0, 0.5, 0.0); // orange
    cairo_move_to(cr, 0.0, 0.0); cairo_line_to(cr, xmax, ymax); // draw diagonal "\"
    cairo_move_to(cr, 0.0, ymax); cairo_line_to(cr, xmax, 0.0); // draw diagonal "/"
    cairo_stroke(cr); // stroke the lines
}

The FLTK coordinate system differs from the default native Cairo coordinate system which uses normalized (0.0 ...
1.0) values for x and y, e.g.: (0 x 1.0), (0 y 1.0). So beware of this when copy/pasting Cairo example programs
that assume normalized values. If need be, you can revert to the Cairo coordinate system by simply calling
cairo_scale() with the widget's w() and h() values. **Example:**

```c
static void my_cairo_draw_cb(Fl_Cairo_Window *window, cairo_t *cr) {
    cairo_scale(cr, window->w(), window->h()); // use Cairo's default coordinate system
    \[..use 0.0 to 1.0 values from here on..\]
}
```

See also

- test/cairo_test.cxx

**Note**

Class **Fl_Cairo_Window** requires the FLTK library to have been built with CMake option OPTION_CAIRO or
configure --enable-cairo.

You can alternatively define your custom Cairo FLTK window, and thus at least override the **draw()** method
to provide custom Cairo support. In this case you will probably use **Fl::cairo_make_current(Fl_Window*)** to
attach a context to your window. You should do this only when your window is the current window.

- **Fl_Window::current()**

### 12.17.2 Member Function Documentation

#### 12.17.2.1 draw()

```c
void Fl_Cairo_Window::draw ()
```

Overloaded to provide Cairo callback support.

Implements **Fl_Widget**.

#### 12.17.2.2 set_draw_cb()

```c
void Fl_Cairo_Window::set_draw_cb ( cairo_draw_cb cb )
```

You must provide a draw callback that implements your Cairo rendering.

This method permits you to set your Cairo callback to **cb**.

The documentation for this class was generated from the following file:
- **Fl_Cairo_Window.H**

### 12.18 Fl_Callback_User_Data Class Reference

A class prototype that allows for additional data in callbacks.

```c
#include <Fl_Widget.H>
```
12.18.1 Detailed Description

A class prototype that allows for additional data in callbacks. Users can extend this class and pass it to widget callbacks. Widgets can take ownership of the callback data, deleting the data when the widget itself is deleted.

The destructor of this class is virtual, allowing for additional code to deallocate resources when the user data is deleted.

Fl_Widget::callback(Fl_Callback*, Fl_Callback_User_Data*, bool)
Fl_Widget::user_data(Fl_Callback_User_Data*, bool)

The documentation for this class was generated from the following file:

- Fl_Widget.H

12.19 Fl_Chart Class Reference

Fl_Chart displays simple charts.

#include <Fl_Chart.H>

Inheritance diagram for Fl_Chart:

```
Fl_Widget
  ↓
Fl_Chart
```

Public Member Functions

- void add (double val, const char *str=0, unsigned col=0)
  
  Adds the data value `val` with optional label `str` and color `col` to the chart.

- uchar autosize () const
  
  Gets whether the chart will automatically adjust the bounds of the chart.

- void autosize (uchar n)
  
  Sets whether the chart will automatically adjust the bounds of the chart.

- void bounds (double a, double b) const
  
  Gets the lower and upper bounds of the chart values.

- void bounds (double *a, double *b)
  
  Sets the lower and upper bounds of the chart values.

- void clear ()
  
  Removes all values from the chart.

- Fl_Chart (int X, int Y , int W, int H, const char *L=0)
  
  Create a new Fl_Chart widget using the given position, size and label string.

- void insert (int ind, double val, const char *str=0, unsigned col=0)
  
  Inserts a data value `val` at the given position `ind`.

- int maxsize () const
  
  Gets the maximum number of data values for a chart.

- void maxsize (int m)
  
  Sets the maximum number of data values for a chart.

- void replace (int ind, double val, const char *str=0, unsigned col=0)
  
  Replaces a data value `val` at the given position `ind`.

- int size () const
  
  Gets the number of data values in the chart.
Returns the number of data values in the chart.

- void size (int W, int H)
  Sets the widget size (width, height).

- Fl_Color textcolor () const
  Gets the chart's text color.

- void textcolor (Fl_Color n)
  Sets the chart's text color to n.

- Fl_Font textfont () const
  Gets the chart's text font.

- void textfont (Fl_Font s)
  Sets the chart's text font to s.

- Fl_Fontsize textsize () const
  Gets the chart's text size.

- void textsize (Fl_Fontsize s)
  Sets the chart's text size to s.

- ~Fl_Chart ()
  Destroys the Fl_Chart widget and all of its data.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.

- unsigned int active () const
  Returns whether the widget is active.

- int active_r () const
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  Gets the label alignment.

- void align (Fl_Align alignment)
  Sets the label alignment.

- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const ∗ as_group () const
- virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const ∗ as_window () const
- void bind_deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
void bind_image (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

Fl_Boxtype box () const

Gets the box type of the widget.

void box (Fl_Boxtype new_box)

Sets the box type for the widget.

Fl_Callback_p callback () const

Gets the current callback function for the widget.

void callback (Fl_Callback *cb)

Sets the current callback function for the widget.

void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)

Sets the current callback function and managed user data for the widget.

void callback (Fl_Callback *cb, void *p)

Sets the current callback function and data for the widget.

void callback (Fl_Callback0 *cb)

Sets the current callback function for the widget.

void callback (Fl_Callback1 *cb, long p=0)

Sets the current callback function for the widget.

unsigned int changed () const

Checks if the widget value changed since the last callback.

void clear_active ()

Marks the widget as inactive without sending events or changing focus.

void clear_changed ()

Marks the value of the widget as unchanged.

void clear_damage (uchar c=0)

Clears or sets the damage flags.

void clear_output ()

Sets a widget to accept input.

void clear_visible ()

Hides the widget.

void clear_visible_focus ()

Disables keyboard focus navigation with this widget.

Fl_Color color () const

Gets the background color of the widget.

void color (Fl_Color bg)

Sets the background color of the widget.

void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.

Fl_Color color2 () const

For back compatibility only.

void color2 (unsigned a)

For back compatibility only.

int contains (const Fl_Widget *w) const

Checks if w is a child of this widget.

void copy_label (const char *new_label)

Sets the current label.

void copy_tooltip (const char *text)

Sets the current tooltip text.

uchar damage () const

Returns non-zero if draw() needs to be called.

void damage (uchar c)
Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *wgt, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *wgt, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual int handle (int event)
  Handles the specified event.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• FL_Color labelcolor () const
  Gets the label color.
• void labelcolor (FL_Color c)
  Sets the label color.
• FL_Font labelfont () const
  Gets the font to use.
• void labelfont (FL_Font f)
  Sets the font to use.
• FL_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (FL_Fontsize pix)
  Sets the font size in pixels.
• FL_Labeltype labeltype () const
  Gets the label type.
• void labeltype (FL_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• FL_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (FL_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• FL_Color selection_color () const
  Gets the selection color.
• void selection_color (FL_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char * tooltip () const
  Gets the current tooltip text.

- void tooltip (const char *text)
  Sets the current tooltip text.

- Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.

- void type (uchar t)
  Sets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void * user_data () const
  Gets the user data for this widget.

- void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

- void user_data (void *v)
  Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  Modifies keyboard focus navigation.

- int visible_r () const
  Returns whether a widget and all its parents are visible.

- int w () const
  Gets the widget width.

- Fl_When when () const
  Returns the conditions under which the callback is called.

- void when (uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x () const
  Gets the widget position in its window.
• int y () const
  
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  
  Draws the Fl_Chart widget.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.

• void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  
  Draws a focus rectangle around the widget.

• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

• void draw_label () const
  
  Draws the widget's label at the defined label position.

• void draw_label (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  
  Creates a widget at the given position and size.

• unsigned int flags () const
  
  Gets the widget flags mask.

• void h (int v)
  
  Internal use only.

• void set_flag (unsigned int c)
  
  Sets a flag in the flags mask.

• void w (int v)
  
  Internal use only.

• void x (int v)
  
  Internal use only.

• void y (int v)
  
  Internal use only.
Static Protected Member Functions

- static void draw_barchart (int x, int y, int w, int h, int numb, FL_CHART_ENTRY entries[], double min, double max, int autosize, int maxnumb, FL_Color textcolor)
  
  Draws a bar chart.

- static void draw_horbarchart (int x, int y, int w, int h, int numb, FL_CHART_ENTRY entries[], double min, double max, int autosize, int maxnumb, FL_Color textcolor)

  Draws a horizontal bar chart.

- static void draw_linechart (int type, int x, int y, int w, int h, int numb, FL_CHART_ENTRY entries[], double min, double max, int autosize, int maxnumb, FL_Color textcolor)

  Draws a line chart.

- static void draw_piechart (int x, int y, int w, int h, int numb, FL_CHART_ENTRY entries[], int special, FL_Color textcolor)

  Draws a pie chart.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)

  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char *t)

  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char *, const bool require_alt=false)

  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPYLABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPYTOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }

flags possible values enumeration.

12.19.1 Detailed Description

Fl_Chart displays simple charts.
It is provided for Forms compatibility.
Todo  Refactor Fl_Chart::type() information.

The type of an Fl_Chart object can be set using type(uchar t) to:

<table>
<thead>
<tr>
<th>Chart Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FL_BAR_CHART</td>
<td>Each sample value is drawn as a vertical bar.</td>
</tr>
<tr>
<td>FL_FILLED_CHART</td>
<td>The chart is filled from the bottom of the graph to the sample values.</td>
</tr>
<tr>
<td>FL_HORBAR_CHART</td>
<td>Each sample value is drawn as a horizontal bar.</td>
</tr>
<tr>
<td>FL_LINE_CHART</td>
<td>The chart is drawn as a polyline with vertices at each sample value.</td>
</tr>
<tr>
<td>FL_PIE_CHART</td>
<td>A pie chart is drawn with each sample value being drawn as a proportionate slice in the circle.</td>
</tr>
<tr>
<td>FL_SPECIALPIE_CHART</td>
<td>Like FL_PIE_CHART, but the first slice is separated from the pie.</td>
</tr>
<tr>
<td>FL_SPIKE_CHART</td>
<td>Each sample value is drawn as a vertical line.</td>
</tr>
</tbody>
</table>

12.19.2 Constructor & Destructor Documentation

12.19.2.1 Fl_Chart()

Fl_Chart::Fl_Chart (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ L = 0 )  

Create a new Fl_Chart widget using the given position, size and label string. The default boxstyle is FL_NO_BOX.

Parameters

| in   | X, Y, W, H | position and size of the widget |
| in   | L          | widget label, default is no label |

12.19.3 Member Function Documentation

12.19.3.1 add()

void Fl_Chart::add (  
    double val,  
    const char ∗ str = 0,  
    unsigned col = 0 )  

Adds the data value val with optional label str and color col to the chart.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>val</th>
<th>data value</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>str</td>
<td>optional data label</td>
</tr>
<tr>
<td>in</td>
<td>col</td>
<td>optional data color</td>
</tr>
</tbody>
</table>

### 12.19.3.2 autosize(1/2)

**uchar Fl_Chart::autosize() const [inline]**

Gets whether the chart will automatically adjust the bounds of the chart.

**Returns**

non-zero if auto-sizing is enabled and zero if disabled.

### 12.19.3.3 autosize(2/2)

**void Fl_Chart::autosize(uchar n) [inline]**

Sets whether the chart will automatically adjust the bounds of the chart.

**Parameters**

|   in  | n | non-zero to enable automatic resizing, zero to disable |

### 12.19.3.4 bounds(1/2)

**void Fl_Chart::bounds(double *a, double *b) const [inline]**

Gets the lower and upper bounds of the chart values.

**Parameters**

| out   | a,b | are set to lower, upper |

### 12.19.3.5 bounds(2/2)

**void Fl_Chart::bounds(double a, double b)**

Sets the lower and upper bounds of the chart values.

**Parameters**

| in    | a,b | are used to set lower, upper |

### 12.19.3.6 draw()

**void Fl_Chart::draw() [protected], [virtual]**

Draws the Fl.Chart widget.

Implements Fl_Widget.
12.19.3.7 **draw_barchart()**

```c
void Fl_Chart::draw_barchart (  
    int x,  
    int y,  
    int w,  
    int h,  
    int numb,  
    FL_CHART_ENTRY entries[],  
    double min,  
    double max,  
    int autosize,  
    int maxnumb,  
    Fl_Color textcolor ) [static], [protected]
```

Draws a bar chart.

- **x, y, w, h** is the bounding box, **entries** the array of **numb** entries, and **min** and **max** the boundaries.

### Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x, y, w, h</td>
<td>Widget position and size</td>
</tr>
<tr>
<td>in</td>
<td>numb</td>
<td>Number of values</td>
</tr>
<tr>
<td>in</td>
<td>entries</td>
<td>Array of values</td>
</tr>
<tr>
<td>in</td>
<td>min</td>
<td>Lower boundary</td>
</tr>
<tr>
<td>in</td>
<td>max</td>
<td>Upper boundary</td>
</tr>
<tr>
<td>in</td>
<td>autosize</td>
<td>Whether the chart autosizes</td>
</tr>
<tr>
<td>in</td>
<td>maxnumb</td>
<td>Maximal number of entries</td>
</tr>
<tr>
<td>in</td>
<td>textcolor</td>
<td>Text color</td>
</tr>
</tbody>
</table>

12.19.3.8 **draw_horbarchart()**

```c
void Fl_Chart::draw_horbarchart (  
    int x,  
    int y,  
    int w,  
    int h,  
    int numb,  
    FL_CHART_ENTRY entries[],  
    double min,  
    double max,  
    int autosize,  
    int maxnumb,  
    Fl_Color textcolor ) [static], [protected]
```

Draws a horizontal bar chart.

- **x, y, w, h** is the bounding box, **entries** the array of **numb** entries, and **min** and **max** the boundaries.

### Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x, y, w, h</td>
<td>Widget position and size</td>
</tr>
<tr>
<td>in</td>
<td>numb</td>
<td>Number of values</td>
</tr>
<tr>
<td>in</td>
<td>entries</td>
<td>Array of values</td>
</tr>
<tr>
<td>in</td>
<td>min</td>
<td>Lower boundary</td>
</tr>
<tr>
<td>in</td>
<td>max</td>
<td>Upper boundary</td>
</tr>
<tr>
<td>in</td>
<td>autosize</td>
<td>Whether the chart autosizes</td>
</tr>
<tr>
<td>in</td>
<td>maxnumb</td>
<td>Maximal number of entries</td>
</tr>
<tr>
<td>in</td>
<td>textcolor</td>
<td>Text color</td>
</tr>
</tbody>
</table>
12.19.3.9  draw_linechart()

void Fl_Chart::draw_linechart (  
    int type,  
    int x,  
    int y,  
    int w,  
    int h,  
    int numb,  
    FL_CHART_ENTRY entries[],  
    double min,  
    double max,  
    int autosize,  
    int maxnumb,  
    Fl_Color textcolor ) [static], [protected]

Draws a line chart. 
*x, y, w, h* is the bounding box, *entries* the array of *numb* entries, and *min* and *max* the boundaries.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>type</th>
<th>Chart type</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x,y,w,h</td>
<td>Widget position and size</td>
</tr>
<tr>
<td>in</td>
<td>numb</td>
<td>Number of values</td>
</tr>
<tr>
<td>in</td>
<td>entries</td>
<td>Array of values</td>
</tr>
<tr>
<td>in</td>
<td>min</td>
<td>Lower boundary</td>
</tr>
<tr>
<td>in</td>
<td>max</td>
<td>Upper boundary</td>
</tr>
<tr>
<td>in</td>
<td>autosize</td>
<td>Whether the chart autosizes</td>
</tr>
<tr>
<td>in</td>
<td>maxnumb</td>
<td>Maximal number of entries</td>
</tr>
<tr>
<td>in</td>
<td>textcolor</td>
<td>Text color</td>
</tr>
</tbody>
</table>

12.19.3.10  draw_piechart()

void Fl_Chart::draw_piechart (  
    int x,  
    int y,  
    int w,  
    int h,  
    int numb,  
    FL_CHART_ENTRY entries[],  
    int special,  
    Fl_Color textcolor ) [static], [protected]

Draws a pie chart.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x,y,w,h</th>
<th>bounding box</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>numb</td>
<td>number of chart entries</td>
</tr>
<tr>
<td>in</td>
<td>entries</td>
<td>array of chart entries</td>
</tr>
<tr>
<td>in</td>
<td>special</td>
<td>special (?)</td>
</tr>
<tr>
<td>in</td>
<td>textcolor</td>
<td>text color</td>
</tr>
</tbody>
</table>

12.19.3.11  insert()

void Fl_Chart::insert (  
    int ind,

double val,
const char * str = 0,
unsigned col = 0)

Inserts a data value \texttt{val} at the given position \texttt{ind}.
Position 1 is the first data value.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>\texttt{ind}</th>
<th>insertion position</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>\texttt{val}</td>
<td>data value</td>
</tr>
<tr>
<td>in</td>
<td>\texttt{str}</td>
<td>optional data label</td>
</tr>
<tr>
<td>in</td>
<td>\texttt{col}</td>
<td>optional data color</td>
</tr>
</tbody>
</table>

12.19.3.12 \texttt{maxsize()}

```cpp
void Fl_Chart::maxsize (int m)
```

Sets the maximum number of data values for a chart.
If you do not call this method then the chart will be allowed to grow to any size depending on available memory.

**Parameters**

| in  | \texttt{m}  | maximum number of data values allowed. |

12.19.3.13 \texttt{replace()}

```cpp
void Fl_Chart::replace (int ind,
     double val,
     const char * str = 0,
     unsigned col = 0)
```

Replaces a data value \texttt{val} at the given position \texttt{ind}.
Position 1 is the first data value.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>\texttt{ind}</th>
<th>insertion position</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>\texttt{val}</td>
<td>data value</td>
</tr>
<tr>
<td>in</td>
<td>\texttt{str}</td>
<td>optional data label</td>
</tr>
<tr>
<td>in</td>
<td>\texttt{col}</td>
<td>optional data color</td>
</tr>
</tbody>
</table>

12.19.3.14 \texttt{size()}

```cpp
void Fl_Chart::size (int \_W, int \_H) [inline]
```

Sets the widget size (width, height).
This is the same as calling \texttt{Fl_Widget::size(int \_W, int \_H)};

**Parameters**

| in  | \texttt{W,H} | new width and height of the widget |

The documentation for this class was generated from the following files:
12.20 FL_CHART_ENTRY Struct Reference

For internal use only.

#include <Fl_Chart.H>

Public Attributes

- unsigned col
  
  For internal use only.

- char str [FL_CHART_LABEL_MAX+1]
  
  For internal use only.

- float val
  
  For internal use only.

12.20.1 Detailed Description

For internal use only.

The documentation for this struct was generated from the following file:

- Fl_Chart.H

12.21 Fl_Check_Browser Class Reference

The Fl_Check_Browser widget displays a scrolling list of text lines that may be selected and/or checked by the user.

#include <Fl_Check_Browser.H>

Inheritance diagram for Fl_Check_Browser:

```
Fl_Widget
    |
    |
    v
Fl_Group
    |
    |
    v
Fl_Browser_
    |
    |
    v
Fl_Check_Browser
```

Public Member Functions

- int add (char *s)
  
  Add a new unchecked line to the end of the browser.

- int add (char *s, int b)
  
  Add a new line to the end of the browser.

- int add (const char *s)
  
  See int Fl_Check_Browser::add(char *s)

- int add (const char *s, int b)
  
  See int Fl_Check_Browser::add(char *s)

- void check_all ()
  
  Sets all the items checked.

- void check_none ()
Sets all the items unchecked.

- **int checked (int item) const**
  
  Gets the current status of item item.

- **void checked (int item, int b)**
  
  Sets the check status of item item to b.

- **void clear ()**
  
  Remove every item from the browser.

- **Fl_Check_Browser (int x, int y, int w, int h, const char ∗l=0)**
  
  The constructor makes an empty browser.

- **void ∗ item_at (int index) const FL_OVERRIDE**
  
  This method must be provided by the subclass to return the item for the specified index.

- **void item_swap (int ia, int ib)**
  
  This optional method should be provided by the subclass to efficiently swap browser items a and b, such as for sorting.

- **int nchecked () const**
  
  Returns how many items are currently checked.

- **int nitems () const**
  
  Returns how many lines are in the browser.

- **int remove (int item)**
  
  Remove line n and make the browser one line shorter.

- **void set_checked (int item)**
  
  Equivalent to Fl_Check_Browser::checked(item, 1).

- **char ∗ text (int item) const**
  
  Return a pointer to an internal buffer holding item item's text.

- **int value () const**
  
  Returns the index of the currently selected item.

- **∼Fl_Check_Browser ()**
  
  The destructor deletes all list items and destroys the browser.

---

**Public Member Functions inherited from Fl_Browser_**

- **int deselect (int docallbacks=0)**
  
  Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

- **void display (void ∗item)**
  
  Displays the item, scrolling the list as necessary.

- **uchar has_scrollbar () const**
  
  Returns the current scrollbar mode, see Fl_Browser_::has_scrollbar(uchar)

- **void has_scrollbar (uchar mode)**
  
  Sets whether the widget should have scrollbars or not (default Fl_Browser_::BOTH).

- **int hposition () const**
  
  Gets the horizontal scroll position of the list as a pixel position pos.

- **void hposition (int)**
  
  Sets the horizontal scroll position of the list to pixel position pos.

- **int linespacing () const**
  
  Return the height of additional spacing between browser lines.

- **void linespacing (int pixels)**
  
  Add some space between browser lines.

- **int position () const**
  
  

- **void position (int pos)**
  
  

- **void position (int x, int y)**
  
  

- **void resize (int X, int Y, int W, int H) FL_OVERRIDE**
  
  

Repositions and/or resizes the browser.

- void scrollbar_left()
  Moves the vertical scrollbar to the lefthand side of the list.
- void scrollbar_right()
  Moves the vertical scrollbar to the righthand side of the list.
- int scrollbar_size() const
  Gets the current size of the scrollbars’ troughs, in pixels.
- void scrollbar_size(int newSize)
  Sets the pixel size of the scrollbars’ troughs to newSize, in pixels.
- int scrollbar_width() const
  Returns the global value Fl::scrollbar_size().
- void scrollbar_width(int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.
- int select(void *item, int val=1, int docallbacks=0)
  Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.
- int select_only(void *item, int docallbacks=0)
  Selects item and returns 1 if the state changed or 0 if it did not.
- void sort(int flags=0)
  Sorts the items in the browser based on flags.
- Fl_Color textcolor() const
  Gets the default text color for the lines in the browser.
- void textcolor(Fl_Color col)
  Sets the default text color for the lines in the browser to color col.
- Fl_Font textfont() const
  Gets the default text font for the lines in the browser.
- void textfont(Fl_Font font)
  Sets the default text font for the lines in the browser to font.
- Fl_Fontsize textsize() const
  Gets the default text size (in pixels) for the lines in the browser.
- void textsize(Fl_Fontsize newSize)
  Sets the default text size (in pixels) for the lines in the browser to size.
- int vposition() const
  Gets the vertical scroll position of the list as a pixel position pos.
- void vposition(int pos)
  Sets the vertical scroll position of the list to pixel position pos.

Public Member Functions inherited from Fl_Group

- Fl_Widget * & _ddfdesign_kludge()
  This is for forms compatibility only.
- void add(Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
- void add(Fl_Widget &o)
  See void Fl_Group::add(Fl_Widget &w)
- void add_resizable(Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
- Fl_Widget * const * array() const
  Returns a pointer to the array of children.
- Fl_Group * const * as_group() const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• void **begin ()**
  
  *Sets the current group so you can build the widget tree by just constructing the widgets.*

• Fl_Widget *child (int n) const
  
  Returns array()[n].

• int **children () const**
  
  *Returns how many child widgets the group has.*

• void **clear ()**
  
  *Deletes all child widgets from memory recursively.*

• unsigned int **clip_children ()**
  
  *Returns the current clipping mode.*

• void **clip_children (int c)**
  
  *Controls whether the group widget clips the drawing of child widgets to its bounding box.*

• virtual int **delete_child (int n)**
  
  *Removes the widget at index from the group and deletes it.*

• void **end ()**
  
  *Exactly the same as current(this->parent()).*

• int **find (const Fl_Widget &o) const**
  
  See int Fl_Group::find(const Fl_Widget *w) const.

• int **find (const Fl_Widget *) const**
  
  *Searches the child array for the widget and returns the index.*

• Fl_Group (int, int, int, int, const char *)=0)
  
  *Creates a new Fl_Group widget using the given position, size, and label string.*

• void **focus (Fl_Widget &W)**

• void **forms_end ()**
  
  *This is for forms compatibility only.*

• int **handle (int) FL_OVERRIDE**
  
  *Handles the specified event.*

• void **init_sizes ()**
  
  *Resets the internal array of widget sizes and positions.*

• void **insert (Fl_Widget &, int i)**
  
  *The widget is removed from its current group (if any) and then inserted into this group.*

• void **insert (Fl_Widget &o, Fl_Widget *before)**
  
  *This does insert(w, find(before)).*

• void **remove (Fl_Widget &)**
  
  *Removes a widget from the group but does not delete it.*

• void **remove (Fl_Widget &o)**
  
  *Removes the widget o from the group.*

• void **remove (int index)**
  
  *Removes the widget at index from the group but does not delete it.*

• Fl_Widget *resizable () const
  
  *Returns the group's resizable widget.*

• void **resizable (Fl_Widget &o)**
  
  *Sets the group's resizable widget.*

• void **resizable (Fl_Widget *o)**
  
  *The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*

• void **resize (int, int, int) FL_OVERRIDE**
  
  *Resizes the Fl_Group widget and all of its children.*

• virtual ~Fl_Group ()
  
  *The destructor also deletes all the children.*
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
- unsigned int active () const
- int active_r () const

- void callback (Fl_Callback0 * cb)
- unsigned int changed () const
- void clear_active ()
Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.

- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  Gets the background color of the widget.

- void color (Fl_Color bg)
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  For back compatibility only.

- void color2 (unsigned a)
  For back compatibility only.

- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

- void copy_label (const char *new_label)
  Sets the current label.

- void copy_tooltip (const char *text)
  Sets the current tooltip text.

- uchar damage () const
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  Internal use only.

- void deactivate ()
  Deactivates the widget.

- Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reas reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reas reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void **do_callback** (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void **draw_label** (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int **h** () const
  Gets the widget height.
• virtual void **hide** ()
  Makes a widget invisible.
• Fl_Image * **image** ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image * **image** () const
  Gets the image that is used as part of the widget label when in the active state.
• void **image** (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void **image** (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int **image_bound** () const
  Returns whether the image is managed by the widget.
• int **inside** (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int **is_label_copied** () const
  Returns whether the current label was assigned with copy_label().
• const char * **label** () const
  Gets the current label text.
• void **label** (const char *text)
  Sets the current label pointer.
• void **label** (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color **labelcolor** () const
  Gets the label color.
• void **labelcolor** (Fl_Color c)
  Sets the label color.
• Fl_Font **labelfont** () const
  Gets the font to use.
• void **labelfont** (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize **labelsize** () const
  Gets the font size in pixels.
• void **labelsize** (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype **labeltype** () const
  Gets the label type.
• void **labeltype** (Fl_Labeltype a)
  Sets the label type.
• void **measure_label** (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool **needs_keyboard** () const
  Returns whether this widget needs a keyboard.
• void **needs_keyboard** (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int **output** () const
Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.

- **void set_visible ()**
  
  Makes the widget visible.

- **void set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  
  Makes a widget visible.

- **void size (int W, int H)**
  
  Changes the size of the widget.

- **int take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char * tooltip () const**
  
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  
  Gets the widget type.

- **void type (uchar t)**
  
  Sets the widget type.
• int **use_accents_menu**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void **user_data**() const

  Gets the user data for this widget.

• void **user_data**(FL_Callback_User_Data *v, bool auto_free)

  Sets the user data for this widget.

• void **user_data**(void *v)

  Sets the user data for this widget.

• unsigned int **visible**() const

  Returns whether a widget is visible.

• unsigned int **visible_focus**() const

  Checks whether this widget has a visible focus.

• void **visible_focus**(int v)

  Modifies keyboard focus navigation.

• int **visible_r**() const

  Returns whether a widget and all its parents are visible.

• int **w**() const

  Gets the widget width.

• FL_When **when**() const

  Returns the conditions under which the callback is called.

• void **when**(uchar i)

  Sets the flags used to decide when a callback is called.

• FL_Window **window**() const

  Returns a pointer to the nearest parent window up the widget hierarchy.

• int **x**() const

  Gets the widget position in its window.

• int **y**() const

  Gets the widget position in its window.

• virtual ~**Fl_Widget**()

  Destroys the widget.

Protected Member Functions

• int **handle**(int) FL_OVERRIDE

  Handles the event within the normal widget bounding box.

• void **item_draw**(void *, int, int, int, int) const FL_OVERRIDE

  This method must be provided by the subclass to draw the item in the area indicated by X, Y, W, H.

• void **item_first**(void *) const FL_OVERRIDE

  This method must be provided by the subclass to return the first item in the list.

• int **item_height**(void *) const FL_OVERRIDE

  This method must be provided by the subclass to return the height of item in pixels.

• void **item_next**(void *) const FL_OVERRIDE

  This method must be provided by the subclass to return the item in the list after item.

• void **item_prev**(void *) const FL_OVERRIDE

  This method must be provided by the subclass to return the item in the list before item.

• void **item_select**(void *, int) FL_OVERRIDE

  This method must be implemented by the subclass if it supports multiple selections; sets the selection state to val for the item.

• int **item_selected**(void *) const FL_OVERRIDE

  This method must be implemented by the subclass if it supports multiple selections; returns the selection state for item.

• const char **item_text**(void *) const FL_OVERRIDE
This optional method returns a string (label) that may be used for sorting.

- **int item_width (void *) const FL_OVERRIDE**

  This method must be provided by the subclass to return the width of the item in pixels.

**Protected Member Functions inherited from Fl_Browser_**

- **void bbox (int &X, int &Y, int &W, int &H) const**

  Returns the bounding box for the interior of the list's display window, inside the scrollbars.

- **void deleting (void *item)**

  This method should be used when item is being deleted from the list.

- **int displayed (void *item) const**

  Returns non-zero if item has been scrolled to a position where it is being displayed.

- **void draw () FL_OVERRIDE**

  Draws the list within the normal widget bounding box.

- **void *find_item (int ypos)**

  This method returns the item under mouse y position ypos.

- **Fl_Browser_ (int X, int Y, int W, int H, const char *L=0)**

  The constructor makes an empty browser.

- **virtual int full_height () const**

  This method may be provided by the subclass to indicate the full height of the item list, in pixels.

- **virtual int full_width () const**

  This method may be provided by the subclass to indicate the full width of the item list, in pixels.

- **virtual int incr_height () const**

  This method may be provided to return the average height of all items to be used for scrolling.

- **void inserting (void *a, void *b)**

  This method should be used when an item is in the process of being inserted into the list.

- **virtual void *item_last () const**

  This method must be provided by the subclass to return the last item in the list.

- **virtual int item_quick_height (void *item) const**

  This method may be provided by the subclass to return the height of the item, in pixels.

- **int leftedge () const**

  This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

- **void new_list ()**

  This method should be called when the list data is completely replaced or cleared.

- **void redraw_line (void *item)**

  This method should be called when the contents of item has changed, but not its height.

- **void redraw_lines ()**

  This method will cause the entire list to be redrawn.

- **void replacing (void *a, void *b)**

  This method should be used when item a is being replaced by item b.

- **void *selection () const**

  Returns the item currently selected, or NULL if there is no selection.

- **void swapping (void *a, void *b)**

  This method should be used when two items a and b are being swapped.

- **void *top () const**

  Returns the item that appears at the top of the list.
Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw () FL_OVERRIDE
  Draws the widget.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Public Types inherited from Fl_Browser_
• enum {
  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7 }
  Values for has_scrollbar() for has_scrollbar() for has_scrollbar().

Static Public Member Functions inherited from Fl_Group
• static Fl_Group * current ()
  Returns the currently active group.
• static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget
• static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Public Attributes inherited from Fl_Browser_
• Fl_Scrollbar hscrollbar
  Horizontal scrollbar.
• Fl_Scrollbar scrollbar
  Vertical scrollbar.

Protected Types inherited from Fl_Widget
• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE杨OCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_FACENTS =
  MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31}
  flags possible values enumeration.
12.21 Fl_Check_Browser Class Reference

12.21.1 Detailed Description

The Fl_Check_Browser widget displays a scrolling list of text lines that may be selected and/or checked by the user.

12.21.2 Member Function Documentation

12.21.2.1 add() [1/2]

```cpp
int Fl_Check_Browser::add ( char * s )
```

Add a new unchecked line to the end of the browser.

See also

```cpp
add(char *s, int b)
```

12.21.2.2 add() [2/2]

```cpp
int Fl_Check_Browser::add ( char * s, int b )
```

Add a new line to the end of the browser.

The text is copied using the strdup() function. It may also be NULL to make a blank line. It can set the item checked if b is not 0.

12.21.2.3 handle()

```cpp
int Fl_Check_Browser::handle ( int event ) [protected], [virtual]
```

Handles the event within the normal widget bounding box.

Parameters

- in event The event to process.

Returns

1 if event was processed, 0 if not.

Reimplemented from Fl_Browser_.

12.21.2.4 item_at()

```cpp
void * Fl_Check_Browser::item_at ( int index ) const [virtual]
```

This method must be provided by the subclass to return the item for the specified index.

Parameters

- in index The index of the item to be returned

Returns

The item at the specified index.

Reimplemented from Fl_Browser_.

12.21.2.5 item_draw()

```cpp
void Fl_Check_Browser::item_draw ( void * item,
```

Generated by Doxygen
**12.21.2.6 item_first()**

```cpp
void *Fl_Check_Browser::item_first () const [protected], [virtual]
```

This method must be provided by the subclass to return the first item in the list.

See also

- item_first(), item_next(), item_last(), item_prev()

Implements Fl_Browser_.

**12.21.2.7 item_height()**

```cpp
int Fl_Check_Browser::item_height (void *item) const [protected], [virtual]
```

This method must be provided by the subclass to return the height of item in pixels. Allow for two additional pixels for the list selection box.

**Parameters**

- **in item** - The item whose height is returned.

Returns

The height of the specified item in pixels.

See also

- item_height(), item_width(), item_quick_height()

Implements Fl_Browser_.

**12.21.2.8 item_next()**

```cpp
void *Fl_Check_Browser::item_next (void *item) const [protected], [virtual]
```

This method must be provided by the subclass to return the item in the list after item.

See also

- item_first(), item_next(), item_last(), item_prev()

Implements Fl_Browser_.

**12.21.2.9 item_prev()**

```cpp
void *Fl_Check_Browser::item_prev (void *item) const [protected], [virtual]
```

This method must be provided by the subclass to return the item in the list before item.

See also

- item_first(), item_next(), item_last(), item_prev()

Implements Fl_Browser_.

```

```
12.21.2.10  item_select()

```cpp
void Fl_Check_Browser::item_select (  
    void * item,  
    int val ) [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; sets the selection state to \texttt{val}
for the \texttt{item}.

Sets the selection state for \texttt{item}, where optional \texttt{val} is 1 (select, the default) or 0 (de-select).

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>\texttt{item}</th>
<th>The item to be selected</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>\texttt{val}</td>
<td>The optional selection state; 1=select, 0=de-select. The default is to select the item (1).</td>
</tr>
</tbody>
</table>

Reimplemented from \texttt{Fl_Browser}.

12.21.2.11  item_selected()

```cpp
int Fl_Check_Browser::item_selected (  
    void * item ) const [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; returns the selection state for
\texttt{item}.

The method should return 1 if \texttt{item} is selected, or 0 otherwise.

**Parameters**

| in  | \texttt{item} | The item to test. |

Reimplemented from \texttt{Fl_Browser}.

12.21.2.12  item_swap()

```cpp
void Fl_Check_Browser::item_swap (  
    void * a,  
    void * b ) [virtual]
```

This optional method should be provided by the subclass to efficiently swap browser items \texttt{a} and \texttt{b}, such as for
sorting.

**Parameters**

| in  | \texttt{a,b} | The two items to be swapped. |

Reimplemented from \texttt{Fl_Browser}.

12.21.2.13  item_text()

```cpp
const char * Fl_Check_Browser::item_text (  
    void * item ) const [protected], [virtual]
```

This optional method returns a string (label) that may be used for sorting.

**Parameters**

| in  | \texttt{item} | The item whose label text is returned. |
Returns

The item's text label. (Can be NULL if blank)

Reimplemented from Fl_Browser_.

### 12.21.2.14 item_width()

```c
int Fl_Check_Browser::item_width ( 
    void ∗ item ) const [protected], [virtual]
```

This method must be provided by the subclass to return the width of the item in pixels. Allow for two additional pixels for the list selection box.

**Parameters**

- `item` The item whose width is returned.

**Returns**

The width of the item in pixels.

Implements Fl_Browser_.

### 12.21.2.15 nitems()

```c
int Fl_Check_Browser::nitems ( ) const [inline]
```

Returns how many lines are in the browser. The last line number is equal to this.

### 12.21.2.16 remove()

```c
int Fl_Check_Browser::remove ( 
    int item )
```

Remove line n and make the browser one line shorter. Returns the number of lines left in the browser.

The documentation for this class was generated from the following files:

- `Fl_Check_Browser.H`
- `Fl_Check_Browser.cxx`

### 12.22 FL_Check_Button Class Reference

A button with a "checkmark" to show its status.

Inheritance diagram for FL_Check_Button:

```
Fl_Widget
   |
   v
Fl_Button
   |
   v
Fl_Light_Button
   |
   v
FL_Check_Button
```

**Public Member Functions**

- `FL_Check_Button (int X, int Y, int W, int H, const char ∗L=0)`

  Creates a new FL_Check_Button widget using the given position, size, and label string.
Public Member Functions inherited from Fl_Light_Button

- Fl_Light_Button (int x, int y, int w, int h, const char *l=0)
  
  Creates a new Fl_Light_Button widget using the given position, size, and label string.

- int handle (int) FL_OVERRIDE
  
  Handles the specified event.

Public Member Functions inherited from Fl_Button

- int clear ()
  
  Same as value(0).

- uchar compact ()
  
  Return true if buttons are rendered as compact buttons.

- void compact (uchar v)
  
  Decide if buttons should be rendered in compact mode.

- Fl_Boxtype down_box () const
  
  Returns the current down box type, which is drawn when value() is non-zero.

- void down_box (Fl_Boxtype b)
  
  Sets the down box type.

- Fl_Color down_color () const
  
  (for backwards compatibility)

- void down_color (unsigned c)
  
  (for backwards compatibility)

- Fl_Button (int X, int Y, int W, int H, const char *L=0)
  
  The constructor creates the button using the given position, size, and label.

- int set ()
  
  Same as value(1).

- void setonly ()
  
  Turns on this button and turns off all other radio buttons in the group. (calling value(1) or set() does not do this).

- int shortcut () const
  
  Returns the current shortcut key for the button.

- void shortcut (const char *s)
  
  (for backwards compatibility)

- void shortcut (int s)
  
  Sets the shortcut key to s.

- char value () const
  
  Returns the current value of the button (0 or 1).

- int value (int v)
  
  Sets the current value of the button.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()

- void _set_fullscreen ()

- void activate ()
  
  Activates the widget.

- unsigned int active () const
  
  Returns whether the widget is active.

- int active_r () const
  
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.

- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window * as_gl_window()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const * as_gl_window() const

- virtual Fl_Group * as_group()
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const * as_group() const

- virtual Fl_Window * as_window()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const * as_window() const

- void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  Gets the current callback function for the widget.

- void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.

- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()
  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)
  Clears or sets the damage flags.

- void clear_output ()
  Sets a widget to accept input.

- void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget ∗ w) const
  Checks if w is a child of this widget.

• void copy_label (const char ∗ new_label)
  Sets the current label.

• void copy_tooltip (const char ∗ text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.

• Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image ∗ deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image & img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Callback _Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Callback _Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image ∗ image ()
Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image ∗ image () const**
  
  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image ∗img)**
  
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget ∗wgt) const**
  
  Checks if this widget is a child of `wgt`.

- **int is_label_copied () const**
  
  Returns whether the current label was assigned with `copy_label()`.

- **const char ∗ label () const**
  
  Gets the current label text.

- **void label (const char ∗text)**
  
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char ∗b)**
  
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  
  Sets the label color.

- **Fl_Font labelfont () const**
  
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width `ww` and height `hh` accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group ∗ parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group ∗p)**
  
  Internal use only - “for hacks only”.

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int testShortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
Sets the user data for this widget.

- unsigned int visible() const
  Returns whether a widget is visible.
- unsigned int visible_focus() const
  Checks whether this widget has a visible focus.
- void visible_focus(int v)
  Modifies keyboard focus navigation.
- int visible_r() const
  Returns whether a widget and all its parents are visible.
- int w() const
  Gets the widget width.
- Fl_When when() const
  Returns the conditions under which the callback is called.
- void when(uchar i)
  Sets the flags used to decide when a callback is called.
- Fl_Window* window() const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- int x() const
  Gets the widget position in its window.
- int y() const
  Gets the widget position in its window.
- virtual ~Fl_Widget()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback(Fl_Widget* widget, void* data)
  The default callback for all widgets that don't set a callback.
- static unsigned int labelShortcut(const char* t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int testShortcut(const char*, const bool require_alt=false)
  Returns true if the given text t contains the entered "&x" shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
Protected Member Functions inherited from Fl_Light_Button

• void draw () FL_OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Button

• void simulate_key_action ()

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Static Protected Member Functions inherited from Fl_Button

• static void key_release_timeout (void ∗)

Static Protected Attributes inherited from Fl_Button

• static Fl_Widget_Tracker ∗ key_release_tracker = 0

Generated by Doxygen
12.22.1 Detailed Description

A button with a "checkmark" to show its status.

![Fl_Check_Button]

Figure 12.7 Fl_Check_Button

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for type() and when().

The Fl_Check_Button subclass displays its "ON" state by showing a "checkmark" rather than drawing itself pushed in.

12.22.2 Constructor & Destructor Documentation

12.22.2.1 Fl_Check_Button()

Fl_Check_Button::Fl_Check_Button (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char ∗ L = 0 )

Creates a new Fl_Check_Button widget using the given position, size, and label string. The default box type is FL_NO_BOX, which draws the label w/o a box right of the checkmark. The selection_color() sets the color of the checkmark. Default is FL_FOREGROUND_COLOR (usually black). You can use down_box() to change the box type of the checkmark. Default is FL_DOWN_BOX.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X,Y,W,H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

The documentation for this class was generated from the following files:

- Fl_Check_Button.H
- Fl_Check_Button.cxx

12.23 Fl_Choice Class Reference

A button that is used to pop up a menu.

```cpp
#include <Fl_Choice.H>
```

Inheritance diagram for Fl_Choice:

```
Fl_Widget
    ↓
Fl_Menu_
    ↓
Fl_Choice
    ↓
Fl_Scheme_Choice
```

Public Member Functions

- Fl_Choice (int X, int Y, int W, int H, const char ∗L=0)
Create a new Fl_Choice widget using the given position, size and label string.

- **int handle (int) FL_OVERRIDE**
  Handles the specified event.
- **int value () const**
  Gets the index of the last item chosen by the user.
- **int value (const Fl_Menu_Item *v)**
  Sets the currently selected value using a pointer to menu item.
- **int value (int v)**
  Sets the currently selected value using the index into the menu item array.

### Public Member Functions inherited from Fl_Menu_

- **int add (const char *)**
  This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with |' separating the menu items, and tab separating the menu item names from an optional shortcut string.
  ```c
  int add (const char *, int shortcut, Fl_Callback *, void *, int=0)
  Adds a new menu item.
  ```
  ```c
  int add (const char *, a, const char *, b, Fl_Callback *, c, void *, d=0, int e=0)
  See int Fl_Menu_::add(const char* label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)
  ```
- **void clear ()**
  Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.
- **int clear_submenu (int index)**
  Clears the specified submenu pointed to by index of all menu items.
- **void copy (const Fl_Menu_Item *, void *, user_data=0)**
  Sets the menu array pointer with a copy of m that will be automatically deleted.
- **Fl_Boxtype down_box () const**
  This box type is used to surround the currently-selected items in the menus.
- **void down_box (Fl_Boxtype b)**
  Sets the box type used to surround the currently-selected items in the menus.
- **Fl_Color down_color () const**
  For back compatibility, same as selection_color()
- **void down_color (unsigned c)**
  For back compatibility, same as selection_color()
- **int find_index (const char *) const**
  Find the menu item index for a given menu pathname, such as "Edit/Copy".
- **int find_index (const Fl_Menu_Item *, item) const**
  Find the index into the menu array for a given item.
- **int find_index (Fl_Callback *, cb) const**
  Find the index into the menu array for a given callback cb.
- **const Fl_Menu_Item * find_item (const char *, name) const**
  Find the menu item for the given menu pathname, such as "Edit/Copy".
- **const Fl_Menu_Item * find_item (Fl_Callback *)**
  Find the menu item for the given callback cb.
- **const Fl_Menu_Item * find_item_with_argument (long v)**
  Find the menu item for the given user argument v.
- **const Fl_Menu_Item * find_item_with_user_data (void *)**
  Find the menu item for the given user data v.
- **Fl_Menu_ (int, int, int, int, const char * = 0)**
  Creates a new Fl_Menu_ widget using the given position, size, and label string.
- **void global ()**
  Make the shortcuts for this menu work no matter what window has the focus when you type it.
• int insert (int index, const char *, int shortcut, Fl_Callback *, void *=0, int e=0)
  Inserts a new menu item at the specified index position.
• int insert (int index, const char *a, const char *b, Fl_Callback *c, void *d=0, int e=0)
  See int Fl_Menu_::insert(const char* label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)
• int item_pathname (char *name, int namelen, const Fl_Menu_Item *finditem=0) const
  Get the menu 'pathname' for the specified menuitem.
• const Fl_Menu_Item * menu () const
  Returns a pointer to the array of Fl_Menu_Items.
• void menu (const Fl_Menu_Item *m)
  Sets the menu array pointer directly.
• Fl_Boxtype menu_box () const
  Get the box type for the menu popup windows.
• void menu_box (Fl_Boxtype b)
  Set the box type for the menu popup windows.
• const Fl_Menu_Item * menu_end ()
  Finishes menu modifications and returns menu().
• int mode (int i) const
  Gets the flags of item i.
• void mode (int i, int fl)
  Sets the flags of item i.
• const Fl_Menu_Item * mvalue () const
  Returns a pointer to the last menu item that was picked.
• const Fl_Menu_Item * picked (const Fl_Menu_Item *)
  When user picks a menu item, call this.
• const Fl_Menu_Item * prev_mvalue () const
  Returns a pointer to the menu item that was picked before the current one was picked.
• void remove (int)
  Deletes item i from the menu.
• void replace (int, const char *)
  Changes the text of item i.
• void setonly (Fl_Menu_Item *item)
  Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.
• void shortcut (int i, int s)
  Changes the shortcut of item i to s.
• int size () const
  This returns the number of Fl_Menu_Item structures that make up the menu, correctly counting submenus.
• void size (int W, int H)
• const Fl_Menu_Item * testShortcut ()
  Returns the menu item with the entered shortcut (key value).
• const char * text () const
  Returns the title of the last item chosen.
• const char * text (int i) const
  Returns the title of item i.
• Fl_Color textcolor () const
  Get the current color of menu item labels.
• void texture (Fl_Color c)
  Sets the current color of menu item labels.
• Fl_Font textfont () const
  Gets the current font of menu item labels.
• void textfont (Fl_Font c)
  Sets the current font of menu item labels.
- \texttt{Fl_Fontsize \texttt{textsize}()} const
  
  \textit{Gets the font size of menu item labels.}

- void \texttt{textsize(Fl_Fontsize\ c)}
  
  \textit{Sets the font size of menu item labels.}

- int \texttt{value()} const
  
  \textit{Returns the index into \texttt{menu()} of the last item chosen by the user.}

- int \texttt{value(const Fl_Menu.Item *\ i)}
  
  \textit{The value is the index into \texttt{menu()} of the last item chosen by the user.}

- int \texttt{value(int\ i)}
  
  \textit{The value is the index into \texttt{menu()} of the last item chosen by the user.}

**Public Member Functions inherited from \texttt{Fl_Widget}**

- void \_\texttt{clear_fullscreen()}\()
  
  Activates the widget.

- void \_\texttt{set_fullscreen()}\()
  
  
  \textit{Activates the widget.}

- unsigned int \texttt{active()} const
  
  \textit{Returns whether the widget is active.}

- int \texttt{active_r()} const
  
  \textit{Returns whether the widget and all of its parents are active.}

- \texttt{Fl.Align align()} const
  
  \textit{Gets the label alignment.}

- void \texttt{align(Fl.Align\ \texttt{alignment})}
  
  \textit{Sets the label alignment.}

- long \texttt{argument()} const
  
  \textit{Gets the current user data (long) argument that is passed to the callback function.}

- void \texttt{argument(long\ \texttt{v})}
  
  \textit{Sets the current user data (long) argument that is passed to the callback function.}

- virtual \texttt{class Fl.Gl_Window\ \ast as_gl_window()}
  
  Returns a \texttt{Fl.Gl_Window} pointer if this widget is an \texttt{Fl.Gl_Window}.

- virtual \texttt{class Fl.Gl_Window} const \texttt{as_gl_window()}\ const
  
  Returns a \texttt{Fl.Gl_Window} pointer if this widget is an \texttt{Fl.Gl_Window}.

- virtual \texttt{Fl.Group\ \ast as_group()}\()
  
  Returns a \texttt{Fl.Group} pointer if this widget is an \texttt{Fl.Group}.

- virtual \texttt{Fl.Group} const \texttt{as_group()}\ const
  
  Returns a \texttt{Fl.Group} pointer if this widget is an \texttt{Fl.Group}.

- virtual \texttt{Fl.Window\ \ast as_window()}\()
  
  Returns a \texttt{Fl.Window} pointer if this widget is an \texttt{Fl.Window}.

- virtual \texttt{Fl.Window} const \texttt{as_window()}\ const
  
  Sets the image to use as part of the widget label when in the inactive state.

- void \texttt{bind_deimage(Fl.Image\ \ast img)}
  
  \textit{Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.}

- void \texttt{bind_deimage(int\ f)}
  
  \textit{Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.}

- void \texttt{bind_image(Fl.Image\ \ast\ img)}
  
  \textit{Sets the image to use as part of the widget label when in the active state.}

- void \texttt{bind_image(int\ f)}
  
  \textit{Sets the image to use as part of the widget label when in the active state.}

- \texttt{Fl.Boxtype box()}\()
  
  \textit{Gets the box type of the widget.}

- void \texttt{box(Fl.Boxtype\ new_box)}
  
  \textit{Sets the box type for the widget.}

- \texttt{Fl.Callback\ p\ \texttt{callback}()}\ const
  
  \textit{Generated by Doxygen}
Gets the current callback function for the widget.

- **void callback (Fl_Callback ∗cb)**
  - Sets the current callback function for the widget.

- **void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)**
  - Sets the current callback function and managed user data for the widget.

- **void callback (Fl_Callback ∗cb, void ∗p)**
  - Sets the current callback function and data for the widget.

- **void callback (Fl_Callback0 ∗cb)**
  - Sets the current callback function for the widget.

- **void callback (Fl_Callback1 ∗cb, long p=0)**
  - Sets the current callback function for the widget.

- **unsigned int changed () const**
  - Checks if the widget value changed since the last callback.

- **void clear_active ()**
  - Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  - Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  - Clears or sets the damage flags.

- **void clear_output ()**
  - Sets a widget to accept input.

- **void clear_visible ()**
  - Hides the widget.

- **void clear_visible_focus ()**
  - Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  - Gets the background color of the widget.

- **void color (Fl_Color bg)**
  - Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  - Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  - For back compatibility only.

- **void color2 (unsigned a)**
  - For back compatibility only.

- **int contains (const Fl_Widget ∗w) const**
  - Checks if w is a child of this widget.

- **void copy_label (const char ∗new_label)**
  - Sets the current label.

- **void copy_tooltip (const char ∗text)**
  - Sets the current tooltip text.

- **uchar damage () const**
  - Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  - Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  - Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  - Internal use only.

- **void deactivate ()**
  - Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size to use.
Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int `takesevents`() const
  Returns if the widget is able to take events.
• int `test_shortcut`()  
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.
• const char * `tooltip`() const
  Gets the current tooltip text.
• void `tooltip`(const char *text)  
  Sets the current tooltip text.
• Fl_Window * `top_window`() const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * `top_window_offset`(int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar `type`() const
  Gets the widget type.
• void `type`(uchar t)  
  Sets the widget type.
• int `use_accents_menu`()  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * `user_data`() const
  Gets the user data for this widget.
• void `user_data`(Fl_Callback_User_Data *v, bool auto_free)  
  Sets the user data for this widget.
• void `user_data`(void *v)  
  Sets the user data for this widget.
• unsigned int `visible`() const
  Returns whether a widget is visible.
• unsigned int `visible_focus`() const
  Checks whether this widget has a visible focus.
• void `visible_focus`(int v)  
  Modifies keyboard focus navigation.
• int `visible_r`() const
  Returns whether a widget and all its parents are visible.
• int `w`() const
  Gets the widget width.
• Fl_When `when`() const
  Returns the conditions under which the callback is called.
• void `when`(uchar i)  
  Sets the flags used to decide when a callback is called.
• Fl_Window * `window`() const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int `x`() const
  Gets the widget position in its window.
• int `y`() const
  Gets the widget position in its window.
• virtual ~Fl_Widget()  
  Destroys the widget.

Protected Member Functions

• void `draw`() FL_OVERRIDE
  Draws the widget.
Protected Member Functions inherited from Fl_Menu_

- int item_pathname_ (char ∗name, int namelen, const Fl_Menu_Item ∗finditem, const Fl_Menu_Item ∗menu=0) const

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.
- void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y , int W, int H) const
  
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.
- void set_flag (unsigned int c)
  
  Sets a flag in the flags mask.
- void w (int v)
  
  Internal use only.
- void x (int v)
  
  Internal use only.
- void y (int v)
  
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text ∗t contains the entered '&x' shortcut.
12.23.1 Detailed Description

A button that is used to pop up a menu.

This is a button that, when pushed, pops up a menu (or hierarchy of menus) defined by an array of Fl_Menu_Item objects. Motif calls this an OptionButton.

The only difference between this and a Fl_Menu_Button is that the name of the most recent chosen menu item is displayed inside the box, while the label is displayed outside the box. However, since the use of this is most often to control a single variable rather than do individual callbacks, some of the Fl_Menu_Button methods are redescribed here in those terms.

When the user clicks a menu item, value() is set to that item and then:

- The item’s callback is done if one has been set; the Fl_Choice is passed as the Fl_Widget* argument, along with any userdata configured for the callback.

- If the item does not have a callback, the Fl_Choice widget’s callback is done instead, along with any userdata configured for it. The callback can determine which item was picked using value(), mvalue(), item_pathname(), etc.
All three mouse buttons pop up the menu. The Forms behavior of the first two buttons to increment/decrement the choice is not implemented. This could be added with a subclass, however.

The menu will also pop up in response to shortcuts indicated by putting a ‘&’ character in the label(). See Fl_Button::shortcut(int s) for a description of this.

Typing the shortcut() of any of the items will do exactly the same as when you pick the item with the mouse. The ‘&’ character in item names are only looked at when the menu is popped up, however.

The inherited Fl_Widget::changed() and related methods can be used as follows:

- int Fl_Widget::changed() const This value is true when the user picks a different value. It is turned off by value() and just before doing a callback (the callback can turn it back on if desired).
- void Fl_Widget::set_changed() This method sets the changed() flag.
- void Fl_Widget::clear_changed() This method clears the changed() flag.

The inherited Fl_Menu_::down_box() methods can be used as follows:

- Fl_Boxtype Fl_Menu_::down_box() const Gets the current down box, which is used when the menu is popped up. The default down box type is FL_DOWN_BOX.
- void Fl_Menu_::down_box(Fl_Boxtype b) Sets the current down box type to b.

Simple example:

```c
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Choice.H>

int main() {
  Fl_Window *win = new Fl_Window(300,200);
  Fl_Choice *choice = new Fl_Choice(100,10,100,25,"Choice:"
  choice->add("Zero");
  choice->add("One");
  choice->add("Two");
  choice->add("Three");
  choice->value(2); // make "Two" selected by default (zero based)
  win->end();
  win->show();
  return Fl::run();
}
```

### 12.23.2 Constructor & Destructor Documentation

#### 12.23.2.1 Fl_Choice()

Fl_Choice::Fl_Choice (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char * L = 0 )

Create a new Fl_Choice widget using the given position, size and label string. The default boxtype is FL_UP_BOX.

The constructor sets menu() to NULL. See Fl_Menu_ for the methods to set or change the menu.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>X,Y,W,H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

### 12.23.3 Member Function Documentation

#### 12.23.3.1 draw()

void Fl_Choice::draw ( ) [protected], [virtual]
Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:
```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```
Implements Fl_Widget.

12.23.3.2 handle()

```cpp
int Fl_Choice::handle (  
    int event ) [virtual]
```
Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-
circuit events that you don't handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class.
This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The
effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses)
in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In
such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by
returning 1 even if you didn't do anything with it.

Parameters

```
in  event  the kind of event received
```

Return values

```
0 if the event was not used or understood
1 if the event was used and can be deleted
```

See also

Fl_Event

Reimplemented from Fl_Widget.
Reimplemented in Fl_Scheme_Choice.

12.23.3.3 value() [1/3]

```cpp
int Fl_Choice::value ( ) const [inline]
```
Gets the index of the last item chosen by the user.
The index is -1 initially.

12.23.3.4 value() [2/3]

```cpp
int Fl_Choice::value (  
    const Fl_Menu_Item * v )
```
Sets the currently selected value using a pointer to menu item.
Changing the selected value causes a redraw().

Parameters

```
in  v   pointer to menu item in the menu item array.
```
Returns
non-zero if the new value is different to the old one.

12.23.3.5 value() [3/3]
int Fl_Choice::value (int v)
Sets the currently selected value using the index into the menu item array.
Changing the selected value causes a redraw().

Parameters

\[ \text{in } v \text{ index of value in the menu item array.} \]

Returns
non-zero if the new value is different to the old one.

The documentation for this class was generated from the following files:

• Fl_Choice.H
• Fl_Choice.cxx

12.24 Fl_Clock Class Reference

This widget provides a round analog clock display.

#include <Fl_Clock.H>

Inheritance diagram for Fl_Clock:

```plaintext
Fl_Widget
  Fl_Clock_Output
  Fl_Clock
  Fl_Round_Clock
```

Public Member Functions

- **Fl_Clock** (int X, int Y, int W, int H, const char *L=0)
  
  Create an Fl_Clock widget using the given position, size, and label string.

- **Fl_Clock** (uchar t, int X, int Y, int W, int H, const char *L)
  
  Create an Fl_Clock widget using the given clock type \( t \), position, size, and label string.

- int handle (int) FL_OVERRIDE
  
  Handles the specified event.

- ~Fl_Clock ()
  
  The destructor removes the clock.

Public Member Functions inherited from Fl_Clock_Output

- **Fl_Clock_Output** (int X, int Y, int W, int H, const char *L=0)
  
  Create a new Fl_Clock_Output widget with the given position, size and label.
• int \texttt{hour} () const
  \textit{Returns the displayed hour (0 to 23).}
• int \texttt{minute} () const
  \textit{Returns the displayed minute (0 to 59).}
• int \texttt{second} () const
  \textit{Returns the displayed second (0 to 60, 60=leap second).}
• int \texttt{shadow} () const
  \textit{Returns the shadow drawing mode of the hands.}
• void \texttt{shadow} (int mode)
  \textit{Sets the shadow drawing mode of the hands.}
• ulong \texttt{value} () const
  \textit{Returns the displayed time.}
• void \texttt{value} (int H, int m, int s)
  \textit{Set the displayed time.}
• void \texttt{value} (ulong v)
  \textit{Set the displayed time.}

\textbf{Public Member Functions inherited from Fl_Widget}

• void \texttt{_clear_fullscreen} ()
• void \texttt{_set_fullscreen} ()
• void \texttt{activate} ()
  \textit{Activates the widget.}
• unsigned int \texttt{active} () const
  \textit{Returns whether the widget is active.}
• int \texttt{active}_r () const
  \textit{Returns whether the widget and all of its parents are active.}
• Fl\_Align \texttt{align} () const
  \textit{Gets the label alignment.}
• void \texttt{align} (Fl\_Align alignment)
  \textit{Sets the label alignment.}
• long \texttt{argument} () const
  \textit{Gets the current user data (long) argument that is passed to the callback function.}
• void \texttt{argument} (long v)
  \textit{Sets the current user data (long) argument that is passed to the callback function.}
• virtual class Fl\_Gl\_Window \ast \texttt{as_gl_window} ()
  \textit{Returns an Fl\_Gl\_Window pointer if this widget is an Fl\_Gl\_Window.}
• virtual class Fl\_Gl\_Window const \ast \texttt{as_gl_window} () const
• virtual Fl\_Group \ast \texttt{as_group} ()
  \textit{Returns an Fl\_Group pointer if this widget is an Fl\_Group.}
• virtual Fl\_Group const \ast \texttt{as_group} () const
• virtual Fl\_Window \ast \texttt{as_window} ()
  \textit{Returns an Fl\_Window pointer if this widget is an Fl\_Window.}
• virtual Fl\_Window const \ast \texttt{as_window} () const
• void \texttt{bind_deimage} (Fl\_Image \ast img)
  \textit{Sets the image to use as part of the widget label when in the inactive state.}
• void \texttt{bind_deimage} (int f)
  \textit{Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.}
• void \texttt{bind_image} (Fl\_Image \ast img)
  \textit{Sets the image to use as part of the widget label when in the active state.}
• void \texttt{bind_image} (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  Gets the box type of the widget.
- **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.
- **Fl_Callback_p callback () const**
  Gets the current callback function for the widget.
- **void callback (Fl_Callback *cb)**
  Sets the current callback function for the widget.
- **void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**
  Sets the current callback function and managed user data for the widget.
- **void callback (Fl_Callback *cb, void *p)**
  Sets the current callback function and data for the widget.
- **void callback (Fl_Callback0 *cb)**
  Sets the current callback function for the widget.
- **void callback (Fl_Callback1 *cb, long p=0)**
  Sets the current callback function for the widget.
- **unsigned int changed () const**
  Checks if the widget value changed since the last callback.
- **void clear_active ()**
  Marks the widget as inactive without sending events or changing focus.
- **void clear_changed ()**
  Marks the value of the widget as unchanged.
- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.
- **void clear_output ()**
  Sets a widget to accept input.
- **void clear_visible ()**
  Hides the widget.
- **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.
- **Fl_Color color () const**
  Gets the background color of the widget.
- **void color (Fl_Color bg)**
  Sets the background color of the widget.
- **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.
- **Fl_Color color2 () const**
  For back compatibility only.
- **void color2 (unsigned a)**
  For back compatibility only.
- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.
- **void copy_label (const char *new_label)**
  Sets the current label.
- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.
- **uchar damage () const**
  Returns non-zero if draw() needs to be called.
- **void damage (uchar c)**
  Sets the damage bits for the widget.
• void **damage**(uchar c, int x, int y, int w, int h)
  
  \textit{Sets the damage bits for an area inside the widget.}

• void **deactivate** ()
  
  \textit{Deactivates the widget.}

• Fl\_Image \* **deimage** ()
  
  \textit{Gets the image that is used as part of the widget label when in the inactive state.}

• const Fl\_Image \* **deimage** () const
  
  \textit{Gets the image that is used as part of the widget label when in the inactive state.}

• void **deimage** (Fl\_Image \&img)
  
  \textit{Sets the image to use as part of the widget label when in the inactive state.}

• void **deimage** (Fl\_Image \*img)
  
  \textit{Sets the image to use as part of the widget label when in the inactive state.}

• int **deimage\_bound** () const
  
  \textit{Returns whether the inactive image is managed by the widget.}

• void **do\_callback**(Fl\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)
  
  \textit{Calls the widget callback function with default arguments.}

• void **do\_callback**(Fl\_Widget \*widget, long arg, Fl\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)
  
  \textit{Calls the widget callback function with arbitrary arguments.}

• void **do\_callback**(Fl\_Widget \*widget, void \*arg=0, Fl\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)
  
  \textit{Calls the widget callback function with arbitrary arguments.}

• void **draw\_label**(int, int, int, int, Fl\_Align) const
  
  \textit{Draws the label in an arbitrary bounding box with an arbitrary alignment.}

• int **h** () const
  
  \textit{Gets the widget height.}

• virtual void **hide** ()
  
  \textit{Makes a widget invisible.}

• Fl\_Image \* **image** ()
  
  \textit{Gets the image that is used as part of the widget label when in the active state.}

• const Fl\_Image \* **image** () const
  
  \textit{Gets the image that is used as part of the widget label when in the active state.}

• void **image** (Fl\_Image \&img)
  
  \textit{Sets the image to use as part of the widget label when in the active state.}

• void **image** (Fl\_Image \*img)
  
  \textit{Sets the image to use as part of the widget label when in the active state.}

• int **image\_bound** () const
  
  \textit{Returns whether the image is managed by the widget.}

• int **inside**(const Fl\_Widget \*wgt) const
  
  \textit{Checks if this widget is a child of wgt.}

• int **is\_label\_copied** () const
  
  \textit{Returns whether the current label was assigned with copy\_label().}

• const char \* **label** () const
  
  \textit{Gets the current label text.}

• void **label** (const char \*text)
  
  \textit{Sets the current label pointer.}

• void **label** (Fl\_Labeltype a, const char \*b)
  
  \textit{Shortcut to set the label text and type in one call.}

• Fl\_Color **labelcolor** () const
  
  \textit{Gets the label color.}

• void **labelcolor** (Fl\_Color c)
Sets the label color.

- `Fl_Font labelfont () const`
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

- `void labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width ww and height hh accordingly with the label size.

- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group *p)`
  Internal use only - “for hacks only”.

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.

- `void set_visible ()`
  Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  Returns whether the widget's label uses ‘&’ to indicate shortcuts.

- `void shortcut_label (int value)`
  Sets whether the widget's label uses ‘&’ to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (FL_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• FL_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,

  flags possible values enumeration.

Protected Member Functions inherited from Fl_Clock_Output

- void draw () FL_OVERRIDE
  Draw clock with current position and size.
- void draw (int X, int Y, int W, int H)
  Draw clock with the given position and size.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
12.24 Fl_Clock Class Reference

- void **draw_label** (int, int, int, int) const  
  
  *Draws the label in an arbitrary bounding box.*

- **Fl_Widget** (int x, int y, int w, int h, const char ∗label=0L)  
  
  *Creates a widget at the given position and size.*

- unsigned int **flags** () const  
  
  *Gets the widget flags mask.*

- void **h** (int v)  
  
  *Internal use only.*

- void **set_flag** (unsigned int c)  
  
  *Sets a flag in the flags mask.*

- void **w** (int v)  
  
  *Internal use only.*

- void **x** (int v)  
  
  *Internal use only.*

- void **y** (int v)  
  
  *Internal use only.*

12.24.1 Detailed Description

This widget provides a round analog clock display. **Fl_Clock** is provided for Forms compatibility. It installs a 1-second timeout callback using Fl::add_timeout(). You can choose the rounded or square type of the clock with **type()**. Please see **Fl_Clock_Output** widget for applicable values.

- class **Fl_Clock_Output**
## 12.24.2 Constructor & Destructor Documentation

### 12.24.2.1 Fl_Clock() [1/2]

```cpp
Fl_Clock::Fl_Clock (int X, int Y, int W, int H, const char ∗L = 0)
```

Create an Fl_Clock widget using the given position, size, and label string.
The default clock type is FL_SQUARE_CLOCK and the default boxtype is FL_UP_BOX.

### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X, Y, W, H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

### 12.24.2.2 Fl_Clock() [2/2]

```cpp
Fl_Clock::Fl_Clock (uchar t, int X, int Y, int W, int H, const char ∗L)
```

Create an Fl_Clock widget using the given clock type t, position, size, and label string.
The default clock type t is FL_SQUARE_CLOCK. You can set the clock type to FL_ROUND_CLOCK or any other valid clock type. See Fl_Clock_Output widget for applicable values.
The default boxtype is FL_UP_BOX for FL_SQUARE_CLOCK and FL_NO_BOX for FL_ROUND_CLOCK, if set by the constructor. If you change the clock type with type() later you should also set the boxtype with box().

### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>t</th>
<th>type of clock: FL_ROUND_CLOCK or FL_SQUARE_CLOCK (0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X, Y, W, H</td>
<td>position and size of the widget</td>
</tr>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

class Fl_Clock_Output

## 12.24.3 Member Function Documentation

### 12.24.3.1 handle()

```cpp
int Fl_Clock::handle (int event) [virtual]
```

Handles the specified event.
You normally don’t call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited handle() method in your overridden method so that you don’t short-circuit events that you don’t handle. In this last case you should return the callee retval.
One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.
In rare cases you may want to return 1 from your handle() method although you don’t really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses)
in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>event</th>
<th>the kind of event received</th>
</tr>
</thead>
</table>

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>if the event was not used or understood</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>if the event was used and can be deleted</td>
</tr>
</tbody>
</table>

Fl_Clock
  ↓
Fl_Round_Clock
```

Public Member Functions

- Fl_Clock_Output (int X, int Y, int W, int H, const char *L=0)
  Create a new Fl_Clock_Output widget with the given position, size and label.
- int hour () const
  Returns the displayed hour (0 to 23).
- int minute () const
  Returns the displayed minute (0 to 59).
- int second () const
  Returns the displayed second (0 to 60, 60=leap second).
- int shadow () const
  Returns the shadow drawing mode of the hands.
- void shadow (int mode)
  Sets the shadow drawing mode of the hands.
• **ulong value () const**
  Returns the displayed time.

• **void value (int H, int m, int s)**
  Set the displayed time.

• **void value (ulong v)**
  Set the displayed time.

### Public Member Functions inherited from Fl_Widget

- **void _clear_fullscreen ()**
  Activates the widget.

- **void _set_fullscreen ()**

- **void activate ()**
  Activates the widget.

- **unsigned int active () const**
  Returns whether the widget is active.

- **int active_r () const**
  Returns whether the widget and all of its parents are active.

- **Fl_Align align () const**
  Gets the label alignment.

- **void align (Fl_Align alignment)**
  Sets the label alignment.

- **long argument () const**
  Gets the current user data (long) argument that is passed to the callback function.

- **void argument (long v)**
  Sets the current user data (long) argument that is passed to the callback function.

- **virtual class Fl_Gl_Window ∗ as_gl_window ()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- **virtual class Fl_Gl_Window const ∗ as_gl_window () const**

- **virtual Fl_Group ∗ as_group ()**
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **virtual Fl_Group const ∗ as_group () const**

- **virtual Fl_Window ∗ as_window ()**
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **virtual Fl_Window const ∗ as_window () const**

- **void bind_deimage (Fl_Image ∗ img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void bind_deimage (int f)**
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image (Fl_Image ∗ img)**
  Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  Gets the current callback function for the widget.

- **void callback (Fl_Callback ∗cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)**
Sets the current callback function and managed user data for the widget.

- void `callback (Fl_Callback ∗ cb, void ∗ p)`
  Sets the current callback function and data for the widget.
- void `callback (Fl_Callback0 ∗ cb)`
  Sets the current callback function for the widget.
- void `callback (Fl_Callback1 ∗ cb, long p=0)`
  Sets the current callback function for the widget.
- unsigned int `changed () const`
  Checks if the widget value changed since the last callback.
- void `clear_active ()`
  Marks the widget as inactive without sending events or changing focus.
- void `clear_changed ()`
  Marks the value of the widget as unchanged.
- void `clear_damage (uchar c=0)`
  Clears or sets the damage flags.
- void `clear_output ()`
  Sets a widget to accept input.
- void `clear_visible ()`
  Hides the widget.
- void `clear_visible_focus ()`
  Disables keyboard focus navigation with this widget.
- Fl_Color `color () const`
  Gets the background color of the widget.
- void `color (Fl_Color bg)`
  Sets the background color of the widget.
- void `color (Fl_Color bg, Fl_Color sel)`
  Sets the background and selection color of the widget.
- Fl_Color `color2 () const`
  For back compatibility only.
- void `color2 (unsigned a)`
  For back compatibility only.
- int `contains (const Fl_Widget ∗ w) const`
  Checks if w is a child of this widget.
- void `copy_label (const char ∗ new_label)`
  Sets the current label.
- void `copy_tooltip (const char ∗ text)`
  Sets the current tooltip text.
- uchar `damage () const`
  Returns non-zero if `draw()` needs to be called.
- void `damage (uchar c)`
  Sets the damage bits for the widget.
- void `damage (uchar c, int x, int y, int w, int h)`
  Sets the damage bits for an area inside the widget.
- int `damage_resize (int, int, int, int)`
  Internal use only.
- void `deactivate ()`
  Deactivates the widget.
- Fl_Image ∗ `deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.
- const Fl_Image ∗ `deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual int handle (int event)
  Handles the specified event.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
Sets the font size in pixels.

- `Fl_Labeltype labeltype () const`
  Gets the label type.

- `void labeltype (Fl_Labeltype a)`
  Sets the label type.

- `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

- `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

- `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

- `unsigned int output () const`
  Returns if a widget is used for output only.

- `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

- `void parent (Fl_Group * p)`
  Internal use only - “for hacks only”.

- `void position (int X, int Y)`
  Repositions the window or widget.

- `void redraw ()`
  Schedules the drawing of the widget.

- `void redraw_label ()`
  Schedules the drawing of the label.

- `virtual void resize (int x, int y, int w, int h)`
  Changes the size or position of the widget.

- `Fl_Color selection_color () const`
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  Sets the selection color.

- `void set_active ()`
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  Marks the value of the widget as changed.

- `void set_output ()`
  Sets a widget to output only.

- `void set_visible ()`
  Makes the widget visible.

- `void set_visible_focus ()`
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- `void shortcut_label (int value)`
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- `virtual void show ()`
  Makes a widget visible.

- `void size (int W, int H)`
  Changes the size of the widget.

- `int take_focus ()`
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draw clock with current position and size.

• void draw (int X, int Y, int W, int H)
  Draw clock with the given position and size.
Protected Member Functions inherited from Fl_Widget

- void **clear_flag**(unsigned int c)
  Clears a flag in the flags mask.

- void **draw_backdrop**() const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box**() const
  Draws the widget box according its box style.

- void **draw_box**(Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void **draw_box**(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus**() const
  Draws a focus rectangle around the widget.

- void **draw_focus**(Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void **draw_focus**(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void **draw_label**() const
  Draws the widget's label at the defined label position.

- void **draw_label**(int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget(int x, int y, int w, int h, const char ∗ label=0L)
  Creates a widget at the given position and size.

- unsigned int **flags**() const
  Gets the widget flags mask.

- void **h**(int v)
  Internal use only.

- void **set_flag**(unsigned int c)
  Sets a flag in the flags mask.

- void **w**(int v)
  Internal use only.

- void **x**(int v)
  Internal use only.

- void **y**(int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void **default_callback**(Fl_Widget ∗ widget, void ∗ data)
  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut(const char ∗ t)
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut(const char ∗ t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from **Fl_Widget**

- `enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<25, USERFLAG2 = 1<<26, USERFLAG1 = 1<<27
} flags possible values enumeration.

### 12.25.1 Detailed Description

This widget can be used to display a program-supplied time. The time shown on the clock is not updated. To display the current time, use `Fl_Clock` instead.

![Figure 12.11 FL_SQUARE_CLOCK type](image)

**Figure 12.11 FL_SQUARE_CLOCK type**

![Figure 12.12 FL_ROUND_CLOCK type](image)

**Figure 12.12 FL_ROUND_CLOCK type**

Values for clock `type()` (#include `<FL/Clock.H>`):

```c
#define FL_SQUARE_CLOCK 0 // Square Clock variant
#define FL_ROUND_CLOCK 1  // Round Clock variant
#define FL_ANALOG_CLOCK FL_SQUARE_CLOCK // An analog clock is square
#define FL_DIGITAL_CLOCK FL_SQUARE_CLOCK // Not yet implemented
```

### 12.25.2 Constructor & Destructor Documentation

#### 12.25.2.1 Fl_Clock_Output()

```c
Fl_Clock_Output::Fl_Clock_Output ( 
```
Create a new `Fl_Clock_Output` widget with the given position, size and label. The default clock type is `FL_SQUARE_CLOCK` and the default boxtype is `FL_UP_BOX`.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>X, Y, W, H</code></td>
<td>position and size of the widget</td>
</tr>
<tr>
<td><code>L</code></td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

### 12.25.3 Member Function Documentation

#### 12.25.3.1 draw() [1/2]

```cpp
void Fl_Clock_Output::draw () [protected], [virtual]
```

Draw clock with current position and size. Implements `Fl_Widget`.

#### 12.25.3.2 draw() [2/2]

```cpp
void Fl_Clock_Output::draw ( int X, int Y, int W, int H ) [protected]
```

Draw clock with the given position and size.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>X, Y, W, H</code></td>
<td>position and size</td>
</tr>
</tbody>
</table>

#### 12.25.3.3 hour()

```cpp
int Fl_Clock_Output::hour ( ) const [inline]
```

Returns the displayed hour (0 to 23).

See also

- `value()`, `minute()`, `second()`

#### 12.25.3.4 minute()

```cpp
int Fl_Clock_Output::minute ( ) const [inline]
```

Returns the displayed minute (0 to 59).

See also

- `value()`, `hour()`, `second()`

#### 12.25.3.5 second()

```cpp
int Fl_Clock_Output::second ( ) const [inline]
```

Returns the displayed second (0 to 60, 60=leap second).
See also

\texttt{value()}, \texttt{hour()}, \texttt{minute()}

\subsection{shadow() [1/2]}

\begin{verbatim}
int Fl_Clock_Output::shadow ( ) const [inline]
\end{verbatim}

Returns the shadow drawing mode of the hands.

Returns

shadow drawing mode of the hands

Return values

<table>
<thead>
<tr>
<th>0</th>
<th>no shadows</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>draw shadows of hands (default)</td>
</tr>
</tbody>
</table>

\subsection{shadow() [2/2]}

\begin{verbatim}
void Fl_Clock_Output::shadow ( int mode ) [inline]
\end{verbatim}

Sets the shadow drawing mode of the hands.

Enables (1) or disables (0) drawing the hands with shadows.

Values except 0 and 1 are reserved for future extensions and yield undefined behavior.

The default is to draw the shadows (1).

Parameters

\begin{verbatim}
in mode 1 = shadows (default), 0 = no shadows
\end{verbatim}

\subsection{value() [1/3]}

\begin{verbatim}
ulong Fl_Clock_Output::value ( ) const [inline]
\end{verbatim}

Returns the displayed time.

Returns the time in seconds since the UNIX epoch (January 1, 1970).

See also

\texttt{value(ulong)}

\subsection{value() [2/3]}

\begin{verbatim}
void Fl_Clock_Output::value ( int H, int m, int s )
\end{verbatim}

Set the displayed time.

Set the time in hours, minutes, and seconds.

Parameters

\begin{verbatim}
in H,m,s displayed time
\end{verbatim}
12.26 Fl_Color_Chooser Class Reference

See also

   hour(), minute(), second()

12.25.3.10 value() [3/3]

void Fl_Clock_Output::value (ulong v)

Set the displayed time.
Set the time in seconds since the UNIX epoch (January 1, 1970).

Parameters

| in  | v | seconds since epoch |

See also

   value()

The documentation for this class was generated from the following files:

- Fl_Clock.H
- Fl_Clock.cxx

12.26 Fl_Color_Chooser Class Reference

The Fl_Color_Chooser widget provides a standard RGB color chooser.

```c
#include <Fl_Color_Chooser.H>
```

Inheritance diagram for Fl_Color_Chooser:

```
Fl_Widget
    |           |
    |           |
Fl_Group
    |           |
    |           |
Fl_Color_Chooser
```

Public Member Functions

- double b () const
  
  Returns the current blue value.

- Fl_Color_Chooser (int X, int Y, int W, int H, const char *L=0)
  
  Creates a new Fl_Color_Chooser widget using the given position, size, and label string.

- double g () const
  
  Returns the current green value.

- int handle (int e) FL_OVERRIDE
  
  Handles all events received by this widget.

- int hsv (double H, double S, double V)
  
  Set the hsv values.

- double hue () const
  
  Returns the current hue.

- int mode ()
  
  Returns which Fl_Color_Chooser variant is currently active.

- void mode (int newMode)
Set which Fl_Color_Chooser variant is currently active.

- **double r () const**
  Returns the current red value.
- **int rgb (double R, double G, double B)**
  Sets the current rgb color values.
- **double saturation () const**
  Returns the saturation.
- **double value () const**
  Returns the value/brightness.

Public Member Functions inherited from Fl_Group

- **FL_Widget *&_ddfdesign_kludge ()**
  This is for forms compatibility only.
- **void add (FL_Widget &)**
  The widget is removed from its current group (if any) and then added to the end of this group.
- **void add (FL_Widget *o)**
  See void Fl_Group::add(FL_Widget &w)
- **void addResizable (FL_Widget &o)**
  Adds a widget to the group and makes it the resizable widget.
- **FL_Widget *const * array () const**
  Returns a pointer to the array of children.
- **FL_Group const * as_group () const FL_OVERRIDE**
  FL_Group * as_group () FL_OVERRIDE
  Returns an FL_Group pointer if this widget is an FL_Group.
- **void begin ()**
  Sets the current group so you can build the widget tree by just constructing the widgets.
- **FL_Widget * child (int n) const**
  Returns array()[n].
- **int children () const**
  Returns how many child widgets the group has.
- **void clear ()**
  Deletes all child widgets from memory recursively.
- **unsigned int clip_children ()**
  Returns the current clipping mode.
- **void clip_children (int c)**
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
- **virtual int delete_child (int n)**
  Removes the widget at index from the group and deletes it.
- **void end ()**
  Exactly the same as current(this->parent()).
- **int find (const FL_Widget &o) const**
  See int Fl_Group::find(const FL_Widget *w) const.
- **int find (const FL_Widget *) const**
  Searches the child array for the widget and returns the index.
- **FL_Group (int, int, int, int, const char *)=0**
  Creates a new FL_Group widget using the given position, size, and label string.
- **void focus (FL_Widget *)**
  void forms_end ()
  This is for forms compatibility only.
- **int handle (int) FL_OVERRIDE**
Handles the specified event.

- void init_sizes()
  Resets the internal array of widget sizes and positions.
- void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
  Removes the widget at index from the group but does not delete it.
- Fl_Widget * resizable () const
  Returns the group's resizable widget.
- void resizable (Fl_Widget &o)
  Sets the group's resizable widget.
- void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void resize (int, int, int, int) FL_OVERRIDE
  Resizes the Fl_Group widget and all of its children.
- virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- **void bind_image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **void bind_image (int f)**
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- **Fl_Boxtype box () const**
  Gets the box type of the widget.

- **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.

- **Fl_Callback_p callback () const**
  Gets the current callback function for the widget.

- **void callback (Fl_Callback *cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**
  Sets the current callback function and managed user data for the widget.

- **void callback (Fl_Callback *cb, void *p)**
  Sets the current callback function and data for the widget.

- **void callback (Fl_Callback0 *cb)**
  Sets the current callback function for the widget.

- **void callback (Fl_Callback1 *cb, long p=0)**
  Sets the current callback function for the widget.

- **unsigned int changed () const**
  Checks if the widget value changed since the last callback.

- **void clear_active ()**
  Marks the widget as inactive without sending events or changing focus.

- **void clear_changed ()**
  Marks the value of the widget as unchanged.

- **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- **void clear_output ()**
  Sets a widget to accept input.

- **void clear_visible ()**
  Hides the widget.

- **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  For back compatibility only.

- **void color2 (unsigned a)**
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  Sets the current label.

- **void copy_tooltip (const char *text)**
  Sets the current tooltip text.
- **uchar damage () const**
  
  Returns non-zero if `draw()` needs to be called.

- **void damage (uchar c)**

  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**

  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**

  Internal use only.

- **void deactivate ()**

  Deactivates the widget.

- **Fl_Image ∗ deimage ()**

  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image ∗ deimage () const**

  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**

  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image ∗ img)**

  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**

  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**

  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget ∗ widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**

  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget ∗ widget, void ∗ arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**

  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**

  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**

  Gets the widget height.

- **virtual void hide ()**

  Makes a widget invisible.

- **Fl_Image ∗ image ()**

  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image ∗ image () const**

  Gets the image that is used as part of the widget label when in the active state.

- **void image (Fl_Image &img)**

  Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image ∗ img)**

  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**

  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget ∗ wgt) const**

  Checks if this widget is a child of `wgt`.

- **int is_label_copied () const**

  Returns whether the current label was assigned with `copy_label()`.

- **const char ∗ label () const**

  Gets the current label text.

- **void label (const char ∗ text)**

  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char ∗ b)**
Shortcut to set the label text and type in one call.

- **FL_Color labelcolor () const**
  
  Gets the label color.

- **void labelcolor (FL_Color c)**
  
  Sets the label color.

- **FL_Font labelfont () const**
  
  Gets the font to use.

- **void labelfont (FL_Font f)**
  
  Sets the font to use.

- **FL_Fontsize labelsize () const**
  
  Gets the font size in pixels.

- **void labelsize (FL_Fontsize pix)**
  
  Sets the font size in pixels.

- **FL_Labeltype labeltype () const**
  
  Gets the label type.

- **void labeltype (FL_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width ww and height hh accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **FL_Group *parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (FL_Group *p)**
  
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **FL_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (FL_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.

- **void set_visible ()**
  
  Makes the widget visible.

- **void set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '& to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void *user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Static Public Member Functions

- static void hsv2rgb (double H, double S, double V, double &R, double &G, double &B)
  This static method converts HSV colors to RGB colorspace.
- static void rgb2hsv (double R, double G, double B, double &H, double &S, double &V)
  This static method converts RGB colors to HSV colorspace.

Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Related Symbols

(Note that these are not member symbols.)

- int fl_color_chooser (const char *name, double &r, double &g, double &b, int cmode)
  Pops up a window to let the user pick an arbitrary RGB color.
- int fl_color_chooser (const char *name, uchar &r, uchar &g, uchar &b, int cmode)
  Pops up a window to let the user pick an arbitrary RGB color.

Additional Inherited Members

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7
  , OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11
  , MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15
  , GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19 , 
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22 , 
  AUTO_DELETE_USER_DATA = 1<<23 , 
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31 
} flags possible values enumeration.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw () FL_OVERRID
12.26 Fl_ColorChooser Class Reference

Draws the widget.

- void **draw_child** (Fl_Widget &widget) const
  Forces a child to redraw.

- void **draw_children**()
  Draws all children of the group.

- void **draw_outside_label** (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.

- virtual int **on_insert** (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.

- virtual int **on_move** (int, int)
  Allow derived groups to act when a widget is moved within the group.

- virtual void **on_remove** (int)
  Allow derived groups to act when a child widget is removed from the group.

- int * **sizes**()
  Returns the internal array of widget sizes and positions.

- void **update_child** (Fl_Widget &widget) const
  Draws a child only if it needs it.

**Protected Member Functions inherited from Fl_Widget**

- void **clear_flag** (unsigned int c)
  Clears a flag in the flags mask.

- void **draw_backdrop** () const
  If FLALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void **draw_box** () const
  Draws the widget box according its box style.

- void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void **draw_focus** () const
  Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void **draw_label** () const
  Draws the widget's label at the defined label position.

- void **draw_label** (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int **flags** () const
  Gets the widget flags mask.

- void **h** (int v)
  Internal use only.

- void **set_flag** (unsigned int c)
  Sets a flag in the flags mask.

- void **w** (int v)
  Internal use only.

- void **x** (int v)
  Internal use only.

- void **y** (int v)
  Internal use only.
12.26.1 Detailed Description

The **Fl_Color_Chooser** widget provides a standard RGB color chooser.

![Fl_Color_Chooser](image)

You can place any number of the widgets into a panel of your own design. The diagram shows the widget as part of a color chooser dialog created by the `fl_color_chooser()` function. The **Fl_Color_Chooser** widget contains the hue box, value slider, and rgb input fields from the above diagram (it does not have the color chips or the Cancel or OK buttons). The callback is done every time the user changes the rgb value. It is not done if they move the hue control in a way that produces the same rgb value, such as when saturation or value is zero.

The `fl_color_chooser()` function pops up a window to let the user pick an arbitrary RGB color. They can pick the hue and saturation in the "hue box" on the left (hold down CTRL to just change the saturation), and the brightness using the vertical slider. Or they can type the 8-bit numbers into the RGB **Fl_Value_Input** fields, or drag the mouse across them to adjust them. The pull-down menu lets the user set the input fields to show RGB, HSV, or 8-bit RGB (0 to 255).

The user can press CTRL-C to copy the currently selected color value as text in RGB hex format with leading zeroes to the clipboard, for instance `FL_GREEN` would be '00FF00' (since FLTK 1.4.0).

`fl_color_chooser()` returns non-zero if the user picks ok, and updates the RGB values. If the user picks cancel or closes the window this returns zero and leaves RGB unchanged.

If you use the color chooser on an 8-bit screen, it will allocate all the available colors, leaving you no space to exactly represent the color the user picks! You can however use `fl_rectf()` to fill a region with a simulated color using dithering.

Callback reasons can be **FL_REASON_DRAGGED**, **FL_REASON_CHANGED**, or **FL_REASON_RESELECTED**.

12.26.2 Constructor & Destructor Documentation

12.26.2.1 Fl_Color_Chooser()

```cpp
Fl_Color_Chooser::Fl_Color_Chooser (int X, int Y, int W, int H, const char * L = 0 )
```

Creates a new **Fl_Color_Chooser** widget using the given position, size, and label string.

The recommended dimensions are 200x95. The color is initialized to black.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>X, Y, W, H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>
### Member Function Documentation

#### b()

```cpp
double Fl_Color_Chooser::b ( ) const [inline]
```

Returns the current blue value.
0 <= b <= 1.

#### g()

```cpp
double Fl_Color_Chooser::g ( ) const [inline]
```

Returns the current green value.
0 <= g <= 1.

#### handle()

```cpp
int Fl_Color_Chooser::handle ( int e ) [virtual]
```

Handles all events received by this widget.
This specific `handle()` method processes the standard 'copy' function as seen in other input widgets. It copies the current color value to the clipboard as a string in RGB format ('RRGGBB'). This format is independent of the `Fl_Color_Chooser` display format setting. No other formats are supplied. The keyboard events handled are:

- `ctrl-c`
- `ctrl-x`
- `ctrl-Insert`

All other events are processed by the parent class `Fl_Group`. This enables the user to choose a color value, press `ctrl-c` to copy the value to the clipboard and paste it into a color selection widget in another application window or any other text input (e.g. a preferences dialog or an editor).

**Note**

Keyboard event handling by the current focus widget has priority, hence moving the focus to one of the buttons or selecting text in one of the input widgets effectively disables this special method.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>e</th>
<th>current event</th>
</tr>
</thead>
</table>

**Returns**

1 if event has been handled, 0 otherwise

**See also**

`Fl_Group::handle(int)`

Reimplemented from `Fl_Widget`.

#### hsv()

```cpp
int Fl_Color_Chooser::hsv ( double H, double S, double V )
```

Set the hsv values.
The passed values are clamped (or for hue, modulus 6 is used) to get legal values. Does not do the callback.
Parameters

**in** | **H,S,V** color components.

**Returns**

1 if a new hsv value was set, 0 if the hsv value was the previous one.

### 12.26.3.5 hsv2rgb()

```cpp
void Fl_Color_Chooser::hsv2rgb ( double H, double S, double V, double & R, double & G, double & B ) [static]
```

This *static* method converts HSV colors to RGB colorspace.

Parameters

**in** | **H,S,V** color components
| **out** | **R,G,B** color components

### 12.26.3.6 hue()

```cpp
double Fl_Color_Chooser::hue ( ) const [inline]
```

Returns the current hue.

0 <= hue < 6. Zero is red, one is yellow, two is green, etc. *This value is convenient for the internal calculations - some other systems consider hue to run from zero to one, or from 0 to 360.*

### 12.26.3.7 mode() [1/2]

```cpp
int Fl_Color_Chooser::mode ( ) [inline]
```

Returns which **Fl_Color_Chooser** variant is currently active.

Returns

color modes are rgb(0), byte(1), hex(2), or hsv(3)

### 12.26.3.8 mode() [2/2]

```cpp
void Fl_Color_Chooser::mode ( int newMode )
```

Set which **Fl_Color_Chooser** variant is currently active.

Parameters

| **in** | **newMode** color modes are rgb(0), byte(1), hex(2), or hsv(3) |

### 12.26.3.9 r()

```cpp
double Fl_Color_Chooser::r ( ) const [inline]
```

Returns the current red value.

0 <= r <= 1.
12.26.3.10 rgb()

```cpp
int Fl_Color_Chooser::rgb ( double R, double G, double B )
```

Sets the current rgb color values. Does not do the callback. Does not clamp (but out of range values will produce psychedelic effects in the hue selector).

**Parameters**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>R,G,B</td>
</tr>
</tbody>
</table>

**Returns**

1 if a new rgb value was set, 0 if the rgb value was the previous one.

12.26.3.11 rgb2hsv()

```cpp
void Fl_Color_Chooser::rgb2hsv ( double R, double G, double B, double & H, double & S, double & V ) [static]
```

This static method converts RGB colors to HSV colorspace.

**Parameters**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>R,G,B</td>
</tr>
<tr>
<td>out</td>
<td>H,S,V</td>
</tr>
</tbody>
</table>

12.26.3.12 saturation()

```cpp
double Fl_Color_Chooser::saturation ( ) const [inline]
```

Returns the saturation.

0 \leq saturation \leq 1.

12.26.3.13 value()

```cpp
double Fl_Color_Chooser::value ( ) const [inline]
```

Returns the value/brightness.

0 \leq value \leq 1.

The documentation for this class was generated from the following files:

- Fl_Color_Chooser.H
- Fl_Color_Chooser.cxx

12.27 Fl_Copy_Surface Class Reference

Supports copying of graphical data to the clipboard.

```cpp
#include <Fl_Copy_Surface.H>
```

Inheritance diagram for Fl_Copy_Surface:

---

Generated by Doxygen
Public Member Functions

- **Fl_Copy_Surface (int w, int h)**
  - the constructor
- **int h ()**
  - Returns the pixel height of the copy surface.
- **bool is_current () FL_OVERRIDE**
  - Is this surface the current drawing surface?
- **void origin (int *x, int *y) FL_OVERRIDE**
  - Computes the coordinates of the current origin of graphics functions.
- **void origin (int x, int y) FL_OVERRIDE**
  - Sets the position of the origin of graphics in the drawable part of the drawing surface.
- **int printable_rect (int *w, int *h) FL_OVERRIDE**
  - Computes the width and height of the drawable area of the drawing surface.
- **void set_current () FL_OVERRIDE**
  - Make this surface the current drawing surface.
- **int w ()**
  - Returns the pixel width of the copy surface.
- **~Fl_Copy_Surface ()**
  - the destructor

Public Member Functions inherited from **Fl_Widget_Surface**

- **void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)**
  - Draws the widget on the drawing surface.
- **void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)**
  - Draws a window with its title bar and frame if any.
- **void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)**
  - Draws a rectangular part of an on-screen window.

Public Member Functions inherited from **Fl_Surface_Device**

- **Fl_Graphics_Driver * driver ()**
  - Returns the graphics driver of this drawing surface.
- **virtual ~Fl_Surface_Device ()**
  - The destructor.

Protected Member Functions

- **void translate (int x, int y) FL_OVERRIDE**
  - Translates the current graphics origin accounting for the current rotation.
- **void untranslate () FL_OVERRIDE**
  - Undoes the effect of a previous translate() call.
12.27 Fl_Copy_Surface Class Reference

Protected Member Functions inherited from Fl_Widget_Surface

- Fl_Widget_Surface (Fl_Graphics_Driver *d)
  The constructor.

Protected Member Functions inherited from Fl_Surface_Device

- void driver (Fl_Graphics_Driver *graphics_driver)
  Sets the graphics driver of this drawing surface.
- virtual void end_current ()
  FLTK calls this each time a surface ceases to be the current drawing surface.
- Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)
  Constructor that sets the graphics driver to use for the created surface.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * pop_current ()
  Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void push_current (Fl_Surface_Device *new_current)
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static Fl_Surface_Device * surface ()
  The current drawing surface.

Protected Attributes inherited from Fl_Widget_Surface

- int x_offset
  horizontal offset to the origin of graphics coordinates
- int y_offset
  vertical offset to the origin of graphics coordinates

12.27.1 Detailed Description

Supports copying of graphical data to the clipboard.

After creation of an Fl_Copy_Surface object, make it the current drawing surface calling Fl_Surface_Device::push_current(),
and all subsequent graphics requests will be recorded in the clipboard. It's possible to draw widgets (using
Fl_Copy_Surface::draw() ) or to use any of the Drawing functions or the Color & Font functions. Finally, delete the
Fl_Copy_Surface object to load the clipboard with the graphical data.
Fl_Gl_Window 's can be copied to the clipboard as well.

Usage example:

```cpp
Fl_Widget *g = ...; // a widget you want to copy to the clipboard
Fl_Copy_Surface *copy_surf = new Fl_Copy_Surface(g->w(), g->h()); // create an Fl_Copy_Surface object
Fl_Surface_Device::push_current(copy_surf); // direct graphics requests to the clipboard
fl_color(FL_WHITE); fl_rectf(0, 0, g->w(), g->h()); // draw a white background
copy_surf->draw(g); // draw the g widget in the clipboard
Fl_Surface_Device::pop_current(); // direct graphics requests back to their previous destination
delete copy_surf; // after this, the clipboard is loaded
```

Platform details:

- Windows: Transparent RGB images copy without transparency. The graphical data are copied to the clipboard
  in two formats: 1) as an 'enhanced metafile'; 2) as a color bitmap. Applications to which the clipboard content
  can be pasted use the format that suits them best.

- Mac OS: The graphical data are copied to the clipboard (a.k.a. pasteboard) in two 'flavors': 1) in vectorial
  form as PDF data; 2) in bitmap form as a TIFF image. Applications to which the clipboard content is pasted
  can use the flavor that suits them best.

- X11 and Wayland: the graphical data are copied to the clipboard as an image in BMP format.
12.27.2 Constructor & Destructor Documentation

12.27.2.1 Fl_Copy_Surface()

Fl_Copy_Surface::Fl_Copy_Surface (  
  int w,  
  int h )

the constructor

Parameters

| w,h | Width and height of the drawing surface in FLTK units |

12.27.3 Member Function Documentation

12.27.3.1 is_current()

bool Fl_Copy_Surface::is_current ( ) [virtual]

Is this surface the current drawing surface?
Reimplemented from Fl_Surface_Device.

12.27.3.2 origin [1/2]

void Fl_Copy_Surface::origin (  
  int * x,  
  int * y ) [virtual]

Computes the coordinates of the current origin of graphics functions.

Parameters

| out x,y | If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin. |

Reimplemented from Fl_Widget_Surface.

12.27.3.3 origin [2/2]

void Fl_Copy_Surface::origin (  
  int x,  
  int y ) [virtual]

Sets the position of the origin of graphics in the drawable part of the drawing surface.
Arguments should be expressed relatively to the result of a previous printable_rect() call. That is, printable_rect(&w, &h); origin(w/2, 0); sets the graphics origin at the top center of the drawable area. Successive origin() calls don't combine their effects. Origin() calls are not affected by rotate() calls (for classes derived from Fl_Paged_Device).

Parameters

| in x,y | Horizontal and vertical positions in the drawing surface of the desired origin of graphics. |

Reimplemented from Fl_Widget_Surface.

12.27.3.4 printable_rect()

int Fl_Copy_Surface::printable_rect (  
  int * w,  
  int * h ) [virtual]

Computes the width and height of the drawable area of the drawing surface.
Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to origin(). If the
object is derived from class Fl_Paged_Device, values account for the user-selected paper type and print orientation and are changed by scale() calls.

Returns

0 if OK, non-zero if any error

Reimplemented from Fl_Widget_Surface.

12.27.3.5 set_current()

void Fl_Copy_Surface::set_current {
    void ) [virtual]

Make this surface the current drawing surface.
This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().

Note

It's recommended to use this function only as follows:

- The current drawing surface is the display;
- make current another surface, e.g., an Fl_Printer or an Fl_Image_Surface object, calling set_current() on this object;
- draw to that surface;
- make the display current again with Fl_Display_Device::display_device()-&gt;set_current();. Don't do any other call to set_current() before this one.

Other scenarios of drawing surface changes should be performed via Fl_Surface_Device::push_current() / Fl_Surface_Device::pop_current().

Reimplemented from Fl_Surface_Device.

12.27.3.6 translate()

void Fl_Copy_Surface::translate (  
    int x,  
    int y ) [protected], [virtual]

Translates the current graphics origin accounting for the current rotation.
Each translate() call must be matched by an untranslate() call. Successive translate() calls add up their effects.
Reimplemented from Fl_Widget_Surface.

12.27.3.7 untranslate()

void Fl_Copy_Surface::untranslate (  
    void ) [protected], [virtual]

Undoes the effect of a previous translate() call.
Reimplemented from Fl_Widget_Surface.

The documentation for this class was generated from the following files:

- Fl_Copy_Surface.H
- Fl_Copy_Surface.cxx

12.28 Fl_Counter Class Reference

Controls a single floating point value with button (or keyboard) arrows.
#include &lt;Fl_Counter.H&gt;

Inheritance diagram for Fl_Counter:
Public Member Functions

- **FL.Counter** (int X, int Y, int W, int H, const char *L=0)
  Creates a new FL.Counter widget using the given position, size, and label string.
- int **handle** (int) FL_OVERRIDE
  Handles the specified event.
- void **lstep** (double a)
  Sets the increment for the large step buttons.
- double **step** () const
  Returns the increment for normal step buttons.
- void **step** (double a)
  Sets the increment for the normal step buttons.
- void **step** (double a, double b)
  Sets the increments for the normal and large step buttons.
- FL.Color **textcolor** () const
  Gets the font color.
- void **textcolor** (FL.Color s)
  Sets the font color to s.
- FL.Font **textfont** () const
  Gets the text font.
- void **textfont** (FL.Font s)
  Sets the text font to s.
- FL.Fontsize **textsize** () const
  Gets the font size.
- void **textsize** (FL.Fontsize s)
  Sets the font size to s.
- **~FL.Counter** ()
  Destroys the valuator.

Public Member Functions inherited from FL.Valuator

- void **bounds** (double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
  Clamps the passed value to the valuator range.
- virtual int **format** (char *)
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double **increment** (double, int)
  Adds n times the step value to the passed value.
- double **maximum** () const
  Gets the maximum value for the valuator.
• void **maximum**(double a)
  
  *Sets the maximum value for the valuator.*

• double **minimum** () const
  
  *Gets the minimum value for the valuator.*

• void **minimum**(double a)
  
  *Sets the minimum value for the valuator.*

• void **precision**(int digits)
  
  *Sets the step value to \(1.0 / 10^{\text{digits}}\).*

• void **range**(double a, double b)
  
  *Sets the minimum and maximum values for the valuator.*

• double **round**(double)
  
  *Round the passed value to the nearest step increment.*

• double **step** () const
  
  *Gets or sets the step value.*

• void **step**(double a, int b)
  
  *See double Fl_Valuator::step() const*

• void **step**(double s)
  
  *See double Fl_Valuator::step() const.*

• void **step**(int a)
  
  *See double Fl_Valuator::step() const*

• double **value** () const
  
  *Gets the floating point(double) value.*

• int **value**(double)
  
  *Sets the current value.*

Public Member Functions inherited from Fl_Widget

• void **_clear_fullscreen** ()

• void **_set_fullscreen** ()

• void **activate** ()
  
  *Activates the widget.*

• unsigned int **active** () const
  
  *Returns whether the widget is active.*

• int **active_r** () const
  
  *Returns whether the widget and all of its parents are active.*

• Fl_Align **align** () const
  
  *Gets the label alignment.*

• void **align**(Fl_Align alignment)
  
  *Sets the label alignment.*

• long **argument** () const
  
  *Gets the current user data (long) argument that is passed to the callback function.*

• void **argument**(long v)
  
  *Sets the current user data (long) argument that is passed to the callback function.*

• virtual class Fl_Gl_Window ∗ **as_gl_window** ()
  
  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

• virtual class Fl_Gl_Window const ∗ **as_gl_window** () const

• virtual Fl_Group ∗ **as_group** ()
  
  *Returns an Fl_Group pointer if this widget is an Fl_Group.*

• virtual Fl_Group const ∗ **as_group** () const

• virtual Fl_Window ∗ **as_window** ()

• virtual Fl_Window const ∗ **as_window** () const
Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback *cb, void *p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 *cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 *cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
  Gets the background color of the widget.
- void color (Fl_Color bg)
  Sets the background color of the widget.
- void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
- Fl_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- int contains (const Fl_Widget *w) const
Checks if \( w \) is a child of this widget.

- **void copy_label** (const char *new_label)
  Sets the current label.

- **void copy_tooltip** (const char *text)
  Sets the current tooltip text.

- **uchar damage()** const
  Returns non-zero if \( \text{draw()} \) needs to be called.

- **void damage(uchar c)**
  Sets the damage bits for the widget.

- **void damage(uchar c, int x, int y, int w, int h)**
  Sets the damage bits for an area inside the widget.

- **int damage_resize(int, int, int, int)**
  Internal use only.

- **void deactivate()**
  Deactivates the widget.

- **Fl_Image *deimage()**
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image *deimage() const**
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage(Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage(Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound() const**
  Returns whether the inactive image is managed by the widget.

- **void do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

- **void do_callback(Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void do_callback(Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

- **void draw_label(int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h() const**
  Gets the widget height.

- **virtual void hide()**
  Makes a widget invisible.

- **Fl_Image *image()**
  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image *image() const**
  Gets the image that is used as part of the widget label when in the active state.

- **void image(Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

- **void image(Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound() const**
  Returns whether the image is managed by the widget.

- **int inside(const Fl_Widget *wgt) const**
  Checks if this widget is a child of \( wgt \).

- **int is_label_copied() const**
  Returns whether the current label was assigned with \( \text{copy_label()} \).
• const char * label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
Sets a widget to output only.

- **void** set_visible()
  
  Makes the widget visible.

- **void** set_visible_focus()
  
  Enables keyboard focus navigation with this widget.

- **int** shortcut_label() const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void** shortcut_label(int value)
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void** show()
  
  Makes a widget visible.

- **void** size(int W, int H)
  
  Changes the size of the widget.

- **int** take_focus()
  
  Gives the widget the keyboard focus.

- **unsigned int** takesevents() const
  
  Returns if the widget is able to take events.

- **int** testShortcut()
  
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char** * tooltip() const
  
  Gets the current tooltip text.

- **void** tooltip(const char *text)
  
  Sets the current tooltip text.

- **Fl_Window** * top_window() const
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window** * top_window_offset(int &xoff, int &yoff) const
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar** type() const
  
  Gets the widget type.

- **void** use_accents_menu()
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void** * user_data() const
  
  Gets the user data for this widget.

- **void** user_data(Fl_Callback_User_Data*v, bool auto_free)
  
  Sets the user data for this widget.

- **void** user_data(void*v)
  
  Sets the user data for this widget.

- **unsigned int** visible() const
  
  Returns whether a widget is visible.

- **unsigned int** visible_focus() const
  
  Checks whether this widget has a visible focus.

- **void** visible_focus(int v)
  
  Modifies keyboard focus navigation.

- **int** visible_r() const
  
  Returns whether a widget and all its parents are visible.

- **int** w() const
  
  Gets the widget width.

- **Fl_When** when() const
  
  Returns the conditions under which the callback is called.
• void when (uchar i)
    Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
    Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
    Gets the widget position in its window.
• int y () const
    Gets the widget position in its window.
• virtual ~Fl_Widget ()
    Destroys the widget.

Protected Member Functions

• void arrow_widths (int &w1, int &w2)
    Compute sizes (widths) of arrow boxes.
• void draw () FL_OVERRIDE
    Draws the widget.

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char ∗L)
    Creates a new Fl_Valuator widget using the given position, size, and label string.
• void handle_drag (double newvalue)
    Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
• void handle_push ()
    Stores the current value in the previous value.
• void handle_release ()
    Called after an FL_WHEN_RELEASE event is received and before the callback.
• int horizontal () const
    Tells if the valuator is an FL_HORIZONTAL one.
• double previous_value () const
    Gets the previous floating point value before an event changed it.
• void set_value (double v)
    Sets the current floating point value.
• double softclamp (double)
    Clamps the value, but accepts v if the previous value is not already out of range.
• virtual void value_damage ()
    Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
    Clears a flag in the flags mask.
• void draw_backdrop () const
    If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
    Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
    Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
    Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

---

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

- static void default_callback (Fl_Widget ∗ widget, void ∗ data)
  The default callback for all widgets that don't set a callback.

- static unsigned int label_shortcut (const char ∗ t)
  Returns the Unicode value of the '&x' shortcut in a given text.

- static int test_shortcut (const char ∗ t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

---

**Protected Types inherited from Fl_Widget**

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUSED = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_Tooltip = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCEPTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
  flags possible values enumeration.

---

Generated by Doxygen
12.28.1 Detailed Description

Controls a single floating point value with button (or keyboard) arrows. Double arrows buttons achieve larger steps than simple arrows.

See also

Fl_Spinner for value input with vertical step arrows.

Figure 12.14 Fl_Counter

The type of an Fl_Counter object can be set using Fl_Widget::type(uchar) to:

- FL_NORMAL_COUNTER: Displays a counter with 4 arrow buttons.
- FL_SIMPLE_COUNTER: Displays a counter with only 2 arrow buttons.

12.28.2 Constructor & Destructor Documentation

12.28.2.1 Fl_Counter()

Fl_Counter::Fl_Counter {
    int X,
    int Y,
    int W,
    int H,
    const char ∗ L = 0
}

Creates a new Fl_Counter widget using the given position, size, and label string. The default type is FL_NORMAL_COUNTER.

Parameters

| in  | X,Y,W,H | position and size of the widget |
| in  | L      | widget label, default is no label |

12.28.3 Member Function Documentation

12.28.3.1 arrow_widths()

void Fl_Counter::arrow_widths ( {
    int & w1,
    int & w2 ) [protected]

Compute sizes (widths) of arrow boxes. This method computes the two sizes of the arrow boxes of Fl_Counter. You can override it in a subclass if you want to draw fancy arrows or change the layout. However, the basic layout is fixed and can't be changed w/o overriding the draw() and handle() methods.

Basic layout:

```
+-----------+-------------+-----+------+
| «     | <     | value     | >   | »     |
+-----------+-------------+-----+------+
```

The returned value w2 should be zero if the counter type() is FL_SIMPLE_COUNTER.

Parameters

| out | w1 | width of single arrow box |

Generated by Doxygen
Parameters

| out | w2 | width of double arrow box |

### 12.28.3.2 draw()

```cpp
def Fl_Counter::draw ( ) [protected], [virtual]

Draws the widget.
```

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own `draw() method, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```cpp
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

### 12.28.3.3 handle()

```cpp
def Fl_Counter::handle ( ) [virtual]

Handles the specified event.
```

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may “ring the bell” or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in | event | the kind of event received |

Return values

- 0 if the event was not used or understood
- 1 if the event was used and can be deleted

See also

- `Fl_Event`

Reimplemented from `Fl_Widget`.

### 12.28.3.4 lstep()

```cpp
def Fl_Counter::lstep ( ) [inline]

Sets the increment for the large step buttons.
```

The default value is 1.0.
12.28.3.5 step() [1/2]

void Fl_Counter::step (  
   double a ) [inline]
Sets the increment for the normal step buttons.

Parameters

| in | a | large step increment. |

12.28.3.6 step() [2/2]

void Fl_Counter::step (  
   double a,  
   double b ) [inline]
Sets the increments for the normal and large step buttons.

Parameters

| in | a,b | normal and large step increments. |

The documentation for this class was generated from the following files:

- Fl_Counter.H
- Fl_Counter.cxx

12.29 Fl_Device_Plugin Class Reference

This plugin socket allows the integration of new device drivers for special window or screen types.

```
#include <Fl_Device.H>
```

Inheritance diagram for Fl_Device_Plugin:

```
Fl_Device_Plugin
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>
| Fl_Plugin
<table>

</tr>
</tbody>
</table>
| Fl_Device_Plugin
```

Public Member Functions

- **Fl_Device_Plugin** (const char *pluginName)
  The constructor.
- virtual const char * **klass** ()
  Returns the class name.
- virtual const char * **name** ()=0
  Returns the plugin name.
- virtual int **print** (Fl_Widget *w)=0
  Prints a widget.
- virtual Fl_RGB_Image * **rectangle_capture** (Fl_Widget *widget, int x, int y, int w, int h)=0
  Captures a rectangle of a widget as an image.
Public Member Functions inherited from **Fl_Plugin**

- **Fl_Plugin** (const char *klass, const char *name)
  
  Create a plugin.

- virtual **~Fl_Plugin** ()
  
  Clear the plugin and remove it from the database.

**Static Public Member Functions**

- static **Fl_Device_Plugin** *opengl_plugin ()
  
  Returns the OpenGL plugin.

### 12.29.1 Detailed Description

This plugin socket allows the integration of new device drivers for special window or screen types. This class is not intended for use outside the FLTK library. It is currently used to provide an automated printing service and screen capture for OpenGL windows, if linked with fltk_gl.

### 12.29.2 Member Function Documentation

#### 12.29.2.1 rectangle_capture()

`virtual Fl_RGB_Image * Fl_Device_Plugin::rectangle_capture ( Fl_Widget * widget, int x, int y, int w, int h ) [pure virtual]`

Captures a rectangle of a widget as an image.

**Returns**

The captured pixels as an RGB image.

The documentation for this class was generated from the following files:

- **Fl_Device.H**
- **Fl_Device.cxx**

### 12.30 Fl_Dial Class Reference

The **Fl_Dial** widget provides a circular dial to control a single floating point value.

```cpp
#include <Fl_Dial.H>
```

Inheritance diagram for **Fl_Dial**:

```
Fl_Widget

Generated by Doxygen
Public Member Functions

- short angle1 () const
  Sets or gets the angles used for the minimum and maximum values.
- void angle1 (short a)
  See short angle1 () const.
- short angle2 () const
  See short angle1 () const.
- void angle2 (short a)
  See short angle1 () const.
- void angles (short a, short b)
  See short angle1 () const.
- Fl_Dial (int x, int y, int w, int h, const char ∗ l=0)
  Creates a new Fl_Dial widget using the given position, size, and label string.
- int handle (int) FL_OVERRIDE
  Allow subclasses to handle event based on current position and size.

Public Member Functions inherited from Fl_Valuator

- void bounds (double a, double b)
  Sets the minimum (a) and maximum (b) values for the valuator widget.
- double clamp (double)
  Clamps the passed value to the valuator range.
- virtual int format (char ∗)
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double increment (double, int)
  Adds n times the step value to the passed value.
- double maximum () const
  Gets the maximum value for the valuator.
- void maximum (double a)
  Sets the maximum value for the valuator.
- double minimum () const
  Gets the minimum value for the valuator.
- void minimum (double a)
  Sets the minimum value for the valuator.
- void precision (int digits)
  Sets the step value to \(1.0 / 10^{\text{digits}}\).
- void range (double a, double b)
  Sets the minimum and maximum values for the valuator.
- double round (double)
  Round the passed value to the nearest step increment.
- double step () const
  Gets or sets the step value.
- void step (double a, int b)
  See double Fl_Valuator::step () const
- void step (double s)
  See double Fl_Valuator::step () const.
- void step (int a)
  See double Fl_Valuator::step () const
- double value () const
  Gets the floating point (double) value.
- int value (double)
  Sets the current value.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen()
- void _set_fullscreen()
- void activate()
  Activates the widget.
- unsigned int active() const
  Returns whether the widget is active.
- int active_r() const
  Returns whether the widget and all of its parents are active.
- Fl_Align align() const
  Gets the label alignment.
- void align(Fl_Align alignment)
  Sets the label alignment.
- long argument() const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument(long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window() const
- virtual Fl_Group * as_group()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group() const
- virtual Fl_Window * as_window()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window() const
- void bind_deimage(Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage(int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image(Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image(int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box() const
  Gets the box type of the widget.
- void box(Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback() const
  Gets the current callback function for the widget.
- void callback(Fl_Callback * cb)
  Sets the current callback function for the widget.
- void callback(Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback(Fl_Callback * cb, void *p)
  Sets the current callback function and data for the widget.
- void callback(Fl_Callback0 * cb)
  Sets the current callback function for the widget.
- void callback(Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed() const
Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget * w) const
  Checks if w is a child of this widget.
• void copy_label (const char * new_label)
  Sets the current label.
• void copy_tooltip (const char * text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• virtual void hide ()
  Makes a widget invisible.
• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char *label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color labelcolor () const
  Gets the label color.
• void labelcolor (Fl_Color c)
  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**
  
  Changes the size or position of the widget.

- **Fl_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.

- **void set_visible ()**
  
  Makes the widget visible.

- **void set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  
  Makes a widget visible.

- **void size (int W, int H)**
  
  Changes the size of the widget.

- **int take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char * tooltip () const**
  
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void *user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window *window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws dial at current position and size.
• void draw (int X, int Y, int W, int H)
  Draws dial at given position and size.
• int handle (int event, int X, int Y, int W, int H)
  Allows subclasses to handle event based on given position and size.

Protected Member Functions inherited from Fl_Valuator

• Fl_Valuator (int X, int Y, int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
• void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
• void handle_push ()
  Stores the current value in the previous value.
• void **handle_release** ()
  
  Called after an FL_WHEN_RELEASE event is received and before the callback.

• int **horizontal** () const
  
  Tells if the valuator is an FL_HORIZONTAL one.

• double **previous_value** () const
  
  Gets the previous floating point value before an event changed it.

• void **set_value** (double v)
  
  Sets the current floating point value.

• double **softclamp** (double)
  
  Clamps the value, but accepts v if the previous value is not already out of range.

• virtual void **value_damage** ()
  
  Asks for partial redraw.

**Protected Member Functions inherited from Fl_Widget**

• void **clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

• void **draw_backdrop** () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void **draw_box** () const
  
  Draws the widget box according its box style.

• void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void **draw_focus** () const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

• void **draw_label** () const
  
  Draws the widget's label at the defined label position.

• void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• Fl_Widget **(int x, int y, int w, int h, const char *label=0L)**
  
  Creates a widget at the given position and size.

• unsigned int **flags** () const
  
  Gets the widget flags mask.

• void **h** (int v)
  
  Internal use only.

• void **set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

• void **w** (int v)
  
  Internal use only.

• void **x** (int v)
  
  Internal use only.

• void **y** (int v)
  
  Internal use only.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don’t set a callback.

• static unsigned int labelShortcut (const char *t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int testShortcut (const char *t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,

}

flags possible values enumeration.

12.30.1 Detailed Description

The Fl.Dial widget provides a circular dial to control a single floating point value.

Use type() to set the type of the dial to:

• FL_NORMAL_DIAL - Draws a normal dial with a knob.

• FL_LINE_DIAL - Draws a dial with a line.

• FL_FILL_DIAL - Draws a dial with a filled arc.

12.30.2 Constructor & Destructor Documentation

12.30.2.1 Fl.Dial()

Fl.Dial::Fl.Dial ( 
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0 )

Creates a new Fl.Dial widget using the given position, size, and label string.
The default type is FL_NORMAL_DIAL.
12.30.3 Member Function Documentation

12.30.3.1 angle1()

short Fl_Dial::angle1 ( ) const [inline]
Sets Or gets the angles used for the minimum and maximum values.
The default values are 45 and 315 (0 degrees is straight down and the angles progress clockwise). Normally angle1
is less than angle2, but if you reverse them the dial moves counter-clockwise.

12.30.3.2 draw() [1/2]

void Fl_Dial::draw ( void ) [protected], [virtual]
Draws dial at current position and size.
Implements Fl_Widget.

12.30.3.3 draw() [2/2]

void Fl_Dial::draw ( int X, int Y, int W, int H ) [protected]
Draws dial at given position and size.

Parameters

| in | X,Y,W,H | position and size |

12.30.3.4 handle() [1/2]

int Fl_Dial::handle ( int event, int X, int Y, int W, int H ) [protected]
Allows subclasses to handle event based on given position and size.

Parameters

| in | event,X,Y,W,H | event to handle, related position and size. |

12.30.3.5 handle() [2/2]

int Fl_Dial::handle ( int e ) [virtual]
Allow subclasses to handle event based on current position and size.
Reimplemented from Fl_Widget.
The documentation for this class was generated from the following files:

- Fl_Dial.H
- Fl_Dial.cxx

12.31 Fl_Display_Device Class Reference

The computer’s display.

#include <Fl_Device.H>

Inheritance diagram for Fl_Display_Device:

```
Fl_Surface_Device
    ^
    | Fl_Display_Device
```

Static Public Member Functions

- static Fl_Display_Device * display_device ()
  "Returns a pointer to the unique display device."

Static Public Member Functions inherited from Fl_Surface_Device

- static Fl_Surface_Device * pop_current ()
  "Removes the top element from the current drawing surface stack, and makes the new top element current."
- static void push_current (Fl_Surface_Device * new_current)
  "Pushes new_current on top of the stack of current drawing surfaces, and makes it current."
- static Fl_Surface_Device * surface ()
  "The current drawing surface."

Additional Inherited Members

Public Member Functions inherited from Fl_Surface_Device

- Fl_Graphics_Driver * driver ()
  "Returns the graphics driver of this drawing surface."
- virtual bool is_current ()
  "Is this surface the current drawing surface?"
- virtual void set_current (void)
  "Make this surface the current drawing surface."
- virtual ~Fl_Surface_Device ()
  "The destructor."

Protected Member Functions inherited from Fl_Surface_Device

- void driver (Fl_Graphics_Driver * graphics_driver)
  "Sets the graphics driver of this drawing surface."
- virtual void end_current ()
  "FLTK calls this each time a surface ceases to be the current drawing surface."
- Fl_Surface_Device (Fl_Graphics_Driver * graphics_driver)
  "Constructor that sets the graphics driver to use for the created surface."

### 12.31.1 Detailed Description

The computer's display.
When FLTK begins to access the computer's display, it creates an object of class Fl_Display_Device and makes it the current drawing surface.
The documentation for this class was generated from the following files:

- Fl_Device.H
- Fl_Device.cxx
12.32 Fl_Double_Window Class Reference

The Fl_Double_Window provides a double-buffered window.
#include <Fl_Double_Window.H>

Inheritance diagram for Fl_Double_Window:

```
+-----------------------+
| Fl_Widget             |
| (virtual)             |
+-----------------------+    +-----------------------+
| Fl_Group              |    | Fl_Window             |
| (virtual)             |    +-----------------------+    +-----------------------+
| Fl_Double_Window      |    | Fl_Cairo_Window       |
| (virtual)             |    | Fl_Overlay_Window     |
+-----------------------+    +-----------------------+    +-----------------------+
```

Public Member Functions

- Fl_Double_Window * as_double_window () FL_OVERRIDE
  Return non-null if this is an Fl_Overlay_Window object.
- Fl_Double_Window (int W, int H, const char *l=0)
  Creates a new Fl_Double_Window widget using the given position, size, and label (title) string.
- Fl_Double_Window (int X, int Y, int W, int H, const char *l=0)
  See Fl_Double_Window::Fl_Double_Window(int w, int h, const char *label = 0)
- void flush () FL_OVERRIDE
  Forcing the window to be drawn, this window is also made current and calls draw().
- void hide () FL_OVERRIDE
  Makes a widget invisible.
- void resize (int, int, int) FL_OVERRIDE
  Changes the size or position of the widget.
- void show () FL_OVERRIDE
  Makes a widget visible.
- void show (int a, char **b)
  Same as Fl_Window::show(int a, char **b)
- ~Fl_Double_Window ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Window

- virtual class Fl_Overlay_Window * as_overlay_window ()
  Return non-null if this is an Fl_Overlay_Window object.
- Fl_Window const * as_window () const FL_OVERRIDE
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- unsigned int border () const
  Returns whether the window possesses a border.
- void border (int b)
  Sets whether or not the window manager border is around the window.
- void clear_border ()
  Fast inline function to turn the window manager border off.
• void clear_modal_states ()

Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

• void copy_label (const char *a)

Sets the window titlebar label to a copy of a character string.

• void cursor (const Fl_RGB_Image *, int, int)

Changes the cursor for this window using the provided image as cursor's shape.

• void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)

For back compatibility only.

• void cursor (Fl_Cursor)

Changes the cursor for this window.

• int decorated_h () const

Returns the window height including any window title bar and any frame added by the window manager.

• int decorated_w () const

Returns the window width including any frame added by the window manager.

• void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)

For back compatibility only.

• void default_cursor (Fl_Cursor)

Sets the default window cursor.

• void draw_backdrop ()

Draw the background image if one is set and is aligned inside.

• Fl_Window (int w, int h, const char *title=0)

Creates a window from the given width w, height h, and title.

• Fl_Window (int x, int y, int w, int h, const char *title=0)

Creates a window from the given position (x, y), size (w, h) and title.

• void free_position ()

Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.

• void fullscreen ()

Makes the window completely fill one or more screens, without any window manager border visible.

• unsigned int fullscreen_active () const

Returns non zero if FULLSCREEN flag is set, 0 otherwise.

• void fullscreen_off ()

Turns off any side effects of fullscreen()

• void fullscreen_off (int X, int Y, int W, int H)

Turns off any side effects of fullscreen() and does resize(x,y,w,h).

• void fullscreen_screens (int top, int bottom, int left, int right)

Sets which screens should be used when this window is in fullscreen mode.

• int handle (int) FL_OVERRIDE

Handles the specified event.

• void hide () FL_OVERRIDE

Removes the window from the screen.

• void hotspot (const Fl_Widget &p, int offscreen=0)

See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

• void hotspot (const Fl_Widget *, int offscreen=0)

See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

• void hotspot (int x, int y, int offscreen=0)

Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

• const void * icon () const

Gets the current icon window target dependent data.

• void icon (const Fl_RGB_Image *)

Generated by Doxygen
Sets or resets a single window icon.

- **void icon (const void *ic)**
  
  Platform-specific method to set the window icon usable on Windows and X11 only.

- **void iconize ()**
  
  Iconifies the window.

- **const char * iconlabel () const**
  
  See void Fl_Window::iconlabel(const char *)

- **void iconlabel (const char *)**
  
  Sets the icon label.

- **void icons (const Fl_RGB_Image *[], int)**
  
  Sets the window icons.

- **void icons (HICON big_icon, HICON small_icon)**
  
  Sets the window icons using HICON handles (Windows platform only).

- **const char * label () const**
  
  See void Fl_Window::label(const char *)

- **void label (const char *)**
  
  Sets the window title bar label.

- **void label (const char *label, const char *iconlabel)**
  
  Sets the icon label.

- **void make_current ()**
  
  Sets things up so that the drawing functions in `<FL/fl_draw.H>` will go into this window.

- **void maximize ()**
  
  Maximizes a top-level window to its current screen.

- **unsigned int maximize_active () const**
  
  Returns whether the window is currently maximized.

- **unsigned int menu_window () const**
  
  Returns true if this window is a menu window.

- **unsigned int modal () const**
  
  Returns true if this window is modal.

- **unsigned int non_modal () const**
  
  Returns true if this window is modal or non-modal.

- **fl_uintptr_t os_id ()**
  
  Returns a platform-specific identification of a shown window, or 0 if not shown.

- **unsigned int override () const**
  
  Returns non zero if OVERRIDE flag is set, 0 otherwise.

- **void resize (int X, int Y, int W, int H)**
  
  Changes the size and position of the window.

- **int screen_num ()**
  
  The number of the screen containing the mapped window.

- **void screen_num (int screen_num)**
  
  Set the number of the screen where to map the window.

- **void set_menu_window ()**
  
  Marks the window as a menu window.

- **void set_modal ()**
  
  A “modal” window, when shown(), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the “transient for” property).

- **void set_non_modal ()**
  
  A “non-modal” window (terminology borrowed from Microsoft Windows) acts like a modal() one in that it remains on top, but it has no effect on event delivery.
• void **set_override** ()
  
  Activates the flags NOBORDER|OVERRIDE.

• void **set_tooltip_window** ()
  
  Marks the window as a tooltip window.

• const Fl_Image ∗ **shape** ()
  
  Returns the image controlling the window shape or NULL.

• void shape (const Fl_Image &b)
  
  Set the window's shape with an Fl_Image.

• void shape (const Fl_Image ∗img)
  
  Assigns a non-rectangular shape to the window.

• void **show** () FL_OVERRIDE
  
  Puts the window on the screen.

• void **show** (int argc, char **argv)
  
  Puts the window on the screen with show() and parses command-line arguments.

• int **shown** ()
  
  Returns non-zero if show() has been called (but not hide() ).

• void **size_range** (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
  
  Sets the allowable range the user can resize this window to.

• unsigned int **tooltip_window** () const
  
  Returns true if this window is a tooltip window.

• void un_maximize () const
  
  Returns a previously maximized top-level window to its previous size.

• void **wait_for_expose** ()
  
  Waits for the window to be displayed after calling show().

• int x_root () const
  
  Gets the x position of the window on the screen.

• const char ∗ xclass () const
  
  Returns the xclass for this window, or a default.

• void xclass (const char ∗c)
  
  Sets the xclass for this window.

• int y_root () const
  
  Gets the y position of the window on the screen.

• virtual ~FL_Window ()
  
  The destructor also deletes all the children.

**Public Member Functions inherited from Fl_Group**

• Fl_Widget ∗& **_ddfdesign_kludge** ()
  
  This is for forms compatibility only.

• void **add** (Fl_Widget &)
  
  The widget is removed from its current group (if any) and then added to the end of this group.

• void **add** (Fl_Widget ∗o)
  
  See void Fl_Group::add(Fl_Widget &w)

• void **add resizable** (Fl_Widget ∗o)
  
  Adds a widget to the group and makes it the resizable widget.

• Fl_Widget ∗const ∗ **array** () const
  
  Returns a pointer to the array of children.

• Fl_Group ∗const ∗ as_group () const FL_OVERRIDE

• Fl_Group ∗ as_group () FL_OVERRIDE
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

• void **begin** ()
Sets the current group so you can build the widget tree by just constructing the widgets.

- `Fl_Widget * child (int n) const`  
  Returns array()[n].

- `int children () const`  
  Returns how many child widgets the group has.

- `void clear ()`  
  Deletes all child widgets from memory recursively.

- `unsigned int clip_children ()`  
  Returns the current clipping mode.

- `void clip_children (int c)`  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- `virtual int delete_child (int n)`  
  Removes the widget at index from the group and deletes it.

- `void end ()`  
  Exactly the same as current(this->parent()).

- `int find (const Fl_Widget &o) const`  
  See int Fl_Group::find(const Fl_Widget *w) const.

- `int find (const Fl_Widget *) const`  
  Searches the child array for the widget and returns the index.

- `Fl_Group (int, int, int, int, const char *)=0)`  
  Creates a new Fl_Group widget using the given position, size, and label string.

- `void focus (Fl_Widget *W)`  
  This is for forms compatibility only.

- `void forms_end ()`  
  This does insert(w, find(before)).

- `void init_sizes ()`  
  Resets the internal array of widget sizes and positions.

- `void insert (Fl_Widget &, int i)`  
  The widget is removed from its current group (if any) and then inserted into this group.

- `void insert (Fl_Widget &o, Fl_Widget *before)`  
  This does insert(w, find(before)).

- `void remove (Fl_Widget &)`  
  Removes a widget from the group but does not delete it.

- `void remove (Fl_Widget *o)`  
  Removes the widget o from the group.

- `void remove (int index)`  
  Removes the widget at index from the group but does not delete it.

- `Fl_Widget * resizable () const`  
  Returns the group's resizable widget.

- `void resizable (Fl_Widget &o)`  
  Sets the group's resizable widget.

- `void resizable (Fl_Widget *o)`  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- `virtual ~Fl_Group ()`  
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
- void bind_deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
  Sets the current label.
• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Imaug = deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Imaug = deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Imaug &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Imaug =img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Determines whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reasong reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (Fl_Widget ∗+widget, long arg, Fl_Callback_Reasong reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (Fl_Widget ∗+widget, void ∗+arg=0, Fl_Callback_Reasong reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, Fl_Align) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int `h () const`
  
  Gets the widget height.

- Fl_Image * image ()
  
  Gets the image that is used as part of the widget label when in the active state.

- const Fl_Image * image () const
  
  Gets the image that is used as part of the widget label when in the active state.

- void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

- void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.

- int `image_bound () const`
  
  Returns whether the image is managed by the widget.

- int `inside (const Fl_Widget *wgt) const`
  
  Checks if this widget is a child of `wgt`.

- int `is_label_copied () const`
  
  Returns whether the current label was assigned with `copy_label()`.

- const char * `label () const`
  
  Gets the current label text.

- void `label (const char *text)`
  
  Sets the current label pointer.

- void `label (Fl_Labeltype a, const char *b)`
  
  Shortcut to set the label text and type in one call.

- Fl_Color `labelcolor () const`
  
  Gets the label color.

- void `labelcolor (Fl_Color c)`
  
  Sets the label color.

- Fl_Font `labelfont () const`
  
  Gets the font to use.

- void `labelfont (Fl_Font f)`
  
  Sets the font to use.

- Fl_Fontsize `labelsiz e () const`
  
  Gets the font size in pixels.

- void `labelsiz e (Fl_Fontsize pix)`
  
  Sets the font size in pixels.

- Fl_Labeltype `labeltype () const`
  
  Gets the label type.

- void `labeltype (Fl_Labeltype a)`
  
  Sets the label type.

- void `measure_label (int &ww, int &hh) const`
  
  Sets width `ww` and height `hh` accordingly with the label size.

- bool `needs_keyboard () const`
  
  Returns whether this widget needs a keyboard.

- void `needs_keyboard (bool needs)`
  
  Sets whether this widget needs a keyboard.

- unsigned int `output () const`
  
  Returns if a widget is used for output only.

- Fl_Group * `parent () const`
  
  Returns a pointer to the parent widget.

- void `parent (Fl_Group *p)`
  
  Internal use only - “for hacks only”.

Generated by Doxygen
• void **position**(int X, int Y)
  Repositions the window or widget.

• void **redraw**()
  Schedules the drawing of the widget.

• void **redraw_label**()
  Schedules the drawing of the label.

• **Fl_Color** **selection_color** () const
  Gets the selection color.

• void **selection_color**(Fl_Color a)
  Sets the selection color.

• void **set_active**()
  Marks the widget as active without sending events or changing focus.

• void **set_changed**()
  Marks the value of the widget as changed.

• void **set_output**()
  Sets a widget to output only.

• void **set_visible**()
  Makes the widget visible.

• void **set_visible_focus**()
  Enables keyboard focus navigation with this widget.

• int **shortcut_label** () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void **shortcut_label** (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• void **size** (int W, int H)
  Changes the size of the widget.

• int **take_focus**()
  Gives the widget the keyboard focus.

• unsigned int **takesevents** () const
  Returns if the widget is able to take events.

• int **test_shortcut**()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char **∗** **tooltip** () const
  Gets the current tooltip text.

• void **tooltip**(const char **∗** text)
  Sets the current tooltip text.

• **Fl_Window** **∗** **top_window** () const
  Returns a pointer to the top-level window for the widget.

• **Fl_Window** **∗** **top_window_offset** (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar **type** () const
  Gets the widget type.

• void **type** (uchar t)
  Sets the widget type.

• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void **∗** **user_data** () const
  Gets the user data for this widget.

• void **user_data**(Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

• void **user_data** (void ∗v)
Sets the user data for this widget.

- **unsigned int visible () const**
  Returns whether a widget is visible.

- **unsigned int visible_focus () const**
  Checks whether this widget has a visible focus.

- **void visible_focus (int v)**
  Modifies keyboard focus navigation.

- **int visible_r () const**
  Returns whether a widget and all its parents are visible.

- **int w () const**
  Gets the widget width.

- **Fl_When when () const**
  Returns the conditions under which the callback is called.

- **void when (uchar i)**
  Sets the flags used to decide when a callback is called.

- **Fl_Window * window () const**
  Returns a pointer to the nearest parent window up the widget hierarchy.

- **int x () const**
  Gets the widget position in its window.

- **int y () const**
  Gets the widget position in its window.

- **virtual ~Fl_Widget ()**
  Destroys the widget.

### Additional Inherited Members

**Public Types inherited from Fl_Window**

- typedef struct HICON__ * HICON

**Static Public Member Functions inherited from Fl_Window**

- **static Fl_Window * current ()**
  Returns the last window that was made current.

- **static void default_callback (Fl_Window *, void *)**
  Back compatibility: Sets the default callback v for win to call on close event.

- **static void default_icon (const Fl_RGB_Image *)**
  Sets a single default window icon.

- **static void default_icons (const Fl_RGB_Image *[], int)**
  Sets the default window icons.

- **static void default_icons (HICON big_icon, HICON small_icon)**
  Sets the default window icons (Windows platform only).

- **static const char * default_xclass ()**
  Returns the default xclass.

- **static void default_xclass (const char *)**
  Sets the default window xclass.

- **static bool is_a_rescale ()**
  Returns true when a window is being rescaled.

- **static char show_next_window_iconic ()**
  Returns the static flag whether the next window should be opened iconified.

- **static void show_next_window_iconic (char stat)**
  Sets a static flag whether the next window should be opened iconified.
Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU
  = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Window

- void default_size_range ()
  Protected method to calculate the default size range of a window.
- void draw () FL_OVERRIDE
  Draws the widget.
- int force_position () const
  Returns the internal state of the window's FORCE_POSITION flag.
- void force_position (int force)
  Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void free_icons ()
  Deletes all icons previously attached to the window.
- int is_resizable ()
  Protected method to determine whether a window is resizable.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
Draws all children of the group.

- void `draw_outside_label` (const `Fl_Widget` &widget) const

  Parents normally call this to draw outside labels of child widgets.

- virtual int `on_insert` (`Fl_Widget` *, int)

  Allow derived groups to act when a widget is added as a child.

- virtual int `on_move` (int, int)

  Allow derived groups to act when a widget is moved within the group.

- virtual void `on_remove` (int)

  Allow derived groups to act when a child widget is removed from the group.

- int * `sizes` ()

  Returns the internal array of widget sizes and positions.

- void `update_child` (`Fl_Widget` &widget) const

  Draws a child only if it needs it.

Protected Member Functions inherited from `Fl_Widget`

- void `clear_flag` (unsigned int c)

  Clears a flag in the flags mask.

- void `draw_backdrop` () const

  If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.

- void `draw_box` () const

  Draws the widget box according its box style.

- void `draw_box` (Fl_Boxtype t, Fl_Color c) const

  Draws a box of type t, of color c at the widget's position and size.

- void `draw_box` (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const

  Draws a box of type t, of color c at the position X,Y and size W,H.

- void `draw_focus` () const

  Draws a focus rectangle around the widget.

- void `draw_focus` (Fl_Boxtype t, int X, int Y, int W, int H) const

  Draws a focus rectangle around the widget.

- void `draw_focus` (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const

  Draws a focus box for the widget at the given position and size.

- void `draw_label` () const

  Draws the widget's label at the defined label position.

- void `draw_label` (int, int, int, int) const

  Draws the label in an arbitrary bounding box.

- `Fl_Widget` (int x, int y, int w, int h, const char *label=0L)

  Creates a widget at the given position and size.

- unsigned int `flags` () const

  Gets the widget flags mask.

- void `h` (int v)

  Internal use only.

- void `set_flag` (unsigned int c)

  Sets a flag in the flags mask.

- void `w` (int v)

  Internal use only.

- void `x` (int v)

  Internal use only.

- void `y` (int v)

  Internal use only.
Static Protected Attributes inherited from Fl_Window

- static Fl_Window * current_
  Stores the last window that was made current.

12.32.1 Detailed Description

The Fl_Double_Window provides a double-buffered window. It will draw the window data into an off-screen pixmap, and then copy it to the on-screen window.

12.32.2 Constructor & Destructor Documentation

12.32.2.1 ~Fl_Double_Window()

Fl_Double_Window::~Fl_Double_Window()

The destructor also deletes all the children.
This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code.

12.32.3 Member Function Documentation

12.32.3.1 as_double_window()

Fl_Double_Window * Fl_Double_Window::as_double_window() [inline], [virtual]

Return non-null if this is an Fl_Overlay_Window object.
Reimplemented from Fl_Window.

12.32.3.2 flush()

void Fl_Double_Window::flush() [virtual]

Forces the window to be drawn, this window is also made current and calls draw().
Reimplemented from Fl_Window.
Reimplemented in Fl_Overlay_Window.

12.32.3.3 hide()

void Fl_Double_Window::hide() [virtual]

Makes a widget invisible.
See also

  show(), visible(), visible_r()

Reimplemented from Fl_Widget.
Reimplemented in Fl_Overlay_Window.

12.32.3.4 resize()

void Fl_Double_Window::resize(
  int x,
  int y,
  int w,
  int h) [virtual]

Changes the size or position of the widget.
This is a virtual function so that the widget may implement its own handling of resizing. The default version does not call the redraw() method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.
Some window managers under X11 call resize() a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.
position(X, Y) is a shortcut for resize(X, Y, w(), h()), and size(W, H) is a shortcut for resize(x(), y(), W, H).
12.33 Fl_End Class Reference

Parameters

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>x,y</td>
<td>new position relative to the parent window</td>
</tr>
<tr>
<td>in</td>
<td>w,h</td>
<td>new size</td>
</tr>
</tbody>
</table>

See also

- position(int,int), size(int,int)

Reimplemented from Fl_Widget.
Reimplemented in Fl_Overlay_Window.

12.32.3.5 show()

void Fl_Double_Window::show ( ) [virtual]

Makes a widget visible.
An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL_SHOW.
The visible() method returns true if the widget is set to be visible. The visible_r() method returns true if the widget and all of its parents are visible. A widget is only visible if visible() is true on it and all of its parents.
Changing it will send FL_SHOW or FL_HIDE events to the widget. Do not change it if the parent is not visible, as this will send false FL_SHOW or FL_HIDE events to the widget.
redraw() is called if necessary on this or the parent.

See also

- hide(), visible(), visible_r()

Reimplemented from Fl_Widget.
Reimplemented in Fl_Overlay_Window.
The documentation for this class was generated from the following files:

- Fl_Double_Window.H
- Fl_Double_Window.cxx

12.33 Fl_End Class Reference

This is a dummy class that allows you to end a Fl_Group in a constructor list of a class:
#include <Fl_Group.H>

Public Member Functions

- Fl_End ()
  
  All it does is calling Fl_Group::current()->end()

12.33.1 Detailed Description

This is a dummy class that allows you to end a Fl_Group in a constructor list of a class:
class MyClass {
  Fl_Group group;
  Fl_Button button_in_group;
  Fl_End end;
  Fl_Button button_outside_group;
  MyClass();
};
MyClass::MyClass() :
group(10,10,100,100),
button_in_group(20,20,60,30),
end(),
button_outside_group(10,120,60,30) {
  [.ctor code..]
}

The documentation for this class was generated from the following file:

- Fl_Group.H

Generated by Doxygen
12.34  Fl_EPS_File_Surface Class Reference

Encapsulated PostScript drawing surface.
#include <Fl_PostScript.H>
Inheritance diagram for Fl_EPS_File_Surface:

```
Fl_Surface_Device
   |          |
   |          |
   Fl_Widget_Surface
   |          |
   |          |
Fl_EPS_File_Surface
```

Public Member Functions

- int close ()
  Completes all EPS output.
- FILE * file ()
  Returns the underlying FILE pointer.
- Fl_EPS_File_Surface (int width, int height, FILE *eps_output, Fl_Color background=FL_WHITE, Fl_PostScript_Close_Command closef=NULL)
  Constructor.
- void origin (int *px, int *py) FL_OVERRIDE
  Computes the coordinates of the current origin of graphics functions.
- void origin (int x, int y) FL_OVERRIDE
  Sets the position of the origin of graphics in the drawable part of the drawing surface.
- int printable_rect (int *w, int *h) FL_OVERRIDE
  Computes the width and height of the drawable area of the drawing surface.
- void translate (int x, int y) FL_OVERRIDE
  Translates the current graphics origin accounting for the current rotation.
- void untranslate () FL_OVERRIDE
  Undoes the effect of a previous translate() call.
- ~Fl_EPS_File_Surface ()
  Destructor.

Public Member Functions inherited from Fl_Widget_Surface

- void draw (Fl_Widget *widget, int delta_x=0, int delta_y=0)
  Draws the widget on the drawing surface.
- void draw_decorated_window (Fl_Window *win, int x_offset=0, int y_offset=0)
  Draws a window with its title bar and frame if any.
- void print_window_part (Fl_Window *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
  Draws a rectangular part of an on-screen window.

Public Member Functions inherited from Fl_Surface_Device

- Fl_Graphics_Driver * driver ()
  Returns the graphics driver of this drawing surface.
- virtual bool is_current ()
  Is this surface the current drawing surface?
- virtual void set_current (void)
  Make this surface the current drawing surface.
- virtual ~Fl_Surface_Device ()
  The destructor.
### Protected Member Functions

- **Fl_PostScript_Graphics_Driver * driver ()**
  
  Returns the PostScript driver of this drawing surface.

### Protected Member Functions inherited from Fl_Widget_Surface

- **Fl_Widget_Surface (Fl_Graphics_Driver *d)**
  
  The constructor.

### Protected Member Functions inherited from Fl_Surface_Device

- **void driver (Fl_Graphics_Driver *graphics_driver)**
  
  Sets the graphics driver of this drawing surface.
- **virtual void end_current ()**
  
  FLTK calls this each time a surface ceases to be the current drawing surface.
- **Fl_Surface_Device (Fl_Graphics_Driver *graphics_driver)**
  
  Constructor that sets the graphics driver to use for the created surface.

### Additional Inherited Members

### Static Public Member Functions inherited from Fl_Surface_Device

- **static Fl_Surface_Device * pop_current ()**
  
  Removes the top element from the current drawing surface stack, and makes the new top element current.
- **static void push_current (Fl_Surface_Device *new_current)**
  
  Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- **static Fl_Surface_Device * surface ()**
  
  The current drawing surface.

### Protected Attributes inherited from Fl_Widget_Surface

- **int x_offset**
  
  Horizontal offset to the origin of graphics coordinates
- **int y_offset**
  
  Vertical offset to the origin of graphics coordinates

### 12.34.1 Detailed Description

Encapsulated PostScript drawing surface.

This drawing surface allows to store any FLTK graphics in vectorial form in an “Encapsulated PostScript” file.

**Usage example:**

```cpp
Fl_Window *win = ...// Window to draw to an .eps file
int ww = win->decorated_w();
int wh = win->decorated_h();
FILE *eps = fl_fopen("/path/to/mywindow.eps", "w");
if (eps) {
    Fl_EPS_File_Surface *surface = new Fl_EPS_File_Surface(ww, wh, eps, win->color());
    Fl_Surface_Device::push_current(surface);
    surface->draw_decorated_window(win);
    Fl_Surface_Device::pop_current();
    delete surface; // the .eps file is not complete until the destructor was run
}
```

Generated by Doxygen
12.34.2 Constructor & Destructor Documentation

12.34.2.1 Fl_EPS_File_Surface()

Fl_EPS_File_Surface::Fl_EPS_File_Surface (  
  int width,  
  int height,  
  FILE * eps_output,  
  Fl_Color background = FL_WHITE,  
  Fl_PostScript_Close_Command closef = NULL )

Constructor.

Parameters

| width, height | Width and height of the EPS drawing area |
| eps_output   | A writable FILE pointer where the Encapsulated PostScript data will be sent |
| background   | Color expected to cover the background of the EPS drawing area. This parameter affects only the drawing of transparent Fl_RGB_Imagel objects: transparent areas of RGB images are blended with the background color. Under the X11 + pango platform, transparent RGB images are correctly blended to their background, thus this parameter has no effect. |
| closef       | If not NULL, the destructor or close() will call closef(eps_output) after all EPS data has been sent. If NULL, fclose(eps_output) is called instead. This allows to close the FILE pointer by, e.g., pclose, or, using a function such as "int keep_open(FILE*)(return 0;)", to keep it open after completion of all output to eps_output. Function closef should return non zero to indicate an error. |

12.34.2.2 ~Fl_EPS_File_Surface()

Fl_EPS_File_Surface::~Fl_EPS_File_Surface ( )

Destructor.

By default, the destructor closes with function fclose() the underlying FILE. See the constructor for how to close it differently or to keep it open. Use close() before object destruction to receive the status code of output operations. If close() is not used and if EPS output results in error, the destructor displays an alert message with fl_alert().

12.34.3 Member Function Documentation

12.34.3.1 close()

int Fl_EPS_File_Surface::close ( )

Completes all EPS output.

The only operation possible with the Fl_EPS_File_Surface object after calling close() is its destruction.

Returns

The status code of output operations to the FILE object. 0 indicates success.

12.34.3.2 origin() [1/2]

void Fl_EPS_File_Surface::origin (  
  int * x,  
  int * y ) [virtual]

Computes the coordinates of the current origin of graphics functions.

Parameters

| out x,y | If non-null, +x and +y are set to the horizontal and vertical coordinates of the graphics origin. |

Reimplemented from Fl_Widget_Surface.
12.34.3.3 \texttt{origin()} [2/2]

\begin{verbatim}
void Fl_EPS_File_Surface::origin (  
    int \textit{x},  
    int \textit{y} ) \text{ [virtual]}
\end{verbatim}

Sets the position of the origin of graphics in the drawable part of the drawing surface. Arguments should be expressed relatively to the result of a previous \texttt{printable_rect()} call. That is, \texttt{printable_rect(&w, &h); origin(w/2, 0);} sets the graphics origin at the top center of the drawable area. Successive \texttt{origin()} calls don't combine their effects. \texttt{origin()} calls are not affected by \texttt{rotate()} calls (for classes derived from \texttt{Fl_Paged_Device}).

\textbf{Parameters}

\begin{tabular}{c|c}
\hline
\textit{x,y} & Horizontal and vertical positions in the drawing surface of the desired origin of graphics. \\
\hline
\end{tabular}

Reimplemented from \texttt{Fl_Widget_Surface}.

12.34.3.4 \texttt{printable_rect()}

\begin{verbatim}
int Fl_EPS_File_Surface::printable_rect (  
    int \* \textit{w},  
    int \* \textit{h} ) \text{ [virtual]}
\end{verbatim}

Computes the width and height of the drawable area of the drawing surface. Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to \texttt{origin()}. If the object is derived from class \texttt{Fl_Paged_Device}, values account for the user-selected paper type and print orientation and are changed by \texttt{scale()} calls.

\textbf{Returns}

\begin{itemize}
\item 0 if OK, non-zero if any error
\end{itemize}

Reimplemented from \texttt{Fl_Widget_Surface}.

12.34.3.5 \texttt{translate()}

\begin{verbatim}
void Fl_EPS_File_Surface::translate (  
    int \textit{x},  
    int \textit{y} ) \text{ [virtual]}
\end{verbatim}

Translates the current graphics origin accounting for the current rotation. Each \texttt{translate()} call must be matched by an \texttt{untranslate()} call. Successive \texttt{translate()} calls add up their effects.

Reimplemented from \texttt{Fl_Widget_Surface}.

12.34.3.6 \texttt{untranslate()}

\begin{verbatim}
void Fl_EPS_File_Surface::untranslate (  
    void ) \text{ [virtual]}
\end{verbatim}

Undoes the effect of a previous \texttt{translate()} call.

Reimplemented from \texttt{Fl_Widget_Surface}.

The documentation for this class was generated from the following file:

\begin{itemize}
\item \texttt{Fl_PostScript.H}
\end{itemize}

12.35 \texttt{Fl_File_Browser} Class Reference

The \texttt{Fl_File_Browser} widget displays a list of filenames, optionally with file-specific icons.

\begin{verbatim}
#include <Fl_File_Browser.H>
\end{verbatim}

Inheritance diagram for \texttt{Fl_File_Browser}:
Public Types

• enum { FILES, DIRECTORIES }

Public Types inherited from Fl_Browser

• enum Fl_Line_Position { TOP, BOTTOM, MIDDLE }
  For internal use only?

Public Types inherited from Fl_Browser_

• enum {
  HORIZONTAL = 1, VERTICAL = 2, BOTH = 3, ALWAYS_ON = 4,
  HORIZONTAL_ALWAYS = 5, VERTICAL_ALWAYS = 6, BOTH_ALWAYS = 7 }
  Values for has_scrollbar().

Public Member Functions

• const char ∗ errmsg () const
  Returns OS error messages, or NULL if none.
• void errmsg (const char ∗ emsg)
  Sets OS error message to a string, which can be NULL.
• int filetype () const
  Sets or gets the file browser type, FILES or DIRECTORIES.
• void filetype (int t)
  Sets or gets the file browser type, FILES or DIRECTORIES.
• const char ∗ filter () const
  Sets or gets the filename filter.
• void filter (const char ∗ pattern)
  Sets or gets the filename filter.
• Fl_File_Browser (int, int, int, int, const char ∗=0)
  The constructor creates the Fl_File_Browser widget at the specified position and size.
• uchar iconsize () const
  Sets or gets the size of the icons.
• void iconsize (uchar s)
  Sets or gets the size of the icons.
• int load (const char ∗ directory, Fl_File_Sort_F ∗ sort=fl_numericsort)
  Loads the specified directory into the browser.
• Fl_Fontsize textsize () const
• void textsize (Fl_Fontsize s)
Public Member Functions inherited from Fl_Browser

- void add (const char *newtext, void *d=0)
  Adds a new line to the end of the browser.
- void bottomline (int line)
  Scrolls the browser so the bottom item in the browser is showing the specified line.
- void clear ()
  Removes all the lines in the browser.
- char column_char () const
  Gets the current column separator character.
- void column_char (char c)
  Sets the column separator to c.
- const int *column_widths () const
  Gets the current column width array.
- void column_widths (const int *arr)
  Sets the current array to arr.
- void *data (int line) const
  Returns the user data() for specified line.
- void data (int line, void *d)
  Sets the user data for specified line to d.
- void display (int line, int val=1)
  For back compatibility.
- int displayed (int line) const
  Returns non-zero if line has been scrolled to a position where it is being displayed.
- Fl_Browser (int X, int Y, int W, int H, const char *L=0)
  The constructor makes an empty browser.
- char format_char () const
  Gets the current format code prefix character, which by default is '@'.
- void format_char (char c)
  Sets the current format code prefix character to c.
- void hide () FL_OVERRIDE
  Hides the entire Fl_Browser widget – opposite of show().
- void hide (int line)
  Makes line invisible, preventing selection by the user.
- Fl_Image *icon (int line) const
  Returns the icon currently defined for line.
- void icon (int line, Fl_Image *icon)
  Set the image icon for line to the value icon.
- void insert (int line, const char *newtext, void *d=0)
  Insert a new entry whose label is newtext above given line, optional data d.
- void lineposition (int line, Fl_Line_Position pos)
  Updates the browser so that line is shown at position pos.
- int load (const char *filename)
  Clears the browser and reads the file, adding each line from the file to the browser.
- void make_visible (int line)
  Make the item at the specified line visible().
- void middleline (int line)
  Scrolls the browser so the middle item in the browser is showing the specified line.
- void move (int to, int from)
  Line from is removed and reinserted at to.
- void remove (int line)
Remove entry for given line number, making the browser one line shorter.

- **void remove_icon (int line)**
  Removes the icon for line.

- **void replace (int a, const char ∗b)**
  For back compatibility only.

- **int select (int line, int val=1)**
  Sets the selection state of the item at line to the value val.

- **int selected (int line) const**
  Returns 1 if specified line is selected, 0 if not.

- **void show () FL_OVERRIDE**
  Shows the entire Fl_Browser widget – opposite of hide().

- **void show (int line)**
  Makes line visible, and available for selection by user.

- **int size () const**
  Returns how many lines are in the browser.

- **void size (int W, int H)**

- **void swap (int a, int b)**
  Swaps two browser lines a and b.

- **const char ∗text (int line) const**
  Returns the label text for the specified line.

- **void text (int line, const char ∗newtext)**
  Sets the text for the specified line to newtext.

- **Fl_Fontsize textsize () const**
  Gets the default text size (in pixels) for the lines in the browser.

- **void textsize (Fl_Fontsize newSize)**
  Sets the default text size (in pixels) for the lines in the browser to newSize.

- **int topline () const**
  Returns the line that is currently visible at the top of the browser.

- **void topline (int line)**
  Scrolls the browser so the top item in the browser is showing the specified line.

- **int value () const**
  Returns the line number of the currently selected line, or 0 if none selected.

- **void value (int line)**
  Sets the browser’s value(), which selects the specified line.

- **int visible (int line) const**
  Returns non-zero if the specified line is visible, 0 if hidden.

- **~Fl_Browser ()**
  The destructor deletes all list items and destroys the browser.

**Public Member Functions inherited from Fl_Browser_**

- **int deselect (int docallbacks=0)**
  Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

- **void display (void ∗item)**
  Displays the item, scrolling the list as necessary.

- **int handle (int event) FL_OVERRIDE**
  Handles the event within the normal widget bounding box.

- **uchar has_scrollbar () const**
  Returns the current scrollbar mode, see Fl_Browser_::has_scrollbar(uchar)

- **void has_scrollbar (uchar mode)**
  Sets whether the widget should have scrollbars or not (default Fl_Browser_::BOTH).
• int hposition () const
  Gets the horizontal scroll position of the list as a pixel position pos.

• void hposition (int)
  Sets the horizontal scroll position of the list to pixel position pos.

• int linespacing () const
  Return the height of additional spacing between browser lines.

• void linespacing (int pixels)
  Add some space between browser lines.

• int position () const
• void position (int pos)
  • void position (int x, int y)

• void resize (int X, int Y, int W, int H) FL_OVERRIDE
  Repositions and/or resizes the browser.

• void scrollbar_left ()
  Moves the vertical scrollbar to the lefthand side of the list.

• void scrollbar_right ()
  Moves the vertical scrollbar to the righthand side of the list.

• int scrollbar_size () const
  Gets the current size of the scrollbars’ troughs, in pixels.

• void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars’ troughs to newSize, in pixels.

• int scrollbar_width () const
  Returns the global value Fl::scrollbar_size().

• void scrollbar_width (int width)
  Sets the global Fl::scrollbar_size(), and forces this instance of the widget to use it.

• int select (void ∗item, int val=1, int docallbacks=0)
  Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.

• int select_only (void ∗item, int docallbacks=0)
  Selects item and returns 1 if the state changed or 0 if it did not.

• void sort (int flags=0)
  Sort the items in the browser based on flags.

• Fl_Color textcolor () const
  Gets the default text color for the lines in the browser.

• void textcolor (Fl_Color col)
  Sets the default text color for the lines in the browser to color col.

• Fl_Font textfont () const
  Gets the default text font for the lines in the browser.

• void textfont (Fl_Font font)
  Sets the default text font for the lines in the browser to font.

• Fl_Fontsize fontsize () const
  Gets the default text size (in pixels) for the lines in the browser.

• void fontsize (Fl_Fontsize newSize)
  Sets the default text size (in pixels) for the lines in the browser to size.

• int vposition () const
  Gets the vertical scroll position of the list as a pixel position pos.

• void vposition (int pos)
  Sets the vertical scroll position of the list to pixel position pos.
Public Member Functions inherited from Fl_Group

- **Fl_Widget * _ddfdesign_kludge ()**
  
  This is for forms compatibility only.

- **void add (Fl_Widget *)**
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void add (Fl_Widget *)**
  
  See void Fl_Group::add(Fl_Widget &w)

- **void add_resizable (Fl_Widget &)**
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget * const * array () const**
  
  Returns a pointer to the array of children.

- **Fl_Group * as_group () const FL_OVERRIDE**
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin ()**
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget * child (int n) const**
  
  Returns array()[n].

- **int children () const**
  
  Returns how many child widgets the group has.

- **void clear ()**
  
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()**
  
  Returns the current clipping mode.

- **void clip_children (int c)**
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child (int n)**
  
  Removes the widget at index from the group and deletes it.

- **void end ()**
  
  Exactly the same as current(this->parent()).

- **int find (const Fl_Widget *) const**
  
  See int Fl_Group::find(const Fl_Widget *) const.

- **int find (const Fl_Widget *) const**
  
  Searches the child array for the widget and returns the index.

- **Fl_Group (int, int, int, int, const char *)=0**
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus (Fl_Widget *)**

- **void forms_end ()**
  
  This is for forms compatibility only.

- **int handle (int) FL_OVERRIDE**
  
  Handles the specified event.

- **void init_sizes ()**
  
  Resets the internal array of widget sizes and positions.

- **void insert (Fl_Widget &, int i)**
  
  The widget is removed from its current group (if any) and then inserted into this group.

- **void insert (Fl_Widget &, Fl_Widget *)**
  
  This does insert(w, find(before)).

- **void remove (Fl_Widget &)**
  
  Removes a widget from the group but does not delete it.

- **void remove (Fl_Widget *)**
Removes the widget \( o \) from the group.

- void remove (int index)

  Removes the widget at \( index \) from the group but does not delete it.

- \*Fl_Widget resizable () const

  Returns the group's resizable widget.

- void resizable (\*Fl_Widget &o)

  Sets the group's resizable widget.

- void resizable (\*Fl_Widget o)

  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- void resize (int, int, int, int) FL_OVERRIDE

  Resizes the Fl_Group widget and all of its children.

- virtual ~Fl_Group ()

  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()

- void _set_fullscreen ()

- void activate ()

  Activates the widget.

- unsigned int active () const

  Returns whether the widget is active.

- int active_r () const

  Returns whether the widget and all of its parents are active.

- Fl_Align align () const

  Gets the label alignment.

- void align (Fl_Align alignment)

  Sets the label alignment.

- long argument () const

  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)

  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window *as_gl_window ()

  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const *as_gl_window () const

  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual Fl_Window *as_window ()

  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const *as_window () const

- void bind_deimage (Fl_Img *img)

  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)

  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Img *img)

  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)

  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const

  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)

  Sets the box type for the widget.

- Fl_Callback_p callback () const
Gets the current callback function for the widget.
• void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
  Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗new_label)
  Sets the current label.
• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• **Fl_Image * deimage ()**
  Gets the image that is used as part of the widget label when in the inactive state.

• **const Fl_Image * deimage () const**
  Gets the image that is used as part of the widget label when in the inactive state.

• **void deimage (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the inactive state.

• **void deimage (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the inactive state.

• **int deimage_bound () const**
  Returns whether the inactive image is managed by the widget.

• **void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with default arguments.

• **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

• **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)**
  Calls the widget callback function with arbitrary arguments.

• **void draw_label (int, int, int, int, Fl_Align) const**
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• **int h () const**
  Gets the widget height.

• **Fl_Image * image ()**
  Gets the image that is used as part of the widget label when in the active state.

• **const Fl_Image * image () const**
  Gets the image that is used as part of the widget label when in the active state.

• **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.

• **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

• **int image_bound () const**
  Returns whether the image is managed by the widget.

• **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.

• **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

• **const char * label () const**
  Gets the current label text.

• **void label (const char *text)**
  Sets the current label pointer.

• **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

• **Fl_Color labelcolor () const**
  Gets the label color.

• **void labelcolor (Fl_Color c)**
  Sets the label color.

• **Fl_Font labelfont () const**
  Gets the font to use.

• **void labelfont (Fl_Font f)**
  Sets the font to use.

• **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.

• **void labelsize (Fl_Fontsize pix)**
Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  
  Sets width \( \text{ww} \) and height \( \text{hh} \) accordingly with the label size.

- **bool needs_keyboard () const**
  
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - “for hacks only”.

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.

- **void set_visible ()**
  
  Makes the widget visible.

- **void set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- **void shortcut_label (int value)**
  
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- **void size (int W, int H)**
  
  Changes the size of the widget.

- **int take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- **const char * tooltip () const**
  
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window *top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window *top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.

• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void *user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window *window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Group

• static Fl_Group *current ()
  Returns the currently active group.

• static void current (Fl_Group *g)
  Sets the current group.
Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (Fl_Widget ∗widget, void ∗data)
  
  The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char ∗t)
  
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char ∗t, const bool require_alt=false)
  
  Returns true if the given text t contains the entered '&x' shortcut.

Public Attributes inherited from `Fl_Browser`

- Fl_Scrollbar `hscrollbar`
  
  Horizontal scrollbar.
- Fl_Scrollbar `scrollbar`
  
  Vertical scrollbar.

Protected Types inherited from `Fl_Widget`

```cpp
enum {
    INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
    FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
    OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
    MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
    GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
    NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
    AUTO_DELETE_USER_DATA = 1<<23 ,
    MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
```

Protected Member Functions inherited from `Fl_Browser`

- FL_BLINE ∗_remove (int line)
  
  Removes the item at the specified line.
- FL_BLINE ∗find_line (int line) const
  
  Returns the item for specified line.
- void insert (int line, FL_BLINE ∗item)
  
  Insert specified item above line.
- void ∗item_at (int line) const FL_OVERRIDE
  
  Return the item at specified line.
- void ∗item_first () const FL_OVERRIDE
  
  Return the very first item in the list.
- void ∗item_last () const FL_OVERRIDE
  
  Returns the very last item in the list.
- void ∗item_next (void ∗item) const FL_OVERRIDE
  
  Returns the next item after item.
- void ∗item_prev (void ∗item) const FL_OVERRIDE
  
  Returns the previous item before item.
- void item_select (void ∗item, int val) FL_OVERRIDE
  
  Change the selection state of item to the value val.
- int item_selected (void ∗item) const FL_OVERRIDE
See if item is selected.

- void item_swap (void ∗a, void ∗b) FL_OVERRIDE
  Swap the items a and b.
- const char ∗ item_text (void ∗item) const FL_OVERRIDE
  Returns the label text for item.
- int lineno (void ∗item) const
  Returns line number corresponding to item, or zero if not found.
- void swap (FL_BLINE ∗a, FL_BLINE ∗b)
  Swap the two items a and b.

Protected Member Functions inherited from Fl_Browser_

- void bbox (int &X, int &Y, int &W, int &H) const
  Returns the bounding box for the interior of the list's display window, inside the scrollbars.
- void deleting (void ∗item)
  This method should be used when item is being deleted from the list.
- int displayed (void ∗item) const
  Returns non-zero if item has been scrolled to a position where it is being displayed.
- void draw () FL_OVERRIDE
  Draws the list within the normal widget bounding box.
- void ∗find_item (int ypos)
  This method returns the item under mouse y position ypos.
- Fl_Browser_ (int X, int Y, int W, int H, const char ∗L=0)
  The constructor makes an empty browser.
- virtual int full_width () const
  This method may be provided by the subclass to indicate the full width of the item list, in pixels.
- void inserting (void ∗a, void ∗b)
  This method should be used when an item is in the process of being inserted into the list.
- virtual int item_quick_height (void ∗item) const
  This method may be provided by the subclass to return the height of the item, in pixels.
- int leftedge () const
  This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.
- void new_list ()
  This method should be called when the list data is completely replaced or cleared.
- void redraw_line (void ∗item)
  This method should be called when the contents of item has changed, but not its height.
- void redraw_lines ()
  This method will cause the entire list to be redrawn.
- void replacing (void ∗a, void ∗b)
  This method should be used when item a is being replaced by item b.
- void ∗selection () const
  Returns the item currently selected, or NULL if there is no selection.
- void swapping (void ∗a, void ∗b)
  This method should be used when two items a and b are being swapped.
- void ∗top () const
  Returns the item that appears at the top of the list.
Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw () FL_OVERRIDE
  Draws the widget.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.
- virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
- int * sizes ()
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
Sets a flag in the flags mask.

- void \(w\) (int \(v\))
  
  *Internal use only.*

- void \(x\) (int \(v\))
  
  *Internal use only.*

- void \(y\) (int \(v\))
  
  *Internal use only.*

### 12.35.1 Detailed Description

The `Fl_File_Browser` widget displays a list of filenames, optionally with file-specific icons.

### 12.35.2 Constructor & Destructor Documentation

#### 12.35.2.1 Fl_File_Browser()

```cpp
Fl_File_Browser::Fl_File_Browser (
    int \(X\),
    int \(Y\),
    int \(W\),
    int \(H\),
    const char * \(l = 0\))
```

The constructor creates the `Fl_File_Browser` widget at the specified position and size. The destructor destroys the widget and frees all memory that has been allocated.

### 12.35.3 Member Function Documentation

#### 12.35.3.1 errmsg() [1/2]

```cpp
const char * Fl_File_Browser::errmsg ( ) const [inline]
```

Returns OS error messages, or NULL if none. Use when advised.

#### 12.35.3.2 errmsg() [2/2]

```cpp
void Fl_File_Browser::errmsg (const char * \(emsg\))
```

Sets OS error message to a string, which can be NULL. Frees previous if any. void `errmsg(const char *emsg);`

#### 12.35.3.3 filetype() [1/2]

```cpp
int Fl_File_Browser::filetype ( ) const [inline]
```

Sets or gets the file browser type, FILES or DIRECTORIES. When set to FILES, both files and directories are shown. Otherwise only directories are shown.

#### 12.35.3.4 filetype() [2/2]

```cpp
void Fl_File_Browser::filetype (int \(t\)) [inline]
```

Sets or gets the file browser type, FILES or DIRECTORIES. When set to FILES, both files and directories are shown. Otherwise only directories are shown.

#### 12.35.3.5 filter() [1/2]

```cpp
const char * Fl_File_Browser::filter ( ) const [inline]
```

Sets or gets the filename filter. The pattern matching uses the `fl_filename_match()` function in FLTK.
12.35.3.6 filter() [2/2]
void Fl_File_Browser::filter (const char * pattern)
Sets or gets the filename filter.
The pattern matching uses the fl_filename_match() function in FLTK.

12.35.3.7 iconsize() [1/2]
uchar Fl_File_Browser::iconsize ( ) const [inline]
Sets or gets the size of the icons.
The default size is 20 pixels.

12.35.3.8 iconsize() [2/2]
void Fl_File_Browser::iconsize (uchar s) [inline]
Sets or gets the size of the icons.
The default size is 20 pixels.

12.35.3.9 load()
int Fl_File_Browser::load (const char * directory, Fl_File_Sort_F * sort = fl_numericsort)
Loads the specified directory into the browser.
If icons have been loaded then the correct icon is associated with each file in the list.
If directory is "", all mount points (unix) or drive letters (Windows) are listed.
The sort argument specifies a sort function to be used with fl_filename_list().
Return value is the number of filename entries, or 0 if none. On error, 0 is returned, and errmsg() has OS error string if non-NULL.
The documentation for this class was generated from the following files:
  • Fl_File_Browser.H
  • Fl_File_Browser.cxx

12.36 Fl_File_Chooser Class Reference
The Fl_File_Chooser widget displays a standard file selection dialog that supports various selection modes.

Public Types
  • enum Type { SINGLE = 0 , MULTI = 1 , CREATE = 2 , DIRECTORY = 4 }
    Determines the type of file chooser presented to the user.

Public Member Functions
  • Fl_Widget * add_extra (Fl_Widget *gr)
    Adds an extra widget at the bottom of the Fl_File_Chooser window.
  • void callback (void (*)(Fl_File_Chooser *, void *), void *d=0)
    Sets the file chooser callback cb and associated data d.
  • Fl_Color color ()
    Gets the background color of the Fl_File_Browser list.
  • void color (Fl_Color c)
    Sets the background color of the Fl_File_Browser list.
  • int count ()
Returns the number of selected files.

- char * directory ()
  Gets the current directory.
- void directory (const char *d)
  Sets the current directory.
- const char * filter ()
  Gets the current filename filter patterns.
- void filter (const char *p)
  Sets the current filename filter patterns.
- int filter_value ()
  Gets the current filename filter selection.
- void filter_value (int f)
  Sets the current filename filter selection.

**Fl_File_Chooser** (const char *pathname, const char *pattern, int type_val, const char *title)

The constructor creates the Fl_File_Chooser dialog shown.

- int h () const
  Hides the Fl_File_Chooser window.
- void hide ()

- uchar iconsize ()
  Gets the size of the icons in the Fl_File_Browser.
- void iconsize (uchar s)
  Sets the size of the icons in the Fl_File_Browser.
- const char * label ()
  Gets the title bar text for the Fl_File_Chooser.
- void label (const char *l)
  Sets the title bar text for the Fl_File_Chooser.
- const char * ok_label ()
  Gets the label for the "ok" button in the Fl_File_Chooser.
- void ok_label (const char *l)
  Sets the label for the "ok" button in the Fl_File_Chooser.

- int preview () const
  Returns the current state of the preview box.
- void preview (int e)
  Enable or disable the preview tile.

- void rescan ()
  Reloads the current directory in the Fl_File_Browser.
- void rescan_keep_filename ()
  Rescan the current directory without clearing the filename, then select the file if it is in the list.

- void resize (int x, int y, int w, int h)
- void show ()
  Shows the Fl_File_Chooser window.

- int shown ()
  Returns non-zero if the file chooser main window show() has been called, but not hide().
- void size (int w, int h)

**Fl_Color textcolor ()**

- Gets the current Fl_File_Browser text color.
- void textcolor (Fl_Color c)
  Sets the current Fl_File_Browser text color.

**Fl_Font textfont ()**

- Gets the current Fl_File_Browser text font.
• void **textfont** (Fl_Font f)
  Sets the current Fl_File_Browser text font.

• Fl_Fontsize **textsize** ()
  Gets the current Fl_File_Browser text size.

• void **textsize** (Fl_Fontsize s)
  Sets the current Fl_File_Browser text size.

• int **type** ()
  Gets the current type of Fl_File_Chooser.

• void **type** (int t)
  Sets the current type of Fl_File_Chooser.

• void * **user_data** () const
  Gets the file chooser user data.

• void **user_data** (void * d)
  Sets the file chooser user data d.

• void **value** (const char * filename)
  Sets the current value of the selected file.

• const char * **value** (int f=1)
  Gets the current value of the selected file(s).

• int **visible** ()
  Returns 1 if the Fl_File_Chooser window is visible.

• int w () const
• int x () const
• int y () const

• ~Fl_File_Chooser ()
  Destroys the widget and frees all memory used by it.

**Public Attributes**

• Fl_Button * newButton
  The "new directory" button is exported so that application developers can control the appearance and use.

• Fl_Check_Button * previewButton
  The "preview" button is exported so that application developers can control the appearance and use.

• Fl_Check_Button * showHiddenButton
  When checked, hidden files (i.e., filename begins with dot) are displayed.

**Static Public Attributes**

• static const char * add_favorites_label = "Add to Favorites"
  [standard text may be customized at run-time]

• static const char * all_files_label = "All Files (+)"
  [standard text may be customized at run-time]

• static const char * custom_filter_label = "Custom Filter"
  [standard text may be customized at run-time]

• static const char * existing_file_label = "Please choose an existing file!"
  [standard text may be customized at run-time]

• static const char * favorites_label = "Favorites"
  [standard text may be customized at run-time]

• static const char * filename_label = "Filename:"
  [standard text may be customized at run-time]

• static const char * filesystems_label = Fl::system_driver()->filesystems_label()
  [standard text may be customized at run-time]

• static const char * hidden_label = "Show hidden files"
• static const char * manage_favorites_label = "Manage Favorites"
• static const char * new_directory_label = "New Directory?"
• static const char * new_directory_tooltip = "Create a new directory."
• static const char * preview_label = "Preview"
• static const char * save_label = "Save"
• static Fl_File_Sort_F * sort = fl_numericsort
  
  the sort function that is used when loading the contents of a directory.

Protected Member Functions
• void show_error_box (int val)
  Show error box if val=1, hide if val=0.

Related Symbols
(Note that these are not member symbols.)
• char * fl_dir_chooser (const char *message, const char *fname, int relative)
  Shows a file chooser dialog and gets a directory.
• char * fl_file_chooser (const char *message, const char *pat, const char *fname, int relative)
  Shows a file chooser dialog and gets a filename.
• void fl_file_chooser_callback (void(*cb)(const char *))
  Set the file chooser callback.
• void fl_file_chooser_ok_label (const char *l)
  Set the "OK" button label.

12.36.1 Detailed Description

The Fl_File_Chooser widget displays a standard file selection dialog that supports various selection modes.
Features include:

- Multiple filter patterns can be specified, with parenthesis around filters, and tabs to separate each pattern, e.g.:
  ```
  char pattern[] = "Image Files (*.bmp,gif,jpg,png,xbm,xpm)\t"
  "Web Files (*.htm,html,php)\t"
  "All Files (*)\t"
  ``
- If no "*" pattern is provided, then an entry for "All Files (*)" is automatically added.
- An optional file preview box is provided which can be toggled by programmer or user showing images, or the first 2048 bytes of printable text.
- Preview image loading functions can be registered to provide custom file previews.
- The favorites button shows up to 100 user-saved favorite directories, the user's home directory, and a filesystems item.
- A simple dialog is provided for managing saved directories.
- Shortcut keys are provided:

<table>
<thead>
<tr>
<th>Shortcut</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alt+a</td>
<td>Adds a directory to the favorites list</td>
</tr>
<tr>
<td>Alt+m</td>
<td>Manages the favorites list</td>
</tr>
<tr>
<td>Alt+f</td>
<td>Shows the filesystem list</td>
</tr>
<tr>
<td>Alt+h</td>
<td>Go to the home directory</td>
</tr>
<tr>
<td>Alt+0..9</td>
<td>going to any of the first 10 favorites</td>
</tr>
</tbody>
</table>

The `Fl_FileChooser` widget transmits UTF-8 encoded filenames to its user. It is recommended to open files that may have non-ASCII names with the `fl_fopen()` or `fl_open()` utility functions that handle these names in a cross-
platform way (whereas the standard fopen()/open() functions fail on the Windows platform to open files with a non-ASCII name).

The Fl_File_Chooser class also exports several static values that may be used to localize or customize the appearance of all file chooser dialogs:

<table>
<thead>
<tr>
<th>Member</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>add_favorites_label</td>
<td>&quot;Add to Favorites&quot;</td>
</tr>
<tr>
<td>all_files_label</td>
<td>&quot;All Files (+)&quot;</td>
</tr>
<tr>
<td>custom_filter_label</td>
<td>&quot;Custom Filter&quot;</td>
</tr>
<tr>
<td>existing_file_label</td>
<td>&quot;Please choose an existing file!&quot;</td>
</tr>
<tr>
<td>favorites_label</td>
<td>&quot;Favorites&quot;</td>
</tr>
<tr>
<td>filename_label</td>
<td>&quot;Filename:&quot;</td>
</tr>
<tr>
<td>filesystems_label</td>
<td>&quot;My Computer&quot; (Windows) &quot;File Systems&quot; (all others)</td>
</tr>
<tr>
<td>hidden_label</td>
<td>&quot;Show hidden files:&quot;</td>
</tr>
<tr>
<td>manage_favorites_label</td>
<td>&quot;Manage Favorites&quot;</td>
</tr>
<tr>
<td>new_directory_label</td>
<td>&quot;New Directory?&quot;</td>
</tr>
<tr>
<td>new_directory_tooltip</td>
<td>&quot;Create a new directory.&quot;</td>
</tr>
<tr>
<td>preview_label</td>
<td>&quot;Preview&quot;</td>
</tr>
<tr>
<td>save_label</td>
<td>&quot;Save&quot;</td>
</tr>
<tr>
<td>show_label</td>
<td>&quot;Show:&quot;</td>
</tr>
<tr>
<td>sort</td>
<td>fl_numericsort</td>
</tr>
</tbody>
</table>

The Fl_File_Chooser::sort member specifies the sort function that is used when loading the contents of a directory and can be customized at run-time.

The Fl_File_Chooser class also exports the Fl_File_Chooser::newButton and Fl_File_Chooser::previewButton widgets so that application developers can control their appearance and use.

### 12.36.2 Member Enumeration Documentation

#### 12.36.2.1 Type

```cpp
enum Fl_File_Chooser::Type
```

Determines the type of file chooser presented to the user.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SINGLE</td>
<td>Select a single, existing file.</td>
</tr>
<tr>
<td>MULTI</td>
<td>Select one or more existing files.</td>
</tr>
<tr>
<td>CREATE</td>
<td>When used alone, select a single, existing file or specify a new filename. Can be combined with DIRECTORY (e.g. CREATE/DIRECTORY) to have the same effect for directories.</td>
</tr>
<tr>
<td>DIRECTORY</td>
<td>Select a single, existing directory. Can be combined with CREATE.</td>
</tr>
</tbody>
</table>

### 12.36.3 Constructor & Destructor Documentation

#### 12.36.3.1 Fl_File_Chooser()

`Fl_File_Chooser::Fl_File_Chooser ( const char *pathname, const char *pattern, int type_val, const char *title )`
The constructor creates the Fl_File_Chooser dialog shown.

- The **pathname** argument can be a directory name or a complete file name (in which case the corresponding file is highlighted in the list and in the filename input field.)

- The **pattern** argument can be a NULL string or "*" to list all files, or it can be a series of descriptions and filter strings separated by tab characters (\t). The format of filters is either "Description text (patterns)" or just "patterns". A file chooser that provides filters for HTML and image files might look like:
  
  "HTML Files (*.html)\tImage Files (*.bmp,gif,jpg,png)"

  The file chooser will automatically add the "All Files (*)" pattern to the end of the string you pass if you do not provide one. The first filter in the string is the default filter. See the FLTK documentation on `fl_filename_match()` for the kinds of pattern strings that are supported.

- The **type_val** argument can be one of the `Fl_File_Chooser::Type` values.

- The **title** argument is used to set the title bar text for the Fl_File_Chooser window.

### 12.36.4 Member Function Documentation

#### 12.36.4.1 `add_extra()`

```cpp
Fl_Widget * Fl_File_Chooser::add_extra (Fl_Widget * extra)
```

Adds an extra widget at the bottom of the Fl_File_Chooser window. You can use any `Fl_Widget` or `Fl_Group`. If you use an `Fl_Group`, set its (x, y) coordinates to (0, 0) and position its children relative to (0, 0) inside the `Fl_Group` container widget. Make sure that all child widgets of the `Fl_Group` are entirely included inside the bounding box of their parents, i.e. the `Fl_Group` widget, and the Fl_File_Chooser window, respectively.

**Note**

The width of the Fl_File_Chooser window is an undocumented implementation detail and may change in the future.

If `extra` is NULL any previous extra widget is removed.

**Parameters**

```
in extra Custom widget or group to be added to the Fl_File_Chooser window.
```

**Returns**

Pointer to previous extra widget or NULL if not set previously.

**Note**

`Fl_File_Chooser` does **not** delete the extra widget in its destructor! The extra widget is removed from the Fl_File_Chooser window before the Fl_File_Chooser widget gets destroyed. To prevent memory leakage, don't forget to delete unused extra widgets.

#### 12.36.4.2 `filter()`

```cpp
void Fl_File_Chooser::filter (const char * p)
```

Sets the current filename filter patterns. The filter patterns use `fl_filename_match()`. Multiple patterns can be used by separating them with tabs, like "*.jpg\t*.png\t*.gif\t*". In addition, you can provide human-readable labels with the patterns inside parenthesis, like "JPEG Files (*.jpg)\tPNG Files (*.png)\tGIF Files (*.gif)\tAll Files (*)". Use filter(NULL) to show all files.
12.36.4.3 iconsize() [1/2]

uchar Fl_File_Chooser::iconsize ( )

Gets the size of the icons in the Fl_File_Browser.
By default the icon size is set to 1.5 times the textsize().

12.36.4.4 iconsize() [2/2]

void Fl_File_Chooser::iconsize ( uchar s )

Sets the size of the icons in the Fl_File_Browser.
By default the icon size is set to 1.5 times the textsize().

12.36.4.5 preview()

void Fl_File_Chooser::preview ( int e )

Enable or disable the preview tile.
1 = enable preview, 0 = disable preview.

12.36.4.6 shown()

int Fl_File_Chooser::shown ( )

Returns non-zero if the file chooser main window show() has been called, but not hide().

See also

Fl_Window::shown()

12.36.4.7 value()

const char * Fl_File_Chooser::value ( int f = 1 )

Gets the current value of the selected file(s).
f is a 1-based index into a list of file names. The number of selected files is returned by Fl_File_Chooser::count().
This sample code loops through all selected files:

// Get list of filenames user selected from a MULTI chooser
for ( int t=1; t<chooser->count(); t++ ) {
    const char *filename = chooser->value(t);
    ...
}

12.36.5 Member Data Documentation

12.36.5.1 showHiddenButton

Fl_File_Chooser::showHiddenButton

When checked, hidden files (i.e., filename begins with dot) are displayed.
The "showHiddenButton" button is exported so that application developers can control its appearance.
The documentation for this class was generated from the following files:

• Fl_File_Chooser.H
• Fl_File_Chooser.cxx
• Fl_File_Chooser2.cxx
• fl_file_dir.cxx

12.37 Fl_File_Icon Class Reference

The Fl_File_Icon class manages icon images that can be used as labels in other widgets and as icons in the
FileBrowser widget.
#include <Fl_File_Icon.H>
Public Types

- enum {
  ANY, PLAIN, FIFO, DEVICE,
  LINK, DIRECTORY
}
- enum {
  END, COLOR, LINE, CLOSEDLINE,
  POLYGON, OUTLINEPOLYGON, VERTEX
}

Public Member Functions

- short ∗ add (short d)
  Adds a keyword value to the icon array, returning a pointer to it.
- short ∗ add_color (Fl_Color c)
  Adds a color value to the icon array, returning a pointer to it.
- short ∗ add_vertex (float x, float y)
  Adds a vertex value to the icon array, returning a pointer to it.
- short ∗ add_vertex (int x, int y)
  Adds a vertex value to the icon array, returning a pointer to it.
- void clear ()
  Clears all icon data from the icon.
- void draw (int x, int y, int w, int h, Fl_Color ic, int active=1)
  Draws an icon in the indicated area.
- Fl_File_Icon (const char ∗ p, int t, int nd=0, short ∗ d=0)
  Creates a new Fl_File_Icon with the specified information.
- void label (Fl_Widget ∗ w)
  Applies the icon to the widget, registering the Fl_File_Icon label type as needed.
- void load (const char ∗ f)
  Loads the specified icon image.
- int load_fti (const char ∗ fti)
  Loads an SGI icon file.
- int load_image (const char ∗ i)
  Load an image icon file from an image filename.
- Fl_File_Icon ∗ next ()
  Returns next file icon object.
- const char ∗ pattern ()
  Returns the filename matching pattern for the icon.
- int size ()
  Returns the number of words of data used by the icon.
- int type ()
  Returns the filetype associated with the icon, which can be one of the following:
- short ∗ value ()
  Returns the data array for the icon.
- ∼Fl_File_Icon ()
  The destructor destroys the icon and frees all memory that has been allocated for it.

Static Public Member Functions

- static Fl_File_Icon ∗ find (const char ∗ filename, int filetype=ANY)
  Finds an icon that matches the given filename and file type.
- static Fl_File_Icon ∗ first ()
  Returns a pointer to the first icon in the list.
- static void labeltype (const Fl_Label ∗ o, int x, int y, int w, int h, Fl_Align a)
Draw the icon label.

- static void load_system_icons (void)
  Loads all system-defined icons.

### 12.37.1 Detailed Description

The Fl_File_Icon class manages icon images that can be used as labels in other widgets and as icons in the FileBrowser widget.

### 12.37.2 Constructor & Destructor Documentation

#### 12.37.2.1 Fl_File_Icon()

```cpp
Fl_File_Icon::Fl_File_Icon (const char * p, int t, int nd = 0, short * d = 0)
```

Creates a new Fl_File_Icon with the specified information.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>p</th>
<th>filename pattern</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>t</td>
<td>file type</td>
</tr>
<tr>
<td>in</td>
<td>nd</td>
<td>number of data values</td>
</tr>
<tr>
<td>in</td>
<td>d</td>
<td>data values</td>
</tr>
</tbody>
</table>

### 12.37.3 Member Function Documentation

#### 12.37.3.1 add()

```cpp
short * Fl_File_Icon::add (short d)
```

Adds a keyword value to the icon array, returning a pointer to it.

**Parameters**

| in | d | data value |

#### 12.37.3.2 add_color()

```cpp
short * Fl_File_Icon::add_color (Fl_Color c) [inline]
```

Adds a color value to the icon array, returning a pointer to it.

**Parameters**

| in | c | color value |

#### 12.37.3.3 add_vertex() [1/2]

```cpp
short * Fl_File_Icon::add_vertex (float x, float y) [inline]
```

Adds a vertex value to the icon array, returning a pointer to it.
The floating point version goes from 0.0 to 1.0. The origin (0.0) is in the lower-lefthand corner of the icon.

### Parameters

- **in x,y** vertex coordinates

#### 12.37.3.4 add_vertex() [2/2]

```c
short * Fl_File_Icon::add_vertex ( int x,
                                   int y ) [inline]
```

Adds a vertex value to the icon array, returning a pointer to it.

The integer version accepts coordinates from 0 to 10000. The origin (0.0) is in the lower-lefthand corner of the icon.

### Parameters

- **in x,y** vertex coordinates

#### 12.37.3.5 draw()

```c
void Fl_File_Icon::draw ( int x,
                         int y,
                         int w,
                         int h,
                         Fl_Color ic,
                         int active = 1 )
```

Draws an icon in the indicated area.

### Parameters

- **in x,y,w,h** position and size
- **in ic** icon color
- **in active** status, default is active [non-zero]

#### 12.37.3.6 find()

```c
Fl_File_Icon * Fl_File_Icon::find ( const char * filename,
                                    int filetype = ANY ) [static]
```

Finds an icon that matches the given filename and file type.

### Parameters

- **in filename** name of file
- **in filetype** enumerated file type

**Returns**

- matching file icon or NULL

#### 12.37.3.7 label()

```c
void Fl_File_Icon::label ( Fl_Widget * w )
```
Applies the icon to the widget, registering the Fl_File_Icon label type as needed.

Parameters

|   |   | widget for which this icon will become the label |

### 12.37.3.8 labeltype()

```cpp
def Fl_File_Icon::labeltype (  
    const Fl_Widget * o,  
    int x,  
    int y,  
    int w,  
    int h,  
    Fl_Align a ) [static]
```

Draw the icon label.

Parameters

|   |   | label data |
| in | o | label data |
| in | x,y,w,h | position and size of label |
| in | a | label alignment [not used] |

### 12.37.3.9 load()

```cpp
def Fl_File_Icon::load (  
    const char * f )
```

Loads the specified icon image. The format is deduced from the filename.

Parameters

|   |   | filename |

### 12.37.3.10 load_fti()

```cpp
def Fl_File_Icon::load_fti (  
    const char * fti )
```

Loads an SGI icon file.

Parameters

|   |   | icon filename |

Returns

0 on success, non-zero on error

### 12.37.3.11 load_image()

```cpp
def Fl_File_Icon::load_image (  
    const char * ifile )
```

Load an image icon file from an image filename.
Parameters

| in | ifile | image filename |

Returns

0 on success, non-zero on error

12.37.3.12 load_system_icons()

void Fl_File_Icon::load_system_icons (
    void ) [static]

Loads all system-defined icons.
This call is useful when using the FileChooser widget and should be used when the application starts:
Fl_File_Icon::load_system_icons();

12.37.3.13 next()

Fl_File_Icon * Fl_File_Icon::next ( ) [inline]
Returns next file icon object.
See Fl_File_Icon::first()

12.37.3.14 type()

int Fl_File_Icon::type ( ) [inline]
Returns the filetype associated with the icon, which can be one of the following:
- Fl_File_Icon::ANY, any kind of file.
- Fl_File_Icon::PLAIN, plain files.
- Fl_File_Icon::FIFO, named pipes.
- Fl_File_Icon::DEVICE, character and block devices.
- Fl_File_Icon::LINK, symbolic links.
- Fl_File_Icon::DIRECTORY, directories.

The documentation for this class was generated from the following files:
- Fl_File_Ic on.H
- Fl_File_Icon.cxx
- Fl_File_Icon2.cxx

12.38 Fl_File_Input Class Reference

This widget displays a pathname in a text input field.
#include <Fl_File_Input.H>
Inheritance diagram for Fl_File_Input:
Public Member Functions

- **Fl_Boxtype** `down_box ()` const
  
  Gets the box type used for the navigation bar.

- **void** `down_box (Fl_Boxtype b)`
  
  Sets the box type to use for the navigation bar.

- **Fl_Color** `errorcolor ()` const
  
  Gets the current error color.

- **void** `errorcolor (Fl_Color c)`
  
  Sets the current error color to `c`.

- **Fl_File_Input** (int X, int Y, int W, int H, const char ∗L=0)
  
  Creates a new Fl_File_Input widget using the given position, size, and label string.

- **int** `handle (int event) FL_OVERRIDE`
  
  Handle events in the widget.

- **const char ∗** `value ()`
  
  Returns the current value, which is a pointer to an internal buffer and is valid only until the next event is handled.

- **int** `value (const char ∗str)`
  
  Sets the value of the widget given a new string value.

- **int** `value (const char ∗str, int len)`
  
  Sets the value of the widget given a new string value and its length.

Public Member Functions inherited from **Fl_Input**

- **Fl_Input** (int, int, int, int, const char ∗=0)
  
  Creates a new Fl_Input widget using the given position, size, and label string.

- **int** `handle (int) FL_OVERRIDE`
  
  Handles the specified event.

Public Member Functions inherited from **Fl_Input_**

- **int** `append (const char ∗t, int l=0, char keep_selection=0)`
  
  Append text at the end.

- **bool** `can redo ()` const
  
  Check if there is a redo action available.

- **bool** `can undo ()` const
  
  Check if the last operation can be undone.

- **int** `copy (int clipboard)`
  
  Put the current selection into the clipboard.

- **int** `copy cuts ()`
  
  Copies the yank buffer to the clipboard.

- **Fl_Color** `cursor color ()` const
  
  Gets the color of the cursor.

- **void** `cursor color (Fl_Color n)`
  
  Sets the color of the cursor.

- **int** `cut ()`
  
  Deletes the current selection.

- **int** `cut (int a, int b)`
  
  Deletes all characters between index `a` and `b`.

- **int** `cut (int n)`
  
  Deletes the next `n` bytes rounded to characters before or after the cursor.

- **double** `dvalue ()` const
  
  Returns the widget text interpreted as a floating point number.
• Fl_Input_ (int, int, int, int, const char ∗=0)
  Creates a new Fl_Input_ widget.
• unsigned int index (int i) const
  Returns the character at index \( i \).
• int input_type () const
  Gets the input field type.
• void input_type (int t)
  Sets the input field type.
• int insert (const char ∗t, int l=0)
  Inserts text at the cursor position.
• int insert_position () const
  Gets the position of the text cursor.
• int insert_position (int p)
  Sets the cursor position and mark.
• int insert_position (int p, int m)
  Sets the index for the cursor and mark.
• int ivalue () const
  Returns the widget text interpreted as a signed integer.
• int mark () const
  Gets the current selection mark.
• int mark (int m)
  Sets the current selection mark.
• int maximum_size () const
  Gets the maximum length of the input field in characters.
• void maximum_size (int m)
  Sets the maximum length of the input field in characters.
• int position () const
• int position (int p)
• int position (int p, int m)
• int readonly () const
  Gets the read-only state of the input field.
• void readonly (int b)
  Sets the read-only state of the input field.
• int redo ()
  Redo previous undo operation.
• int replace (int b, int e, const char ∗text, int ilen=0)
  Deletes text from \( b \) to \( e \) and inserts the new string \( \text{text} \).
• void resize (int, int, int, int) FL_OVERRIDE
  Changes the size of the widget.
• int shortcut () const
  Return the shortcut key associated with this widget.
• void shortcut (int s)
  Sets the shortcut key associated with this widget.
• int size () const
  Returns the number of bytes in value().
• void size (int W, int H)
  Sets the width and height of this widget.
• int static_value (const char ∗)
  Changes the widget text.
• int static_value (const char ∗, int)
  Changes the widget text.
- int tab_nav () const  
  Gets whether the Tab key causes focus navigation in multiline input fields or not.
- void tab_nav (int val)  
  Sets whether the Tab key does focus navigation, or inserts tab characters into Fl_Multiline_Input.
- Fl_Color textcolor () const  
  Gets the color of the text in the input field.
- void textcolor (FL_Color n)  
  Sets the color of the text in the input field.
- Fl_Font textfont () const  
  Gets the font of the text in the input field.
- void textfont (FL_Font s)  
  Sets the font of the text in the input field.
- Fl_Fontsize textsize () const  
  Gets the size of the text in the input field.
- void textsize (FL_Fontsize s)  
  Sets the size of the text in the input field.
- int undo ()  
  Undoes previous changes to the text buffer.
- const char * value () const  
  Returns the text displayed in the widget.
- int value (const char *)  
  Changes the widget text.
- int value (const char *, int)  
  Changes the widget text.
- int value (double value)  
  Changes the widget text to a floating point number ("%g").
- int value (int value)  
  Changes the widget text to a signed integer number.
- int wrap () const  
  Gets the word wrapping state of the input field.
- void wrap (int b)  
  Sets the word wrapping state of the input field.
- ~Fl_Input_ ()  
  Destroys the widget.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()  
  Activates the widget.
- unsigned int active () const  
  Returns whether the widget is active.
- int active_r () const  
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const  
  Gets the label alignment.
- void align (FL_Align alignment)  
  Sets the label alignment.
- long argument () const  
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  *Sets the current user data (long) argument that is passed to the callback function.*

• virtual class Fl_Gl_Window ∗ as_gl_window ()
  *Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.*

• virtual class Fl_Gl_Window const ∗ as_gl_window () const

• virtual Fl_Group ∗ as_group ()
  *Returns an Fl_Group pointer if this widget is an Fl_Group.*

• virtual Fl_Group const ∗ as_group () const

• virtual Fl_Window ∗ as_window ()
  *Returns an Fl_Window pointer if this widget is an Fl_Window.*

• virtual Fl_Window const ∗ as_window () const

• void bind_deimage (Fl_Image ∗ img)
  *Sets the image to use as part of the widget label when in the inactive state.*

• void bind_deimage (int f)
  *Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

• void bind_image (Fl_Image ∗ img)
  *Sets the image to use as part of the widget label when in the active state.*

• void bind_image (int f)
  *Bind the image to the widget, so the widget will delete the image when it is no longer needed.*

• Fl_Boxtype box () const
  *Gets the box type of the widget.*

• void box (Fl_Boxtype new_box)
  *Sets the box type for the widget.*

• Fl_Callback_p callback () const
  *Gets the current callback function for the widget.*

• void callback (Fl_Callback ∗ cb)
  *Sets the current callback function for the widget.*

• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  *Sets the current callback function and managed user data for the widget.*

• void callback (Fl_Callback ∗ cb, void ∗ p)
  *Sets the current callback function and data for the widget.*

• void callback (Fl_Callback0 ∗ cb)
  *Sets the current callback function for the widget.*

• void callback (Fl_Callback1 ∗ cb, long p=0)
  *Sets the current callback function for the widget.*

• unsigned int changed () const
  *Checks if the widget value changed since the last callback.*

• void clear_active ()
  *Marks the widget as inactive without sending events or changing focus.*

• void clear_changed ()
  *Marks the value of the widget as unchanged.*

• void clear_damage (uchar c=0)
  *Clears or sets the damage flags.*

• void clear_output ()
  *Sets a widget to accept input.*

• void clear_visible ()
  *Hides the widget.*

• void clear_visible_focus ()
  *Disables keyboard focus navigation with this widget.*

• Fl_Color color () const
  *Gets the background color of the widget.*
• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.

• void copy_label (const char *new_label)
  Sets the current label.

• void copy_tooltip (const char *text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.

• Fl_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  Gets the widget height.

• virtual void hide ()
  Makes a widget invisible.

• Fl_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
Sets the image to use as part of the widget label when in the active state.

- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.

- **int image_bound () const**
  Returns whether the image is managed by the widget.

- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.

- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().

- **const char * label () const**
  Gets the current label text.

- **void label (const char *text)**
  Sets the current label pointer.

- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.

- **Fl_Color labelcolor () const**
  Gets the label color.

- **void labelcolor (Fl_Color c)**
  Sets the label color.

- **Fl_Font labelfont () const**
  Gets the font to use.

- **void labelfont (Fl_Font f)**
  Sets the font to use.

- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  Sets width ww and height hh accordingly with the label size.

- **bool needs_keyboard () const**
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
  • int shortcut_label () const
    Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Changes the size of the widget.
• int take_focus ()
  Gives the widget the keyboard focus.
• unsigned int takesevents () const
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char ∗tooltip () const
  Gets the current tooltip text.
• void tooltip (const char ∗text)
  Sets the current tooltip text.
• Fl_Window ∗top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window ∗top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void ∗user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void ∗v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
Class Documentation

Modifies keyboard focus navigation.

- int visible_r () const
  Returns whether a widget and all its parents are visible.

- int w () const
  Gets the widget width.

- FL_When when () const
  Returns the conditions under which the callback is called.

- void when (uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x () const
  Gets the widget position in its window.

- int y () const
  Gets the widget position in its window.

- virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

- void draw () FL_OVERRIDE
  Draws the file input widget.

Protected Member Functions inherited from Fl_Input

- void draw () FL_OVERRIDE
  Draws the widget.

- int handle_key ()
  Handles a keystroke.

- int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

- int apply_undo ()
  Apply the current undo/redo operation.

- void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.

- void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.

- void handle_mouse (int, int, int, int, int keepmark=0)
  Handles mouse clicks and mouse moves.

- int handletext (int e, int, int, int, int)
  Handles all kinds of text field related events.

- int line_end (int i) const
  Finds the end of a line.

- int line_start (int i) const
  Finds the start of a line.

- int linesPerPage ()

- void maybe_do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

- int up_down_position (int, int keepmark=0)
  Moves the cursor to the column given by up_down_pos.
• int word_end (int i) const  
  Finds the end of a word.
• int word_start (int i) const  
  Finds the start of a word.
• int xscroll () const
• int yscroll () const
• void yscroll (int yOffset)

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)  
  Clears a flag in the flags mask.
• void draw_backdrop () const  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const  
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const  
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const  
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const  
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y , int W, int H) const  
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const  
  Draws a focus box for the widget at the given position and size.
• void draw_label () const  
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const  
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)  
  Creates a widget at the given position and size.
• unsigned int flags () const  
  Gets the widget flags mask.
• void h (int v)  
  Internal use only.
• void set_flag (unsigned int c)  
  Sets a flag in the flags mask.
• void w (int v)  
  Internal use only.
• void x (int v)  
  Internal use only.
• void y (int v)  
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)  
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)  
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)  
  Returns true if the given text t contains the entered 'x' shortcut.
Static Public Attributes inherited from Fl_Input

- static const char ∗ copy_menu_text = "Copy"
  [this text may be customized at run-time]
- static const char ∗ cut_menu_text = "Cut"
  [this text may be customized at run-time]
- static const char ∗ paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,

  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

12.38.1 Detailed Description

This widget displays a pathname in a text input field. A navigation bar located above the input field allows the user to navigate upward in the directory tree. You may want to handle FL_WHEN_CHANGED events for tracking text changes and also FL_WHEN_RELEASE for button release when changing to parent dir. FL_WHEN_RELEASE callback won't be called if the directory clicked is the same as the current one.

![Figure 12.17 Fl_File_Input](image)

Note

As all Fl_Input derived objects, Fl_File_Input may call its callback when losing focus (see FL_UNFOCUS) to update its state like its cursor shape. One resulting side effect is that you should call clear_changed() early in your callback to avoid reentrant calls if you plan to show another window or dialog box in the callback.

12.38.2 Constructor & Destructor Documentation

12.38.2.1 Fl_File_Input()

Fl_File_Input::Fl_File_Input ( int X, int Y, int W, int H, const char ∗ L = 0 )

Creates a new Fl_File_Input widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X, Y, W, H</th>
<th>position and size of the widget</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

### 12.38.3 Member Function Documentation

#### 12.38.3.1 down_box()

```cpp
default void Fl_File_Input::down_box (Fl_Boxtype b) [inline]
```
Sets the box type to use for the navigation bar.

#### 12.38.3.2 draw()

```cpp
default void Fl_File_Input::draw () [protected], [virtual]
```
Draws the file input widget.
Implements Fl_Widget.

#### 12.38.3.3 errorcolor() [1/2]

```cpp
Fl_Color Fl_File_Input::errorcolor () const [inline]
```
Gets the current error color.
Returns FL_RED since FLTK 1.4.0 (default in 1.3.x). Retained for backwards compatibility.

**Deprecated** Will be removed in FLTK 1.5.0 or higher.

**Todo** Remove Fl_File_Input::errorcolor() in FLTK 1.5.0 or higher.

#### 12.38.3.4 errorcolor() [2/2]

```cpp
void Fl_File_Input::errorcolor (Fl_Color c) [inline]
```
Sets the current error color to c.
Does nothing since FLTK 1.4.0. Retained for backwards compatibility.

**Deprecated** Will be removed in FLTK 1.5.0 or higher.

**Todo** Remove Fl_File_Input::errorcolor(Fl_Color) in FLTK 1.5.0 or higher.

#### 12.38.3.5 handle()

```cpp
int Fl_File_Input::handle (int event) [virtual]
```
Handle events in the widget.
Return non zero if event is handled.

**Parameters**

| in  | event |

Reimplemented from Fl_Widget.
12.38.3.6 value() [1/2]

int Fl_File_Input::value (const char * str)

Sets the value of the widget given a new string value.
Returns non 0 on success.

Parameters

| in  | str  | new string value |

12.38.3.7 value() [2/2]

int Fl_File_Input::value (const char * str, int len)

Sets the value of the widget given a new string value and its length.
Returns non 0 on success.

Parameters

| in  | str  | new string value |
| in  | len  | length of value |

The documentation for this class was generated from the following files:

- Fl_File_Input.H
- Fl_File_Input.cxx

12.39 Fl_Fill_Dial Class Reference

Draws a dial with a filled arc.

#include <Fl_Fill_Dial.H>

Inheritance diagram for Fl_Fill_Dial:

```
    Fl_Widget
     ↓
    Fl_Valuator
     ↓
    Fl_Dial
     ↓
Fl_Fill_Dial
```

Public Member Functions

- **Fl_Fill_Dial** (int X, int Y, int W, int H, const char *L)
  
  Creates a filled dial, also setting its type to FL_FILL_DIAL.

Public Member Functions inherited from Fl_Dial

- short **angle1** () const
  
  Sets Or gets the angles used for the minimum and maximum values.

- void **angle1** (short a)
See short `angle1() const`.

- **short angle2() const**
  
  See short `angle1() const`.

- **void angle2(short a)**
  
  See short `angle1() const`.

- **void angles(short a, short b)**
  
  See short `angle1() const`.

- **Fl_Dial(int x, int y, int w, int h, const char ∗l=0)**
  
  Creates a new `Fl_Dial` widget using the given position, size, and label string.

- **int handle(int) FL_OVERRIDE**
  
  Allow subclasses to handle event based on current position and size.

### Public Member Functions inherited from `Fl_Valuator`

- **void bounds(double a, double b)**
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **double clamp(double)**
  
  Clamps the passed value to the valuator range.

- **virtual int format(char ∗)**
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- **double increment(double, int)**
  
  Adds n times the step value to the passed value.

- **double maximum() const**
  
  Gets the maximum value for the valuator.

- **void maximum(double a)**
  
  Sets the maximum value for the valuator.

- **double minimum() const**
  
  Gets the minimum value for the valuator.

- **void minimum(double a)**
  
  Sets the minimum value for the valuator.

- **void precision(int digits)**
  
  Sets the step value to \(1.0 / 10^{\text{digits}}\).

- **void range(double a, double b)**
  
  Sets the minimum and maximum values for the valuator.

- **double round(double)**
  
  Round the passed value to the nearest step increment.

- **double step() const**
  
  Gets or sets the step value.

- **void step(double a, int b)**
  
  See double `Fl_Valuator::step() const`

- **void step(double s)**
  
  See double `Fl_Valuator::step() const`.

- **void step(int a)**
  
  See double `Fl_Valuator::step() const`.

- **double value() const**
  
  Gets the floating point(double) value.

- **int value(double)**
  
  Sets the current value.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Group * as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group () const
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 * cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

• void copy_label (const char ∗new_label)
  Sets the current label.

• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.

• Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image ∗&img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void **do_callback** (**Fl_Widget** ∗**widget**, long **arg**, **Fl_Callback_Reason** **reason**=**FL_REASON_UNKNOWN**)  
  *Calls the widget callback function with arbitrary arguments.*

• void **do_callback** (**Fl_Widget** ∗**widget**, void ∗**arg**=0, **Fl_Callback_Reason** **reason**=**FL_REASON_UNKNOWN**)  
  *Calls the widget callback function with arbitrary arguments.*

• void **draw_label** (int, int, int, int, **Fl_Align**) const  
  *Draws the label in an arbitrary bounding box with an arbitrary alignment.*

• int **h** () const  
  *Gets the widget height.*

• virtual void **hide** ()  
  *Makes a widget invisible.*

• **Fl_Image** ∗**image** ()  
  *Gets the image that is used as part of the widget label when in the active state.*

• const **Fl_Image** ∗**image** () const  
  *Gets the image that is used as part of the widget label when in the active state.*

• void **image** (**Fl_Image** &**img**)  
  *Sets the image to use as part of the widget label when in the active state.*

• void **image** (**Fl_Image** ∗**img**)  
  *Sets the image to use as part of the widget label when in the active state.*

• int **image_bound** () const  
  *Returns whether the image is managed by the widget.*

• int **inside** (**const Fl_Widget** ∗**wgt**) const  
  *Checks if this widget is a child of wgt.*

• int **is_label_copied** () const  
  *Returns whether the current label was assigned with copy_label().*

• const char ∗**label** () const  
  *Gets the current label text.*

• void **label** (const char ∗**text**)  
  *Sets the current label pointer.*

• void **label** (**Fl_Labeltype** **a**, const char ∗**b**)  
  *Shortcut to set the label text and type in one call.*

• **Fl_Color** **labelcolor** () const  
  *Gets the label color.*

• void **labelcolor** (**Fl_Color** **c**)  
  *Sets the label color.*

• **Fl_Font** **labelfont** () const  
  *Gets the font to use.*

• void **labelfont** (**Fl_Font** **f**)  
  *Sets the font to use.*

• **Fl_Fontsize** **labelsize** () const  
  *Gets the font size in pixels.*

• void **labelsize** (**Fl_Fontsize** **pix**)  
  *Sets the font size in pixels.*

• **Fl_Labeltype** **labeltype** () const  
  *Gets the label type.*

• void **labeltype** (**Fl_Labeltype** **a**)  
  *Sets the label type.*

• void **measure_label** (int &**ww**, int &**hh**) const  
  *Sets width ww and height hh accordingly with the label size.*

• bool **needs_keyboard** () const  
  *Returns whether this widget needs a keyboard.*

• void **needs_keyboard** (bool **needs**)
Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.

• Fl_Group ∗ parent () const
  Returns a pointer to the parent widget.

• void parent (Fl_Group ∗p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  Gets the selection color.

• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.

• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int testShortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

• const char ∗ tooltip () const
  Gets the current tooltip text.

• void tooltip (const char ∗text)
  Sets the current tooltip text.

• Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• **uchar type () const**
  
  Gets the widget type.

• **void type (uchar t)**
  
  Sets the widget type.

• **int use_accents_menu ()**
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• **void * user_data () const**
  
  Gets the user data for this widget.

• **void user_data (Fl_Callback_User_Data *v, bool auto_free)**
  
  Sets the user data for this widget.

• **void user_data (void *v)**
  
  Sets the user data for this widget.

• **unsigned int visible () const**
  
  Returns whether a widget is visible.

• **unsigned int visible_focus () const**
  
  Checks whether this widget has a visible focus.

• **void visible_focus (int v)**
  
  Modifies keyboard focus navigation.

• **int visible_r () const**
  
  Returns whether a widget and all its parents are visible.

• **int w () const**
  
  Gets the widget width.

• **FL_When when () const**
  
  Returns the conditions under which the callback is called.

• **void when (uchar i)**
  
  Sets the flags used to decide when a callback is called.

• **FL_Window * window () const**
  
  Returns a pointer to the nearest parent window up the widget hierarchy.

• **int x () const**
  
  Gets the widget position in its window.

• **int y () const**
  
  Gets the widget position in its window.

• **virtual ~Fl_Widget ()**
  
  Destroys the widget.

### Additional Inherited Members

**Static Public Member Functions inherited from Fl_Widget**

• **static void default_callback (Fl_Widget *widget, void *data)**
  
  The default callback for all widgets that don't set a callback.

• **static unsigned int label_shortcut (const char *t)**
  
  Returns the Unicode value of the '&x' shortcut in a given text.

• **static int test_shortcut (const char *, const bool require_alt=false)**
  
  Returns true if the given text t contains the entered '&x' shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6,
  CHANGED = 1<<7, OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9,
  COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTip_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTip = 1<<17, FULLSCREEN = 1<<18,
  MAC_USE_ACCENTS_MENU = 1<<19, NEEDS_KEYBOARD = 1<<20,
  IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22, AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<25, USERFLAG2 = 1<<26, USERFLAG1 = 1<<27
}

flags possible values enumeration.

Protected Member Functions inherited from Fl_Dial

- void draw () FL_OVERRIDE
  Draws dial at current position and size.
- void draw (int X, int Y, int W, int H)
  Draws dial at given position and size.
- void handle (int event, int X, int Y, int W, int H)
  Allows subclasses to handle event based on given position and size.

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y, int W, int H, const char ∗L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void handle_push ()
  Stores the current value in the previous value.
- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
- double previous_value () const
  Gets the previous floating point value before an event changed it.
- void set_value (double v)
  Sets the current floating point value.
- double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void value_damage ()
  Asks for partial redraw.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
Draws the widget box according its box style.

- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
  Draws a box of type t, of color c at the widget's position and size.

- `void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const`
  Draws a box of type t, of color c at the position X,Y and size W,H.

- `void draw_focus () const`
  Draws a focus rectangle around the widget.

- `void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const`
  Draws a focus rectangle around the widget.

- `void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const`
  Draws a focus box for the widget at the given position and size.

- `void draw_label () const`
  Draws the widget's label at the defined label position.

- `void draw_label (int, int, int, int) const`
  Draws the label in an arbitrary bounding box.

- `Fl_Widget (int x, int y, int w, int h, const char *label=0L)`
  Creates a widget at the given position and size.

- `unsigned int flags () const`
  Gets the widget flags mask.

- `void h (int v)`
  Internal use only.

- `void set_flag (unsigned int c)`
  Sets a flag in the flags mask.

- `void w (int v)`
  Internal use only.

- `void x (int v)`
  Internal use only.

- `void y (int v)`
  Internal use only.

### 12.39.1 Detailed Description

Draws a dial with a filled arc.

The documentation for this class was generated from the following files:

- `Fl_Fill_Dial.H`
- `Fl_Fill_Dial.cxx`

### 12.40 Fl_Fill_Slider Class Reference

Widget that draws a filled horizontal slider, useful as a progress or value meter.

```c
#include <Fl_Fill_Slider.H>
```

Inheritance diagram for Fl_Fill_Slider:

```
Fl_Widget
    ↓
Fl_Valuator
    ↓
Fl_Slider
    ↓
Fl_Fill_Slider
```
Public Member Functions

- **Fl_Fill_Slider** (int X, int Y, int W, int H, const char *L=0)
  
  Creates the slider from its position, size and optional title.

Public Member Functions inherited from **Fl_Slider**

- void **bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- **Fl_Slider** (int X, int Y, int W, int H, const char *L=0)
  
  Creates a new **Fl_Slider** widget using the given position, size, and label string.

- **Fl_Slider** (uchar t, int X, int Y, int W, int H, const char *L)
  
  Creates a new **Fl_Slider** widget using the given type, position, size, and label string.

- int **handle** (int) FL_OVERRIDE
  
  Handles the specified event.

- int **scrollvalue** (int pos, int size, int first, int total)
  
  Sets the size and position of the sliding knob in the box.

- **Fl_Boxtype** **slider** () const
  
  Gets the slider box type.

- void **slider** (Fl_Boxtype c)
  
  Sets the slider box type.

- float **slider_size** () const
  
  Get the dimensions of the moving piece of slider.

- void **slider_size** (double v)
  
  Set the dimensions of the moving piece of slider.

Public Member Functions inherited from **Fl_Valuator**

- void **bounds** (double a, double b)
  
  Sets the minimum (a) and maximum (b) values for the valuator widget.

- double **clamp** (double)
  
  Clamps the passed value to the valuator range.

- virtual int **format** (char *p)
  
  Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.

- double **increment** (double, int)
  
  Adds n times the step value to the passed value.

- double **maximum** () const
  
  Gets the maximum value for the valuator.

- void **maximum** (double a)
  
  Sets the maximum value for the valuator.

- double **minimum** () const
  
  Gets the minimum value for the valuator.

- void **minimum** (double a)
  
  Sets the minimum value for the valuator.

- void **precision** (int digits)
  
  Sets the step value to \(1.0 / 10^{{\text{digits}}}\).

- void **range** (double a, double b)
  
  Sets the minimum and maximum values for the valuator.

- double **round** (double)
  
  Round the passed value to the nearest step increment.

- double **step** () const
  
  Gets or sets the step value.
• void **step** (double a, int b)
  
    See double Fl_Valuator::step() const

• void **step** (double s)
  
    See double Fl_Valuator::step() const.

• void **step** (int a)
  
    See double Fl_Valuator::step() const

• double **value** () const
  
    Gets the floating point(double) value.

• int **value** (double)
  
    Sets the current value.

**Public Member Functions inherited from Fl_Widget**

• void **_clear_fullscreen** ()

• void **_set_fullscreen** ()

• void **activate** ()
  
    Activates the widget.

• unsigned int **active** () const
  
    Returns whether the widget is active.

• int **active_r** () const
  
    Returns whether the widget and all of its parents are active.

• Fl_Align **align** () const
  
    Gets the label alignment.

• void **align** (Fl_Align alignment)
  
    Sets the label alignment.

• long **argument** () const
  
    Gets the current user data (long) argument that is passed to the callback function.

• void **argument** (long v)
  
    Sets the current user data (long) argument that is passed to the callback function.

• virtual class Fl_Gl_Window * **as_gl_window** ()
  
    Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

• virtual class Fl_Gl_Window const * **as_gl_window** () const

• virtual Fl_Group * **as_group** ()
  
    Returns an Fl_Group pointer if this widget is an Fl_Group.

• virtual Fl_Group const * **as_group** () const

• virtual Fl_Window * **as_window** ()
  
    Returns an Fl_Window pointer if this widget is an Fl_Window.

• virtual Fl_Window const * **as_window** () const

• void **bind_deimage** (Fl_Image * img)
  
    Sets the image to use as part of the widget label when in the inactive state.

• void **bind_deimage** (int f)
  
    Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

• void **bind_image** (Fl_Image * img)
  
    Sets the image to use as part of the widget label when in the active state.

• void **bind_image** (int f)
  
    Bind the image to the widget, so the widget will delete the image when it is no longer needed.

• Fl_Boxtype **box** () const
  
    Gets the box type of the widget.

• void **box** (Fl_Boxtype new_box)
  
    Sets the box type for the widget.
• **Fl_Callback_p callback () const**
  
  Gets the current callback function for the widget.

• **void callback (Fl_Callback *cb)**
  
  Sets the current callback function for the widget.

• **void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)**
  
  Sets the current callback function and managed user data for the widget.

• **void callback (Fl_Callback *cb, void *p)**
  
  Sets the current callback function and data for the widget.

• **void callback (Fl_Callback0 *cb)**
  
  Sets the current callback function for the widget.

• **void callback (Fl_Callback1 *cb, long p=0)**
  
  Sets the current callback function for the widget.

• **unsigned int changed () const**
  
  Checks if the widget value changed since the last callback.

• **void clear_active ()**
  
  Marks the widget as inactive without sending events or changing focus.

• **void clear_changed ()**
  
  Marks the value of the widget as unchanged.

• **void clear_damage (uchar c=0)**
  
  Clears or sets the damage flags.

• **void clear_output ()**
  
  Sets a widget to accept input.

• **void clear_visible ()**
  
  Hides the widget.

• **void clear_visible_focus ()**
  
  Disables keyboard focus navigation with this widget.

• **Fl_Color color () const**
  
  Gets the background color of the widget.

• **void color (Fl_Color bg)**
  
  Sets the background color of the widget.

• **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

• **Fl_Color color2 () const**
  
  For back compatibility only.

• **void color2 (unsigned a)**
  
  For back compatibility only.

• **int contains (const Fl_Widget *w) const**
  
  Checks if w is a child of this widget.

• **void copy_label (const char *new_label)**
  
  Sets the current label.

• **void copy_tooltip (const char *text)**
  
  Sets the current tooltip text.

• **uchar damage () const**
  
  Returns non-zero if draw() needs to be called.

• **void damage (uchar c)**
  
  Sets the damage bits for the widget.

• **void damage (uchar c, int x, int y, int w, int h)**
  
  Sets the damage bits for an area inside the widget.

• **int damage_resize (int, int, int)**
  
  Internal use only.

• **void deactivate ()**

Generated by Doxygen
Deactivates the widget.

- FL_Image * deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

- const FL_Image * deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (FL_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (FL_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

- void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

- void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

- void draw_label (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int h () const
  Gets the widget height.

- virtual void hide ()
  Makes a widget invisible.

- FL_Image * image ()
  Gets the image that is used as part of the widget label when in the active state.

- const FL_Image * image () const
  Gets the image that is used as part of the widget label when in the active state.

- void image (FL_Image &img)
  Sets the image to use as part of the widget label when in the active state.

- void image (FL_Image *img)
  Sets the image to use as part of the widget label when in the active state.

- int image_bound () const
  Returns whether the image is managed by the widget.

- int inside (const FL_Widget *wgt) const
  Checks if this widget is a child of wgt.

- int is_labelCopied () const
  Returns whether the current label was assigned with copy_label().

- const char * label () const
  Gets the current label text.

- void label (const char *text)
  Sets the current label pointer.

- void label (FL_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

- FL_Color labelcolor () const
  Gets the label color.

- void labelcolor (FL_Color c)
  Sets the label color.

- FL_Font labelfont () const
  Gets the font to use.

- void labelfont (FL_Font f)
  Sets the font to use.
- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.

- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.

- **Fl_Labeltype labeltype () const**
  Gets the label type.

- **void labeltype (Fl_Labeltype a)**
  Sets the label type.

- **void measure_label (int &ww, int &hh) const**
  Sets width ww and height hh accordingly with the label size.

- **bool needs_keyboard () const**
  Returns whether this widget needs a keyboard.

- **void needs_keyboard (bool needs)**
  Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**
  Changes the size or position of the widget.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses ' & ' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses ' & ' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
Gives the widget the keyboard focus.

• unsigned int takesevents() const
  Returns if the widget is able to take events.

• int test_shortcut()
  Returns true if the widget's label contains the entered 'x' shortcut.

• const char * tooltip() const
  Gets the current tooltip text.

• void tooltip(const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window() const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset(int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type() const
  Gets the widget type.

• void type(uchar t)
  Sets the widget type.

• int use_accents_menu()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data() const
  Gets the user data for this widget.

• void user_data(Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data(void *v)
  Sets the user data for this widget.

• unsigned int visible() const
  Returns whether a widget is visible.

• unsigned int visible_focus() const
  Checks whether this widget has a visible focus.

• void visible_focus(int v)
  Modifies keyboard focus navigation.

• int visible_r() const
  Returns whether a widget and all its parents are visible.

• int w() const
  Gets the widget width.

• Fl_When when() const
  Returns the conditions under which the callback is called.

• void when(uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window() const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x() const
  Gets the widget position in its window.

• int y() const
  Gets the widget position in its window.

• virtual ~Fl_Widget()
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
- static int test_shortcut (const char *t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

Protected Member Functions inherited from Fl_Slider

- void draw () FL_OVERRIDE
  Draws the widget.
- void draw (int, int, int, int)
- int handle (int, int, int, int)

Protected Member Functions inherited from Fl_Valuator

- Fl_Valuator (int X, int Y , int W, int H, const char *L)
  Creates a new Fl_Valuator widget using the given position, size, and label string.
- void handle_drag (double newvalue)
  Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void handle_push ()
  Stores the current value in the previous value.
- void handle_release ()
  Called after an FL_WHEN_RELEASE event is received and before the callback.
- int horizontal () const
  Tells if the valuator is an FL_HORIZONTAL one.
- double previous_value () const
  Gets the previous floating point value before an event changed it.
- void set_value (double v)
  Sets the current floating point value.
- double softclamp (double)
  Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void value_damage ()
  Asks for partial redraw.

Generated by Doxygen
Protected Member Functions inherited from Fl_Widget

- void clear_flag(unsigned int c)
  Clears a flag in the flags mask.
- void draw_backdrop() const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box() const
  Draws the widget box according its box style.
- void draw_box(Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus() const
  Draws a focus rectangle around the widget.
- void draw_focus(Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label() const
  Draws the widget's label at the defined label position.
- void draw_label(int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget(int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
- unsigned int flags() const
  Gets the widget flags mask.
- void h(int v)
  Internal use only.
- void set_flag(unsigned int c)
  Sets a flag in the flags mask.
- void w(int v)
  Internal use only.
- void x(int v)
  Internal use only.
- void y(int v)
  Internal use only.

12.40.1 Detailed Description

Widget that draws a filled horizontal slider, useful as a progress or value meter.
The documentation for this class was generated from the following files:

- Fl_Fill_Slider.H
- Fl_Slider.cxx

12.41 Fl_Flex Class Reference

Fl_Flex is a container (layout) widget for one row or one column of widgets.
#include <Fl_Flex.H>
Inheritance diagram for Fl_Flex:
Public Types

- `enum { VERTICAL = 0 , HORIZONTAL = 1 , COLUMN = 0 , ROW = 1 }`

Public Member Functions

- `virtual void end ()`
  
  Ends automatic child addition and resizes all children.

- `void fixed (Fl_Widget &w, int size)`
  
  Set the horizontal or vertical size of a child widget.

- `int fixed (Fl_Widget *w) const`
  
  Return whether the given widget has a fixed size or resizes dynamically.

- `void fixed (Fl_Widget *w, int size)`
  
  Set the horizontal or vertical size of a child widget.

- `Fl_Flex (int direction)`
  
  Construct a new Fl_Flex widget specifying its layout.

- `Fl_Flex (int w, int h, int direction)`
  
  Construct a new Fl_Flex widget specifying its layout and size.

- `Fl_Flex (int X, int Y, int W, int H, const char *L=0)`
  
  Construct a new Fl_Flex widget with the given position, size, and label.

- `Fl_Flex (int x, int y, int w, int h, int direction)`
  
  Construct a new Fl_Flex widget specifying its layout, position, and size.

- `int gap () const`
  
  Return the gap size of the widget.

- `void gap (int g)`
  
  Set the gap size of the widget.

- `int horizontal () const`
  
  Returns non-zero (true) if Fl_Flex alignment is horizontal (row mode).

- `void layout ()`
  
  Calculates the layout of the widget and redraws it.

- `int margin () const`
  
  Returns the left margin size of the widget.

- `int margin (int left, int top, int right, int bottom) const`
  
  Returns all (four) margin sizes of the widget.

- `void margin (int left, int top, int right, int bottom)`
  
  Set the margin sizes at all four edges of the Fl_Flex widget.

- `void margin (int m, int g=-1)`
  
  Set the margin and optionally the gap size of the widget.

- `bool need_layout () const`
  
  Returns whether layout calculation is required.

- `void need_layout (int set)`
  
  Set or reset the request to calculate the layout of children.

- `void resize (int x, int y, int w, int h) FL_OVERRIDE`
  
  Resize the container and calculate all child positions and sizes.
• int spacing () const
  Gets the number of extra pixels of blank space that are added between the children.
• void spacing (int i)
  Sets the number of extra pixels of blank space that are added between the children.

Public Member Functions inherited from Fl_Group

• FL_Widget *&_ddfdesign_kludge ()
  This is for forms compatibility only.
• void add (FL_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.
• void add (FL_Widget *)
  See void Fl_Group::add(FL_Widget &w)
• void add_resizable (FL_Widget &o)
  Adds a widget to the group and makes it the resizable widget.
• FL_Widget *const * array () const
  Returns a pointer to the array of children.
• FL_Group const * as_group () const FL_OVERRIDE
• FL_Group * as_group () FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.
• FL_Widget * child (int n) const
  Returns array()[n].
• int children () const
  Returns how many child widgets the group has.
• void clear ()
  Deletes all child widgets from memory recursively.
• unsigned int clip_children ()
  Returns the current clipping mode.
• void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
• virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
• void end ()
  Exactly the same as current(this->parent()).
• int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
• int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
• FL_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.
• void focus (FL_Widget *)
• void forms_end ()
  This is for forms compatibility only.
• int handle (int) FL_OVERRIDE
  Handles the specified event.
• void init_sizes ()
  Resets the internal array of widget sizes and positions.
• void insert (FL_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
- void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).
- void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
- void remove (Fl_Widget *o)
  Removes the widget o from the group.
- void remove (int index)
  Removes the widget at index from the group but does not delete it.
- Fl_Widget * resizable () const
  Returns the group's resizable widget.
- void resizable (Fl_Widget &o)
  Sets the group's resizable widget.
- void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void resize (int, int, int, int) FL_OVERRIDE
  Resizes the Fl_Group widget and all of its children.
- virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Window * as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• **Fl_Boxtype box () const**
  Gets the box type of the widget.

• **void box (Fl_Boxtype new_box)**
  Sets the box type for the widget.

• **Fl_Callback_p callback () const**
  Gets the current callback function for the widget.

• **void callback (Fl_Callback ∗cb)**
  Sets the current callback function for the widget.

• **void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)**
  Sets the current callback function and managed user data for the widget.

• **void callback (Fl_Callback ∗cb, void ∗p)**
  Sets the current callback function and data for the widget.

• **void callback (Fl_Callback0 ∗cb)**
  Sets the current callback function for the widget.

• **void callback (Fl_Callback1 ∗cb, long p=0)**
  Sets the current callback function for the widget.

• **unsigned int changed () const**
  Checks if the widget value changed since the last callback.

• **void clear_active ()**
  Marks the widget as inactive without sending events or changing focus.

• **void clear_changed ()**
  Marks the value of the widget as unchanged.

• **void clear_damage (uchar c=0)**
  Clears or sets the damage flags.

• **void clear_output ()**
  Sets a widget to accept input.

• **void clear_visible ()**
  Hides the widget.

• **void clear_visible_focus ()**
  Disables keyboard focus navigation with this widget.

• **Fl_Color color () const**
  Gets the background color of the widget.

• **void color (Fl_Color bg)**
  Sets the background color of the widget.

• **void color (Fl_Color bg, Fl_Color sel)**
  Sets the background and selection color of the widget.

• **Fl_Color color2 () const**
  For back compatibility only.

• **void color2 (unsigned a)**
  For back compatibility only.

• **int contains (const Fl_Widget ∗w) const**
  Checks if w is a child of this widget.

• **void copy_label (const char ∗new_label)**
  Sets the current label.

• **void copy_tooltip (const char ∗text)**
  Sets the current tooltip text.

• **uchar damage () const**
  Returns non-zero if draw() needs to be called.

• **void damage (uchar c)**
  Sets the damage bits for the widget.

• **void damage (uchar c, int x, int y, int w, int h)**
  For back compatibility only.
Setting the damage bits for an area inside the widget.

- `int damage_resize(int, int, int, int)`
  
  Internal use only.

- `void deactivate()`
  
  Deactivates the widget.

- `void *deimage()`
  
  Gets the image that is used as part of the widget label when in the inactive state.

  ```
  const Fl_Image *deimage() const
  
  Gets the image that is used as part of the widget label when in the inactive state.
  ```

  ```
  void deimage(Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.
  ```

  ```
  void deimage(Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.
  ```

  ```
  int deimage_bound() const
  
  Returns whether the inactive image is managed by the widget.
  ```

- `void do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`

  Calls the widget callback function with default arguments.

- `void do_callback(Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`

  Calls the widget callback function with arbitrary arguments.

- `void do_callback(Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`

  Calls the widget callback function with arbitrary arguments.

- `void draw_label(int, int, int, int, Fl_Align) const`

  Draws the label in an arbitrary bounding box with an arbitrary alignment.

  ```
  int h() const
  
  Gets the widget height.
  ```

  ```
  virtual void hide() const
  
  Makes a widget invisible.
  ```

- `Fl_Image *image()`

  Gets the image that is used as part of the widget label when in the active state.

  ```
  const Fl_Image *image() const
  
  Gets the image that is used as part of the widget label when in the active state.
  ```

  ```
  void image(Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.
  ```

  ```
  void image(Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.
  ```

  ```
  int image_bound() const
  
  Returns whether the image is managed by the widget.
  ```

- `int inside(const Fl_Widget *wgt) const`

  Checks if this widget is a child of `wgt`.

- `int is_label_copied() const`

  Returns whether the current label was assigned with `copy_label()`.

- `const char *label()` const

  Gets the current label text.

  ```
  void label(const char *text)
  
  Sets the current label pointer.
  ```

  ```
  void label(Fl_Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.
  ```

- `Fl_Color labelcolor()` const

  Gets the label color.

- `void labelcolor(Fl_Color c)`

  Sets the label color.
• Fl_Font labelfont () const
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group * parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char ∗ tooltip () const
  Gets the current tooltip text.

- void tooltip (const char ∗text)
  Sets the current tooltip text.

- Fl_Window ∗ top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window ∗ top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.

- void type (uchar t)
  Sets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void ∗ user_data () const
  Gets the user data for this widget.

- void user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

- void user_data (void ∗v)
  Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

- void visible_focus (int v)
  Modifies keyboard focus navigation.

- int visible_r () const
  Returns whether a widget and all its parents are visible.

- int w () const
  Gets the widget width.

- Fl_When when () const
  Returns the conditions under which the callback is called.

- void when (uchar i)
  Sets the flags used to decide when a callback is called.

- Fl_Window ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- int x () const
  Gets the widget position in its window.

- int y () const
  Gets the widget position in its window.

- virtual ~Fl_Widget ()
  Destroys the widget.
Protected Member Functions

- virtual int alloc_size (int size) const
  Return new size to be allocated for array of fixed size widgets.

- void draw () FL_OVERRIDE
  Draw the widget.

- void init (int t=VERTICAL)

- void on_remove (int) FL_OVERRIDE
  Allow derived groups to act when a child widget is removed from the group.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.

- void draw () FL_OVERRIDE
  Draws the widget.

- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.

- void draw_children ()
  Draws all children of the group.

- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.

- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.

- virtual int on_move (int, int)
  Allow derived groups to act when a widget is moved within the group.

- int * sizes ()
  Returns the internal array of widget sizes and positions.

- void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

- void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- void draw_box () const
  Draws the widget box according its box style.

- void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
Draws the label in an arbitrary bounding box.

- **Fl_Widget** (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from **Fl_Group**

- static Fl_Group ∗ current ()
  Returns the currently active group.

- static void current (Fl_Group ∗g)
  Sets the current group.

Static Public Member Functions inherited from **Fl_Widget**

- static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.

- static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int test_shortcut (const char ∗, const bool require_alt=false)
  Returns true if the given text ∗ contains the entered ‘&x’ shortcut.

Protected Types inherited from **Fl_Widget**

- enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,

  flags possible values enumeration.
12.41.1 Detailed Description

`Fl_Flex` is a container (layout) widget for one row or one column of widgets. It provides flexible positioning of its children either in one row or in one column. `Fl_Flex` is designed to be as simple as possible. You can set individual widget sizes or let `Fl_Flex` position and size the widgets to fit in the container. All "flexible" (i.e. non-fixed size) widgets are assigned the same width or height, respectively. For details see below.

You can set the margins around all children at the inner side of the box frame (if any). `Fl_Flex` supports setting different margin sizes on top, bottom, left, and right sides. The default margin size is 0 on all edges of the container. You can set the gap size between all children. The gap size is always the same between all of its children. This is similar to the 'spacing' of `Fl_Pack`. The default gap size is 0.

`Fl_Flex` can either consist of a single row, i.e. `type(Fl_Flex::HORIZONTAL)` or a single column, i.e. `type(Fl_Flex::VERTICAL)`. The default value is `Fl_Flex::VERTICAL` for consistency with `Fl_Pack` but you can use `type()` to assign a row (`Fl_Flex::HORIZONTAL`) layout. If `type() == Fl_Flex::HORIZONTAL` widgets are resized horizontally to fit in the container and their height is the full `Fl_Flex` height minus border size and margins. You can set a fixed widget width by using `fixed()`.

If `type() == Fl_Flex::VERTICAL` widgets are resized vertically to fit in the container and their width is the full `Fl_Flex` width minus border size and margins. You can set a fixed widget height by using `fixed()`.

To create arbitrary spacing you can use invisible boxes of flexible or fixed sizes (see example below). Alternate constructors let you specify the layout as `Fl_Flex::HORIZONTAL` or `Fl_Flex::VERTICAL` directly. `Fl_Flex::ROW` is an alias of `Fl_Flex::HORIZONTAL` and `Fl_Flex::COLUMN` is an alias of `Fl_Flex::VERTICAL`. The default box type is `FL_NO_BOX` as inherited from `Fl_Group`. You may need to set a box type with a solid background depending on your layout.

**Important:** You should always make sure that the `Fl_Flex` container cannot be resized smaller than its designed minimal size. This can usually be done by setting a `size_range()` on the window as shown in the example below. `Fl_Flex` does not take care of sensible sizes. If it is resized too small the behavior is undefined, i.e. widgets may overlap and/or shrink to zero size.

**Hint:** In many cases `Fl_Flex` can be used as a drop-in replacement for `Fl_Pack`. This is the recommended single row/column container since FLTK 1.4.0. Its resizing behavior is much more predictable (as expected) than that of `Fl_Pack` which "resizes itself to shrink-wrap itself around all of the children". `Fl_Flex` containers can be nested so you can create flexible layouts with multiple columns and rows. However, if your UI design is more complex you may want to use `Fl_Grid` instead.

Example:

```
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Flex.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_Button.H>

int main(int argc, char **argv) {
    Fl_Double_Window window(410, 40, "Simple Fl_Flex Demo");
    Fl_Flex flex(5, 5, 400, 30, Fl_Flex::HORIZONTAL);
    Fl_Button b1(0, 0, 0, 0, "File");
    Fl_Button b2(0, 0, 0, 0, "Save");
    Fl_Box bx(0, 0, 0, 0);
    Fl_Button b3(0, 0, 0, 0, "Exit");
    flex.fixed(bx, 60); // set fix width of invisible box
    flex.gap(10);
    flex.end();
    window.resizable(flex);
    window.end();
    window.size_range(300, 30);
    window.show(argc, argv);
    return Fl::run();
}
```

12.41.3 Constructor & Destructor Documentation

12.41.3.1 Fl_Flex() [1/4]

Fl_Flex::Fl_Flex (  
  int X,  
  int Y,  
  int W,  
  int H,  
  const char ∗ L = 0 )

Construct a new Fl_Flex widget with the given position, size, and label. You can set type(Fl_Flex::HORIZONTAL) or type(Fl_Flex::VERTICAL). The default is type(Fl_Flex::VERTICAL).

Alternate constructors let you specify the layout as Fl_Flex::HORIZONTAL or Fl_Flex::VERTICAL directly. Fl_Flex::ROW is an alias of Fl_Flex::HORIZONTAL and Fl_Flex::COLUMN is an alias of Fl_Flex::VERTICAL.

Parameters

| in  X, Y  | position |
| in  W, H  | size (width and height) |
| in  L     | label (optional) |

See also

    Fl_Flex::Fl_Flex(int direction)
    Fl_Flex::Fl_Flex(int w, int h, int direction)
    Fl_Flex::Fl_Flex(int x, int y, int w, int h, int direction)
    Fl_Flex::Fl_Flex(int x, int y, int w, int h, const char ∗ L)

12.41.3.2 Fl_Flex() [2/4]

Fl_Flex::Fl_Flex (  
  int direction )

Construct a new Fl_Flex widget specifying its layout. Use Fl_Flex::HORIZONTAL (aka Fl_Flex::ROW) or Fl_Flex::VERTICAL (aka Fl_Flex::COLUMN) as the direction argument.

This constructor sets the position and size to (0, 0, 0, 0) which is suitable for nested Fl_Flex widgets. Use one of the other constructors to set the desired position and size as well.
Parameters

\[
\begin{array}{|c|c|}
\hline
\text{in} & \text{direction} \\
\hline
\text{horizontal (row) or vertical (column) layout} \\
\hline
\end{array}
\]

See also

- `Fl_Flex::Fl_Flex(int w, int h, int direction)`
- `Fl_Flex::Fl_Flex(int x, int y, int w, int h, int direction)`
- `Fl_Flex::Fl_Flex(int x, int y, int w, int h, const char *L)`

12.41.3.3 Fl_Flex() [3/4]

\[
\begin{array}{c}
\text{Fl_Flex::Fl_Flex (}
\end{array}
\]

Construct a new Fl_Flex widget specifying its layout and size.

Use Fl_Flex::HORIZONTAL (aka Fl_Flex::ROW) or Fl_Flex::VERTICAL (aka Fl_Flex::COLUMN) as the direction argument.

This constructor sets the position to \((x = 0, y = 0)\) which is suitable for nested Fl_Flex widgets. Use one of the other constructors to set the desired position as well.

Parameters

\[
\begin{array}{|c|c|}
\hline
\text{in} & \text{w,h} \\
\hline
\text{widget size} \\
\hline
\text{in} & \text{direction} \\
\hline
\text{horizontal (row) or vertical (column) layout} \\
\hline
\end{array}
\]

See also

- `Fl_Flex::Fl_Flex(int direction)`
- `Fl_Flex::Fl_Flex(int x, int y, int w, int h, int direction)`
- `Fl_Flex::Fl_Flex(int x, int y, int w, int h, const char *L)`

12.41.3.4 Fl_Flex() [4/4]

\[
\begin{array}{c}
\text{Fl_Flex::Fl_Flex (}
\end{array}
\]

Construct a new Fl_Flex widget specifying its layout, position, and size.

Use Fl_Flex::HORIZONTAL (aka Fl_Flex::ROW) or Fl_Flex::VERTICAL (aka Fl_Flex::COLUMN) as the direction argument.

This constructor sets the position and size of the widget which is suitable for top level Fl_Flex widgets but does not set a widget label. Use Fl_Widget::label() to set one if desired.

Parameters

\[
\begin{array}{|c|c|}
\hline
\text{in} & \text{x,y} \\
\hline
\text{widget position} \\
\hline
\text{in} & \text{w,h} \\
\hline
\text{widget size} \\
\hline
\text{in} & \text{direction} \\
\hline
\text{horizontal (row) or vertical (column) layout} \\
\hline
\end{array}
\]

- `Fl_Flex::Fl_Flex(int x, int y, int w, int h, const char *L)`

### 12.41.4 Member Function Documentation

#### 12.41.4.1 alloc_size()

```cpp
ing int Fl_Flex::alloc_size (int size) const [protected], [virtual]
```

Return new size to be allocated for array of fixed size widgets.
This method is called when the array of fixed size widgets needs to be expanded. The current size is provided (size can be 0). The default method adds 8 to the current size.
This can be used in derived classes to change the allocation strategy. Note that this method only queries the new size which shall be allocated but does not allocate the memory.

**Parameters**

- `in size` current size

**Returns**

- `int new size (to be allocated)`

#### 12.41.4.2 draw()

```cpp
void Fl_Flex::draw (void) [protected], [virtual]
```

Draw the widget.
This will finally calculate the layout of the widget and of all its children if necessary and draw the widget.
Some changes of included children may require a new layout to be calculated. If this is the case the user may need to call `layout()` to make sure everything is calculated properly.

See also

- `layout()`

Implements `Fl_Widget`.

#### 12.41.4.3 end()

```cpp
void Fl_Flex::end ( ) [virtual]
```

Ends automatic child addition and resizes all children.
This marks the `Fl_Flex` widget as changed (need_layout(1)) which forces the widget to calculate its layout depending on all children and whether they have been assigned fix sizes or not right before it is drawn.

See also

- `need_layout(int)`
- `draw()`

#### 12.41.4.4 fixed() [1/3]

```cpp
void Fl_Flex::fixed ( Fl_Widget & w, int size ) [inline]
```

Set the horizontal or vertical size of a child widget.
### Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>w</th>
<th>widget to be affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>size</td>
<td>width (Fl_Flex::HORIZONTAL) or height (Fl_Flex::VERTICAL)</td>
</tr>
</tbody>
</table>

See also

fixed(Fl_Widget ∗w, int size)

#### 12.41.4.5 fixed() [2/3]

```cpp
int Fl_Flex::fixed (Fl_Widget ∗w) const
```

Return whether the given widget has a fixed size or resizes dynamically.

**Parameters**

| in | w | widget |

**Returns**

- whether the widget has a fixed size

**Return values**

| 1   | the widget has a fixed size |
| 0   | the widget resizes dynamically |

#### 12.41.4.6 fixed() [3/3]

```cpp
void Fl_Flex::fixed (Fl_Widget ∗child, int size)
```

Set the horizontal or vertical size of a child widget.

This sets either the width or height of a child widget, depending on the type() of the Fl_Flex container (Fl_Flex::HORIZONTAL or Fl_Flex::VERTICAL). The other dimension is set to the full width or height of the Fl_Flex widget minus border and margin sizes. This can be used to set a fixed widget width or height of children of Fl_Flex so they are not resized dynamically. If size is 0 (zero) or negative the widget size is reset to flexible size.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>child</th>
<th>widget to be affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>size</td>
<td>width (Fl_Flex::HORIZONTAL) or height (Fl_Flex::VERTICAL)</td>
</tr>
</tbody>
</table>

#### 12.41.4.7 gap() [1/2]

```cpp
int Fl_Flex::gap () const [inline]
```

Return the gap size of the widget.

**Returns**

- gap size between all child widgets.
12.41.4.8 gap() [2/2]

```c
void Fl_Flex::gap ( int g ) [inline]
```

Set the gap size of the widget. The gap size is some free space between child widgets. The size must be \(\geq 0\). Negative values are clamped to 0.

**Parameters**

| in | g | gap size |

12.41.4.9 horizontal()

```c
int Fl_Flex::horizontal ( ) const [inline]
```

Returns non-zero (true) if Fl_Flex alignment is horizontal (row mode).

**Returns**

non-zero if Fl_Flex alignment is horizontal

**Return values**

| 1 | if type() == Fl_Flex::HORIZONTAL |
| 0 | if type() == Fl_Flex::VERTICAL |

See class Fl_Flex documentation for details.

12.41.4.10 layout()

```c
void Fl_Flex::layout ( )
```

Calculates the layout of the widget and redraws it. If you change widgets in the Fl_Flex container you should call this method to force recalculation of child widget sizes and positions. This can be useful (necessary) if you hide(), show(), add() or remove() children. Call this method if you need to recalculate widget positions for usage in an algorithm that places widgets at certain positions or when you need to display (show) or hide one or more children depending on the current layout (for instance a side bar). This method also calls redraw() on the Fl_Flex widget.

12.41.4.11 margin() [1/4]

```c
int Fl_Flex::margin ( ) const [inline]
```

Returns the left margin size of the widget. This returns the left margin of the widget which is not necessarily the same as all other margins.

**Note**

This method is useful if you never set different margin sizes.

**See also**

int margin(int *left, int *top, int *right, int *bottom) to get all four margin values.

**Returns**

size of left margin.
12.41.12 margin() [2/4]

int Fl_Flex::margin (  
    int * left,  
    int * top,  
    int * right,  
    int * bottom ) const [inline]

Returns all (four) margin sizes of the widget.  
All margin sizes are returned in the given arguments. If any argument is NULL the respective value is not returned.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>left</th>
<th>returns left margin if not NULL</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>top</td>
<td>returns top margin if not NULL</td>
</tr>
<tr>
<td>in</td>
<td>right</td>
<td>returns right margin if not NULL</td>
</tr>
<tr>
<td>in</td>
<td>bottom</td>
<td>returns bottom margin if not NULL</td>
</tr>
</tbody>
</table>

Returns

whether all margins are equal

Return values

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>all margins have the same size</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>at least one margin has a different size</td>
<td></td>
</tr>
</tbody>
</table>

12.41.13 margin() [3/4]

void Fl_Flex::margin (  
    int left,  
    int top,  
    int right,  
    int bottom ) [inline]

Set the margin sizes at all four edges of the Fl_Flex widget.  
The margin is the free space inside the widget border around all child widgets.  
You must use all four parameters of this method to set the four margins in the order left, top, right, bottom.  
Negative values are set to 0 (zero).  
To set all margins to equal sizes, use margin(int m) which sets all four margins to the same size.

Parameters

| in | left,top,right,bottom | margin sizes, must be >= 0 |

See also

margin(int, int)

12.41.14 margin() [4/4]

void Fl_Flex::margin (  
    int m,  
    int g = -1 ) [inline]

Set the margin and optionally the gap size of the widget.  
This method can be used to set both the margin and the gap size.  
If you don't use the second parameter g or supply a negative value the gap size is not changed.
The margin is the free space inside the widget border around all child widgets. This method sets the margin to the same size at all four edges of the Fl_Flex widget. The gap size $g$ is the free space between child widgets. Negative values do not change the gap value. This is the default if this argument is omitted.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$m$</td>
<td>Margin size, must be $\geq 0$</td>
</tr>
<tr>
<td>$g$</td>
<td>Gap size (ignored, if negative)</td>
</tr>
</tbody>
</table>

See also

**gap(int)**

#### 12.41.4.15 need_layout() [1/2]

```cpp
bool Fl_Flex::need_layout () const [inline]
```

Returns whether layout calculation is required. This should rarely be needed by user code. Used internally in draw().

#### 12.41.4.16 need_layout() [2/2]

```cpp
void Fl_Flex::need_layout ( int set ) [inline]
```

Set or reset the request to calculate the layout of children. This is intended for internal use but can also be used by user code to request layout calculation before the widget is drawn. Call this if you changed attributes or sizes of children to ensure that the layout is calculated properly. Changing other Fl_Flex attributes or resizing the widget does this automatically.

**Note**

Never call this with `$set == 0$` because this would defeat its purpose to recalculate the layout before the widget is drawn.

#### 12.41.4.17 on_remove()

```cpp
void Fl_Flex::on_remove ( int index ) [protected], [virtual]
```

Allow derived groups to act when a child widget is removed from the group. Widgets derived from Fl_Group may store additional data for their children. Overriding this method will allow derived classes to remove these data structures just before the child is removed.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>Remove the child at this position in the array_</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Group.

#### 12.41.4.18 resize()

```cpp
void Fl_Flex::resize ( int x, int y, int w, int h ) [virtual]
```
Resize the container and calculate all child positions and sizes.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>x, y</th>
<th>position</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>w, h</td>
<td>width and height</td>
</tr>
</tbody>
</table>

Reimplemented from Fl_Widget.

12.41.19 spacing() [1/2]

int Fl_Flex::spacing () const [inline]

Gets the number of extra pixels of blank space that are added between the children.

This method is the same as 'int gap()' and is defined to enable using Fl_Flex as a drop-in replacement of Fl_Pack.

See also

int gap()

12.41.20 spacing() [2/2]

void Fl_Flex::spacing (int i) [inline]

Sets the number of extra pixels of blank space that are added between the children.

This method is the same as 'gap(int)' and is defined to enable using Fl_Flex as a drop-in replacement of Fl_Pack.

See also

void gap(int)

The documentation for this class was generated from the following files:

- Fl_Flex.H
- Fl_Flex.cxx

12.42 Fl_Float_Input Class Reference

The Fl_Float_Input class is a subclass of Fl_Input that only allows the user to type floating point numbers (sign, digits, decimal point, more digits, 'E' or 'e', sign, digits).

#include <Fl_Float_Input.H>

Inheritance diagram for Fl_Float_Input:

Fl_Input
  ↓
Fl_Float_Input
```

Public Member Functions

- Fl_Float_Input (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new Fl_Float_Input widget using the given position, size, and label string.
Public Member Functions inherited from Fl_Input

• Fl_Input (int, int, int, int, const char *=0)
  Creates a new Fl_Input widget using the given position, size, and label string.
• int handle (int) FL_OVERRIDE
  Handles the specified event.

Public Member Functions inherited from Fl_Input_

• int append (const char *, int l=0, char keep_selection=0)
  Append text at the end.
• bool can_redo () const
  Check if there is a redo action available.
• bool can_undo () const
  Check if the last operation can be undone.
• int copy (int clipboard)
  Put the current selection into the clipboard.
• int copy_cuts ()
  Copies the yank buffer to the clipboard.
• Fl_Color cursor_color () const
  Gets the color of the cursor.
• void cursor_color (Fl_Color n)
  Sets the color of the cursor.
• int cut ()
  Deletes the current selection.
• int cut (int a, int b)
  Deletes all characters between index a and b.
• int cut (int n)
  Deletes the next n bytes rounded to characters before or after the cursor.
• double dvalue () const
  Returns the widget text interpreted as a floating point number.
• Fl_Input_ (int, int, int, int, const char *=0)
  Creates a new Fl_Input_ widget.
• unsigned int index (int i) const
  Returns the character at index i.
• int input_type () const
  Gets the input field type.
• void input_type (int t)
  Sets the input field type.
• int insert (const char *, int l=0)
  Inserts text at the cursor position.
• int insert_position () const
  Gets the position of the text cursor.
• int insert_position (int p)
  Sets the cursor position and mark.
• int insert_position (int p, int m)
  Sets the index for the cursor and mark.
• int ivalue () const
  Returns the widget text interpreted as a signed integer.
• int mark () const
  Gets the current selection mark.
• int mark (int m)
Sets the current selection mark.

- int `maximum_size ()` const
  
  Gets the maximum length of the input field in characters.

- void `maximum_size (int m)`
  
  Sets the maximum length of the input field in characters.

- int `position ()` const
- int `position (int p)`
- int `position (int p, int m)`
- int `readonly ()` const
  
  Gets the read-only state of the input field.

- void `readonly (int b)`
  
  Sets the read-only state of the input field.

- int `redo ()`
  
  Redo previous undo operation.

- int `replace (int b, int e, const char ∗text, int ilen=0)`
  
  Deletes text from `b` to `e` and inserts the new string `text`.

- void `resize (int, int, int, int)` FL_OVERRIDE
  
  Changes the size of the widget.

- int `shortcut ()` const
  
  Return the shortcut key associated with this widget.

- void `shortcut (int s)`
  
  Sets the shortcut key associated with this widget.

- int `size ()` const
  
  Returns the number of bytes in `value()`.

- void `size (int W, int H)`
  
  Sets the width and height of this widget.

- int `static_value (const char ∗)`
  
  Changes the widget text.

- int `static_value (const char ∗, int)`
  
  Changes the widget text.

- int `tab_nav ()` const
  
  Gets whether the Tab key causes focus navigation in multiline input fields or not.

- void `tab_nav (int val)`
  
  Sets whether the Tab key does focus navigation, or inserts tab characters into `Fl_Multiline_Input`.

- `Fl_Color textcolor ()` const
  
  Gets the color of the text in the input field.

- void `textcolor (Fl_Color n)`
  
  Sets the color of the text in the input field.

- `FL_Font textfont ()` const
  
  Gets the font of the text in the input field.

- void `textfont (FL_Font s)`
  
  Sets the font of the text in the input field.

- `FL_Fontsize textsize ()` const
  
  Gets the size of the text in the input field.

- void `textsize (FL_Fontsize s)`
  
  Sets the size of the text in the input field.

- int `undo ()`
  
  Undoes previous changes to the text buffer.

- const char ∗`value ()` const
  
  Returns the text displayed in the widget.

- int `value (const char ∗)`
Changes the widget text.

- int value (const char *, int)
  Changes the widget text.
- int value (double value)
  Changes the widget text to a floating point number ("%g").
- int value (int value)
  Changes the widget text to a signed integer number.
- void wrap (int b)
  Sets the word wrapping state of the input field.
- ~Fl_Input_()
  Destroys the widget.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen()
- void _set_fullscreen()
- void activate()
  Activates the widget.
- unsigned int active() const
  Returns whether the widget is active.
- int active_r() const
  Returns whether the widget and all of its parents are active.
- Fl_Align align() const
  Gets the label alignment.
- void align(Fl_Align alignment)
  Sets the label alignment.
- long argument() const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument(long v)
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window() const
- virtual Fl_Group * as_group()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group() const
- virtual Fl_Window * as_window()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window() const
- void bind_deimage(Fl_image const * img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage(int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image(Fl_image * img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image(int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box() const
  Gets the box type of the widget.
• **void** box (Fl_Boxtype new_box)
  *Sets the box type for the widget.*

• **Fl_Callback_p** callback () const
  *Gets the current callback function for the widget.*

• **void** callback (Fl_Callback cb)
  *Sets the current callback function for the widget.*

• **void** callback (Fl_Callback cb, Fl_Callback_User_Data *p, bool auto_free)
  *Sets the current callback function and managed user data for the widget.*

• **void** callback (Fl_Callback cb, void *p)
  *Sets the current callback function and data for the widget.*

• **void** callback (Fl_Callback0 cb)
  *Sets the current callback function for the widget.*

• **void** callback (Fl_Callback1 cb, long p=0)
  *Sets the current callback function for the widget.*

• **unsigned int** changed () const
  *Checks if the widget value changed since the last callback.*

• **void** clear_active ()
  *Marks the widget as inactive without sending events or changing focus.*

• **void** clear_changed ()
  *Marks the value of the widget as unchanged.*

• **void** clear_damage (uchar c=0)
  *Clears or sets the damage flags.*

• **void** clear_output ()
  *Sets a widget to accept input.*

• **void** clear_visible ()
  *Hides the widget.*

• **void** clear_visible_focus ()
  *Disables keyboard focus navigation with this widget.*

• **Fl_Color** color () const
  *Gets the background color of the widget.*

• **void** color (Fl_Color bg)
  *Sets the background color of the widget.*

• **void** color (Fl_Color bg, Fl_Color sel)
  *Sets the background and selection color of the widget.*

• **Fl_Color** color2 () const
  *For back compatibility only.*

• **void** color2 (unsigned a)
  *For back compatibility only.*

• **int** contains (const Fl_Widget *w) const
  *Checks if w is a child of this widget.*

• **void** copy_label (const char *new_label)
  *Sets the current label.*

• **void** copy_tooltip (const char *text)
  *Sets the current tooltip text.*

• **uchar** damage () const
  *Returns non-zero if draw() needs to be called.*

• **void** damage (uchar c)
  *Sets the damage bits for the widget.*

• **void** damage (uchar c, int x, int y, int w, int h)
  *Sets the damage bits for an area inside the widget.*

• **int** damage_resize (int, int, int, int)
Internal use only.

- **void** **deactivate** ()
  
  Deactivates the widget.

- **FL_Image** **∗** **deimage** ()
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **const FL_Image** **∗** **deimage** () const
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **void** **deimage** (**FL_Image** &img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void** **deimage** (**FL_Image** **∗** img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- **int** **deimage_bound** () const
  
  Returns whether the inactive image is managed by the widget.

- **void** **do_callback** (**FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  
  Calls the widget callback function with default arguments.

- **void** **do_callback** (**FL_Widget** **∗** wgt, **long** arg, **FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  
  Calls the widget callback function with arbitrary arguments.

- **void** **do_callback** (**FL_Widget** **∗** wgt, **void** **∗** arg=0, **FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
  
  Calls the widget callback function with arbitrary arguments.

- **void** **draw_label** (int, int, int, int, **FL_Align**) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int** **h** () const
  
  Gets the widget height.

- virtual **void** **hide** ()
  
  Makes a widget invisible.

- **FL_Image** **∗** **image** ()
  
  Gets the image that is used as part of the widget label when in the active state.

- **const FL_Image** **∗** **image** () const
  
  Gets the image that is used as part of the widget label when in the active state.

- **void** **image** (**FL_Image** &img)
  
  Sets the image to use as part of the widget label when in the active state.

- **void** **image** (**FL_Image** **∗** img)
  
  Sets the image to use as part of the widget label when in the active state.

- **int** **image_bound** () const
  
  Returns whether the image is managed by the widget.

- **int** **inside** (**const FL_Widget** **∗** wgt) const
  
  Checks if this widget is a child of wgt.

- **int** **is_label_copied** () const
  
  Returns whether the current label was assigned with copy_label().

- **const char** **∗** **label** () const
  
  Gets the current label text.

- **void** **label** (**const char** **∗** text)
  
  Sets the current label pointer.

- **void** **label** (**FL_Labeltype** a, **const char** **∗** b)
  
  Shortcut to set the label text and type in one call.

- **FL_Color** **labelcolor** () const
  
  Gets the label color.

- **void** **labelcolor** (**FL_Color** c)
  
  Sets the label color.

- **FL_Font** **labelfont** () const
  
  Gets the font to use.
• void labelfont (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype labeltype () const
  Gets the label type.
• void labeltype (Fl_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.
• unsigned int output () const
  Returns if a widget is used for output only.
• Fl_Group *parent () const
  Returns a pointer to the parent widget.
• void parent (Fl_Group *p)
  Internal use only - "for hacks only".
• void position (int X, int Y)
  Repositions the window or widget.
• void redraw ()
  Schedules the drawing of the widget.
• void redraw_label ()
  Schedules the drawing of the label.
• Fl_Color selection_color () const
  Gets the selection color.
• void selection_color (Fl_Color a)
  Sets the selection color.
• void set_active ()
  Marks the widget as active without sending events or changing focus.
• void set_changed ()
  Marks the value of the widget as changed.
• void set_output ()
  Sets a widget to output only.
• void set_visible ()
  Makes the widget visible.
• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.
• int shortcut_label () const
  Returns whether the widget's label uses ' &' to indicate shortcuts.
• void shortcut_label (int value)
  Sets whether the widget's label uses ' &' to indicate shortcuts.
• virtual void show ()
  Makes a widget visible.
• void size (int W, int H)
  Changes the size of the widget.
Gives the widget the keyboard focus.

- `unsigned int takeEvents()` const
  Returns if the widget is able to take events.

- `int testShortcut()` const
  Returns true if the widget’s label contains the entered ‘&x’ shortcut.

- `const char * tooltip()` const
  Gets the current tooltip text.

- `void tooltip(const char *text)`
  Sets the current tooltip text.

- `Fl_Window * top_window()` const
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset(int &xoff, int &yoff)` const
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type()` const
  Gets the widget type.

- `void type(uchar t)`
  Sets the widget type.

- `int useAccentsMenu()` const
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void *user_data()` const
  Gets the user data for this widget.

- `void user_data(Fl_Callback_User_Data *v, bool auto_free)`
  Sets the user data for this widget.

- `void user_data(void *v)`
  Sets the user data for this widget.

- `unsigned int visible()` const
  Returns whether a widget is visible.

- `unsigned int visible_focus()` const
  Checks whether this widget has a visible focus.

- `void visible_focus(int v)`
  Modifies keyboard focus navigation.

- `int visible_r()` const
  Returns whether a widget and all its parents are visible.

- `int w()` const
  Gets the widget width.

- `Fl_When when()` const
  Returns the conditions under which the callback is called.

- `void when(uchar i)`
  Sets the flags used to decide when a callback is called.

- `Fl_Window * window()` const
  Returns a pointer to the nearest parent window up the widget hierarchy.

- `int x()` const
  Gets the widget position in its window.

- `int y()` const
  Gets the widget position in its window.

- `virtual ~Fl_Widget()`
  Destroys the widget.
Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don't set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the '&x' shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from Fl_Input

• static const char ∗copy_menu_text = "Copy"
  [this text may be customized at run-time]
• static const char ∗cut_menu_text = "Cut"
  [this text may be customized at run-time]
• static const char ∗paste_menu_text = "Paste"
  [this text may be customized at run-time]

Protected Types inherited from Fl_Widget

enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPYED_TOOLIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU
  = 1<<19, NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
flags possible values enumeration.

Protected Member Functions inherited from Fl_Input

• void draw () FL_OVERRIDE
  Draws the widget.
• int handle_key ()
  Handles a keystroke.
• int handle_rmb ()
  Handle right mouse button down events.

Protected Member Functions inherited from Fl_Input_

• int apply_undo ()
  Apply the current undo/redo operation.
• void drawtext (int, int, int, int)
  Draws the text in the passed bounding box.
• void drawtext (int, int, int, int, bool draw_active)
  Draws the text in the passed bounding box.
• void handle_mouse (int, int, int, int keepmark=0)
Handles mouse clicks and mouse moves.

- `int handle_text(int e, int, int, int, int)`
  Handles all kinds of text field related events.

- `int line_end(int i) const`
  Finds the end of a line.

- `int line_start(int i) const`
  Finds the start of a line.

- `int linesPerPage()`

- `void maybe_do_callback(Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`

- `int up_down_position(int, int keepmark=0)`
  Moves the cursor to the column given by `up_down_pos`.

- `int word_end(int i) const`
  Finds the end of a word.

- `int word_start(int i) const`
  Finds the start of a word.

- `int xscroll()`
  Gets the page length.

- `int yscroll()`
  Gets the vertical scroll position.

- `void yscroll(int yOffset)`

Protected Member Functions inherited from `Fl_Widget`

- `void clear_flag(unsigned int c)`
  Clears a flag in the flags mask.

- `void draw_backdrop()`
  If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.

- `void draw_box()`
  Draws the widget box according to its box style.

- `void draw_box(Fl_Boxtype t, Fl_Color c)`
  Draws a box of type `t`, of color `c` at the widget’s position and size.

- `void draw_box(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c)`
  Draws a box of type `t`, of color `c` at the position `X, Y` and size `W,H`.

- `void draw_focus()`
  Draws a focus rectangle around the widget.

- `void draw_focus(Fl_Boxtype t, int X, int Y, int W, int H)`
  Draws a focus rectangle around the widget.

- `void draw_focus(Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg)`
  Draws a focus box for the widget at the given position and size.

- `void draw_label()`
  Draws the widget’s label at the defined label position.

- `void draw_label(int, int, int, int)`
  Draws the label in an arbitrary bounding box.

- `Fl_Widget(int x, int y, int w, int h, const char *label=0L)`
  Creates a widget at the given position and size.

- `unsigned int flags()`
  Gets the widget flags mask.

- `void h(int v)`
  Internal use only.

- `void set_flag(unsigned int c)`
  Sets a flag in the flags mask.

- `void w(int v)`
  Internal use only.
12.42.1 Detailed Description

The Fl_Float_Input class is a subclass of Fl_Input that only allows the user to type floating point numbers (sign, digits, decimal point, more digits, ‘E’ or ‘e’, sign, digits).

12.42.2 Constructor & Destructor Documentation

12.42.2.1 Fl_Float_Input()

Fl_Float_Input::Fl_Float_Input (  
    int X,  
    int Y,  
    int W,  
    int H,  
    const char ∗ l = 0 )

Creates a new Fl_Float_Input widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- Fl_Float_Input.H
- Fl_Input.cxx

12.43 Fl_FormsBitmap Class Reference

Forms compatibility Bitmap Image Widget.

#include <Fl_FormsBitmap.H>

Inheritance diagram for Fl_FormsBitmap:

```
Fl_Widget
    └── Fl_FormsBitmap
```

Public Member Functions

- Fl_Bitmap ∗ bitmap () const  
  
  Gets a the current associated Fl_Bitmap objects.
- void bitmap (Fl_Bitmap ∗B)
  
  Sets a new bitmap.
- Fl_FormsBitmap (Fl_Boxtype, int, int, int, int, const char ∗=0)
  
  Creates a bitmap widget from a box type, position, size and optional label specification.
- void set (int W, int H, const uchar ∗=bits)
  
  Sets a new bitmap bits with size W,H.

Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
Activates the widget.
• unsigned int active() const
  Returns whether the widget is active.
• int active_r() const
  Returns whether the widget and all of its parents are active.
• Fl_Align align() const
  Gets the label alignment.
• void align(Fl_Align alignment)
  Sets the label alignment.
• long argument() const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument(long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window * as_gl_window()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const * as_gl_window() const
• virtual Fl_Group * as_group()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const * as_group() const
• virtual Fl_Window * as_window()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const * as_window() const
• void bind_deimage(Fl_Image * img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage(int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image(Fl_Image * img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image(int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box() const
  Gets the box type of the widget.
• void box(Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback_p callback() const
  Gets the current callback function for the widget.
• void callback(Fl_Callback * cb)
  Sets the current callback function for the widget.
• void callback(Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback(Fl_Callback * cb, void * p)
  Sets the current callback function and data for the widget.
• void callback(Fl_Callback0 * cb)
  Sets the current callback function for the widget.
• void callback(Fl_Callback1 * cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed() const
  Checks if the widget value changed since the last callback.
• void clear_active()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed()
Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

• void copy_label (const char ∗new_label)
  Sets the current label.

• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.

• Fl_Image ∗deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image ∗deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image ∗img)
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  
  Gets the widget height.

• virtual int handle (int event)
  
  Handles the specified event.

• virtual void hide ()
  
  Makes a widget invisible.

• Fl_Image ∗ image ()
  
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image ∗ image () const
  
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget ∗wgt) const
  
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  
  Returns whether the current label was assigned with copy_label().

• const char ∗ label () const
  
  Gets the current label text.

• void label (const char ∗text)
  
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char ∗b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  
  Gets the label color.

• void labelcolor (Fl_Color c)
  
  Sets the label color.

• Fl_Font labelfont () const
  
  Gets the font to use.

• void labelfont (Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize labelsize () const
  
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  
  Sets whether this widget needs a keyboard.

• unsigned int output () const
• Fl_Group * parent () const
  Returns a pointer to the parent widget.

• void parent (Fl_Group * p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.

• virtual void resize (int x, int y, int w, int h)
  Changes the size or position of the widget.

• Fl_Color selection_color () const
  Gets the selection color.

• void selection_color (Fl_Color a)
  Sets the selection color.

• void set_active ()
  Marks the widget as active without sending events or changing focus.

• void set_changed ()
  Marks the value of the widget as changed.

• void set_output ()
  Sets a widget to output only.

• void set_visible ()
  Makes the widget visible.

• void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

• int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void show ()
  Makes a widget visible.

• void size (int W, int H)
  Changes the size of the widget.

• int take_focus ()
  Gives the widget the keyboard focus.

• unsigned int takesevents () const
  Returns if the widget is able to take events.

• int testShortcut ()
  Returns true if the widget's label contains the entered 'x' shortcut.

• const char * tooltip () const
  Gets the current tooltip text.

• void tooltip (const char *text)
  Sets the current tooltip text.

• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.

• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

• void user_data (void *v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void visible_focus (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int w () const
  Gets the widget width.

• Fl_When when () const
  Returns the conditions under which the callback is called.

• void when (uchar i)
  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const
  Gets the widget position in its window.

• int y () const
  Gets the widget position in its window.

• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  Draws the bitmap and its associated box.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.

• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

• void draw_box () const
  Draws the widget box according its box style.

• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.

• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget’s label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char ∗label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

• static void default_callback (Fl_Widget ∗widget, void ∗data)
  The default callback for all widgets that don’t set a callback.
• static unsigned int label_shortcut (const char ∗t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
• static int test_shortcut (const char ∗t, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Types inherited from Fl_Widget

• enum {
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }
  flags possible values enumeration.

12.43.1 Detailed Description

Forms compatibility Bitmap Image Widget.
12.43.2 Member Function Documentation

12.43.2.1 draw()

```cpp
void Fl_FormsBitmap::draw()
    void ) [protected], [virtual]
```

Draws the bitmap and its associated box.
Implements Fl_Widget.

12.43.2.2 set()

```cpp
void Fl_FormsBitmap::set(int W, int H, const uchar ∗ bits)
```

Sets a new bitmap bits with size W,H.
Deletes the previous one.
The documentation for this class was generated from the following files:

- Fl_FormsBitmap.H
- forms_bitmap.cxx

12.44 Fl_FormsPixmap Class Reference

Forms pixmap drawing routines.
#include <Fl_FormsPixmap.H>

Inheritance diagram for Fl_FormsPixmap:

```
Fl_Widget
    Fl_FormsPixmap
```

Public Member Functions

- `Fl_FormsPixmap (Fl_Boxtype t, int X, int Y, int W, int H, const char ∗L=0)`
  Creates a new Fl_FormsPixmap widget using the given box type, position, size and label string.

- `Fl_Pixmap ∗ Pixmap () const`
  Get the internal pixmap pointer.

- `void Pixmap (Fl_Pixmap ∗ B)`
  Set the internal pixmap pointer to an existing pixmap.

- `void set (char ∗ const ∗ bits)`
  Set/create the internal pixmap using raw data.

Public Member Functions inherited from Fl_Widget

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
  Activates the widget.

- `unsigned int active () const`
  Returns whether the widget is active.

- `int active_r () const`
  Returns whether the widget and all of its parents are active.

- `Fl_Align align () const`
  Returns whether the widget and all of its parents are active.
Gets the label alignment.

- void **align (Fl_Align alignment)**
  Sets the label alignment.

- long **argument () const**
  Gets the current user data (long) argument that is passed to the callback function.

- void **argument (long v)**
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window ∗ **as_gl_window ()**
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const ∗ **as_gl_window () const**

- virtual Fl_Group ∗ **as_group ()**
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- virtual Fl_Group const ∗ **as_group () const**

- virtual Fl_Window ∗ **as_window ()**
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- virtual Fl_Window const ∗ **as_window () const**

- void **bind_deimage (Fl_Image ∗ img)**
  Sets the image to use as part of the widget label when in the inactive state.

- void **bind_deimage (int f)**
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void **bind_image (Fl_Image ∗ img)**
  Sets the image to use as part of the widget label when in the active state.

- void **bind_image (int f)**
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype **box () const**
  Gets the box type of the widget.

- void **box (Fl_Boxtype new_box)**
  Sets the box type for the widget.

- Fl_Callback_p **callback () const**
  Gets the current callback function for the widget.

- void **callback (Fl_Callback ∗ cb)**
  Sets the current callback function for the widget.

- void **callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)**
  Sets the current callback function and managed user data for the widget.

- void **callback (Fl_Callback ∗ cb, void ∗ p)**
  Sets the current callback function and data for the widget.

- void **callback (Fl_Callback0 ∗ cb)**
  Sets the current callback function for the widget.

- void **callback (Fl_Callback1 ∗ cb, long p=0)**
  Sets the current callback function for the widget.

- unsigned int **changed () const**
  Checks if the widget value changed since the last callback.

- void **clear_active ()**
  Marks the widget as inactive without sending events or changing focus.

- void **clear_changed ()**
  Marks the value of the widget as unchanged.

- void **clear_damage (uchar c=0)**
  Clears or sets the damage flags.

- void **clear_output ()**
  Sets a widget to accept input.

- void **clear_visible ()**
Hides the widget.

- void clear_visible_focus ()
  
  Disables keyboard focus navigation with this widget.

- Fl_Color color () const
  
  Gets the background color of the widget.

- void color (Fl_Color bg)
  
  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)
  
  Sets the background and selection color of the widget.

- Fl_Color color2 () const
  
  For back compatibility only.

- void color2 (unsigned a)
  
  For back compatibility only.

- int contains (const Fl_Widget ∗w) const
  
  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)
  
  Sets the current label.

- void copy_tooltip (const char ∗text)
  
  Sets the current tooltip text.

- uchar damage () const
  
  Returns non-zero if draw() needs to be called.

- void damage (uchar c)
  
  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)
  
  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int, int)
  
  Internal use only.

- void deactivate ()
  
  Deactivates the widget.

- Fl_Image ∗deimage ()
  
  Gets the image that is used as part of the widget label when in the inactive state.

- const Fl_Image ∗deimage () const
  
  Gets the image that is used as part of the widget label when in the inactive state.

- void deimage (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- void deimage (Fl_Image ∗img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- int deimage_bound () const
  
  Returns whether the inactive image is managed by the widget.

- void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.

- void do_callback (Fl_Widget ∗widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

- void do_callback (Fl_Widget ∗widget, void ∗arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

- void draw_label (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- int h () const
  
  Gets the widget height.

- virtual int handle (int event)
  
  Handles the specified event.
• virtual void hide ()
  
  Makes a widget invisible.

• Fl_Image * image ()

  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const

  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)

  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image * img)

  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const

  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget * wgt) const

  Checks if this widget is a child of wgt.

• int is_label_copied () const

  Returns whether the current label was assigned with copy_label().

• const char * label () const

  Gets the current label text.

• void label (const char * text)

  Sets the current label pointer.

• void label (Fl_Labeltype a, const char * b)

  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const

  Gets the label color.

• void labelcolor (Fl_Color c)

  Sets the label color.

• Fl_Font labelfont () const

  Gets the font to use.

• void labelfont (Fl_Font f)

  Sets the font to use.

• Fl_Fontsize labelsize () const

  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)

  Sets the font size in pixels.

• Fl_Labeltype labeltype () const

  Gets the label type.

• void labeltype (Fl_Labeltype a)

  Sets the label type.

• void measure_label (int &ww, int &hh) const

  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const

  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)

  Sets whether this widget needs a keyboard.

• unsigned int output () const

  Returns if a widget is used for output only.

• Fl_Group * parent () const

  Returns a pointer to the parent widget.

• void parent (Fl_Group * p)

  Internal use only - “for hacks only”.

• void position (int X, int Y)
Repositions the window or widget.

- **void redraw ()**
  Schedules the drawing of the widget.

- **void redraw_label ()**
  Schedules the drawing of the label.

- **virtual void resize (int x, int y, int w, int h)**
  Changes the size or position of the widget.

- **Fl_Color selection_color () const**
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  Sets the selection color.

- **void set_active ()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  Marks the value of the widget as changed.

- **void set_output ()**
  Sets a widget to output only.

- **void set_visible ()**
  Makes the widget visible.

- **void set_visible_focus ()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show ()**
  Makes a widget visible.

- **void size (int W, int H)**
  Changes the size of the widget.

- **int take_focus ()**
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  Returns if the widget is able to take events.

- **int test_shortcut ()**
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char * tooltip () const**
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  Gets the widget type.

- **void type (uchar t)**
  Sets the widget type.

- **int use_accents_menu ()**
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void * user_data () const**
  Gets the user data for this widget.
• void **user_data** (Fl_Callback_User_Data ∗v, bool auto_free)
  
  *Sets the user data for this widget.*

• void **user_data** (void ∗v)
  
  *Sets the user data for this widget.*

• unsigned int **visible** () const
  
  *Returns whether a widget is visible.*

• unsigned int **visible_focus** () const
  
  *Checks whether this widget has a visible focus.*

• void **visible_focus** (int v)
  
  *Modifies keyboard focus navigation.*

• int **visible_r** () const
  
  *Returns whether a widget and all its parents are visible.*

• int **w** () const
  
  *Gets the widget width.*

• Fl_When **when** () const
  
  *Returns the conditions under which the callback is called.*

• void **when** (uchar i)
  
  *Sets the flags used to decide when a callback is called.*

• Fl_Window ∗ **window** () const
  
  *Returns a pointer to the nearest parent window up the widget hierarchy.*

• int **x** () const
  
  *Gets the widget position in its window.*

• int **y** () const
  
  *Gets the widget position in its window.*

• virtual ∼**Fl_Widget** ()
  
  *Destroys the widget.*

### Protected Member Functions

• void **draw** () FL_OVERRIDE
  
  *Draws the widget.*

### Protected Member Functions inherited from **Fl_Widget**

• void **clear_flag** (unsigned int c)
  
  *Clears a flag in the flags mask.*

• void **draw_backdrop** () const
  
  *If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.*

• void **draw_box** () const
  
  *Draws the widget box according its box style.*

• void **draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  *Draws a box of type t, of color c at the widget's position and size.*

• void **draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  *Draws a box of type t, of color c at the position X,Y and size W,H.*

• void **draw_focus** () const
  
  *Draws a focus rectangle around the widget.*

• void **draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  *Draws a focus rectangle around the widget.*

• void **draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  *Draws a focus box for the widget at the given position and size.*

• void **draw_label** () const
  
  *Draws the widget's label at the defined label position.*
• void **draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

• **Fl_Widget**(int x, int y, int w, int h, const char *label=0L)

  Creates a widget at the given position and size.

• unsigned int **flags**( ) const
  
  Gets the widget flags mask.

• void **h**( int v)
  
  Internal use only.

• void **set_flag**( unsigned int c)

  Sets a flag in the flags mask.

• void **w**( int v)
  
  Internal use only.

• void **x**( int v)
  
  Internal use only.

• void **y**( int v)
  
  Internal use only.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

• static void **default_callback**( Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don’t set a callback.

• static unsigned int **label_shortcut**( const char *t)

  Returns the Unicode value of the ‘&x’ shortcut in a given text.

• static int **test_shortcut**( const char *, const bool require_alt=false)

  Returns true if the given text **t** contains the entered ‘&x’ shortcut.

**Protected Types inherited from Fl_Widget**

• enum {
  
  INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,
  FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7 ,
  OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11 ,
  MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15 ,
  GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU = 1<<19 ,
  NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,
  AUTO_DELETE_USER_DATA = 1<<23 ,
  MAXIMIZED = 1<<24 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 , USERFLAG1 = 1<<31 }

  flags possible values enumeration.

12.44.1 Detailed Description

Forms pixmap drawing routines.

12.44.2 Constructor & Destructor Documentation

12.44.2.1 Fl_FormsPixmap()

Fl_FormsPixmap::Fl_FormsPixmap (  
  Fl_Boxtype t,
  int X,

Generated by Doxygen
int Y,
int W,
int H,
    const char * L = 0)

Creates a new Fl_FormsPixmap widget using the given box type, position, size and label string.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>t</th>
<th>box type</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>X,Y,W,H</td>
<td>position and size</td>
</tr>
<tr>
<td>in</td>
<td>L</td>
<td>widget label, default is no label</td>
</tr>
</tbody>
</table>

### 12.44.3 Member Function Documentation

#### 12.44.3.1 draw()

```c
void Fl_FormsPixmap::draw () [protected, [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```c
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();  // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.

#### 12.44.3.2 Pixmap()

```c
void Fl_FormsPixmap::Pixmap ( Fl_Pixmap * B ) [inline]
```

Set the internal pixmap pointer to an existing pixmap.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>B</th>
<th>existing pixmap</th>
</tr>
</thead>
</table>

#### 12.44.3.3 set()

```c
void Fl_FormsPixmap::set ( char *const * bits )
```

Set/create the internal pixmap using raw data.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>bits</th>
<th>raw data</th>
</tr>
</thead>
</table>

The documentation for this class was generated from the following files:

- Fl_FormsPixmap.H
- forms_pixmap.cxx

### 12.45 Fl_FormsText Class Reference

Inheritance diagram for Fl_FormsText:
Public Member Functions

- **Fl_FormsText** (Fl_Boxtype b, int X, int Y, int W, int H, const char *l=0)

Public Member Functions inherited from **Fl_Widget**

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  
  Activates the widget.
- unsigned int active () const
  
  Returns whether the widget is active.
- int active_r () const
  
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  
  Gets the label alignment.
- void align (Fl_Align alignment)
  
  Sets the label alignment.
- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window * as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const * as_gl_window () const
- virtual Fl_Group * as_group ()
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.
- virtual Fl_Group const * as_group () const
- virtual Fl_Window * as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const * as_window () const
- void bind_deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.
- Fl_Callback * callback () const
  
  Gets the current callback function for the widget.
- void callback (Fl_Callback *cb)
Sets the current callback function for the widget.

- void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)

  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback ∗cb, void ∗p)

  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 ∗cb)

  Sets the current callback function for the widget.

- void callback (Fl_Callback1 ∗cb, long p=0)

  Sets the current callback function for the widget.

- unsigned int changed () const

  Checks if the widget value changed since the last callback.

- void clear_active ()

  Marks the widget as inactive without sending events or changing focus.

- void clear_changed ()

  Marks the value of the widget as unchanged.

- void clear_damage (uchar c=0)

  Clears or sets the damage flags.

- void clear_output ()

  Sets a widget to accept input.

- void clear_visible ()

  Hides the widget.

- void clear_visible_focus ()

  Disables keyboard focus navigation with this widget.

- Fl_Color color () const

  Gets the background color of the widget.

- void color (Fl_Color bg)

  Sets the background color of the widget.

- void color (Fl_Color bg, Fl_Color sel)

  Sets the background and selection color of the widget.

- Fl_Color color2 () const

  For back compatibility only.

- void color2 (unsigned a)

  For back compatibility only.

- int contains (const Fl_Widget ∗w) const

  Checks if w is a child of this widget.

- void copy_label (const char ∗new_label)

  Sets the current label.

- void copy_tooltip (const char ∗text)

  Sets the current tooltip text.

- uchar damage () const

  Returns non-zero if draw() needs to be called.

- void damage (uchar c)

  Sets the damage bits for the widget.

- void damage (uchar c, int x, int y, int w, int h)

  Sets the damage bits for an area inside the widget.

- int damage_resize (int, int, int)

  Internal use only.

- void deactivate ()

  Deactivates the widget.

- Fl_Image ∗deimage ()

  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image * deimage () const
  
  Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const
  
  Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  
  Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const
  
  Gets the widget height.

• virtual int handle (int event)
  
  Handles the specified event.

• virtual void hide ()
  
  Makes a widget invisible.

• Fl_Image * image ()
  
  Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const
  
  Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  
  Gets the current label text.

• void label (const char *text)
  
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  
  Gets the label color.

• void labelcolor (Fl_Color c)
  
  Sets the label color.

• Fl_Font labelfont () const
  
  Gets the font to use.

• void labelfont (Fl_Font f)
  
  Sets the font to use.

• Fl_Fontsize labelsize () const
Gets the font size in pixels.

• void *labelsize* (*Fl_Fontsize* pix)
  
  Sets the font size in pixels.

• *Fl_Labeltype* *labeltype* () const
  
  Gets the label type.

• void *labeltype* (*Fl_Labeltype* a)
  
  Sets the label type.

• void *measure_label* (int &ww, int &hh) const
  
  Sets width ww and height hh accordingly with the label size.

• bool *needs_keyboard* () const
  
  Returns whether this widget needs a keyboard.

• void *needs_keyboard* (bool needs)
  
  Sets whether this widget needs a keyboard.

• unsigned int *output* () const
  
  Returns if a widget is used for output only.

• *Fl_Group* ∗ *parent* () const
  
  Returns a pointer to the parent widget.

• void *parent* (*Fl_Group* ∗p)
  
  Internal use only - "for hacks only".

• void *position* (int X, int Y)
  
  Repositions the window or widget.

• void *redraw* ()
  
  Schedules the drawing of the widget.

• void *redraw_label* ()
  
  Schedules the drawing of the label.

• virtual void *resize* (int x, int y, int w, int h)
  
  Changes the size or position of the widget.

• *Fl_Color* *selection_color* () const
  
  Gets the selection color.

• void *selection_color* (*Fl_Color* a)
  
  Sets the selection color.

• void *set_active* ()
  
  Marks the widget as active without sending events or changing focus.

• void *set_changed* ()
  
  Marks the value of the widget as changed.

• void *set_output* ()
  
  Sets a widget to output only.

• void *set_visible* ()
  
  Makes the widget visible.

• void *set_visible_focus* ()
  
  Enables keyboard focus navigation with this widget.

• int *shortcut_label* () const
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

• void *shortcut_label* (int value)
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

• virtual void *show* ()
  
  Makes a widget visible.

• void *size* (int W, int H)
  
  Changes the size of the widget.

• int *take_focus* ()
  
  Gives the widget the keyboard focus.
• unsigned int takesevents () const

  Returns if the widget is able to take events.

• int test_shortcut ()

  Returns true if the widget's label contains the entered '&x' shortcut.

• const char * tooltip () const

  Gets the current tooltip text.

• void tooltip (const char *text)

  Sets the current tooltip text.

• Fl_Window * top_window () const

  Returns a pointer to the top-level window for the widget.

• Fl_Window * top_window_offset (int &xoff, int &yoff) const

  Finds the x/y offset of the current widget relative to the top-level window.

• uchar type () const

  Gets the widget type.

• void type (uchar t)

  Sets the widget type.

• int use_accents_menu ()

  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const

  Gets the user data for this widget.

• void user_data (Fl_Callback_User_Data *v, bool auto_free)

  Sets the user data for this widget.

• void user_data (void *v)

  Sets the user data for this widget.

• unsigned int visible () const

  Returns whether a widget is visible.

• unsigned int visible_focus () const

  Checks whether this widget has a visible focus.

• void visible_focus (int v)

  Modifies keyboard focus navigation.

• int visible_r () const

  Returns whether a widget and all its parents are visible.

• int w () const

  Gets the widget width.

• Fl_When when () const

  Returns the conditions under which the callback is called.

• void when (uchar i)

  Sets the flags used to decide when a callback is called.

• Fl_Window * window () const

  Returns a pointer to the nearest parent window up the widget hierarchy.

• int x () const

  Gets the widget position in its window.

• int y () const

  Gets the widget position in its window.

• virtual ~Fl_Widget ()

  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE

  Draws the widget.
Protected Member Functions inherited from Fl_Widget

- **void clear_flag** (unsigned int c)
  
  Clears a flag in the flags mask.

- **void draw_backdrop** () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.

- **void draw_box** () const
  
  Draws the widget box according its box style.

- **void draw_box** (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.

- **void draw_box** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.

- **void draw_focus** () const
  
  Draws a focus rectangle around the widget.

- **void draw_focus** (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.

- **void draw_focus** (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.

- **void draw_label** () const
  
  Draws the widget's label at the defined label position.

- **void draw_label** (int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- **Fl_Widget** (int x, int y, int w, int h, const char *label=0L)
  
  Creates a widget at the given position and size.

- **unsigned int flags** () const
  
  Gets the widget flags mask.

- **void h** (int v)
  
  Internal use only.

- **void set_flag** (unsigned int c)
  
  Sets a flag in the flags mask.

- **void w** (int v)
  
  Internal use only.

- **void x** (int v)
  
  Internal use only.

- **void y** (int v)
  
  Internal use only.

**Additional Inherited Members**

**Static Public Member Functions inherited from Fl_Widget**

- **static void default_callback** (Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don’t set a callback.

- **static unsigned int labelShortcut** (const char *t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- **static int testShortcut** (const char *, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.
Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6,Changed = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTOP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCEPTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23, MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
} flags possible values enumeration.

12.45.1 Member Function Documentation

12.45.1.1 draw()

void Fl_FormsText::draw ( ) [protected], [virtual]
Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

Implements Fl_Widget.
The documentation for this class was generated from the following file:

- forms.H

12.46 Fl_Free Class Reference

Emulation of the Forms "free" widget.
#include <Fl_Free.H>
Inheritance diagram for Fl_Free:

```
Fl_Widget
  ↓
Fl_Free
```

Public Member Functions

- **Fl_Free (uchar t, int X, int Y, int W, int H, const char *L, FL_HANDLEPTR hdl)**
  Create a new Fl_Free widget with type, position, size, label and handler.
- **int handle (int e) FL_OVERRIDE**
  Handles the specified event.
- **~Fl_Free ()**
  The destructor will call the handle function with the event FL_FREE_MEM.
Public Member Functions inherited from Fl_Widget

• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
• Fl_Align align () const
  Gets the label alignment.
• void align (Fl_Align alignment)
  Sets the label alignment.
• long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
• void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
• virtual class Fl_Gl_Window ∗ as_gl_window ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
• virtual class Fl_Gl_Window const ∗ as_gl_window () const
• virtual Fl_Group ∗ as_group ()
  Returns an Fl_Group pointer if this widget is an Fl_Group.
• virtual Fl_Group const ∗ as_group () const
• virtual Fl_Window ∗ as_window ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.
• virtual Fl_Window const ∗ as_window () const
• void bind_deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
• void bind_image (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the active state.
• void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
• Fl_Boxtype box () const
  Gets the box type of the widget.
• void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
• Fl_Callback ∗ p callback () const
  Gets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
• void callback (Fl_Callback ∗ cb, void ∗ p)
  Sets the current callback function and data for the widget.
• void callback (Fl_Callback0 ∗ cb)
  Sets the current callback function for the widget.
• void callback (Fl_Callback1 ∗ cb, long p=0)
  Sets the current callback function for the widget.
• unsigned int changed () const
Checks if the widget value changed since the last callback.
• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
• void clear_changed ()
  Marks the value of the widget as unchanged.
• void clear_damage (uchar c=0)
  Clears or sets the damage flags.
• void clear_output ()
  Sets a widget to accept input.
• void clear_visible ()
  Hides the widget.
• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
• Fl_Color color () const
  Gets the background color of the widget.
• void color (Fl_Color bg)
  Sets the background color of the widget.
• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.
• Fl_Color color2 () const
  For back compatibility only.
• void color2 (unsigned a)
  For back compatibility only.
• int contains (const Fl_Widget ∗ w) const
  Checks if w is a child of this widget.
• void copy_label (const char ∗ new_label)
  Sets the current label.
• void copy_tooltip (const char ∗ text)
  Sets the current tooltip text.
• uchar damage () const
  Returns non-zero if draw() needs to be called.
• void damage (uchar c)
  Sets the damage bits for the widget.
• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
• int damage_resize (int, int, int)
  Internal use only.
• void deactivate ()
  Deactivates the widget.
• Fl_Image ∗ deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
• const Fl_Image ∗ deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
• void deimage (Fl_Image ∗ &img)
  Sets the image to use as part of the widget label when in the inactive state.
• void deimage (Fl_Image ∗ img)
  Sets the image to use as part of the widget label when in the inactive state.
• int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void *do_callback* (Fl_Widget *widget, long arg, Fl_Callback_Reas on reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void *do_callback* (Fl_Widget *widget, void *arg=0, Fl_Callback_Reas on reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void *draw_label* (int, int, int, int, Fl_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int *h* () const
  Gets the widget height.
• virtual void *hide* ()
  Makes a widget invisible.
• Fl_Image *image* ()
  Gets the image that is used as part of the widget label when in the active state.
• const Fl_Image *image* () const
  Gets the image that is used as part of the widget label when in the active state.
• void *image* (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void *image* (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int *image_bound* () const
  Returns whether the image is managed by the widget.
• int *inside* (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int *is_label_copied* () const
  Returns whether the current label was assigned with copy_label().
• const char *label* () const
  Gets the current label text.
• void *label* (const char *text)
  Sets the current label pointer.
• void *label* (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• Fl_Color *labelcolor* () const
  Gets the label color.
• void *labelcolor* (Fl_Color c)
  Sets the label color.
• Fl_Font *labelfont* () const
  Gets the font to use.
• void *labelfont* (Fl_Font f)
  Sets the font to use.
• Fl_Fontsize *labelsize* () const
  Gets the font size in pixels.
• void *labelsize* (Fl_Fontsize pix)
  Sets the font size in pixels.
• Fl_Labeltype *labeltype* () const
  Gets the label type.
• void *labeltype* (Fl_Labeltype a)
  Sets the label type.
• void *measure_label* (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool *needs_keyboard* () const
  Returns whether this widget needs a keyboard.
• void *needs_keyboard* (bool needs)
Sets whether this widget needs a keyboard.

- **unsigned int output()** const
  Returns if a widget is used for output only.

- **Fl_Group * parent()** const
  Returns a pointer to the parent widget.

- **void parent(Fl_Group *p)**
  Internal use only - "for hacks only".

- **void position(int X, int Y)**
  Repositions the window or widget.

- **void redraw()**
  Schedules the drawing of the widget.

- **void redraw_label()**
  Schedules the drawing of the label.

- **virtual void resize(int x, int y, int w, int h)**
  Changes the size or position of the widget.

- **Fl_Color selection_color()** const
  Gets the selection color.

- **void selection_color(Fl_Color a)**
  Sets the selection color.

- **void set_active()**
  Marks the widget as active without sending events or changing focus.

- **void set_changed()**
  Marks the value of the widget as changed.

- **void set_output()**
  Sets a widget to output only.

- **void set_visible()**
  Makes the widget visible.

- **void set_visible_focus()**
  Enables keyboard focus navigation with this widget.

- **int shortcut_label()** const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label(int value)**
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **virtual void show()**
  Makes a widget visible.

- **void size(int W, int H)**
  Changes the size of the widget.

- **int take_focus()**
  Gives the widget the keyboard focus.

- **unsigned int takeevents()** const
  Returns if the widget is able to take events.

- **int test_shortcut()**
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char * tooltip()** const
  Gets the current tooltip text.

- **void tooltip(const char *text)**
  Sets the current tooltip text.

- **Fl_Window * top_window()** const
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset(int &xoff, int &yoff)** const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.

Protected Member Functions

• void draw () FL OVERRIDE
  Draws the widget.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
  Draws the widget's label at the defined label position.
- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
- Fl_Widget (int x, int y, int w, int h, const char ∗ label=0L)
  Creates a widget at the given position and size.
- unsigned int flags () const
  Gets the widget flags mask.
- void h (int v)
  Internal use only.
- void set_flag (unsigned int c)
  Sets a flag in the flags mask.
- void w (int v)
  Internal use only.
- void x (int v)
  Internal use only.
- void y (int v)
  Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget ∗ widget, void ∗ data)
  Returns the default callback for all widgets that don't set a callback.
- static unsigned int label_shortcut (const char ∗ t)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char ∗ t, const bool require_alt=false)
  Returns true if the given text t contains the entered 'x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,

}
  flags possible values enumeration.
12.46.1 Detailed Description

Emulation of the Forms “free” widget. This emulation allows the free demo to run, and appears to be useful for porting programs written in Forms which use the free widget or make subclasses of the Forms widgets.

There are five types of free, which determine when the handle function is called:

- FL_NORMAL_FREE normal event handling.
- FL_SLEEPING_FREE deactivates event handling (widget is inactive).
- FL_INPUT_FREE accepts FL_FOCUS events.
- FL_CONTINUOUS_FREE sets a timeout callback 100 times a second and provides an FL_STEP event. This has obvious detrimental effects on machine performance.
- FL_ALL_FREE same as FL_INPUT_FREE and FL_CONTINUOUS_FREE.

12.46.2 Constructor & Destructor Documentation

12.46.2.1 Fl_Free()

Fl_Free::Fl_Free (uchar t, int X, int Y, int W, int H, const char * L, FL_HANDLEPTR hdl)

Create a new Fl_Free widget with type, position, size, label and handler.

Parameters

<table>
<thead>
<tr>
<th>in t</th>
<th>type</th>
</tr>
</thead>
<tbody>
<tr>
<td>in X,Y,W,H</td>
<td>position and size</td>
</tr>
<tr>
<td>in L</td>
<td>widget label</td>
</tr>
<tr>
<td>in hdl</td>
<td>handler function</td>
</tr>
</tbody>
</table>

The constructor takes both the type and the handle function. The handle function should be declared as follows:

```c
int handle_function(Fl_Widget *w, int event, float event_x, float event_y, char key)
```

This function is called from the handle() method in response to most events, and is called by the draw() method.

The event argument contains the event type:

```c
#old event names for compatibility:
#define FL_MOUSE FL_DRAG
#define FL_DRAW 0
#define FL_STEP 9
#define FL_FREEMEM 12
#define FL_FREEZE FL_UNMAP
#define FL_THAW FL_MAP
```

12.46.3 Member Function Documentation

12.46.3.1 draw()

```c
void Fl_Free::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call redraw() instead.

Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded scrollbar, you can do it (because draw() is virtual) like this:

```c
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements Fl_Widget.

### 12.46.3.2 handle()

```c
int Fl_Free::handle (int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

**Parameters**

- **in event** the kind of event received

**Return values**

- 0 if the event was not used or understood
- 1 if the event was used and can be deleted

**See also**

- Fl_Event

Reimplemented from Fl_Widget.

The documentation for this class was generated from the following files:

- Fl_Free.H
- forms_free.cxx

### 12.47 Fl_GIF_Image Class Reference

The Fl_GIF_Image class supports loading, caching, and drawing of Compuserve GIF\textsuperscript{SM} images.

```c
#include <Fl_GIF_Image.H>
```

Inheritance diagram for Fl_GIF_Image:

Classes

- struct GIF_FRAME

Public Member Functions

- **FL_GIF_Image (const char *filename)**
  
  This constructor loads a GIF image from the given file.

- **FL_GIF_Image (const char *imagename, const unsigned char *data)**
  
  This constructor loads a GIF image from memory (deprecated).

- **FL_GIF_Image (const char *imagename, const unsigned char *data, const size_t length)**
  
  This constructor loads a GIF image from memory.

Public Member Functions inherited from Fl_Pixmap

- int cache_h ()
- int cache_w ()
- void color_average (Fl_Color c, float i) FL_OVERRIDE
  
  The color_average() method averages the colors in the image with the provided FLTK color value.

- Fl_Image * copy () const

- Fl_Image * copy (int W, int H) const FL_OVERRIDE
  
  Creates a resized copy of the image.

- void desaturate () FL_OVERRIDE
  
  The desaturate() method converts an image to grayscale.

- void draw (int X, int Y)

- void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE
  
  Draws the image to the current drawing surface with a bounding box.

- Fl_Pixmap (char *const *D)
  
  The constructors create a new pixmap from the specified XPM data.

- Fl_Pixmap (const char *const *D)
  
  The constructors create a new pixmap from the specified XPM data.

- Fl_Pixmap (const uchar *const *D)
  
  The constructors create a new pixmap from the specified XPM data.

- Fl_Pixmap (uchar *const *D)
  
  The constructors create a new pixmap from the specified XPM data.

- void label (Fl_Menu_Item *m) FL_OVERRIDE
  
  This method is an obsolete way to set the image attribute of a menu item.

- void label (Fl_Widget *w) FL_OVERRIDE
  
  This method is an obsolete way to set the image attribute of a widget or menu item.

- void uncache () FL_OVERRIDE
  
  If the image has been cached for display, delete the cache data.

- virtual ~Fl_Pixmap ()
  
  The destructor frees all memory and server resources that are used by the pixmap.

Public Member Functions inherited from Fl_Image

- virtual class Fl_Shared_Image * as_shared_image ()
  
  Returns whether an image is an Fl_Shared_Image or not.

- Fl_Image * copy () const
  
  Creates a copy of the image in the same size.

- int count () const
  
  Returns the number of data values associated with the image.

- int d () const
Returns the image depth.

- const char *const * data () const
  
  Returns a pointer to the current image data array.

- int data_h () const
  
  Returns the height of the image data.

- int data_w () const
  
  Returns the width of the image data.

- void draw (int X, int Y)
  
  Draws the image to the current drawing surface.

- int fail () const
  
  Returns a value that is not 0 if there is currently no image available.

- Fl_Image (int W, int H, int D)
  
  The constructor creates an empty image with the specified width, height, and depth.

- int h () const
  
  Returns the current image drawing height in FLTK units.

- void inactive ()
  
  The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.

- int ld () const
  
  Returns the current line data size in bytes.

- virtual void release ()
  
  Releases an Fl_Image - the same as 'delete this'.

- virtual void scale (int width, int height, int proportional=1, int can_expand=0)
  
  Sets the drawing size of the image.

- int w () const
  
  Returns the current image drawing width in FLTK units.

- virtual ~Fl_Image ()
  
  The destructor is a virtual method that frees all memory used by the image.

Static Public Member Functions

- static bool is_animated (const char *name_)

Static Public Member Functions inherited from Fl_Image

- static Fl_Labeltype define_FL_IMAGE_LABEL ()

- static Fl_RGB_Scaling RGB_scaling ()
  
  Returns the currently used RGB image scaling method.

- static void RGB_scaling (Fl_RGB_Scaling)
  
  Sets the RGB image scaling method used for copy(int, int).

- static Fl_RGB_Scaling scaling_algorithm ()
  
  Gets what algorithm is used when resizing a source image to draw it.

- static void scaling_algorithm (Fl_RGB_Scaling algorithm)
  
  Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes

- static bool animate = false
  
  Sets how the shared image core routine should treat animated GIF files.

Generated by Doxygen
Static Public Attributes inherited from Fl_Image

- static const int ERR_FILE_ACCESS = -2
- static const int ERR_FORMAT = -3
- static const int ERR_MEMORY_ACCESS = -4
- static const int ERR_NO_IMAGE = -1
- static bool register_images_done = false

Protected Member Functions

- Fl_GIF_Image ()
  The default constructor creates an empty GIF image.
- Fl_GIF_Image (const char ∗filename, bool anim)
- Fl_GIF_Image (const char ∗imagename, const unsigned char ∗data, const size_t length, bool anim)
- void load (const char ∗filename, bool anim)
- void load (const char ∗imagename, const unsigned char ∗data, const size_t length, bool anim)
- void load_gif_ (class Fl_Image_Reader &rdr, bool anim=false)
- virtual void on_extension_data (GIF_FRAME &)
- virtual void on_frame_data (GIF_FRAME &)

Protected Member Functions inherited from Fl_Pixmap

- void measure ()

Protected Member Functions inherited from Fl_Image

- void d (int D)
  Sets the current image depth.
- void data (const char ∗const ∗p, int c)
  Sets the current data pointer and count of pointers in the array.
- void draw_empty (int X, int Y)
  The protected method draw_empty() draws a box with an X in it.
- int draw_scaled (int X, int Y, int W, int H)
  Draw the image to the current drawing surface rescaled to a given width and height.
- void h (int H)
  Sets the height of the image data.
- void ld (int LD)
  Sets the current line data size in bytes.
- void w (int W)
  Sets the width of the image data.

Additional Inherited Members

Public Attributes inherited from Fl_Pixmap

- int alloc_data

Static Protected Member Functions inherited from Fl_Image

- static void labeltype (const Fl_Label ∗lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void measure (const Fl_Label ∗lo, int &lw, int &lh)
12.47.1 Detailed Description

The Fl_GIF_Image class supports loading, caching, and drawing of Compuserve GIF images. The class loads the first image and supports transparency.

12.47.2 Constructor & Destructor Documentation

12.47.2.1 Fl_GIF_Image() [1/3]

Fl_GIF_Image::Fl_GIF_Image (const char * filename)

This constructor loads a GIF image from the given file. If a GIF image is animated, Fl_GIF_Image will only read and display the first frame of the animation. The destructor frees all memory and server resources that are used by the image. Use Fl_Image::fail() to check if Fl_GIF_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the GIF format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason.

Parameters

| in | filename | a full path and name pointing to a GIF image file. |

See also

Fl_GIF_Image::Fl_GIF_Image(const char * imagename, const unsigned char * data, const long length)

12.47.2.2 Fl_GIF_Image() [2/3]

Fl_GIF_Image::Fl_GIF_Image (const char * imagename, const unsigned char * data)

This constructor loads a GIF image from memory (deprecated).

Deprecated Please use Fl_GIF_Image(const char * imagename, const unsigned char * data, const size_t length) instead.

Note

Buffer overruns will not be checked.

This constructor should not be used because the caller can't supply the memory size and the image reader can't check for "end of memory" errors.

Note

A new constructor with parameter length is available since FLTK 1.4.0.

Parameters

| in | imagename | A name given to this image or NULL |
| in | data | Pointer to the start of the GIF image in memory. |

See also

Fl_GIF_Image(const char * filename)

Fl_GIF_Image(const char * imagename, const unsigned char * data, const size_t length)
12.47.2.3 Fl_GIF_Image() [3/3]

Fl_GIF_Image::Fl_GIF_Image (const char * imagename, const unsigned char * data, const size_t length)

This constructor loads a GIF image from memory. Construct an image from a block of memory inside the application. Fluid offers "binary data" chunks as a great way to add image data into the C++ source code. imagename can be NULL. If a name is given, the image is added to the list of shared images and will be available by that name.

If a GIF image is animated, Fl_GIF_Image will only read and display the first frame of the animation. The destructor frees all memory and server resources that are used by the image. The third parameter length is used to test for buffer overruns, i.e. truncated images. Use Fl_Image::fail() to check if Fl_GIF_Image failed to load. fail() returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the GIF format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>imagename</td>
<td>A name given to this image or NULL</td>
</tr>
<tr>
<td>data</td>
<td>Pointer to the start of the GIF image in memory.</td>
</tr>
<tr>
<td>length</td>
<td>Length of the GIF image in memory.</td>
</tr>
</tbody>
</table>

See also

    Fl_GIF_Image::Fl_GIF_Image(const char *filename)
    Fl_Shared_Image

Since

    1.4.0

12.47.3 Member Data Documentation

12.47.3.1 animate

bool Fl_GIF_Image::animate = false [static]

Sets how the shared image core routine should treat animated GIF files. The default is to treat them as ordinary GIF's e.g. it creates a Fl_GIF_Image object. If this variable is set, then an animated GIF object Fl_Anim_GIF_Image is created.

The documentation for this class was generated from the following files:

- Fl_GIF_Image.H
- Fl_Anim_GIF_Image.cxx
- Fl_GIF_Image.cxx

12.48 Fl_GI_Choice Class Reference

Public Member Functions

- Fl_GI_Choice (int m, const int *alistp, Fl_GI_Choice *n)

Friends

- class Fl_GI_Window_Driver

The documentation for this class was generated from the following file:

- Fl_GI_Choice.H
12.49  Fl_Gl_Window Class Reference

The Fl_Gl_Window widget sets things up so OpenGL works.

```cpp
#include <Fl_Gl_Window.H>
```

Inheritance diagram for Fl_Gl_Window:

```
Fl_Widget
    ↓
Fl_Group
    ↓
Fl_Window
    ↓
Fl_Gl_Window
    ↓
Fl_Glut_Window
```

Public Member Functions

- `Fl_Gl_Window const * as_gl_window () const FL_OVERRIDE`
  - Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- `int can_do ()`
  - Returns non-zero if the hardware supports the current OpenGL mode.
- `int can_do_overlay ()`
  - Returns true if the hardware overlay is possible.
- `GLContext context () const`
  - Returns a pointer to the window's OpenGL rendering context.
- `void context (GLContext, int destroy_flag=0)`
  - Sets a pointer to the GLContext that this window is using.
- `char context_valid () const`
  - Will only be set if the OpenGL context is created or recreated.
- `void context_valid (char v)`
  - See char Fl_Gl_Window::context_valid() const.
- `Fl_Gl_Window (int W, int H, const char *l=0)`
  - Creates a new Fl_Gl_Window widget using the given size, and label string.
- `Fl_Gl_Window (int X, int Y , int W, int H, const char *l=0)`
  - Creates a new Fl_Gl_Window widget using the given position, size, and label string.
- `void flush () FL_OVERRIDE`
  - Forces the window to be drawn, this window is also made current and calls draw().
- `int handle (int) FL_OVERRIDE`
  - Handle some FLTK events as needed.
- `void hide () FL_OVERRIDE`
  - Hides the window and destroys the OpenGL context.
- `void hide_overlay ()`
  - Hides the window if it is not this window, does nothing in Windows.
- `void invalidate ()`
  - The invalidate() method turns off valid() and is equivalent to calling value(0).
- `void make_current ()`
  - The make_current() method selects the OpenGL context for the widget.
- `void make_overlay_current ()`
Selects the OpenGL context for the widget’s overlay.

- **Fl_Mode mode () const**
  Returns the current OpenGL capabilities of the window.

- **int mode (const int *a)**
  Set the OpenGL capabilities of the window using platform-specific data.

- **int mode (int a)**
  Set or change the OpenGL capabilities of the window.

- **void ortho ()**
  Sets the projection so 0,0 is in the lower left of the window and each pixel is 1 unit wide/tall.

- **int pixel_h ()**
  Gives the window height in OpenGL pixels.

- **int pixel_w ()**
  Gives the window width in OpenGL pixels.

- **float pixels_per_unit ()**
  The number of pixels per FLTK unit of length for the window.

- **void redraw_overlay ()**
  Causes draw_overlay() to be called at a later time.

- **void resize (int, int, int, int) FL_OVERRIDE**
  Changes the size or position of the widget.

- **void show () FL_OVERRIDE**
  Makes a widget visible.

- **void show (int a, char **b)**
  Same as Fl_Window::show(int a, char **b)

- **void swapBuffers ()**
  The swapBuffers() method swaps the back and front buffers.

- **int swap_interval () const**
  Gets the rate at which the GL windows swaps buffers.

- **void swap_interval (int)**
  Sets the rate at which the GL windows swaps buffers.

- **char valid () const**
  Is turned off when FLTK creates a new context for this window or when the window resizes, and is turned on after draw() is called.

- **void valid (char v)**
  See char Fl_Gl_Window::valid() const.

- **Fl_Gl_Window ()**
  The destructor removes the widget and destroys the OpenGL context associated with it.

## Public Member Functions inherited from Fl_Window

- **virtual class Fl_Double_Window * as_double_window ()**
  Return non-null if this is an Fl_Double_Window object.

- **virtual class Fl_Overlay_Window * as_overlay_window ()**
  Return non-null if this is an Fl_Overlay_Window object.

- **Fl_Window const * as_window () const FL_OVERRIDE**
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- **unsigned int border () const**
  Returns whether the window possesses a border.

- **void border (int b)**
  Sets whether or not the window manager border is around the window.

- **void clear_border ()**
Fast inline function to turn the window manager border off.

- void **clear_modal_states** ()
  
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

- void **copy_label** (const char ∗a)
  
  Sets the window title bar label to a copy of a character string.

- void **cursor** (const Fl_RGB_Image ∗, int, int)
  
  Changes the cursor for this window using the provided image as cursor's shape.

- void **cursor** (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.

- void **cursor** (Fl_Cursor)
  
  Changes the cursor for this window.

- int **decorated_h** () const
  
  Returns the window height including any window title bar and any frame added by the window manager.

- int **decorated_w** () const
  
  Returns the window width including any frame added by the window manager.

- void **default_cursor** (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  
  For back compatibility only.

- void **default_cursor** (Fl_Cursor)
  
  Sets the default window cursor.

- void **draw_backdrop** ()
  
  Draw the background image if one is set and is aligned inside.

- Fl_Window (int w, int h, const char ∗title=0)
  
  Creates a window from the given width \( w \), height \( h \), and \( title \).

- Fl_Window (int x, int y, int w, int h, const char ∗title=0)
  
  Creates a window from the given position \( (x, y) \), size \( (w, h) \) and \( title \).

- void **free_position** ()
  
  Undoes the effect of a previous \( \text{resize()} \) or \( \text{show()} \) so that the next time \( \text{show()} \) is called the window manager is free to position the window.

- void **fullscreen** ()
  
  Makes the window completely fill one or more screens, without any window manager border visible.

- unsigned int **fullscreen_active** () const
  
  Returns non zero if \( \text{FULLSCREEN} \) flag is set, 0 otherwise.

- void **fullscreen_off** ()
  
  Turns off any side effects of \( \text{fullscreen()} \)

- void **fullscreen_off** (int X, int Y, int W, int H)
  
  Turns off any side effects of \( \text{fullscreen()} \) and does \( \text{resize(x,y,w,h)} \).

- void **fullscreen_screens** (int top, int bottom, int left, int right)
  
  Sets which screens should be used when this window is in fullscreen mode.

- int **handle** (int) FL_OVERRIDE
  
  Handles the specified event.

- void **hide** () FL_OVERRIDE
  
  Removes the window from the screen.

- void **hotspot** (const Fl_Widget &p, int offscreen=0)
  
  See void \( \text{Fl_Window::hotspot(int x, int y, int offscreen = 0)} \)

- void **hotspot** (const Fl_Widget ∗, int offscreen=0)
  
  See void \( \text{Fl_Window::hotspot(int x, int y, int offscreen = 0)} \)

- void **hotspot** (int x, int y, int offscreen=0)
  
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- const void ∗**icon** () const
  
  Gets the current icon window target dependent data.
• void **icon** (const **Fl_RGB_Image** *)
  Sets or resets a single window icon.
• void **icon** (const void *)
  Platform-specific method to set the window icon usable on Windows and X11 only.
• void **iconize** ()
  Iconifies the window.
• const char * **iconlabel** () const
  See void **Fl_Window::iconlabel**(const char*)
• void **iconlabel** (const char *)
  Sets the icon label.
• void **icons** (const **Fl_RGB_Image** *[], int)
  Sets the window icons.
• void **icons** (**HICON** big_icon, **HICON** small_icon)
  Sets the window icons using HICON handles (Windows platform only).
• const char * **label** () const
  See void **Fl_Window::label**(const char*)
• void **label** (const char *)
  Sets the window title bar label.
• void **label** (const char *label, const char *iconlabel)
  Sets the icon label.
• void **make_current** ()
  Sets things up so that the drawing functions in <**FL/fl_draw.H**> will go into this window.
• void **maximize** ()
  Maximizes a top-level window to its current screen.
• unsigned int **maximize_active** () const
  Returns whether the window is currently maximized.
• unsigned int **menu_window** () const
  Returns true if this window is a menu window.
• unsigned int **modal** () const
  Returns true if this window is modal.
• unsigned int **non_modal** () const
  Returns true if this window is modal or non-modal.
• **fluintptr_t** **os_id** ()
  Returns a platform-specific identification of a shown window, or 0 if not shown.
• unsigned int **override** () const
  Returns non zero if OVERRIDE flag is set, 0 otherwise.
• void **resize** (int X, int Y, int W, int H) **FL_OVERRIDE**
  Changes the size and position of the window.
• int **screen_num** ()
  The number of the screen containing the mapped window.
• void **screen_num** (int screen_num)
  Set the number of the screen where to map the window.
• void **set_menu_window** ()
  Marks the window as a menu window.
• void **set_modal** ()
  A "modal" window, when **shown()**, will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).
• void **set_non_modal** ()
A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a modal() one in that it remains on top, but it has no effect on event delivery.

- **void set_override ()**
  Activates the flags NOBORDER|OVERRIDE.
- **void set_tooltip_window ()**
  Marks the window as a tooltip window.
- **const Fl_Image ∗ shape ()**
  Returns the image controlling the window shape or NULL.
- **void shape (const Fl_Image &b)**
  Set the window’s shape with an Fl_Image.
- **void shape (const Fl_Image ∗img)**
  Assigns a non-rectangular shape to the window.
- **void show () FL_OVERRIDE**
  Puts the window on the screen.
- **void show (int argc, char ∗∗argv)**
  Puts the window on the screen with show() and parses command-line arguments.
- **int shown ()**
  Returns non-zero if show() has been called (but not hide() ).
- **void size_range (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)**
  Sets the allowable range the user can resize this window to.
- **unsigned int tooltip_window () const**
  Returns true if this window is a tooltip window.
- **void un_maximize ()**
  Returns a previously maximized top-level window to its previous size.
- **void wait_for_expose ()**
  Waits for the window to be displayed after calling show().
- **int x_root () const**
  Gets the x position of the window on the screen.
- **const char ∗ xclass () const**
  Returns the xclass for this window, or a default.
- **void xclass (const char ∗c)**
  Sets the xclass for this window.
- **int y_root () const**
  Gets the y position of the window on the screen.
- **virtual ∼Fl_Window ()**
  The destructor also deletes all the children.

**Public Member Functions inherited from Fl_Group**

- **Fl_Widget ∗& _ddfdesign_kludge ()**
  This is for forms compatibility only.
- **void add (Fl_Widget &)**
  The widget is removed from its current group (if any) and then added to the end of this group.
- **void add (Fl_Widget ∗o)**
  See void Fl_Group::add(Fl_Widget &w)
- **void add_resizable (Fl_Widget &o)**
  Adds a widget to the group and makes it the resizable widget.
- **Fl_Widget ∗const ∗ array () const**
  Returns a pointer to the array of children.
- **Fl_Group const ∗ as_group () const FL_OVERRIDE**
- **Fl_Group ∗ as_group () FL_OVERRIDE**
Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin ()**
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget ∗ child (int n) const**
  Returns arra[y] [n].

- **int children () const**
  Returns how many child widgets the group has.

- **void clear ()**
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()**
  Returns the current clipping mode.

- **void clip_children (int c)**
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child (int n)**
  Removes the widget at index from the group and deletes it.

- **void end ()**
  Exactly the same as current(this->parent()).

- **int find (const Fl_Widget &o) const**
  See int Fl_Group::find(const Fl_Widget ∗w) const.

- **int find (const Fl_Widget ∗) const**
  Searches the child array for the widget and returns the index.

- **Fl_Group (int, int, int, int, const char ∗=0)**
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus (Fl_Widget ∗W)**

- **void forms_end ()**
  This is for forms compatibility only.

- **void init_sizes ()**
  Resets the internal array of widget sizes and positions.

- **void insert (Fl_Widget &, int i)**
  The widget is removed from its current group (if any) and then inserted into this group.

- **void insert (Fl_Widget &, Fl_Widget ∗before)**
  This does insert(w, find(before)).

- **void remove (Fl_Widget ∗) &**
  Removes a widget from the group but does not delete it.

- **void remove (Fl_Widget ∗o)**
  Removes the widget o from the group.

- **void remove (int index)**
  Removes the widget at index from the group but does not delete it.

- **Fl_Widget ∗ resizable () const**
  Returns the group's resizable widget.

- **void resizable (Fl_Widget ∗o)**
  Sets the group's resizable widget.

- **void resizable (Fl_Widget ∗o)**
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- **virtual ∼Fl_Group ()**
  The destructor also deletes all the children.
Public Member Functions inherited from Fl_Widget

- void _clear_fullscreen ()
- void _set_fullscreen ()
- void activate ()
  Activates the widget.
- unsigned int active () const
  Returns whether the widget is active.
- int active_r () const
  Returns whether the widget and all of its parents are active.
- Fl_Align align () const
  Gets the label alignment.
- void align (Fl_Align alignment)
  Sets the label alignment.
- long argument () const
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  Sets the current user data (long) argument that is passed to the callback function.
- void bind_deimage (Fl_Image img)
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image img)
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  Gets the current callback function for the widget.
- void callback (Fl_Callback cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback cb, Fl_Callback_User_Data p, bool auto_free)
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback cb, void p)
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback0 cb)
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 cb, long p=0)
  Sets the current callback function for the widget.
- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
Sets a widget to accept input.

- **void clear_visible ()**
  
  Hides the widget.

- **void clear_visible_focus ()**
  
  Disables keyboard focus navigation with this widget.

- **Fl_Color color () const**
  
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

- **Fl_Color color2 () const**
  
  For back compatibility only.

- **void color2 (unsigned a)**
  
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  
  Sets the current label.

- **void copy_tooltip (const char *text)**
  
  Sets the current tooltip text.

- **uchar damage () const**
  
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  
  Internal use only.

- **void deactivate ()**
  
  Deactivates the widget.

- **Fl_Image * deimage ()**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image * deimage () const**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound () const**
  
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_CallbackReason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget +widget, long arg, Fl_CallbackReason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget +widget, void +arg=0, Fl_CallbackReason reason=FL_REASON_UNKNOWN)**
  
  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, Fl_Align) const**
  
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h () const**
  
  Gets the widget height.
• `Fl_Image * image ()`
  Gets the image that is used as part of the widget label when in the active state.

• `const Fl_Image * image () const`
  Gets the image that is used as part of the widget label when in the active state.

• `void image (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the active state.

• `void image (Fl_Image * img)`
  Sets the image to use as part of the widget label when in the active state.

• `int image_bound () const`
  Returns whether the image is managed by the widget.

• `int inside (const Fl_Widget * wgt) const`
  Checks if this widget is a child of `wgt`.

• `int is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.

• `const char * label () const`
  Gets the current label text.

• `void label (const char * text)`
  Sets the current label pointer.

• `void label (Fl_Labeltype a, const char * b)`
  Shortcut to set the label text and type in one call.

• `Fl_Color labelcolor () const`
  Gets the label color.

• `void labelcolor (Fl_Color c)`
  Sets the label color.

• `Fl_Font labelfont () const`
  Gets the font to use.

• `void labelfont (Fl_Font f)`
  Sets the font to use.

• `Fl_Fontsize labelsize () const`
  Gets the font size in pixels.

• `void labelsize (Fl_Fontsize pix)`
  Sets the font size in pixels.

• `Fl_Labeltype labeltype () const`
  Gets the label type.

• `void labeltype (Fl_Labeltype a)`
  Sets the label type.

• `void measure_label (int &ww, int &hh) const`
  Sets width `ww` and height `hh` accordingly with the label size.

• `bool needs_keyboard () const`
  Returns whether this widget needs a keyboard.

• `void needs_keyboard (bool needs)`
  Sets whether this widget needs a keyboard.

• `unsigned int output () const`
  Returns if a widget is used for output only.

• `Fl_Group * parent () const`
  Returns a pointer to the parent widget.

• `void parent (Fl_Group * p)`
  Internal use only - “for hacks only”.

• `void position (int X, int Y)`
  Repositions the window or widget.

• `void redraw ()`
Schedules the drawing of the widget.

- **void **redraw_label ()
  Schedules the drawing of the label.

- **Fl_Color** selection_color () const
  Gets the selection color.

- **void** selection_color (Fl_Color a)
  Sets the selection color.

- **void** set_active ()
  Marks the widget as active without sending events or changing focus.

- **void** set_changed ()
  Marks the value of the widget as changed.

- **void** set_output ()
  Sets a widget to output only.

- **void** set_visible ()
  Makes the widget visible.

- **void** set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- **int** shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void** shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **void** size (int W, int H)
  Changes the size of the widget.

- **int** take_focus ()
  Gives the widget the keyboard focus.

- **unsigned int** takesevents () const
  Returns if the widget is able to take events.

- **int** test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

- **const char ∗** tooltip () const
  Gets the current tooltip text.

- **void** tooltip (const char ∗text)
  Sets the current tooltip text.

- **Fl_Window ∗** top_window () const
  Returns a pointer to the top-level window for the widget.

- **Fl_Window ∗** top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar** type () const
  Gets the widget type.

- **void** type (uchar t)
  Sets the widget type.

- **int** use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- **void ∗** user_data () const
  Gets the user data for this widget.

- **void** user_data (Fl_Callback_User_Data ∗v, bool auto_free)
  Sets the user data for this widget.

- **void** user_data (void ∗v)
  Sets the user data for this widget.

- **unsigned int** visible () const
  Returns whether a widget is visible.
- unsigned int **visible_focus** () const
  Checks whether this widget has a visible focus.
- void **visible_focus** (int v)
  Modifies keyboard focus navigation.
- int **visible_r** () const
  Returns whether a widget and all its parents are visible.
- int **w** () const
  Gets the widget width.
- **Fl_When** **when** () const
  Returns the conditions under which the callback is called.
- void **when** (uchar i)
  Sets the flags used to decide when a callback is called.
- **Fl_Window** *window** () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
- int **x** () const
  Gets the widget position in its window.
- int **y** () const
  Gets the widget position in its window.
- virtual ~**Fl_Widget** ()
  Destroys the widget.

**Static Public Member Functions**

- static int **can_do** (const int *m)
  Returns non-zero if the hardware supports the given OpenGL mode.
- static int **can_do** (int m)
  Returns non-zero if the hardware supports the given OpenGL mode.

**Static Public Member Functions inherited from Fl_Window**

- static **Fl_Window** *current** ()
  Returns the last window that was made current.
- static void **default_callback** (Fl_Window *, void *)
  Back compatibility: Sets the default callback v for win to call on close event.
- static void **default_icon** (const Fl_RGB_Image *v)
  Sets a single default window icon.
- static void **default_icons** (const Fl_RGB_Image *[ ]; int)
  Sets the default window icons.
- static void **default_icons** (HICON big_icon, HICON small_icon)
  Sets the default window icons (Windows platform only).
- static const char * **default_xclass** ()
  Returns the default xclass.
- static void **default_xclass** (const char *v)
  Sets the default window xclass.
- static bool **is_a_rescale** ()
  Returns true when a window is being rescaled.
- static char **show_next_window_iconic** ()
  Returns the static flag whether the next window should be opened iconified.
- static void **show_next_window_iconic** (char stat)
  Sets a static flag whether the next window should be opened iconified.
Static Public Member Functions inherited from Fl_Group

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *t)
  Returns the Unicode value of the ‘&x’ shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered ‘&x’ shortcut.

Protected Member Functions

- void draw () FL_OVERRIDE
  Draws the Fl_Gl_Window.
- void draw_begin ()
  Supports drawing to an Fl_Gl_Window with the FLTK 2D drawing API.
- void draw_end ()
  To be used as a match for a previous call to Fl_Gl_Window::draw_begin().

Protected Member Functions inherited from Fl_Window

- void default_size_range ()
  Protected method to calculate the default size range of a window.
- void draw () FL_OVERRIDE
  Draws the widget.
- int force_position () const
  Returns the internal state of the window’s FORCE_POSITION flag.
- void force_position (int force)
  Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void free_icons ()
  Deletes all icons previously attached to the window.
- int is_resizable ()
  Protected method to determine whether a window is resizable.

Protected Member Functions inherited from Fl_Group

- Fl_Rect * bounds ()
  Returns the internal array of widget sizes and positions.
- void draw_child (Fl_Widget &widget) const
  Forces a child to redraw.
- void draw_children ()
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
Allow derived groups to act when a widget is moved within the group.
• virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.

Static Protected Attributes inherited from Fl_Window

```
• static Fl_Window * current_
  Stores the last window that was made current.
```

12.49.1 Detailed Description

The Fl_Gl_Window widget sets things up so OpenGL works. It also keeps an OpenGL "context" for that window, so that changes to the lighting and projection may be reused between redraws. Fl_Gl_Window also flushes the OpenGL streams and swaps buffers after draw() returns. OpenGL hardware typically provides some overlay bit planes, which are very useful for drawing UI controls atop your 3D graphics. If the overlay hardware is not provided, FLTK tries to simulate the overlay. This works pretty well if your graphics are double buffered, but not very well for single-buffered. Please note that the FLTK drawing and clipping functions will not work inside an Fl_Gl_Window. All drawing should be done using OpenGL calls exclusively.

See also

OpenGL and support of HighDPI displays

Note

FLTK 1.4 introduces a driver system for graphic calls. It is now possible to add a selection of widgets to an OpenGL window. The widgets will draw on top of any OpenGL rendering. The number of supported widgets will increase as the driver development improves. Program test/cube.cxx illustrates how to do that. FLTK expects that when an Fl_Gl_Window is a child of a parent Fl_Window, the child window lies entirely inside its parent window. If that's not the case, what happens to the part of the GL subwindow which leaks outside its parent is undefined and susceptible to be platform-specific.

12.49.2 Constructor & Destructor Documentation

12.49.2.1 Fl_Gl_Window() [1/2]

```
Fl_Gl_Window::Fl_Gl_Window ( int W, int H, const char * l = 0 ) [inline]
```

Creates a new Fl_Gl_Window widget using the given size, and label string. The default boxtype is FL_NO_BOX. The default mode is FL_RGB|FL_DOUBLE|FL_DEPTH.
12.49.2.2 \texttt{Fl\_Gl\_Window()} [2/2]

\begin{verbatim}
Fl_Gl_Window::Fl_Gl_Window (  
    int \texttt{X},  
    int \texttt{Y},  
    int \texttt{W},  
    int \texttt{H},  
    const char * \texttt{l} = 0 ) \{ \textrm{inline} \}
\end{verbatim}

Creates a new \texttt{Fl\_Gl\_Window} widget using the given position, size, and label string.
The default boxtype is \texttt{FL\_NO\_BOX}. The default mode is \texttt{FL\_RGB|FL\_DOUBLE|FL\_DEPTH}.

12.49.3 Member Function Documentation

12.49.3.1 \texttt{as\_gl\_window()} [1/2]

\begin{verbatim}
Fl_Gl_Window const * Fl_Gl_Window::as_gl_window ( ) const \{ \textrm{inline}, \textrm{virtual} \}
\end{verbatim}
Reimplemented from \texttt{Fl\_Widget}.

12.49.3.2 \texttt{as\_gl\_window()} [2/2]

\begin{verbatim}
Fl_Gl_Window * Fl_Gl_Window::as_gl_window ( ) \{ \textrm{inline}, \textrm{virtual} \}
\end{verbatim}
Returns an \texttt{Fl\_Gl\_Window} pointer if this widget is an \texttt{Fl\_Gl\_Window}.
Use this method if you have a widget (pointer) and need to know whether this widget is derived from \texttt{Fl\_Gl\_Window}.
If it returns non-NULL, then the widget in question is derived from \texttt{Fl\_Gl\_Window}.

Return values

\begin{verbatim}
\texttt{NULL} if this widget is not derived from \texttt{Fl\_Gl\_Window}.
\end{verbatim}

Note

This method is provided to avoid \texttt{dynamic\_cast}.

See also

\texttt{Fl\_Widget::as\_group()}, \texttt{Fl\_Widget::as\_window()}

Reimplemented from \texttt{Fl\_Widget}.

12.49.3.3 \texttt{can\_do()}

\begin{verbatim}
static int Fl_Gl_Window::can_do (  
    const int * \texttt{m} ) \{ \textrm{inline}, \textrm{static} \}
\end{verbatim}
Returns non-zero if the hardware supports the given OpenGL mode.

See also

\texttt{Fl\_Gl\_Window::mode(const int \texttt{m})}

12.49.3.4 \texttt{can\_do\_overlay()}

\begin{verbatim}
int Fl_Gl_Window::can_do_overlay ( )
\end{verbatim}
Returns true if the hardware overlay is possible.
If this is false, FLTK will try to simulate the overlay, with significant loss of update speed. Calling this will cause FLTK to open the display.

12.49.3.5 \texttt{context()} [1/2]

\begin{verbatim}
GLContext Fl_Gl_Window::context ( ) const \{ \textrm{inline} \}
\end{verbatim}
Returns a pointer to the window's OpenGL rendering context.
12.49.3.6 context() [2/2]

```cpp
void Fl_Gl_Window::context (GLContext v, int destroy_flag = 0)
```

Sets a pointer to the GLContext that this window is using. This is a system-dependent structure, but it is portable to copy the context from one window to another. You can also set it to NULL, which will force FLTK to recreate the context the next time `make_current()` is called, this is useful for getting around bugs in OpenGL implementations.

If `destroy_flag` is true the context will be destroyed by fltk when the window is destroyed, or when the mode() is changed, or the next time context(x) is called.

12.49.3.7 context_valid()

```cpp
char Fl_Gl_Window::context_valid () const [inline]
```

Will only be set if the OpenGL context is created or recreated.

It differs from `Fl_Gl_Window::valid()` which is also set whenever the context changes size.

12.49.3.8 draw()

```cpp
void Fl_Gl_Window::draw () [protected], [virtual]
```

Draws the `Fl_Gl_Window`.

You **must** subclass `Fl_Gl_Window` and provide an implementation for `draw()`. You may also provide an implementation of `draw_overlay()` if you want to draw into the overlay planes. You can avoid reinitializing the viewport and lights and other things by checking `valid()` at the start of `draw()` and only doing the initialization if it is false.

The `draw()` method can only use OpenGL calls. Do not attempt to call X, any of the functions in `<FL/fl_draw.H>`, or glX directly. Do not call `gl_start()` or `gl_finish()`.

If double-buffering is enabled in the window, the back and front buffers are swapped after this function is completed.

The following pseudo-code shows how to use "if (valid())" to initialize the viewport:

```cpp
void mywindow::draw() {
  if (!valid()) {
    glViewport(0,0,pixel_w(),pixel_h());
    glFrustum(...) or glOrtho(...)
    ...other initialization...
  }
  if (!context_valid()) {
    ...load textures, etc. ...
  }
  // clear screen
  glClearColor(...);
  glClear(...);
  ... draw your geometry here ...
}
```

Actual example code to clear screen to black and draw a 2D white "X":

```cpp
void mywindow::draw() {
  if (!valid()) {
    glLoadIdentity();
    glViewport(0,0,pixel_w(),pixel_h());
    glOrtho(-w(),w(),-h(),h(),-1,1);
  }
  // Clear screen
  glClearColor(GL_COLOR_BUFFER_BIT);
  // Draw white 'X'
  glColor3f(1.0, 1.0, 1.0);
  glBegin(GL_LINESPAIR); glVertex2f(w(), h()); glVertex2f(-w(), h()); glEnd();
  glBegin(GL_LINESPAIR); glVertex2f(w(), -h()); glVertex2f(-w(), -h()); glEnd();
}
```

Regular FLTK widgets can be added as children to the `Fl_Gl_Window`. To correctly overlay the widgets, `Fl_Gl_Window::draw()` must be called after rendering the main scene.

```cpp
void mywindow::draw() {
  // draw 3d graphics scene
  Fl_Gl_Window::draw();
  // -- or --
  draw_begin();
  Fl_Window::draw();
}
```
// other 2d drawing calls, overlays, etc.
draw_end();
}

Implements Fl_Widget.
Reimplemented in Fl_Glut_Window.

### 12.49.3.9 draw_begin()

```cpp
void Fl_Gl_Window::draw_begin ( ) [protected]
```

Supports drawing to an Fl_Gl_Window with the FLTK 2D drawing API.

See also

*Using FLTK widgets in OpenGL Windows*

### 12.49.3.10 draw_end()

```cpp
void Fl_Gl_Window::draw_end ( ) [protected]
```

To be used as a match for a previous call to Fl_Gl_Window::draw_begin().

See also

*Using FLTK widgets in OpenGL Windows*

### 12.49.3.11 flush()

```cpp
void Fl_Gl_Window::flush ( ) [virtual]
```

Forces the window to be drawn, this window is also made current and calls draw().
Reimplemented from Fl_Window.

### 12.49.3.12 handle()

```cpp
int Fl_Gl_Window::handle ( int event ) [virtual]
```

Handle some FLTK events as needed.
Reimplemented from Fl_Widget.
Reimplemented in Fl_Glut_Window.

### 12.49.3.13 hide()

```cpp
void Fl_Gl_Window::hide ( ) [virtual]
```

Hides the window and destroys the OpenGL context.
Reimplemented from Fl_Widget.

### 12.49.3.14 make_current()

```cpp
void Fl_Gl_Window::make_current ( )
```

The make_current() method selects the OpenGL context for the widget.
It is called automatically prior to the draw() method being called and can also be used to implement feedback and/or selection within the handle() method.

### 12.49.3.15 make_overlay_current()

```cpp
void Fl_Gl_Window::make_overlay_current ( )
```

Selects the OpenGL context for the widget's overlay.
This method is called automatically prior to the draw_overlay() method being called and can also be used to implement feedback and/or selection within the handle() method.
12.49.3.16  mode() [1/3]

Fl_Mode Fl_Gl_Window::mode ( ) const [inline]
Returns the current OpenGL capabilities of the window.
Don't use this if capabilities were set through Fl_Gl_Window::mode(const int *a).

12.49.3.17  mode() [2/3]

int Fl_Gl_Window::mode ( const int *a ) [inline]
Set the OpenGL capabilities of the window using platform-specific data.

Parameters

| a | zero-ending array of platform-specific attributes and attribute values |

Unix/Linux platform: attributes are GLX attributes adequate for the 3rd argument of the glXChooseVisual() function (e.g., GLX_DOUBLEBUFFER, defined by including <GL/glx.h>).

Note

What attributes are adequate here is subject to change. The preferred, stable public API is Fl_Gl_Window::mode(int a).

Windows platform: this member function is of no use.

Mac OS X platform: attributes belong to the CGLPixelFormatAttribute enumeration (defined by including <OpenGL/OpenGL.h>, e.g., kCGLPFADoubleBuffer) and may be followed by adequate attribute values.

12.49.3.18  mode() [3/3]

int Fl_Gl_Window::mode ( int a ) [inline]
Set or change the OpenGL capabilities of the window.
The value can be any of the following OR'd together:

- FL_RGB - RGB color (not indexed)
- FL_RGB8 - RGB color with at least 8 bits of each color
- FL_INDEX - Indexed mode
- FL_SINGLE - not double buffered
- FL_DOUBLE - double buffered
- FL_ACCUM - accumulation buffer
- FL_ALPHA - alpha channel in color
- FL_DEPTH - depth buffer
- FL_STENCIL - stencil buffer
- FL_MULTISAMPLE - multisample antialiasing
- FL_OPENGL3 - use OpenGL version 3.0 or more.

FL_RGB and FL_SINGLE have a value of zero, so they are "on" unless you give FL_INDEX or FL_DOUBLE.
If the desired combination cannot be done, FLTK will try turning off FL_MULTISAMPLE. If this also fails the show() will call Fl::error() and not show the window.

You can change the mode while the window is displayed. This is most useful for turning double-buffering on and off.
Under X this will cause the old X window to be destroyed and a new one to be created. If this is a top-level window this will unfortunately also cause the window to blink, raise to the top, and be de-iconized, and the xid() will change, possibly breaking other code. It is best to make the GL window a child of another window if you wish to do this!
mode() must not be called within draw() since it changes the current context.
The FL_OPENGL3 flag is required to access OpenGL version 3 or more under the X11 and MacOS platforms; it's optional under Windows and Wayland. See more details in Using OpenGL 3.0 (or higher versions).
12.49 Fl_Gl_Window Class Reference

12.49.3.19 ortho()

void Fl_Gl_Window::ortho ( )
Sets the projection so 0,0 is in the lower left of the window and each pixel is 1 unit wide/tall. If you are drawing 2D images, your draw() method may want to call this if valid() is false.

12.49.3.20 pixel_h()

int Fl_Gl_Window::pixel_h ( ) [inline]
Gives the window height in OpenGL pixels. When an Fl_Gl_Window is mapped to a HighDPI display, the value given by Fl_Gl_Window::h() which is expressed in FLTK units, may differ from the window height in pixels. Calls to OpenGL functions expecting pixel values (e.g., glViewport) should therefore use pixel_h() rather than h(). Method pixel_h() detects when the GUI is rescaled or when the window has been moved between low and high resolution displays and automatically adjusts the returned value.

Version 1.3.4

12.49.3.21 pixel_w()

int Fl_Gl_Window::pixel_w ( ) [inline]
Gives the window width in OpenGL pixels. When an Fl_Gl_Window is mapped to a HighDPI display, the value given by Fl_Gl_Window::w() which is expressed in FLTK units, may differ from the window width in pixels. Calls to OpenGL functions expecting pixel values (e.g., glViewport) should therefore use pixel_w() rather than w(). Method pixel_w() detects when the GUI is rescaled or when the window has been moved between low and high resolution displays and automatically adjusts the returned value.

Version 1.3.4

12.49.3.22 pixels_per_unit()

float Fl_Gl_Window::pixels_per_unit ( )
The number of pixels per FLTK unit of length for the window. This method dynamically adjusts its value when the GUI is rescaled or when the window is moved to/from displays of distinct resolutions. This method is useful, e.g., to convert, in a window's handle() method, the FLTK units returned by Fl::event_x() and Fl::event_y() to the pixel units used by the OpenGL source code.

Version 1.3.4

12.49.3.23 redraw_overlay()

void Fl_Gl_Window::redraw_overlay ( )
Causes draw_overlay() to be called at a later time. Initially the overlay is clear. If you want the window to display something in the overlay when it first appears, you must call this immediately after you show() your window.
12.49.3.24 resize()

void Fl_Gl_Window::resize (   
    int x,   
    int y,   
    int w,   
    int h ) [virtual]

Changes the size or position of the widget.
This is a virtual function so that the widget may implement its own handling of resizing. The default version does not call the redraw() method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call resize() a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for resize(X, Y, w(), h()), and size(W, H) is a shortcut for resize(x(), y(), W, H).

Parameters

| in | x, y | new position relative to the parent window |
| in | w, h | new size |

See also

position(int,int), size(int,int)

Reimplemented from Fl_Widget.

12.49.3.25 show()

void Fl_Gl_Window::show ( ) [virtual]

Makes a widget visible.
An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL_SHOW.
The visible() method returns true if the widget is set to be visible. The visible_r() method returns true if the widget and all of its parents are visible. A widget is only visible if visible() is true on it and all of its parents.
Changing it will send FL_SHOW or FL_HIDE events to the widget. Do not change it if the parent is not visible, as this will send false FL_SHOW or FL_HIDE events to the widget. redraw() is called if necessary on this or the parent.

See also

hide(), visible(), visible_r()

Reimplemented from Fl_Widget.

12.49.3.26 swap_buffers()

void Fl_Gl_Window::swap_buffers ( )
The swap_buffers() method swaps the back and front buffers.
It is called automatically after the draw() method is called.

12.49.3.27 swap_interval() [1/2]

int Fl_Gl_Window::swap_interval ( ) const

Gets the rate at which the GL windows swaps buffers.
This method can be called after the OpenGL context was created, typically within the user overridden Fl_Gl_Window::draw() method that will be overridden by the user.
Note

This method depends highly on the underlying OpenGL contexts and driver implementation. Some drivers return no information, most drivers don’t support intervals with multiple frames and return only 0 or 1. Some drivers have the ability to set the swap interval but no way to query it, hence this method may return -1 even though the interval was set correctly. Conversely a return value greater zero does not guarantee that the driver actually honors the setting.

Returns

an integer greater zero if vertical blanking is taken into account when swapping OpenGL buffers
0 if the vertical blanking is ignored
-1 if the information can not be retrieved

12.49.3.28 swap_interval() [2/2]

void Fl_Gl_Window::swap_interval (  
    int frames )

Sets the rate at which the GL windows swaps buffers.
This method can be called after the OpenGL context was created, typically within the user overridden Fl_Gl_Window::draw() method that will be overridden by the user.

Note

This method depends highly on the underlying OpenGL contexts and driver implementation. Most driver seem to accept only 0 and 1 to swap buffer asynchronously or in sync with the vertical blank.

Parameters

| in   | frames     | set the number of vertical frame blanks between OpenGL buffer swaps |

12.49.3.29 valid()

char Fl_Gl_Window::valid ( ) const [inline]

Is turned off when FLTK creates a new context for this window or when the window resizes, and is turned on after draw() is called.

You can use this inside your draw() method to avoid unnecessarily initializing the OpenGL context. Just do this:

```cpp
void mywindow::draw() { 
    if (!valid()) { 
        glViewport(0,0,pixel_w(),pixel_h());
        glFrustum(...);
        ...other initialization...
    }
    if (!context_valid()) { 
        ...load textures, etc. ...
    }
    ... draw your geometry here ... 
}
```

You can turn valid() on by calling valid(1). You should only do this after fixing the transformation inside a draw() or after make_current(). This is done automatically after draw() returns.

The documentation for this class was generated from the following files:

- Fl_Gl_Window.H
- Fl_Gl_Overlay.cxx
- Fl_Gl_Window.cxx

12.50 Fl_Glut_Bitmap_Font Struct Reference

fltk glut font/size attributes used in the glutXXX functions
#include <glut.H>

Generated by Doxygen
Public Attributes

• \texttt{Fl\_Font} font
• \texttt{Fl\_Fontsize} size

12.50.1 Detailed Description

\texttt{fltk} glut font/size attributes used in the glutXXX functions

The documentation for this struct was generated from the following file:

• glut.H

12.51 \texttt{Fl\_Glut\_StrokeChar} Struct Reference

Public Attributes

• int \texttt{Number}
• GLfloat \texttt{Right}
• const \texttt{Fl\_Glut\_StrokeStrip *} \texttt{Strips}

The documentation for this struct was generated from the following file:

• glut.H

```

Public Member Functions

- **Fl_Glut_Window** (int w, int h, const char *t=0)
  
  Creates a glut window, registers to the glut windows list.

- **Fl_Glut_Window** (int x, int y, int w, int h, const char *t=0)
  
  Creates a glut window, registers to the glut windows list.

- `void make_current()`

- `~Fl_Glut_Window()`
  
  Destroys the glut window, first unregister it from the glut windows list.

Public Member Functions inherited from Fl_Gl_Window

- `Fl_Gl_Window const * as_gl_window () const FL_OVERRIDE`

- `Fl_Gl_Window * as_gl_window () FL_OVERRIDE`
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- `int can_do ()`
  
  Returns non-zero if the hardware supports the current OpenGL mode.

- `int can_do_overlay ()`
  
  Returns true if the hardware overlay is possible.

- `GLContext context () const`
  
  Returns a pointer to the window's OpenGL rendering context.

- `void context (GLContext, int destroy_flag=0)`
  
  Sets a pointer to the GLContext that this window is using.

- `char context_valid () const`
  
  Will only be set if the OpenGL context is created or recreated.

- `void context_valid (char v)`
  
  See char Fl_Gl_Window::context_valid() const.

- **Fl_Gl_Window** (int W, int H, const char *l=0)
  
  Creates a new Fl_Gl_Window widget using the given size, and label string.

- **Fl_Gl_Window** (int X, int Y, int W, int H, const char *l=0)
  
  Creates a new Fl_Gl_Window widget using the given position, size, and label string.

- `void flush () FL_OVERRIDE`
  
  Forces the window to be drawn, this window is also made current and calls draw().

- `void hide () FL_OVERRIDEE`
Hides the window and destroys the OpenGL context.

- **void hide_overlay()**
  - Hides the window if it is not this window, does nothing in Windows.

- **void invalidate()**
  - The invalidate() method turns off valid() and is equivalent to calling value(0).

- **void make_current()**
  - The make_current() method selects the OpenGL context for the widget.

- **void make_overlay_current()**
  - Selects the OpenGL context for the widget’s overlay.

- **FL_Mode mode() const**
  - Returns the current OpenGL capabilities of the window.

- **int mode(const int*a)**
  - Set the OpenGL capabilities of the window using platform-specific data.

- **int mode(int a)**
  - Set or change the OpenGL capabilities of the window.

- **void ortho()**
  - Sets the projection so 0,0 is in the lower left of the window and each pixel is 1 unit wide/tall.

- **int pixel_h()**
  - Gives the window height in OpenGL pixels.

- **int pixel_w()**
  - Gives the window width in OpenGL pixels.

- **float pixels_per_unit()**
  - The number of pixels per FLTK unit of length for the window.

- **void redraw_overlay()**
  - Causes draw_overlay() to be called at a later time.

- **void resize(int, int, int, int) FL_OVERRIDE**
  - Changes the size or position of the widget.

- **void show() FL_OVERRIDE**
  - Makes a widget visible.

- **void show(int a, char**∗∗∗∗b)**
  - Same as Fl_Window::show(int a, char**∗∗b)

- **void swapBuffers()**
  - The swap_buffers() method swaps the back and front buffers.

- **int swap_interval() const**
  - Gets the rate at which the GL windows swaps buffers.

- **void swap_interval(int)**
  - Sets the rate at which the GL windows swaps buffers.

- **char valid() const**
  - Is turned off when FLTK creates a new context for this window or when the window resizes, and is turned on after draw() is called.

- **void valid(char v)**
  - See char Fl_Gl_Window::valid() const.

- **~Fl_Gl_Window()**
  - The destructor removes the widget and destroys the OpenGL context associated with it.
Public Member Functions inherited from Fl_Window

- virtual class Fl_Double_Window * as_double_window ()
  Return non-null if this is an Fl_Double_Window object.
- virtual class Fl_Overlay_Window * as_overlay_window ()
  Return non-null if this is an Fl_Overlay_Window object.
- Fl_Window const * as_window () const FL_OVERRIDE
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- unsigned int border () const
  Returns whether the window possesses a border.
- void border (int b)
  Sets whether or not the window manager border is around the window.
- void clear_border ()
  Fast inline function to turn the window manager border off.
- void clear_modal_states ()
  Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
- void copy_label (const char *a)
  Sets the window titlebar label to a copy of a character string.
- void cursor (const Fl_RGB_Image *c, int, int)
  Changes the cursor for this window using the provided image as cursor's shape.
- void cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  For back compatibility only.
- void cursor (Fl_Cursor)
  Changes the cursor for this window.
- int decorated_h () const
  Returns the window height including any window title bar and any frame added by the window manager.
- int decorated_w () const
  Returns the window width including any frame added by the window manager.
- void default_cursor (Fl_Cursor c, Fl_Color, Fl_Color=FL_WHITE)
  For back compatibility only.
- void default_cursor (Fl_Cursor)
  Sets the default window cursor.
- void draw_backdrop ()
  Draw the background image if one is set and is aligned inside.
- Fl_Window (int w, int h, const char *title=0)
  Creates a window from the given width w, height h, and title.
- Fl_Window (int x, int y, int w, int h, const char *title=0)
  Creates a window from the given position (x, y), size (w, h) and title.
- void free_position ()
  Undoes the effect of a previous resize() or show() so that the next time show() is called the window manager is free to position the window.
- void fullscreen ()
  Makes the window completely fill one or more screens, without any window manager border visible.
- unsigned int fullscreen_active () const
  Returns non zero if FULLSCREEN flag is set, 0 otherwise.
- void fullscreen_off ()
  Turns off any side effects of fullscreen()
- void fullscreen_off (int X, int Y, int W, int H)
  Turns off any side effects of fullscreen() and does resize(x,y,w,h).
- void fullscreen_screens (int top, int bottom, int left, int right)
Sets which screens should be used when this window is in fullscreen mode.

- int handle (int) FL_OVERRIDE
  Handles the specified event.

- void hide () FL_OVERRIDE
  Removes the window from the screen.

- void hotspot (const Fl_Widget &p, int offscreen=0)
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- void hotspot (const Fl_Widget *, int offscreen=0)
  See void Fl_Window::hotspot(int x, int y, int offscreen = 0)

- void hotspot (int x, int y, int offscreen=0)
  Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- const void * icon () const
  Gets the current icon window target dependent data.

- void icon (const Fl_RGB_Image *)
  Sets or resets a single window icon.

- void icon (const void *ic)
  Platform-specific method to set the window icon usable on Windows and X11 only.

- void iconize ()
  Iconifies the window.

- const char * iconlabel () const
  See void Fl_Window::iconlabel(const char *)

- void iconlabel (const char *)
  Sets the icon label.

- void icons (const Fl_RGB_Image *[ ], int)
  Sets the window icons.

- void icons (HICON big_icon, HICON small_icon)
  Sets the window icons using HICON handles (Windows platform only).

- const char * label () const
  See void Fl_Window::label(const char *)

- void label (const char *)
  Sets the window title bar label.

- void label (const char *label, const char *iconlabel)
  Sets the icon label.

- void make_current ()
  Sets things up so that the drawing functions in <FL/fl_draw.H> will go into this window.

- void maximize ()
  Maximizes a top-level window to its current screen.

- unsigned int maximize_active () const
  Returns whether the window is currently maximized.

- unsigned int menu_window () const
  Returns true if this window is a menu window.

- unsigned int modal () const
  Returns true if this window is modal.

- unsigned int non_modal () const
  Returns true if this window is modal or non-modal.

- fl_uintptr_t os_id ()
  Returns a platform-specific identification of a shown window, or 0 if not shown.

- unsigned int override () const
Returns non zero if OVERRIDE flag is set, 0 otherwise.

\- void \texttt{resize} (int X, int Y, int W, int H) \texttt{FL\_OVERRIDE}

Changes the size and position of the window.

\- int \texttt{screen\_num} ()

The number of the screen containing the mapped window.

\- void \texttt{screen\_num} (int screen\_num)

Set the number of the screen where to map the window.

\- void \texttt{set\_menu\_window} ()

Marks the window as a menu window.

\- void \texttt{set\_modal} ()

A ”modal” window, when \texttt{shown()}, will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the ”transient for” property).

\- void \texttt{set\_non\_modal} ()

A ”non-modal” window (terminology borrowed from Microsoft Windows) acts like a \texttt{modal()} one in that it remains on top, but it has no effect on event delivery.

\- void \texttt{set\_override} ()

Activates the flags NOBORDER/OVERRIDE.

\- void \texttt{set\_tooltip\_window} ()

Marks the window as a tooltip window.

\- const \texttt{Fl\_Image} \* \texttt{shape} ()

Returns the image controlling the window shape or NULL.

\- void \texttt{shape} (const \texttt{Fl\_Image} \&b)

Set the window's shape with an \texttt{Fl\_Image}.

\- void \texttt{shape} (const \texttt{Fl\_Image} \*img)

Assigns a non-rectangular shape to the window.

\- void \texttt{show} () \texttt{FL\_OVERRIDE}

Puts the window on the screen.

\- void \texttt{show} (int argc, char \*=\*argv)

Puts the window on the screen with \texttt{show()} and parses command-line arguments.

\- int \texttt{shown} ()

Returns non-zero if \texttt{show()} has been called (but not \texttt{hide()}).

\- void \texttt{size\_range} (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)

Sets the allowable range the user can resize this window to.

\- unsigned int \texttt{tooltip\_window} () const

Returns true if this window is a tooltip window.

\- void \texttt{un\_maximize} ()

Returns a previously maximized top-level window to its previous size.

\- void \texttt{wait\_for\_expose} ()

Waits for the window to be displayed after calling \texttt{show()}.

\- int \texttt{x\_root} () const

Gets the x position of the window on the screen.

\- const char \* \texttt{xclass} () const

Returns the xclass for this window, or a default.

\- void \texttt{xclass} (const char \*=c)

Sets the xclass for this window.

\- int \texttt{y\_root} () const

Gets the y position of the window on the screen.

\- virtual \texttt{~FL\_Window} ()

The destructor also deletes all the children.
Public Member Functions inherited from Fl_Group

- **Fl_Widget** *& _ddfdesign_kludge ()
  This is for forms compatibility only.

- **void add (Fl_Widget &)
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void add (Fl_Widget &o)
  See void Fl_Group::add(Fl_Widget &w)

- **void add_resizable (Fl_Widget &o)
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget** *const & array () const
  Returns a pointer to the array of children.

- **Fl_Group** *const as_group () const FL_OVERRIDE
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void begin ()
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget** *child (int n) const
  Returns array()[n].

- **int children () const
  Returns how many child widgets the group has.

- **void clear ()
  Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()
  Returns the current clipping mode.

- **void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- **virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.

- **void end ()
  Exactly the same as current(this->parent()).

- **int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget &w) const.

- **int find (const Fl_Widget &)
  Searches the child array for the widget and returns the index.

- **Fl_Group** (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.

- **void focus (Fl_Widget &W)

- void forms_end ()
  This is for forms compatibility only.

- **void init_sizes ()
  Resets the internal array of widget sizes and positions.

- **void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.

- **void insert (Fl_Widget &o, Fl_Widget *before)
  This does insert(w, find(before)).

- **void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.

- **void remove (Fl_Widget &o)
  Removes the widget o from the group.

- **void remove (int index)
Removes the widget at index from the group but does not delete it.

- \textbf{Fl_Widget *} resizable () const
  
  Returns the group's resizable widget.

- void resizable (Fl_Widget &o)
  
  Sets the group's resizable widget.

- void resizable (Fl_Widget *o)
  
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- virtual ~Fl_Group ()
  
  The destructor also deletes all the children.

**Public Member Functions inherited from Fl_Widget**

- void \_clear_fullscreen ()
- void \_set_fullscreen ()
- void activate ()
  
  Activates the widget.

- unsigned int active () const
  
  Returns whether the widget is active.

- int active_r () const
  
  Returns whether the widget and all of its parents are active.

- Fl_Align align () const
  
  Gets the label alignment.

- void align (Fl_Align alignment)
  
  Sets the label alignment.

- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.

- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.

- void bind_deimage (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the inactive state.

- void bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void bind_image (Fl_Image *img)
  
  Sets the image to use as part of the widget label when in the active state.

- void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype box () const
  
  Gets the box type of the widget.

- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.

- Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.

- void callback (Fl_Callback *cb)
  
  Sets the current callback function for the widget.

- void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.

- void callback (Fl_Callback *cb, void *p)
  
  Sets the current callback function and data for the widget.

- void callback (Fl_Callback0 *cb)
  
  Sets the current callback function for the widget.

- void callback (Fl_Callback1 *cb, long p=0)
Sets the current callback function for the widget.

- unsigned int changed () const
  Checks if the widget value changed since the last callback.
- void clear_active ()
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  Clears or sets the damage flags.
- void clear_output ()
  Sets a widget to accept input.
- void clear_visible ()
  Hides the widget.
- void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.
- FL_Color color () const
  Gets the background color of the widget.
- void color (FL_Color bg)
  Sets the background color of the widget.
- void color (FL_Color bg, FL_Color sel)
  Sets the background and selection color of the widget.
- FL_Color color2 () const
  For back compatibility only.
- void color2 (unsigned a)
  For back compatibility only.
- int contains (const Fl_Widget *w) const
  Checks if w is a child of this widget.
- void copy_label (const char *new_label)
  Sets the current label.
- void copy_tooltip (const char *text)
  Sets the current tooltip text.
- uchar damage () const
  Returns non-zero if draw() needs to be called.
- void damage (uchar c)
  Sets the damage bits for the widget.
- void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.
- int damage_resize (int, int, int, int)
  Internal use only.
- void deactivate ()
  Deactivates the widget.
- FL_Image *deimage ()
  Gets the image that is used as part of the widget label when in the inactive state.
- const FL_Image *deimage () const
  Gets the image that is used as part of the widget label when in the inactive state.
- void deimage (FL_Image &img)
  Sets the image to use as part of the widget label when in the inactive state.
- void deimage (FL_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.
- int deimage_bound () const
  Returns whether the inactive image is managed by the widget.
• void do_callback (FL_Callback Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with default arguments.
• void do_callback (FL_Widget *widget, long arg, FL_Callback Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void do_callback (FL_Widget *widget, void *arg=0, FL_Callback Reason reason=FL_REASON_UNKNOWN)
  Calls the widget callback function with arbitrary arguments.
• void draw_label (int, int, int, int, FL_Align) const
  Draws the label in an arbitrary bounding box with an arbitrary alignment.
• int h () const
  Gets the widget height.
• FL_Image *image ()
  Gets the image that is used as part of the widget label when in the active state.
• const FL_Image *image () const
  Gets the image that is used as part of the widget label when in the active state.
• void image (FL_Image &img)
  Sets the image to use as part of the widget label when in the active state.
• void image (FL_Image *img)
  Sets the image to use as part of the widget label when in the active state.
• int image_bound () const
  Returns whether the image is managed by the widget.
• int inside (const FL_Widget *wgt) const
  Checks if this widget is a child of wgt.
• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().
• const char *label () const
  Gets the current label text.
• void label (const char *text)
  Sets the current label pointer.
• void label (FL_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.
• FL_Color labelcolor () const
  Gets the label color.
• void labelcolor (FL_Color c)
  Sets the label color.
• FL_Font labelfont () const
  Gets the font to use.
• void labelfont (FL_Font f)
  Sets the font to use.
• FL_Fontsize labelsize () const
  Gets the font size in pixels.
• void labelsize (FL_Fontsize pix)
  Sets the font size in pixels.
• FL_Labeltype labeltype () const
  Gets the label type.
• void labeltype (FL_Labeltype a)
  Sets the label type.
• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.
• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.
• void needs_keyboard (bool needs)
Sets whether this widget needs a keyboard.

- **unsigned int output () const**
  
  Returns if a widget is used for output only.

- **Fl_Group * parent () const**
  
  Returns a pointer to the parent widget.

- **void parent (Fl_Group *p)**
  
  Internal use only - "for hacks only".

- **void position (int X, int Y)**
  
  Repositions the window or widget.

- **void redraw ()**
  
  Schedules the drawing of the widget.

- **void redraw_label ()**
  
  Schedules the drawing of the label.

- **Fl_Color selection_color () const**
  
  Gets the selection color.

- **void selection_color (Fl_Color a)**
  
  Sets the selection color.

- **void set_active ()**
  
  Marks the widget as active without sending events or changing focus.

- **void set_changed ()**
  
  Marks the value of the widget as changed.

- **void set_output ()**
  
  Sets a widget to output only.

- **void set_visible ()**
  
  Makes the widget visible.

- **void set_visible_focus ()**
  
  Enables keyboard focus navigation with this widget.

- **int shortcut_label () const**
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- **void shortcut_label (int value)**
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- **void size (int W, int H)**
  
  Changes the size of the widget.

- **int take_focus ()**
  
  Gives the widget the keyboard focus.

- **unsigned int takesevents () const**
  
  Returns if the widget is able to take events.

- **int testShortcut ()**
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- **const char * tooltip () const**
  
  Gets the current tooltip text.

- **void tooltip (const char *text)**
  
  Sets the current tooltip text.

- **Fl_Window * top_window () const**
  
  Returns a pointer to the top-level window for the widget.

- **Fl_Window * top_window_offset (int &xoff, int &yoff) const**
  
  Finds the x/y offset of the current widget relative to the top-level window.

- **uchar type () const**
  
  Gets the widget type.

- **void type (uchar t)**
  
  Sets the widget type.
• int **use_accents_menu** ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

• void * user_data () const
  Gets the user data for this widget.

• void **user_data** (**Fl_Callback_User_Data** ∗v, bool auto_free)
  Sets the user data for this widget.

• void **user_data** (void ∗v)
  Sets the user data for this widget.

• unsigned int visible () const
  Returns whether a widget is visible.

• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.

• void **visible_focus** (int v)
  Modifies keyboard focus navigation.

• int visible_r () const
  Returns whether a widget and all its parents are visible.

• int **w** () const
  Gets the widget width.

• **Fl_When** when () const
  Returns the conditions under which the callback is called.

• void **when** (uchar i)
  Sets the flags used to decide when a callback is called.

• **Fl_Window** ∗ window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.

• int **x** () const
  Gets the widget position in its window.

• int **y** () const
  Gets the widget position in its window.

• virtual ∼**Fl_Widget** ()
  Destroys the widget.

Public Attributes

• void(* display *)()
• void(* entry *) (int)
• void(* keyboard *) (uchar, int x, int y)
• int menu [3]
• void(* motion *) (int x, int y)
• void(* mouse *) (int b, int state, int x, int y)
• int number
• void(* overlaydisplay *)()
• void(* passivemotion *) (int x, int y)
• void(* reshape *) (int w, int h)
• void(* special *) (int, int x, int y)
• void(* visibility *) (int)

Protected Member Functions

• void draw () FL_OVERRIDEdraws the FI GI_Window.
• void draw_overlay () FL_OVERRIDE
  You must implement this virtual function if you want to draw into the overlay.
• int handle (int) FL_OVERRIDE
  Handle some FLTK events as needed.
Protected Member Functions inherited from `Fl_Gl_Window`

- `void draw_begin ()`
  Supports drawing to an `Fl_Gl_Window` with the FLTK 2D drawing API.
- `void draw_end ()`
  To be used as a match for a previous call to `Fl_Gl_Window::draw_begin()`.

Protected Member Functions inherited from `Fl_Window`

- `void default_size_range ()`
  Protected method to calculate the default size range of a window.
- `void draw () FL_OVERRIDE`
  Draws the widget.
- `int force_position () const`
  Returns the internal state of the window's FORCE_POSITION flag.
- `void force_position (int force)`
  Sets an internal flag that tells FLTK and the window manager to honor position requests.
- `void free_icons ()`
  Deletes all icons previously attached to the window.
- `int is_resizable ()`
  Protected method to determine whether a window is resizable.

Protected Member Functions inherited from `Fl_Group`

- `Fl_Rect * bounds ()`
  Returns the internal array of widget sizes and positions.
- `void draw_child (Fl_Widget &widget) const`
  Forces a child to redraw.
- `void draw_children ()`
  Draws all children of the group.
- `void draw_outside_label (const Fl_Widget &widget) const`
  Parents normally call this to draw outside labels of child widgets.
- `virtual int on_insert (Fl_Widget *, int)`
  Allow derived groups to act when a widget is added as a child.
- `virtual int on_move (int, int)`
  Allow derived groups to act when a widget is moved within the group.
- `virtual void on_remove (int)`
  Allow derived groups to act when a child widget is removed from the group.
- `int * sizes ()`
  Returns the internal array of widget sizes and positions.
- `void update_child (Fl_Widget &widget) const`
  Draws a child only if it needs it.

Protected Member Functions inherited from `Fl_Widget`

- `void clear_flag (unsigned int c)`
  Clears a flag in the flags mask.
- `void draw_backdrop () const`
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
  Draws the widget box according its box style.
- `void draw_box (Fl_Boxtype t, Fl_Color c) const`
Draws a box of type t, of color c at the widget's position and size.

- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.

- void draw_focus () const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h) const
  Draws a focus rectangle around the widget.

- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.

- void draw_label () const
  Draws the widget's label at the defined label position.

- void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.

- Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.

- unsigned int flags () const
  Gets the widget flags mask.

- void h (int v)
  Internal use only.

- void set_flag (unsigned int c)
  Sets a flag in the flags mask.

- void w (int v)
  Internal use only.

- void x (int v)
  Internal use only.

- void y (int v)
  Internal use only.

Additional Inherited Members

Public Types inherited from Fl_Window

- typedef struct HICON__ * HICON

Static Public Member Functions inherited from Fl_Gl_Window

- static int can_do (const int *m)
  Returns non-zero if the hardware supports the given OpenGL mode.

- static int can_do (int m)
  Returns non-zero if the hardware supports the given OpenGL mode.

Static Public Member Functions inherited from Fl_Window

- static Fl_Window * current ()
  Returns the last window that was made current.

- static void default_callback (Fl_Window *, void *)
  Back compatibility: Sets the default callback v for win to call on close event.

- static void default_icon (const Fl_RGB_Image *)
  Sets a single default window icon.

- static void default_icons (const Fl_RGB_Image *, int)
  Sets the default window icons.

- static void default_icons (HICON big_icon, HICON small_icon)
  Sets the default window icons (Windows platform only).
- static const char * default_xclass ()
  Returns the default xclass.
- static void default_xclass (const char *)
  Sets the default window xclass.
- static bool is_a_rescale ()
  Returns true when a window is being rescaled.
- static char show_next_window_iconic ()
  Returns the static flag whether the next window should be opened iconified.
- static void show_next_window_iconic (char stat)
  Sets a static flag whether the next window should be opened iconified.

**Static Public Member Functions inherited from Fl_Group**

- static Fl_Group * current ()
  Returns the currently active group.
- static void current (Fl_Group *g)
  Sets the current group.

**Static Public Member Functions inherited from Fl_Widget**

- static void default_callback (Fl_Widget *widget, void *data)
  The default callback for all widgets that don’t set a callback.
- static unsigned int label_shortcut (const char *)
  Returns the Unicode value of the '&x' shortcut in a given text.
- static int test_shortcut (const char *, const bool require_alt=false)
  Returns true if the given text t contains the entered '&x' shortcut.

**Protected Types inherited from Fl_Widget**

```c
enum {
  INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
  FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
  OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
  MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
  GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
  NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,
  AUTO_DELETE_USER_DATA = 1<<23,
  MAXIMIZED = 1<<24, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30, USERFLAG1 = 1<<31
}
```

flags possible values enumeration.

**Static Protected Attributes inherited from Fl_Window**

- static Fl_Window * current_
  Stores the last window that was made current.

### 12.55.1 Detailed Description

GLUT is emulated using this window class and these static variables (plus several more static variables hidden in glut_compatibility.cxx):
12.55.2 Member Function Documentation

12.55.2.1 draw()

void Fl_Glut_Window::draw ()
    { [protected], [virtual]

Draws the Fl_Gl_Window.
You must subclass Fl_Gl_Window and provide an implementation for draw(). You may also provide an implementation of draw_overlay() if you want to draw into the overlay planes. You can avoid reinitializing the viewport and lights and other things by checking valid() at the start of draw() and only doing the initialization if it is false.
The draw() method can only use OpenGL calls. Do not attempt to call X, any of the functions in <FL/fl_draw.H>,
or glX directly. Do not call gl_start() or gl_finish().
If double-buffering is enabled in the window, the back and front buffers are swapped after this function is completed.
The following pseudo-code shows how to use "if (!valid())" to initialize the viewport:

```cpp
void mywindow::draw() {
    if (!valid()) {
        glViewport(0,0,pixel_w(),pixel_h());
        glFrustum(...) or glOrtho(...)
        ...other initialization ...
    if (!context_valid()) {
        ...load textures, etc. ...
    }
    // clear screen
    glClearColor(...);
    glClear(...);
    // draw your geometry here ...
}
```

Actual example code to clear screen to black and draw a 2D white "X":

```cpp
void mywindow::draw() {
    if (!valid()) {
        glLoadIdentity();
        glViewport(0,0,pixel_w(),pixel_h());
        glOrtho(-w(),w(),-h(),h(),-1,1);
    }
    // Clear screen
    glClearColor(GL_COLOR_BUFFER_BIT);
    // Draw white 'X'
    glColor3f(1.0, 1.0, 1.0);
    glBegin(GL_LINES); glVertex2f(w(), h()); glVertex2f(-w(),-h()); glEnd();
    glBegin(GL_LINES); glVertex2f(w(),-h()); glVertex2f(-w(), h()); glEnd();
}
```

Regular FLTK widgets can be added as children to the Fl_Gl_Window. To correctly overlay the widgets, Fl_Gl_Window::draw() must be called after rendering the main scene.

```cpp
void mywindow::draw() {
    // draw 3d graphics scene
    Fl_Gl_Window::draw();
    // -- or --
    draw_begin();
    Fl_Window::draw();
    // other 2d drawing calls, overlays, etc.
    draw_end();
}
```

Reimplemented from Fl_Gl_Window.

12.55.2.2 draw_overlay()

void Fl_Glut_Window::draw_overlay ( )
    { [protected], [virtual]

You must implement this virtual function if you want to draw into the overlay.
The overlay is cleared before this is called. You should draw anything that is not clear using OpenGL. You must use
gl_color(i) to choose colors (it allocates them from the colormap using system-specific calls), and remember that you are in an indexed OpenGL mode and drawing anything other than flat-shaded will probably not work.
Both this function and Fl_Gl_Window::draw() should check Fl_Gl_Window::valid() and set the same transformation.
If you don't your code may not work on other systems. Depending on the OS, and on whether overlays are real or simulated, the OpenGL context may be the same or different between the overlay and main window.
Reimplemented from Fl_Gl_Window.

12.55.2.3 handle()

int Fl_Glut_Window::handle ( int event )
    { [protected], [virtual]
Handle some FLTK events as needed. 
Reimplemented from Fl_Gl_Window. 
The documentation for this class was generated from the following files:

- glut.H
- glut_compatibility.cxx

12.56  Fl_Grid Class Reference

Fl_Grid is a container (layout) widget with multiple columns and rows.
#include <Fl_Grid.H>
Inheritance diagram for Fl_Grid:

```
Fl_Widget
  ↓
Fl_Group
  ↓
Fl_Grid
```

Classes

- class Cell

Public Member Functions

- Fl_Grid::Cell * cell (Fl_Widget * widget) const
  Get the grid cell of widget widget.
- Fl_Grid::Cell * cell (int row, int col) const
  Get the grid cell of row row and column col.
- virtual void clear_layout ()
  Reset the layout w/o removing widgets.
- void col_gap (const int * value, size_t size)
  Set more than one column gaps at once.
- int col_gap (int col) const
  Set the gap of column col.
- void col_gap (int col, int value)
  Set the gap of column col.
- void col_weight (const int * value, size_t size)
  Set the weight of more than one column.
- int col_weight (int col) const
  Set the weight of a column.
- void col_width (const int * value, size_t size)
  Set minimal widths of more than one column.
- int col_width (int col) const
  Set the minimal width of a column.
- short cols () const
- int computed_col_width (int col) const
- int computed_row_height (int row) const
- void debug (int level=127)
  Output layout information of this Fl_Grid to stderr.
- **Fl_Grid** (int X, int Y, int W, int H, const char *L=0)
  
  Create a new Fl_Grid widget.

- void **gap** (int *row_gap, int *col_gap) const
  
  Get the default gaps for rows and columns.

- virtual void **gap** (int row_gap, int col_gap=-1)
  
  Set default gaps for rows and columns.

- virtual void **layout** ()
  
  Calculate the grid layout and resize and position all widgets.

- virtual void **layout** (int rows, int cols, int margin=-1, int gap=-1)
  
  Set the basic layout parameters of the Fl_Grid widget.

- int **margin** (int *left, int *top, int *right, int *bottom) const
  
  Returns all outside margin sizes of the grid.

- virtual void **margin** (int left, int top=-1, int right=-1, int bottom=-1)
  
  Set all margins (left, top, right, bottom).

- bool **need_layout** () const
  
  Return whether layout calculation is required.

- void **need_layout** (int set)
  
  Request or reset the request to calculate the layout of children.

- virtual void **resize** (int X, int Y, int W, int H) FL_OVERRIDE
  
  Recalculate the layout and position and resize all widgets.

- int **row_gap** (int row) const
  
  Set the gap of row row.

- void **row_gap** (const int *value, size_t size)
  
  Set more than one row gaps at once.

- int **row_gap** (int row) const
  
  Set the gap of row row.

- void **row_gap** (int row, int value)
  
  Set the gap of row row.

- int **row_height** (int row) const
  
  Set the minimal row height of more than one row.

- void **row_height** (int row, int value)
  
  Set the minimal row height of row row.

- int **row_weight** (int row) const
  
  Set the weight of more than one row.

- void **row_weight** (int row, int value)
  
  Set the row weight of row row.

- short **rows** () const
  
  Enable or disable drawing of the grid helper lines for visualization.

- void **show_grid** (int set)
  
  Enable or disable drawing of the grid helper lines for visualization.

- **Fl_Grid::Cell** *widget** (Fl_Widget *wi, int row, int col, Fl_Grid_Align align=FL_GRID_FILL)
  
  Assign a widget to a grid cell and set its alignment.

- **Fl_Grid::Cell** *widget** (Fl_Widget *wi, int row, int col, int rowspan, int colspan, Fl_Grid_Align align=FL_GRID_FILL)
  
  Assign a widget to a grid cell and set cell spanning and alignment.
Public Member Functions inherited from Fl_Group

- **Fl_Widget** & _ddfdesign_kludge ()
  
  This is for forms compatibility only.

- void **add** (Fl_Widget &)
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- void **add** (Fl_Widget *)
  
  See void Fl_Group::add(Fl_Widget &w)

- void **add_resizable** (Fl_Widget &o)
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget** *const * array () const
  
  Returns a pointer to the array of children.

- **Fl_Group** *const * as_group () const FL_OVERRIDE

  Returns an Fl_Group pointer if this widget is an Fl_Group.

- void **begin** ()
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget** * child (int n) const
  
  Returns array()[n].

- int **children** () const
  
  Returns how many child widgets the group has.

- void **clear** ()
  
  Deletes all child widgets from memory recursively.

- unsigned int **clip_children** ()
  
  Returns the current clipping mode.

- void **clip_children** (int c)
  
  Controls whether the group widget clips the drawing of child widgets to its bounding box.

- virtual int **delete_child** (int n)
  
  Removes the widget at index from the group and deletes it.

- void **end** ()
  
  Exactly the same as current(this->parent()).

- int **find** (const Fl_Widget &o) const
  
  See int Fl_Group::find(const Fl_Widget *w) const.

- int **find** (const Fl_Widget *) const
  
  Searches the child array for the widget and returns the index.

- **Fl_Group** (int, int, int, int, const char * = 0)
  
  Creates a new Fl_Group widget using the given position, size, and label string.

- void **focus** (Fl_Widget *)

- void **forms_end** ()
  
  This is for forms compatibility only.

- int **handle** (int) FL_OVERRIDE
  
  Handles the specified event.

- void **init_sizes** ()
  
  Resets the internal array of widget sizes and positions.

- void **insert** (Fl_Widget &, int i)
  
  The widget is removed from its current group (if any) and then inserted into this group.

- void **insert** (Fl_Widget &, Fl_Widget *)
  
  This does insert(w, find(before)).

- void **remove** (Fl_Widget &)
  
  Removes a widget from the group but does not delete it.

- void **remove** (Fl_Widget *)

Generated by Doxygen
Removes the widget from the group.

- void `remove` (int index)
  Removes the widget at index from the group but does not delete it.

- Fl_Widget * `resizable` () const
  Returns the group’s resizable widget.

- void `resizable` (Fl_Widget &o)
  Sets the group’s resizable widget.

- void `resizable` (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

- void `resize` (int, int, int, int) FL_OVERRIDE
  Resizes the Fl_Group widget and all of its children.

- virtual ~Fl_Group ()
  The destructor also deletes all the children.

### Public Member Functions inherited from Fl_Widget

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
  Activates the widget.

- unsigned int `active` () const
  Returns whether the widget is active.

- int `active_r` () const
  Returns whether the widget and all of its parents are active.

- Fl_Align `align` () const
  Gets the label alignment.

- void `align` (Fl_Align alignment)
  Sets the label alignment.

- long `argument` () const
  Gets the current user data (long) argument that is passed to the callback function.

- void `argument` (long v)
  Sets the current user data (long) argument that is passed to the callback function.

- virtual class Fl_Gl_Window * `as_gl_window` ()
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual class Fl_Gl_Window const * `as_gl_window` () const
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.

- virtual Fl_Window * `as_window` ()
  Returns an Fl_Window pointer if this widget is an Fl_Window.

- void `bind_deimage` (Fl_Image *img)
  Sets the image to use as part of the widget label when in the inactive state.

- void `bind_deimage` (int f)
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void `bind_image` (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

- void `bind_image` (int f)
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- Fl_Boxtype `box` () const
  Gets the box type of the widget.

- void `box` (Fl_Boxtype new_box)
  Sets the box type for the widget.

- Fl_Callback_p `callback` () const
Gets the current callback function for the widget.

• void callback (Fl_Callback ∗cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback ∗cb, Fl_Callback_User_Data ∗p, bool auto_free)
  Sets the current callback function and managed user data for the widget.

• void callback (Fl_Callback ∗cb, void ∗p)
  Sets the current callback function and data for the widget.

• void callback (Fl_Callback0 ∗cb)
  Sets the current callback function for the widget.

• void callback (Fl_Callback1 ∗cb, long p=0)
  Sets the current callback function for the widget.

• unsigned int changed () const
  Checks if the widget value changed since the last callback.

• void clear_active ()
  Marks the widget as inactive without sending events or changing focus.

• void clear_changed ()
  Marks the value of the widget as unchanged.

• void clear_damage (uchar c=0)
  Clears or sets the damage flags.

• void clear_output ()
  Sets a widget to accept input.

• void clear_visible ()
  Hides the widget.

• void clear_visible_focus ()
  Disables keyboard focus navigation with this widget.

• Fl_Color color () const
  Gets the background color of the widget.

• void color (Fl_Color bg)
  Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)
  Sets the background and selection color of the widget.

• Fl_Color color2 () const
  For back compatibility only.

• void color2 (unsigned a)
  For back compatibility only.

• int contains (const Fl_Widget ∗w) const
  Checks if w is a child of this widget.

• void copy_label (const char ∗new_label)
  Sets the current label.

• void copy_tooltip (const char ∗text)
  Sets the current tooltip text.

• uchar damage () const
  Returns non-zero if draw() needs to be called.

• void damage (uchar c)
  Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)
  Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)
  Internal use only.

• void deactivate ()
  Deactivates the widget.
- `Fl_Image * deimage ()`
  Gets the image that is used as part of the widget label when in the inactive state.

- `const Fl_Image * deimage () const`
  Gets the image that is used as part of the widget label when in the inactive state.

- `void deimage (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `void deimage (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the inactive state.

- `int deimage_bound () const`
  Returns whether the inactive image is managed by the widget.

- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with default arguments.

- `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  Calls the widget callback function with arbitrary arguments.

- `void draw_label (int, int, int, int, Fl_Align) const`
  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- `int h () const`
  Gets the widget height.

- `virtual void hide ()`
  Makes a widget invisible.

- `Fl_Image * image ()`
  Gets the image that is used as part of the widget label when in the active state.

- `const Fl_Image * image () const`
  Gets the image that is used as part of the widget label when in the active state.

- `void image (Fl_Image &img)`
  Sets the image to use as part of the widget label when in the active state.

- `void image (Fl_Image *img)`
  Sets the image to use as part of the widget label when in the active state.

- `int image_bound () const`
  Returns whether the image is managed by the widget.

- `int inside (const Fl_Widget *wgt) const`
  Checks if this widget is a child of `wgt`.

- `int is_label_copied () const`
  Returns whether the current label was assigned with `copy_label()`.

- `const char * label () const`
  Gets the current label text.

- `void label (const char *text)`
  Sets the current label pointer.

- `void label (Fl_Labeltype a, const char *b)`
  Shortcut to set the label text and type in one call.

- `Fl_Color labelcolor () const`
  Gets the label color.

- `void labelcolor (Fl_Color c)`
  Sets the label color.

- `Fl_Font labelfont () const`
  Gets the font to use.

- `void labelfont (Fl_Font f)`
  Sets the font to use.

- `Fl_Fontsize labelsize () const`
**Class Documentation**

- void `labelsize (Fl_Fontsize pix)`  
  Gets the font size in pixels.

- void `labeltype (Fl_Labeltype a)`  
  Sets the label type.

- void `measure_label (int &ww, int &hh) const`  
  Sets width `ww` and height `hh` accordingly with the label size.

- bool `needs_keyboard () const`  
  Returns whether this widget needs a keyboard.

- void `needs_keyboard (bool needs)`  
  Sets whether this widget needs a keyboard.

- unsigned int `output () const`  
  Returns if a widget is used for output only.

- Fl_Group * `parent () const`  
  Returns a pointer to the parent widget.

- void `parent (Fl_Group *p)`  
  Internal use only - "for hacks only".

- void `position (int X, int Y)`  
  Repositions the window or widget.

- void `redraw ()`  
  Schedules the drawing of the widget.

- void `redraw_label ()`  
  Schedules the drawing of the label.

- Fl_Color `selection_color () const`  
  Gets the selection color.

- void `selection_color (Fl_Color a)`  
  Sets the selection color.

- void `set_active ()`  
  Marks the widget as active without sending events or changing focus.

- void `set_changed ()`  
  Marks the value of the widget as changed.

- void `set_output ()`  
  Sets a widget to output only.

- void `set_visible ()`  
  Makes the widget visible.

- void `set_visible_focus ()`  
  Enables keyboard focus navigation with this widget.

- int `shortcut_label () const`  
  Returns whether the widget’s label uses ‘&’ to indicate shortcuts.

- void `shortcut_label (int value)`  
  Sets whether the widget’s label uses ‘&’ to indicate shortcuts.

- virtual void `show ()`  
  Makes a widget visible.

- void `size (int W, int H)`  
  Changes the size of the widget.

- void `take_focus ()`  
  Gives the widget the keyboard focus.

- unsigned int `takesevents () const`  
  Returns if the widget is able to take events.
• int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.
• const char * tooltip () const
  Gets the current tooltip text.
• void tooltip (const char *text)
  Sets the current tooltip text.
• Fl_Window * top_window () const
  Returns a pointer to the top-level window for the widget.
• Fl_Window * top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.
• uchar type () const
  Gets the widget type.
• void type (uchar t)
  Sets the widget type.
• int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
• void * user_data () const
  Gets the user data for this widget.
• void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.
• void user_data (void *v)
  Sets the user data for this widget.
• unsigned int visible () const
  Returns whether a widget is visible.
• unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  Modifies keyboard focus navigation.
• int visible_r () const
  Returns whether a widget and all its parents are visible.
• int w () const
  Gets the widget width.
• Fl_When when () const
  Returns the conditions under which the callback is called.
• void when (uchar i)
  Sets the flags used to decide when a callback is called.
• Fl_Window * window () const
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  Gets the widget position in its window.
• int y () const
  Gets the widget position in its window.
• virtual ~Fl_Widget ()
  Destroys the widget.
Protected Member Functions

- **Cell * add_cell** (int row, int col)
- virtual void draw () FL_OVERRIDE
  
  Draws the Fl_Grid widget and all children.
- virtual void draw_grid ()
  
  Draws the grid helper lines for design and debugging purposes.
- void init ()
- void on_remove (int) FL_OVERRIDE
  
  Fl_Group calls this method when a child widget is about to be removed.
- void remove_cell (int row, int col)

Protected Member Functions inherited from Fl_Group

- **Fl_Rect * bounds ()**
  
  Returns the internal array of widget sizes and positions.
- void draw () FL_OVERRIDE
  
  Draws the widget.
- void draw_child (Fl_Widget &widget) const
  
  Forces a child to redraw.
- void draw_children ()
  
  Draws all children of the group.
- void draw_outside_label (const Fl_Widget &widget) const
  
  Parents normally call this to draw outside labels of child widgets.
- virtual int on_insert (Fl_Widget *, int)
  
  Allow derived groups to act when a widget is added as a child.
- virtual int on_move (int, int)
  
  Allow derived groups to act when a widget is moved within the group.
- int * sizes ()
  
  Returns the internal array of widget sizes and positions.
- void update_child (Fl_Widget &widget) const
  
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

- void clear_flag (unsigned int c)
  
  Clears a flag in the flags mask.
- void draw_backdrop () const
  
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void draw_box () const
  
  Draws the widget box according its box style.
- void draw_box (Fl_Boxtype t, Fl_Color c) const
  
  Draws a box of type t, of color c at the widget's position and size.
- void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  
  Draws a box of type t, of color c at the position X,Y and size W,H.
- void draw_focus () const
  
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  
  Draws a focus rectangle around the widget.
- void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  
  Draws a focus box for the widget at the given position and size.
- void draw_label () const
Draws the widget’s label at the defined label position.

- **void draw_label**(int, int, int, int) const
  
  Draws the label in an arbitrary bounding box.

- **Fl_Widget**(int x, int y, int w, int h, const char *label=0L)
  
  Creates a widget at the given position and size.

- unsigned int **flags**( ) const
  
  Gets the widget flags mask.

- **void h**(int v)
  
  Internal use only.

- **void set_flag**(unsigned int c)
  
  Sets a flag in the flags mask.

- **void w**(int v)
  
  Internal use only.

- **void x**(int v)
  
  Internal use only.

- **void y**(int v)
  
  Internal use only.

Protected Attributes

- bool **draw_grid_**

- **Fl_Color grid_color**

Friends

- class **Fl_Grid_Type**

Additional Inherited Members

**Static Public Member Functions inherited from Fl_Group**

- static **Fl_Group** +current()
  
  Returns the currently active group.

- static void **current**(Fl_Group *g)
  
  Sets the current group.

**Static Public Member Functions inherited from Fl_Widget**

- static void **default_callback**(Fl_Widget *widget, void *data)
  
  The default callback for all widgets that don’t set a callback.

- static unsigned int **label_shortcut**(const char *t)
  
  Returns the Unicode value of the ‘&x’ shortcut in a given text.

- static int **test_shortcut**(const char *, const bool require_alt=false)
  
  Returns true if the given text t contains the entered ‘&x’ shortcut.

**Protected Types inherited from Fl_Widget**

flags possible values enumeration.

### 12.56.1 Detailed Description

**Fl_Grid** is a container (layout) widget with multiple columns and rows. This container widget features very flexible layouts in columns and rows w/o the need to position each child widget in x/y coordinates. Widgets are assigned to grid cells (column, row) with their minimal sizes in \( w() \) and \( h() \). The \( x() \) and \( y() \) positions are ignored and can be \((0, 0)\). **Fl_Grid** calculates widget positions and resizes the widgets to fit into the grid. It is possible to create a single row or column of widgets with **Fl_Grid**.

You should design your grid with the smallest possible sizes of all widgets in mind. **Fl_Grid** will automatically assign additional space to cells according to some rules (described later) when resizing the **Fl_Grid** widget. **Hint**: You should set a minimum window size to make sure the **Fl_Grid** is never resized below its minimal sizes. Resizing below the given widget sizes results in undefined behavior. **Fl_Grid** and other container widgets (e.g. **Fl_Group**) can be nested. One main advantage of this usage is that widget coordinates in embedded **Fl_Grid** widgets become relative to the group and will be positioned as expected.

**Todo** This (relative group coordinates of nested groups of **Fl_Grid**) needs explanation and maybe an example.

**Fl_Grid** child widgets are handled by its base class **Fl_Group** but **Fl_Grid** stores additional data corresponding to each widget in internal grid cells. **Fl_Grid** children are allowed to span multiple columns and rows like HTML `<table>` cells. Individual children can have fixed sizes or be aligned inside their cells (left, right, top, bottom, and more) and/or follow their cell sizes when the **Fl_Grid** container is resized.

Note to resizing: since **Fl_Grid** uses its own layout algorithm the normal **Fl_Group::resizable()** widget is ignored (if set). Calling `init_sizes()` is not necessary.

Note

**Fl_Grid** is, as of FLTK 1.4.0, still in experimental state and should be used with caution. The API can still be changed although it is assumed to be almost stable - as stable as possible for a first release.

**Example:** Simple 3x3 **Fl_Grid** with five buttons:

```c++
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Grid.H>
#include <FL/Fl_Button.H>

int main(int argc, char *argv) {
    Fl_Double_Window *win = new Fl_Double_Window(320, 180, "3x3 Fl_Grid with Buttons");
    // create the Fl_Grid container with five buttons
    Fl_Grid *grid = new Fl_Grid(0, 0, win->w(), win->h());
    grid->layout(3, 3, 10, 10);
    grid->color(FL_WHITE);
    Fl_Button *b0 = new Fl_Button(0, 0, 0, 0, "New");
    Fl_Button *b1 = new Fl_Button(0, 0, 0, 0, "Options");
    Fl_Button *b3 = new Fl_Button(0, 0, 0, 0, "About");
    Fl_Button *b4 = new Fl_Button(0, 0, 0, 0, "Help");
    Fl_Button *b6 = new Fl_Button(0, 0, 0, 0, "Quit");
    // assign buttons to grid positions
    grid->widget(b0, 0, 0, 0, 0, "New");
    grid->widget(b3, 1, 1, 0, 0, "Options");
    grid->widget(b4, 2, 0, 0, 0, "About");
    grid->widget(b6, 2, 2, 0, 0, "Quit");
    // 1 to display grid helper lines
    grid->show_grid(1);
    win->end();
    win->resizable(grid);
    win->size_range(300, 100);
    win->show(argc, argv);
    return Fl::run();
}
```

Generated by Doxygen
12.56.2 Constructor & Destructor Documentation

12.56.2.1 Fl_Grid()

```
Fl_Grid::Fl_Grid (
    int X,
    int Y,
    int W,
    int H,
    const char ∗ L = 0 )
```

Create a new Fl_Grid widget.

**Todo**  More documentation of Fl_Grid constructor?

12.56.3 Member Function Documentation

12.56.3.1 cell() [1/2]

```
Fl_Grid::Cell ∗ Fl_Grid::cell (  
    Fl_Widget ∗ widget ) const
```

Get the grid cell of widget widget.

The pointer to the cell can be used for further assignment of properties like alignment etc.

Hint: If you know the row and column index of the cell you should use Fl_Grid::cell(int row, int col) instead because it is much faster.

Please see Fl_Grid::cell(int row, int col) for details and the validity of cell pointers.

**Parameters**

<table>
<thead>
<tr>
<th>in</th>
<th>widget</th>
<th>widget whose cell is requested</th>
</tr>
</thead>
</table>
Return values

\textbf{NULL} if widget is not assigned to a cell

12.56.3.2 cell() [2/2]

\texttt{Fl\_Grid::Cell* Fl\_Grid::cell (int row, int col) const}

Get the grid cell of row \texttt{row} and column \texttt{col}.
Widgets and other attributes are organized in cells (\texttt{Fl\_Grid::Cell}).
This cell is an opaque structure (class) with some public methods. \textbf{Don't} assume anything about grid cell sizes and
ordering in memory. These are implementation details that can be changed without notice.
The validity of an \texttt{Fl\_Grid::Cell} pointer is limited. It will definitely be invalidated when the overall grid layout is
changed, for instance by calling layout(int, int).
Adding new cells beyond the current layout limits will also invalidate cell pointers but this is not (yet) implemented.
Attempts to assign widgets to out-of-bounds cells are currently ignored.
The only well-defined usage of cell pointers is to set one or more properties like widget alignment of a cell after
retrieving the cell pointer. Don't store cell pointers in your program for later reference.

Parameters

\begin{tabular}{ll}
  \textbf{in} & \texttt{row} & row index \\
  \textbf{in} & \texttt{col} & column index \\
\end{tabular}

Returns

pointer to cell

Return values

\textbf{NULL} if \texttt{row} or \texttt{col} is out of bounds or no widget was assigned

12.56.3.3 clear_layout()

\texttt{void Fl\_Grid::clear\_layout ( ) [virtual]}

Reset the layout w/o removing widgets.
Removes all cells and sets rows and cols to zero. Existing widgets are kept as children of the \texttt{Fl\_Group} (base class)
but are hidden.
This method should be rarely used. You may want to call \texttt{Fl\_Grid::clear()} to remove all widgets and reset the layout
to zero rows and columns.
You must call layout(int rows, int cols, ...) to set a new layout, allocate new cells, and assign widgets to new cells.
\textbf{Todo} \texttt{Fl\_Grid::clear()} needs to be implemented as documented above!

12.56.3.4 col_gap() [1/2]

\texttt{void Fl\_Grid::col\_gap (}
\texttt{const int* value,}
\texttt{size_t size )}

Set more than one column gaps at once.

See also

\texttt{Fl\_Grid::col\_weight(const int* value, size_t size)} for handling of the value array and size.
12.56.3.5  col_gap() [2/2]
void Fl_Grid::col_gap (  
    int col,  
    int value  )

Set the gap of column col.
Note that the gap is right of each column except the last one which is ignored. Use margin() for the right most column.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>col</th>
<th>column</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>gap size after the column</td>
</tr>
</tbody>
</table>

12.56.3.6  col_weight() [1/2]

void Fl_Grid::col_weight (  
    const int * value,  
    size_t size  )

Set the weight of more than one column.  
The values are taken from the array value and assigned sequentially to columns, starting from column 0. If the array size is too large extraneous values are ignored.  
Negative values in the array are not assigned to their columns, i.e. the existing value for the corresponding column is not changed.  

Example:
int val[] = { 0, 0, 50, -1, 1, 50, 0 };
grid->col_weight(val, sizeof(val)/sizeof(val[0]));

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>value</th>
<th>an array of column weights</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>size</td>
<td>the size of the array (number of values)</td>
</tr>
</tbody>
</table>

12.56.3.7  col_weight() [2/2]

void Fl_Grid::col_weight (  
    int col,  
    int value  )

Set the weight of a column.
Column and row weights are used to distribute additional space when the grid is resized beyond its defined (minimal) size. All weight values are relative and can be chosen freely. Suggested weights are in the range {0 .. 100}, 0 (zero) disables resizing of the column.  

How does it work?  
Whenever additional space (say: SPACE in pixels) is to be distributed to a set of columns the weights of all columns are added to a value SUM, then every single column width is increased by the value (in pseudo code):

\[
col\text{.width} += \text{SPACE} \times \text{col\text{.weight} / SUM}
\]

Resulting pixel values are rounded to the next integer and rounding differences are added to or subtracted from the column with the highest weight. If more columns have the same weight one of them is chosen.  

Note
If none of the columns considered for resizing have weights > 0 then Fl_Grid assigns the remaining space to an arbitrary column or to all considered columns evenly. This is implementation defined and can be changed without notice. You can avoid this situation by designing your grid with sensible sizes and weights.  

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>col</th>
<th>column number (counting from 0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>weight, must be &gt;= 0</td>
</tr>
</tbody>
</table>
12.56.3.8 col_width() [1/2]

void Fl_Grid::col_width (  
    const int * value,  
    size_t size  
)  

Set minimal widths of more than one column.  
The values are taken from the array value and assigned sequentially to columns, starting from column 0. If the 
array size is too large extraneous values are ignored. Negative values in the array are not assigned to their columns, i.e. the existing value for the corresponding column is not changed.

Example:
```
int widths[] = { 0, 0, 50, -1, -1, 50, 0 };
grid->col_width(widths, sizeof(width)/sizeof(width[0]));
```

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>an array of column widths</td>
</tr>
<tr>
<td>size</td>
<td>the size of the array (number of values)</td>
</tr>
</tbody>
</table>

12.56.3.9 col_width() [2/2]

void Fl_Grid::col_width (  
    int col,  
    int value  
)  

Set the minimal width of a column.  
Column widths are calculated by using the maximum of all widget widths in that column and the given column width. After calculating the width additional space is added when resizing according to the weight of the column. You can set one or more column widths in one call by using `Fl_Grid::col_width(const int *value, size_t size)`.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>column number (counting from 0)</td>
</tr>
<tr>
<td>value</td>
<td>minimal column width, must be ≥ 0</td>
</tr>
</tbody>
</table>

See also

`Fl_Grid::col_width(const int *value, size_t size)`

12.56.3.10 debug()

void Fl_Grid::debug (  
    int level = 127  
)  

Output layout information of this Fl_Grid to stderr. Parameter level will be used to define the amount of output.

- 0 = nothing  
- 127 = everything  
- other values not yet defined

Note

It is not yet defined which kind of values level will have, either a numerical value (127 = maximum, 0 = nothing) or a bit mask that determines what to output.

Todo Add more information about cells and children.

Control output by using level.
Parameters

| in  | level      | not yet used (0-127, default = 127) |

### 12.56.3.11 draw()

```cpp
void Fl_Grid::draw () [protected], [virtual]
```

Draws the Fl_Grid widget and all children.
If the layout has been changed **layout()** is called before the widget is drawn so all children are arranged as designed.

See also

- **layout()**
- **need_layout()**

Implements **Fl_Widget**.

### 12.56.3.12 draw_grid()

```cpp
void Fl_Grid::draw_grid () [protected], [virtual]
```

Draws the grid helper lines for design and debugging purposes. This method is protected so it can be modified in subclasses.

### 12.56.3.13 gap() [1/2]

```cpp
void Fl_Grid::gap ( int * row_gap, int * col_gap ) const
```

Get the default gaps for rows and columns.

Parameters

| out  | row_gap | pointer to int to receive column gap, may be NULL |
| out  | col_gap | pointer to int to receive column gap, may be NULL |

### 12.56.3.14 gap() [2/2]

```cpp
void Fl_Grid::gap ( int row_gap, int col_gap = -1 ) [virtual]
```

Set default gaps for rows and columns.

All gaps are positioned below the rows and right of their columns. The bottom row and the right-most column don't have a gap, i.e. the gap sizes of these columns and rows are ignored. You can use a right or bottom margin instead.

You have to specify at least one argument, **col_gap** is optional. If you don't specify an argument or use a negative value (e.g. -1) then that margin is not affected.

You can also initialize the default gaps with **layout(int, int, int)**.

Parameters

| in  | row_gap | default gap for all rows |
| in  | col_gap | default gap for all columns |
See also

`Fl_Grid::layout(int rows, int cols, int margin, int gap)`

12.56.3.15  `layout()` [1/2]

```cpp
void Fl_Grid::layout ( ) [virtual]
```

Calculate the grid layout and resize and position all widgets.
This is called automatically when the `Fl_Grid` is resized. You need to call it once after you added widgets or moved widgets between cells.
Calling it once after all modifications are completed is enough.

**Todo**  Document when and why to call `layout()` w/o args. See `Fl_Flex::layout()`

See also

`Fl_Grid::layout(int rows, int cols, int margin, int gap)`

12.56.3.16  `layout()` [2/2]

```cpp
void Fl_Grid::layout ( int rows,
     int cols, int margin = -1,
     int gap = -1 ) [virtual]
```

Set the basic layout parameters of the `Fl_Grid` widget.
You need to specify at least `rows` and `cols` to define a layout before you can add widgets to the grid.
Parameters `margin` and `gap` are optional.
You can call `layout(int rows, int cols, int margin, int gap)` again to change the layout but this is inefficient since all cells are reallocated if the layout changed.
Calling this with the same values of `rows` and `cols` is fast and can be used to change `margin` and `gap` w/o reallocating the cells.

`margin` sets all margins (left, top, right, bottom) to the same value. Negative values (e.g. -1) don’t change the established margins. The default value set by the constructor is 0.
`gap` sets row and column gaps to the same value. Negative values (e.g. -1) do not affect the established gaps. The default value set by the constructor is 0.
After you added all widgets you must call `layout()` once without arguments to calculate the actual layout and to position and resize all widgets.

**Todo**  Document when and why to call `layout()` w/o args. See `Fl_Flex::layout()`

**Parameters**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>in</strong></td>
<td><code>rows</code></td>
<td>number of rows</td>
</tr>
<tr>
<td><strong>in</strong></td>
<td><code>cols</code></td>
<td>number of columns</td>
</tr>
<tr>
<td><strong>in</strong></td>
<td><code>margin</code></td>
<td>margin size inside the <code>Fl_Grid</code>'s border</td>
</tr>
<tr>
<td><strong>in</strong></td>
<td><code>gap</code></td>
<td>gap size between cells</td>
</tr>
</tbody>
</table>

See also

`Fl_Grid::layout()`

12.56.3.17  `margin()` [1/2]

```cpp
int Fl_Grid::margin ( int * left,  
                        int * top,  
                        int * right,  
                        int * bottom,  
                        int margin ) [virtual]
```

Set the margin size of the `Fl_Grid` widget.
You need to specify at least `left`, `top`, `right`, and `bottom` to define a layout before you can add widgets to the grid.
Parameters `margin` and `gap` are optional.
You can call `margin(int * left, int * top, int * right, int * bottom, int margin)` again to change the layout but this is inefficient since all cells are reallocated if the layout changed.
Calling this with the same values of `left`, `top`, `right`, and `bottom` is fast and can be used to change `margin` w/o reallocating the cells.

After you added all widgets you must call `margin()` once without arguments to calculate the actual layout and to position and resize all widgets.

**Todo**  Document when and why to call `margin()` w/o args. See `Fl_Flex::margin()`

See also

`Fl_Grid::margin()`
Returns all outside margin sizes of the grid.
All margin sizes are returned in the given arguments. If any argument is NULL the respective value is not returned.

Parameters

<table>
<thead>
<tr>
<th>out</th>
<th>left</th>
<th>returns left margin if not NULL</th>
</tr>
</thead>
<tbody>
<tr>
<td>out</td>
<td>top</td>
<td>returns top margin if not NULL</td>
</tr>
<tr>
<td>out</td>
<td>right</td>
<td>returns right margin if not NULL</td>
</tr>
<tr>
<td>out</td>
<td>bottom</td>
<td>returns bottom margin if not NULL</td>
</tr>
</tbody>
</table>

Returns

whether all margins are equal

Return values

| 1 | all margins have the same size |
| 0 | at least one margin has a different size |

### 12.56.3.18 margin() [2/2]

void Fl_Grid::margin (  
  int left,  
  int top = -1,  
  int right = -1,  
  int bottom = -1 ) [virtual]  

Set all margins (left, top, right, bottom).
All margins are measured in pixels inside the box borders. You need to specify at least one argument, all other arguments are optional. If you don't specify an argument or use a negative value (e.g. -1) then that particular margin is not affected.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>left</th>
<th>left margin</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>top</td>
<td>top margin</td>
</tr>
<tr>
<td>in</td>
<td>right</td>
<td>right margin</td>
</tr>
<tr>
<td>in</td>
<td>bottom</td>
<td>bottom margin</td>
</tr>
</tbody>
</table>

### 12.56.3.19 need_layout()

void Fl_Grid::need_layout (  
  int set ) [inline]  

Request or reset the request to calculate the layout of children.  
If called with true (1) this calls redraw() to schedule a full draw(). When draw is eventually called, the layout is (re)calculated before actually drawing the widget.

Parameters

| in | set | 1 to request layout calculation, 0 to reset the request |
12.56.3.20 on_remove()

```c
void Fl_Grid::on_remove (  
    int index  ) [protected], [virtual]
```

*Fl_Group* calls this method when a child widget is about to be removed. Make sure that the widget is also removed from our internal list of children. Reimplemented from *Fl_Group*.

12.56.3.21 resize()

```c
void Fl_Grid::resize (  
    int X,  
    int Y,  
    int W,  
    int H ) [virtual]
```

Recalculate the layout and position and resize all widgets. This method overrides *Fl_Group::resize()* and calculates all positions and sizes of its children according to its own rules.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>X, Y</th>
<th>new widget position</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>W, H</td>
<td>new widget size</td>
</tr>
</tbody>
</table>

Reimplemented from *Fl_Widget*.

12.56.3.22 row_gap() [1/2]

```c
void Fl_Grid::row_gap (  
    const int * value,  
    size_t size       )
```

Set more than one row gaps at once.

See also

*Fl_Grid::col_weight(const int *value, size_t size)* for handling of the value array and *size*.

12.56.3.23 row_gap() [2/2]

```c
void Fl_Grid::row_gap (  
    int row,  
    int value )
```

Set the gap of row *row*.

Note that the gap is below each row except the last one which is ignored. Use *margin()* for the bottom row.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>row</th>
<th>row</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>gap size below the row</td>
</tr>
</tbody>
</table>

12.56.3.24 row_height() [1/2]

```c
void Fl_Grid::row_height (  
    const int * value,  
    size_t size       )
```

Set the minimal row height of more than one row.
Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>value</th>
<th>array of height values</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>size</td>
<td>size of array value</td>
</tr>
</tbody>
</table>

See also

`Fl_Grid::col_weight(const int *value, size_t size)` for handling of the value array and size.

12.56.3.25  `row_height()` [2/2]

```cpp
void Fl_Grid::row_height ( int row, int value )
```

Set the minimal row height of row `row`.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>row</th>
<th>row</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>minimal height of the row</td>
</tr>
</tbody>
</table>

12.56.3.26  `row_weight()` [1/2]

```cpp
void Fl_Grid::row_weight ( const int *value, size_t size )
```

Set the weight of more than one row.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>value</th>
<th>array of height values</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>size</td>
<td>size of array value</td>
</tr>
</tbody>
</table>

See also

`Fl_Grid::col_weight(const int *value, size_t size)` for handling of the value array and size.

12.56.3.27  `row_weight()` [2/2]

```cpp
void Fl_Grid::row_weight ( int row, int value )
```

Set the row weight of row `row`.

Parameters

<table>
<thead>
<tr>
<th>in</th>
<th>row</th>
<th>row</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>value</td>
<td>weight of the row</td>
</tr>
</tbody>
</table>

12.56.3.28  `show_grid()` [1/2]

```cpp
void Fl_Grid::show_grid ( int set ) [inline]
```
Enable or disable drawing of the grid helper lines for visualization. Use this method during the design stage of your Fl_Grid widget or for debugging if widgets are not positioned as intended. The default is a light green color but you can change it for better contrast if needed, see show_grid(int set, Fl_Color col).

Note

You can define the environment variable FLTK_GRID_DEBUG=1 to set show_grid(1) for all Fl_Grid widgets at construction time. This enables you to debug the grid layout w/o changing code.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>set</code></td>
<td>1 (true) = draw, 0 = don't draw the grid</td>
</tr>
</tbody>
</table>

See also

show_grid(int set, Fl_Color col)

12.56.3.29 show_grid() [2/2]

void Fl_Grid::show_grid ( 
    int set, 
    Fl_Color col ) [inline]

Enable or disable drawing of the grid helper lines for visualization. This method also sets the color used for the helper lines. The default is a light green color but you can change it to any color for better contrast if needed.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>set</code></td>
<td>1 (true) = draw, 0 = don't draw the grid</td>
</tr>
<tr>
<td><code>col</code></td>
<td>color to use for the grid helper lines</td>
</tr>
</tbody>
</table>

See also

show_grid(int set)

12.56.3.30 widget() [1/2]

Fl_Grid::Cell * Fl_Grid::widget ( 
    Fl_Widget * wi, 
    int row, 
    int col, 
    Fl_Grid_Align align = FL_GRID_FILL )

Assign a widget to a grid cell and set its alignment. This short form sets row and column spanning attributes to (1, 1). For more information see Fl_Grid::widget(Fl_Widget *wi, int row, int col, int rowspan, int colspan, Fl_Grid_Align align)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wi</code></td>
<td>widget to be assigned to the cell</td>
</tr>
<tr>
<td><code>row</code></td>
<td>row</td>
</tr>
<tr>
<td><code>col</code></td>
<td>column</td>
</tr>
<tr>
<td><code>align</code></td>
<td>widget alignment inside the cell</td>
</tr>
</tbody>
</table>
Assign a widget to a grid cell and set cell spanning and alignment. Default alignment is FL_GRID_FILL which stretches the widget in horizontal and vertical directions to fill the whole cell(s) given by colspan and rowspan. You can use this method to move a widget from one cell to another; it is automatically removed from its old cell. If the new cell is already assigned to another widget that widget is deassigned but kept as a child of the group. Before you can assign a widget to a cell it must have been created as a child of the Fl_Grid widget (i.e. its Fl_Group).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wi</td>
<td>widget to be assigned to the cell</td>
</tr>
<tr>
<td>row</td>
<td>row</td>
</tr>
<tr>
<td>col</td>
<td>column</td>
</tr>
<tr>
<td>rowspan</td>
<td>vertical span in cells, default 1</td>
</tr>
<tr>
<td>colspan</td>
<td>horizontal span in cells, default 1</td>
</tr>
<tr>
<td>align</td>
<td>widget alignment inside the cell</td>
</tr>
</tbody>
</table>

Returns

assigned cell

Return values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>if row or col is out of bounds</td>
</tr>
</tbody>
</table>

Fl_Grid::widget(Fl_Widget *wi, int row, int col, int rowspan, int colspan, Fl_Grid_Align align)

The documentation for this class was generated from the following files:

- Fl_Grid.H
- Fl_Grid.cxx

12.57 Fl_Group Class Reference

The Fl_Group class is the FLTK container widget.

#include <Fl_Group.H>

Inheritance diagram for Fl_Group:
Public Member Functions

- **FL_Widget** *&* _ddfdesign_kludge ()
  
  *This is for forms compatibility only.*

- **void add (FL_Widget &)*

  *The widget is removed from its current group (if any) and then added to the end of this group.*

- **void add (FL_Widget *o)*

  *See void FL_Group::add(FL_Widget &w)*

- **void add_resizable (FL_Widget *o)*

  *Adds a widget to the group and makes it the resizable widget.*

- **FL_Widget *const + array () const*

  *Returns a pointer to the array of children.*

- **FL_Group const + as_group () const FL_OVERRIDE*

  *Returns an FL_Group pointer if this widget is an FL_Group.*

- **void begin ()*

  *Sets the current group so you can build the widget tree by just constructing the widgets.*

- **FL_Widget *child (int n) const***

  *Returns array()[n].*

- **int children () const*

  *Returns how many child widgets the group has.*

- **void clear ()*

  *Deletes all child widgets from memory recursively.*

- **unsigned int clip_children ()***

  *Returns the current clipping mode.*
• void clip_children (int c)
  Controls whether the group widget clips the drawing of child widgets to its bounding box.
• virtual int delete_child (int n)
  Removes the widget at index from the group and deletes it.
• void end ()
  Exactly the same as current(this->parent()).
• int find (const Fl_Widget &o) const
  See int Fl_Group::find(const Fl_Widget *w) const.
• int find (const Fl_Widget *) const
  Searches the child array for the widget and returns the index.
• Fl_Group (int, int, int, int, const char * = 0)
  Creates a new Fl_Group widget using the given position, size, and label string.
• void focus (Fl_Widget *W)
• void forms_end ()
  This is for forms compatibility only.
• int handle (int) FL_OVERRIDE
  Handles the specified event.
• void init_sizes ()
  Resets the internal array of widget sizes and positions.
• void insert (Fl_Widget &, int i)
  The widget is removed from its current group (if any) and then inserted into this group.
• void insert (Fl_Widget &, Fl_Widget *before)
  This does insert(w, find(before)).
• void remove (Fl_Widget &)
  Removes a widget from the group but does not delete it.
• void remove (Fl_Widget *o)
  Removes the widget o from the group.
• void remove (int index)
  Removes the widget at index from the group but does not delete it.
• Fl_Widget *resizable () const
  Returns the group's resizable widget.
• void resizable (Fl_Widget &o)
  Sets the group's resizable widget.
• void resizable (Fl_Widget *o)
  The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
• void resize (int, int, int, int) FL_OVERRIDE
  Resizes the Fl_Group widget and all of its children.
• virtual ~Fl_Group ()
  The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget
• void _clear_fullscreen ()
• void _set_fullscreen ()
• void activate ()
  Activates the widget.
• unsigned int active () const
  Returns whether the widget is active.
• int active_r () const
  Returns whether the widget and all of its parents are active.
Gets the label alignment.

- `void align(Fl_Align alignment)`
  Sets the label alignment.

- `long argument() const`  
  Gets the current user data (long) argument that is passed to the callback function.

- `void argument(long v)`  
  Sets the current user data (long) argument that is passed to the callback function.

- `virtual class Fl_Gl_Window * as_gl_window()`  
  Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.

- `virtual class Fl_Gl_Window const * as_gl_window() const`  
  Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.

- `virtual Fl_Window * as_window()`  
  Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.

- `virtual Fl_Window const * as_window() const`  
  Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.

- `void bind_deimage(Fl_Image * img)`  
  Sets the image to use as part of the widget label when in the inactive state.

- `void bind_deimage(int f)`  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- `void bind_image(Fl_Image * img)`  
  Sets the image to use as part of the widget label when in the active state.

- `void bind_image(int f)`  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.

- `Fl_Boxtype box() const`  
  Gets the box type of the widget.

- `void box(Fl_Boxtype new_box)`  
  Sets the box type for the widget.

- `Fl_Callback_p callback() const`  
  Gets the current callback function for the widget.

- `void callback(Fl_Callback * cb)`  
  Sets the current callback function for the widget.

- `void callback(Fl_Callback * cb, Fl_Callback_User_Data * p, bool auto_free)`  
  Sets the current callback function and managed user data for the widget.

- `void callback(Fl_Callback * cb, void * p)`  
  Sets the current callback function and data for the widget.

- `void callback(Fl_Callback0 * cb)`  
  Sets the current callback function for the widget.

- `void callback(Fl_Callback1 * cb, long p=0)`  
  Sets the current callback function for the widget.

- `unsigned int changed() const`  
  Checks if the widget value changed since the last callback.

- `void clear_active()`  
  Marks the widget as inactive without sending events or changing focus.

- `void clear_changed()`  
  Marks the value of the widget as unchanged.

- `void clear_damage(uchar c=0)`  
  Clears or sets the damage flags.

- `void clear_output()`  
  Sets a widget to accept input.

- `void clear_visible()`  
  Hides the widget.

- `void clear_visible_focus()`  
  Disables keyboard focus navigation with this widget.
- **Fl_Color color ( ) const**
  
  Gets the background color of the widget.

- **void color (Fl_Color bg)**
  
  Sets the background color of the widget.

- **void color (Fl_Color bg, Fl_Color sel)**
  
  Sets the background and selection color of the widget.

- **Fl_Color color2 ( ) const**
  
  For back compatibility only.

- **void color2 (unsigned a)**
  
  For back compatibility only.

- **int contains (const Fl_Widget *w) const**
  
  Checks if w is a child of this widget.

- **void copy_label (const char *new_label)**
  
  Sets the current label.

- **void copy_tooltip (const char *text)**
  
  Sets the current tooltip text.

- **uchar damage ( ) const**
  
  Returns non-zero if draw() needs to be called.

- **void damage (uchar c)**
  
  Sets the damage bits for the widget.

- **void damage (uchar c, int x, int y, int w, int h)**
  
  Sets the damage bits for an area inside the widget.

- **int damage_resize (int, int, int, int)**
  
  Internal use only.

- **void deactivate ( )**
  
  Deactivates the widget.

- **Fl_Image * deimage ( )**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **const Fl_Image * deimage ( ) const**
  
  Gets the image that is used as part of the widget label when in the inactive state.

- **void deimage (Fl_Image &img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

- **void deimage (Fl_Image *img)**
  
  Sets the image to use as part of the widget label when in the inactive state.

- **int deimage_bound ( ) const**
  
  Returns whether the inactive image is managed by the widget.

- **void do_callback (Fl_Callback_Reas one FL_REASON_UNKNOWN)**

  Calls the widget callback function with default arguments.

- **void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reas one FL_REASON_UNKNOWN)**

  Calls the widget callback function with arbitrary arguments.

- **void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reas one FL_REASON_UNKNOWN)**

  Calls the widget callback function with arbitrary arguments.

- **void draw_label (int, int, int, int, Fl_Align) const**

  Draws the label in an arbitrary bounding box with an arbitrary alignment.

- **int h ( ) const**

  Gets the widget height.

- **virtual void hide ( )**

  Makes a widget invisible.

- **Fl_Image * image ( )**

  Gets the image that is used as part of the widget label when in the active state.

- **const Fl_Image * image ( ) const**
Gets the image that is used as part of the widget label when in the active state.

• void image (Fl_Image &img)
  Sets the image to use as part of the widget label when in the active state.

• void image (Fl_Image *img)
  Sets the image to use as part of the widget label when in the active state.

• int image_bound () const
  Returns whether the image is managed by the widget.

• int inside (const Fl_Widget *wgt) const
  Checks if this widget is a child of wgt.

• int is_label_copied () const
  Returns whether the current label was assigned with copy_label().

• const char * label () const
  Gets the current label text.

• void label (const char *text)
  Sets the current label pointer.

• void label (Fl_Labeltype a, const char *b)
  Shortcut to set the label text and type in one call.

• Fl_Color labelcolor () const
  Gets the label color.

• void labelcolor (Fl_Color c)
  Sets the label color.

• Fl_Font labelfont () const
  Gets the font to use.

• void labelfont (Fl_Font f)
  Sets the font to use.

• Fl_Fontsize labelsize () const
  Gets the font size in pixels.

• void labelsize (Fl_Fontsize pix)
  Sets the font size in pixels.

• Fl_Labeltype labeltype () const
  Gets the label type.

• void labeltype (Fl_Labeltype a)
  Sets the label type.

• void measure_label (int &ww, int &hh) const
  Sets width ww and height hh accordingly with the label size.

• bool needs_keyboard () const
  Returns whether this widget needs a keyboard.

• void needs_keyboard (bool needs)
  Sets whether this widget needs a keyboard.

• unsigned int output () const
  Returns if a widget is used for output only.

• Fl_Group * parent () const
  Returns a pointer to the parent widget.

• void parent (Fl_Group *p)
  Internal use only - "for hacks only".

• void position (int X, int Y)
  Repositions the window or widget.

• void redraw ()
  Schedules the drawing of the widget.

• void redraw_label ()
  Schedules the drawing of the label.
- `Fl_Color selection_color () const`
  
  Gets the selection color.

- `void selection_color (Fl_Color a)`
  
  Sets the selection color.

- `void set_active ()`
  
  Marks the widget as active without sending events or changing focus.

- `void set_changed ()`
  
  Marks the value of the widget as changed.

- `void set_output ()`
  
  Sets a widget to output only.

- `void set_visible ()`
  
  Makes the widget visible.

- `void set_visible_focus ()`
  
  Enables keyboard focus navigation with this widget.

- `int shortcut_label () const`
  
  Returns whether the widget's label uses '&' to indicate shortcuts.

- `void shortcut_label (int value)`
  
  Sets whether the widget's label uses '&' to indicate shortcuts.

- `virtual void show ()`
  
  Makes a widget visible.

- `void size (int W, int H)`
  
  Changes the size of the widget.

- `int take_focus ()`
  
  Gives the widget the keyboard focus.

- `unsigned int takesevents () const`
  
  Returns if the widget is able to take events.

- `int testShortcut ()`
  
  Returns true if the widget's label contains the entered 'x' shortcut.

- `const char * tooltip () const`
  
  Gets the current tooltip text.

- `void tooltip (const char * text)`
  
  Sets the current tooltip text.

- `Fl_Window * top_window () const`
  
  Returns a pointer to the top-level window for the widget.

- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
  
  Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
  
  Gets the widget type.

- `void type (uchar t)`
  
  Sets the widget type.

- `int use_accents_menu ()`
  
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- `void * user_data () const`
  
  Gets the user data for this widget.

- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
  
  Sets the user data for this widget.

- `void user_data (void *v)`
  
  Sets the user data for this widget.

- `unsigned int visible () const`
  
  Returns whether a widget is visible.

- `unsigned int visible_focus () const`
Checks whether this widget has a visible focus.

- void **visible_focus**( int v)
  
  Modifies keyboard focus navigation.

- int **visible_r** () const

  Returns whether a widget and all its parents are visible.

- int **w** () const

  Gets the widget width.

- **Fl_When** when () const

  Returns the conditions under which the callback is called.

- void **when** (uchar i)

  Sets the flags used to decide when a callback is called.

- **Fl_Window** **∗** window () const

  Returns a pointer to the nearest parent window up the widget hierarchy.

- int **x** () const

  Gets the widget position in its window.

- int **y** () const

  Gets the widget position in its window.

- virtual **∼Fl_Widget** ()

  Destroys the widget.

**Static Public Member Functions**

- static **Fl_Group** **∗** current ()

  Returns the currently active group.

- static void current (Fl_Group ∗g)

  Sets the current group.

**Static Public Member Functions inherited from Fl_Widget**

- static void default_callback (Fl_Widget ∗widget, void ∗data)

  The default callback for all widgets that don't set a callback.

- static unsigned int labelShortcut (const char ∗t)

  Returns the Unicode value of the '&x' shortcut in a given text.

- static int testShortcut (const char ∗t, const bool require_alt=false)

  Returns true if the given text t contains the entered '&x' shortcut.

**Protected Member Functions**

- Fl_Rect **∗** bounds ()

  Returns the internal array of widget sizes and positions.

- void **draw** () FL_OVERRIDE

  Draws the widget.

- void draw_child (Fl_Widget &widget) const

  Forces a child to redraw.

- void draw_children ()

  Draws all children of the group.

- void **draw_outside_label** (const Fl_Widget &widget) const

  Parents normally call this to draw outside labels of child widgets.

- virtual int on_insert (Fl_Widget ∗, int)

  Allow derived groups to act when a widget is added as a child.

- virtual int on_move (int, int)

  Allow derived groups to act when a widget is moved within the group.
• virtual void on_remove (int)
  Allow derived groups to act when a child widget is removed from the group.
• int * sizes ()
  Returns the internal array of widget sizes and positions.
• void update_child (Fl_Widget &widget) const
  Draws a child only if it needs it.

Protected Member Functions inherited from Fl_Widget

• void clear_flag (unsigned int c)
  Clears a flag in the flags mask.
• void draw_backdrop () const
  If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
• void draw_box () const
  Draws the widget box according its box style.
• void draw_box (Fl_Boxtype t, Fl_Color c) const
  Draws a box of type t, of color c at the widget's position and size.
• void draw_box (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color c) const
  Draws a box of type t, of color c at the position X,Y and size W,H.
• void draw_focus () const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int X, int Y, int W, int H) const
  Draws a focus rectangle around the widget.
• void draw_focus (Fl_Boxtype t, int x, int y, int w, int h, Fl_Color bg) const
  Draws a focus box for the widget at the given position and size.
• void draw_label () const
  Draws the widget's label at the defined label position.
• void draw_label (int, int, int, int) const
  Draws the label in an arbitrary bounding box.
• Fl_Widget (int x, int y, int w, int h, const char *label=0L)
  Creates a widget at the given position and size.
• unsigned int flags () const
  Gets the widget flags mask.
• void h (int v)
  Internal use only.
• void set_flag (unsigned int c)
  Sets a flag in the flags mask.
• void w (int v)
  Internal use only.
• void x (int v)
  Internal use only.
• void y (int v)
  Internal use only.
Additional Inherited Members

Protected Types inherited from **Fl_Widget**

flags possible values enumeration.

12.57.1 Detailed Description

The **Fl_Group** class is the FLTK container widget. It maintains an array of child widgets. These children can themselves be any widget including **Fl_Group**. The most important subclass of **Fl_Group** is **Fl_Window**, however groups can also be used to control radio buttons or to enforce resize behavior.

The tab and arrow keys are used to move the focus between widgets of this group, and to other groups. The only modifier grabbed is shift (for shift-tab), so that ctrl-tab, alt-up, and such are free for the app to use as shortcuts.

To remove a widget from the group and destroy it, in 1.3.x (and up) you can simply use:

```
delete some_widget;
```

..and this will trigger proper scheduling of the widget's removal from its parent group.

If used as a child of **Fl_Tabs**, setting `when(FL_WHEN_CLOSED)` will enable the Close button in the corresponding tab. If the user clicks the Close button, the callback of this group will be called with the callback reason `FL_REASON_CLOSED`.

12.57.2 Constructor & Destructor Documentation

12.57.2.1 **Fl_Group()**

```
Fl_Group::Fl_Group ( 
  int X,
  int Y,
  int W,
  int H,
  const char * l = 0 )
```

Creates a new **Fl_Group** widget using the given position, size, and label string. The default boxtype is **FL_NO_BOX**.

12.57.2.2 **~Fl_Group()**

```
Fl_Group::~Fl_Group ( ) [virtual]
```

The destructor also deletes all the children.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. It is allowed that the **Fl_Group** and all of its children are automatic (local) variables, but you must declare the **Fl_Group** first, so that it is destroyed last.

If you add static or automatic (local) variables to an **Fl_Group**, then it is your responsibility to remove (or delete) all such static or automatic child widgets **before destroying** the group - otherwise the group will attempt to call delete operator on them leading to undefined behavior!
12.57.3 Member Function Documentation

12.57.3.1 array()

```cpp
Fl_Widget *const * Fl_Group::array () const
```

Returns a pointer to the array of children.

**Note**

This pointer is only valid until the next time a child is added or removed.

12.57.3.2 as_group() [1/2]

```cpp
Fl_Group const * Fl_Group::as_group ( ) const [inline], [virtual]
```

Reimplemented from `Fl_Widget`.

12.57.3.3 as_group() [2/2]

```cpp
Fl_Group * Fl_Group::as_group ( ) [inline], [virtual]
```

Returns an `Fl_Group` pointer if this widget is an `Fl_Group`. Use this method if you have a widget (pointer) and need to know whether this widget is derived from `Fl_Group`. If it returns non-NULL, then the widget in question is derived from `Fl_Group`, and you can use the returned pointer to access its children or other `Fl_Group`-specific methods.

**Example:**

```cpp
void my_callback (Fl_Widget *w, void *) {
  Fl_Group *g = w->as_group();
  if (g)
    printf ("This group has %d children\n", g->children());
  else
    printf ("This widget is not a group!\n");
}
```

**Return values**

- `NULL` if this widget is not derived from `Fl_Group`.

**Note**

This method is provided to avoid `dynamic_cast`.

**See also**

- `Fl_Widget::as_window()`, `Fl_Widget::as_gl_window()`

Reimplemented from `Fl_Widget`.

12.57.3.4 begin()

```cpp
void Fl_Group::begin ( )
```

Sets the current group so you can build the widget tree by just constructing the widgets. `begin()` is automatically called by the constructor for `Fl_Group` (and thus for `Fl_Window` as well). `begin()` is exactly the same as `current(this)`. Don't forget to `end()` the group or window!

12.57.3.5 bounds()

```cpp
Fl_Rect * Fl_Group::bounds ( ) [protected]
```

Returns the internal array of widget sizes and positions. If the `bounds()` array does not exist, it will be allocated and filled with the current widget sizes and positions. The `bounds()` array stores the initial positions of widgets as `Fl_Rect`'s. The size of the array is `children() + 2`.

- The first `Fl_Rect` is the group,
- the second is the resizable (clipped to the group),

Generated by Doxygen
- the rest are the children.

This is a convenient order for the resize algorithm. If the group and/or the resizable() is a Fl_Window (or subclass) then the x() and y() coordinates of their respective Fl_Rect's are zero.

Note
You should never need to use this protected method directly, unless you have special needs to rearrange the children of a Fl_Group. Fl_Tile uses this to rearrange its widget positions. The returned array should be considered read-only. Do not change its contents. If you need to rearrange children in a group, do so by resizing the children and call init_sizes().

#include <FL/Fl_Rect.H> if you want to access the bounds() array in your derived class. Fl_Rect.H is intentionally not included by Fl_Group.H to avoid unnecessary dependencies.

Returns
Array of Fl_Rect's with widget positions and sizes. The returned array is only valid until init_sizes() is called or widgets are added to or removed from the group.

See also
init_sizes()

Since
FLTK 1.4.0

12.57.3.6 child()

Fl_Widget * Fl_Group::child ( int n ) const [inline]

Returns array()[n]. No range checking is done!

12.57.3.7 clear()

void Fl_Group::clear ( void )

Deletes all child widgets from memory recursively. This method differs from the remove() method in that it affects all child widgets and deletes them from memory. The resizable() widget of the Fl_Group is set to the Fl_Group itself.

12.57.3.8 clip_children() [1/2]

unsigned int Fl_Group::clip_children ( ) [inline]

Returns the current clipping mode.

Returns
true, if clipping is enabled, false otherwise.

See also
void Fl_Group::clip_children(int c)

12.57.3.9 clip_children() [2/2]

void Fl_Group::clip_children ( int c ) [inline]

Controls whether the group widget clips the drawing of child widgets to its bounding box. Set c to 1 if you want to clip the child widgets to the bounding box. The default is to not clip (0) the drawing of child widgets.
12.57.3.10 current() [1/2]

`Fl_Group * Fl_Group::current ( ) [static]`

Returns the currently active group.

The `Fl_Widget` constructor automatically does `current() -> add(widget)` if this is not null. To prevent new widgets from being added to a group, call `Fl_Group::current(0).

12.57.3.11 current() [2/2]

`void Fl_Group::current ( Fl_Group * g ) [static]`

Sets the current group.

See also

`Fl_Group::current()`

12.57.3.12 delete_child()

`int Fl_Group::delete_child ( int index ) [virtual]`

Removes the widget at `index` from the group and deletes it.

This method does nothing if `index` is out of bounds.

This method differs from the `remove()` method in that it deletes the widget from memory. Since this method is virtual it can be reimplemented in subclasses with additional requirements and consequences. See the documentation of subclasses.

Many subclasses don't need to reimplement this method.

Note

This method may refuse to remove and delete the widget if it is an essential part of the `Fl_Group`, for instance a scrollbar in an `Fl_Scroll` group. In this case the widget is neither removed nor deleted.

This method does not call `init_sizes()` or `redraw()`. This is left to user code if necessary.

Returns 0 if the widget was removed and deleted. Return values > 0 are reserved for use by FLTK core widgets. Return values < 0 are free to be used by user defined widgets.

Todo Reimplementation of `Fl_Group::delete_child(int)` in more FLTK subclasses. This is not yet complete.

Parameters

| in index | index of child to be removed |

Returns

success (0) or error code

Return values

| 0 success | 1 index out of range | 2 widget not allowed to be removed (see note) | >2 reserved for FLTK use |

Since

FLTK 1.4.0

Reimplemented in `Fl_Scroll`.

Generated by Doxygen
12.57.13  draw()

void Fl_Group::draw ( ) [protected], [virtual]
Draws the widget.
Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as
soon as possible, call redraw() instead.
Override this function to draw your own widgets.
If you ever need to call another widget's draw method from within your own draw() method, e.g. for an embedded
scrollbar, you can do it (because draw() is virtual) like this:
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
Implements Fl_Widget.
Reimplemented in Fl_Help_View, Fl_Pack, Fl_Scroll, Fl_Spinner, Fl_Table, Fl_Tabs, Fl_Text_Display, Fl_Tree,
Fl_Window, Fl_Wizard, and Fl_Terminal.

12.57.14  draw_child()

void Fl_Group::draw_child ( 
    Fl_Widget & widget ) const [protected]
Forces a child to redraw.
This draws a child widget, if it is not clipped. The damage bits are cleared after drawing.

12.57.15  draw_children()

void Fl_Group::draw_children ( ) [protected]
Draws all children of the group.
This is useful, if you derived a widget from Fl_Group and want to draw a special border or background. You can call
draw_children() from the derived draw() method after drawing the box, border, or background.

12.57.16  end()

void Fl_Group::end ( )
Exactly the same as current(this->parent()).
Any new widgets added to the widget tree will be added to the parent of the group.

12.57.17  find()

int Fl_Group::find ( 
    const Fl_Widget * o ) const
Searches the child array for the widget and returns the index.
Returns children() if the widget is NULL or not found.

12.57.18  focus()

void Fl_Group::focus ( 
    Fl_Widget * W ) [inline]

Deprecated  This is for backwards compatibility only. You should use W->take_focus() instead.
See also
    Fl_Widget::take_focus();

12.57.19  handle()

int Fl_Group::handle ( 
    int event ) [virtual]
Handles the specified event.
You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.
When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.
Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to override the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to filter event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you consumed the event by returning 1 even if you didn't do anything with it.

Parameters

| in | event | the kind of event received |

Return values

| 0  | if the event was not used or understood |
| 1  | if the event was used and can be deleted |

See also

`Fl_Event`

Reimplemented from `Fl_Widget`.
Reimplemented in `Fl_Table, Fl_Terminal, Fl_Text_Display, Fl_Text_Editor, Fl_Tree, Fl_Spinner, Fl_Table_Row, Fl_Tile, Fl_Help_View, Fl_Scroll, Fl_Tabs, and Fl_Window`.

### 12.57.3.20 init_sizes()

```cpp
void Fl_Group::init_sizes()
```

Resets the internal array of widget sizes and positions.

The `Fl_Group` widget keeps track of the original widget sizes and positions when resizing occurs so that if you resize a window back to its original size the widgets will be in the correct places. If you rearrange the widgets in your group, call this method to register the new arrangement with the `Fl_Group` that contains them.

If you add or remove widgets, this will be done automatically.

Note

The internal array of widget sizes and positions will be allocated and filled when the next `resize()` occurs. For more information on the contents and structure of the `bounds()` array see `bounds()`.

See also

`bounds()`

`sizes()` (deprecated)

### 12.57.3.21 insert() [1/2]

```cpp
void Fl_Group::insert(
    Fl_Widget & o,
    int index)
```

The widget is removed from its current group (if any) and then inserted into this group.

It is put at index \( n \) - or at the end, if \( n \geq \text{children().} \). This can also be used to rearrange the widgets inside a group.
12.57.3.22  **insert()**  [2/2]

```cpp
void Fl_Group::insert ( 
    Fl_Widget & o,  
    Fl_Widget * before ) [inline]
```

This does insert(w, find(before)).
This will append the widget if before is not in the group.

12.57.3.23  **on_insert()**

```cpp
int Fl_Group::on_insert ( 
    Fl_Widget * candidate,  
    int index ) [protected], [virtual]
```

Allow derived groups to act when a widget is added as a child.
Widgets derived from Fl_Group may store additional data for their children. Overriding this method will allow derived classes to generate these data structures just before the child is added.
This method usually returns the same index that was given in the parameters. By setting a new index, the position of other widgets in the child pointer array can be preserved (e.g. Fl_Scroll keeps its scroll bars as the last two children).
By returning -1, Fl_Group::insert will not add the child to array_. This is not recommended, but Fl_Table does something similar to forward children to a hidden group.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>candidate</td>
</tr>
<tr>
<td>index</td>
</tr>
</tbody>
</table>

Returns

- index to position the child as planned  
- a new index to force the child to a different position  
-1 to keep the group from adding the candidate

Reimplemented in Fl_Scroll, Fl_Tabs, and Fl_Tile.

12.57.3.24  **on_move()**

```cpp
int Fl_Group::on_move ( 
    int oldIndex,  
    int newIndex ) [protected], [virtual]
```

Allow derived groups to act when a widget is moved within the group.
Widgets derived from Fl_Group may store additional data for their children. Overriding this method will allow derived classes to move these data structures just before the child itself is moved.
This method usually returns the new index that was given in the parameters. By setting a different destination index, the position of other widgets in the child pointer array can be preserved.
By returning -1, Fl_Group::insert will not move the child.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>oldIndex</td>
</tr>
<tr>
<td>newIndex</td>
</tr>
</tbody>
</table>

Returns

- newIndex to position the child as planned  
- a different index to force the child to a different position  
-1 to keep the group from moving the child
Reimplemented in Fl_Scroll, Fl_Tabs, and Fl_Tile.

**12.57.3.25 on_remove()**

```cpp
template<typename T>
void Fl_Group::on_remove (int index) const [protected], [virtual]
```

Allow derived groups to act when a child widget is removed from the group. Widgets derived from Fl_Group may store additional data for their children. Overriding this method will allow derived classes to remove these data structures just before the child is removed.

**Parameters**

- `index`: remove the child at this position in the array.

Reimplemented in Fl_Flex, Fl_Grid, Fl_Tabs, and Fl_Tile.

**12.57.3.26 remove() [1/3]**

```cpp
void Fl_Group::remove (Fl_Widget & o)
```

Removes a widget from the group but does not delete it. This method does nothing if the widget is not a child of the group. This method differs from the clear() method in that it only affects a single widget and does not delete it from memory.

**Note**

If you have the child's index anyway, use remove(int index) instead, because this doesn't need a child lookup in the group's table of children. This can be much faster, if there are lots of children.

**12.57.3.27 remove() [2/3]**

```cpp
void Fl_Group::remove (Fl_Widget * o) [inline]
```

Removes the widget o from the group.

**See also**

void remove(Fl_Widget&)

**12.57.3.28 remove() [3/3]**

```cpp
void Fl_Group::remove (int index)
```

Removes the widget at index from the group but does not delete it. This method does nothing if index is out of bounds. This method differs from the clear() method in that it only affects a single widget and does not delete it from memory.

**Since**

FLTK 1.3.0

**12.57.3.29 resizable() [1/3]**

```cpp
Fl_Widget * Fl_Group::resizable ( ) const [inline]
```

Returns the group's resizable widget.

**See** void Fl_Group::resizable(Fl_Widget *o)
**12.57.30 resizable() [2/3]**

void Fl_Group::resizable (  
    Fl_Widget & o ) [inline]

Sets the group's resizable widget.
See void Fl_Group::resizable(Fl_Widget *o)

**12.57.31 resizable() [3/3]**

void Fl_Group::resizable (  
    Fl_Widget * o ) [inline]

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
If the resizable is NULL the group's size is fixed and all of the widgets in the group remain a fixed size and distance
from the top-left corner. This is the default for groups derived from Fl_Window and Fl_Pack.
The resizable may be set to the group itself, in which case all of the widgets that are its direct children are resized
proportionally. This is the default value for Fl_Group.
The resizable widget defines the resizing box for the group, which could be the group itself or one of the group's
direct children. When the group is resized it calculates a new size and position for all of its children. Widgets that
are horizontally or vertically inside the dimensions of the box are scaled to the new size. Widgets outside the box
are moved.

Note

The resizable of a group **must** be one of

- NULL
- the group itself
- a direct child of the group.

If you set any other widget that is not a direct child of the group as its resizable then the behavior is undefined.
This is **not** checked by Fl_Group for historical reasons.

In these examples the gray area is the resizable:
It is possible to achieve any type of resize behavior by using an invisible \texttt{Fl\_Box} as the resizable and/or by using a hierarchy of \texttt{Fl\_Group} widgets, each with their own resizing strategies. See the \texttt{How Does Resizing Work?} chapter for more examples and detailed explanation.

Note

The \texttt{resizable()} widget of a window can also affect the window's resizing behavior if \texttt{Fl\_Window::size\_range()} is not called. Please see \texttt{Fl\_Window::default\_size\_range()} for more information on how the default size range is calculated.

See also

\texttt{Fl\_Window::size\_range()}
\texttt{Fl\_Window::default\_size\_range()}

\subsubsection{12.57.3.32 resize()}

\begin{verbatim}
void Fl\_Group::resize (int X, int Y, int W, int H) [virtual]
\end{verbatim}

Resizes the \texttt{Fl\_Group} widget and all of its children. The \texttt{Fl\_Group} widget first resizes itself, and then it moves and resizes all its children according to the rules documented for \texttt{Fl\_Group::resizable(Fl\_Widget*)}

See also

\texttt{Fl\_Group::resizable(Fl\_Widget*)}
\texttt{Fl\_Group::resizable()}
\texttt{Fl\_Widget::resize(int,int,int,int)}

Reimplemented from \texttt{Fl\_Widget}.
Reimplemented in \texttt{Fl\_Input\_Choice, Fl\_Pack, Fl\_Scroll, Fl\_Spinner, Fl\_Table, Fl\_Terminal, Fl\_Text\_Display, Fl\_Tile, Fl\_Window, Fl\_Help\_View, Fl\_Overlay\_Window, Fl\_Tabs, and Fl\_Tree}.

\subsubsection{12.57.3.33 sizes()}

\begin{verbatim}
int * Fl\_Group::sizes () [protected]
\end{verbatim}

Returns the internal array of widget sizes and positions. For backward compatibility with FLTK versions before 1.4.

The \texttt{sizes()} array stores the initial positions of widgets as (left, right, top, bottom) quads. The first quad is the group, the second is the resizable (clipped to the group), and the rest are the children. If the group and/or the \texttt{resizable()} is a \texttt{Fl\_Window}, then the first (left) and third (top) entries of their respective quads (x,y) are zero.
**Deprecated**  Deprecated since 1.4.0. Please use `bounds()` instead.

**Note**  This method will be removed in a future FLTK version (1.5.0 or higher).

**Returns**  
Array of int's with widget positions and sizes. The returned array is only valid until `init_sizes()` is called or widgets are added to or removed from the group.

**Note**  Since FLTK 1.4.0 the returned array is a **read-only** and re-ordered copy of the internal `bounds()` array. Do not change its contents. If you need to rearrange children in a group, do so by resizing the children and call `init_sizes()`.

**See also**

`bounds()`

### 12.57.34  update_child()

```cpp
void Fl_Group::update_child ( Fl_Widget & widget ) const  [protected]
```

**Draws a child only if it needs it.**  
This draws a child widget, if it is not clipped and if any `damage()` bits are set. The damage bits are cleared after drawing.

**See also**

`Fl_Group::draw_child(Fl_Widget& widget) const`

- `Fl_Help_View.H`
12.59 Fl_Help_Dialog Class Reference

The Fl_Help_Dialog widget displays a standard help dialog window using the Fl_Help_View widget.

Public Member Functions

- **Fl_Help_Dialog ()**
  The constructor creates the dialog pictured above.

- **int h ()**
  Returns the position and size of the help dialog.

- **void hide ()**
  Hides the Fl_Help_Dialog window.

- **int load (const char ∗f)**
  Loads the specified HTML file into the Fl_Help_View widget.

- **void position (int xx, int yy)**
  Set the screen position of the dialog.

- **void resize (int xx, int yy, int ww, int hh)**
  Change the position and size of the dialog.

- **void show ()**
  Shows the Fl_Help_Dialog window.

- **void show (int argc, char ∗∗argv)**
  Shows the main Help Dialog Window Delegates call to encapsulated window void Fl_Window::show(int argc, char ∗∗argv) instance method.

- **Fl_Fontsize textsize ()**
  Sets or gets the default text size for the help view.

- **void textsize (Fl_Fontsize s)**
  Sets or gets the default text size for the help view.

- **void topline (const char ∗n)**
  Sets the top line in the Fl_Help_View widget to the named or numbered line.

- **void topline (int n)**
  Sets the top line in the Fl_Help_View widget to the named or numbered line.

- **const char ∗ value () const**
  The first form sets the current buffer to the string provided and reformats the text.

- **void value (const char ∗f)**
  The first form sets the current buffer to the string provided and reformats the text.

- **int visible ()**
  Returns 1 if the Fl_Help_Dialog window is visible.

- **int w ()**
  Returns the position and size of the help dialog.

- **int x ()**
  Returns the position and size of the help dialog.

- **int y ()**
  Returns the position and size of the help dialog.

- **~Fl_Help_Dialog ()**
  The destructor destroys the widget and frees all memory that has been allocated for the current file.
12.59.1 Detailed Description

The Fl_Help_Dialog widget displays a standard help dialog window using the Fl_Help_View widget. The Fl_Help_Dialog class is not part of the FLTK core library, but instead of fltk_images. Use --use-images when compiling with fltk-config.

![Figure 12.23 Fl_Help_Dialog](image)

12.59.2 Member Function Documentation

12.59.2.1 load()

```cpp
int Fl_Help_Dialog::load (const char * f)
```

Loads the specified HTML file into the Fl_Help_View widget. The filename can also contain a target name ("filename.html#target"). Always use forward slashes as path delimiters, MSWindows-style backslashes are not supported here.

**Parameters**

- `f` the name and path of an HTML file

**Returns**

0 on success, -1 on error

**See also**

Fl_Help_View::load(), fl_load_uri()

12.59.2.2 show()

```cpp
void Fl_Help_Dialog::show ( )
```

Shows the Fl_Help_Dialog window. Shows the main Help Dialog Window Delegates call to encapsulated window _ void Fl_Window::show() method.

12.59.2.3 textsize()

```cpp
void Fl_Help_Dialog::textsize (Fl_Fontsize s)
```

Sets or gets the default text size for the help view. Sets the internal Fl_Help_View instance text size. Delegates call to encapsulated view _ void Fl_Help_View::textsize(Fl_Fontsize s) instance method
12.59.2.4 value() [1/2]

const char * Fl_Help_Dialog::value ( ) const
The first form sets the current buffer to the string provided and reformats the text.
It also clears the history of the "back" and "forward" buttons. The second form returns the current buffer contents.

12.59.2.5 value() [2/2]

void Fl_Help_Dialog::value ( const char * v )
The first form sets the current buffer to the string provided and reformats the text.
It also clears the history of the "back" and "forward" buttons. The second form returns the current buffer contents.

The documentation for this class was generated from the following files:

• Fl_Help_Dialog.H
• Fl_Help_Dialog.cxx
• Fl_Help_Dialog_Dox.cxx

12.60 Fl_Help_Font_Stack Struct Reference

Public Member Functions

• size_t count ( ) const
  Gets the current count of font style elements in the stack.

• Fl_Help_Font_Stack ( )
  font stack construction, initialize attributes.

• void init ( Fl_Font f, Fl_Fontsize s, Fl_Color c)

• void pop ( Fl_Font &f, Fl_Fontsize &s, Fl_Color &c)
  Pops from the stack the font style triplet and calls fl_font() & fl_color() adequately.

• void push ( Fl_Font f, Fl_Fontsize s, Fl_Color c)
  Pushes the font style triplet on the stack, also calls fl_font() & fl_color() adequately.

• void top ( Fl_Font &f, Fl_Fontsize &s, Fl_Color &c)
  Gets the top (current) element on the stack.

Protected Attributes

• Fl_Help_Font_Style elts_[MAX_FL_HELP_FS_ELTS]
  font elements

• size_t nfonts_
  current number of fonts in stack

The documentation for this struct was generated from the following file:

• Fl_Help_View.H

12.61 Fl_Help_Font_Style Struct Reference

Fl_Help_View font stack element definition.
#include <Fl_Help_View.H>

Public Member Functions

• Fl_Help_Font_Style ( Fl_Font afont, Fl_Fontsize asize, Fl_Color acolor)
• void get ( Fl_Font &afont, Fl_Fontsize &asize, Fl_Color &acolor)
  Gets current font attributes.

• void set ( Fl_Font afont, Fl_Fontsize asize, Fl_Color acolor)
  Sets current font attributes.
Public Attributes

- **Fl_Color c**
  
  Font Color.

- **Fl_Font f**
  
  Font.

- **Fl_Fontsize s**
  
  Font Size.

12.61.1 Detailed Description

Fl_Help_View font stack element definition.

The documentation for this struct was generated from the following file:

- Fl_Help_View.H

12.62 Fl_Help_Link Struct Reference

Definition of a link for the html viewer.

#include <Fl_Help_View.H>

Public Attributes

- **char filename [192]**
  
  Reference filename.

- **int h**
  
  Height of link text.

- **char name [32]**
  
  Link target (blank if none)

- **int w**
  
  Width of link text.

- **int x**
  
  X offset of link text.

- **int y**
  
  Y offset of link text.

12.62.1 Detailed Description

Definition of a link for the html viewer.

The documentation for this struct was generated from the following file:

- Fl_Help_View.H

12.63 Fl_Help_Target Struct Reference

Fl_Help_Target structure.

#include <Fl_Help_View.H>

Public Attributes

- **char name [32]**
  
  Target name.

- **int y**
  
  Y offset of target.
12.64 Fl_Help_View Class Reference

The Fl_Help_View widget displays HTML text.
#include <Fl_Help_View.H>
Inheritance diagram for Fl_Help_View:

```
Fl_Help_View
`s
Fl_Group `s
Fl_Widget `s
```

Public Member Functions

- void clear_selection ()
  Removes the current text selection.
- const char * directory () const
  Returns the current directory for the text in the buffer.
- const char * filename () const
  Returns the current filename for the text in the buffer.
- int find (const char * s, int p=0)
  Finds the specified string s at starting position p.
- Fl_Help_View (int xx, int yy, int ww, int hh, const char * l=0)
  The constructor creates the Fl_Help_View widget at the specified position and size.
- int handle (int) FL_OVERRIDE
  Handles events in the widget.
- int leftline () const
  Gets the left position in pixels.
- void leftline (int)
  Scrolls the text to the indicated position, given a pixel column.
- void link (Fl_Help_Func *fn)
  This method assigns a callback function to use when a link is followed or a file is loaded (via Fl_Help_View::load()) that requires a different file or path.
- int load (const char * f)
  Loads the specified file.
- void resize (int, int, int, int) FL_OVERRIDE
  Resizes the help widget.
- int scrollbar_size () const
  Gets the current size of the scrollbars’ troughs, in pixels.
- void scrollbar_size (int newSize)
  Sets the pixel size of the scrollbars’ troughs to newSize, in pixels.
- void select_all ()
  Selects all the text in the view.
- int size () const
Gets the size of the help view.

- **void** `size` ([int W], [int H])
  
  Returns the current default text color.

- **void** `textcolor` ([Fl_Color c])
  
  Sets the default text color.

- **Fl_Color** `textcolor` () const
  
  Returns the current default text color.

- **void** `textcolor` ([Fl_Color c])
  
  Sets the default text color.

- **Fl_Font** `textfont` () const
  
  Returns the current default text font.

- **void** `textfont` ([Fl_Font f])
  
  Sets the default text font.

- **Fl_Font** `textfont` () const
  
  Returns the current default text font.

- **void** `textfont` ([Fl_Font f])
  
  Sets the default text font.

- **Fl_Fontsize** `textsize` () const
  
  Gets the default text size.

- **void** `textsize` ([Fl_Fontsize s])
  
  Sets the default text size.

- **const char** `∗` `title` ()
  
  Returns the current document title, or NULL if there is no title.

- **int** `topline` () const
  
  Returns the current top line in pixels.

- **void** `topline` ([const char ∗n])
  
  Scrolls the text to the indicated position, given a named destination.

- **void** `topline` ([int])
  
  Scrolls the text to the indicated position, given a pixel line.

- **const char** `∗` `value` () const
  
  Returns the current buffer contents.

- **void** `value` ([const char ∗val])
  
  Sets the current help text buffer to the string provided and reformats the text.

- **~Fl_Help_View** ()
  
  Destroys the Fl_Help_View widget.

### Public Member Functions inherited from Fl_Group

- **Fl_Widget ∗& _ddfdesign_kludge** ()
  
  This is for forms compatibility only.

- **void** `add` ([Fl_Widget &])
  
  The widget is removed from its current group (if any) and then added to the end of this group.

- **void** `add` ([Fl_Widget ∗o])
  
  See void Fl_Group::add(Fl_Widget &w)

- **void** `add_resizable` ([Fl_Widget ∗&o])
  
  Adds a widget to the group and makes it the resizable widget.

- **Fl_Widget ∗const ∗ array** () const
  
  Returns a pointer to the array of children.

- **Fl_Group const ∗ as_group** () const FL_OVERRIDE
  
  Returns an Fl_Group pointer if this widget is an Fl_Group.

- **void** `begin` ()
  
  Sets the current group so you can build the widget tree by just constructing the widgets.

- **Fl_Widget ∗ child** ([int n]) const
  
  Returns `array()[n].`

- **int** `children` () const
  
  Returns how many child widgets the group has.

- **void** `clear` ()

Generated by Doxygen
12.64 Fl_Help_View Class Reference

Deletes all child widgets from memory recursively.

- **unsigned int clip_children ()**
  - Returns the current clipping mode.
- **virtual void clip_children (int c)**
  - Controls whether the group widget clips the drawing of child widgets to its bounding box.
- **virtual int delete_child (int n)**
  - Removes the widget at index from the group and deletes it.
- **void end ()**
  - Exactly the same as current(this->parent()).
- **int find (const Fl_Widget &o) const**
  - See int Fl_Group::find(const Fl_Widget *w) const.
- **int find (const Fl_Widget *) const**
  - Searches the child array for the widget and returns the index.
- **Fl_Group (int, int, int, int, const char * = 0)**
  - Creates a new Fl_Group widget using the given position, size, and label string.
- **void focus (Fl_Widget *)**
- **void forms_end ()**
  - This is for forms compatibility only.
- **void init_sizes ()**
  - Resets the internal array of widget sizes and positions.
- **void insert (Fl_Widget &, int i)**
  - The widget is removed from its current group (if any) and then inserted into this group.
- **void insert (Fl_Widget &o, Fl_Widget *)**
  - This does insert(w, find(before)).
- **void remove (Fl_Widget &)**
  - Removes a widget from the group but does not delete it.
- **void remove (Fl_Widget *o)**
  - Removes the widget o from the group.
- **void remove (int index)**
  - Removes the widget at index from the group but does not delete it.
- **Fl_Widget * resizable () const**
  - Returns the group's resizable widget.
- **void resizable (Fl_Widget &o)**
  - Sets the group's resizable widget.
- **void resizable (Fl_Widget *)**
  - The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- **virtual ~Fl_Group ()**
  - The destructor also deletes all the children.

Public Member Functions inherited from Fl_Widget

- **void _clear_fullscreen ()**
- **void _set_fullscreen ()**
- **void activate ()**
  - Activates the widget.
- **unsigned int active () const**
  - Returns whether the widget is active.
- **int active_r () const**
  - Returns whether the widget and all of its parents are active.
- **Fl_Align align () const**
  - Gets the label alignment.

Generated by Doxygen
- void align (Fl_Align alignment)
  
  Sets the label alignment.
- long argument () const
  
  Gets the current user data (long) argument that is passed to the callback function.
- void argument (long v)
  
  Sets the current user data (long) argument that is passed to the callback function.
- virtual class Fl_Gl_Window ∗ as_gl_window ()
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual class Fl_Gl_Window const ∗ as_gl_window () const
  
  Returns an Fl_Gl_Window pointer if this widget is an Fl_Gl_Window.
- virtual Fl_Window ∗ as_window ()
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- virtual Fl_Window const ∗ as_window () const
  
  Returns an Fl_Window pointer if this widget is an Fl_Window.
- void bind_deimage (Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the inactive state.
- void bind_deimage (int f)
  
  Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void bind_image (Fl_Image ∗ img)
  
  Sets the image to use as part of the widget label when in the active state.
- void bind_image (int f)
  
  Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- Fl_Boxtype box () const
  
  Gets the box type of the widget.
- void box (Fl_Boxtype new_box)
  
  Sets the box type for the widget.
- Fl_Callback_p callback () const
  
  Gets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback ∗ cb, Fl_Callback_User_Data ∗ p, bool auto_free)
  
  Sets the current callback function and managed user data for the widget.
- void callback (Fl_Callback ∗ cb, void ∗ p)
  
  Sets the current callback function and data for the widget.
- void callback (Fl_Callback ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback0 ∗ cb)
  
  Sets the current callback function for the widget.
- void callback (Fl_Callback1 ∗ cb, long p=0)
  
  Sets the current callback function for the widget.
- unsigned int changed () const
  
  Checks if the widget value changed since the last callback.
- void clear_active ()
  
  Marks the widget as inactive without sending events or changing focus.
- void clear_changed ()
  
  Marks the value of the widget as unchanged.
- void clear_damage (uchar c=0)
  
  Clears or sets the damage flags.
- void clear_output ()
  
  Sets a widget to accept input.
- void clear_visible ()
  
  Hides the widget.
- void clear_visible_focus ()
  
  Disables keyboard focus navigation with this widget.
- Fl_Color color () const
Gets the background color of the widget.

• void color (Fl_Color bg)

Sets the background color of the widget.

• void color (Fl_Color bg, Fl_Color sel)

Sets the background and selection color of the widget.

• Fl_Color color2 () const

For back compatibility only.

• void color2 (unsigned a)

For back compatibility only.

• int contains (const Fl_Widget *w) const

Checks if w is a child of this widget.

• void copy_label (const char *new_label)

Sets the current label.

• void copy_tooltip (const char *text)

Sets the current tooltip text.

• uchar damage () const

Returns non-zero if draw() needs to be called.

• void damage (uchar c)

Sets the damage bits for the widget.

• void damage (uchar c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.

• int damage_resize (int, int, int, int)

Internal use only.

• void deactivate ()

Deactivates the widget.

• Fl_Image * deimage ()

Gets the image that is used as part of the widget label when in the inactive state.

• const Fl_Image * deimage () const

Gets the image that is used as part of the widget label when in the inactive state.

• void deimage (Fl_Image &img)

Sets the image to use as part of the widget label when in the inactive state.

• void deimage (Fl_Image *img)

Sets the image to use as part of the widget label when in the inactive state.

• int deimage_bound () const

Returns whether the inactive image is managed by the widget.

• void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with default arguments.

• void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with arbitrary arguments.

• void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with arbitrary arguments.

• void draw_label (int, int, int, int, Fl_Align) const

Draws the label in an arbitrary bounding box with an arbitrary alignment.

• int h () const

Gets the widget height.

• virtual void hide ()

Makes a widget invisible.

• Fl_Image * image ()

Gets the image that is used as part of the widget label when in the active state.

• const Fl_Image * image () const

Gets the image that is used as part of the widget label when in the active state.
- **void image (Fl_Image &img)**
  Sets the image to use as part of the widget label when in the active state.
- **void image (Fl_Image *img)**
  Sets the image to use as part of the widget label when in the active state.
- **int image_bound () const**
  Returns whether the image is managed by the widget.
- **int inside (const Fl_Widget *wgt) const**
  Checks if this widget is a child of wgt.
- **int is_label_copied () const**
  Returns whether the current label was assigned with copy_label().
- **const char * label () const**
  Gets the current label text.
- **void label (const char *text)**
  Sets the current label pointer.
- **void label (Fl_Labeltype a, const char *b)**
  Shortcut to set the label text and type in one call.
- **Fl_Color labelcolor () const**
  Gets the label color.
- **void labelcolor (Fl_Color c)**
  Sets the label color.
- **Fl_Font labelfont () const**
  Gets the font to use.
- **void labelfont (Fl_Font f)**
  Sets the font to use.
- **Fl_Fontsize labelsize () const**
  Gets the font size in pixels.
- **void labelsize (Fl_Fontsize pix)**
  Sets the font size in pixels.
- **Fl_Labeltype labeltype () const**
  Gets the label type.
- **void labeltype (Fl_Labeltype a)**
  Sets the label type.
- **void measure_label (int &ww, int &hh) const**
  Sets width ww and height hh accordingly with the label size.
- **bool needs_keyboard () const**
  Returns whether this widget needs a keyboard.
- **void needs_keyboard (bool needs)**
  Sets whether this widget needs a keyboard.
- **unsigned int output () const**
  Returns if a widget is used for output only.
- **Fl_Group * parent () const**
  Returns a pointer to the parent widget.
- **void parent (Fl_Group *p)**
  Internal use only - "for hacks only".
- **void position (int X, int Y)**
  Repositions the window or widget.
- **void redraw ()**
  Schedules the drawing of the widget.
- **void redraw_label ()**
  Schedules the drawing of the label.
- **Fl_Color selection_color () const**
Gets the selection color.

- void selection_color (Fl_Color a)
  Sets the selection color.

- void set_active ()
  Marks the widget as active without sending events or changing focus.

- void set_changed ()
  Marks the value of the widget as changed.

- void set_output ()
  Sets a widget to output only.

- void set_visible ()
  Makes the widget visible.

- void set_visible_focus ()
  Enables keyboard focus navigation with this widget.

- int shortcut_label () const
  Returns whether the widget's label uses '&' to indicate shortcuts.

- void shortcut_label (int value)
  Sets whether the widget's label uses '&' to indicate shortcuts.

- virtual void show ()
  Makes a widget visible.

- void size (int W, int H)
  Changes the size of the widget.

- int take_focus ()
  Gives the widget the keyboard focus.

- unsigned int takesevents () const
  Returns if the widget is able to take events.

- int test_shortcut ()
  Returns true if the widget's label contains the entered '&x' shortcut.

- const char *tooltip () const
  Gets the current tooltip text.

- void tooltip (const char *text)
  Sets the current tooltip text.

- Fl_Window *top_window () const
  Returns a pointer to the top-level window for the widget.

- Fl_Window *top_window_offset (int &xoff, int &yoff) const
  Finds the x/y offset of the current widget relative to the top-level window.

- uchar type () const
  Gets the widget type.

- void type (uchar t)
  Sets the widget type.

- int use_accents_menu ()
  Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void *user_data () const
  Gets the user data for this widget.

- void user_data (Fl_Callback_User_Data *v, bool auto_free)
  Sets the user data for this widget.

- void user_data (void *v)
  Sets the user data for this widget.

- unsigned int visible () const
  Returns whether a widget is visible.

- unsigned int visible_focus () const
  Checks whether this widget has a visible focus.
• void visible_focus (int v)
  
  
  Modifies keyboard focus navigation.
• int visible_r () const
  
  Returns whether a widget and all its parents are visible.
• int w () const
  
  Gets the widget width.
• Fl_When when () const
  
  Returns the conditions under which the callback is called.
• void when (uchar i)
  
  Sets the flags used to decide when a callback is called.
• Fl_Window ∗ window () const
  
  Returns a pointer to the nearest parent window up the widget hierarchy.
• int x () const
  
  Gets the widget position in its window.
• int y () const
  
  Gets the widget position in its window.
• virtual ∼Fl_Widget ()
  
  Destroys the widget.

Protected Member Functions

• void draw () FL_OVERRIDE
  
  Draws the Fl_Help_View widget.

Protected Member Functions inherited from Fl_Group

• Fl_Rect ∗ bounds ()
